Clean cylinder block thoroughly and check all core hole plugs for evidence of leaking.

INSPECTION

Examine block for cracks or fractures.

The cylinder walls should be checked for out-of-round and taper with Cylinder Bore Indicator Tool C-119. The cylinder block should be bored and honed with new pistons and rings fitted if:

- The cylinder bores show more than 0.127 mm (0.005 in.) out-of-round.
- The cylinder bores show a taper of more than 0.254 mm (0.010 in.).
- The cylinder walls are badly scuffed or scored.

Boring and honing operation should be closely coordinated with the fitting of pistons and rings, so that specified clearances can be maintained.

OIL LINE PLUG

The oil line plug is located in the vertical passage at the rear of the block between the oil-to-filter and oil-from-filter passages (Fig. 67). Improper installation or plug missing could cause erratic, low, or no oil pressure.

The oil plug must come out the bottom. Use flat dowel, down the oil pressure sending unit hole from the top, to remove oil plug.

(1) Remove oil pressure sending unit from back of block.

(2) Insert a 3.175 mm (1/8 in.) finish wire, or equivalent, into passage.

(3) Plug should be 190.0 to 195.2 mm (7-1/2 to 7-11/16 in.) from machined surface of block (Fig. 67).

CLEANING AND INSPECTION (Continued)

If plug is too high, use a suitable flat dowel to position properly.

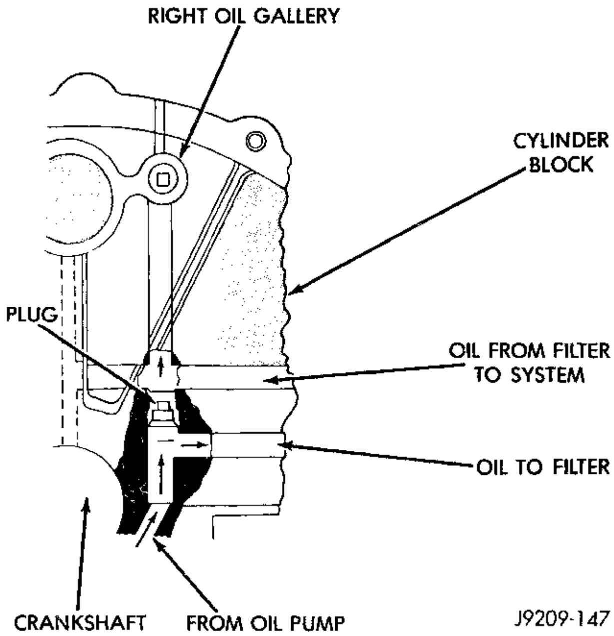

Fig. 67 Oil Line Plug

(4) If plug is too low, remove oil pan and No. 4 main bearing cap. Use suitable flat dowel to position properly. Coat outside diameter of plug with Mopar Stud and Bearing Mount Adhesive, or equivalent. Plug should be 54.0 to 57.7 mm (2-1/8 to 2-5/16 in.) from bottom of the block.

SPECIFICATIONS

3.9L ENGINE SPECIFICATIONS

GENERAL INFORMATION

Engine Type	90° V-6 OHV
Bore and Stroke	99.3 x 84.0 mm (3.91 x 3.31 in.)
Displacement	3.9L (238 c.i.)
Compression Ratio	9.1:1
Firing Order	1–6–5–4–3–2
Lubrication	Pressure Feed - Full Flow Filtration
Cooling System	Liquid Cooled - Forced Circulation
Cylinder Block	Cast Iron
Cylinder Head	Cast Iron
Crankshaft	Nodular Iron
Camshaft	Nodular Cast Iron
Combustion Chambers	"Fast Burn" Design
Pistons	Aluminum Alloy w/strut
Engine Type	90° V-6 OHV
Connecting Rods	Forged Steel
Combustion Pressure (Min.)	689.5 kPa (100 psi)

5.2L ENGINE

INDEX

GENERAL INFORMATION

VALVES AND VALVE SPRINGS

The valves are arranged in-line and inclined 18°. The rocker pivot support and the valve guides are cast integral with the heads.

OIL PUMP PRESSURE

The MINIMUM oil pump pressure is 41.4 kPa (6 psi) at curb idle. The NORMAL oil pump pressure is 207-552 kPa (30-80 psi) at 3,000 RPM or more.

CAUTION: If oil pressure is ZERO at curb idle, DO NOT run engine.

PISTON AND CONNECTING ROD ASSEMBLY

The pistons are elliptically turned so that the diameter at the pin boss is less than its diameter across the thrust face. This allows for expansion under normal operating conditions. Under operating temperatures, expansion forces the pin bosses away from each other, causing the piston to assume a more nearly round shape.

All pistons are machined to the same weight, regardless of size, to maintain piston balance.

The piston pin rotates in the piston only and is retained by the press interference fit of the piston pin in the connecting rod.

DESCRIPTION AND OPERATION

ENGINE DESCRIPTION/IDENTIFICATION

The 5.2 Liter (318 CID) eight-cylinder engine is a V-Type lightweight, single cam, overhead valve engine with hydraulic roller tappets. This engine is designed for unleaded fuel.

mopar AUTHENTIC RESTORATION PRODUCT

DESCRIPTION AND OPERATION (Continued)

Engine lubrication system consists of a rotor type oil pump and a full flow oil filter.

The cylinders are numbered from front to rear; 1, 3, 5, 7 on the left bank and 2, 4, 6, 8 on the right bank. The firing order is 1-8-4-3-6-5-7-2 (Fig. 1).

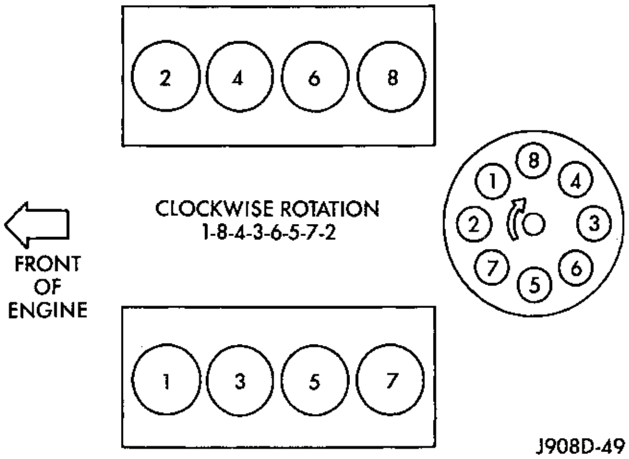

Fig. 1 Firing Order

The engine serial number is stamped into a machined pad located on the left, front corner of the cylinder block. When component part replacement is necessary, use the engine type and serial number for reference (Fig. 2).

X M 5.2L T XXXX XXXXXXXX

X = Last Digit of Model Year
M = Plant - M Mound Road
S Saltillo
T Trenton
K Toluca
5.2L = Engine Displacement
T = Usage - T Truck
XXXX = Month/Day
XXXXXXXX = Serial Code - Last 8 Digits of VIN No.

J9209-73

Fig. 2 Engine Identification Number

LUBRICATION SYSTEM

A gear—type positive displacement pump is mounted at the underside of the rear main bearing cap. The pump draws oil through the screen and inlet tube from the sump at the rear of the oil pan. The oil is driven between the drive and idler gears and pump body, then forced through the outlet to the block. An oil gallery in the block channels the oil to the inlet side of the full flow oil filter. After passing through the filter element, the oil passes from the center outlet of the filter through an oil gallery that channels the oil up to the main gallery which extends the entire length on the right side of the block. The oil then goes down to the No. 1 main bearing, back up to the left side of the block and into the oil gallery on the left side of the engine.

Galleries extend downward from the main oil gallery to the upper shell of each main bearing. The crankshaft is drilled internally to pass oil from the main bearing journals to the connecting rod journals. Each connecting rod bearing has half a hole in it, oil passes through the hole when the rods rotate and the hole lines up, oil is then thrown off as the rod rotates. This oil throw off lubricates the camshaft lobes, distributor drive gear, cylinder walls, and piston pins.

The hydraulic valve tappets receive oil directly from the main oil gallery. The camshaft bearings receive oil from the main bearing galleries. The front camshaft bearing journal passes oil through the camshaft sprocket to the timing chain. Oil drains back to the oil pan under the number one main bearing cap.

The oil supply for the rocker arms and bridged pivot assemblies is provided by the hydraulic valve tappets which pass oil through hollow push rods to a hole in the corresponding rocker arm. Oil from the rocker arm lubricates the valve train components. The oil then passes down through the push rod guide holes, and the oil drain back passages in the cylinder head past the valve tappet area, and returns to the oil pan.

Mopar AUTHENTIC RESTORATION PRODUCT

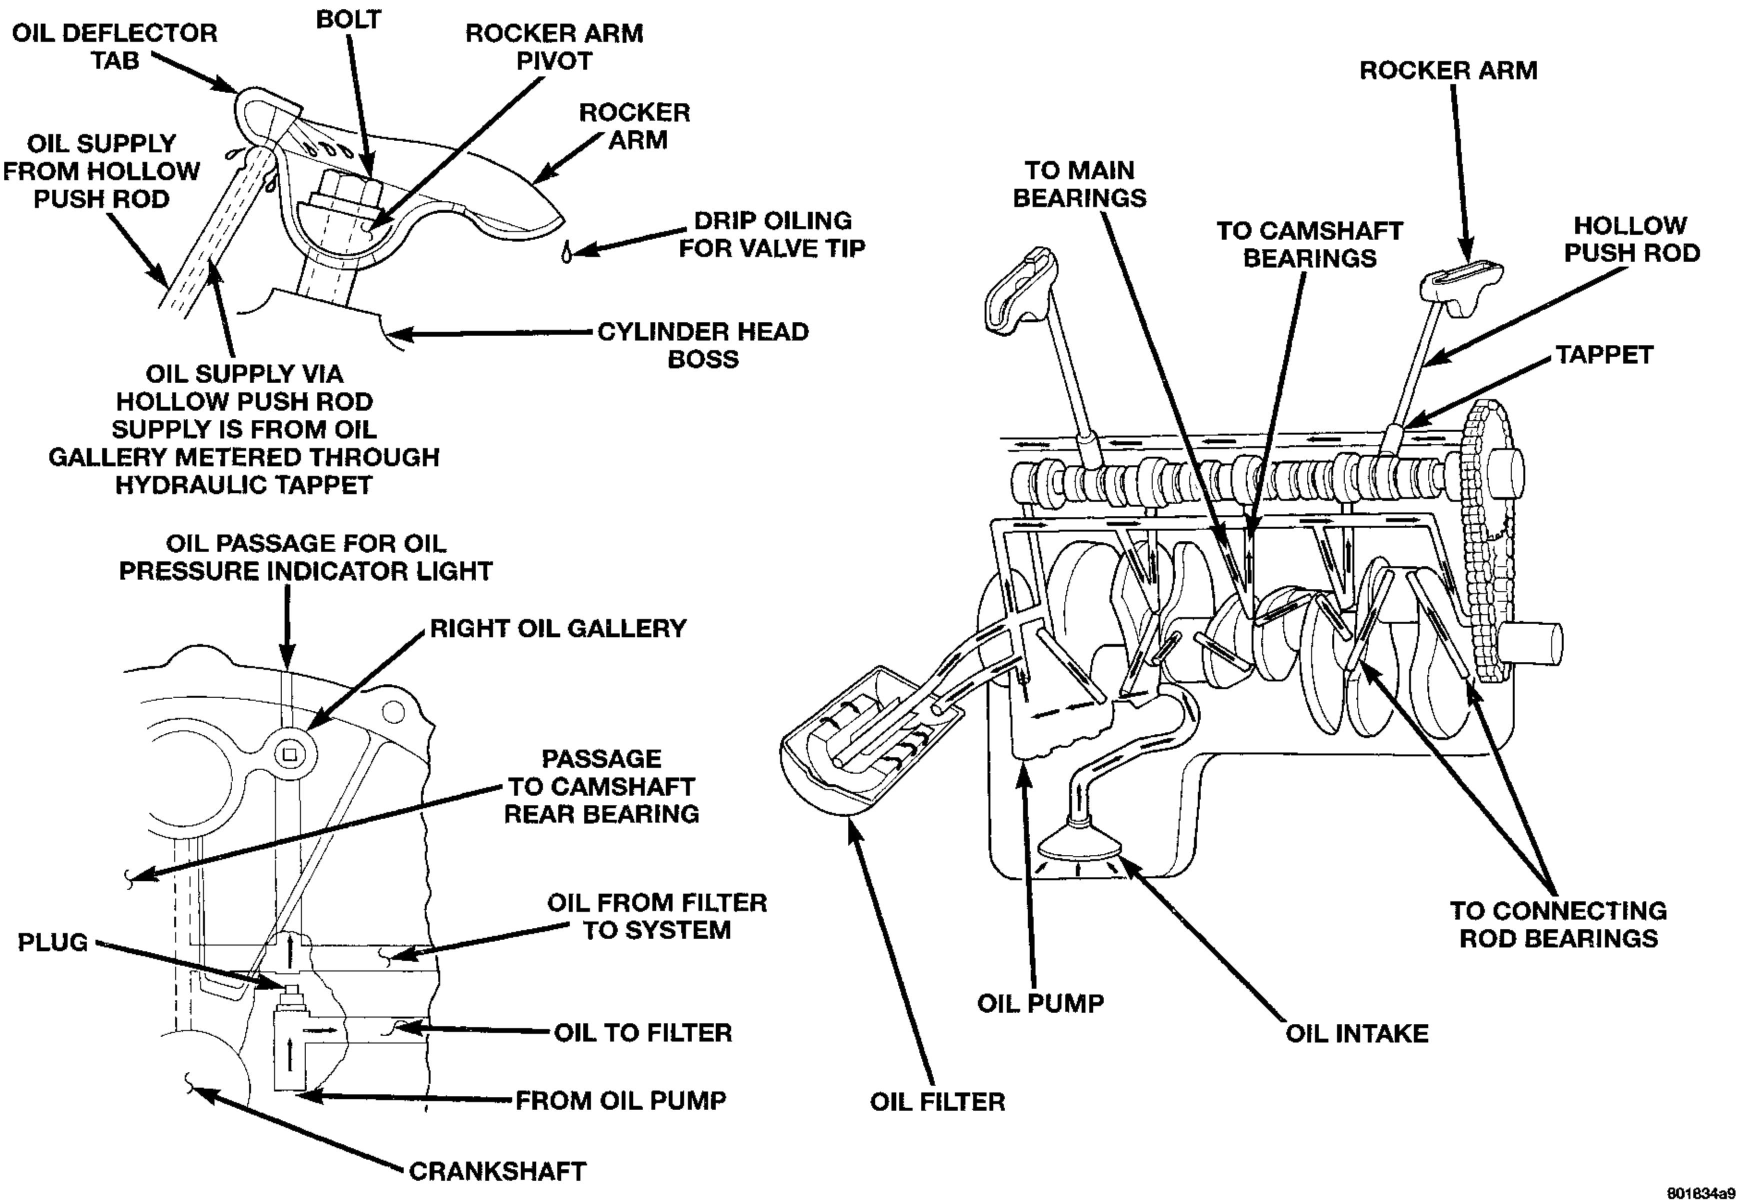

Fig. 3 Oil Lubrication System

DESCRIPTION AND OPERATION (Continued)

ENGINE COMPONENTS

CYLINDER HEAD

The alloy cast iron cylinder heads (Fig. 4) are held in place by 10 bolts. The spark plugs are located in the peak of the wedge between the valves.

The 5.2L cylinder head is identified by the foundry mark NH.

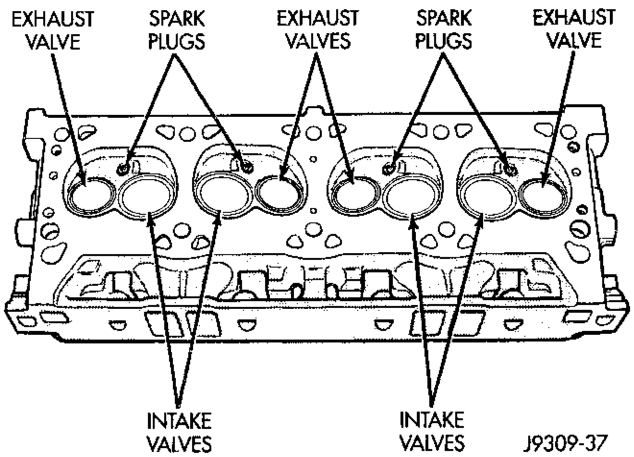

Fig. 4 Cylinder Head Assembly

PISTONS

All pistons are machined to the same weight, regardless of size, to maintain piston balance.

The pistons are elliptically turned so that the diameter at the pin boss is less than its diameter across the thrust face. This allows for expansion under normal operating conditions. Under operating temperatures, expansion forces the pin bosses away from each other, causing the piston to assume a more nearly round shape.

The piston pin rotates in the piston only and is retained by the press interference fit of the piston pin in the connecting rod.

SERVICE PROCEDURES

VALVE TIMING

(1) Turn crankshaft until the No.6 exhaust valve is closing and No.6 intake valve is opening.

(2) Insert a 6.350 mm (1/4 inch) spacer between rocker arm pad and stem tip of No.1 intake valve. Allow spring load to bleed tappet down giving in effect a solid tappet.

(3) Install a dial indicator so plunger contacts valve spring retainer as nearly perpendicular as possible. Zero the indicator.

(4) Rotate the crankshaft clockwise (normal running direction) until the valve has lifted 0.863 mm (0.034 inch). The timing of the crankshaft should now read from 10° before top dead center to 2° after top dead center. Remove spacer.

CAUTION: DO NOT turn crankshaft any further clockwise as valve spring might bottom and result in serious damage.

If reading is not within specified limits:
- Check sprocket index marks.
- Inspect timing chain for wear.
- Check accuracy of DC mark on timing indicator.

MEASURING TIMING CHAIN STRETCH

NOTE: To access timing chain Refer to Timing Chain Cover in Removal and Installation Section.

(1) Place a scale next to the timing chain so that any movement of the chain may be measured.

(2) Place a torque wrench and socket over camshaft sprocket attaching bolt. Apply torque in the direction of crankshaft rotation to take up slack; 41 N·m (30 ft. lbs.) torque with cylinder head installed or 20 N·m (15 ft. lbs.) torque with cylinder head removed. With a torque applied to the camshaft sprocket bolt, crankshaft should not be permitted to move. It may be necessary to block the crankshaft to prevent rotation.

(3) Hold a scale with dimensional reading even with the edge of a chain link. With cylinder heads installed, apply 14 N·m (30 ft. lbs.) torque in the reverse direction. With the cylinder heads removed, apply 20 N·m (15 ft. lbs.) torque in the reverse direction. Note the amount of chain movement (Fig. 5).

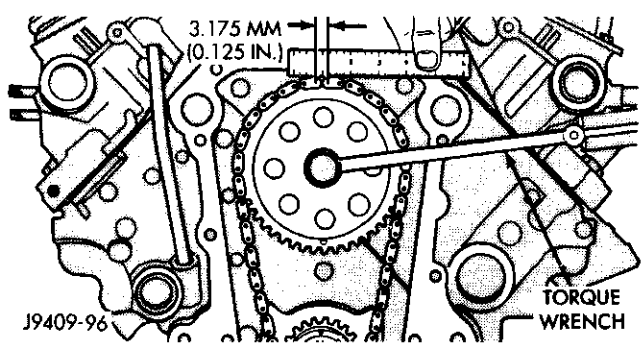

Fig. 5 Measuring Timing Chain Wear and Stretch

(4) Install a new timing chain, if its movement exceeds 3.175 mm (1/8 inch).

(5) If chain is not satisfactory, remove camshaft sprocket attaching bolt and remove timing chain with crankshaft and camshaft sprockets.

(6) Place both camshaft sprocket and crankshaft sprocket on the bench with timing marks on exact imaginary center line through both camshaft and crankshaft bores.

(7) Place timing chain around both sprockets.

mopar AUTHENTIC RESTORATION PRODUCT

SERVICE PROCEDURES (Continued)

(8) Turn crankshaft and camshaft to line up with keyway location in crankshaft sprocket and in camshaft sprocket.

(9) Lift sprockets and chain (keep sprockets tight against the chain in position as described).

(10) Slide both sprockets evenly over their respective shafts and use a straightedge to check alignment of timing marks (Fig. 6).

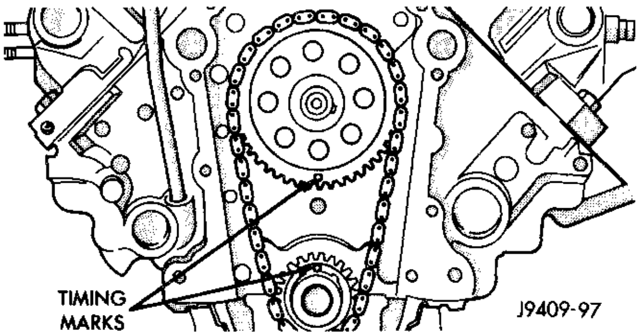

Fig. 6 Alignment of Timing Marks

(11) Install the camshaft bolt. Tighten the bolt to 47 N·m (35 ft. lbs.) torque.

(12) Check camshaft end play. The end play should be 0.051-0.152 mm (0.002-0.006 inch) with a new thrust plate and up to 0.254 mm (0.010 inch) with a used thrust plate. If not within these limits install a new thrust plate.

FITTING PISTONS

Piston and cylinder wall must be clean and dry. Specified clearance between the piston and the cylinder wall is 0.013-0.038 mm (0.0005-0.0015 inch) at 21°C (70°F).

Piston diameter should be measured at the top of skirt, 90° to piston pin axis location A in (Fig. 7). Cylinder bores should be measured halfway down the cylinder bore and transverse to the engine crankshaft center line.

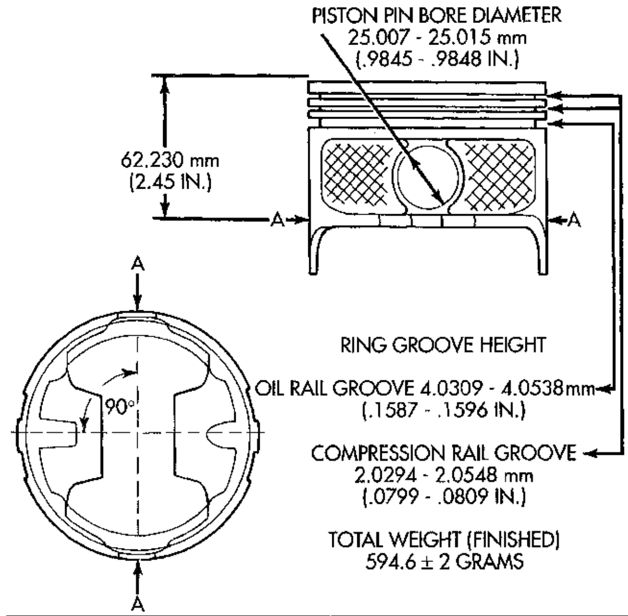
Pistons and cylinder bores should be measured at normal room temperature, 21°C (70°F).

FITTING PISTON RINGS

(1) Measurement of end gaps:

(a) Measure piston ring gap 2 inches from bottom of cylinder bore. An inverted piston can be used to push the rings down to ensure positioning rings squarely in the cylinder bore before measuring.

(b) Insert feeler gauge in the gap. The top compression ring gap should be between 0.254-0.508 mm (0.010-0.020 inch). The second compression ring gap should be between 0.508-0.762 mm (0.020-0.030 inch). The oil ring gap should be 0.254-1.270 mm (0.010-0.050 inch).



PISTON SIZE	A DIA = PISTON DIAMETER		BORE DIAMETER	
	MIN. mm (IN.)	MAX. mm (IN.)	MIN. mm (IN.)	MAX. mm (IN.)

J9509-80

Fig. 7 Piston Measurements

(c) Rings with insufficient end gap may be properly filed to the correct dimension. Rings with excess gaps should not be used.

(2) Install rings and confirm ring side clearance:

(a) Install oil rings being careful not to nick or scratch the piston. Install the oil control rings according to instructions in the package. It is not necessary to use a tool to install the upper and lower rails. Insert oil rail spacer first, then side rails.

(b) Install the second compression rings using Installation Tool C-4184. The compression rings must be installed with the identification mark face up (toward top of piston) and chamfer facing down. An identification mark on the ring is a drill point, a stamped letter "O", an oval depression or the word TOP (Fig. 8) (Fig. 10).

(c) Using a ring installer, install the top compression ring with the chamfer facing up (Fig. 9) (Fig. 10). An identification mark on the ring is a drill point, a stamped letter "O", an oval depression or the word TOP facing up.

(d) Measure side clearance between piston ring and ring land. Clearance should be 0.074-0.097 mm (0.0029-0.0038 inch) for the compression rings. The steel rail oil ring should be free in groove, but

AUTHENTIC RESTORATION PRODUCT

SERVICE PROCEDURES (Continued)

should not exceed 0.246 mm (0.0097 inch) side clearance.

(e) Pistons with insufficient or excessive side clearance should be replaced.

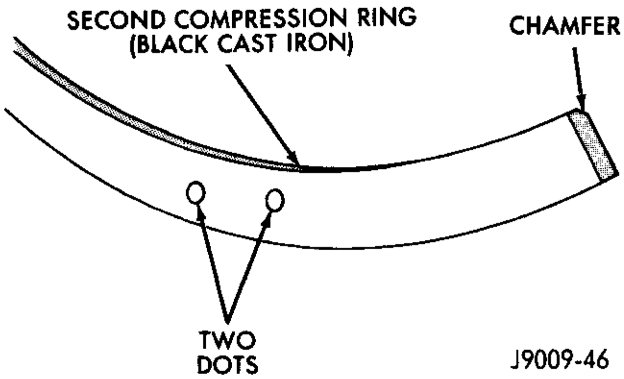

Fig. 8 Second Compression Ring Identification (Typical)

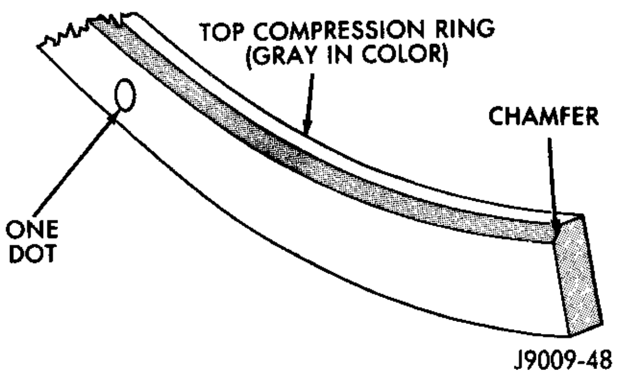

Fig. 9 Top Compression Ring Identification (Typical)

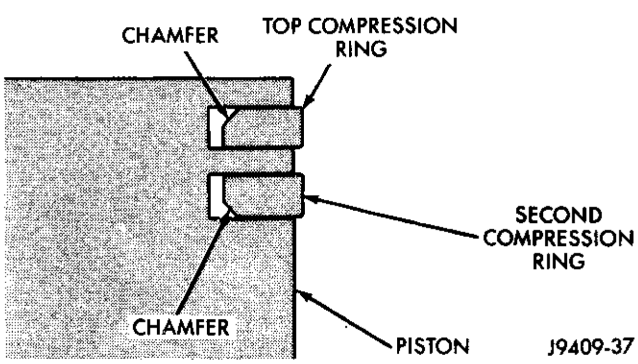

Fig. 10 Compression Ring Chamfer Location (Typical)

FITTING CONNECTING ROD BEARINGS

Fit all rods on a bank until completed. DO NOT alternate from one bank to another, because connecting rods and pistons are not interchangeable from one bank to another.

The bearing caps are not interchangeable and should be marked at removal to ensure correct assembly.

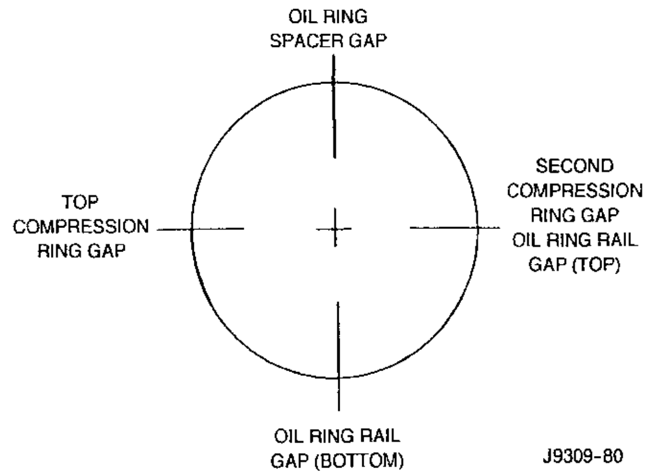

Fig. 11 Proper Ring Installation

Each bearing cap has a small V-groove across the parting face. When installing the lower bearing shell, make certain that the V-groove in the shell is in line with the V-groove in the cap. This provides lubrication of the cylinder wall in the opposite bank.

The bearing shells must be installed so that the tangs are in the machined grooves in the rods and caps.

Limits of taper or out-of-round on any crankshaft journals should be held to 0.025 mm (0.001 inch). Bearings are available in 0.025 mm (0.001 inch), 0.051 mm (0.002 inch), 0.076 mm (0.003 inch), 0.254 mm (0.010 inch) and 0.305 mm (0.012 inch) undersize. **Install the bearings in pairs. DO NOT use a new bearing half with an old bearing half. DO NOT file the rods or bearing caps.**

CRANKSHAFT MAIN BEARINGS

Bearing caps are not interchangeable and should be marked at removal to ensure correct assembly. Upper and lower bearing halves are NOT interchangeable. Lower main bearing halves of No.2 and 4 are interchangeable.

Upper and lower No.3 bearing halves are flanged to carry the crankshaft thrust loads. They are NOT interchangeable with any other bearing halves in the engine (Fig. 12). Bearing shells are available in standard and the following undersizes: 0.25 mm (0.001 inch), 0.051 mm (0.002 inch), 0.076 mm (0.003 inch), 0.254 mm (0.010 inch) and 0.305 mm (0.012 inch). Never install an undersize bearing that will reduce clearance below specifications.

CRANKSHAFT

A crankshaft which has undersize journals will be stamped with 1/4 inch letters on the milled flat on the No.8 crankshaft counterweight (Fig. 13).

FOR EXAMPLE: R2 stamped on the No.8 crankshaft counterweight indicates that the No.2 rod jour-

SERVICE PROCEDURES (Continued)

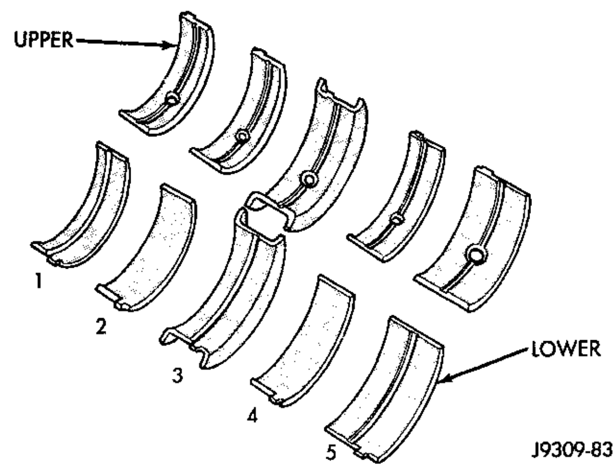

Fig. 12 Main Bearing Identification

nal is 0.025 mm (0.001 in) undersize. M4 indicates that the No.4 main journal is 0.025 mm (0.001 in) undersize. R3 M2 indicates that the No.3 rod journal and the No.2 main journal are 0.025 mm (0.001 in) undersize.

Undersize Journal	Identification Stamp
0.025 mm (0.001 in.) (Rod)	R1-R2-R3 or R4
0.025 mm (0.001 in.) (Main)	M1-M2-M3-M4 or M5

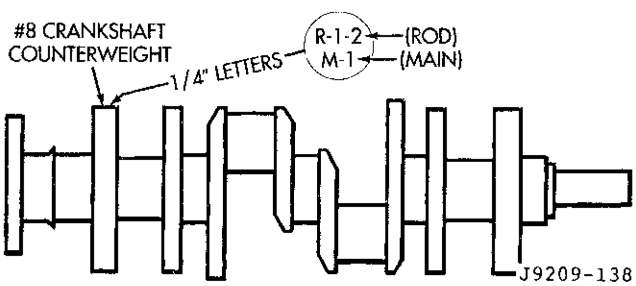

Fig. 13 Location of Crankshaft Identification

When a crankshaft is replaced, all main and connecting rod bearings should be replaced with new bearings. Therefore, selective fitting of the bearings is not required when a crankshaft and bearings are replaced.

REMOVAL AND INSTALLATION

ENGINE MOUNTS—FRONT

REMOVAL

(1) Disconnect the negative cable from the battery.

(2) Position fan to assure clearance for radiator top tank and hose.

CAUTION: DO NOT lift the engine by the intake manifold.

(3) Install engine support/lifting fixture.

(4) Raise vehicle on hoist.

(5) Lift the engine SLIGHTLY and remove the thru-bolt and nut (Fig. 14).

(6) Remove engine support bracket/cushion bolts (Fig. 14). Remove the support bracket/cushion and heat shields.

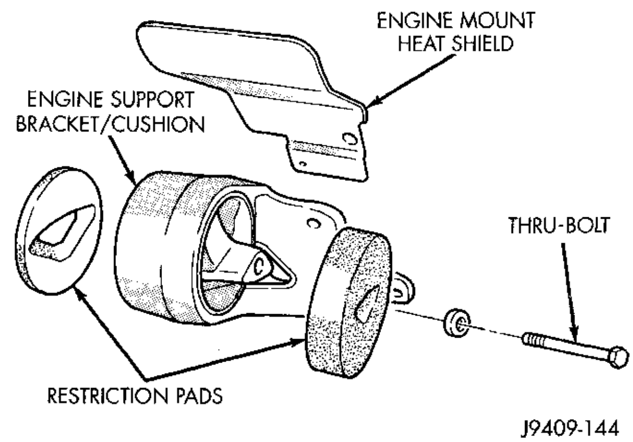

Fig. 14 Engine Front Mounts

INSTALLATION

(1) With engine raised SLIGHTLY, position the engine support bracket/cushion and heat shields to the block. Install new bolts and tighten to 81 N·m (60 ft. lbs.) torque.

(2) Install the thru-bolt into the engine support bracket/cushion.

(3) Lower engine with support/lifting fixture while guiding the engine bracket/cushion and thru-bolt into support cushion brackets (Fig. 15).

(4) Install thru-bolt nuts and tighten the nuts to 68 N·m (50 ft. lbs.) torque.

(5) Lower the vehicle.

(6) Remove lifting fixture.

ENGINE MOUNT—REAR

REMOVAL

(1) Raise the vehicle on a hoist.

(2) Position a transmission jack in place.

(3) Remove support cushion stud nuts (Fig. 16).

(4) Raise rear of transmission and engine SLIGHTLY.

(5) Remove the bolts holding the support cushion to the transmission support bracket. Remove the support cushion.

(6) If necessary, remove the bolts holding the transmission support bracket to the transmission.

REMOVAL AND INSTALLATION (Continued)

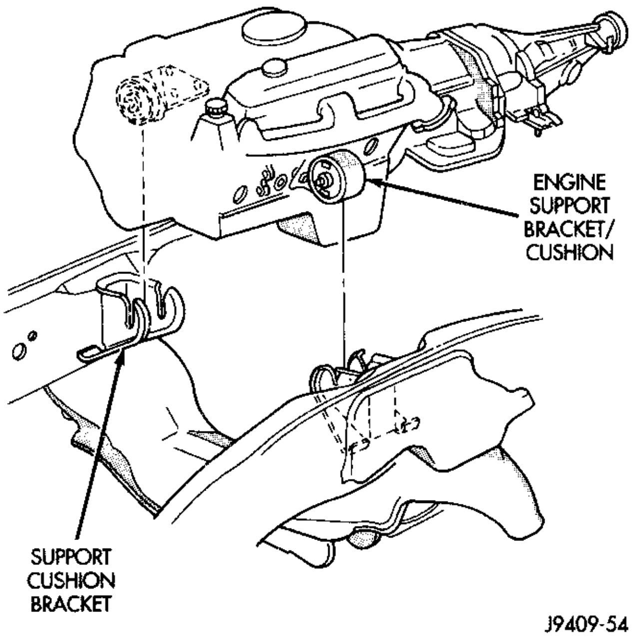

Fig. 15 Positioning Engine Front Mounts

INSTALLATION

(1) If removed, position the transmission support bracket to the transmission. Install new attaching bolts and tighten to 102 N·m (75 ft. lbs.) torque.

(2) Position support cushion to transmission support bracket. Install stud nuts and tighten to 47 N·m (35 ft. lbs.) torque.

(3) Using the transmission jack, lower the transmission and support cushion onto the crossmember (Fig. 16).

(4) Install the support cushion bolts and tighten to 47 N·m (35 ft. lbs.) torque.

(5) Remove the transmission jack.

(6) Lower the vehicle.

ENGINE ASSEMBLY

REMOVAL

(1) Disconnect the battery negative cable.

(2) Drain cooling system. Refer to Group 7, Cooling System for the proper procedure.

(3) Recover refrigerant from a/c system, if equipped. Refer to Group 24, Heating and Air Conditioning for service procedures.

(4) Remove the a/c condenser, if equipped.

(5) Remove the transmission oil cooler. Refer to Group 7, Cooling for the correct procedure.

(6) Remove the washer bottle from the fan shroud.

(7) Remove the viscous fan/drive.

(8) Disconnect the radiator upper hose from the radiator.

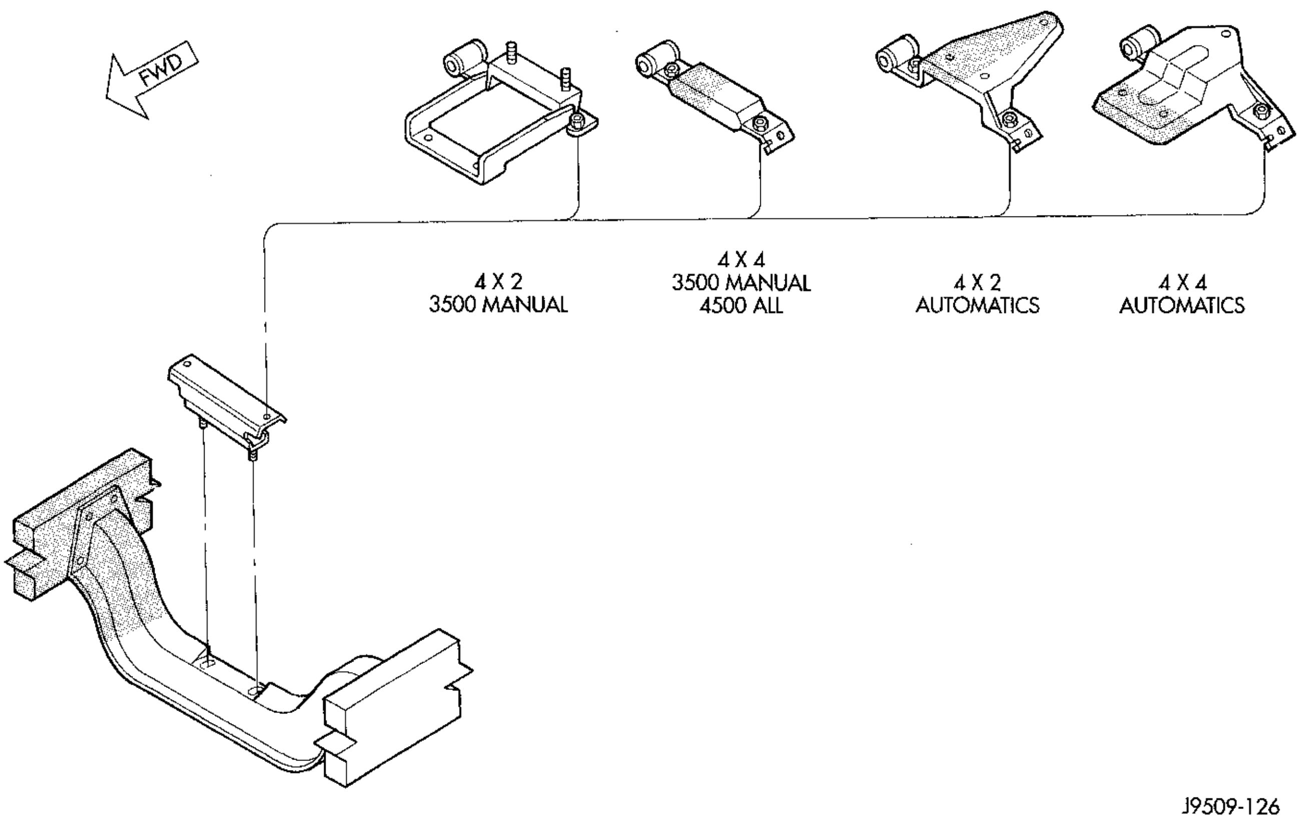

Fig. 16 Engine Rear Support Cushion Assemblies

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

(9) Remove the fan shroud.

(10) Disconnect the transmission cooler lines from the radiator.

(11) Disconnect the lower radiator hose at the radiator.

(12) Remove radiator (refer to Group 7, Cooling System).

(13) Remove the upper crossmember and top core support.

(14) Remove the accessory drive belt (refer to Group 7, Cooling System).

(15) Remove the A/C compressor with the lines attached. Secure compressor out of the way.

(16) Remove generator assembly. (refer to Group 8B, Battery/Starter/Generator Service).

(17) Remove the air cleaner resonator and duct work as an assembly.

(18) Disconnect the throttle linkage.

(19) Remove throttle body.

(20) Remove the intake manifold (refer to Group 11, Exhaust System and Intake Manifold).

(21) Remove the distributor cap and wiring.

(22) Disconnect the heater hoses.

(23) Disconnect the power steering hoses, if equipped.

(24) Perform the Fuel System Pressure Release procedure. Refer to Group 14, Fuel System.

(25) Disconnect the fuel supply line. Refer to Group 14, Fuel Systems for the correct procedure..

(26) On Manual Transmission vehicles, remove the shift lever (refer to Group 21, Transmissions).

(27) Raise and support the vehicle on a hoist and drain the engine oil.

(28) Remove engine front mount thru-bolt nuts.

(29) Disconnect the transmission oil cooler lines from their retainers at the oil pan bolts.

(30) Disconnect exhaust pipe at manifolds.

(31) Disconnect the starter wires. Remove starter motor (refer to Group 8B, Battery/Starter/Generator Service).

(32) Remove the dust shield and transmission inspection cover.

(33) Remove drive plate to converter bolts (Automatic transmission equipped vehicles).

(34) Remove transmission bell housing to engine block bolts.

(35) Lower the vehicle.

(36) Install an engine lifting fixture.

(37) Separate engine from transmission, remove engine from vehicle, and install engine assembly on a repair stand.

INSTALLATION

(1) Remove engine from the repair stand and position in the engine compartment. Position the thru-bolt into the support cushion brackets.

(2) Install engine lifting device.

(3) Lower engine into compartment and align engine with transmission:

- Manual Transmission: Align clutch disc assembly (if disturbed). Refer to Group 6, Clutch for the correct procedure. Install transmission input shaft into clutch disc while mating engine and transmission surfaces. Install two transmission to engine block mounting bolts finger tight.
- Automatic Transmission: Mate engine and transmission and install two transmission to engine block mounting bolts finger tight.

(4) Lower engine assembly until engine mount through bolts rest in mount perches.

(5) Install remaining transmission to engine block mounting bolts and tighten.

(6) Tighten engine mount through bolts.

(7) Install drive plate to torque converter bolts. (Automatic transmission models)

(8) Install the dust shield and transmission cover.

(9) Install the starter and connect the starter wires (refer to Group 8B, Battery/Starter/Generator Service).

(10) Install exhaust pipe to manifold.

(11) Install the transmission cooler line brackets to the oil pan.

(12) Install the drain plug and tighten to 34 N·m (25 ft. lbs.) torque.

(13) Lower the vehicle.

(14) Remove engine lifting fixture.

(15) On Manual Transmission vehicles, install the shift lever (refer to Group 21, Transmissions).

(16) Connect the fuel supply line.

(17) Connect the power steering hoses, if equipped.

(18) Connect the heater hoses.

(19) Install the distributor cap and wiring.

(20) Install the intake manifold. Refer to Group 11, Exhaust System and Intake Manifold.

(21) Using a new gasket, install throttle body. Tighten the throttle body bolts to 23 N·m (200 in. lbs.) torque.

(22) Connect the throttle linkage.

(23) Install the air cleaner resonator and duct work..

(24) Install the generator and wire connections (refer to Group 8B, Battery/Starter/Generator Service).

(25) Install a/c compressor and lines.

(26) Install the accessory drive belt (refer to Group 7, Cooling System).

(27) Install upper radiator support crossmember.

(28) Install radiator (refer to Group 7, Cooling System).

(29) Connect the radiator lower hose.

(30) Connect the transmission oil cooler lines to the radiator.

(31) Install the fan shroud.

REMOVAL AND INSTALLATION (Continued)

(32) Install the fan.
(33) Connect the radiator upper hose.
(34) Install the washer bottle.
(35) Install the transmission oil cooler.
(36) Connect the transmission cooler lines.
(37) If equipped, install the condenser.
(38) Evacuate and charge the air conditioning system, if equipped (refer to Group 24, Heating and Air Conditioning for service procedures).
(39) Add engine oil to crankcase. Refer to Group 0, Lubrication and Maintenance for the correct fill capacity.
(40) Add coolant to the cooling system (refer to Group 7, Cooling System for the proper procedure).
(41) Connect battery negative cable.
(42) Start engine and inspect for leaks.
(43) Road test vehicle.

CYLINDER HEAD COVER

NOTE: A steel backed silicon gasket is used with the cylinder head cover (Fig. 17). This gasket can be used again.

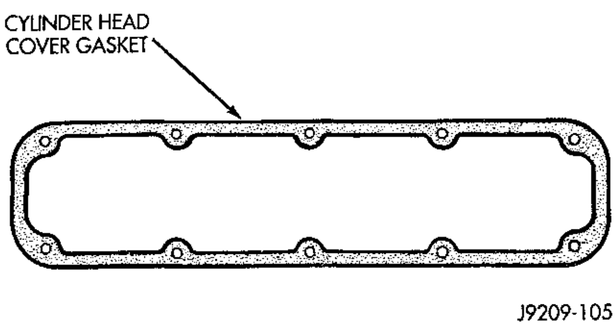

Fig. 17 Cylinder Head Cover Gasket

REMOVAL

(1) Disconnect the negative cable from the battery.
(2) Disconnect closed ventilation system and evaporation control system from cylinder head cover.
(3) Remove cylinder head cover and gasket. The gasket may be used again.

CLEANING

Clean cylinder head cover gasket surface.
Clean head rail, if necessary.

INSPECTION

Inspect cover for distortion and straighten, if necessary.
Check the gasket for use in head cover installation. If damaged, use a new gasket.

INSTALLATION

(1) The cylinder head cover gasket can be used again. Install the gasket onto the head rail.
(2) Position the cylinder head cover onto the gasket. Tighten the bolts to 11 N·m (95 in. lbs.) torque.
(3) Install closed crankcase ventilation system and evaporation control system.
(4) Connect the negative cable to the battery.

ROCKER ARMS AND PUSH RODS

REMOVAL

(1) Disconnect spark plug wires by pulling on the boot straight out in line with plug.
(2) Remove cylinder head cover and gasket.
(3) Remove the rocker arm bolts and pivots (Fig. 18). Place them on a bench in the same order as removed.
(4) Remove the push rods and place them on a bench in the same order as removed.

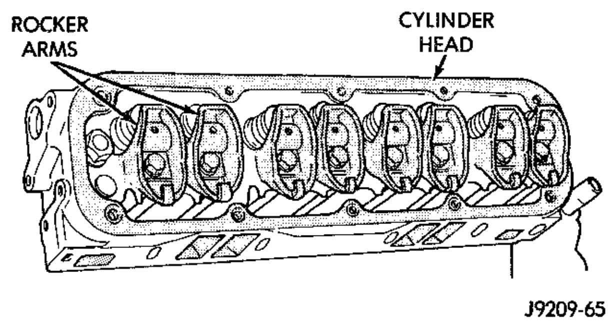

Fig. 18 Rocker Arms

INSTALLATION

(1) Rotate the crankshaft until the "V8" mark lines up with the TDC mark on the timing chain case cover. This mark is located 147° ATDC from the No.1 firing position.
(2) Install the push rods in the same order as removed.
(3) Install rocker arm and pivot assemblies in the same order as removed. Tighten the rocker arm bolts to 28 N·m (21 ft. lbs.) torque.

CAUTION: DO NOT rotate or crank the engine during or immediately after rocker arm installation. Allow the hydraulic roller tappets adequate time to bleed down (about 5 minutes).

(4) Install cylinder head cover.
(5) Connect spark plug wires.

VALVE SPRING AND STEM SEAL REPLACEMENT-IN VEHICLE

(1) Remove the air cleaner.
(2) Remove cylinder head covers and spark plugs.
(3) Remove coil wire from distributor and secure to good ground to prevent engine from starting.

REMOVAL AND INSTALLATION (Continued)

(4) Using suitable socket and flex handle at crankshaft retaining bolt, turn engine so the No.1 piston is at TDC on the compression stroke.

(5) Remove rocker arms.

(6) With air hose attached to an adapter installed in No.1 spark plug hole, apply 620-689 kPa (90-100 psi) air pressure.

(7) Using Valve Spring Compressor Tool MD-998772A with adaptor 6716A, compress valve spring and remove retainer valve locks and valve spring.

(8) Install seals on the exhaust valve stem and position down against valve guides.

(9) The intake valve stem seals should be pushed firmly and squarely over the valve guide using the valve stem as a guide. DO NOT force seal against top of guide. When installing the valve retainer locks, compress the spring only enough to install the locks.

(10) Follow the same procedure on the remaining 7 cylinders using the firing sequence 1-8-4-3-6-5-7-2. Make sure piston in cylinder is at TDC on the valve spring that is being removed.

(11) Remove adapter from the No.1 spark plug hole.

(12) Install rocker arms.

(13) Install covers and coil wire to distributor.

(14) Install air cleaner.

(15) Road test vehicle.

CYLINDER HEADS

REMOVAL

(1) Disconnect the battery negative cable.

(2) Drain cooling system (refer to Group 7, Cooling System for the proper procedures).

(3) Remove the air cleaner resonator and duct work.

(4) Remove the intake manifold-to-generator bracket support rod. Remove the generator.

(5) Remove closed crankcase ventilation system.

(6) Disconnect the evaporation control system.

(7) Perform the Fuel System Pressure Release procedure (refer to Group 14, Fuel System). Disconnect the fuel supply line.

(8) Disconnect accelerator linkage and if so equipped, the speed control and transmission kick-down cables.

(9) Remove distributor cap and wires.

(10) Disconnect the coil wires.

(11) Disconnect heat indicator sending unit wire.

(12) Disconnect heater hoses and bypass hose.

(13) Remove cylinder head covers and gaskets.

(14) Remove intake manifold and throttle body as an assembly. Discard the flange side gaskets and the front and rear cross-over gaskets.

(15) Remove exhaust manifolds.

(16) Remove rocker arm assemblies and push rods. Identify to ensure installation in original locations.

(17) Remove the head bolts from each cylinder head and remove cylinder heads. Discard the cylinder head gasket.

(18) Remove spark plugs.

INSTALLATION

(1) Clean all surfaces of cylinder block and cylinder heads.

(2) Clean cylinder block front and rear gasket surfaces using a suitable solvent.

(3) Position the new cylinder head gaskets onto the cylinder block.

(4) Position the cylinder heads onto head gaskets and cylinder block.

(5) Starting at top center, tighten all cylinder head bolts, in sequence, to 68 N·m (50 ft. lbs.) torque (Fig. 19). Repeat procedure, tighten all cylinder head bolts to 143 N·m (105 ft. lbs.) torque. Repeat procedure to confirm that all bolts are at 143 N·m (105 ft. lbs.) torque.

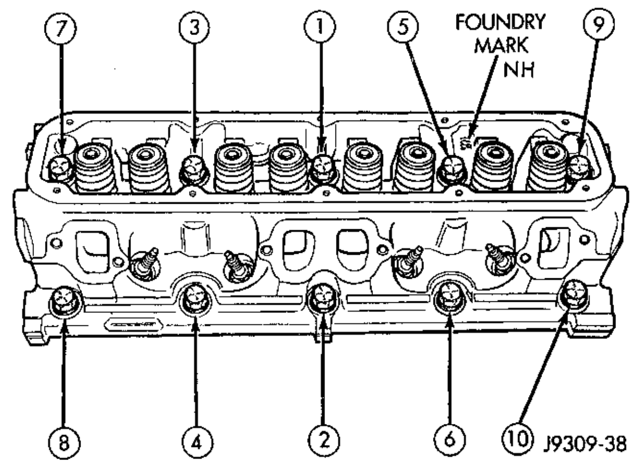

Fig. 19 Cylinder Head Bolt Tightening Sequence

CAUTION: When tightening the rocker arm bolts, make sure the piston in that cylinder is NOT at TDC. Contact between the valves and piston could occur.

(6) Install push rods and rocker arm assemblies in their original position. Tighten the bolts to 28 N·m (21 ft. lbs.) torque.

(7) Install the intake manifold and throttle body assembly (refer to Group 11, Exhaust System and Intake Manifold).

(8) Install exhaust manifolds. Tighten the bolts and nuts to 34 N·m (25 ft. lbs.) torque.

(9) Adjust spark plugs to specifications (refer to Group 8D, Ignition System). Install the plugs and tighten to 41 N·m (30 ft. lbs.) torque.

(10) Install coil wire.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

(11) Connect heat indicator sending unit wire.
(12) Connect the heater hoses and bypass hose.
(13) Install distributor cap and wires.
(14) Connect the accelerator linkage and if so equipped, the speed control and transmission kick-down cables.
(15) Install the fuel supply line.
(16) Install the generator and drive belt. Tighten generator mounting bolt to 41 N·m (30 ft. lbs.) torque. Tighten the adjusting strap bolt to 23 N·m (200 in. lbs.) torque. Refer to Group 7, Cooling System for adjusting the belt tension.
(17) Install the intake manifold-to-generator bracket support rod. Tighten the bolts.
(18) Place the cylinder head cover gaskets in position and install cylinder head covers. Tighten the bolts to 11 N·m (95 in. lbs.) torque.
(19) Install closed crankcase ventilation system.
(20) Connect the evaporation control system.
(21) Install the air cleaner.
(22) Fill cooling system (refer to Group 7, Cooling System for proper procedure).
(23) Connect the negative cable to the battery.

VALVES AND VALVE SPRINGS

REMOVAL

(1) Remove the cylinder head. Refer to procedure in this section.
(2) Compress valve springs using Valve Spring Compressor Tool MD- 998772A and adapter 6716A.
(3) Remove valve retaining locks, valve spring retainers, valve stem seals and valve springs.
(4) Before removing valves, remove any burrs from valve stem lock grooves to prevent damage to the valve guides. Identify valves to ensure installation in original location.

INSTALLATION

(1) Clean valves thoroughly. Discard burned, warped and cracked valves.
(2) Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.
(3) Measure valve stems for wear. If wear exceeds 0.051 mm (0.002 inch), replace the valve.
(4) Coat valve stems with lubrication oil and insert them in cylinder head.
(5) If valves or seats are reground, check valve stem height. If valve is too long, replace cylinder head.
(6) Install new seals on all valve guides. Install valve springs and valve retainers.
(7) Compress valve springs with Valve Spring Compressor Tool MD-998772A and adapter 6716A, install locks and release tool. If valves and/or seats are ground, measure the installed height of springs. Make sure the measurement is taken from bottom of spring seat in cylinder head to the bottom surface of spring retainer. If spacers are installed, measure from the top of spacer. If height is greater than 42.86 mm (1-11/16 inches), install a 1.587 mm (1/16 inch) spacer in head counterbore. This should bring spring height back to normal 41.27 to 42.86 mm (1-5/8 to 1-11/16 inch).

HYDRAULIC TAPPETS

REMOVAL

(1) Remove the air cleaner.
(2) Remove cylinder head cover.
(3) Remove rocker assembly and push rods. Identify push rods to ensure installation in original location.
(4) Remove intake manifold.
(5) Remove yoke retainer and aligning yokes.
(6) Slide Hydraulic Tappet Remover/Installer Tool C-4129-A through opening in cylinder head and seat tool firmly in the head of tappet.
(7) Pull tappet out of bore with a twisting motion. If all tappets are to be removed, identify tappets to ensure installation in original location.
(8) If the tappet or bore in cylinder block is scored, scuffed, or shows signs of sticking, ream the bore to next oversize. Replace with oversize tappet.

INSTALLATION

(1) Lubricate tappets.
(2) Install tappets and push rods in their original positions. Ensure that the oil feed hole in the side of the tappet body faces up (away from the crankshaft).
(3) Install aligning yokes with ARROW toward camshaft.
(4) Install yoke retainer. Tighten the bolts to 23 N·m (200 in. lbs.) torque. Install intake manifold.
(5) Install push rods in original positions.
(6) Install rocker arm.
(7) Install cylinder head cover.
(8) Start and operate engine. Warm up to normal operating temperature.

CAUTION: To prevent damage to valve mechanism, engine must not be run above fast idle until all hydraulic tappets have filled with oil and have become quiet.

VIBRATION DAMPER

REMOVAL

(1) Disconnect the battery negative cable.
(2) Remove the cooling system fan.
(3) Remove the cooling fan shroud.
(4) Remove the accessory drive belt (refer to Group 7, Cooling System).

mopar AUTHENTIC RESTORATION PRODUCTS

REMOVAL AND INSTALLATION (Continued)

(5) Remove the vibration damper pulley.

(6) Remove vibration damper bolt and washer from end of crankshaft.

(7) Install bar and screw from Puller Tool Set C-3688. Install 2 bolts with washers through the puller tool and into the vibration damper (Fig. 20).

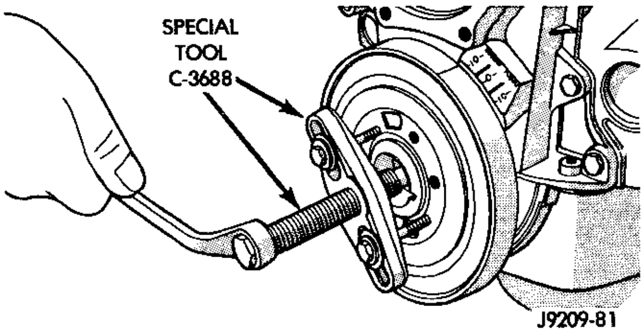

Fig. 20 Vibration Damper Assembly

(8) Pull vibration damper off of the crankshaft.

INSTALLATION

(1) Position the vibration damper onto the crankshaft.

(2) Place installing tool, part of Puller Tool Set C-3688 in position and press the vibration damper onto the crankshaft (Fig. 21).

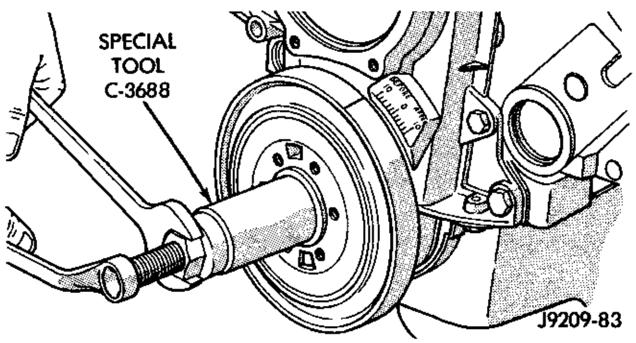

Fig. 21 Installing Vibration Damper

(3) Install the crankshaft bolt and washer. Tighten the bolt to 183 N·m (135 ft. lbs.) torque.

(4) Install the crankshaft pulley. Tighten the pulley bolts to 23 N·m (200 in. lbs.) torque.

(5) Install the accessory drive belt (refer to Group 7, Cooling System).

(6) Position the fan shroud and install the bolts. Tighten the retainer bolts to 11 N·m (95 in. lbs.) torque.

(7) Install the cooling fan

(8) Connect the battery negative cable.

TIMING CHAIN COVER

REMOVAL

(1) Disconnect the negative cable from the battery.

(2) Drain cooling system (refer to Group 7, Cooling System).

(3) Remove the serpentine belt (refer to Group 7, Cooling System).

(4) Remove water pump (refer to Group 7, Cooling System).

(5) Remove power steering pump (refer to Group 19, Steering).

(6) Remove vibration damper.

(7) Loosen oil pan bolts and remove the front bolt at each side.

(8) Remove the cover bolts.

(9) Remove chain case cover and gasket using extreme caution to avoid damaging oil pan gasket.

(10) Place a suitable tool behind the lips of the oil seal to pry the oil seal outward. Be careful not to damage the crankshaft seal surface of cover (Fig. 22).

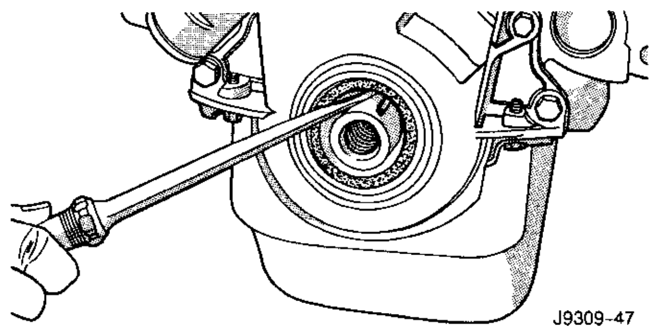

Fig. 22 Removal of Front Crankshaft Oil Seal

INSTALLATION

(1) Be sure mating surfaces of chain case cover and cylinder block are clean and free from burrs.

(2) The water pump mounting surface must be cleaned.

(3) Using a new cover gasket, carefully install chain case cover to avoid damaging oil pan gasket. Use a small amount of Mopar® Silicone Rubber Adhesive Sealant, or equivalent, at the joint between timing chain cover gasket and the oil pan gasket. Finger tighten the timing chain cover bolts at this time.

(4) Place the smaller diameter of the oil seal over Front Oil Seal Installation Tool 6635 (Fig. 23). Seat the oil seal in the groove of the tool.

(5) Position the seal and tool onto the crankshaft (Fig. 24).

(6) Tighten the 4 lower chain case cover bolts to 13N·m (10 ft.lbs.) to prevent the cover from tipping during seal installation.

(7) Using the vibration damper bolt, tighten the bolt to draw the seal into position on the crankshaft (Fig. 25).

REMOVAL AND INSTALLATION (Continued)

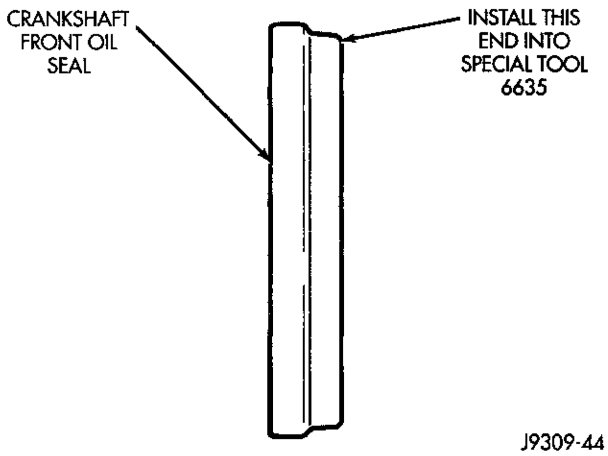

Fig. 23 Placing Oil Seal on Installation Tool 6635

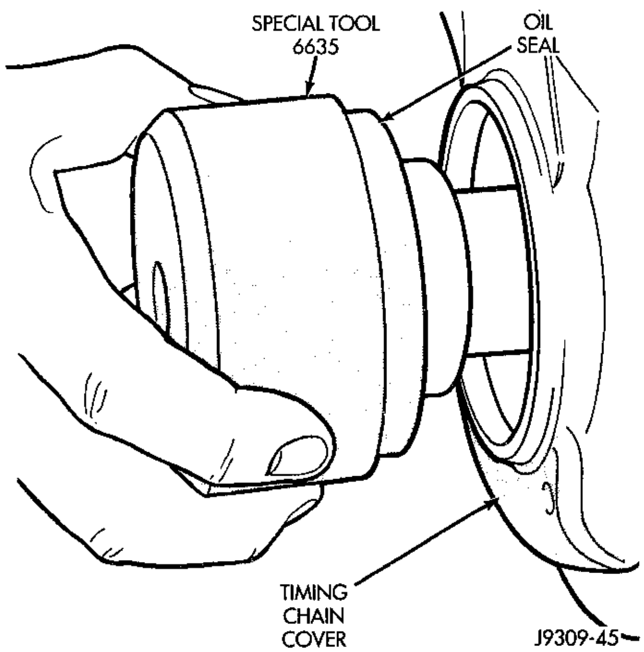

Fig. 24 Position Tool and Seal onto Crankshaft

(8) Loosen the 4 bolts tightened in step 4 to allow realignment of front cover assembly.

(9) Tighten chain case cover bolts to 41 N·m (30 ft.lbs.) torque. Tighten oil pan bolts to 24 N·m (215 in. lbs.) torque.

(10) Remove the vibration damper bolt and seal installation tool.

(11) Inspect the seal flange on the vibration damper.

(12) Install vibration damper.

(13) Install water pump and housing assembly using new gaskets (refer to Group 7, Cooling System). Tighten bolts to 41 N·m (30 ft. lbs.) torque.

(14) Install power steering pump (refer to Group 19, Steering).

(15) Install the serpentine belt (refer to Group 7, Cooling System).

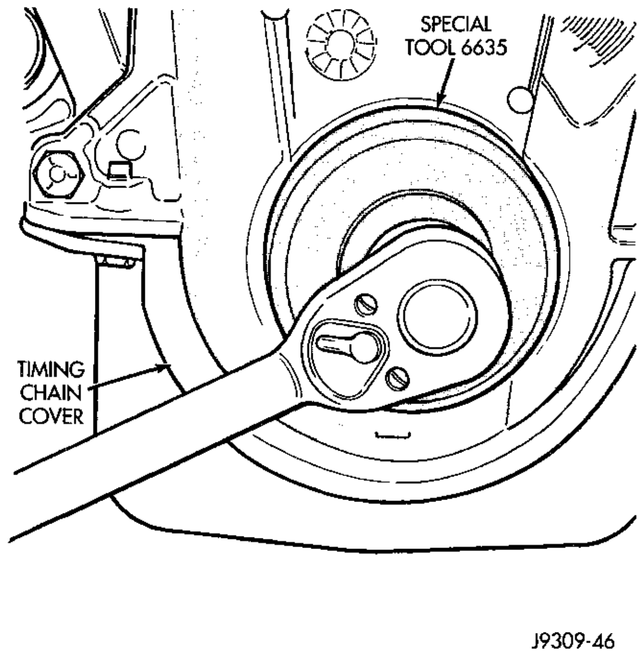

Fig. 25 Installing Oil Seal

(16) Install the cooling system fan. Tighten the bolts to 23 N·m (17 ft. lbs.) torque.

(17) Position the fan shroud and install the bolts. Tighten the bolts to 11 N·m (95 in. lbs.) torque.

(18) Fill cooling system (refer to Group 7, Cooling System for the proper procedure).

(19) Connect the negative cable to the battery.

TIMING CHAIN

REMOVAL

(1) Remove Timing Chain Cover Refer to procedure in this section.

(2) Remove camshaft sprocket attaching bolt and remove timing chain with crankshaft and camshaft sprockets.

INSTALLATION

(1) Place both camshaft sprocket and crankshaft sprocket on the bench with timing marks on exact imaginary center line through both camshaft and crankshaft bores.

(2) Place timing chain around both sprockets.

(3) Turn crankshaft and camshaft to line up with keyway location in crankshaft sprocket and in camshaft sprocket.

(4) Lift sprockets and chain (keep sprockets tight against the chain in position as described).

(5) Slide both sprockets evenly over their respective shafts and use a straightedge to check alignment of timing marks (Fig. 26).

(6) Install the camshaft bolt. Tighten the bolt to 68 N·m (50 ft. lbs.) torque.

mopar AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

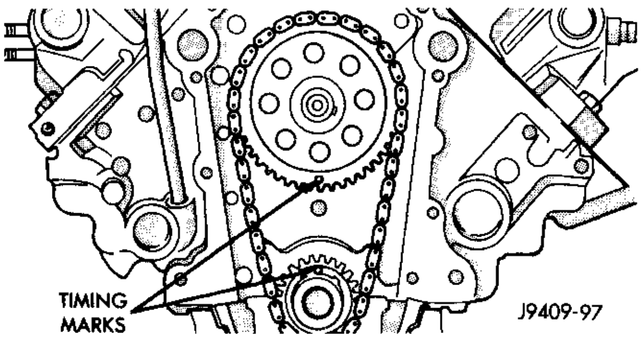

Fig. 26 Alignment of Timing Marks

(7) Check camshaft end play. The end play should be 0.051-0.152 mm (0.002-0.006 inch) with a new thrust plate and up to 0.254 mm (0.010 inch) with a used thrust plate. If not within these limits install a new thrust plate.

CAMSHAFT

NOTE: The camshaft has an integral oil pump and distributor drive gear (Fig. 27).

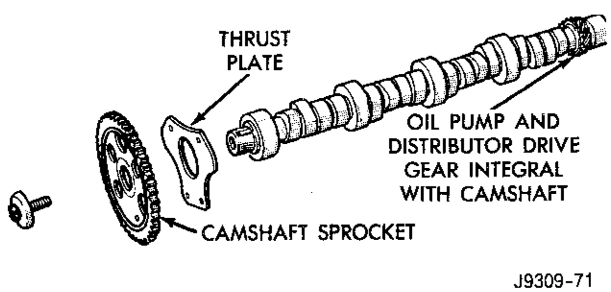

Fig. 27 Camshaft and Sprocket Assembly

REMOVAL

(1) Remove intake manifold.
(2) Remove cylinder head covers.
(3) Remove timing case cover and timing chain.
(4) Remove rocker arms.
(5) Remove push rods and tappets. Identify each part so it can be installed in its original location.
(6) Remove distributor and lift out the oil pump and distributor drive shaft.
(7) Remove camshaft thrust plate, note location of oil tab (Fig. 28).
(8) Install a long bolt into front of camshaft to facilitate removal of the camshaft. Remove camshaft, being careful not to damage cam bearings with the cam lobes.

INSTALLATION

(1) Lubricate camshaft lobes and camshaft bearing journals and insert the camshaft to within 51 mm (2 inches) of its final position in cylinder block.

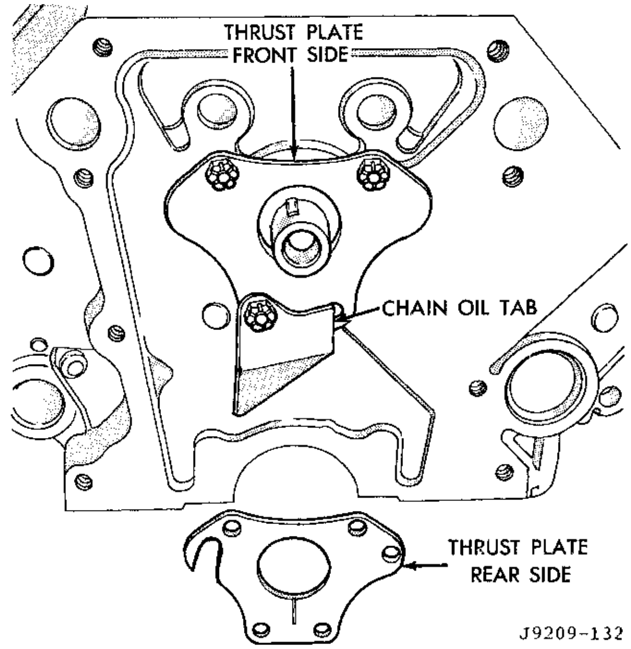

Fig. 28 Timing Chain Oil Tab Installation

NOTE: Whenever an engine has been rebuilt, a new camshaft and/or new tappets installed, add 1 pint of Mopar Crankcase Conditioner, or equivalent. The oil mixture should be left in engine for a minimum of 805 km (500 miles). Drain at the next normal oil change.

(2) Install Camshaft Gear Installer Tool C-3509 with tongue back of distributor drive gear (Fig. 29).

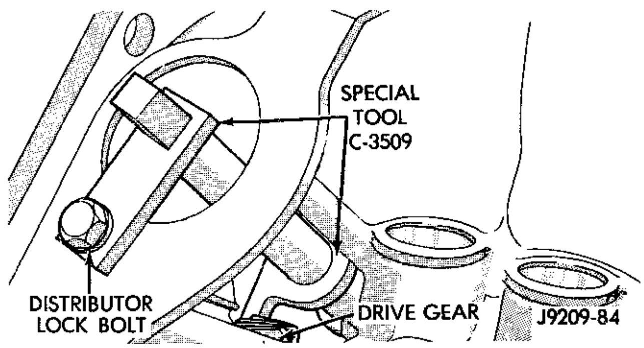

Fig. 29 Camshaft Holding Tool C-3509 (Installed Position)

(3) Hold tool in position with a distributor lock-plate bolt. This tool will restrict camshaft from being pushed in too far and prevent knocking out the welch plug in rear of cylinder block. **Tool should remain installed until the camshaft and crankshaft sprockets and timing chain have been installed.**
(4) Install camshaft thrust plate and chain oil tab. **Make sure tang enters lower right hole in thrust plate.** Tighten bolts to 24 N·m (210 in. lbs.)

REMOVAL AND INSTALLATION (Continued)

torque. Top edge of tab should be flat against thrust plate in order to catch oil for chain lubrication.

(5) Place both camshaft sprocket and crankshaft sprocket on the bench with timing marks on exact imaginary center line through both camshaft and crankshaft bores.

(6) Place timing chain around both sprockets.

(7) Turn crankshaft and camshaft to line up with keyway location in crankshaft sprocket and in camshaft sprocket.

(8) Lift sprockets and chain (keep sprockets tight against the chain in position as described).

(9) Slide both sprockets evenly over their respective shafts and use a straightedge to check alignment of timing marks (Fig. 30).

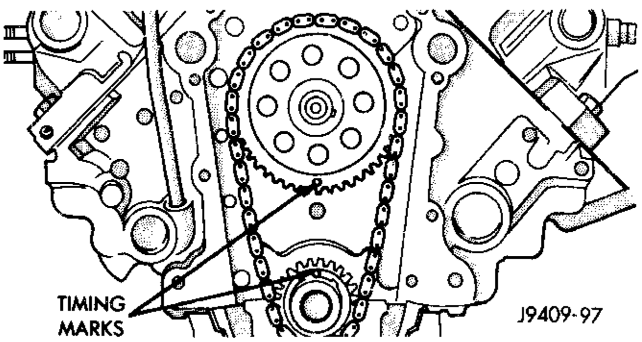

Fig. 30 Alignment of Timing Marks

(10) Install the camshaft bolt/cup washer. Tighten bolt to 68 N·m (50 ft. lbs.) torque.

(11) Measure camshaft end play. Refer to Specifications for proper clearance. If not within limits install a new thrust plate.

(12) Each tappet reused must be installed in the same position from which it was removed. **When camshaft is replaced, all of the tappets must be replaced.**

CAMSHAFT BEARINGS

REMOVAL

NOTE: This procedure requires that the engine is removed from the vehicle.

(1) With engine completely disassembled, drive out rear cam bearing core hole plug.

(2) Install proper size adapters and horseshoe washers (part of Camshaft Bearing Remover/Installer Tool C-3132-A) at back of each bearing shell. Drive out bearing shells (Fig. 31).

INSTALLATION

(1) Install new camshaft bearings with Camshaft Bearing Remover/Installer Tool C-3132-A by sliding the new camshaft bearing shell over proper adapter.

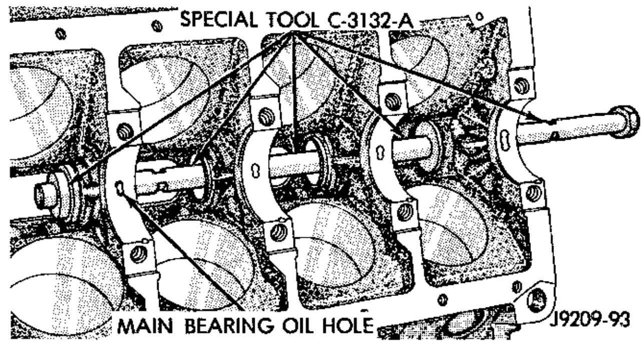

Fig. 31 Camshaft Bearings Removal/Installation with Tool C-3132-A

(2) Position rear bearing in the tool. Install horseshoe lock and by reversing removal procedure, carefully drive bearing shell into place.

(3) Install remaining bearings in the same manner. Bearings must be carefully aligned to bring oil holes into full register with oil passages from the main bearing. If the camshaft bearing shell oil holes are not in exact alignment, remove and install them correctly. Install a new core hole plug at the rear of camshaft. **Be sure this plug does not leak.**

CRANKSHAFT MAIN BEARINGS

REMOVAL

(1) Remove the oil pan.

(2) Remove the oil pump from the rear main bearing cap.

(3) Identify bearing caps before removal. Remove bearing caps one at a time.

(4) Remove upper half of bearing by inserting Crankshaft Main Bearing Remover/Installer Tool C-3059 into the oil hole of crankshaft (Fig. 32).

(5) Slowly rotate crankshaft clockwise, forcing out upper half of bearing shell.

INSTALLATION

Only one main bearing should be selectively fitted while all other main bearing caps are properly tightened. All bearing capbolts removed during service procedures are to be cleaned and oiled before installation.

When installing a new upper bearing shell, slightly chamfer the sharp edges from the plain side.

(1) Start bearing in place, and insert Crankshaft Main Bearing Remover/Installer Tool C-3059 into oil hole of crankshaft (Fig. 32).

(2) Slowly rotate crankshaft counterclockwise sliding the bearing into position. Remove Tool C-3059.

(3) Install the bearing caps. Clean and oil the bolts. Tighten the capbolts to 115 N·m (85 ft. lbs.) torque.

(4) Install the oil pump.

(5) Install the oil pan.

REMOVAL AND INSTALLATION (Continued)

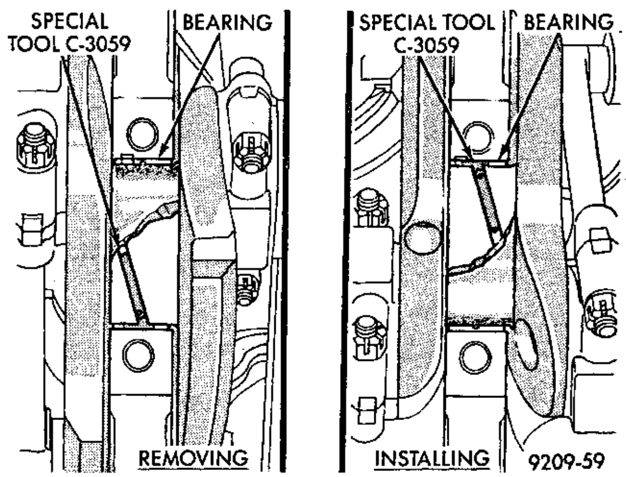

Fig. 32 Upper Main Bearing Removal and Installation with Tool C-3059

DISTRIBUTOR DRIVE SHAFT BUSHING

REMOVAL

(1) Remove distributor, refer to Group 8D, Ignition Systems for the proper procedure.

(2) Remove the intake manifold (refer to Group 11, Exhaust System and Intake Manifold).

(3) Insert Distributor Drive Shaft Bushing Puller Tool C-3052 into old bushing and thread down until a tight fit is obtained (Fig. 33).

(4) Hold puller screw and tighten puller nut until bushing is removed.

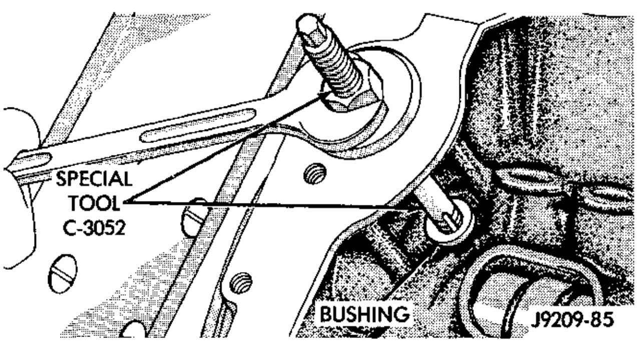

Fig. 33 Distributor Driveshaft Bushing Removal

INSTALLATION

(1) Slide new bushing over burnishing end of Distributor Drive Shaft Bushing Driver/Burnisher Tool C-3053. Insert the tool and bushing into the bore.

(2) Drive bushing and tool into position, using a hammer (Fig. 34).

(3) As the burnisher is pulled through the bushing, the bushing is expanded tight in the block and burnished to correct size (Fig. 35). **DO NOT ream this bushing.**

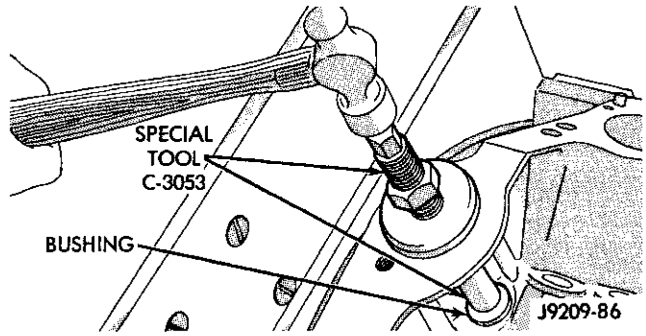

Fig. 34 Distributor Driveshaft Bushing Installation

CAUTION: This procedure MUST be followed when installing a new bushing or seizure to shaft may occur.

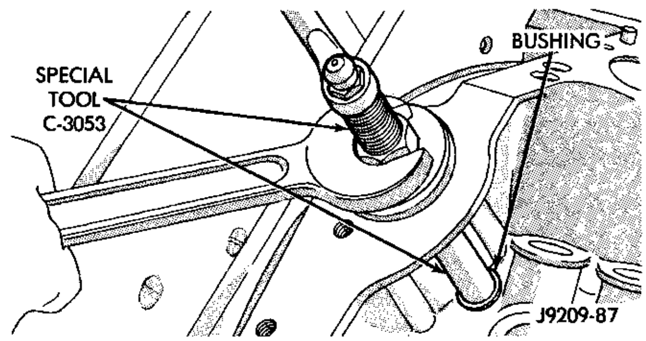

Fig. 35 Burnishing Distributor Driveshaft Bushing

(4) Install the intake manifold (refer to Group 11, Exhaust System and Intake Manifold).

DISTRIBUTOR INSTALLATION

NOTE: Before installing the distributor, the oil pump drive shaft must be aligned to number one cylinder.

(1) Rotate crankshaft until No.1 cylinder is at top dead center on the firing stroke.

(2) When in this position, the timing mark of vibration damper should be under "0" on the timing indicator.

(3) Install the shaft so that after the gear spirals into place, it will index with the oil pump shaft. The slot on top of oil pump shaft should be aligned towards the left front intake manifold attaching bolt hole (Fig. 36).

(4) Install distributor, refer to Group 8D, Ignition Systems for the proper procedure.

After the distributor has been installed, its rotational position must be set using the **SET SYNC** mode of the DRB scan tool. Refer to Checking Distributor Position following the Distributor Installation section in Group 8D, Ignition system.

Do not attempt to adjust ignition timing by rotating the distributor. It has no effect on igni-

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

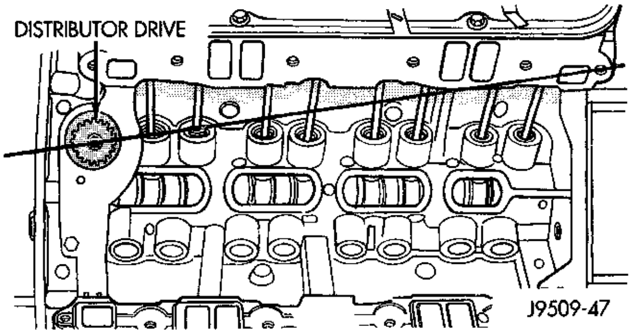

Fig. 36 Position of Oil Pump Shaft Slot

tion timing. Adjusting distributor position will effect fuel synchronization only.

OIL PAN

REMOVAL

(1) Disconnect the negative cable from the battery.
(2) Remove engine oil dipstick.
(3) Raise vehicle.
(4) Drain engine oil.
(5) Remove exhaust pipe.
(6) Remove left engine to transmission strut.
(7) Loosen the right side engine support bracket cushion thru-bolt nut and raise the engine slightly. Remove oil pan by sliding backward and out.
(8) Remove the one-piece gasket.

INSTALLATION

(1) Clean the block and pan gasket surfaces.
(2) Trim or remove excess sealant film in the rear main cap oil pan gasket groove. **DO NOT remove the sealant inside the rear main cap slots.**
(3) If present, trim excess sealant from inside the engine.
(4) Fabricate 4 alignment dowels from 5/16 x 1 1/2 inch bolts. Cut the head off the bolts and cut a slot into the top of the dowel. This will allow easier installation and removal with a screwdriver (Fig. 37).

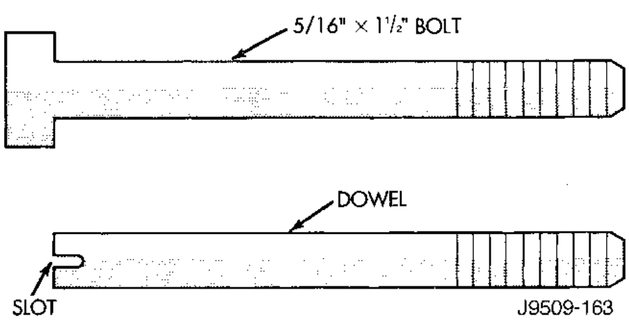

Fig. 37 Fabrication of Alignment Dowels

(5) Install the dowels in the cylinder block (Fig. 38).

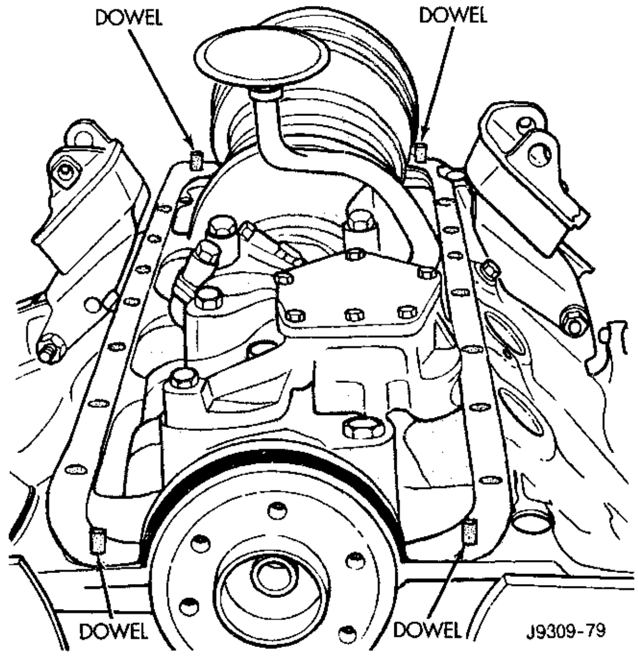

Fig. 38 Position of Dowels in Cylinder Block

(6) Apply small amount of Mopar® Silicone Rubber Adhesive Sealant, or equivalent in the corner of the cap and the cylinder block.
(7) Slide the one-piece gasket over the dowels and onto the block.
(8) Position the oil pan over the dowels and onto the gasket.
(9) Install the oil pan bolts. Tighten the bolts to 24 N·m (215 in. lbs.) torque.
(10) Remove the dowels. Install the remaining oil pan bolts. Tighten these bolts to 24 N·m (215 in. lbs.) torque.
(11) Lower the engine into the support cushion brackets and tighten the thru bolt nut to the proper torque.
(12) Install the drain plug. Tighten drain plug to 34 N·m (25 ft. lbs.) torque.
(13) Install the engine to transmission strut.
(14) Install exhaust pipe.
(15) Lower vehicle.
(16) Install dipstick.
(17) Connect the negative cable to the battery.
(18) Fill crankcase with oil to proper level.

PISTON AND CONNECTING ROD ASSEMBLY

REMOVAL

(1) Remove the engine from the vehicle.
(2) Remove the cylinder head.
(3) Remove the oil pan.
(4) Remove top ridge of cylinder bores with a reliable ridge reamer before removing pistons from cyl-

REMOVAL AND INSTALLATION (Continued)

inder block. Be sure to keep tops of pistons covered during this operation.

(5) Be sure the connecting rod and connecting rod cap are identified with the cylinder number. Remove connecting rod cap. Install connecting rod bolt guide set on connecting rod bolts.

(6) Pistons and connecting rods must be removed from top of cylinder block. When removing piston and connecting rod assemblies, rotate crankshaft to center the connecting rod in the cylinder bore and at BDC. **Be careful not to nick crankshaft journals.**

(7) After removal, install bearing cap on the mating rod.

INSTALLATION

(1) Be sure that compression ring gaps are staggered so that neither is in-line with oil ring rail gap.

(2) Before installing the ring compressor, make sure the oil ring expander ends are butted and the rail gaps located properly (Fig. 39).

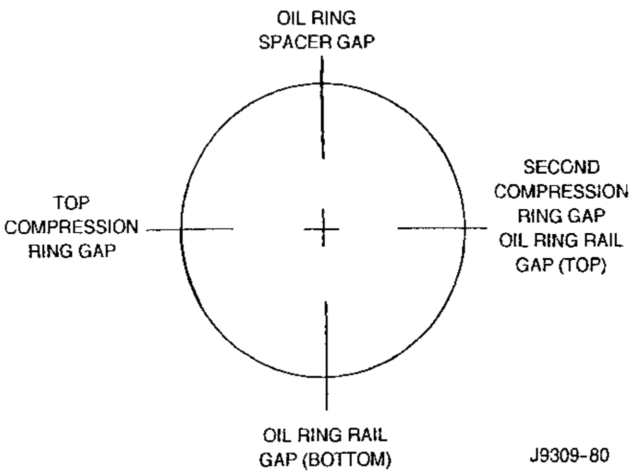

Fig. 39 Proper Ring Installation

(3) Immerse the piston head and rings in clean engine oil. Slide Piston Ring Compressor Tool C-385 over the piston and tighten with the special wrench (part of Tool C-385). **Be sure position of rings does not change during this operation.**

(4) Install connecting rod bolt protectors on rod bolts, the long protector should be installed on the numbered side of the connecting rod.

(5) Rotate crankshaft so that the connecting rod journal is on the center of the cylinder bore. Be sure connecting rod and cylinder bore number are the same. Insert rod and piston into cylinder bore and guide rod over the crankshaft journal.

(6) Tap the piston down in cylinder bore, using a hammer handle. At the same time, guide connecting rod into position on crankshaft journal.

(7) The notch or groove on top of piston must be pointing toward front of engine. The larger chamfer of the connecting rod bore must be installed toward crankshaft journal fillet.

(8) Install rod caps. Be sure connecting rod, connecting rod cap and cylinder bore number are the same. Install nuts on cleaned and oiled rod bolts and tighten nuts to 61 N·m (45 ft. lbs.) torque.

(9) Install the oil pan.

(10) Install the cylinder head.

(11) Install the engine into the vehicle.

CRANKSHAFT

REMOVAL

(1) Remove the oil pan.

(2) Remove the oil pump from the rear main bearing cap.

(3) Remove the vibration damper.

(4) Remove the timing chain cover.

(5) Identify bearing caps before removal. Remove bearing caps and bearings one at a time.

(6) Lift the crankshaft out of the block.

(7) Remove and discard the crankshaft rear oil seals.

(8) Remove and discard the front crankshaft oil seal.

INSTALLATION

(1) Clean Loctite 518 residue and sealant from the cylinder block and rear cap mating surface. Do this before applying the Loctite drop and the installation of rear cap.

(2) Lightly oil the new upper seal lips with engine oil.

(3) Install the new upper rear bearing oil seal with the white paint facing towards the rear of the engine.

(4) Position the crankshaft into the cylinder block.

(5) Lightly oil the new lower seal lips with engine oil.

(6) Install the new lower rear bearing oil seal into the bearing cap with the white paint facing towards the rear of the engine.

(7) Apply 5 mm (0.20 in) drop of Loctite 518, or equivalent, on each side of the rear main bearing cap (Fig. 40). DO NOT over apply sealant or allow the sealant to contact the rubber seal. Assemble bearing cap to cylinder block immediately after sealant application.

(8) To align the bearing cap, use cap slot, alignment dowel and cap bolts. DO NOT remove excess material after assembly. DO NOT strike rear cap more than 2 times for proper engagement.

(9) Clean and oil all cap bolts. Install all main bearing caps. Install all cap bolts and alternately tighten to 115 N·m (85 ft. lbs.) torque.

(10) Install oil pump.

(11) Install the timing chain cover.

(12) Install the vibration damper.

REMOVAL AND INSTALLATION (Continued)

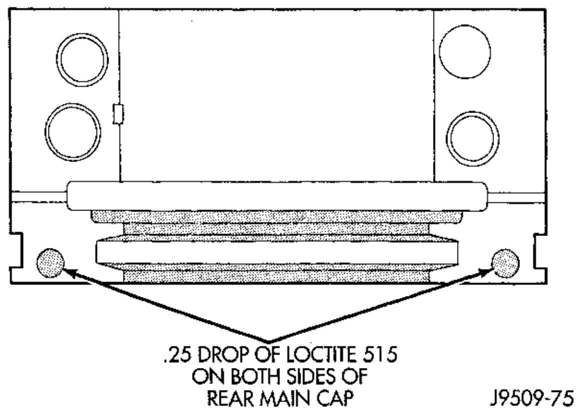

Fig. 40 Sealant Application to Bearing Cap

(13) Apply Mopar® Silicone Rubber Adhesive Sealant, or equivalent, at bearing cap to block joint to provide cap to block and oil pan sealing (Fig. 41). Apply enough sealant until a small amount is squeezed out. Withdraw nozzle and wipe excess sealant off the oil pan seal groove.

(14) Install new front crankshaft oil seal.

(15) Immediately install the oil pan.

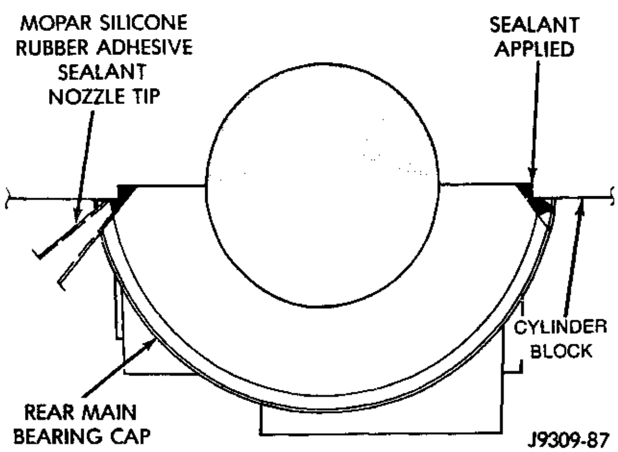

Fig. 41 Apply Sealant to Bearing Cap to Block Joint

OIL PUMP

REMOVAL

(1) Remove the oil pan.

(2) Remove the oil pump from rear main bearing cap.

INSTALLATION

(1) Install oil pump. During installation slowly rotate pump body to ensure driveshaft-to-pump rotor shaft engagement.

(2) Hold the oil pump base flush against mating surface on No.5 main bearing cap. Finger tighten pump attaching bolts. Tighten attaching bolts to 41 N·m (30 ft. lbs.) torque.

(3) Install the oil pan.

FRONT CRANKSHAFT OIL SEAL

The oil seal can be replaced without removing the timing chain cover provided the cover is not misaligned.

(1) Disconnect the negative cable from the battery.

(2) Remove vibration damper.

(3) If front seal is suspected of leaking, check front oil seal alignment to crankshaft. The seal installation/alignment tool 6635, should fit with minimum interference. If tool does not fit, the cover must be removed and installed properly.

(4) Place a suitable tool behind the lips of the oil seal to pry the oil seal outward. Be careful not to damage the crankshaft seal bore of cover.

(5) Place the smaller diameter of the oil seal over Front Oil Seal Installation Tool 6635 (Fig. 42). Seat the oil seal in the groove of the tool.

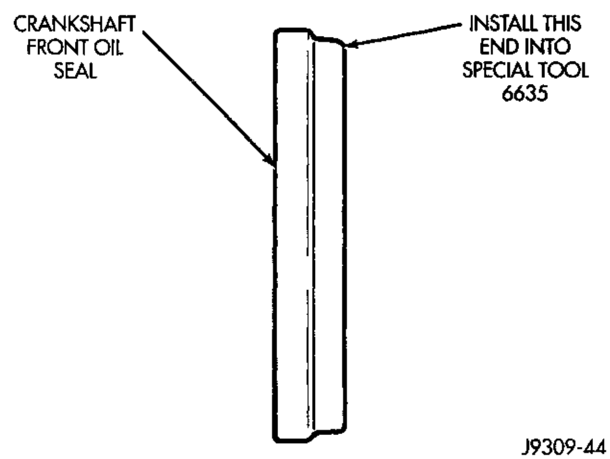

Fig. 42 Placing Oil Seal on Installation Tool 6635

(6) Position the seal and tool onto the crankshaft (Fig. 43).

(7) Using the vibration damper bolt, tighten the bolt to draw the seal into position on the crankshaft (Fig. 44).

(8) Remove the vibration damper bolt and seal installation tool.

(9) Inspect the seal flange on the vibration damper.

(10) Install the vibration damper.

(11) Connect the negative cable to the battery.

CRANKSHAFT REAR OIL SEALS

The service seal is a 2 piece, viton seal. The upper seal half can be installed with crankshaft removed from engine or with crankshaft installed. When a new upper seal is installed, install a new lower seal.

REMOVAL AND INSTALLATION (Continued)

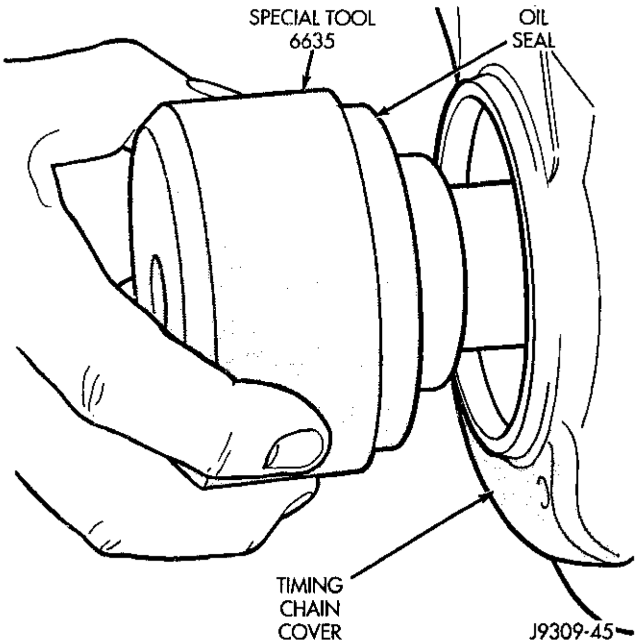

Fig. 43 Position Tool and Seal onto Crankshaft

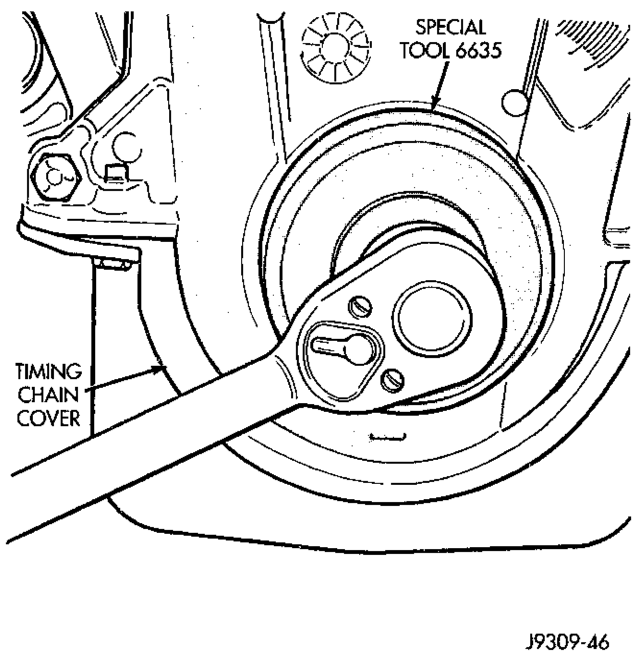

Fig. 44 Installing Oil Seal

The lower seal half can only be installed with the rear main bearing cap removed.

UPPER SEAL —CRANKSHAFT REMOVED

REMOVAL

(1) Remove the crankshaft. Discard the old upper seal.

INSTALLATION

(1) Clean the cylinder block rear cap mating surface. Make sure the seal groove is free of debris.

(2) Lightly oil the new upper seal lips with engine oil.

(3) Install the new upper rear bearing oil seal with the white paint facing towards the rear of the engine.

(4) Position the crankshaft into the cylinder block.

(5) Lightly oil the new lower seal lips with engine oil.

(6) Install the new lower rear bearing oil seal into the bearing cap with the white paint facing towards the rear of the engine.

(7) Apply 5 mm (0.20 in) drop of Loctite 518, or equivalent, on each side of the rear main bearing cap (Fig. 45). DO NOT over apply sealant or allow the sealant to contact the rubber seal. Assemble bearing cap to cylinder block immediately after sealant application.

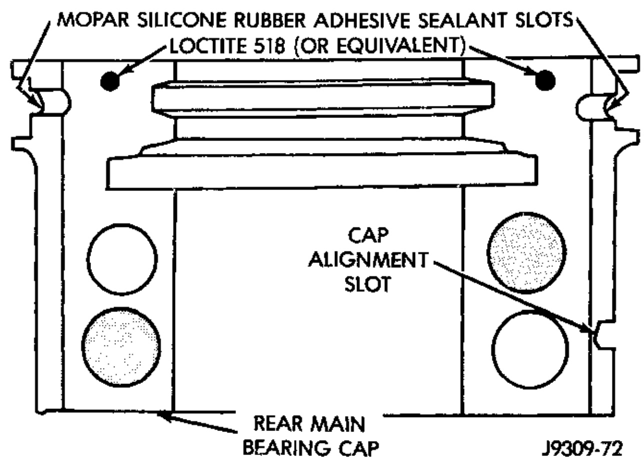

Fig. 45 Sealant Application to Bearing Cap

(8) To align the bearing cap, use cap slot, alignment dowel and cap bolts. DO NOT remove excess material after assembly. DO NOT strike rear cap more than 2 times for proper engagement.

(9) Clean and oil all cap bolts. Install all main bearing caps. Install all cap bolts and alternately tighten to 115 N·m (85 ft. lbs.) torque.

(10) Install oil pump.

(11) Apply Mopar Silicone Rubber Adhesive Sealant, or equivalent, at bearing cap to block joint to provide cap to block and oil pan sealing (Fig. 46). Apply enough sealant until a small amount is squeezed out. Withdraw nozzle and wipe excess sealant off the oil pan seal groove.

(12) Install new front crankshaft oil seal.

(13) Immediately install the oil pan.

REMOVAL AND INSTALLATION (Continued)

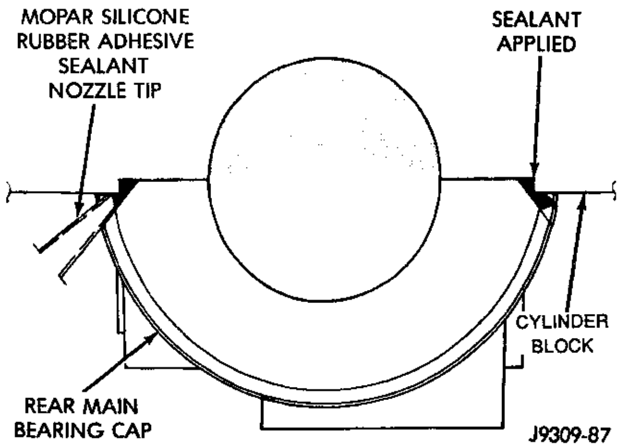

Fig. 46 Apply Sealant to Bearing Cap to Block Joint

UPPER SEAL —CRANKSHAFT INSTALLED

REMOVAL

(1) Remove the oil pan.

(2) Remove the oil pump from the rear main bearing cap.

(3) Remove the rear main bearing cap. Remove and discard the old lower oil seal.

(4) Carefully remove and discard the old upper oil seal.

INSTALLATION

(1) Clean the cylinder block mating surfaces before oil seal installation. Check for burr at the oil hole on the cylinder block mating surface to rear cap.

(2) Lightly oil the new upper seal lips with engine oil. To allow ease of installation of the seal, loosen at least the 2 main bearing caps forward of the rear bearing cap.

(3) Rotate the new upper seal into the cylinder block being careful not to shave or cut the outer surface of the seal. To assure proper installation, use the installation tool provided with the kit. Install the new seal with the white paint facing towards the rear of the engine.

(4) Install the new lower rear bearing oil seal into the bearing cap with the white paint facing towards the rear of the engine.

(5) Apply 5 mm (0.20 in) drop of Loctite 518, or equivalent, on each side of the rear main bearing cap (Fig. 45). DO NOT over apply sealant or allow the sealant to contact the rubber seal. Assemble bearing cap to cylinder block immediately after sealant application. Be sure the white paint faces toward the rear of the engine.

(6) To align the bearing cap, use cap slot, alignment dowel and cap bolts. DO NOT remove excess material after assembly. DO NOT strike rear cap more than 2 times for proper engagement.

(7) Install the rear main bearing cap with cleaned and oiled cap bolts. Alternately tighten ALL cap bolts to 115 N·m (85 ft. lbs.) torque.

(8) Install oil pump.

(9) Apply Mopar Silicone Rubber Adhesive Sealant, or equivalent, at bearing cap to block joint to provide cap to block and oil pan sealing (Fig. 46). Apply enough sealant until a small amount is squeezed out. Withdraw nozzle and wipe excess sealant off the oil pan seal groove.

(10) Immediately install the oil pan.

LOWER SEAL

REMOVAL

(1) Remove the oil pan.

(2) Remove the oil pump from the rear main bearing cap.

(3) Remove the rear main bearing cap and discard the old lower seal.

INSTALLATION

(1) Clean the rear main cap mating surfaces including the oil pan gasket groove.

(2) Carefully install a new upper seal (refer to Upper Seal Replacement - Crankshaft Installed procedure above).

(3) Lightly oil the new lower seal lips with engine oil.

(4) Install a new lower seal in bearing cap with the white paint facing the rear of engine.

(5) Apply 5 mm (0.20 in) drop of Loctite 518, or equivalent, on each side of the rear main bearing cap (Fig. 45). DO NOT over apply sealant or allow the sealant to contact the rubber seal. Assemble bearing cap to cylinder block immediately after sealant application.

(6) To align the bearing cap, use cap slot, alignment dowel and cap bolts. DO NOT remove excess material after assembly. DO NOT strike rear cap more than 2 times for proper engagement.

(7) Install the rear main bearing cap with cleaned and oiled cap bolts. Alternately tighten the cap bolts to 115 N·m (85 ft. lbs.) torque.

(8) Install oil pump.

(9) Apply Mopar Silicone Rubber Adhesive Sealant, or equivalent, at bearing cap to block joint to provide cap to block and oil pan sealing (Fig. 46). Apply enough sealant until a small amount is squeezed out. Withdraw nozzle and wipe excess sealant off the oil pan seal groove.

(10) Immediately install the oil pan.

ENGINE CORE OIL AND CAMSHAFT PLUGS

Engine core plugs have been pressed into the oil galleries behind the camshaft thrust plate (Fig. 47).

REMOVAL AND INSTALLATION (Continued)

This will reduce internal leakage and help maintain higher oil pressure at idle.

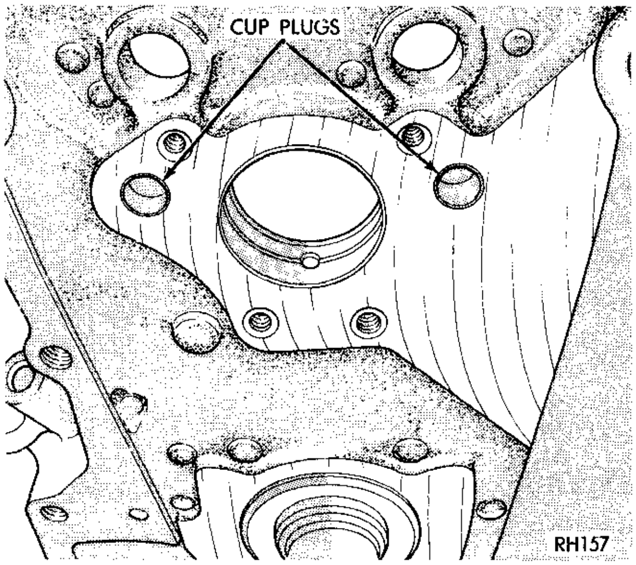

Fig. 47 Location of Cup Plugs in Oil Galleries

REMOVAL

(1) Using a blunt tool such as a drift or a screwdriver and a hammer, strike the bottom edge of the cup plug (Fig. 48).

(2) With the cup plug rotated, grasp firmly with pliers or other suitable tool and remove plug (Fig. 48).

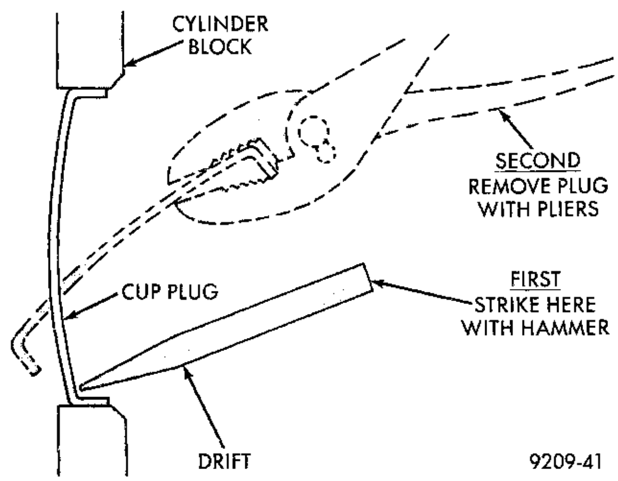

Fig. 48 Core Hole Plug Removal

INSTALLATION

Thoroughly clean inside of cup plug hole in cylinder block or head. Be sure to remove old sealer.

Be certain the new plug is cleaned of all oil or grease.

(1) Coat edges of plug and core hole with Mopar Gasket Maker, or equivalent.

CAUTION: DO NOT drive cup plug into the casting, as restricted coolant flow can result and cause serious engine problems.

(2) Using proper plug drive, drive cup plug into hole. The sharp edge of the plug should be at least 0.50 mm (0.020 in.) inside the lead-in chamfer.

(3) It is not necessary to wait for curing of the sealant. The cooling system can be filled and the vehicle placed in service immediately.

DISASSEMBLY AND ASSEMBLY

HYDRAULIC TAPPETS

CAUTION: The plunger and tappet bodies are not interchangeable. The plunger and valve must always be fitted to the original body. It is advisable to work on one tappet at a time to avoid mixing of parts. Mixed parts are not compatible. DO NOT disassemble a tappet on a dirty work bench.

DISASSEMBLE

(1) Pry out plunger retainer spring clip (Fig. 49).

(2) Clean varnish deposits from inside of tappet body above plunger cap.

(3) Invert tappet body and remove plunger cap, plunger, check valve, check valve spring, check valve retainer and plunger spring (Fig. 49). Check valve could be flat or ball.

ASSEMBLE

(1) Clean all tappet parts in a solvent that will remove all varnish and carbon.

(2) Replace tappets that are unfit for further service with new assemblies.

(3) If plunger shows signs of scoring or wear, install a new tappet assembly. If valve is pitted, or valve seat on end of plunger is prevented from seating, install a new tappet assembly.

(4) Assemble tappets (Fig. 49).

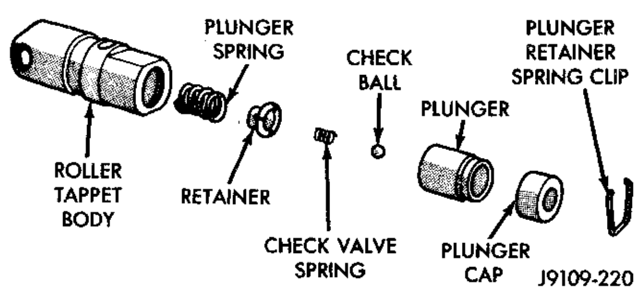

Fig. 49 Hydraulic Tappet Assembly

AUTHENTIC RESTORATION PRODUCTS

DISASSEMBLY AND ASSEMBLY (Continued)

VALVE SERVICE

VALVE GUIDES

Measure valve stem guide clearance as follows:

(1) Install Valve Guide Sleeve Tool C-3973 over valve stem and install valve (Fig. 50). The special sleeve places the valve at the correct height for checking with a dial indicator.

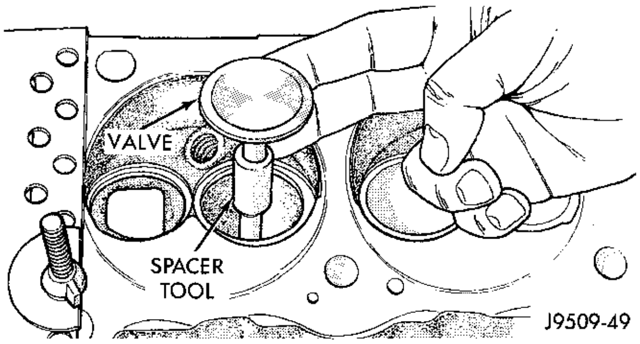

Fig. 50 Positioning Valve with Tool C-3973

(2) Attach Dial Indicator Tool C-3339 to cylinder head and set it at right angle of valve stem being measured (Fig. 51).

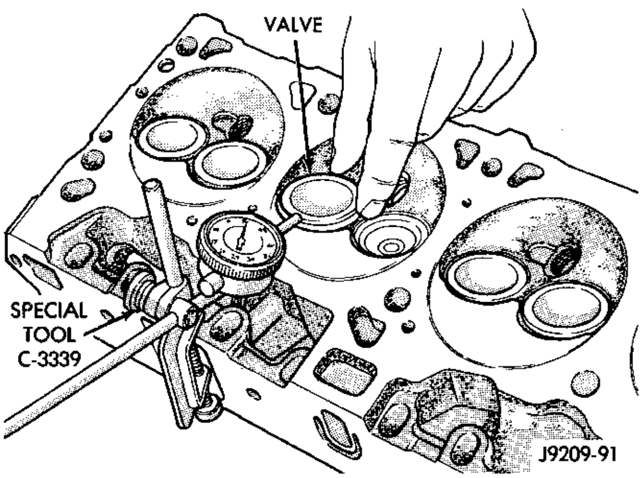

Fig. 51 Measuring Valve Guide Wear

(3) Move valve to and from the indicator. The total dial indicator reading should not exceed 0.432 mm (0.017 inch). Ream the guides for valves with oversize stems if dial indicator reading is excessive or if the stems are scuffed or scored.

(4) Service valves with oversize stems are available (Fig. 52).

(5) Slowly turn reamer by hand and clean guide thoroughly before installing new valve. **Ream the valve guides from standard to 0.381 mm (0.015 inch). Use a 2 step procedure so the valve guides are reamed true in relation to the valve seat:**

- Step 1—Ream to 0.0763 mm (0.003 inch).

Reamer O/S	Valve Guide Size
0.076 mm (0.003 in.)	8.026 – 8.052 mm (0.316 – 0.317 in.)
0.381 mm (0.015 in.)	8.331 – 8.357 mm (0.328 – 0.329 in.)

J9309-30

Fig. 52 Reamer Sizes

- Step 2—Ream to 0.381 mm (0.015 inch).

REFACING VALVES AND VALVE SEATS

The intake and exhaust valves have a 43-1/4° to 43-3/4° face angle and a 44-1/4° to 44-3/4° seat angle (Fig. 53).

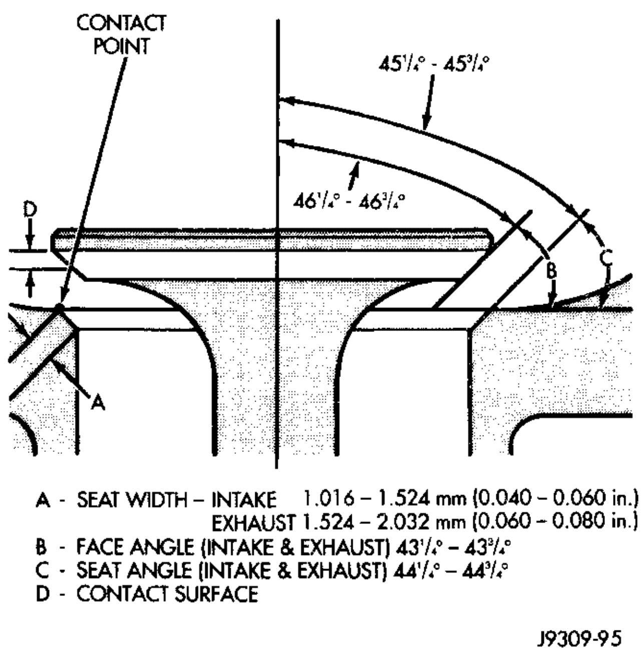

Fig. 53 Valve Face and Seat Angles

VALVES

Inspect the remaining margin after the valves are refaced (Fig. 54). Valves with less than 1.190 mm (0.047 inch) margin should be discarded.

VALVE SEATS

CAUTION: DO NOT un-shroud valves during valve seat refacing (Fig. 55).

(1) When refacing valve seats, it is important that the correct size valve guide pilot be used for reseating stones. A true and complete surface must be obtained.

DISASSEMBLY AND ASSEMBLY (Continued)

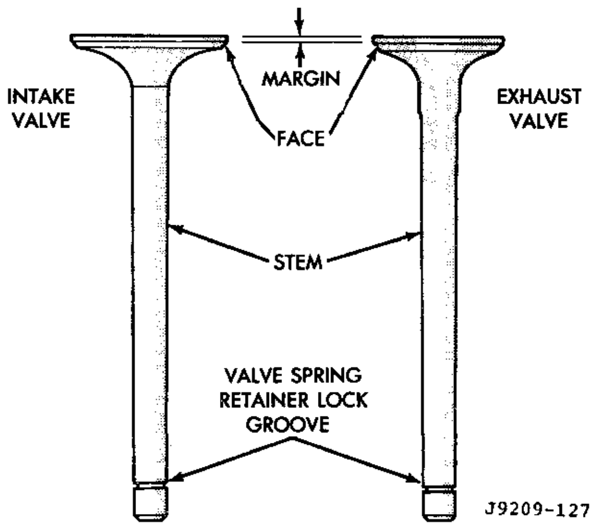

Fig. 54 Intake and Exhaust Valves

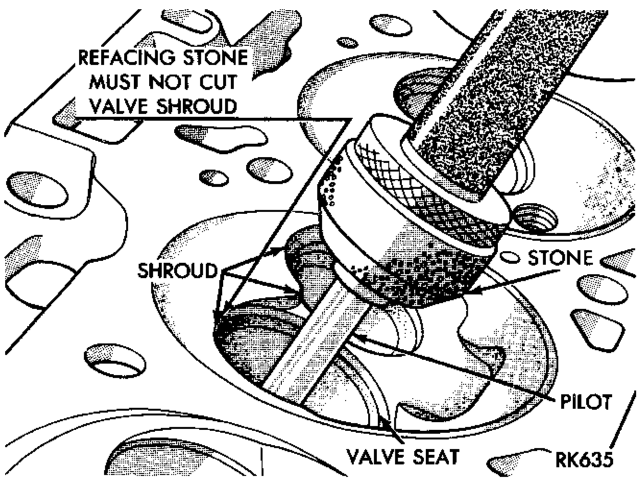

Fig. 55 Refacing Valve Seats

(2) Measure the concentricity of valve seat using a dial indicator. Total runout should not exceed 0.051 mm (0.002 inch) total indicator reading.

(3) Inspect the valve seat with Prussian blue to determine where the valve contacts the seat. To do this, coat valve seat LIGHTLY with Prussian blue then set valve in place. Rotate the valve with light pressure. If the blue is transferred to the center of valve face, contact is satisfactory. If the blue is transferred to the top edge of valve face, lower valve seat with a 15° stone. If the blue is transferred to bottom edge of valve face raise valve seat with a 60° stone.

(4) When seat is properly positioned the width of intake seats should be 1.016-1.524 mm (0.040-0.060 inch). The width of the exhaust seats should be 1.524-2.032 mm (0.060-0.080 inch).

VALVE SPRING INSPECTION

Whenever valves have been removed for inspection, reconditioning or replacement, valve springs should be tested. As an example the compression length of the spring to be tested is 1-5/16 inch. Turn table of Universals Valve Spring Tester Tool until surface is in line with the 1-5/16 inch mark on the threaded stud. Be sure the zero mark is to the front (Fig. 56). Place spring over stud on the table and lift compressing lever to set tone device. Pull on torque wrench until ping is heard. Take reading on torque wrench at this instant. Multiply this reading by 2. This will give the spring load at test length. Fractional measurements are indicated on the table for finer adjustments. Refer to specifications to obtain specified height and allowable tensions. Discard the springs that do not meet specifications.

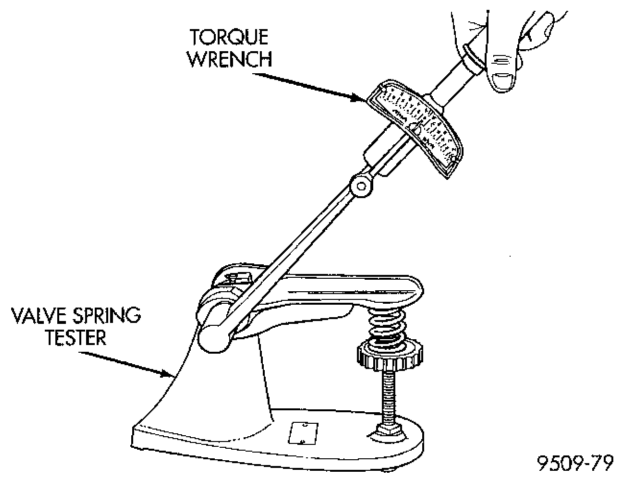

Fig. 56 Testing Valve Spring for Compressed Length

OIL PUMP

DISASSEMBLE

(1) Remove the relief valve as follows:

(a) Remove cotter pin. Drill a 3.175 mm (1/8 inch) hole into the relief valve retainer cap and insert a self-threading sheet metal screw.

(b) Clamp screw into a vise and while supporting oil pump, remove cap by tapping pump body using a soft hammer. Discard retainer cap and remove spring and relief valve (Fig. 57).

(2) Remove oil pump cover (Fig. 58).

(3) Remove pump outer rotor and inner rotor with shaft (Fig. 58).

(4) Wash all parts in a suitable solvent and inspect carefully for damage or wear.

ASSEMBLE

(1) Install pump rotors and shaft, using new parts as required.

(2) Position the oil pump cover onto the pump body. Tighten cover bolts to 11 N·m (95 in. lbs.) torque.

DISASSEMBLY AND ASSEMBLY (Continued)

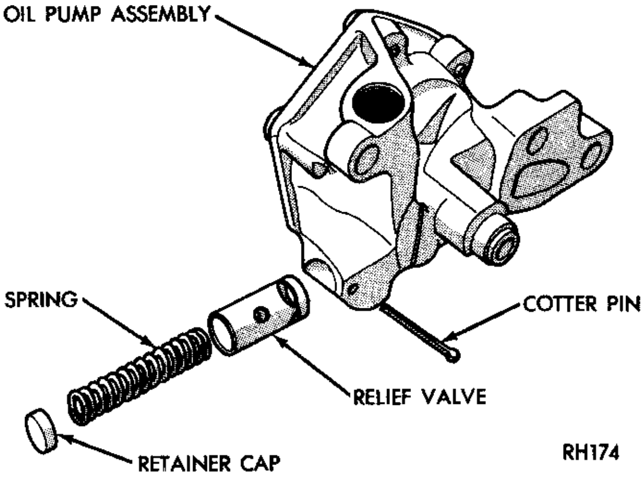

Fig. 57 Oil Pressure Relief Valve

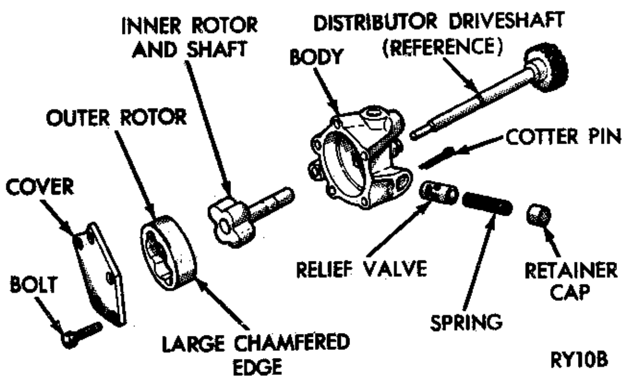

Fig. 58 Oil Pump

(3) Install the relief valve and spring. Insert the cotter pin.

(4) Tap on a new retainer cap.

(5) Prime oil pump before installation by filling rotor cavity with engine oil.

CYLINDER BLOCK

DISASSEMBLE

Engine assembly removed from vehicle:

(1) Remove the cylinder head.

(2) Remove the oil pan.

(3) Remove the piston and connecting rod assemblies.

ASSEMBLE

(1) Install the piston and connecting rod assembly.

(2) Install the oil pan.

(3) Install the cylinder head.

(4) Install the engine into the vehicle.

CLEANING AND INSPECTION

CYLINDER HEADS

CLEANING

Clean all surfaces of cylinder block and cylinder heads.

Clean cylinder block front and rear gasket surfaces using a suitable solvent.

INSPECTION

Inspect all surfaces with a straightedge if there is any reason to suspect leakage. If out-of-flatness exceeds 0.00075 mm/mm (0.00075 inch/inch) times the span length in inches in any direction, either replace head or lightly machine the head surface.

FOR EXAMPLE: A 305 mm (12 inch) span is 0.102 mm (0.004 inch) out-of-flat. The allowable out-of-flat is 305 x 0.00075 (12 x 0.00075) equals 0.23 mm (0.009 inch). This amount of out-of-flat is acceptable.

The cylinder head surface finish should be 1.78-3.00 microns (70-125 micro inches).

Inspect push rods. Replace worn or bent rods.

PISTON AND CONNECTING ROD ASSEMBLY

INSPECTION

Check the crankshaft connecting rod journal for excessive wear, taper and scoring.

Check the cylinder block bore for out-of-round, taper, scoring and scuffing.

Check the pistons for taper and elliptical shape before they are fitted into the cylinder bore (Fig. 59).

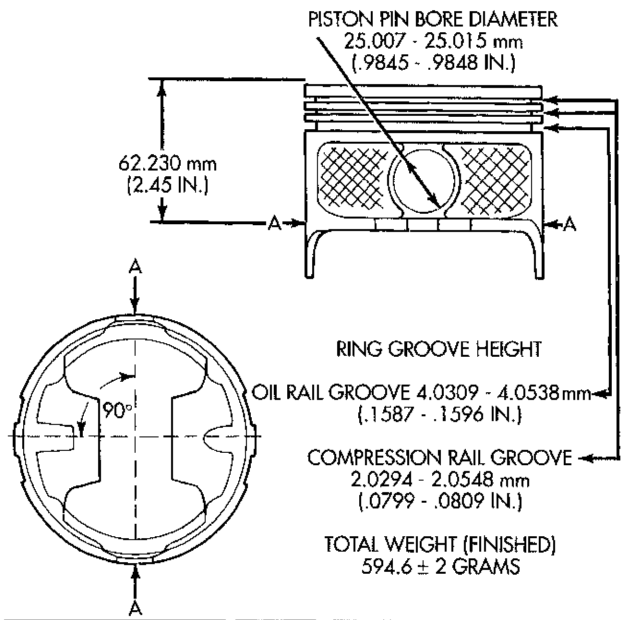
CRANKSHAFT JOURNALS

The crankshaft connecting rod and main journals should be checked for excessive wear, taper and scoring. The maximum taper or out-of-round on any crankshaft journal is 0.025 mm (0.001 inch).

Journal grinding should not exceed 0.305 mm (0.012 inch) under the standard journal diameter. DO NOT grind thrust faces of No.3 main bearing. DO NOT nick crank pin or bearing fillets. After grinding, remove rough edges from crankshaft oil holes and clean out all oil passages.

CAUTION: After any journal grind, it is important that the final paper or cloth polish be in the same direction as the engine rotates.

CLEANING AND INSPECTION (Continued)



PISTON SIZE	A DIA = PISTON DIAMETER		BORE DIAMETER	
	MIN. mm (IN.)	MAX. mm (IN.)	MIN. mm (IN.)	MAX. mm (IN.)
A	99.280 (3.9087)	99.294 (3.9092)	99.306 (3.9097)	99.319 (3.9102)
B	99.294 (3.9092)	99.306 (3.9097)	99.319 (3.9102)	99.332 (3.9107)

J9509-80

Fig. 59 Piston Measurements

OIL PAN

CLEANING

Clean the block and pan gasket surfaces.

Trim or remove excess sealant film in the rear main cap oil pan gasket groove. **DO NOT remove the sealant inside the rear main cap slots.**

If present, trim excess sealant from inside the engine.

Clean oil pan in solvent and wipe dry with a clean cloth.

Clean oil screen and pipe thoroughly in clean solvent. Inspect condition of screen.

INSPECTION

Inspect oil drain plug and plug hole for stripped or damaged threads. Repair as necessary.

Inspect oil pan mounting flange for bends or distortion. Straighten flange, if necessary.

OIL PUMP

INSPECTION

Mating surface of the oil pump cover should be smooth. Replace pump assembly if cover is scratched or grooved.

Lay a straightedge across the pump cover surface (Fig. 60). If a 0.038 mm (0.0015 inch) feeler gauge can be inserted between cover and straightedge, pump assembly should be replaced.

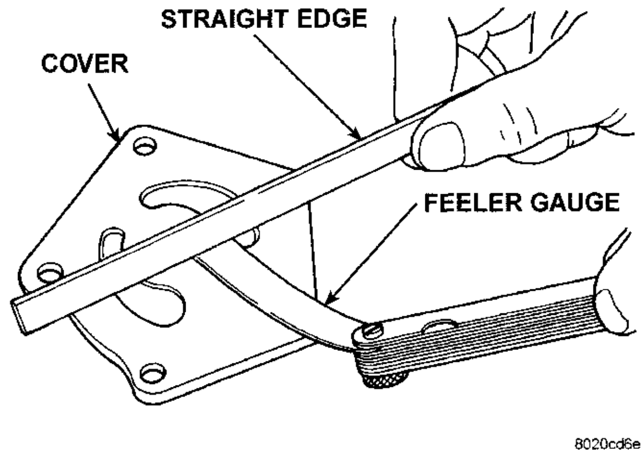

Fig. 60 Checking Oil Pump Cover Flatness

Measure thickness and diameter of OUTER rotor. If outer rotor thickness measures 20.9 mm (0.825 inch) or less or if the diameter is 62.7 mm (2.469 inches) or less, replace outer rotor (Fig. 61).

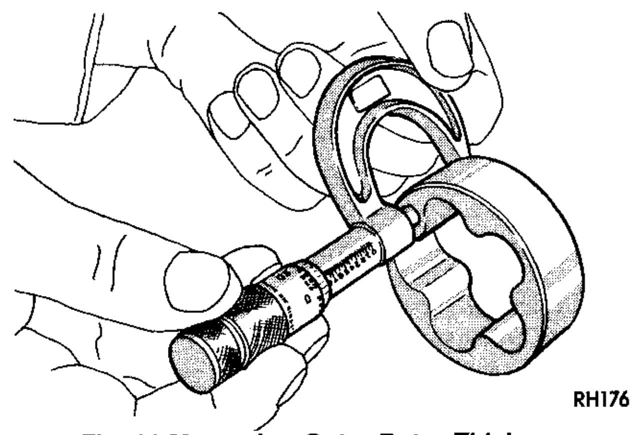

Fig. 61 Measuring Outer Rotor Thickness

If inner rotor measures 20.9 mm (0.825 inch) or less, replace inner rotor and shaft assembly (Fig. 62).

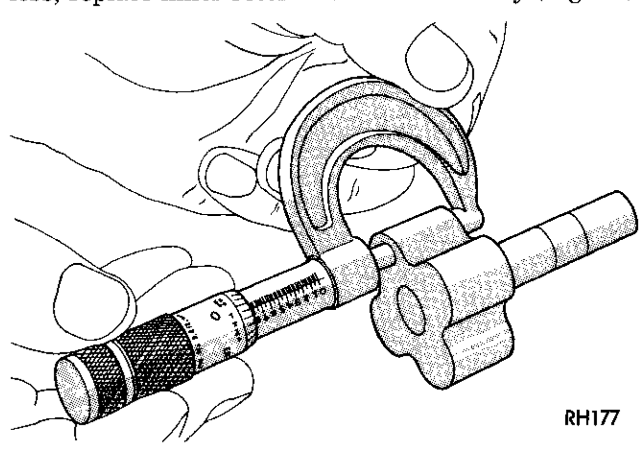

Fig. 62 Measuring Inner Rotor Thickness

AUTHENTIC RESTORATION PRODUCTS

CLEANING AND INSPECTION (Continued)

Slide outer rotor into pump body. Press rotor to the side with your fingers and measure clearance between rotor and pump body (Fig. 63). If clearance is 0.356 mm (0.014 inch) or more, replace oil pump assembly.

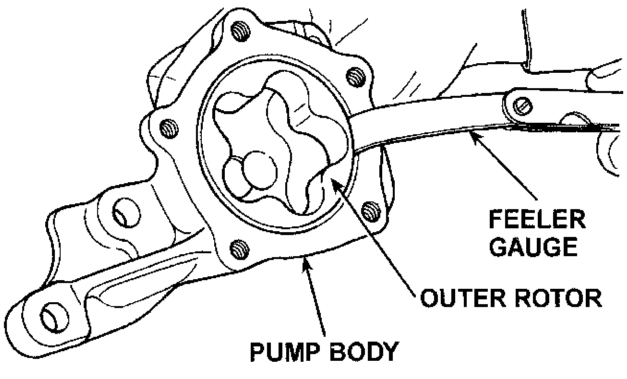

Fig. 63 Measuring Outer Rotor Clearance in Housing

Install inner rotor and shaft into pump body. If clearance between inner and outer rotors is 0.203 mm (0.008 inch) or more, replace shaft and both rotors (Fig. 64).

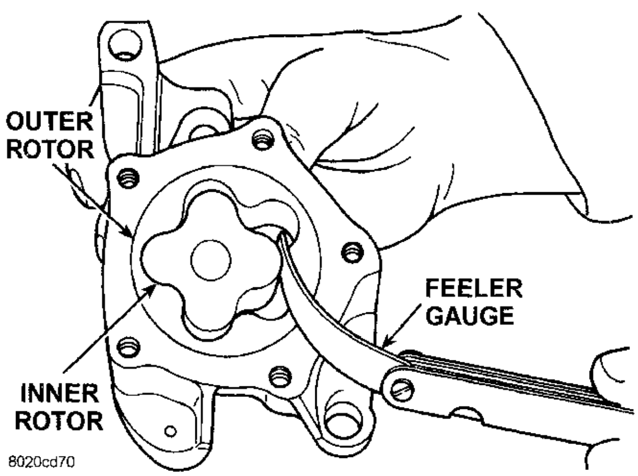

Fig. 64 Measuring Clearance Between Rotors

Place a straightedge across the face of the pump, between bolt holes. If a feeler gauge of 0.102 mm (0.004 inch) or more can be inserted between rotors and the straightedge, replace pump assembly (Fig. 65).

Inspect oil pressure relief valve plunger for scoring and free operation in its bore. Small marks may be removed with 400-grit wet or dry sandpaper.

The relief valve spring has a free length of approximately 49.5 mm (1.95 inches). The spring should test between 19.5 and 20.5 pounds when compressed to 34 mm (1-11/32 inches). Replace spring that fails to meet these specifications (Fig. 66).

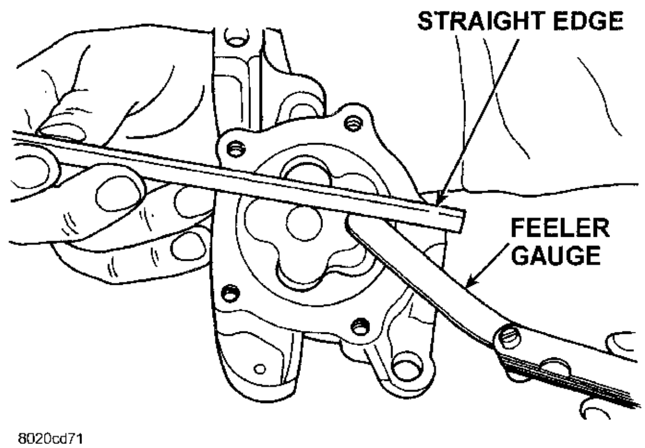

Fig. 65 Measuring Clearance Over Rotors

If oil pressure was low and pump is within specifications, inspect for worn engine bearings or other reasons for oil pressure loss.

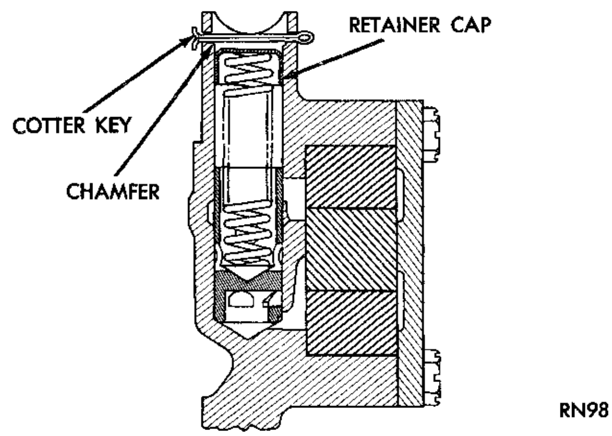

Fig. 66 Proper Installation of Retainer Cap

CYLINDER BLOCK

CLEANING

Clean cylinder block thoroughly and check all core hole plugs for evidence of leaking.

INSPECTION

Examine block for cracks or fractures.

The cylinder walls should be checked for out-of-round and taper with Cylinder Bore Indicator Tool C-119. The cylinder block should be bored and honed with new pistons and rings fitted if:

- The cylinder bores show more than 0.127 mm (0.005 in.) out-of-round.
- The cylinder bores show a taper of more than 0.254 mm (0.010 in.).
- The cylinder walls are badly scuffed or scored.

Boring and honing operation should be closely coordinated with the fitting of pistons and rings, so that specified clearances can be maintained.

CLEANING AND INSPECTION (Continued)

OIL LINE PLUG

The oil line plug is located in the vertical passage at the rear of the block between the oil-to-filter and oil-from-filter passages (Fig. 67). Improper installation or plug missing could cause erratic, low, or no oil pressure.

The oil plug must come out the bottom. Use flat dowel, down the oil pressure sending unit hole from the top, to remove oil plug.

(1) Remove oil pressure sending unit from back of block.

(2) Insert a 3.175 mm (1/8 in.) finish wire, or equivalent, into passage.

(3) Plug should be 190.0 to 195.2 mm (7-1/2 to 7-11/16 in.) from machined surface of block (Fig. 67). If plug is too high, use a suitable flat dowel to position properly.

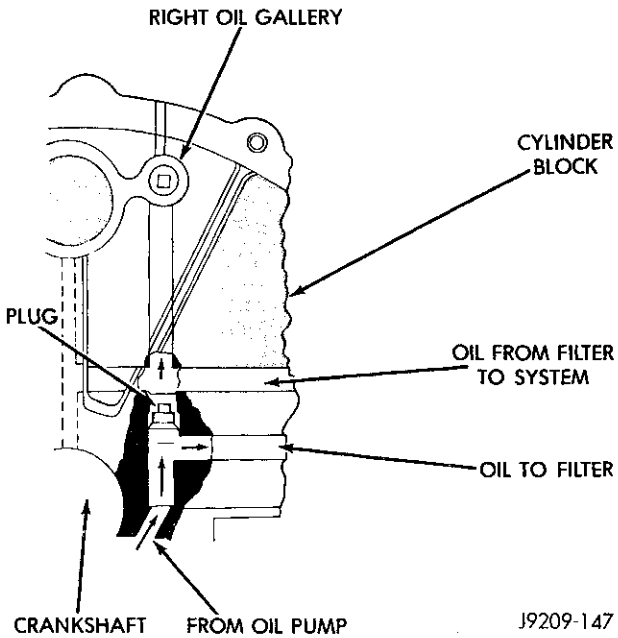

Fig. 67 Oil Line Plug

(4) If plug is too low, remove oil pan and No. 4 main bearing cap. Use suitable flat dowel to position properly. Coat outside diameter of plug with Mopar Stud and Bearing Mount Adhesive, or equivalent. Plug should be 54.0 to 57.7 mm (2-1/8 to 2-5/16 in.) from bottom of the block.

INDEX

GENERAL INFORMATION

OIL PUMP PRESSURE

The MINIMUM oil pump pressure is 41.4 kPa (6 psi) at curb idle. The NORMAL oil pump pressure is 207-552 kPa (30-80 psi) at 3,000 RPM or more.

CAUTION: If oil pressure is ZERO at curb idle, DO NOT run engine.

PISTON AND CONNECTING ROD ASSEMBLY

The pistons are elliptically turned so that the diameter at the pin boss is less than its diameter across the thrust face. This allows for expansion under normal operating conditions. Under operating temperatures, expansion forces the pin bosses away from each other, causing the piston to assume a more nearly round shape.

All pistons are machined to the same weight, regardless of size, to maintain piston balance.

The piston pin rotates in the piston only and is retained by the press interference fit of the piston pin in the connecting rod.

DESCRIPTION AND OPERATION

ENGINE DESCRIPTION/IDENTIFICATION

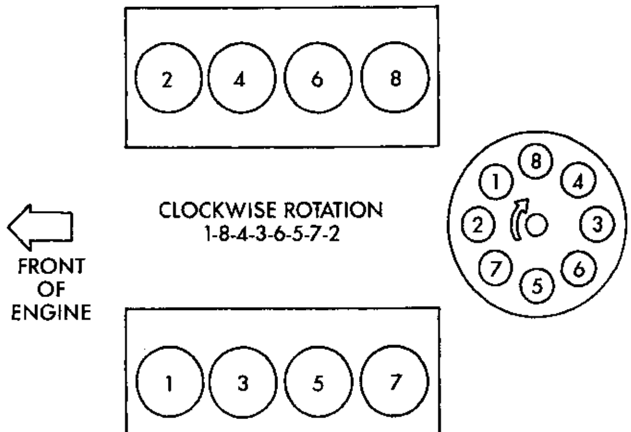
The 5.9 Liter (360 CID) eight-cylinder engine is a V-Type lightweight, single cam, overhead valve engine with hydraulic roller tappets. This engine is designed for unleaded fuel.

The engine lubrication system consists of a rotor type oil pump and a full flow oil filter.

The cylinders are numbered from front to rear; 1, 3, 5, 7 on the left bank and 2, 4, 6, 8 on the right bank. The firing order is 1-8-4-3-6-5-7-2 (Fig. 1).

AUTHENTIC RESTORATION

DESCRIPTION AND OPERATION (Continued)



J908D-49

Fig. 1 Firing Order

The engine serial number is stamped into a machined pad located on the left, front corner of the cylinder block. When component part replacement is necessary, use the engine type and serial number for reference (Fig. 2).

Fig. 2 Engine Identification Number

LUBRICATION SYSTEM

A gear—type positive displacement pump is mounted at the underside of the rear main bearing cap. The pump draws oil through the screen and inlet tube from the sump at the rear of the oil pan. The oil is driven between the drive and idler gears and pump body, then forced through the outlet to the block. An oil gallery in the block channels the oil to the inlet side of the full flow oil filter. After passing through the filter element, the oil passes from the center outlet of the filter through an oil gallery that channels the oil up to the main gallery which extends the entire length on the right side of the block. The oil then goes down to the No. 1 main bearing, back up to the left side of the block and into the oil gallery on the left side of the engine.

Galleries extend downward from the main oil gallery to the upper shell of each main bearing. The crankshaft is drilled internally to pass oil from the main bearing journals to the connecting rod journals. Each connecting rod bearing has half a hole in it, oil passes through the hole when the rods rotate and the hole lines up, oil is then thrown off as the rod rotates. This oil throw off lubricates the camshaft lobes, distributor drive gear, cylinder walls, and piston pins.

The hydraulic valve tappets receive oil directly from the main oil gallery. The camshaft bearings receive oil from the main bearing galleries. The front camshaft bearing journal passes oil through the camshaft sprocket to the timing chain. Oil drains back to the oil pan under the number one main bearing cap.

The oil supply for the rocker arms and bridged pivot assemblies is provided by the hydraulic valve tappets which pass oil through hollow push rods to a hole in the corresponding rocker arm. Oil from the rocker arm lubricates the valve train components. The oil then passes down through the push rod guide holes, and the oil drain back passages in the cylinder head past the valve tappet area, and returns to the oil pan.

DESCRIPTION AND OPERATION (Continued)

ENGINE COMPONENTS

CYLINDER HEADS

The alloy cast iron cylinder heads (Fig. 4) are held in place by 10 bolts. The spark plugs are located in the peak of the wedge between the valves.

The 5.9L cylinder head is identified by the foundry mark CF.

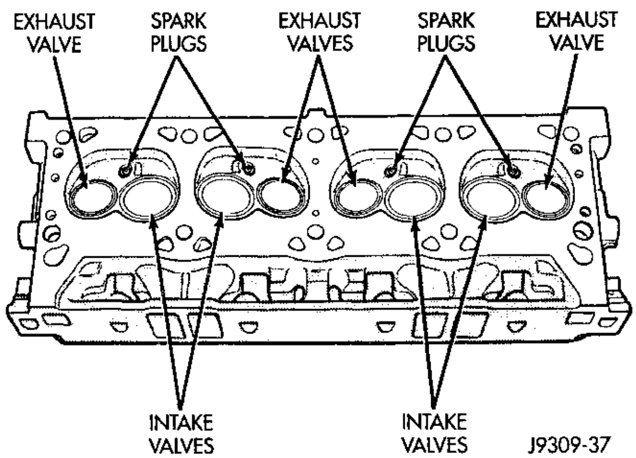

Fig. 4 Cylinder Head Assembly

PISTONS

The pistons are elliptically turned so that the diameter at the pin boss is less than its diameter across the thrust face. This allows for expansion under normal operating conditions. Under operating temperatures, expansion forces the pin bosses away from each other, causing the piston to assume a more nearly round shape.

All pistons are machined to the same weight, regardless of size, to maintain piston balance.

The piston pin rotates in the piston only and is retained by the press interference fit of the piston pin in the connecting rod.

VALVES AND VALVE SPRINGS

The valves are arranged in-line and inclined 18°. The rocker pivot support and the valve guides are cast integral with the heads.

SERVICE PROCEDURES

VALVE TIMING

(1) Turn crankshaft until the No.6 exhaust valve is closing and No.6 intake valve is opening.

(2) Insert a 6.350 mm (1/4 inch) spacer between rocker arm pad and stem tip of No.1 intake valve. Allow spring load to bleed tappet down giving in effect a solid tappet.

(3) Install a dial indicator so plunger contacts valve spring retainer as nearly perpendicular as possible. Zero the indicator.

(4) Rotate the crankshaft clockwise (normal running direction) until the valve has lifted 0.863 mm (0.034 inch). The timing of the crankshaft should now read from 10° before top dead center to 2° after top dead center. Remove spacer.

CAUTION: DO NOT turn crankshaft any further clockwise as valve spring might bottom and result in serious damage.

If reading is not within specified limits:
- Check sprocket index marks.
- Inspect timing chain for wear.
- Check accuracy of DC mark on timing indicator.

MEASURING TIMING CHAIN STRETCH

NOTE: To access timing chain Refer to Timing Chain Cover in Removal and Installation Section.

(1) Place a scale next to the timing chain so that any movement of the chain may be measured.

(2) Place a torque wrench and socket over camshaft sprocket attaching bolt. Apply torque in the direction of crankshaft rotation to take up slack; 41 N·m (30 ft. lbs.) torque with cylinder head installed or 20 N·m (15 ft. lbs.) torque with cylinder head removed. With a torque applied to the camshaft sprocket bolt, crankshaft should not be permitted to move. It may be necessary to block the crankshaft to prevent rotation.

(3) Hold a scale with dimensional reading even with the edge of a chain link. With cylinder heads installed, apply 14 N·m (30 ft. lbs.) torque in the reverse direction. With the cylinder heads removed, apply 20 N·m (15 ft. lbs.) torque in the reverse direction. Note the amount of chain movement (Fig. 5).

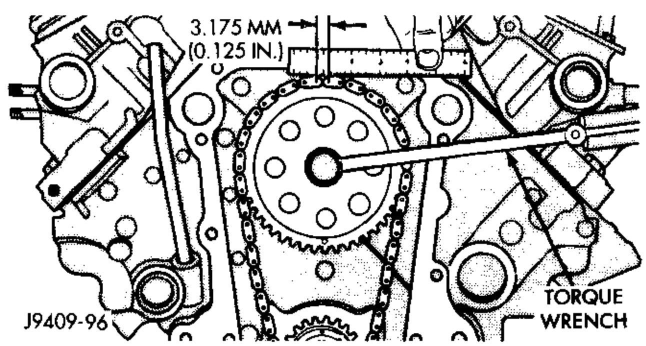

Fig. 5 Measuring Timing Chain Wear and Stretch

(4) Install a new timing chain, if its movement exceeds 3.175 mm (1/8 inch).

(5) If chain is not satisfactory, remove camshaft sprocket attaching bolt and remove timing chain with crankshaft and camshaft sprockets.

(6) Place both camshaft sprocket and crankshaft sprocket on the bench with timing marks on exact

mopar AUTHENTIC RESTORATION

SERVICE PROCEDURES (Continued)

imaginary center line through both camshaft and crankshaft bores.

(7) Place timing chain around both sprockets.

(8) Turn crankshaft and camshaft to line up with keyway location in crankshaft sprocket and in camshaft sprocket.

(9) Lift sprockets and chain (keep sprockets tight against the chain in position as described).

(10) Slide both sprockets evenly over their respective shafts and use a straightedge to check alignment of timing marks (Fig. 6).

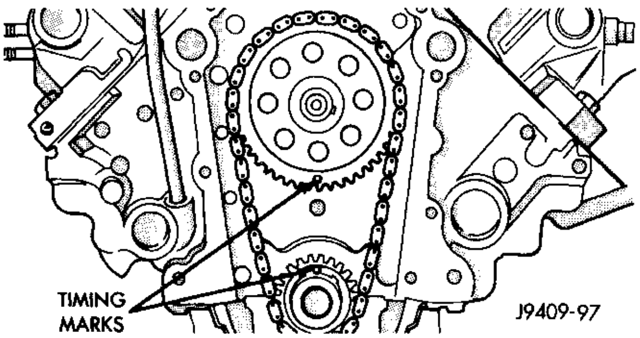

Fig. 6 Alignment of Timing Marks

(11) Install the camshaft bolt. Tighten the bolt to 47 N·m (35 ft. lbs.) torque.

(12) Check camshaft end play. The end play should be 0.051-0.152 mm (0.002-0.006 inch) with a new thrust plate and up to 0.254 mm (0.010 inch) with a used thrust plate. If not within these limits install a new thrust plate.

FITTING PISTONS

Piston and cylinder wall must be clean and dry. Specified clearance between the piston and the cylinder wall is 0.013-0.038 mm (0.0005-0.0015 inch) at 21°C (70°F).

Piston diameter should be measured at the top of skirt, 90° to piston pin axis. Cylinder bores should be measured halfway down the cylinder bore and transverse to the engine crankshaft center line.

Pistons and cylinder bores should be measured at normal room temperature, 21°C (70°F).

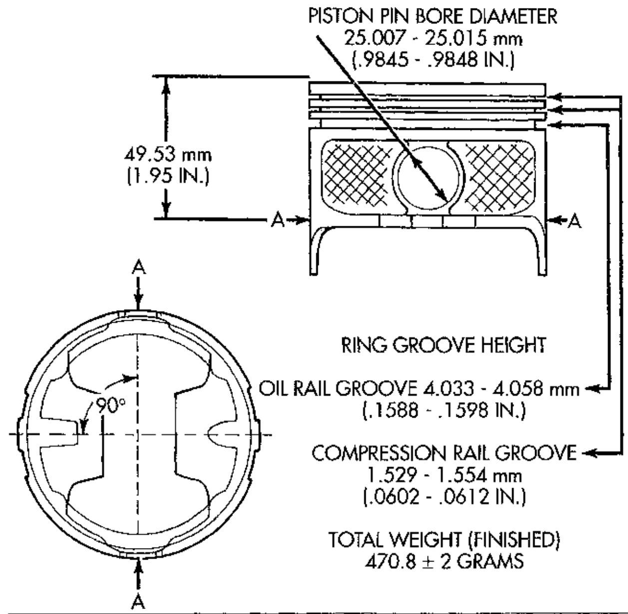
Check the pistons for taper and elliptical shape before they are fitted into the cylinder bore (Fig. 7).

FITTING PISTON RINGS

(1) Measurement of end gaps:

(a) Measure piston ring gap 2 inches from bottom of cylinder bore. An inverted piston can be used to push the rings down to ensure positioning rings squarely in the cylinder bore before measuring.

(b) Insert feeler gauge in the gap. The top compression ring gap should be between 0.254-0.508 mm (0.010-0.020 inch). The second compression ring gap should be between 0.508-0.762 mm (0.020-0.030 inch). The oil ring gap should be 0.254-1.270 mm (0.010-0.050 inch).



PISTON SIZE	A DIA = PISTON DIAMETER		BORE DIAMETER	
	MIN. mm (IN.)	MAX. mm (IN.)	MIN. mm (IN.)	MAX. mm (IN.)
A				
B	101.580 (3.9992)	101.592 (3.9997)	101.605 (4.0002)	101.618 (4.0007)
C	101.592 (3.9997)	101.605 (4.0002)	101.618 (4.0007)	101.630 (4.0012)
D	101.605 (4.0002)	101.618 (4.0007)	101.630 (4.0012)	101.643 (4.0017)
E				

J9509-79

Fig. 7 Piston Measurements

(c) Rings with insufficient end gap may be properly filed to the correct dimension. Rings with excess gaps should not be used.

(2) Install rings and confirm ring side clearance:

(a) Install oil rings being careful not to nick or scratch the piston. Install the oil control rings according to instructions in the package. It is not necessary to use a tool to install the upper and lower rails. Insert oil rail spacer first, then side rails.

(b) Install the second compression rings using Installation Tool C-4184. The compression rings must be installed with the identification mark face up (toward top of piston) and chamfer facing down. An identification mark on the ring is a drill point, a stamped letter "O", an oval depression or the word TOP (Fig. 8) (Fig. 10).

(c) Using a ring installer, install the top compression ring with the chamfer facing up (Fig. 9) (Fig. 10). An identification mark on the ring is a drill point, a stamped letter "O", an oval depression or the word TOP facing up.

(d) Measure side clearance between piston ring and ring land. Clearance should be 0.074-0.097 mm

SERVICE PROCEDURES (Continued)

(0.0029-0.0038 inch) for the compression rings. The steel rail oil ring should be free in groove, but should not exceed 0.246 mm (0.0097 inch) side clearance.

(e) Pistons with insufficient or excessive side clearance should be replaced.

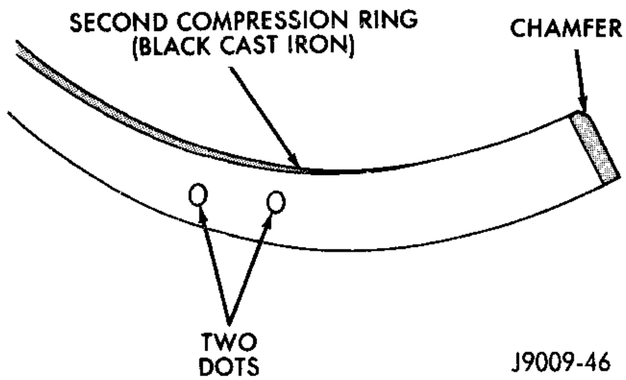


Fig. 8 Second Compression Ring Identification (Typical)

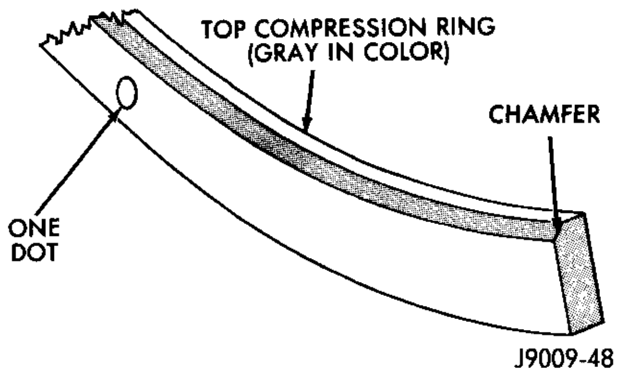

Fig. 9 Top Compression Ring Identification (Typical)

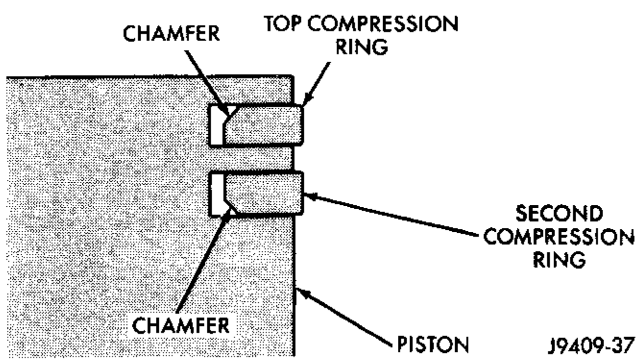

Fig. 10 Compression Ring Chamfer Location (Typical)

FITTING CONNECTING ROD BEARINGS

Fit all rods on a bank until completed. DO NOT alternate from one bank to another, because connecting rods and pistons are not interchangeable from one bank to another.

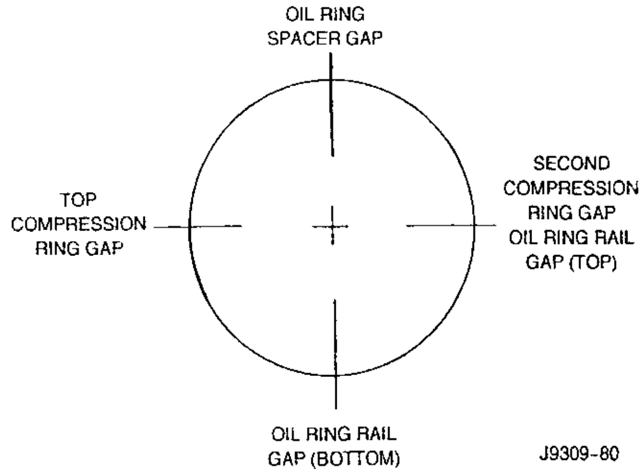

Fig. 11 Proper Ring Installation

The bearing caps are not interchangeable and should be marked at removal to ensure correct assembly.

Each bearing cap has a small V-groove across the parting face. When installing the lower bearing shell, make certain that the V-groove in the shell is in line with the V-groove in the cap. This provides lubrication of the cylinder wall in the opposite bank.

The bearing shells must be installed so that the tangs are in the machined grooves in the rods and caps.

Limits of taper or out-of-round on any crankshaft journals should be held to 0.025 mm (0.001 inch). Bearings are available in 0.025 mm (0.001 inch), 0.051 mm (0.002 inch), 0.076 mm (0.003 inch), 0.254 mm (0.010 inch) and 0.305 mm (0.012 inch) undersize. **Install the bearings in pairs. DO NOT use a new bearing half with an old bearing half. DO NOT file the rods or bearing caps.**

FITTING CRANKSHAFT MAIN BEARINGS

Bearing caps are not interchangeable and should be marked at removal to ensure correct assembly. Upper and lower bearing halves are NOT interchangeable. Lower main bearing halves of No.2 and 4 are interchangeable.

Upper and lower No.3 bearing halves are flanged to carry the crankshaft thrust loads. They are NOT interchangeable with any other bearing halves in the engine (Fig. 12). Bearing shells are available in standard and the following undersizes: 0.25 mm (0.001 inch), 0.051 mm (0.002 inch), 0.076 mm (0.003 inch), 0.254 mm (0.010 inch) and 0.305 mm (0.012 inch). Never install an undersize bearing that will reduce clearance below specifications.

SERVICE PROCEDURES (Continued)

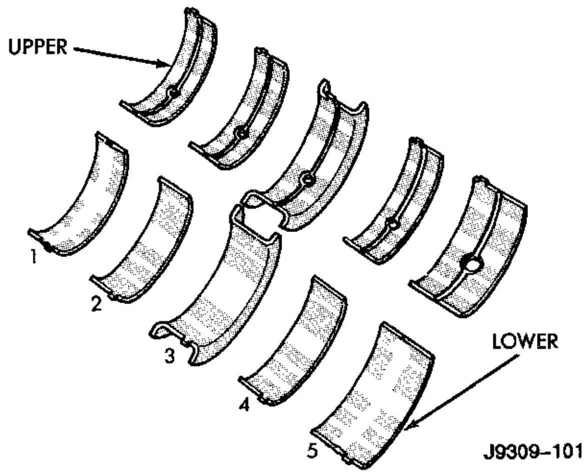

Fig. 12 Main Bearing Identification

CRANKSHAFT SERVICE

A crankshaft which has undersize journals will be stamped with 1/4 inch letters on the milled flat on the No.3 crankshaft counterweight (Fig. 13).

FOR EXAMPLE: R2 stamped on the No.3 crankshaft counterweight indicates that the No.2 rod journal is 0.025 mm (0.001 in) undersize. M4 indicates that the No.4 main journal is 0.025 mm (0.001 in) undersize. R3 M2 indicates that the No.3 rod journal and the No.2 main journal are 0.025 mm (0.001 in) undersize.

Undersize Journal	Identification Stamp
0.025 mm (0.001 inch) (Rod)	R1-R2-R3 or R4
0.025 mm (0.001 inch) (Main)	M1-M2-M3-M4 or M5

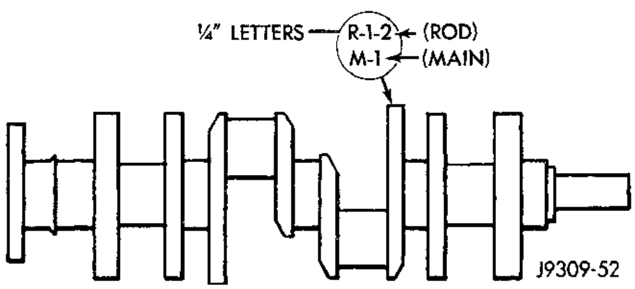

Fig. 13 Location of Crankshaft Identification

When a crankshaft is replaced, all main and connecting rod bearings should be replaced with new bearings. Therefore, selective fitting of the bearings is not required when a crankshaft and bearings are replaced.

INSPECTION OF JOURNALS

The crankshaft connecting rod and main journals should be checked for excessive wear, taper and scoring. The maximum taper or out-of-round on any crankshaft journal is 0.025 mm (0.001 inch).

Journal grinding should not exceed 0.305 mm (0.012 inch) under the standard journal diameter. DO NOT grind thrust faces of No.3 main bearing. DO NOT nick crank pin or bearing fillets. After grinding, remove rough edges from crankshaft oil holes and clean out all oil passages.

CAUTION: After any journal grind, it is important that the final paper or cloth polish be in the same direction as the engine rotates.

REMOVAL AND INSTALLATION

ENGINE MOUNTS—FRONT

REMOVAL

(1) Disconnect the negative cable from the battery.

(2) Position fan to assure clearance for radiator top tank and hose.

CAUTION: DO NOT lift the engine by the intake manifold.

(3) Install engine support/lifting fixture.

(4) Raise vehicle on hoist.

(5) Lift the engine SLIGHTLY and remove the thru-bolt and nut (Fig. 14).

(6) Remove engine support bracket/cushion bolts (Fig. 14). Remove the support bracket/cushion and heat shields.

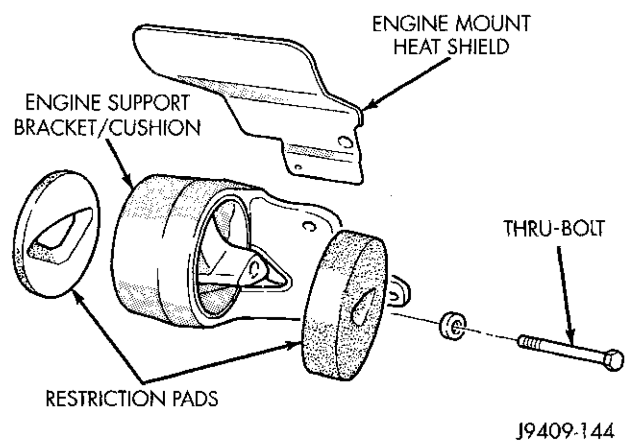

Fig. 14 Engine Front Mounts

INSTALLATION

(1) With engine raised SLIGHTLY, position the engine support bracket/cushion and heat shields to the block. Install new bolts and tighten to 81 N·m (60 ft. lbs.) torque.

REMOVAL AND INSTALLATION (Continued)

(2) Install the thru-bolt into the engine support bracket/cushion.

(3) Lower engine with support/lifting fixture while guiding the engine bracket/cushion and thru-bolt into support cushion brackets (Fig. 15).

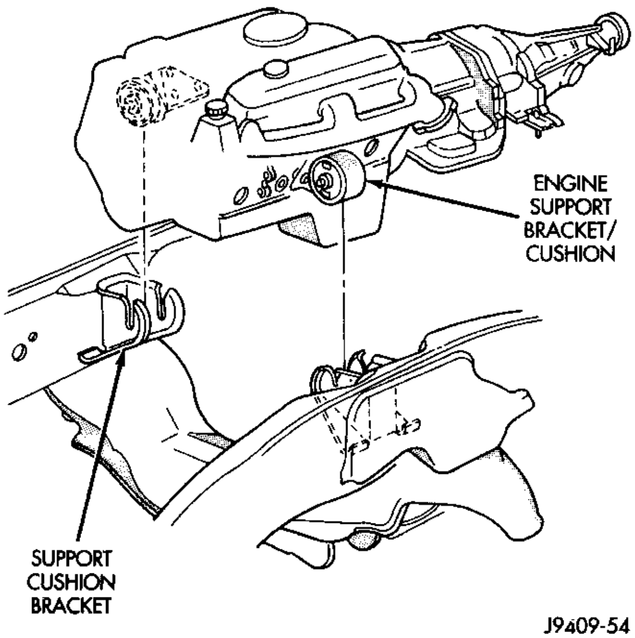

Fig. 15 Positioning Engine Front Mounts

(4) Install thru-bolt nuts and tighten the nuts to 102 N·m (75 ft. lbs.) torque.

(5) Lower the vehicle.

(6) Remove lifting fixture.

ENGINE MOUNT—REAR

REMOVAL

(1) Raise the vehicle on a hoist.

(2) Position a transmission jack in place.

(3) Remove support cushion stud nuts (Fig. 16).

(4) Raise rear of transmission and engine SLIGHTLY.

(5) Remove the bolts holding the support cushion to the transmission support bracket. Remove the support cushion.

(6) If necessary, remove the bolts holding the transmission support bracket to the transmission.

INSTALLATION

(1) If removed, position the transmission support bracket to the transmission. Install new attaching bolts and tighten to 102 N·m (75 ft. lbs.) torque.

(2) Position support cushion to transmission support bracket. Install stud nuts and tighten to 47 N·m (35 ft. lbs.) torque.

(3) Using the transmission jack, lower the transmission and support cushion onto the crossmember (Fig. 16).

(4) Install the support cushion bolts and tighten to 47 N·m (35 ft. lbs.) torque.

(5) Remove the transmission jack.

(6) Lower the vehicle.

ENGINE ASSEMBLY

REMOVAL

(1) Disconnect the battery negative cable.

(2) Drain cooling system. Refer to Group 7, Cooling System for the proper procedure.

(3) Recover refrigerant from a/c system, if equipped. Refer to Group 24, Heating and Air Conditioning for service procedures.

(4) Remove the a/c condenser, if equipped.

(5) Remove the transmission oil cooler. Refer to Group 7, Cooling for the correct procedure.

(6) Remove the washer bottle from the fan shroud.

(7) Remove the viscous fan/drive.

(8) Disconnect the radiator upper hose from the radiator.

(9) Remove the fan shroud.

(10) Disconnect the transmission cooler lines from the radiator.

(11) Disconnect the lower radiator hose at the radiator.

(12) Remove radiator (refer to Group 7, Cooling System).

(13) Remove the upper crossmember and top core support.

(14) Remove the accessory drive belt (refer to Group 7, Cooling System).

(15) Remove the A/C compressor with the lines attached. Secure compressor out of the way.

(16) Remove generator assembly. (refer to Group 8B, Battery/Starter/Generator Service).

(17) Remove the air cleaner resonator and duct work as an assembly.

(18) Disconnect the throttle linkage.

(19) Remove throttle body.

(20) Remove the intake manifold (refer to Group 11, Exhaust System and Intake Manifold).

(21) Remove the distributor cap and wiring.

(22) Disconnect the heater hoses.

(23) Disconnect the power steering hoses, if equipped.

(24) Perform the Fuel System Pressure Release procedure. Refer to Group 14, Fuel System.

(25) Disconnect the fuel supply line. Refer to Group 14, Fuel Systems for the correct procedure..

(26) On Manual Transmission vehicles, remove the shift lever (refer to Group 21, Transmissions).

(27) Raise and support the vehicle on a hoist and drain the engine oil.

REMOVAL AND INSTALLATION (Continued)

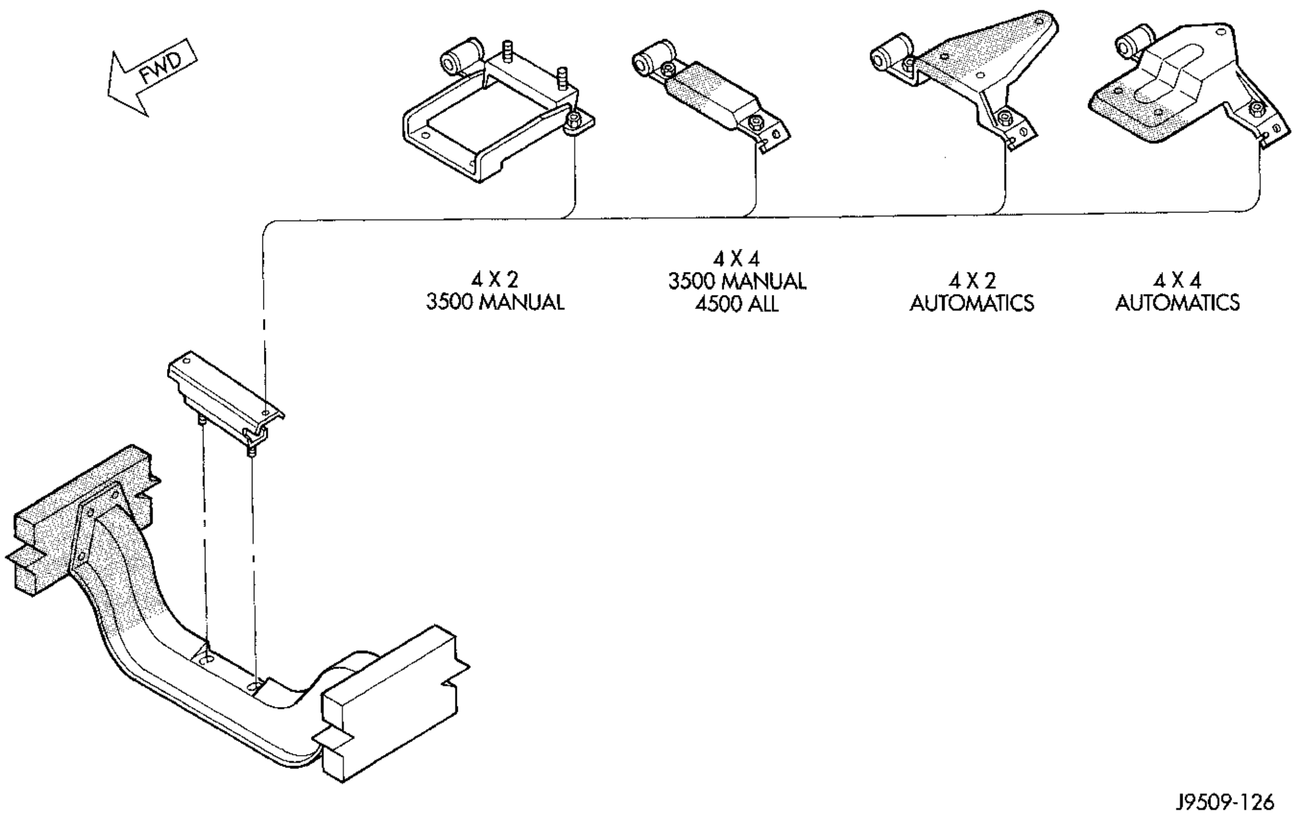

Fig. 16 Engine Rear Support Cushion Assemblies

(28) Remove engine front mount thru-bolt nuts.

(29) Disconnect the transmission oil cooler lines from their retainers at the oil pan bolts.

(30) Disconnect exhaust pipe at manifolds.

(31) Disconnect the starter wires. Remove starter motor (refer to Group 8B, Battery/Starter/Generator Service).

(32) Remove the dust shield and transmission inspection cover.

(33) Remove drive plate to converter bolts (Automatic transmission equipped vehicles).

(34) Remove transmission bell housing to engine block bolts.

(35) Lower the vehicle.

(36) Install an engine lifting fixture.

(37) Separate engine from transmission, remove engine from vehicle, and install engine assembly on a repair stand.

INSTALLATION

(1) Remove engine from the repair stand and position in the engine compartment. Position the thru-bolt into the support cushion brackets.

(2) Install engine lifting device.

(3) Lower engine into compartment and align engine with transmission:

- Manual Transmission: Align clutch disc assembly (if disturbed). Refer to Group 6, Clutch for the correct procedure. Install transmission input shaft into clutch disc while mating engine and transmission surfaces. Install two transmission to engine block mounting bolts finger tight.
- Automatic Transmission: Mate engine and transmission and install two transmission to engine block mounting bolts finger tight.

(4) Lower engine assembly until engine mount through bolts rest in mount perches.

(5) Install remaining transmission to engine block mounting bolts and tighten.

(6) Tighten engine mount through bolts.

(7) Install drive plate to torque converter bolts. (Automatic transmission models)

(8) Install the dust shield and transmission cover.

(9) Install the starter and connect the starter wires (refer to Group 8B, Battery/Starter/Generator Service).

(10) Install exhaust pipe to manifold.

(11) Install the transmission cooler line brackets to the oil pan.

(12) Install the drain plug and tighten to 34 N·m (25 ft. lbs.) torque.

(13) Lower the vehicle.

(14) Remove engine lifting fixture.

(15) On Manual Transmission vehicles, install the shift lever (refer to Group 21, Transmissions).

REMOVAL AND INSTALLATION (Continued)

(16) Connect the fuel supply line.
(17) Connect the power steering hoses, if equipped.
(18) Connect the heater hoses.
(19) Install the distributor cap and wiring.
(20) Install the intake manifold. Refer to Group 11, Exhaust System and Intake Manifold.
(21) Using a new gasket, install throttle body. Tighten the throttle body bolts to 23 N·m (200 in. lbs.) torque.
(22) Connect the throttle linkage.
(23) Install the air cleaner resonator and duct work..
(24) Install the generator and wire connections (refer to Group 8B, Battery/Starter/Generator Service).
(25) Install a/c compressor and lines.
(26) Install the accessory drive belt (refer to Group 7, Cooling System).
(27) Install upper radiator support crossmember.
(28) Install radiator (refer to Group 7, Cooling System).
(29) Connect the radiator lower hose.
(30) Connect the transmission oil cooler lines to the radiator.
(31) Install the fan shroud.
(32) Install the fan.
(33) Connect the radiator upper hose.
(34) Install the washer bottle.
(35) Install the transmission oil cooler.
(36) Connect the transmission cooler lines.
(37) If equipped, install the condenser.
(38) Evacuate and charge the air conditioning system, if equipped (refer to Group 24, Heating and Air Conditioning for service procedures).
(39) Add engine oil to crankcase. Refer to Group 0, Lubrication and Maintenance for the correct fill capacity.
(40) Add coolant to the cooling system (refer to Group 7, Cooling System for the proper procedure).
(41) Connect battery negative cable.
(42) Start engine and inspect for leaks.
(43) Road test vehicle.

CYLINDER HEAD COVER

A steel backed silicon gasket is used with the cylinder head cover (Fig. 17). This gasket can be used again.

REMOVAL

(1) Disconnect the negative cable from the battery.
(2) Disconnect closed ventilation system and evaporation control system from cylinder head cover.
(3) Remove cylinder head cover and gasket. The gasket may be used again.

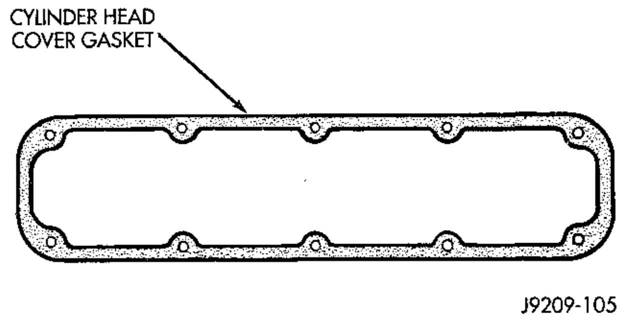

Fig. 17 Cylinder Head Cover Gasket

INSTALLATION

(1) Clean cylinder head cover gasket surface.
(2) Clean head rail, if necessary.
(3) Inspect cover for distortion and straighten, if necessary.
(4) Check the gasket for use in head cover installation. If damaged, use a new gasket.
(5) Position the cylinder head cover onto the gasket. Tighten the bolts to 11 N·m (95 in. lbs.) torque.
(6) Install closed crankcase ventilation system and evaporation control system.
(7) Connect the negative cable to the battery.

ROCKER ARMS AND PUSH RODS

REMOVAL

(1) Disconnect spark plug wires by pulling on the boot straight out in line with plug.
(2) Remove cylinder head cover and gasket.
(3) Remove the rocker arm bolts and pivots (Fig. 18). Place them on a bench in the same order as removed.
(4) Remove the push rods and place them on a bench in the same order as removed.

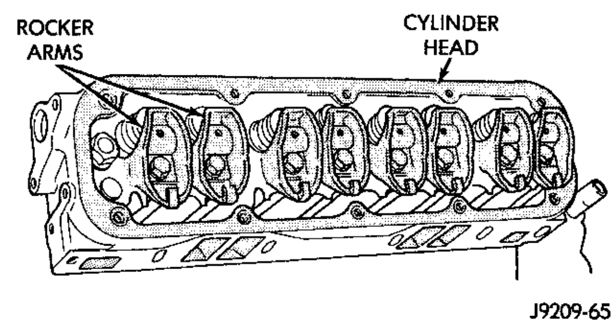

Fig. 18 Rocker Arms

INSTALLATION

(1) Rotate the crankshaft until the "V8" mark lines up with the TDC mark on the timing chain case cover. This mark is located 147° ATDC from the No.1 firing position.
(2) Install the push rods in the same order as removed.

REMOVAL AND INSTALLATION (Continued)

(3) Install rocker arm and pivot assemblies in the same order as removed. Tighten the rocker arm bolts to 28 N·m (21 ft. lbs.) torque.

CAUTION: DO NOT rotate or crank the engine during or immediately after rocker arm installation. Allow the hydraulic roller tappets adequate time to bleed down (about 5 minutes).

(4) Install cylinder head cover.
(5) Connect spark plug wires.

VALVE SPRING AND STEM SEAL REPLACEMENT-IN VEHICLE

(1) Remove the air cleaner.
(2) Remove cylinder head covers and spark plugs.
(3) Remove coil wire from distributor and secure to good ground to prevent engine from starting.
(4) Using suitable socket and flex handle at crankshaft retaining bolt, turn engine so the No.1 piston is at TDC on the compression stroke.
(5) Remove rocker arms.
(6) With air hose attached to an adapter installed in No.1 spark plug hole, apply 620-689 kPa (90-100 psi) air pressure.
(7) Using Valve Spring Compressor Tool MD-998772A with adaptor 6716A, compress valve spring and remove retainer valve locks and valve spring.
(8) Install seals on the exhaust valve stem and position down against valve guides.
(9) The intake valve stem seals should be pushed firmly and squarely over the valve guide using the valve stem as a guide. DO NOT force seal against top of guide. When installing the valve retainer locks, compress the spring only enough to install the locks.
(10) Follow the same procedure on the remaining 7 cylinders using the firing sequence 1-8-4-3-6-5-7-2. Make sure piston in cylinder is at TDC on the valve spring that is being removed.
(11) Remove adapter from the No.1 spark plug hole.
(12) Install rocker arms.
(13) Install covers and coil wire to distributor.
(14) Install air cleaner.
(15) Road test vehicle.

CYLINDER HEADS

REMOVAL

(1) Disconnect the battery negative cable.
(2) Drain cooling system (refer to Group 7, Cooling System for the proper procedures).
(3) Remove the air cleaner resonator and duct work.
(4) Remove the intake manifold-to-generator bracket support rod. Remove the generator.
(5) Remove closed crankcase ventilation system.
(6) Disconnect the evaporation control system.
(7) Perform the Fuel System Pressure Release procedure (refer to Group 14, Fuel System). Disconnect the fuel supply line.
(8) Disconnect accelerator linkage and if so equipped, the speed control and transmission kick-down cables.
(9) Remove distributor cap and wires.
(10) Disconnect the coil wires.
(11) Disconnect heat indicator sending unit wire.
(12) Disconnect heater hoses and bypass hose.
(13) Remove cylinder head covers and gaskets.
(14) Remove intake manifold and throttle body as an assembly. Discard the flange side gaskets and the front and rear cross-over gaskets.
(15) Remove exhaust manifolds.
(16) Remove rocker arm assemblies and push rods. Identify to ensure installation in original locations.
(17) Remove the head bolts from each cylinder head and remove cylinder heads. Discard the cylinder head gasket.
(18) Remove spark plugs.

INSTALLATION

(1) Clean all surfaces of cylinder block and cylinder heads.
(2) Clean cylinder block front and rear gasket surfaces using a suitable solvent.
(3) Position the new cylinder head gaskets onto the cylinder block.
(4) Position the cylinder heads onto head gaskets and cylinder block.
(5) Starting at top center, tighten all cylinder head bolts, in sequence, to 68 N·m (50 ft. lbs.) torque (Fig. 19). Repeat procedure, tighten all cylinder head bolts to 143 N·m (105 ft. lbs.) torque. Repeat procedure to confirm that all bolts are at 143 N·m (105 ft. lbs.) torque.

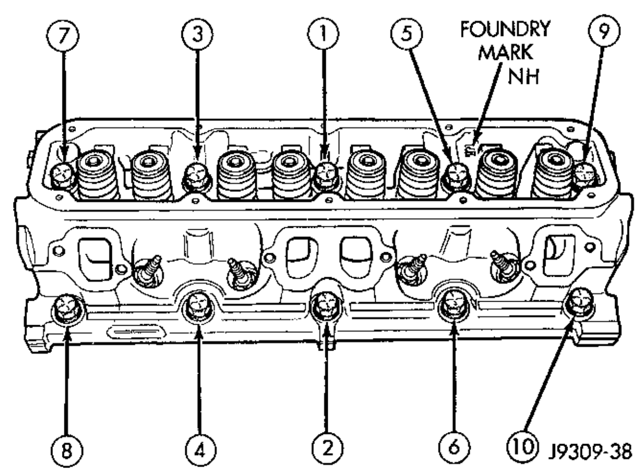

Fig. 19 Cylinder Head Bolt Tightening Sequence

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

CAUTION: When tightening the rocker arm bolts, make sure the piston in that cylinder is NOT at TDC. Contact between the valves and piston could occur.

(6) Install push rods and rocker arm assemblies in their original position. Tighten the bolts to 28 N·m (21 ft. lbs.) torque.

(7) Install the intake manifold and throttle body assembly (refer to Group 11, Exhaust System and Intake Manifold).

(8) Install exhaust manifolds. Tighten the bolts and nuts to 34 N·m (25 ft. lbs.) torque.

(9) Adjust spark plugs to specifications (refer to Group 8D, Ignition System). Install the plugs and tighten to 41 N·m (30 ft. lbs.) torque.

(10) Install coil wire.

(11) Connect heat indicator sending unit wire.

(12) Connect the heater hoses and bypass hose.

(13) Install distributor cap and wires.

(14) Connect the accelerator linkage and if so equipped, the speed control and transmission kick-down cables.

(15) Install the fuel supply line.

(16) Install the generator and drive belt. Tighten generator mounting bolt to 41 N·m (30 ft. lbs.) torque. Tighten the adjusting strap bolt to 23 N·m (200 in. lbs.) torque. Refer to Group 7, Cooling System for adjusting the belt tension.

(17) Install the intake manifold-to-generator bracket support rod. Tighten the bolts.

(18) Place the cylinder head cover gaskets in position and install cylinder head covers. Tighten the bolts to 11 N·m (95 in. lbs.) torque.

(19) Install closed crankcase ventilation system.

(20) Connect the evaporation control system.

(21) Install the air cleaner.

(22) Fill cooling system (refer to Group 7, Cooling System for proper procedure).

(23) Connect the negative cable to the battery.

VALVES AND VALVE SPRINGS

REMOVAL

(1) Remove the cylinder head. Refer to procedure in this section.

(2) Compress valve springs using Valve Spring Compressor Tool MD- 998772A and adapter 6716A.

(3) Remove valve retaining locks, valve spring retainers, valve stem seals and valve springs.

(4) Before removing valves, remove any burrs from valve stem lock grooves to prevent damage to the valve guides. Identify valves to ensure installation in original location.

INSTALLATION

(1) Clean valves thoroughly. Discard burned, warped and cracked valves.

(2) Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.

(3) Measure valve stems for wear. If wear exceeds 0.051 mm (0.002 inch), replace the valve.

(4) Coat valve stems with lubrication oil and insert them in cylinder head.

(5) If valves or seats are reground, check valve stem height. If valve is too long, replace cylinder head.

(6) Install new seals on all valve guides. Install valve springs and valve retainers.

(7) Compress valve springs with Valve Spring Compressor Tool MD-998772A and adapter 6716A, install locks and release tool. If valves and/or seats are ground, measure the installed height of springs. Make sure the measurement is taken from bottom of spring seat in cylinder head to the bottom surface of spring retainer. If spacers are installed, measure from the top of spacer. If height is greater than 42.86 mm (1-11/16 inches), install a 1.587 mm (1/16 inch) spacer in head counterbore. This should bring spring height back to normal 41.27 to 42.86 mm (1-5/8 to 1-11/16 inch).

HYDRAULIC TAPPETS

REMOVAL

(1) Remove the air cleaner.

(2) Remove cylinder head cover.

(3) Remove rocker assembly and push rods. Identify push rods to ensure installation in original location.

(4) Remove intake manifold.

(5) Remove yoke retainer and aligning yokes.

(6) Slide Hydraulic Tappet Remover/Installer tool through opening in cylinder head and seat tool firmly in the head of tappet.

(7) Pull tappet out of bore with a twisting motion. If all tappets are to be removed, identify tappets to ensure installation in original location.

(8) If the tappet or bore in cylinder block is scored, scuffed, or shows signs of sticking, ream the bore to next oversize. Replace with oversize tappet.

INSTALLATION

(1) Lubricate tappets.

(2) Install tappets and push rods in their original positions. Ensure that the oil feed hole in the side of the tappet body faces up (away from the crankshaft).

(3) Install aligning yokes with ARROW toward camshaft.

(4) Install yoke retainer. Tighten the bolts to 23 N·m (200 in. lbs.) torque. Install intake manifold.

(5) Install push rods in original positions.

REMOVAL AND INSTALLATION (Continued)

(6) Install rocker arm.

(7) Install cylinder head cover.

(8) Install distributor, start engine and reset timing.

CAUTION: To prevent damage to valve mechanism, engine must not be run above fast idle until all hydraulic tappets have filled with oil and have become quiet.

VIBRATION DAMPER

REMOVAL

(1) Disconnect the battery negative cable.

(2) Remove the cooling system fan.

(3) Remove the cooling fan shroud.

(4) Remove the accessory drive belt (refer to Group 7, Cooling System).

(5) Remove the vibration damper pulley.

(6) Remove vibration damper bolt and washer from end of crankshaft.

(7) Install bar and screw from Puller Tool Set C-3688. Install 2 bolts with washers through the puller tool and into the vibration damper (Fig. 20).

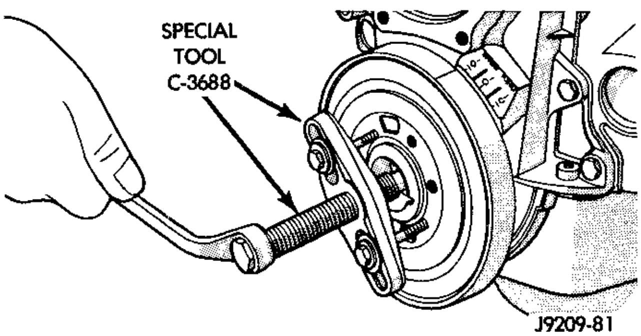

Fig. 20 Vibration Damper Assembly

(8) Pull vibration damper off of the crankshaft.

INSTALLATION

(1) Position the vibration damper onto the crankshaft.

(2) Place installing tool, part of Puller Tool Set C-3688 in position and press the vibration damper onto the crankshaft (Fig. 21).

(3) Install the crankshaft bolt and washer. Tighten the bolt to 183 N·m (135 ft. lbs.) torque.

(4) Install the crankshaft pulley. Tighten the pulley bolts to 23 N·m (200 in. lbs.) torque.

(5) Install the accessory drive belt (refer to Group 7, Cooling System).

(6) Position the fan shroud and install the bolts. Tighten the retainer bolts to 11 N·m (95 in. lbs.) torque.

(7) Install the cooling fan.

(8) Connect the battery negative cable.

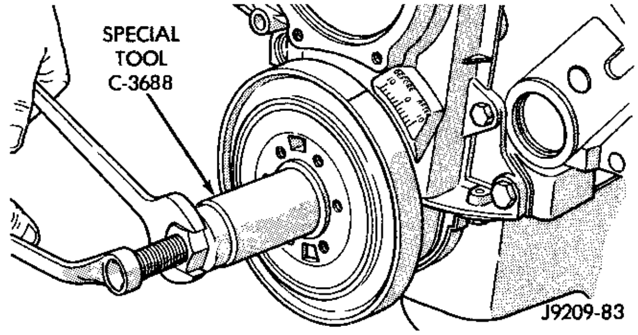

Fig. 21 Installing Vibration Damper

TIMING CHAIN COVER

REMOVAL

(1) Disconnect the negative cable from the battery.

(2) Drain cooling system (refer to Group 7, Cooling System).

(3) Remove the serpentine belt (refer to Group 7, Cooling System).

(4) Remove water pump (refer to Group 7, Cooling System).

(5) Remove power steering pump (refer to Group 19, Steering).

(6) Remove vibration damper.

(7) Loosen oil pan bolts and remove the front bolt at each side.

(8) Remove the cover bolts.

(9) Remove chain case cover and gasket using extreme caution to avoid damaging oil pan gasket.

(10) Place a suitable tool behind the lips of the oil seal to pry the oil seal outward. Be careful not to damage the crankshaft seal surface of cover (Fig. 22).

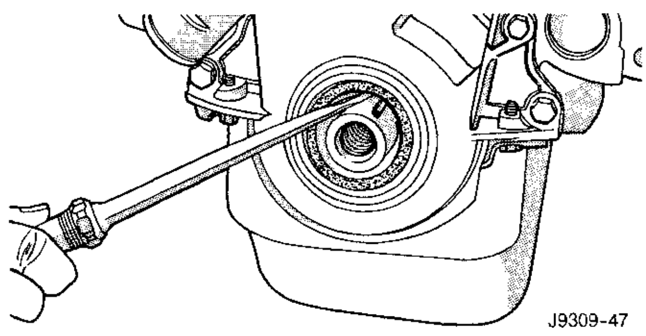

Fig. 22 Removal of Front Crankshaft Oil Seal

INSTALLATION

(1) Be sure mating surfaces of chain case cover and cylinder block are clean and free from burrs.

(2) The water pump mounting surface must be cleaned.

(3) Using a new cover gasket, carefully install chain case cover to avoid damaging oil pan gasket. Use a small amount of Mopar® Silicone Rubber Adhesive Sealant, or equivalent, at the joint between tim-

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

ing chain cover gasket and the oil pan gasket. Finger tighten the timing chain cover bolts at this time.

(4) Place the smaller diameter of the oil seal over Front Oil Seal Installation Tool 6635 (Fig. 23). Seat the oil seal in the groove of the tool.

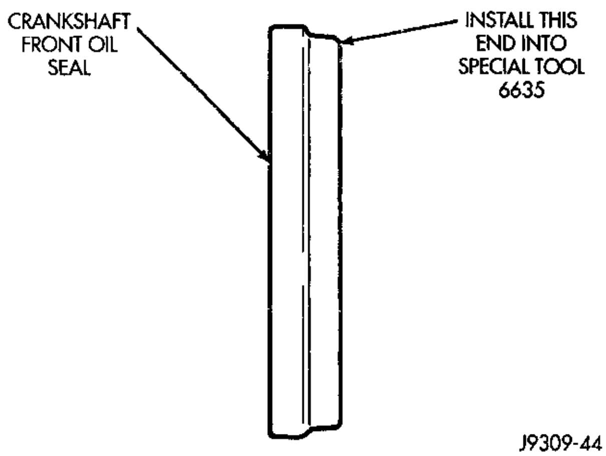

Fig. 23 Placing Oil Seal on Installation Tool 6635

(5) Position the seal and tool onto the crankshaft (Fig. 24).

(6) Tighten the 4 lower chain case cover bolts to 13N·m (10 ft.lbs.) to prevent the cover from tipping during seal installation.

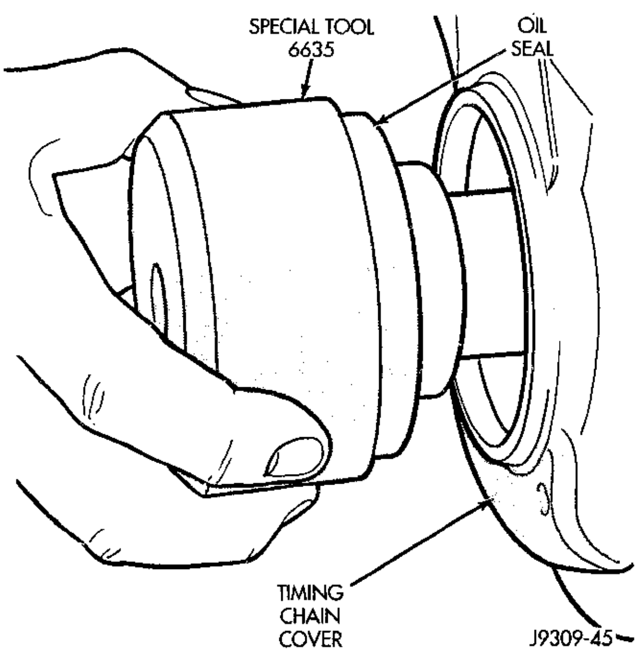

Fig. 24 Position Tool and Seal onto Crankshaft

(7) Using the vibration damper bolt, tighten the bolt to draw the seal into position on the crankshaft (Fig. 25).

(8) Loosen the 4 bolts tightened in step 4 to allow realignment of front cover assembly.

(9) Tighten chain case cover bolts to 41 N·m (30 ft.lbs.) torque. Tighten oil pan bolts to 24 N·m (215 in. lbs.) torque.

(10) Remove the vibration damper bolt and seal installation tool.

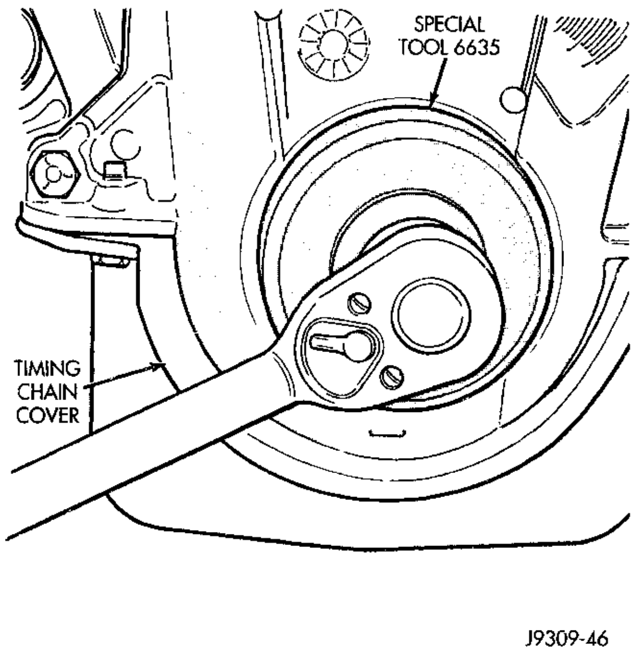

Fig. 25 Installing Oil Seal

(11) Inspect the seal flange on the vibration damper.

(12) Install vibration damper.

(13) Install water pump and housing assembly using new gaskets (refer to Group 7, Cooling System). Tighten bolts to 41 N·m (30 ft. lbs.) torque.

(14) Install power steering pump (refer to Group 19, Steering).

(15) Install the serpentine belt (refer to Group 7, Cooling System).

(16) Install the cooling system fan. Tighten the bolts to 23 N·m (17 ft. lbs.) torque.

(17) Position the fan shroud and install the bolts. Tighten the bolts to 11 N·m (95 in. lbs.) torque.

(18) Fill cooling system (refer to Group 7, Cooling System for the proper procedure).

(19) Connect the negative cable to the battery.

TIMING CHAIN

REMOVAL

(1) Remove Timing Chain Cover Refer to procedure in this section.

(2) Remove camshaft sprocket attaching bolt and remove timing chain with crankshaft and camshaft sprockets.

REMOVAL AND INSTALLATION (Continued)

INSTALLATION

(1) Place both camshaft sprocket and crankshaft sprocket on the bench with timing marks on exact imaginary center line through both camshaft and crankshaft bores.

(2) Place timing chain around both sprockets.

(3) Turn crankshaft and camshaft to line up with keyway location in crankshaft sprocket and in camshaft sprocket.

(4) Lift sprockets and chain (keep sprockets tight against the chain in position as described).

(5) Slide both sprockets evenly over their respective shafts and use a straightedge to check alignment of timing marks (Fig. 26).

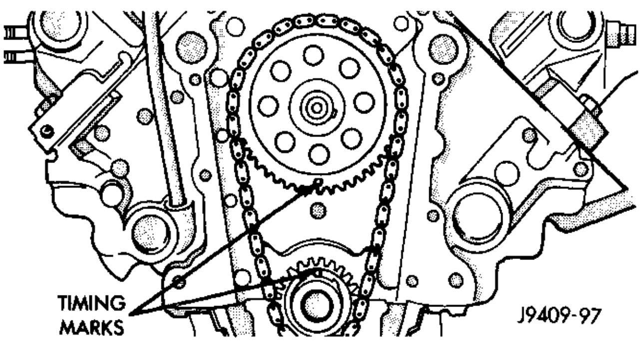

Fig. 26 Alignment of Timing Marks

(6) Install the camshaft bolt. Tighten the bolt to 68 N·m (50 ft. lbs.) torque.

(7) Check camshaft end play. The end play should be 0.051-0.152 mm (0.002-0.006 inch) with a new thrust plate and up to 0.254 mm (0.010 inch) with a used thrust plate. If not within these limits install a new thrust plate.

CAMSHAFT

NOTE: The camshaft has an integral oil pump and distributor drive gear (Fig. 27).

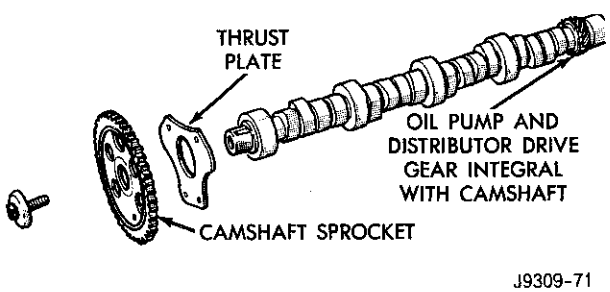

Fig. 27 Camshaft and Sprocket Assembly

REMOVAL

(1) Remove intake manifold.

(2) Remove cylinder head covers.

(3) Remove timing case cover and timing chain.

(4) Remove rocker arms.

(5) Remove push rods and tappets. Identify each part so it can be installed in its original location.

(6) Remove distributor and lift out the oil pump and distributor drive shaft.

(7) Remove camshaft thrust plate, note location of oil tab (Fig. 28).

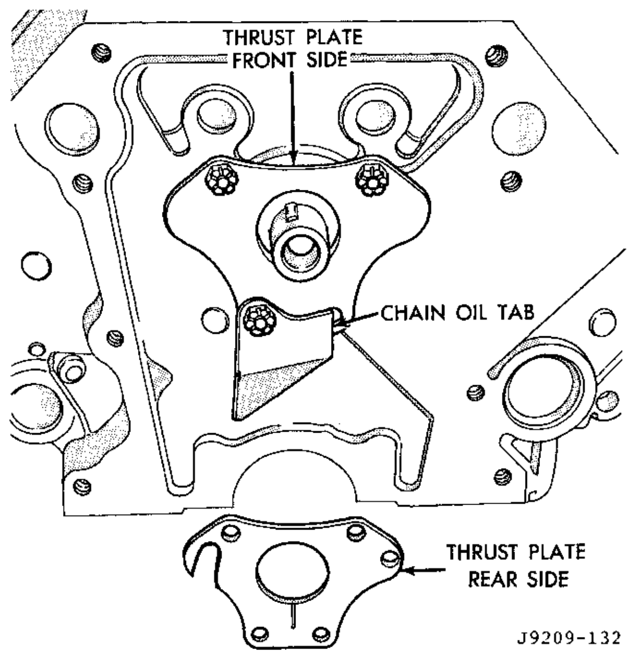

Fig. 28 Timing Chain Oil Tab Installation

(8) Install a long bolt into front of camshaft to facilitate removal of the camshaft. Remove camshaft, being careful not to damage cam bearings with the cam lobes.

INSTALLATION

(1) Lubricate camshaft lobes and camshaft bearing journals and insert the camshaft to within 51 mm (2 inches) of its final position in cylinder block.

NOTE: Whenever an engine has been rebuilt, a new camshaft and/or new tappets installed, add 1 pint of Mopar Crankcase Conditioner, or equivalent. The oil mixture should be left in engine for a minimum of 805 km (500 miles). Drain at the next normal oil change.

(2) Install Camshaft Gear Installer Tool C-3509 with tongue back of distributor drive gear (Fig. 29).

(3) Hold tool in position with a distributor lockplate bolt. This tool will restrict camshaft from being pushed in too far and prevent knocking out the welch plug in rear of cylinder block. **Tool should remain installed until the camshaft and crankshaft sprockets and timing chain have been installed.**

(4) Install camshaft thrust plate and chain oil tab. **Make sure tang enters lower right hole in**

mopar AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

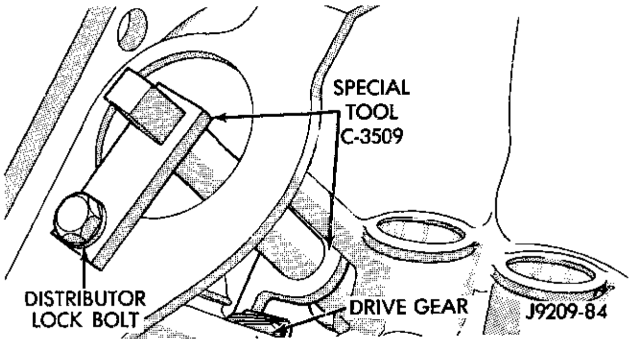

Fig. 29 Camshaft Holding Tool C-3509 (Installed Position)

thrust plate. Tighten bolts to 24 N·m (210 in. lbs.) torque. Top edge of tab should be flat against thrust plate in order to catch oil for chain lubrication.

(5) Place both camshaft sprocket and crankshaft sprocket on the bench with timing marks on exact imaginary center line through both camshaft and crankshaft bores.

(6) Place timing chain around both sprockets.

(7) Turn crankshaft and camshaft to line up with keyway location in crankshaft sprocket and in camshaft sprocket.

(8) Lift sprockets and chain (keep sprockets tight against the chain in position as described).

(9) Slide both sprockets evenly over their respective shafts and use a straightedge to check alignment of timing marks (Fig. 30).

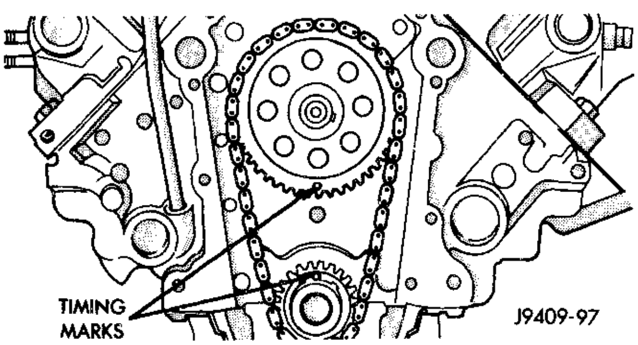

Fig. 30 Alignment of Timing Marks

(10) Install the camshaft bolt/cup washer. Tighten bolt to 68 N·m (50 ft. lbs.) torque.

(11) Measure camshaft end play. Refer to Specifications for proper clearance. If not within limits install a new thrust plate.

(12) Each tappet reused must be installed in the same position from which it was removed. **When camshaft is replaced, all of the tappets must be replaced.**

CAMSHAFT BEARINGS

REMOVAL

NOTE: This procedure requires that the engine is removed from the vehicle.

(1) With engine completely disassembled, drive out rear cam bearing core hole plug.

(2) Install proper size adapters and horseshoe washers (part of Camshaft Bearing Remover/Installer Tool C-3132-A) at back of each bearing shell. Drive out bearing shells (Fig. 31).

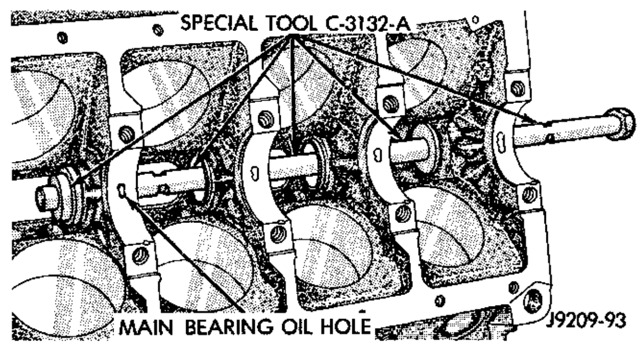

Fig. 31 Camshaft Bearings Removal/Installation with Tool C-3132-A

INSTALLATION

(1) Install new camshaft bearings with Camshaft Bearing Remover/Installer Tool C-3132-A by sliding the new camshaft bearing shell over proper adapter.

(2) Position rear bearing in the tool. Install horseshoe lock and by reversing removal procedure, carefully drive bearing shell into place.

(3) Install remaining bearings in the same manner. Bearings must be carefully aligned to bring oil holes into full register with oil passages from the main bearing. If the camshaft bearing shell oil holes are not in exact alignment, remove and install them correctly. Install a new core hole plug at the rear of camshaft. **Be sure this plug does not leak.**

CAMSHAFT BEARINGS

REMOVAL

NOTE: This procedure requires that the engine is removed from the vehicle.

(1) With engine completely disassembled, drive out rear cam bearing core hole plug.

(2) Install proper size adapters and horseshoe washers (part of Camshaft Bearing Remover/Installer Tool C-3132-A) at back of each bearing shell. Drive out bearing shells (Fig. 32).

REMOVAL AND INSTALLATION (Continued)

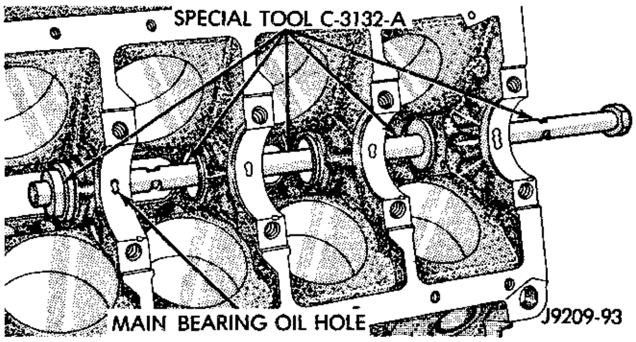

Fig. 32 Camshaft Bearings Removal/Installation with Tool C-3132-A

INSTALLATION

(1) Install new camshaft bearings with Camshaft Bearing Remover/Installer Tool C-3132-A by sliding the new camshaft bearing shell over proper adapter.

(2) Position rear bearing in the tool. Install horseshoe lock and by reversing removal procedure, carefully drive bearing shell into place.

(3) Install remaining bearings in the same manner. Bearings must be carefully aligned to bring oil holes into full register with oil passages from the main bearing. If the camshaft bearing shell oil holes are not in exact alignment, remove and install them correctly. Install a new core hole plug at the rear of camshaft. **Be sure this plug does not leak.**

OIL PAN

REMOVAL

(1) Disconnect the negative cable from the battery.
(2) Remove engine oil dipstick.
(3) Raise vehicle.
(4) Drain engine oil.
(5) Remove exhaust pipe.
(6) Remove left engine to transmission strut.
(7) Loosen the right side engine support bracket cushion thru-bolt nut and raise the engine slightly. Remove oil pan by sliding backward and out.
(8) Remove the one-piece gasket.

INSTALLATION

(1) Clean the block and pan gasket surfaces.

(2) Trim or remove excess sealant film in the rear main cap oil pan gasket groove. **DO NOT remove the sealant inside the rear main cap slots.**

(3) If present, trim excess sealant from inside the engine.

(4) Fabricate 4 alignment dowels from 5/16 x 1 1/2 inch bolts. Cut the head off the bolts and cut a slot into the top of the dowel. This will allow easier installation and removal with a screwdriver (Fig. 33).

(5) Install the dowels in the cylinder block (Fig. 34).

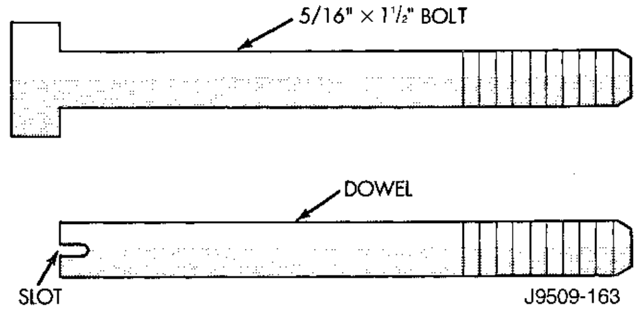

Fig. 33 Fabrication of Alignment Dowels

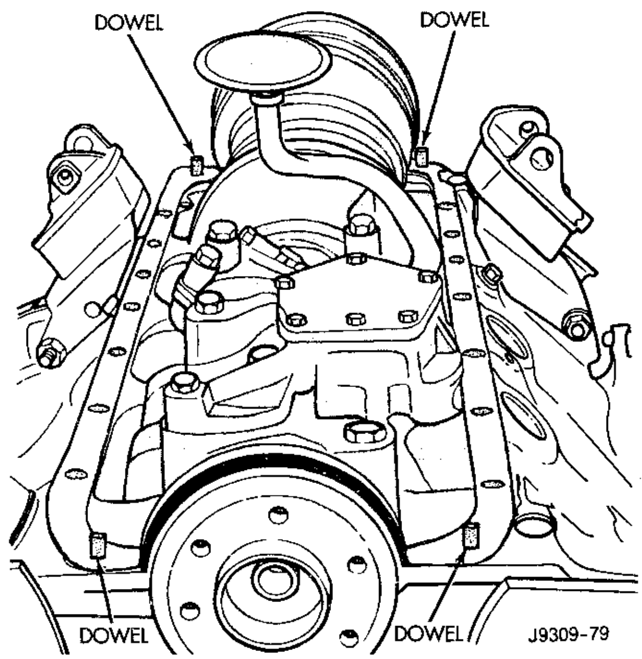

Fig. 34 Position of Dowels in Cylinder Block

(6) Apply small amount of Mopar® Silicone Rubber Adhesive Sealant, or equivalent in the corner of the cap and the cylinder block.

(7) Slide the one-piece gasket over the dowels and onto the block.

(8) Position the oil pan over the dowels and onto the gasket.

(9) Install the oil pan bolts. Tighten the bolts to 24 N·m (215 in. lbs.) torque.

(10) Remove the dowels. Install the remaining oil pan bolts. Tighten these bolts to 24 N·m (215 in. lbs.) torque.

(11) Lower the engine into the support cushion brackets and tighten the thru bolt nut to the proper torque.

(12) Install the drain plug. Tighten drain plug to 34 N·m (25 ft. lbs.) torque.

(13) Install the engine to transmission strut.
(14) Install exhaust pipe.
(15) Lower vehicle.
(16) Install dipstick.

REMOVAL AND INSTALLATION (Continued)

(17) Connect the negative cable to the battery.
(18) Fill crankcase with oil to proper level.

CRANKSHAFT MAIN BEARINGS

REMOVAL

(1) Remove the oil pan.
(2) Remove the oil pump from the rear main bearing cap.
(3) Identify bearing caps before removal. Remove bearing caps one at a time.
(4) Remove upper half of bearing by inserting Crankshaft Main Bearing Remover/Installer Tool C-3059 into the oil hole of crankshaft (Fig. 35).
(5) Slowly rotate crankshaft clockwise, forcing out upper half of bearing shell.

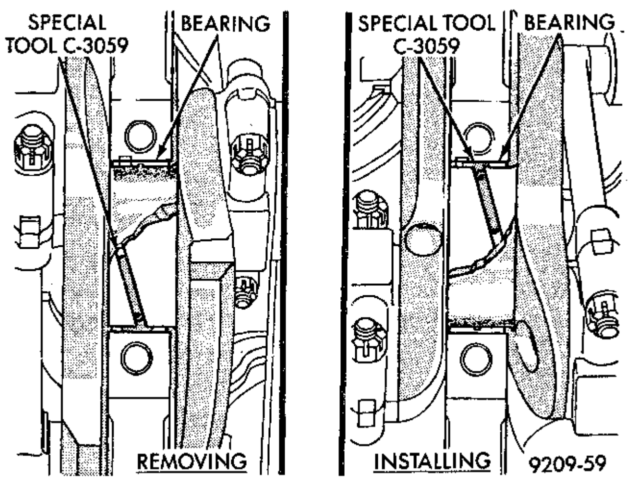

Fig. 35 Upper Main Bearing Removal and Installation with Tool C-3059

INSTALLATION

Only one main bearing should be selectively fitted while all other main bearing caps are properly tightened. All bearing capbolts removed during service procedures are to be cleaned and oiled before installation.

When installing a new upper bearing shell, slightly chamfer the sharp edges from the plain side.

(1) Start bearing in place, and insert Crankshaft Main Bearing Remover/Installer Tool C-3059 into oil hole of crankshaft (Fig. 35).
(2) Slowly rotate crankshaft counterclockwise sliding the bearing into position. Remove Tool C-3059.
(3) Install the bearing cap. Clean and oil the bolts. Tighten the capbolts to 115 N·m (85 ft. lbs.) torque.
(4) Install the oil pump.
(5) Install the oil pan.

PISTON AND CONNECTING ROD ASSEMBLY

REMOVAL

(1) Remove the engine from the vehicle.
(2) Remove the cylinder head.
(3) Remove the oil pan.
(4) Remove top ridge of cylinder bores with a reliable ridge reamer before removing pistons from cylinder block. Be sure to keep tops of pistons covered during this operation.
(5) Be sure the connecting rod and connecting rod cap are identified with the cylinder number. Remove connecting rod cap. Install connecting rod bolt guide set on connecting rod bolts.
(6) Pistons and connecting rods must be removed from top of cylinder block. When removing piston and connecting rod assemblies, rotate crankshaft to center the connecting rod in the cylinder bore and at BDC. **Be careful not to nick crankshaft journals.**
(7) After removal, install bearing cap on the mating rod.

INSTALLATION

(1) Be sure that compression ring gaps are staggered so that neither is in-line with oil ring rail gap.
(2) Before installing the ring compressor, make sure the oil ring expander ends are butted and the rail gaps located properly (Fig. 36).

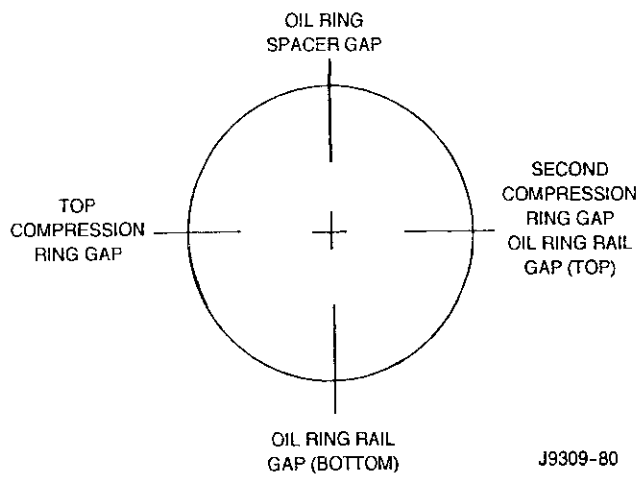

Fig. 36 Proper Ring Installation

(3) Immerse the piston head and rings in clean engine oil. Slide Piston Ring Compressor Tool C-385 over the piston and tighten with the special wrench (part of Tool C-385). **Be sure position of rings does not change during this operation.**
(4) Install connecting rod bolt protectors on rod bolts, the long protector should be installed on the numbered side of the connecting rod.
(5) Rotate crankshaft so that the connecting rod journal is on the center of the cylinder bore. Be sure connecting rod and cylinder bore number are the

REMOVAL AND INSTALLATION (Continued)

same. Insert rod and piston into cylinder bore and guide rod over the crankshaft journal.

(6) Tap the piston down in cylinder bore, using a hammer handle. At the same time, guide connecting rod into position on crankshaft journal.

(7) The notch or groove on top of piston must be pointing toward front of engine. The larger chamfer of the connecting rod bore must be installed toward crankshaft journal fillet.

(8) Install rod caps. Be sure connecting rod, connecting rod cap and cylinder bore number are the same. Install nuts on cleaned and oiled rod bolts and tighten nuts to 61 N·m (45 ft. lbs.) torque.

(9) Install the oil pan.

(10) Install the cylinder head.

(11) Install the engine into the vehicle.

CRANKSHAFT

A crankshaft which has undersize journals will be stamped with 1/4 inch letters on the milled flat on the No.3 crankshaft counterweight (Fig. 37).

FOR EXAMPLE: R2 stamped on the No.3 crankshaft counterweight indicates that the No.2 rod journal is 0.025 mm (0.001 in) undersize. M4 indicates that the No.4 main journal is 0.025 mm (0.001 in) undersize. R3 M2 indicates that the No.3 rod journal and the No.2 main journal are 0.025 mm (0.001 in) undersize.

Undersize Journal	Identification Stamp
0.025 mm (0.001 inch) (Rod)	R1-R2-R3 or R4
0.025 mm (0.001 inch) (Main)	M1-M2-M3-M4 or M5

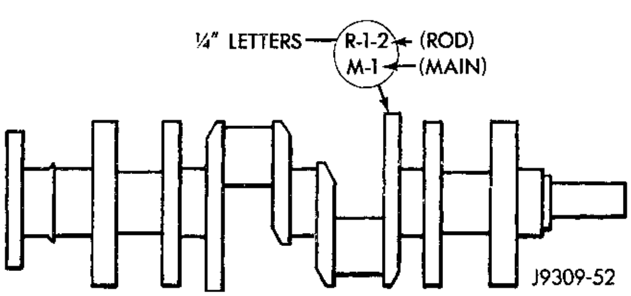

Fig. 37 Location of Crankshaft Identification

When a crankshaft is replaced, all main and connecting rod bearings should be replaced with new bearings. Therefore, selective fitting of the bearings is not required when a crankshaft and bearings are replaced.

REMOVAL

(1) Remove the oil pan.

(2) Remove the oil pump from the rear main bearing cap.

(3) Remove the vibration damper.

(4) Remove the timing chain cover.

(5) Identify bearing caps before removal. Remove bearing caps and bearings one at a time.

(6) Lift the crankshaft out of the block.

(7) Remove and discard the crankshaft rear oil seals.

(8) Remove and discard the front crankshaft oil seal.

INSPECTION OF JOURNALS

The crankshaft connecting rod and main journals should be checked for excessive wear, taper and scoring. The maximum taper or out-of-round on any crankshaft journal is 0.025 mm (0.001 inch).

Journal grinding should not exceed 0.305 mm (0.012 inch) under the standard journal diameter. DO NOT grind thrust faces of No.3 main bearing. DO NOT nick crank pin or bearing fillets. After grinding, remove rough edges from crankshaft oil holes and clean out all oil passages.

CAUTION: After any journal grind, it is important that the final paper or cloth polish be in the same direction as the engine rotates.

CLEANING

Clean Loctite 518 residue and sealant from the cylinder block and rear cap mating surface. Do this before applying the Loctite drop and the installation of rear cap.

INSTALLATION

(1) Lightly oil the new upper seal lips with engine oil.

(2) Install the new upper rear bearing oil seal with the white paint facing towards the rear of the engine.

(3) Position the crankshaft into the cylinder block.

(4) Lightly oil the new lower seal lips with engine oil.

(5) Install the new lower rear bearing oil seal into the bearing cap with the white paint facing towards the rear of the engine.

(6) Apply 5 mm (0.20 in) drop of Loctite 518, or equivalent, on each side of the rear main bearing cap (Fig. 38). DO NOT over apply sealant or allow the sealant to contact the rubber seal. Assemble bearing cap to cylinder block immediately after sealant application.

(7) To align the bearing cap, use cap slot, alignment dowel and cap bolts. DO NOT remove excess material after assembly. DO NOT strike rear cap more than 2 times for proper engagement.

(8) Clean and oil all cap bolts. Install all main bearing caps. Install all cap bolts and alternately tighten to 115 N·m (85 ft. lbs.) torque.

(9) Install oil pump.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

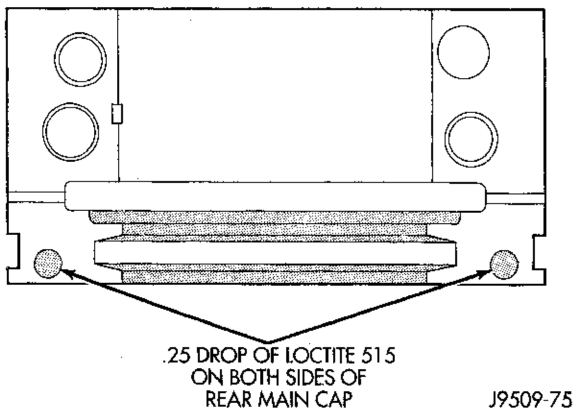

Fig. 38 Sealant Application to Bearing Cap

Apply Mopar® Silicone Rubber Adhesive Sealant, or equivalent, at bearing cap to block joint to provide cap to block and oil pan sealing (Fig. 39). Apply enough sealant until a small amount is squeezed out. Withdraw nozzle and wipe excess sealant off the oil pan seal groove.

(10) Install new front crankshaft oil seal.

(11) Immediately install the oil pan.

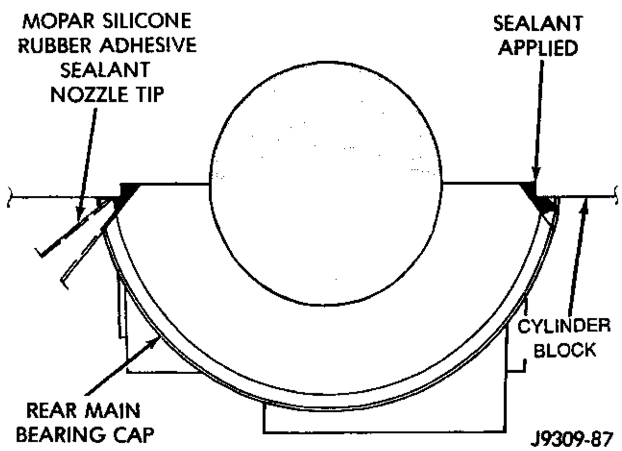

Fig. 39 Apply Sealant to Bearing Cap to Block Joint

OIL PUMP

REMOVAL

(1) Remove the oil pan.

(2) Remove the oil pump from rear main bearing cap.

INSTALLATION

(1) Install oil pump. During installation slowly rotate pump body to ensure driveshaft-to-pump rotor shaft engagement.

(2) Hold the oil pump base flush against mating surface on No.5 main bearing cap. Finger tighten pump attaching bolts. Tighten attaching bolts to 41 N·m (30 ft. lbs.) torque.

(3) Install the oil pan.

FRONT CRANKSHAFT OIL SEAL

The oil seal can be replaced without removing the timing chain cover provided the cover is not misaligned.

(1) Disconnect the negative cable from the battery.

(2) Remove vibration damper.

(3) If front seal is suspected of leaking, check front oil seal alignment to crankshaft. The seal installation/alignment tool 6635, should fit with minimum interference. If tool does not fit, the cover must be removed and installed properly.

(4) Place a suitable tool behind the lips of the oil seal to pry the oil seal outward. Be careful not to damage the crankshaft seal bore of cover.

(5) Place the smaller diameter of the oil seal over Front Oil Seal Installation Tool 6635 (Fig. 40). Seat the oil seal in the groove of the tool.

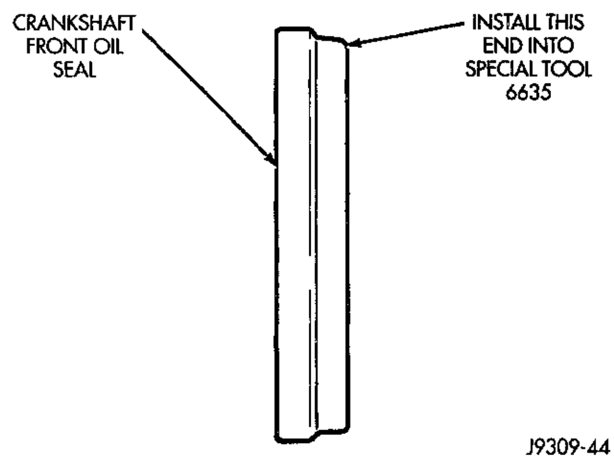

Fig. 40 Placing Oil Seal on Installation Tool 6635

(6) Position the seal and tool onto the crankshaft (Fig. 41).

(7) Using the vibration damper bolt, tighten the bolt to draw the seal into position on the crankshaft (Fig. 42).

(8) Remove the vibration damper bolt and seal installation tool.

(9) Inspect the seal flange on the vibration damper.

(10) Install the vibration damper.

(11) Connect the negative cable to the battery.

CRANKSHAFT REAR OIL SEALS

The service seal is a 2 piece, viton seal. The upper seal half can be installed with crankshaft removed from engine or with crankshaft installed. When a new upper seal is installed, install a new lower seal.

REMOVAL AND INSTALLATION (Continued)

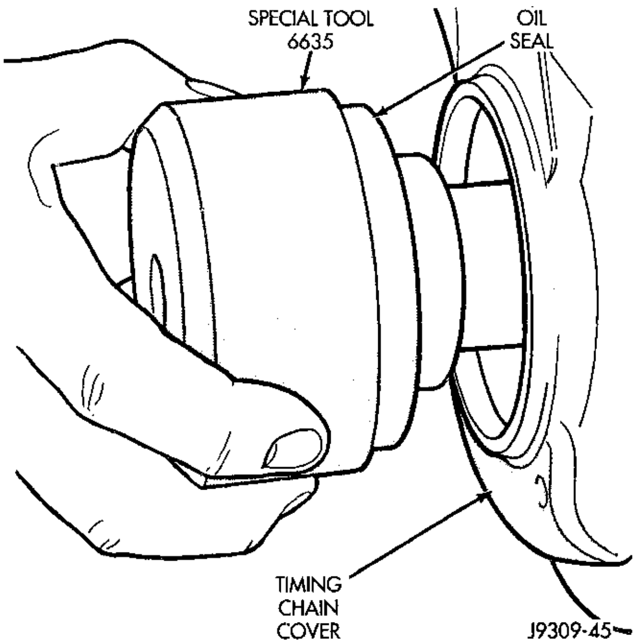

Fig. 41 Position Tool and Seal onto Crankshaft

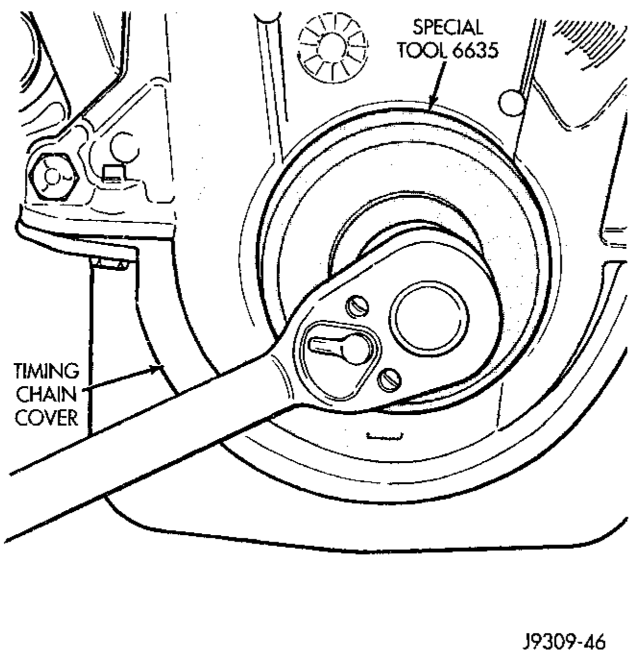

Fig. 42 Installing Oil Seal

The lower seal half can only be installed with the rear main bearing cap removed.

UPPER SEAL REPLACEMENT—CRANKSHAFT REMOVED

(1) Remove the crankshaft. Discard the old upper seal.

(2) Clean the cylinder block rear cap mating surface. Make sure the seal groove is free of debris.

(3) Lightly oil the new upper seal lips with engine oil.

(4) Install the new upper rear bearing oil seal with the white paint facing towards the rear of the engine.

(5) Position the crankshaft into the cylinder block.

(6) Lightly oil the new lower seal lips with engine oil.

(7) Install the new lower rear bearing oil seal into the bearing cap with the white paint facing towards the rear of the engine.

(8) Apply 5 mm (0.20 in) drop of Loctite 518, or equivalent, on each side of the rear main bearing cap (Fig. 43). DO NOT over apply sealant or allow the sealant to contact the rubber seal. Assemble bearing cap to cylinder block immediately after sealant application.

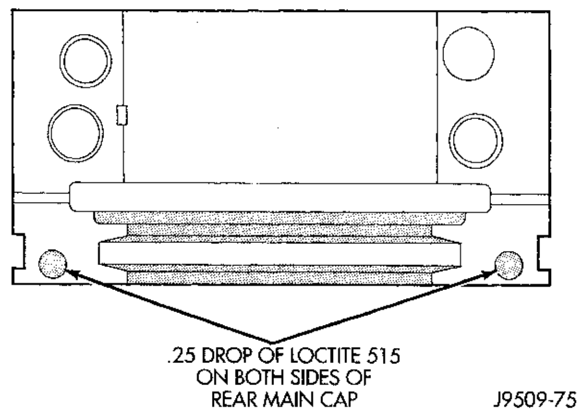

Fig. 43 Sealant Application to Bearing Cap

(9) To align the bearing cap, use cap slot, alignment dowel and cap bolts. DO NOT remove excess material after assembly. DO NOT strike rear cap more than 2 times for proper engagement.

(10) Clean and oil all cap bolts. Install all main bearing caps. Install all cap bolts and alternately tighten to 115 N·m (85 ft. lbs.) torque.

(11) Install oil pump.

(12) Apply Mopar® Silicone Rubber Adhesive Sealant, or equivalent, at bearing cap to block joint to provide cap to block and oil pan sealing (Fig. 44). Apply enough sealant until a small amount is squeezed out. Withdraw nozzle and wipe excess sealant off the oil pan seal groove.

(13) Install new front crankshaft oil seal.

(14) Immediately install the oil pan.

UPPER SEAL REPLACEMENT—CRANKSHAFT INSTALLED

(1) Remove the oil pan.

(2) Remove the oil pump from the rear main bearing cap.

REMOVAL AND INSTALLATION (Continued)

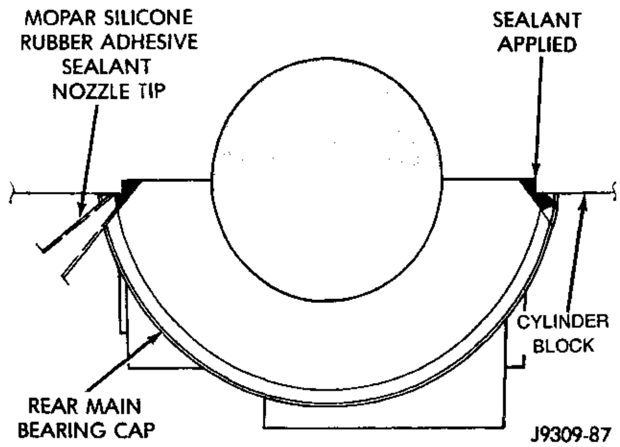

Fig. 44 Apply Sealant to Bearing Cap to Block Joint

(3) Remove the rear main bearing cap. Remove and discard the old lower oil seal.

(4) Carefully remove and discard the old upper oil seal.

(5) Clean the cylinder block mating surfaces before oil seal installation.

(6) Lightly oil the new upper seal lips with engine oil. To allow ease of installation of the seal, loosen at least the 2 main bearing caps forward of the rear bearing cap.

(7) Rotate the new upper seal into the cylinder block being careful not to shave or cut the outer surface of the seal. To assure proper installation, use the installation tool provided with the kit. Install the new seal with the white paint facing towards the rear of the engine.

(8) Install the new lower rear bearing oil seal into the bearing cap with the white paint facing towards the rear of the engine.

(9) Apply 5 mm (0.20 in) drop of Loctite 518, or equivalent, on each side of the rear main bearing cap (Fig. 43). DO NOT over apply sealant or allow the sealant to contact the rubber seal. Assemble bearing cap to cylinder block immediately after sealant application. Be sure the white paint faces toward the rear of the engine.

(10) To align the bearing cap, use cap slot, alignment dowel and cap bolts. DO NOT remove excess material after assembly. DO NOT strike rear cap more than 2 times for proper engagement.

(11) Install the rear main bearing cap with cleaned and oiled cap bolts. Alternately tighten ALL cap bolts to 115 N·m (85 ft. lbs.) torque.

(12) Install oil pump.

(13) Apply Mopar® Silicone Rubber Adhesive Sealant, or equivalent, at bearing cap to block joint to provide cap to block and oil pan sealing (Fig. 44) (Fig. 8). Apply enough sealant until a small amount is squeezed out. Withdraw nozzle and wipe excess sealant off the oil pan seal groove.

(14) Immediately install the oil pan.

LOWER SEAL REPLACEMENT

(1) Remove the oil pan.

(2) Remove the oil pump from the rear main bearing cap.

(3) Remove the rear main bearing cap and discard the old lower seal.

(4) Clean the rear main cap mating surfaces including the oil pan seal grooves.

(5) Carefully install a new upper seal (refer to Upper Seal Replacement - Crankshaft Installed procedure above).

(6) Lightly oil the new lower seal lips with engine oil.

(7) Install a new lower seal in bearing cap with white paint facing the rear of engine.

(8) Apply 5 mm (0.20 in) drop of Loctite 518, or equivalent, on each side of the rear main bearing cap (Fig. 43). DO NOT over apply sealant or allow the sealant to contact the rubber seal. Assemble bearing cap to cylinder block immediately after sealant application.

(9) To align the bearing cap, use cap slot, alignment dowel and cap bolts. DO NOT remove excess material after assembly. DO NOT strike rear cap more than 2 times for proper engagement.

(10) Install the rear main bearing cap with cleaned and oiled cap bolts. Alternately tighten the cap bolts to 115 N·m (85 ft. lbs.) torque.

(11) Install oil pump.

(12) Apply Mopar® Silicone Rubber Adhesive Sealant, or equivalent, at bearing cap to block joint to provide cap to block and oil pan sealing (Fig. 44). Apply enough sealant until a small amount is squeezed out. Withdraw nozzle and wipe excess sealant off the oil pan seal groove.

(13) Immediately install the oil pan.

ENGINE CORE PLUGS

Engine core plugs have been pressed into the oil galleries behind the camshaft thrust plate (Fig. 45). This will reduce internal leakage and help maintain higher oil pressure at idle.

REMOVAL

(1) Using a blunt tool such as a drift or a screwdriver and a hammer, strike the bottom edge of the cup plug (Fig. 46).

(2) With the cup plug rotated, grasp firmly with pliers or other suitable tool and remove plug (Fig. 46).

CLEANING

Thoroughly clean inside of cup plug hole in cylinder block or head. Be sure to remove old sealer.

REMOVAL AND INSTALLATION (Continued)

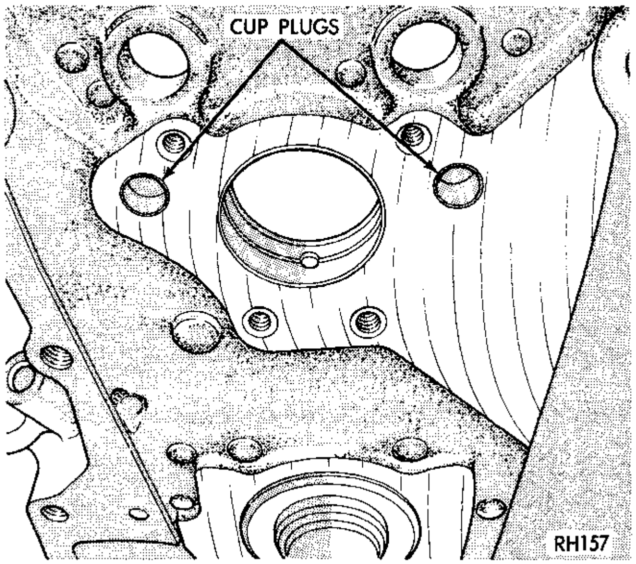

Fig. 45 Location of Cup Plugs in Oil Galleries

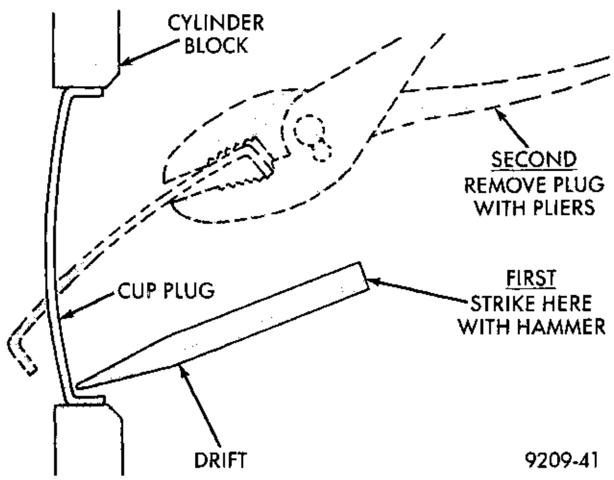

Fig. 46 Core Hole Plug Removal

Make certain the new plug is cleaned of all oil or grease.

INSTALLATION

(1) Coat edges of plug and core hole with Mopar Gasket Maker, or equivalent.

CAUTION: DO NOT drive cup plug into the casting as restricted coolant flow can result and cause serious engine problems.

(2) Using proper plug drive, drive cup plug into hole. The sharp edge of the plug should be at least 0.50 mm (0.020 inch) inside the lead-in chamfer.

(3) It is not necessary to wait for curing of the sealant. The cooling system can be filled and the vehicle placed in service immediately.

DISASSEMBLY AND ASSEMBLY

HYDRAULIC TAPPETS

CAUTION: The plunger and tappet bodies are not interchangeable. The plunger and valve must always be fitted to the original body. It is advisable to work on one tappet at a time to avoid mixing of parts. Mixed parts are not compatible. DO NOT disassemble a tappet on a dirty work bench.

DISASSEMBLE

(1) Pry out plunger retainer spring clip (Fig. 47).

(2) Clean varnish deposits from inside of tappet body above plunger cap.

(3) Invert tappet body and remove plunger cap, plunger, check valve, check valve spring, check valve retainer and plunger spring (Fig. 47). Check valve could be flat or ball.

ASSEMBLE

(1) Clean all tappet parts in a solvent that will remove all varnish and carbon.

(2) Replace tappets that are unfit for further service with new assemblies.

(3) If plunger shows signs of scoring or wear, install a new tappet assembly. If valve is pitted, or valve seat on end of plunger is prevented from seating, install a new tappet assembly.

(4) Assemble tappets (Fig. 47).

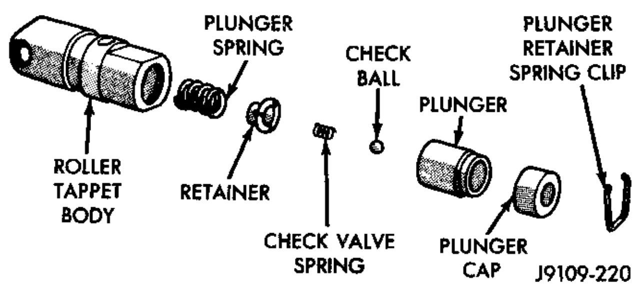

Fig. 47 Hydraulic Tappet Assembly

CYLINDER BLOCK

DISASSEMBLE

(1) Remove the cylinder head.

(2) Remove the oil pan.

(3) Remove the piston/connecting rod assembly.

OIL LINE PLUG

The oil line plug is located in the vertical passage at the rear of the block between the Oil-To-Filter and Oil-From-Filter passages (Fig. 48). Improper installation or plug missing could cause erratic, low or no oil pressure.

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(1) Remove oil pressure sending unit from back of block.
(2) Insert a 3.175 mm (1/8 inch) finish wire or equivalent into passage.
(3) Plug should be 190.0 to 195.2 mm (7-1/2 to 7-11/16 inches) from machined surface of block (Fig. 48). If plug is too high, use a suitable flat dowel drift to position properly.

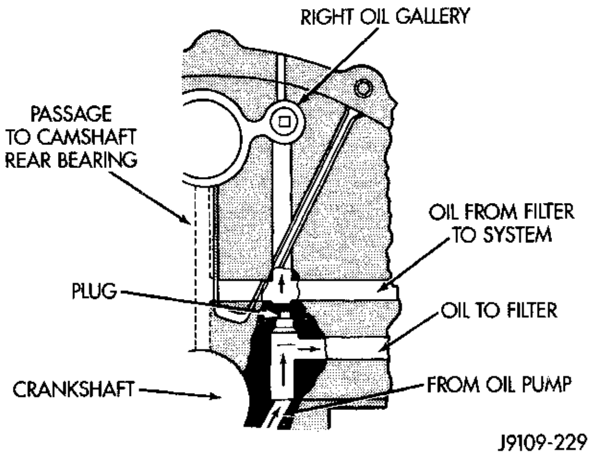

Fig. 48 Oil Line Plug

(4) If plug is too low, remove oil pan and rear main bearing cap. Use suitable flat dowel to properly postion. Coat outside diameter of plug with Mopar® (stud and bearing mount adhesive), or equivalent. Plug should be 54.0 to 57.7 mm (2-1/8 to 2-5/16 inches) from bottom of the block.
(5) Assemble engine and check oil pressure.

ASSEMBLE

(1) Install the piston/connecting rod assembly.
(2) Install the oil pan.
(3) Install the cylinder head.
(4) Install the engine into the vehicle.

VALVE SERVICE

VALVE CLEANING

Clean valves thoroughly. Discard burned, warped and cracked valves.

Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.

VALVE INSPECTION

Measure valve stems for wear. If wear exceeds 0.051 mm (0.002 inch), replace the valve.

VALVE GUIDES

Measure valve stem guide clearance as follows:
(1) Install Valve Guide Sleeve Tool C-3973 over valve stem and install valve (Fig. 49). The special sleeve places the valve at the correct height for checking with a dial indicator.

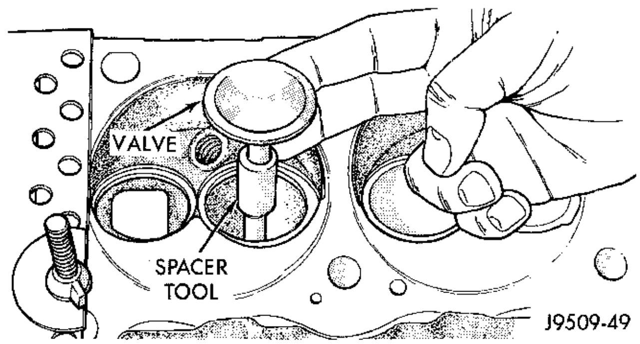

Fig. 49 Positioning Valve with Tool C-3973

(2) Attach Dial Indicator Tool C-3339 to cylinder head and set it at right angle of valve stem being measured (Fig. 50).

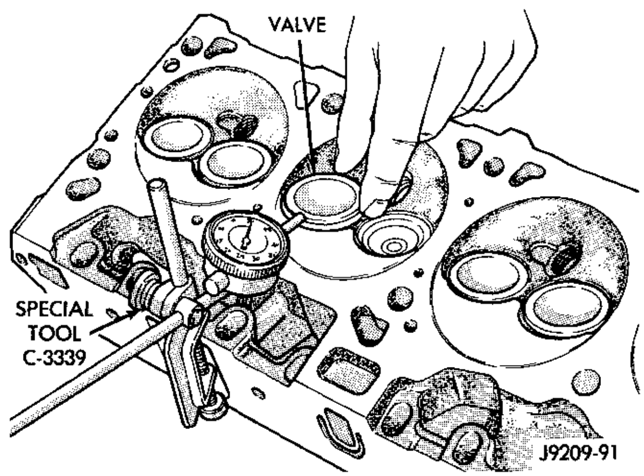

Fig. 50 Measuring Valve Guide Wear

(3) Move valve to and from the indicator. The total dial indicator reading should not exceed 0.432 mm (0.017 inch). Ream the guides for valves with oversize stems if dial indicator reading is excessive or if the stems are scuffed or scored.

Service valves with oversize stems are available (Fig. 51).

Reamer O/S	Valve Guide Size
0.076 mm (0.003 in.)	8.026 – 8.052 mm (0.316 – 0.317 in.)
0.381 mm (0.015 in.)	8.331 – 8.357 mm (0.328 – 0.329 in.)

J9309-30

Fig. 51 Reamer Sizes

DISASSEMBLY AND ASSEMBLY (Continued)

Slowly turn reamer by hand and clean guide thoroughly before installing new valve. **Ream the valve guides from standard to 0.381 mm (0.015 inch). Use a 2 step procedure so the valve guides are reamed true in relation to the valve seat:**

- Step 1—Ream to 0.0763 mm (0.003 inch).
- Step 2—Ream to 0.381 mm (0.015 inch).

REFACING VALVES AND VALVE SEATS

The intake and exhaust valves have a 43-1/4° to 43-3/4° face angle and a 44-1/4° to 44-3/4° seat angle (Fig. 52).

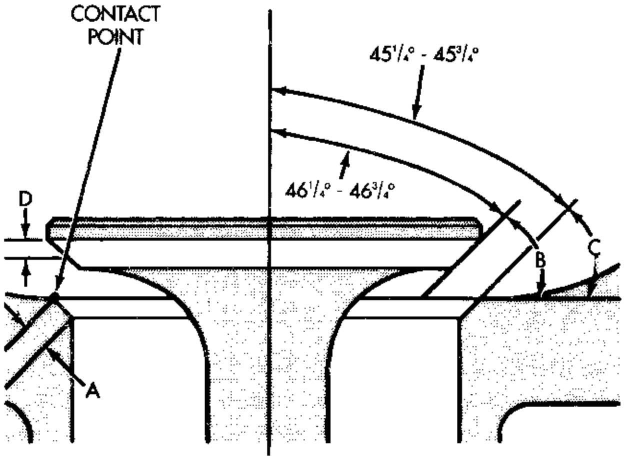

Fig. 52 Valve Face and Seat Angles

VALVES

Inspect the remaining margin after the valves are refaced (Fig. 53). Valves with less than 1.190 mm (0.047 inch) margin should be discarded.

VALVE SEATS

CAUTION: DO NOT un-shroud valves during valve seat refacing (Fig. 54).

(1) When refacing valve seats, it is important that the correct size valve guide pilot be used for reseating stones. A true and complete surface must be obtained.

(2) Measure the concentricity of valve seat using a dial indicator. Total runout should not exceed 0.051 mm (0.002 inch) total indicator reading.

(3) Inspect the valve seat with Prussian blue to determine where the valve contacts the seat. To do this, coat valve seat **LIGHTLY**with Prussian blue then set valve in place. Rotate the valve with light pressure. If the blue is transferred to the center of valve face, contact is satisfactory. If the blue is transferred to the top edge of valve face, lower valve seat with a 15° stone. If the blue is transferred to bottom edge of valve face raise valve seat with a 60° stone.

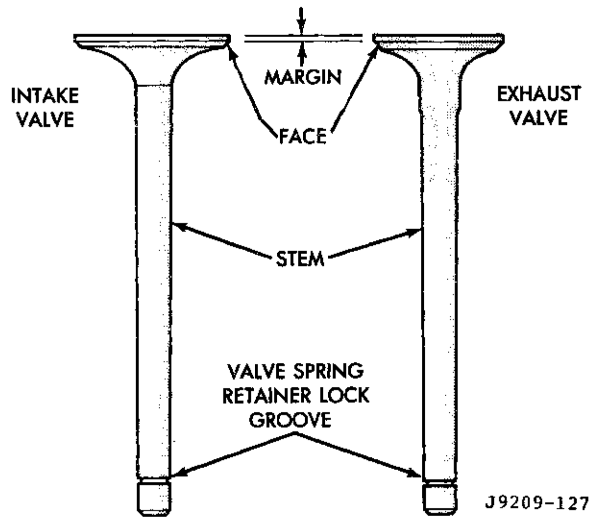

Fig. 53 Intake and Exhaust Valves

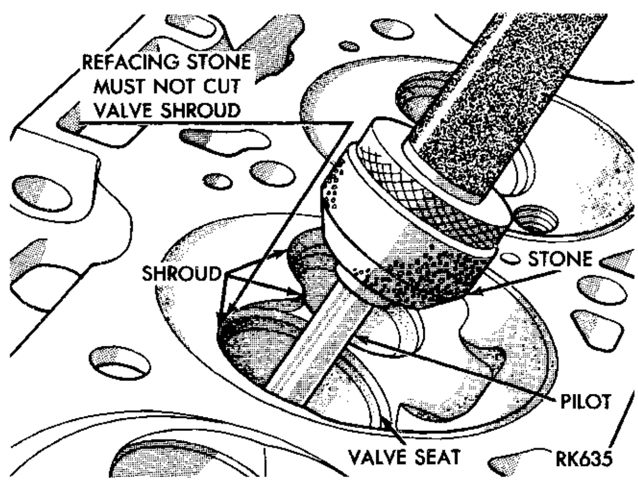

Fig. 54 Refacing Valve Seats

(4) When seat is properly positioned the width of intake seats should be 1.016-1.524 mm (0.040-0.060 inch). The width of the exhaust seats should be 1.524-2.032 mm (0.060-0.080 inch).

VALVE SPRING INSPECTION

Whenever valves have been removed for inspection, reconditioning or replacement, valve springs should be tested. As an example the compression length of the spring to be tested is 1-5/16 inch. Turn table of Universal Valve Spring Tester Tool until surface is in line with the 1-5/16 inch mark on the threaded stud. Be sure the zero mark is to the front (Fig. 55). Place spring over stud on the table and lift compressing lever to set tone device. Pull on torque wrench until ping is heard. Take reading on torque wrench at this

DISASSEMBLY AND ASSEMBLY (Continued)

instant. Multiply this reading by 2. This will give the spring load at test length. Fractional measurements are indicated on the table for finer adjustments. Refer to specifications to obtain specified height and allowable tensions. Discard the springs that do not meet specifications.

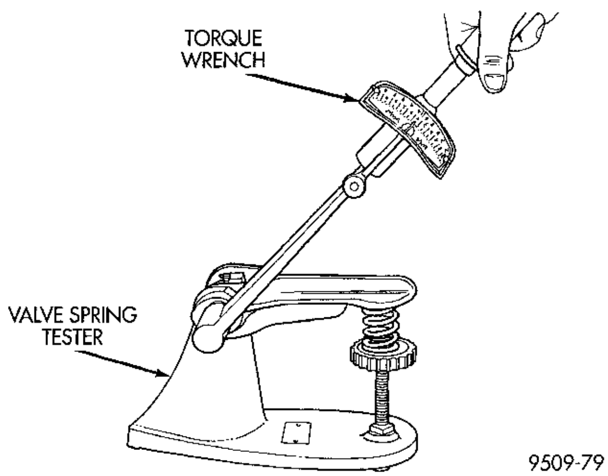

Fig. 55 Testing Valve Spring for Compressed Length

OIL PUMP

DISASSEMBLE

(1) Remove the relief valve as follows:

(a) Remove cotter pin. Drill a 3.175 mm (1/8 inch) hole into the relief valve retainer cap and insert a self-threading sheet metal screw.

(b) Clamp screw into a vise and while supporting oil pump, remove cap by tapping pump body using a soft hammer. Discard retainer cap and remove spring and relief valve (Fig. 56).

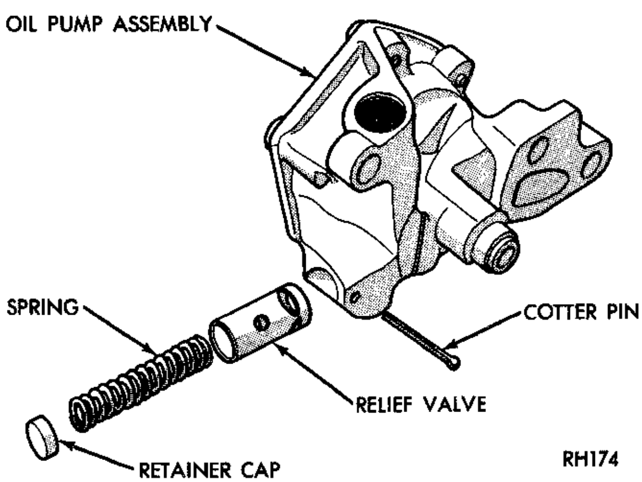

Fig. 56 Oil Pressure Relief Valve

(2) Remove oil pump cover (Fig. 57).

(3) Remove pump outer rotor and inner rotor with shaft (Fig. 57).

(4) Wash all parts in a suitable solvent and inspect carefully for damage or wear.

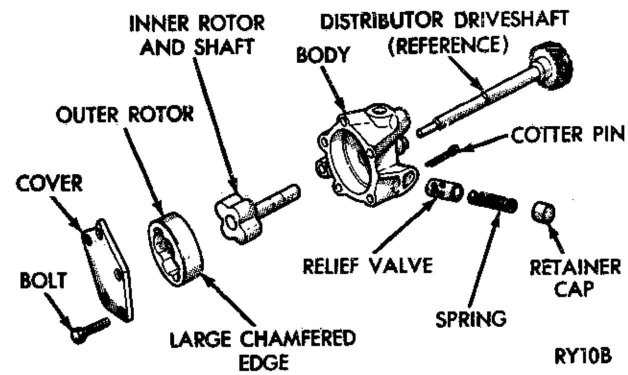

Fig. 57 Oil Pump

ASSEMBLE

(1) Install pump rotors and shaft, using new parts as required.

(2) Position the oil pump cover onto the pump body. Tighten cover bolts to 11 N·m (95 in. lbs.) torque.

(3) Install the relief valve and spring. Insert the cotter pin.

(4) Tap on a new retainer cap.

(5) Prime oil pump before installation by filling rotor cavity with engine oil.

CLEANING AND INSPECTION

CYLINDER HEAD ASSEMBLY

CLEANING

Clean all surfaces of cylinder block and cylinder heads.

Clean cylinder block front and rear gasket surfaces using a suitable solvent.

INSPECTION

Inspect all surfaces with a straightedge if there is any reason to suspect leakage. If out-of-flatness exceeds 0.00075 mm/mm (0.00075 inch/inch) times the span length in inches in any direction, either replace head or lightly machine the head surface.

FOR EXAMPLE: A 305 mm (12 inch) span is 0.102 mm (0.004 inch) out-of-flat. The allowable out-of-flat is 305 X 0.00075 (12 X 0.00075) equals 0.23 mm (0.009 inch). This amount of out-of-flat is acceptable.

The cylinder head surface finish should be 1.78-3.00 microns (70-125 microinches).

CLEANING AND INSPECTION (Continued)

PISTON AND CONNECTING ROD ASSEMBLY

INSPECTION

Check the crankshaft connecting rod journal for excessive wear, taper and scoring.

Check the cylinder block bore for out-of-round, taper, scoring and scuffing.

Check the pistons for taper and elliptical shape before they are fitted into the cylinder bore (Fig. 58).

Fig. 58 Piston Measurements

OIL PAN

CLEANING

Clean the block and pan gasket surfaces.

Trim or remove excess sealant film in the rear main cap oil pan gasket groove. **DO NOT remove the sealant inside the rear main cap slots.**

If present, trim excess sealant from inside the engine.

Clean oil pan in solvent and wipe dry with a clean cloth.

Clean oil screen and pipe thoroughly in clean solvent. Inspect condition of screen.

INSPECTION

Inspect oil drain plug and plug hole for stripped or damaged threads. Repair as necessary.

Inspect oil pan mounting flange for bends or distortion. Straighten flange, if necessary.

OIL PUMP

INSPECTION

Mating surface of the oil pump cover should be smooth. Replace pump assembly if cover is scratched or grooved.

Lay a straightedge across the pump cover surface (Fig. 59). If a 0.038 mm (0.0015 inch) feeler gauge can be inserted between cover and straightedge, pump assembly should be replaced.

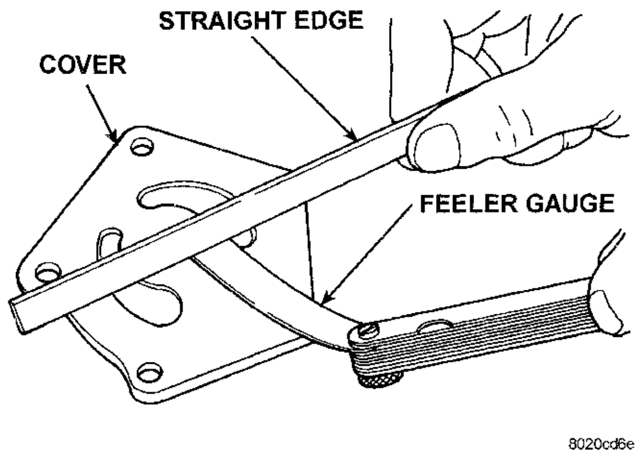

Fig. 59 Checking Oil Pump Cover Flatness

Measure thickness and diameter of OUTER rotor. If outer rotor thickness measures 20.9 mm (0.825 inch) or less or if the diameter is 62.7 mm (2.469 inches) or less, replace outer rotor (Fig. 60).

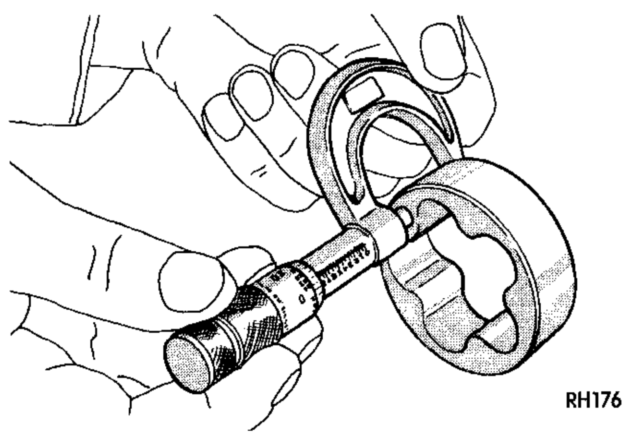

Fig. 60 Measuring Outer Rotor Thickness

If inner rotor measures 20.9 mm (0.825 inch) or less, replace inner rotor and shaft assembly (Fig. 61).

Slide outer rotor into pump body. Press rotor to the side with your fingers and measure clearance between rotor and pump body (Fig. 62). If clearance

CLEANING AND INSPECTION (Continued)

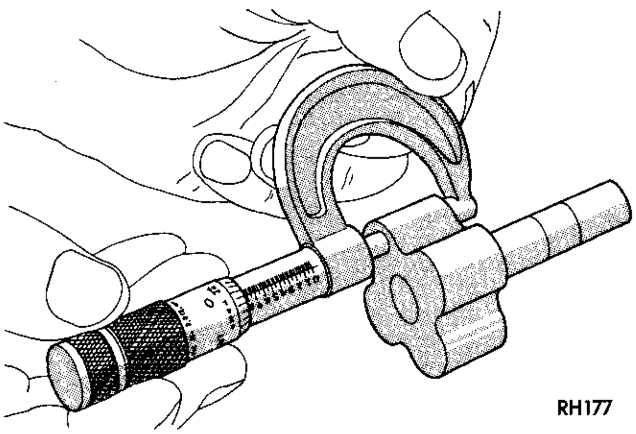

Fig. 61 Measuring Inner Rotor Thickness

is 0.356 mm (0.014 inch) or more, replace oil pump assembly.

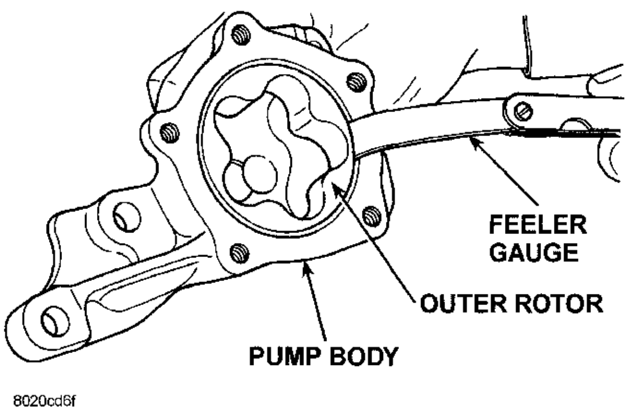

Fig. 62 Measuring Outer Rotor Clearance in Housing

Install inner rotor and shaft into pump body. If clearance between inner and outer rotors is 0.203 mm (0.008 inch) or more, replace shaft and both rotors (Fig. 63).

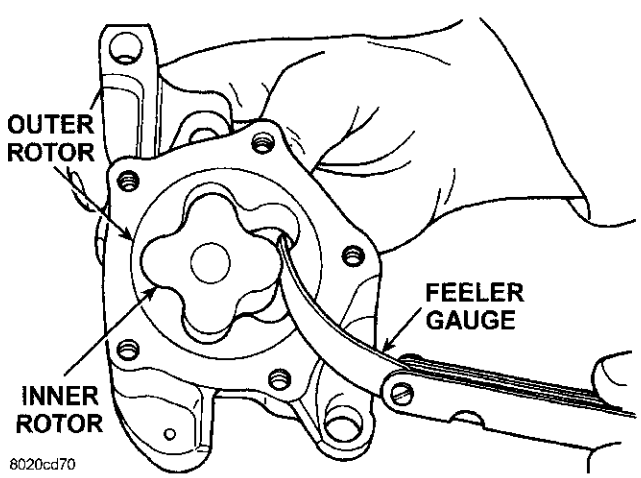

Fig. 63 Measuring Clearance Between Rotors

Place a straightedge across the face of the pump, between bolt holes. If a feeler gauge of 0.102 mm (0.004 inch) or more can be inserted between rotors and the straightedge, replace pump assembly (Fig. 64).

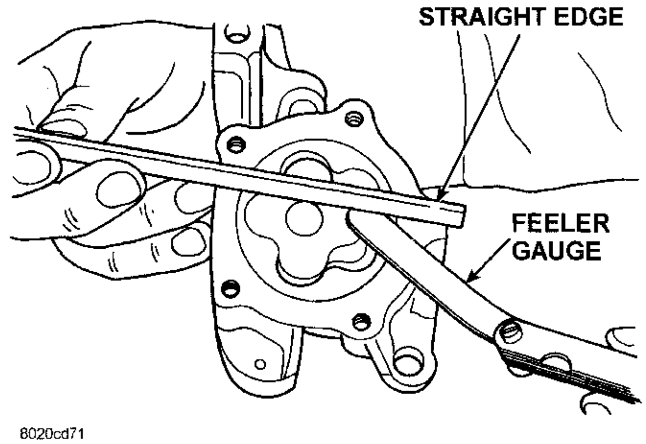

Fig. 64 Measuring Clearance Over Rotors

Inspect oil pressure relief valve plunger for scoring and free operation in its bore. Small marks may be removed with 400-grit wet or dry sandpaper.

The relief valve spring has a free length of approximately 49.5 mm (1.95 inches). The spring should test between 19.5 and 20.5 pounds when compressed to 34 mm (1-11/32 inches). Replace spring that fails to meet these specifications (Fig. 65).

If oil pressure was low and pump is within specifications, inspect for worn engine bearings or other reasons for oil pressure loss.

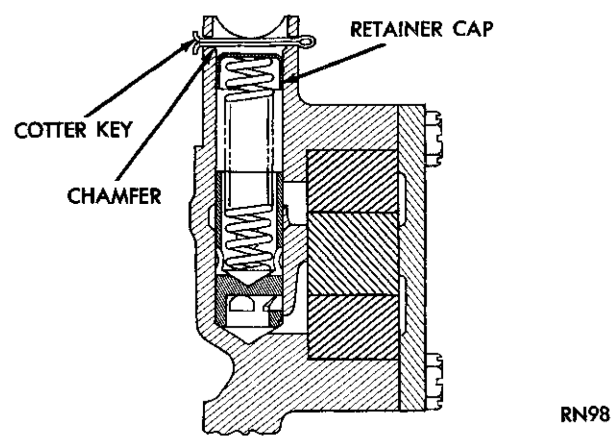

Fig. 65 Proper Installation of Retainer Cap

CYLINDER BLOCK

CLEANING

Clean cylinder block thoroughly and check all core hole plugs for evidence of leaking.

CLEANING AND INSPECTION (Continued)

INSPECTION

Examine block for cracks or fractures.

The cylinder walls should be checked for out-of-round and taper with Cylinder Bore Indicator Tool C-119. The cylinder block should be bored and honed with new pistons and rings fitted if:

• The cylinder bores show more than 0.127 mm (0.005 inch) out-of-round.

• The cylinder bores show a taper of more than 0.254 mm (0.010 inch).

• The cylinder walls are badly scuffed or scored.

Boring and honing operation should be closely coordinated with the fitting of pistons and rings so specified clearances may be maintained.

Refer to Standard Service Procedures in the beginning of this Group for the proper honing of cylinder bores.

8.0L ENGINE

INDEX

DESCRIPTION AND OPERATION

ENGINE DESCRIPTION/IDENTIFICATION

The 8.0 Liter (488 CID) ten-cylinder engine is a V-Type lightweight, single cam, overhead valve engine with hydraulic roller tappets. This engine is designed for unleaded fuel.

Engine lubrication system consists of a gerotor type oil pump mounted in the timing chain cover and driven by the crankshaft. The V-10 uses a full flow oil filter.

The cylinders are numbered from front to rear; 1, 3, 5, 7, 9 on the left bank and 2, 4, 6, 8, 10 on the right bank. The firing order is 1-10-9-4-3-6-5-8-7-2 (Fig. 1).

AUTHENTIC RESTORATION PRODUCT

DESCRIPTION AND OPERATION (Continued)

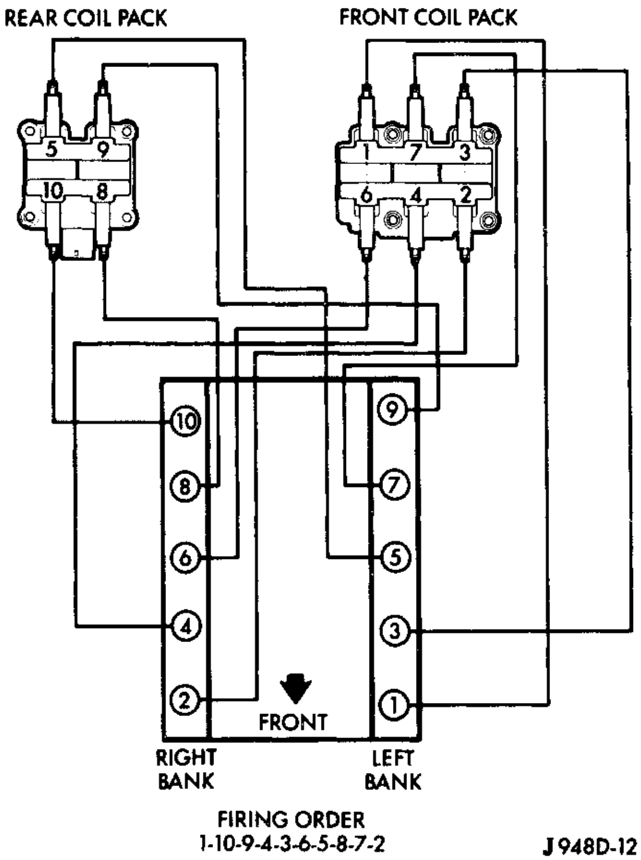

Fig. 1 Firing Order

The engine serial number is located on the lower left front of the cylinder block in front of the engine mount (Fig. 2). When component part replacement is necessary, use the engine type and serial number for reference.

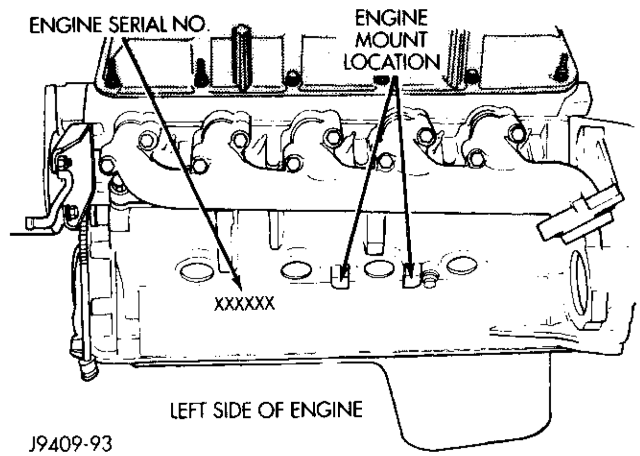

Fig. 2 Engine Identification

LUBRICATION SYSTEM

The lubrication system is a full flow filtration pressure feed type. Oil stored in the oil pan is taken in and discharged by an internal gear pump directly coupled to the crankshaft. Its pressure is regulated by the relief valve located in the chain case cover. The oil is pump through an oil filter and feeds three main oil gallery. This oil gallery feeds oil under pressure to the main and rod bearings and camshaft bearings. Passages in the cylinder block feed oil to the hydraulic lifters through hollow push rods which feeds the rocker arm sockets.

DESCRIPTION AND OPERATION (Continued)

ENGINE COMPONENTS

CYLINDER HEAD COVER

Die-cast magnesium cylinder head covers reduce noise and provide a good sealing surface. A steel backed silicon gasket is used with the cylinder head cover. This gasket can be used again.

CYLINDER HEADS

The alloy cast iron cylinder heads (Fig. 4) are held in place by 12 bolts. The spark plugs are located in the peak of the wedge between the valves.

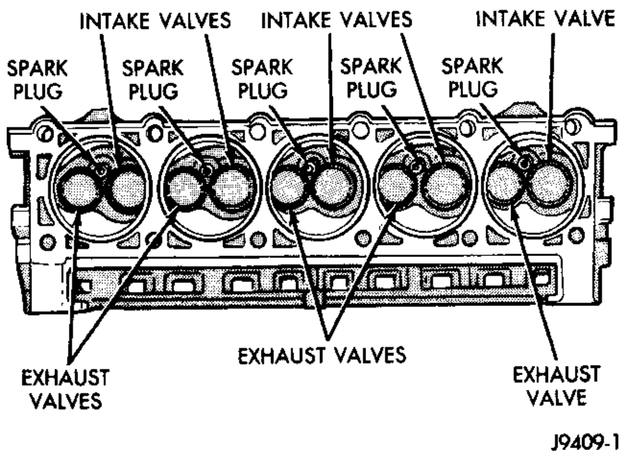

Fig. 4 Cylinder Head Assembly

VALVES AND VALVE SPRINGS

The valves are arranged in-line and inclined 18°. The rocker pivot support and the valve guides are cast integral with the heads.

PISTON AND CONNECTING ROD ASSEMBLY

The pistons are elliptically turned so that the diameter at the pin boss is less than its diameter across the thrust face. This allows for expansion under normal operating conditions. Under operating temperatures, expansion forces the pin bosses away from each other, causing the piston to assume a more nearly round shape.

All pistons are machined to the same weight, regardless of size, to maintain piston balance.

The piston pin rotates in the piston only and is retained by the press interference fit of the piston pin in the connecting rod.

The pistons have a unique dry-film lubricant coating baked onto the skirts to reduce friction. The lubricant is particularly effective during engine break-in, but with time, the material becomes embedded into cylinder bore walls and continues to reduce friction.

SERVICE PROCEDURES

VALVE TIMING

(1) Turn crankshaft until the No.6 exhaust valve is closing and No.6 intake valve is opening.

(2) Insert a 6.350 mm (1/4 inch) spacer between rocker arm pad and stem tip of No.1 intake valve. Allow spring load to bleed tappet down giving in effect a solid tappet.

(3) Install a dial indicator so plunger contacts valve spring retainer as nearly perpendicular as possible. Zero the indicator.

(4) Rotate the crankshaft clockwise (normal running direction) until the valve has lifted 0.863 mm (0.034 inch). The timing of the crankshaft should now read from 10° before top dead center to 2° after top dead center. Use a protractor as there are no timing marks on the engine.

CAUTION: DO NOT turn crankshaft any further clockwise as valve spring might bottom and result in serious damage.

(5) If reading is not within specified limits:
- (a) Check sprocket index marks.
- (b) Inspect timing chain for wear.
- (c) Check accuracy of TDC mark on timing indicator.

MEASURING TIMING CHAIN STRETCH

(1) Place a scale next to the timing chain so that any movement of the chain may be measured.

(2) Place a torque wrench and socket over camshaft sprocket attaching bolt. Apply torque in the direction of crankshaft rotation to take up slack; 41 N·m (30 ft. lbs.) torque with cylinder head installed or 20 N·m (15 ft. lbs.) torque with cylinder head removed. With a torque applied to the camshaft sprocket bolt, crankshaft should not be permitted to move. It may be necessary to block the crankshaft to prevent rotation.

(3) Hold a scale with dimensional reading even with the edge of a chain link. With cylinder heads installed, apply 14 N·m (30 ft. lbs.) torque in the reverse direction. With the cylinder heads removed, apply 20 N·m (15 ft. lbs.) torque in the reverse direction. Note the amount of chain movement (Fig. 5).

(4) Install a new timing chain, if its movement exceeds 3.175 mm (1/8 inch).

FITTING PISTONS

Piston and cylinder wall must be clean and dry. Specified clearance between the piston and the cylinder wall is 0.013-0.038 mm (0.0005-0.0015 inch). The max. allowable clearance is 0.0762 mm (0.003 in.).

Piston diameter should be measured at the top of skirt, 90° to piston pin axis. Cylinder bores should be

SERVICE PROCEDURES (Continued)

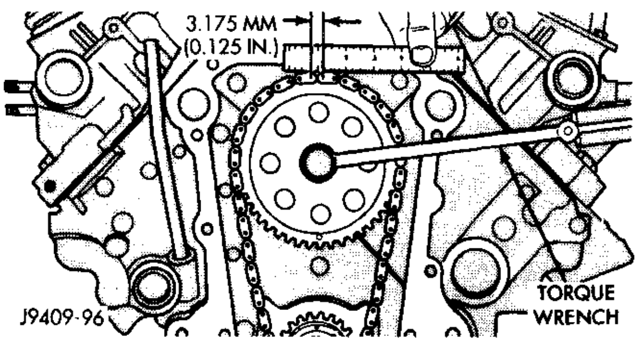

Fig. 5 Measuring Timing Chain Wear and Stretch

measured halfway down the cylinder bore and transverse to the engine crankshaft center line.

Pistons and cylinder bores should be measured at normal room temperature, 21°C (70°F).

(1) To correctly select the proper size piston, a cylinder bore gauge, capable of reading in .0001″ INCREMENTS is required (Fig. 6). If a bore gauge is not available, do not use an inside micrometer.

(2) The coating material is applied to the piston after the final piston machining process. Measuring the outside diameter of a coated piston will not provide accurate results. Therefore measuring the inside diameter of the cylinder bore with a dial Bore Gauge is **MANDATORY.**. To correctly select the proper size piston, a cylinder bore gauge capable of reading in .0001″ increments is required.

(3) Piston installation into the cylinder bore require slightly more pressure than that required for non-coated pistons. The bonded coating on the piston will give the appearance of a line-to-line fit with the cylinder bore.

FITTING RINGS

(1) Measurement of end gaps:

(a) Measure piston ring gap 2 inches from bottom of cylinder bore. An inverted piston can be used to push the rings down to ensure positioning rings squarely in the cylinder bore before measuring.

(b) Insert feeler stock in the gap. Gap for compression rings should be between 0.254-0.508 mm (0.010-0.020 inch). The oil ring gap should be 0.381- 1.397 mm (0.015-0.055 inch).

(c) Rings with insufficient end gap may be properly filed to the correct dimension. Ends should be stoned smooth after filing with Arkansas White Stone. Rings with excess gaps should not be used.

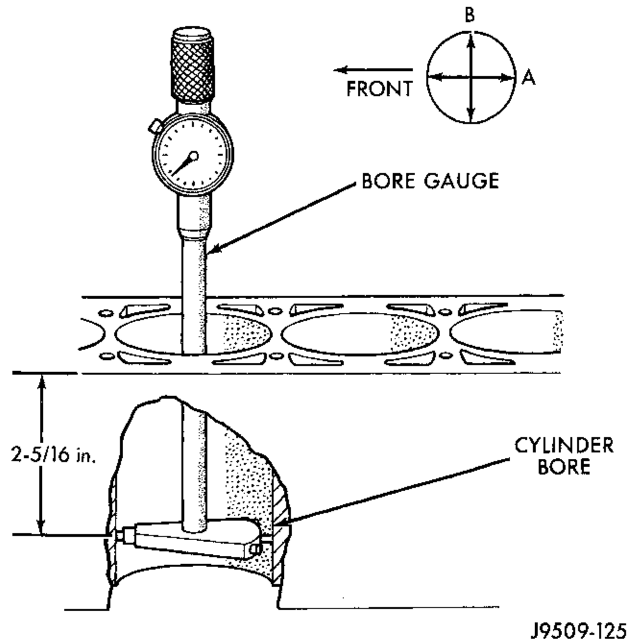

Fig. 6 Bore Gauge

(2) Install rings and confirm ring side clearance:

(a) Install oil rings being careful not to nick or scratch the piston. Install the oil control rings according to instructions in the package. It is not necessary to use a tool to install the upper and lower rails. Insert oil rail spacer first, then side rails.

(b) Install the second compression rings using Installation Tool C-4184. The compression rings must be installed with the identification mark face up (toward top of piston) and chamfer facing down. An identification mark on the ring is a drill point, a stamped letter O, an oval depression or the word TOP (Fig. 7) (Fig. 9).

(c) Using a ring installer, install the top compression ring with the chamfer facing up (Fig. 9). An identification mark on the ring is a drill point, a stamped letter O, an oval depression or the word TOP facing up.

(d) Measure side clearance between piston ring and ring land. Clearance should be 0.074-0.097 mm (0.0029-0.0038 inch) for the compression rings. The steel rail oil ring should be free in groove, but should not exceed 0.246 mm (0.0097 inch) side clearance.

(e) Pistons with insufficient or excessive side clearance should be replaced.

(3) Arrange ring gaps 180° apart as shown in (Fig. 10).

SERVICE PROCEDURES (Continued)

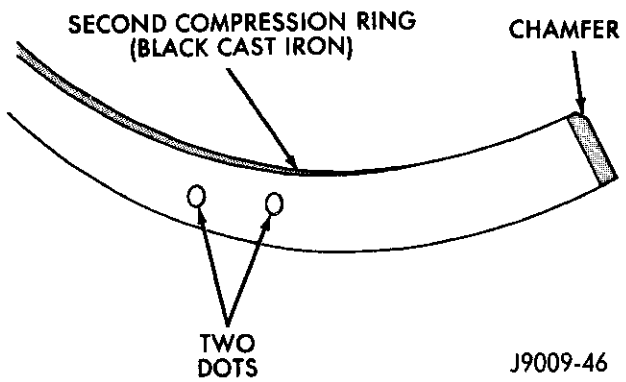

Fig. 7 Second Compression Ring Identification—Typical

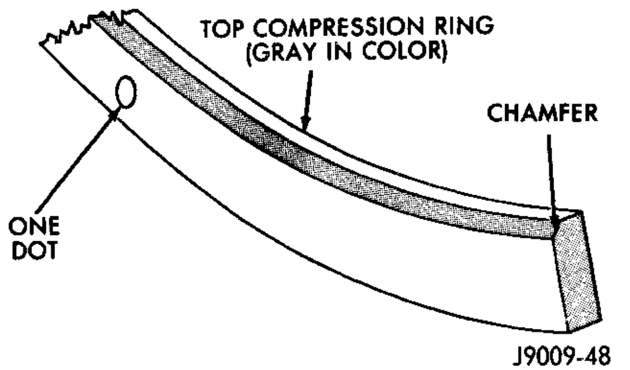

Fig. 8 Top Compression Ring Identification—Typical

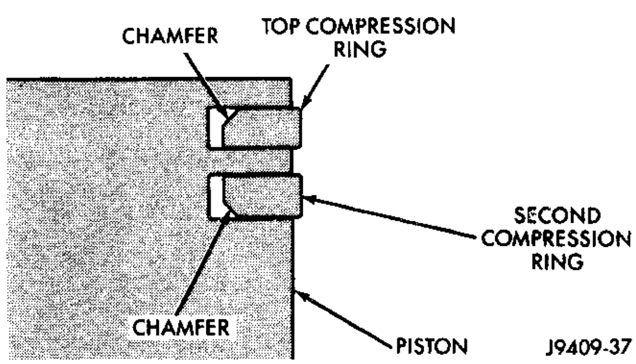

Fig. 9 Compression Ring Chamfer Location—Typical

FITTING CONNECTING ROD BEARINGS

Fit all rods on a bank until completed. DO NOT alternate from one bank to another, because connecting rods and pistons are not interchangeable from one bank to another.

The bearing caps are not interchangeable and should be marked at removal to ensure correct assembly.

Each bearing cap has a small V-groove across the parting face. When installing the lower bearing shell, make certain that the V-groove in the shell is in line with the V-groove in the cap. This provides lubrication of the cylinder wall in the opposite bank.

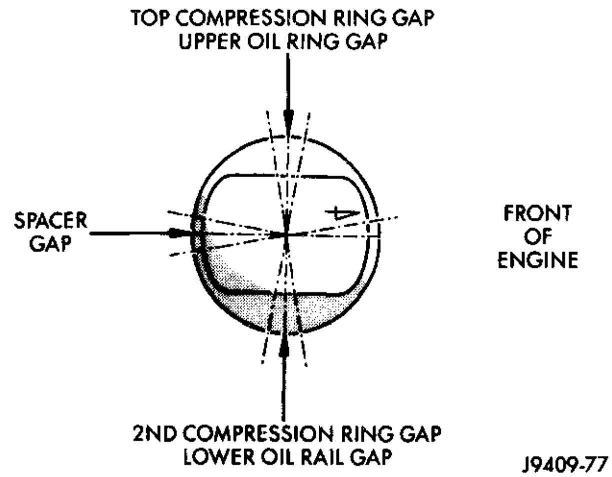

Fig. 10 Proper Ring Installation

The bearing shells must be installed so that the tangs are in the machined grooves in the rods and caps.

Limits of taper or out-of-round on any crankshaft journals should be held to 0.025 mm (0.001 inch). Bearings are available in 0.025 mm (0.001 inch), 0.051 mm (0.002 inch), 0.076 mm (0.003 inch), 0.254 mm (0.010 inch) and 0.305 mm (0.012 inch) undersize. **Install the bearings in pairs. DO NOT use a new bearing half with an old bearing half. DO NOT file the rods or bearing caps.**

FITTING CRANKSHAFT MAIN BEARINGS

Bearing caps are not interchangeable and should be marked at removal to ensure correct assembly. Upper and lower bearing halves are NOT interchangeable. All lower main bearing halves are interchangeable. Upper main bearing halves of No. 2, 4, and 5 are interchangeable. Upper main bearing halves of No. 1 and 6 are interchangeable, this also applies to the lower bearing halves.

The No.3 main bearing is flanged to carry the crankshaft thrust loads. This bearing is NOT interchangeable with any other bearing halves in the engine. Bearing shells are available in standard and the following undersizes: 0.25 mm (0.001 inch), 0.051 mm (0.002 inch), 0.076 mm (0.003 inch), 0.254 mm (0.010 inch) and 0.305 mm (0.012 inch). Never install an undersize bearing that will reduce clearance below specifications.

CRANKSHAFT SERVICE

The crankshaft connecting rod and main journals should be checked for excessive wear, taper and scoring. The maximum taper or out-of-round on any crankshaft journal is 0.025 mm (0.001 inch).

SERVICE PROCEDURES (Continued)

Journal grinding should not exceed 0.305 mm (0.012 inch) under the standard journal diameter. DO NOT grind thrust faces of No.3 main bearing. DO NOT nick crank pin or bearing fillets. After grinding, remove rough edges from crankshaft oil holes and clean out all oil passages.

CAUTION: After any journal grind, it is important that the final paper or cloth polish be in the same direction as the engine rotates.

REMOVAL AND INSTALLATION

ENGINE MOUNTS—FRONT

REMOVAL

(1) Disconnect the negative cable from the battery.

(2) Position fan to assure clearance for radiator top tank and hose.

CAUTION: DO NOT lift the engine by the intake manifold.

(3) Install engine support/lifting fixture.

(4) Raise vehicle on hoist.

(5) Lift the engine SLIGHTLY and remove the thru-bolt and nut and rubber engine restrictors. (Fig. 11).

(6) Remove engine support bracket/cushion bolts (Fig. 11). Remove the support bracket/cushion and heat shields.

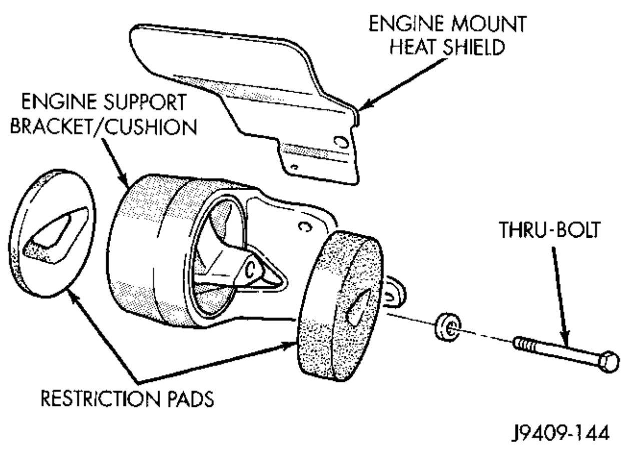

Fig. 11 Engine Mounts—Front

INSTALLATION

(1) With engine raised SLIGHTLY, position the engine support bracket/cushion and heat shields to the block. Install new bolts and tighten to 81 N·m (60 ft. lbs.) torque.

(2) Install the thru-bolt and 2 piece rubber engine rubber restrictors onto the engine support bracket/cushion.

(3) Lower engine with support/lifting fixture while guiding the engine bracket/cushion and thru-bolt into support cushion brackets (Fig. 12).

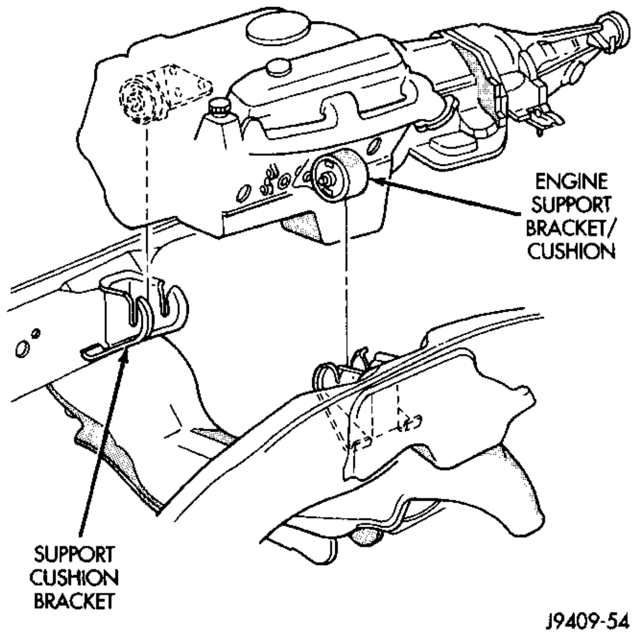

Fig. 12 Positioning Engine Mounts—Front

(4) Install thru-bolt nuts and tighten the nuts to 68 N·m (50 ft. lbs.) torque.

(5) Lower the vehicle.

(6) Remove lifting fixture.

ENGINE MOUNT—REAR

REMOVAL

(1) Raise the vehicle on a hoist.

(2) Position a transmission jack in place.

(3) Remove support cushion stud nuts (Fig. 13).

(4) Raise rear of transmission and engine SLIGHTLY.

(5) Remove the bolts holding the support cushion to the transmission support bracket. Remove the support cushion.

(6) If necessary, remove the bolts holding the transmission support bracket to the transmission.

INSTALLATION

(1) If removed, position the transmission support bracket to the transmission. Install new attaching bolts and tighten to 102 N·m (75 ft. lbs.) torque.

(2) Position support cushion to transmission support bracket. Install stud nuts and tighten to 47 N·m (35 ft. lbs.) torque.

REMOVAL AND INSTALLATION (Continued)

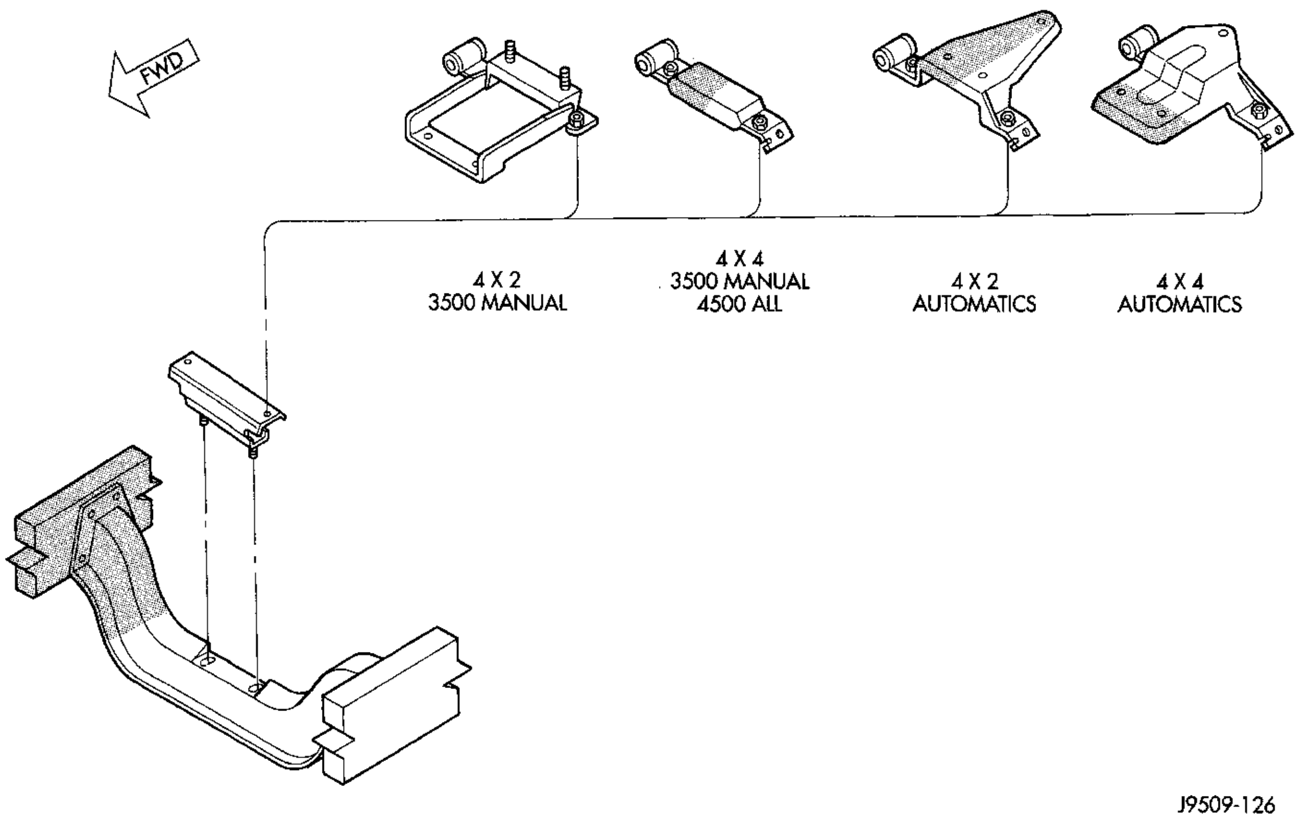

Fig. 13 Engine Rear Support Cushion Assembly

(3) Using the transmission jack, lower the transmission and support cushion onto the crossmember (Fig. 13).

(4) Install the support cushion bolts and tighten to 47 N·m (35 ft. lbs.) torque.

(5) Remove the transmission jack.

(6) Lower the vehicle.

ENGINE ASSEMBLY

REMOVAL

(1) Remove the battery.

(2) Drain cooling system (refer to Group 7, Cooling System for the proper procedure).

(3) Discharge the air conditioning system, if equipped (refer to Group 24, Heating and Air Conditioning for service procedures).

(4) Remove the upper crossmember.

(5) Remove the transmission oil cooler.

(6) Remove the serpentine belt (refer to Group 7, Cooling System).

(7) Remove the A/C compressor with the lines attached. Set aside.

(8) If equipped, remove the condenser.

(9) Remove the washer bottle.

(10) Disconnect the top radiator hose.

(11) Remove the fan.

(12) Remove the fan shroud.

(13) Disconnect the lower radiator hose.

(14) Disconnect the transmission cooler lines.

(15) Remove radiator (refer to Group 7, Cooling System).

(16) Remove the generator with the wire connections (refer to Group 8B, Battery/Starter/Generator Service).

(17) Remove the air cleaner.

(18) Disconnect the throttle linkage.

(19) Remove throttle body.

(20) Remove the upper intake manifold (refer to Group 11, Exhaust System and Intake Manifold).

(21) Remove the coil assemblies with the ignition cables.

(22) Disconnect the heater hoses.

(23) Disconnect the power steering hoses, if equipped.

(24) Perform the Fuel System Pressure release procedure (refer to Group 14, Fuel System). Disconnect the fuel line.

(25) On Manual Transmission vehicles, remove the shift lever (refer to Group 21, Transmissions).

(26) Raise and support the vehicle on a hoist.

(27) Remove the drain plug and drain the engine oil.

(28) Loosen front engine mount thru-bolt nuts.

REMOVAL AND INSTALLATION (Continued)

(29) Remove the transmission cooler line brackets from oil pan.

(30) Disconnect exhaust pipe at manifold (refer to Group 11, Exhaust System and Intake Manifold).

(31) Disconnect the starter wires. Remove starter motor (refer to Group 8B, Battery/Starter/Generator Service).

(32) Refer to Group 21, Transmissions for transmission removal.

(33) Lower vehicle.

CAUTION: DO NOT lift the engine by the intake manifold.

(34) Install an engine lifting fixture.

(35) Remove engine from vehicle and install engine assembly on a repair stand.

INSTALLATION

(1) Remove engine from the repair stand and position in the engine compartment. Position the thru-bolt into the support cushion brackets.

(2) Install an engine support fixture.

(3) Raise and support the vehicle on a hoist.

(4) Refer to Group 21, Transmissions for transmission installation.

(5) Install the prop shaft (refer to Group 16, Propeller Shaft).

(6) Install the starter and connect the starter wires (refer to Group 8B, Battery/Starter/Generator Service).

(7) Install exhaust pipe to manifold (refer to Group 11, Exhaust System and Intake Manifold).

(8) Install the transmission cooler line brackets from oil pan.

(9) Tighten the Front mount thru-bolts and nuts to 102N·m (75 ft. lbs.).

(10) Install the drain plug and tighten to 34 N·m (25 ft. lbs.) torque.

(11) Prime oil pump by squirting oil in the oil filter mounting hole and filling the J-trap of the front timing cover. When oil is running out, install oil filter that has been filled with oil.

(12) Lower the vehicle.

(13) Remove engine lifting fixture.

(14) On Manual Transmission vehicles, install the shift lever (refer to Group 21, Transmissions).

(15) Connect the fuel lines.

(16) Connect the heater hoses.

(17) Install the upper intake manifold (refer to Group 11, Exhaust System and Intake Manifold).

(18) Install the coil assemblies with the ignition cables.

(19) Using a new gasket, install throttle body. Tighten the throttle body nuts to 23 N·m (200 in. lbs.) torque.

(20) Connect the throttle linkage.

(21) Install the air cleaner box.

(22) Install the generator and wire connections (refer to Group 8B, Battery/Starter/Generator Service).

(23) Install the upper crossmember.

(24) Install radiator (refer to Group 7, Cooling System).

(25) Connect the lower radiator hose.

(26) Install the transmission oil cooler.

(27) Connect the transmission cooler lines.

(28) Connect the power steering hoses, if equipped.

(29) Install the fan shroud.

(30) Install the fan.

(31) Connect the top radiator hose.

(32) Install the washer bottle.

(33) If equipped, install the condenser.

(34) Install the A/C compressor with the lines attached.

(35) Install the serpentine belt (refer to Group 7, Cooling System).

(36) Evacuate and charge the air conditioning system, if equipped (refer to Group 24, Heating and Air Conditioning for service procedures).

(37) Add coolant to the cooling system (refer to Group 7, Cooling System for the proper procedure).

(38) Install the battery.

(39) Warm engine and adjust.

(40) Road test vehicle.

CYLINDER HEAD COVER

Die-cast magnesium cylinder head covers (Fig. 14) reduce noise and provide a good sealing surface. A steel backed silicon gasket is used with the cylinder head cover (Fig. 15).

REMOVAL

(1) Disconnect the negative cable from the battery.

(2) Disconnect closed ventilation system and evaporation control system from cylinder head cover. Identify each system for installation.

(3) Remove the upper intake manifold to remove the right side head cover (refer to Group 11, Exhaust System and Intake Manifold).

(4) Remove cylinder head cover bolts and stud bolts. Remove the covers and gaskets. The gasket may be used again.

INSTALLATION

(1) Clean cylinder head cover gasket surface.

(2) Clean head rail, if necessary.

(3) Check the gasket for use in head cover installation. If damaged, use a new gasket.

(4) Install the gasket onto the head rail. **For the left side the number tab is at the front of engine with the number up. For the right side the number tab is at the rear of engine with the number up.**

REMOVAL AND INSTALLATION (Continued)

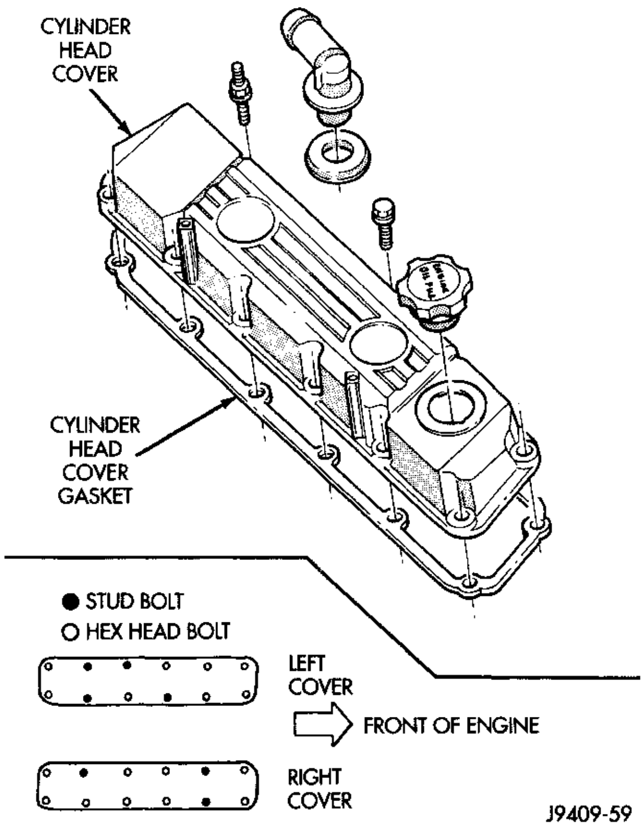

Fig. 14 Cylinder Head Covers

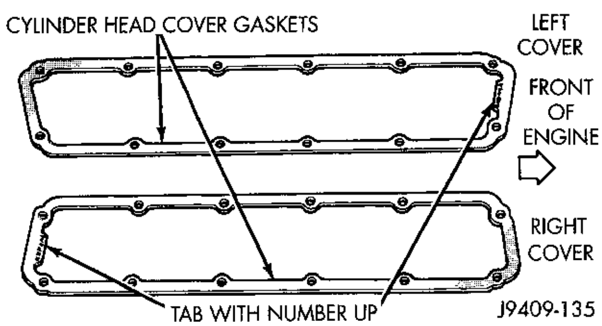

Fig. 15 Cylinder Head Cover Gaskets

CAUTION: The cylinder head cover fasteners have a special plating. DO NOT use alternative fasteners.

(5) Position the cylinder head cover onto the gasket. Install the stud bolts and hex head bolts in the proper positions (Fig. 14). Tighten the stud bolts and the bolts to 16 N·m (144 in. lbs.) torque.

(6) If removed, install the upper intake manifold (refer to Group 11, Exhaust System and Intake Manifold).

(7) Install closed crankcase ventilation system and evaporation control system onto the proper head cover. DO NOT switch the systems.

(8) Connect the negative cable to the battery.

ROCKER ARMS AND PUSH RODS

REMOVAL

(1) Disconnect spark plug wires by pulling the boot straight out in line with plug.

(2) Remove cylinder head cover and gasket.

(3) Remove the rocker arm bolts and the rocker arm assembly (Fig. 16). Place rocker arm assemblies on a bench in the same order as removed.

(4) Remove the push rods and place them on a bench in the same order as removed.

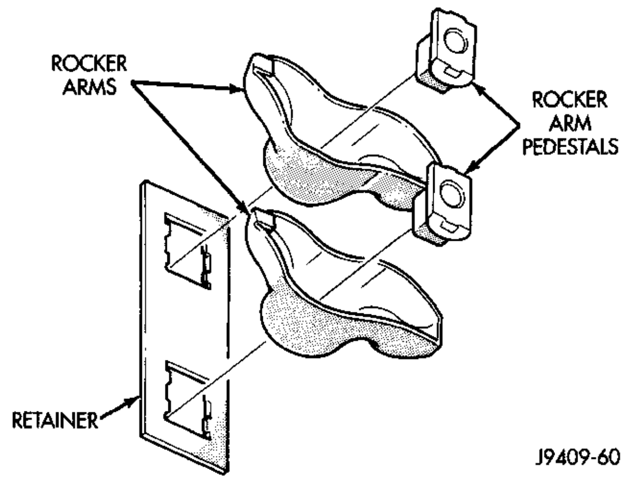

Fig. 16 Rocker Arm Assembly

INSTALLATION

CAUTION: DO NOT rotate or crank the engine during or immediately after rocker arm installation. Allow the hydraulic roller tappets adequate time to bleed down (about 5 minutes).

(1) Install the push rods in the same order as removed.

(2) Install rocker arm assemblies in the same order as removed. Tighten the rocker arm bolts to 28 N·m (21 ft. lbs.) torque.

(3) Install cylinder head cover and gasket. DO NOT use alternative fasteners.

(4) Connect spark plug wires.

VALVE STEM SEAL AND SPRING REPLACEMENT

This procedure is done with the cylinder head installed.

(1) Disconnect the negative cable from the battery.

(2) Set engine basic timing to Top Dead Center (TDC) and remove air cleaner.

(3) Remove cylinder head covers and spark plugs.

(4) Using suitable socket and flex handle at crankshaft retaining bolt, turn engine so the No.1 piston is at TDC on the compression stroke.

(5) Remove rocker arms.

REMOVAL AND INSTALLATION (Continued)

(6) With air hose attached to an adapter installed in No.1 spark plug hole, apply 620-689 kPa (90-100 psi) air pressure.

(7) Using Valve Spring Compressor Tool MD-998772A with adapter 6716A, compress valve spring and remove retainer valve locks and valve spring.

(8) Install seals on the exhaust valve stem and position down against valve guides. The exhaust valve stem seal is brown.

(9) The black intake valve stem seals should be pushed firmly and squarely over the valve guide using the valve stem as a guide. DO NOT force seal against top of guide. When installing the valve retainer locks, compress the spring only enough to install the locks.

(10) Follow the same procedure on the remaining 9 cylinders using the firing sequence 1-10-9-4-3-6-5-8-7-2. Make sure piston in cylinder is at TDC on the valve spring that is being removed.

(11) Remove adapter from the No.1 spark plug hole.

(12) Install rocker arms.

(13) The cylinder head cover gasket can be used again. Install the gasket onto the head rail. **For the left side the number tab is at the front of engine with the number up. For the right side the number tab is at the rear of engine with the number up.**

CAUTION: The cylinder head cover fasteners have a special plating. DO NOT use alternative fasteners.

(14) Position the cylinder head cover onto the gasket. Install the stud bolts and hex head bolts in the proper positions (Fig. 17). Tighten the stud bolts and the bolts to 16 N·m (144 in. lbs.) torque.

(15) Install closed crankcase ventilation system.

(16) Connect the evaporation control system.

(17) Install air cleaner.

(18) Connect the negative cable to the battery.

(19) Road test vehicle and check for leaks.

CYLINDER HEADS

REMOVAL

(1) Disconnect the negative cable from the battery.

(2) Drain cooling system (refer to Group 7, Cooling System for the proper procedures).

(3) Remove the heat shields (Fig. 18).

(4) Remove the intake manifold-to-generator bracket support rod. Remove the generator.

(5) Remove closed crankcase ventilation system.

(6) Disconnect the evaporation control system.

(7) Remove the air cleaner.

(8) Perform the Fuel System Pressure release procedure (refer to Group 14, Fuel System). Disconnect the fuel line.

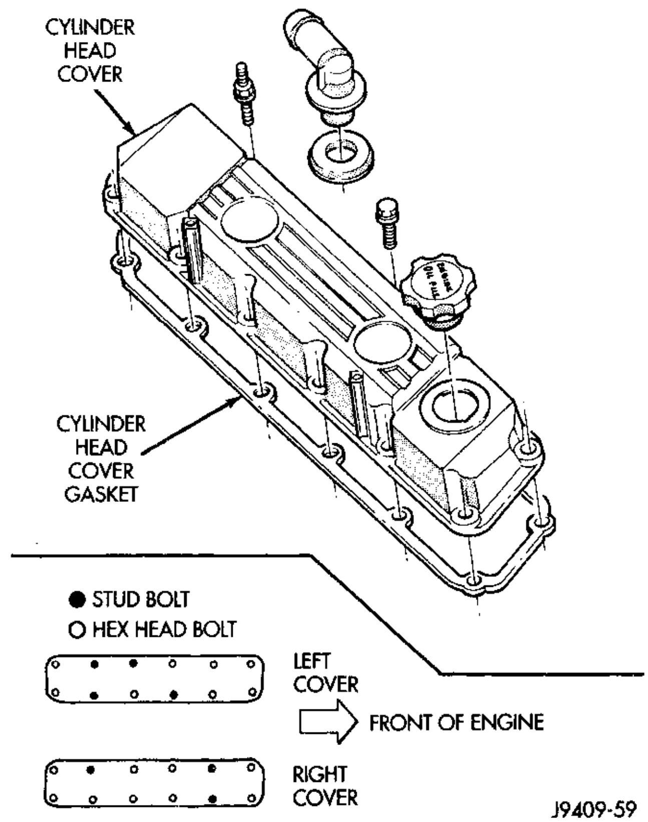

Fig. 17 Cylinder Head Covers

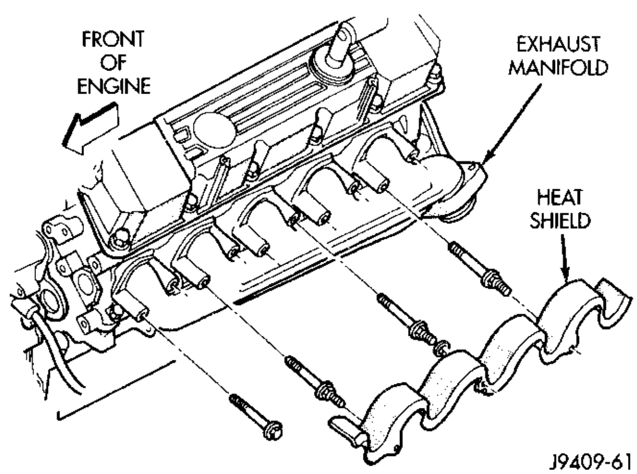

Fig. 18 Spark Plug Wire Heat Shields (Left Side Shown)

(9) Disconnect accelerator linkage and if so equipped, the speed control and transmission kick-down cables.

(10) Remove coil pack and bracket (Fig. 19).

(11) Disconnect the coil wires.

(12) Disconnect heat indicator sending unit wire.

(13) Disconnect heater hoses and bypass hose.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

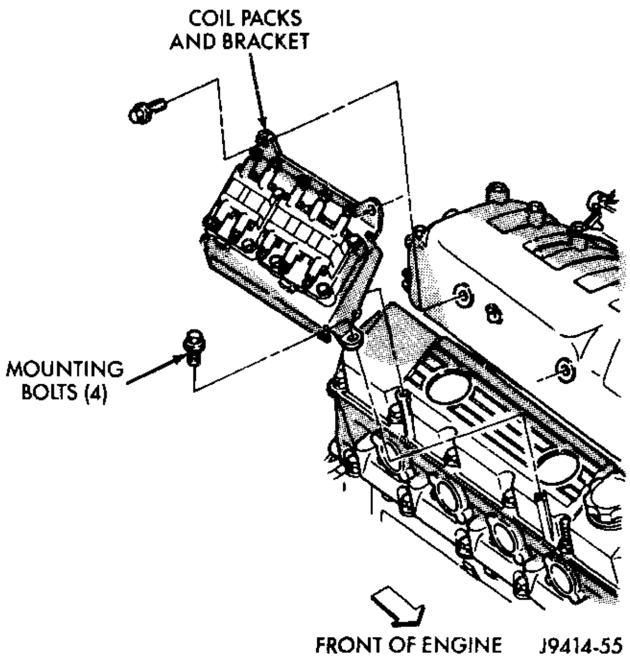

Fig. 19 Coil Pack and Bracket

(14) Remove upper intake manifold and throttle body as an assembly.

(15) Remove cylinder head covers and gaskets.

(16) Remove the EGR tube. Discard the gasket, for right side only.

(17) Remove lower intake manifold. Discard the flange side gaskets and the front and rear cross-over gaskets.

(18) Disconnect exhaust pipe from exhaust manifold (refer to Group 11, Exhaust System and Intake Manifold).

(19) Remove exhaust manifolds and gaskets (refer to Group 11, Exhaust System and Intake Manifold).

(20) Remove rocker arm assemblies and push rods. Identify to ensure installation in original locations.

(21) Remove the head bolts from each cylinder head and remove cylinder heads. Discard the cylinder head gasket.

(22) Remove spark plugs.

INSTALLATION

(1) Position the new cylinder head gaskets onto the cylinder block.

(2) Position the cylinder heads onto head gaskets and cylinder block.

(3) Tighten the cylinder head bolts in two steps (Fig. 20):

• Step 1—Tighten all cylinder head bolts, in sequence, to 58 N·m (43 ft. lbs.) torque.

• Step 2—Tighten all cylinder head bolts, in sequence, to 143 N·m (105 ft. lbs.) torque.

CAUTION: When tightening the rocker arm bolts, make sure the piston in that cylinder is NOT at TDC. Contact between the valves and piston could occur.

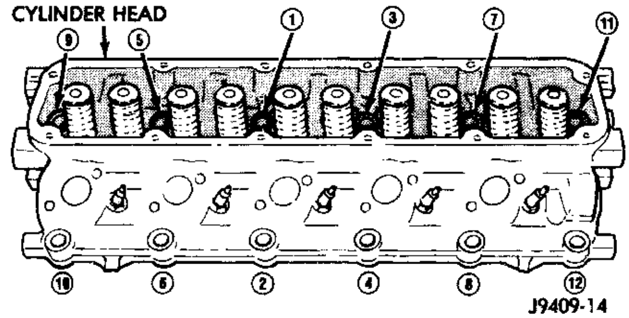

Fig. 20 Cylinder Head Bolt Tightening Sequence

(4) Install push rods and rocker arm assemblies in their original position. Tighten the bolts to 28 N·m (21 ft. lbs.) torque.

(5) Install the side intake manifold gaskets. Be sure that the locator dowels are positioned in the head (Fig. 21).

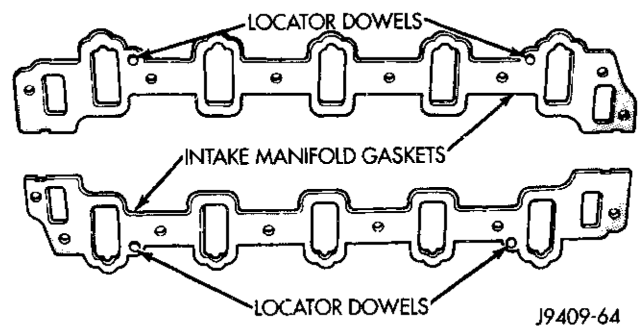

Fig. 21 Intake Manifold Flange Gasket Alignment

(6) Peel off the protective paper (blue - rear and brown - front) and press firmly onto the block (Fig. 22). **BE SURE THE BLOCK IS OIL FREE.** Aligning slots in end seals with notches in intake manifold gaskets.

(7) Insert Mopar® Silicone Rubber Adhesive Sealant, or equivalent, into the four corner pockets (Fig. 23). **Fill the pocket, but DO NOT overfill.**

(8) The lower intake manifold MUST be installed within 3 minutes of sealant application. Carefully lower intake manifold into position on the cylinder block and cylinder heads. After intake manifold is in place, inspect to make sure seals and gaskets are in place.

(9) Finger start all bolts, alternate one side to the other.

(10) Tighten the lower intake manifold bolts to 54 N·m (40 ft. lbs.) torque.

(11) Using a new gasket, position the upper intake manifold onto the lower intake manifold.

REMOVAL AND INSTALLATION (Continued)

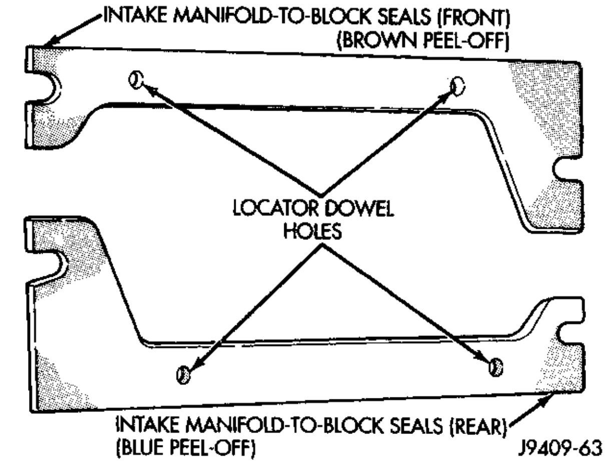

Fig. 22 Intake Manifold-to-Block Seals

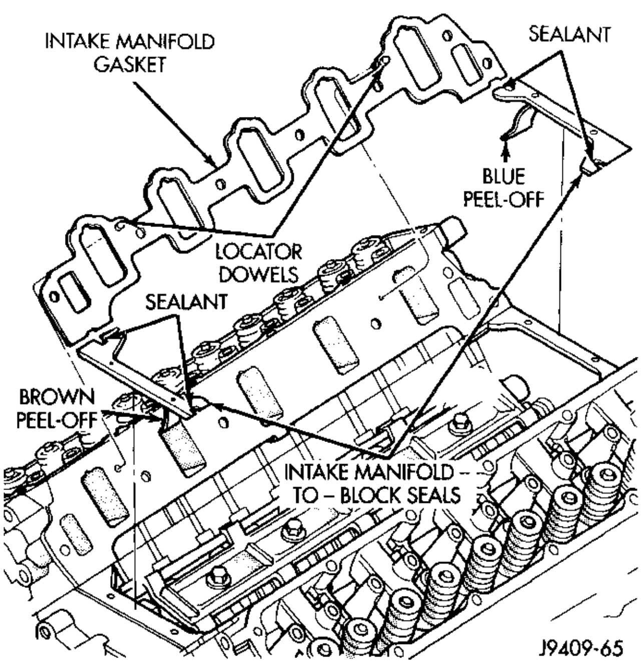

Fig. 23 Mopar® Silicone Rubber Adhesive Sealant Application Locations

(12) Tighten upper intake manifold bolts to 22 N·m (16 ft. lbs.) torque.

(13) Install the exhaust manifolds and new gaskets. Tighten the bolts and stud bolts to 22 N·m (16 ft. lbs.) torque.

(14) Install exhaust pipe to the exhaust manifold. Tighten the bolts to 34 n·m (25 ft. lbs.) torque.

(15) Using a new gasket, position the EGR tube to the intake manifold and the exhaust manifold. Tighten the EGR tube nut to 34 N·m (25 ft. lbs.) torque. Tighten the bolts to 20 N·m (174 in. lbs.) torque.

(16) Install the heat shields and the washers. **Make sure that heat shields tabs hook over the exhaust gasket.** Tighten the nuts to 15 N·m (132 in. lbs.) torque.

(17) Adjust spark plugs to specifications (refer to Group 8D, Ignition System). Install the plugs and tighten to 41 N·m (30 ft. lbs.) torque.

(18) Install coil packs and bracket. Tighten the bracket bolts to 21 N·m (190 in. lbs.) torque. Connect the coil wires.

(19) Connect heat indicator sending unit wire.

(20) Connect the heater hoses and bypass hose.

(21) Connect the accelerator linkage and if so equipped, the speed control and transmission kick-down cables.

(22) Install the fuel line.

(23) Install the generator and drive belt. Tighten generator mounting bolt to 41 N·m (30 ft. lbs.) torque. Tighten the adjusting strap bolt to 23 N·m (200 in. lbs.) torque. Refer to Group 7, Cooling System for adjusting the belt tension.

(24) Install the intake manifold-to-generator bracket support rod. Tighten the bolts to 41 N·m (30 ft. lbs.) torque.

(25) The cylinder head cover gasket can be used again. Install the gasket onto the head rail. **For the left side the number tab is at the front of engine with the number up. For the right side the number tab is at the rear of engine with the number up.**

CAUTION: The cylinder head cover fasteners have a special plating. DO NOT use alternative fasteners.

(26) Position the cylinder head cover onto the gasket. Install the stud bolts and hex head bolts in the proper positions (Fig. 1). Tighten the stud bolts and the bolts to 16 N·m (144 in. lbs.) torque.

(27) Install closed crankcase ventilation system.

(28) Connect the evaporation control system.

(29) Install the air cleaner.

(30) Fill cooling system (refer to Group 7, Cooling System for proper procedure).

(31) Connect the negative cable to the battery.

(32) Check for leaks (fuel, oil, antifreeze, etc.).

VALVES AND VALVE SPRINGS

REMOVAL

(1) Remove the cylinder head.

(2) Special studs must be used to adapt the Valve Spring Compressor Tool to the V-10 cylinder head (Fig. 24). Install the metric end into the Special Tool MD998772A and the 5/16 end into the cylinder head.

(3) Compress valve springs using Valve Spring Compressor Tool MD-998772A with Adapter 6716A and Screw 6765 (Fig. 25). Tap the retainer using a brass drift and ball peen hammer to loosen locks away from retainer.

REMOVAL AND INSTALLATION (Continued)

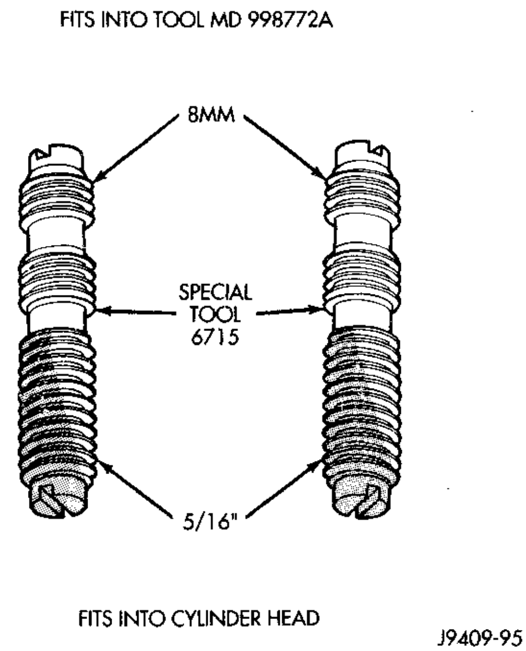

Fig. 24 Special Studs 6715 for V-10 Engine

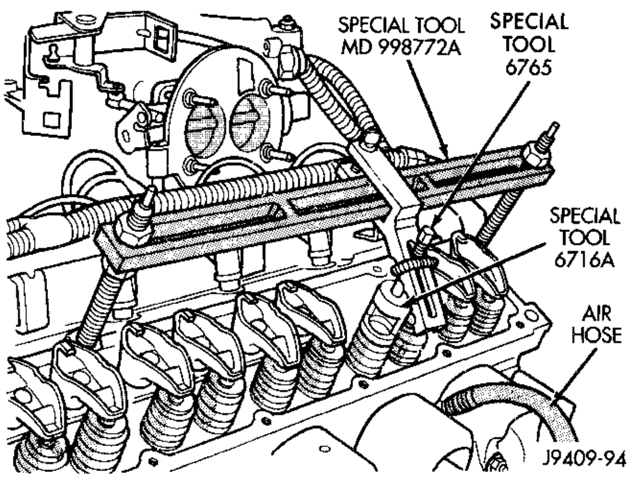

Fig. 25 Valve Spring Compressor MD-998772A with Adaptor 6716-A and Screw 6765

(4) Remove valve retaining locks, valve spring retainers and valve springs. Check for abnormal wear, replace as required.

(5) Remove the valve stem seals.

(6) Before removing valves, remove any burrs from valve stem lock grooves to prevent damage to the valve guides. Identify valves to ensure installation in original location.

INSTALLATION

(1) Clean valves thoroughly. Discard burned, warped and cracked valves.

(2) Remove carbon and varnish deposits from inside of valve guides with a reliable guide cleaner.

(3) Measure valve stems for wear. If wear exceeds 0.051 mm (0.002 inch), replace the valve.

(4) Make sure there are no burrs on valve stems.

(5) Coat valve stems with lubrication oil. Insert valves into valve guides in cylinder head.

(6) Install new seals on all valve guides **(BLACK on intake and BROWN on exhaust)**. Install valve springs and valve retainers.

(7) Compress valve springs with Valve Spring Compressor Tool MD-998772A and adapter 6716A, install locks and release tool. Tap the retainer with a brass or heavy plastic hammer to ensure locks have been seated.

(8) If valves and/or seats were ground, measure the installed height of springs. Make sure the measurement is taken from bottom of spring seat in cylinder head to the bottom surface of spring retainer. If spacers are installed, measure from the top of spacer. If height is greater than 42.86 mm (1-11/16 inches), install a 1.587 mm (1/16 inch) spacer in head counterbore. Ensure this brings spring height back to normal, 41.27 to 42.86 mm (1-5/8 to 1-11/16 inch).

HYDRAULIC TAPPETS

REMOVAL

(1) Disconnect the negative cable from the battery.

(2) Remove the air cleaner.

(3) Remove cylinder head cover.

(4) Remove rocker arm assembly and push rods. Identify push rods to ensure installation in original location.

(5) Remove upper and lower intake manifold.

(6) Cut the cylinder head gasket for accessibility if the end tappets are to be removed.

(7) Remove yoke retainer spider and tappet aligning yokes (Fig. 26).

(8) Pull tappet out of bore with a twisting motion. If all tappets are to be removed, identify tappets to ensure installation in original location.

(9) If the tappet or bore in cylinder block is scored, scuffed, or shows signs of sticking, ream the bore to next oversize. Replace with oversize tappet.

(10) Check camshaft lobes for abnormal wear.

INSTALLATION

(1) Lubricate tappets.

(2) Install tappets in their original positions. **Ensure that the oil bleed hole (if so equipped) faces forward.**

(3) Install tappet aligning yokes. Position the yoke retainer spider over the tappet aligning yokes (Fig. 26) Install the yoke retaining spider bolts and tighten to 22 N·m (16 ft. lbs.) torque.

(4) Install the push rods in their original location.

REMOVAL AND INSTALLATION (Continued)

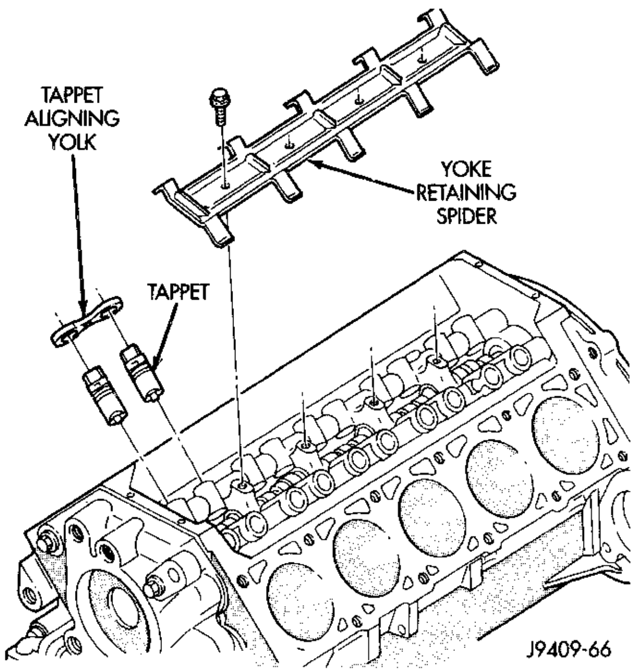

Fig. 26 Tappets, Aligning Yoke and Yoke Retaining Spider

(5) Position the rocker arm assembly on the pedestal and align to the push rods. Install the bolts and tighten to 28 N·m (21 ft. lbs.) torque.

(6) Install lower and upper intake manifold.

(7) The cylinder head cover gasket can be used again. Install the gasket onto the head rail. **For the left side the number tab is at the front of engine with the number up. For the right side the number tab is at the rear of engine with the number up.**

(8) Position the cylinder head cover onto the gasket. Install the stud bolts and hex head bolts in the proper positions (Fig. 26). Tighten the stud bolts and the bolts to 16 N·m (144 in. lbs.) torque.

(9) Install the air cleaner.

CAUTION: To prevent damage to valve mechanism, engine must not be run above fast idle until all hydraulic tappets have filled with oil and have become quiet.

(10) Connect the negative cable to the battery.

(11) Road test vehicle and check for leaks.

VIBRATION DAMPER

REMOVAL

(1) Disconnect the negative cable from the battery.

(2) Remove fan shroud retainer bolts and set shroud back over engine.

(3) Remove the cooling system fan.

(4) Remove the serpentine belt (refer to Group 7, Cooling System).

(5) Remove crankshaft pulley/damper bolt and washer from end of crankshaft (Fig. 27).

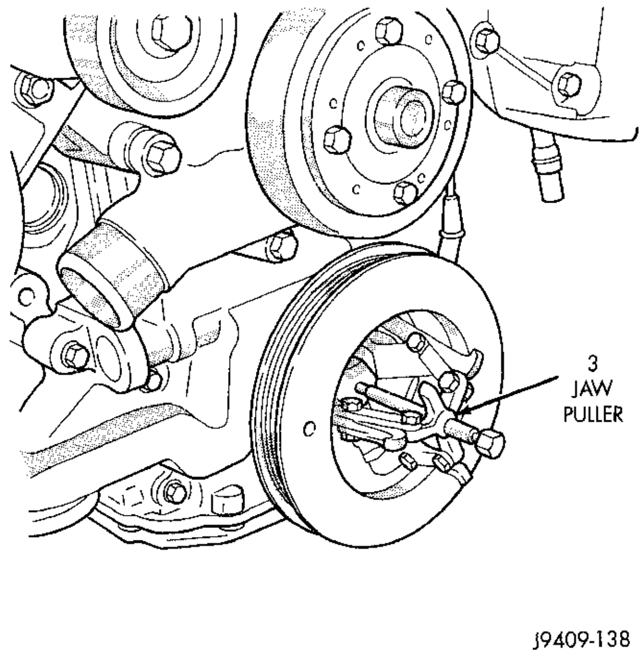

Fig. 27 Crankshaft Pulley—Damper

(6) Using a 3-prong puller tool, pull pulley—damper off of the crankshaft.

(7) Inspect crankshaft oil seal (Fig. 28).

INSTALLATION

(1) Position the crankshaft pulley/damper onto the crankshaft.

(2) Use tool C-3688 to press the pulley/damper onto the crankshaft. Install crankshaft bolt and washer and tighten to 183 N·m (135 ft. lbs.) torque (Fig. 28).

(3) Install the serpentine belt (refer to Group 7, Cooling System).

(4) Install the cooling system fan. Tighten the bolts to 23 N·m (17 ft. lbs.) torque.

(5) Position the fan shroud and install the bolts. Tighten the bolts to 11 N·m (95 in. lbs.) torque.

(6) Connect the negative cable to the battery.

TIMING CHAIN COVER

REMOVAL

(1) Disconnect the negative cable from the battery.

(2) Drain cooling system (refer to Group 7, Cooling System).

(3) Remove the serpentine belt (refer to Group 7, Cooling System).

(4) Remove fan shroud.

(5) Remove fan.

REMOVAL AND INSTALLATION (Continued)

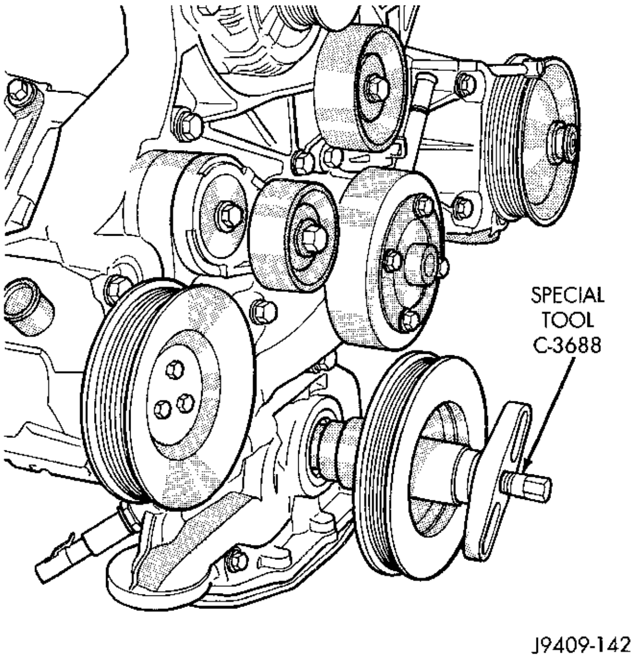

Fig. 28 Installing Crankshaft Pulley—Damper

(6) Unbolt A/C compressor and set on top of engine.
(7) Remove generator, air pump, and bracket assembly.
(8) Remove water pump (refer to Group 7, Cooling System).
(9) Using a 3-prong puller to remove pulley/damper from the crankshaft. (Fig. 29)

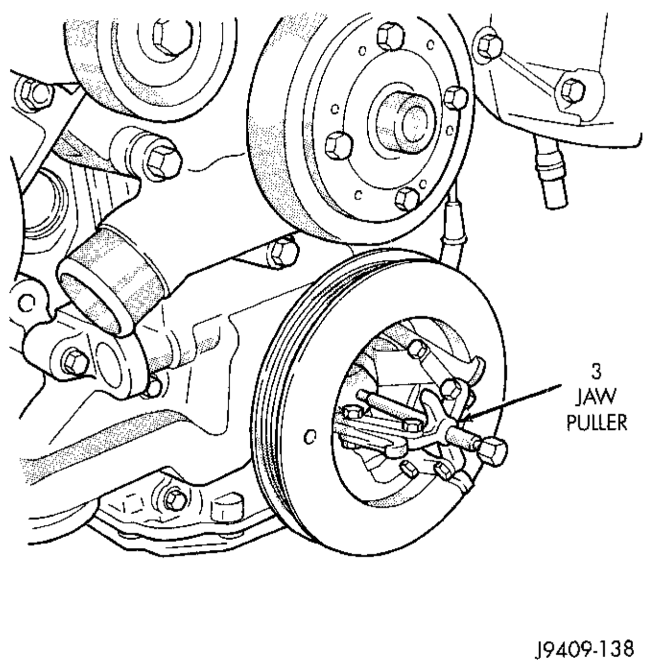

Fig. 29 Pulley—Damper Removal

(10) Loosen oil pan bolts and remove the front oil pan bolts that mount the pan to the timing chain cover.
(11) Remove the cover bolts.
(12) Remove timing chain cover and gasket using extreme caution to avoid damaging oil pan gasket.
(13) Inspect surface of cover. Remove any burrs or high spots.

INSTALLATION

(1) Be sure mating surfaces of timing chain cover and cylinder block are clean and free from burrs.
(2) Lubricate the pump rotors using petroleum jelly or lubriplate and install in the timing chain cover (Fig. 30).

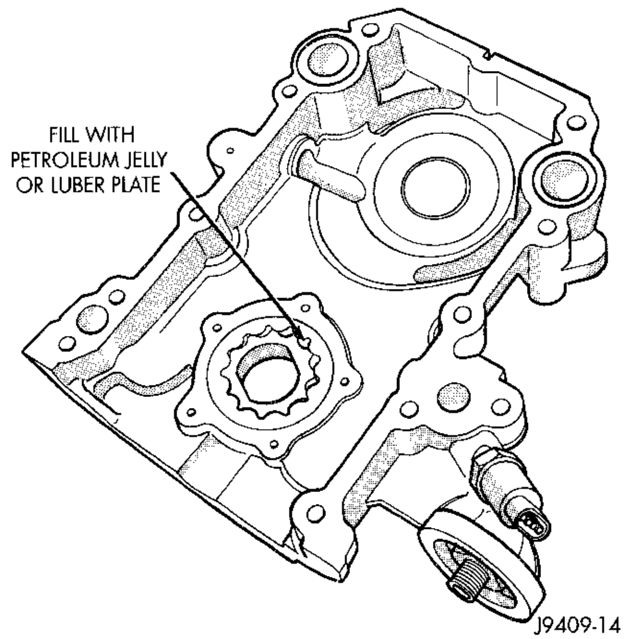

Fig. 30 Priming Oil Pump.

(3) Using a new cover gasket, carefully install timing chain cover to avoid damaging oil pan gasket. Use a small amount of Mopar® Silicone Rubber Adhesive Sealant, or equivalent, at the joint between timing chain cover gasket and the oil pan gasket. Finger tighten the timing chain cover bolts at this time.
(4) Tighten timing chain cover bolts to 47 N·m (35 ft. lbs.) torque. Tighten oil pan bolts to 24 N·m (215 in. lbs.) torque.
(5) Install pulley/vibration damper use tool C-3688 (Fig. 31)
(6) Prime oil pump by squirt oil in the oil filter mounting hole and filling the J-trap of the front timing cover. When oil is running out, install oil filter that has been filled with oil.
(7) Install water pump and housing assembly using o-ring (refer to Group 7, Cooling System). Tighten bolts to 41 N·m (30 ft. lbs.) torque.

REMOVAL AND INSTALLATION (Continued)

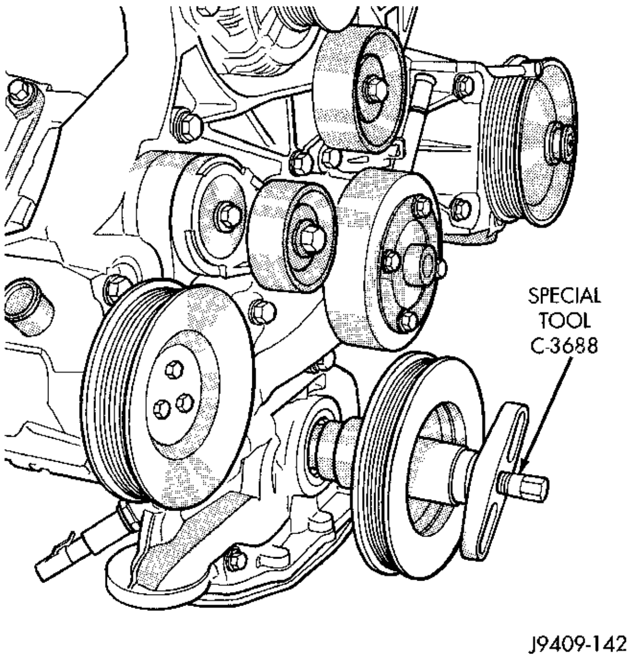

Fig. 31 Installing Crankshaft Pulley/Damper

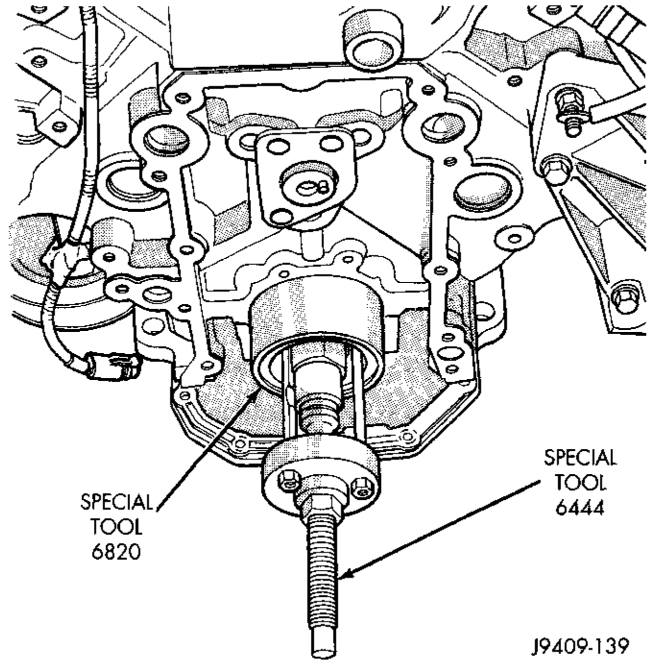

Fig. 32 Crankshaft Sprocket Removal.

(8) Install generator, air pump, and bracket assembly.
(9) Install A/C compressor.
(10) (10) Install the cooling system fan. Tighten the bolts to 23 N·m (17 ft. lbs.) torque.
(11) Position the fan shroud and install the bolts. Tighten the bolts to 11 N·m (95 in. lbs.) torque.
(12) Install the serpentine belt (refer to Group 7, Cooling System).
(13) Fill cooling system (refer to Group 7, Cooling System for the proper procedure).
(14) Connect the negative cable to the battery.
(15) Road test vehicle and check for leaks.

TIMING CHAIN

REMOVAL

(1) Remove timing chain cover and gasket using extreme caution to avoid damaging oil pan gasket.
(2) Aline camshaft and crankshaft centerline. Remove camshaft sprocket attaching bolt and remove timing chain and camshaft sprockets.
(3) Use puller 6444 and jaws 6820 to remove crankshaft sprocket (Fig. 32).

INSTALLATION

(1) Line up key in crankshaft with keyway in sprocket, press on crankshaft timing sprocket, use tools C-3688, C-3718 and MB-990799, seat sprocket against crankshaft shoulder (Fig. 33).
(2) Turn crankshaft to line up the timing mark with the crankshaft and camshaft centerline.
(3) Put chain on camshaft sprocket.

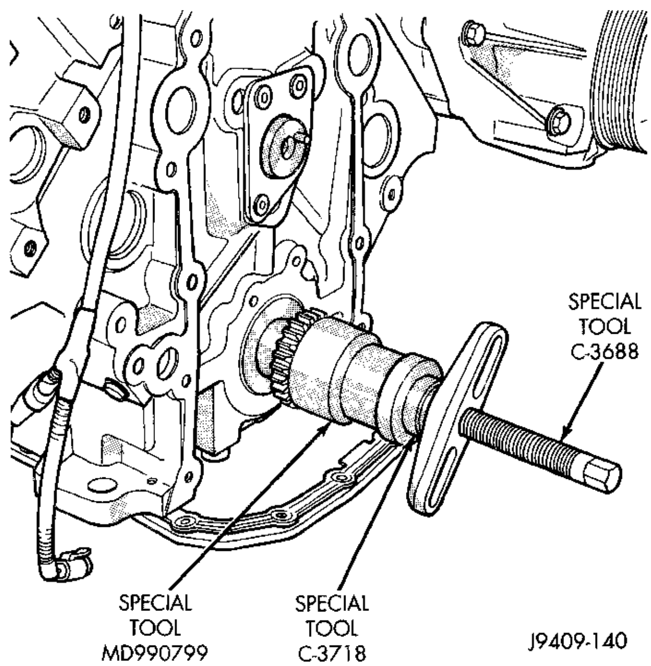

Fig. 33 Crankshaft Sprocket Installation

(4) Take chain and camshaft sprocket, align timing marks and install chain and cam sprocket onto crankshaft sprocket. Check to see that timing marks are on the centerline of the crankshaft and camshaft centerline (Fig. 34).
(5) Install the camshaft bolt. Tighten the bolt to 61 N·m (45 ft. lbs.) torque.
(6) Check camshaft end play. The end play should be 0.051-0.152 mm (0.002-0.006 inch) with a new

REMOVAL AND INSTALLATION (Continued)

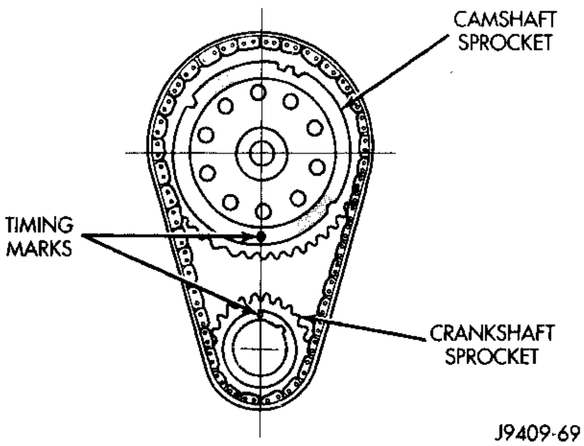

Fig. 34 Alignment of Timing Marks

thrust plate and up to 0.254 mm (0.010 inch) with a used thrust plate. If not within these limits install a new thrust plate.

(7) Install timing chain cover.

TIMING CHAIN COVER OIL SEAL (COVER NOT REMOVED)

REMOVAL

(1) Disconnect the negative cable from the battery.

(2) Remove the cooling fan and shroud.

(3) Remove the serpentine belt (refer to Group 7, Cooling Systems).

(4) Using a 3-jaw puller tool, pull pulley/damper off of the crankshaft.

(5) Place a suitable tool behind the lips of the oil seal to pry the oil seal outward. Be careful not to damage the crankshaft seal surface of the cover (Fig. 35).

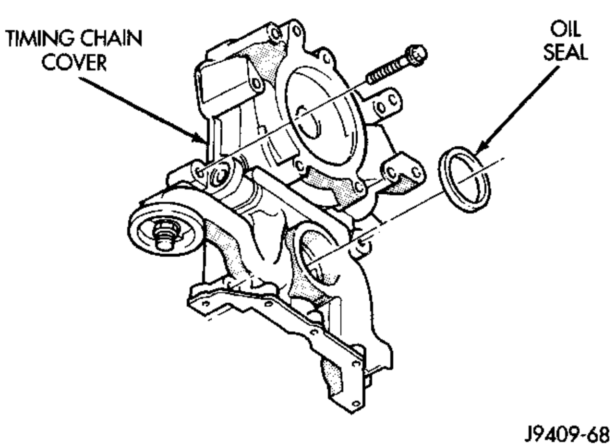

Fig. 35 Timing Chain Cover and Oil Seal

INSTALLATION

(1) Position the crankshaft front oil seal onto seal installer special tool 6806 and C-3688 (Fig. 36). Install seal.

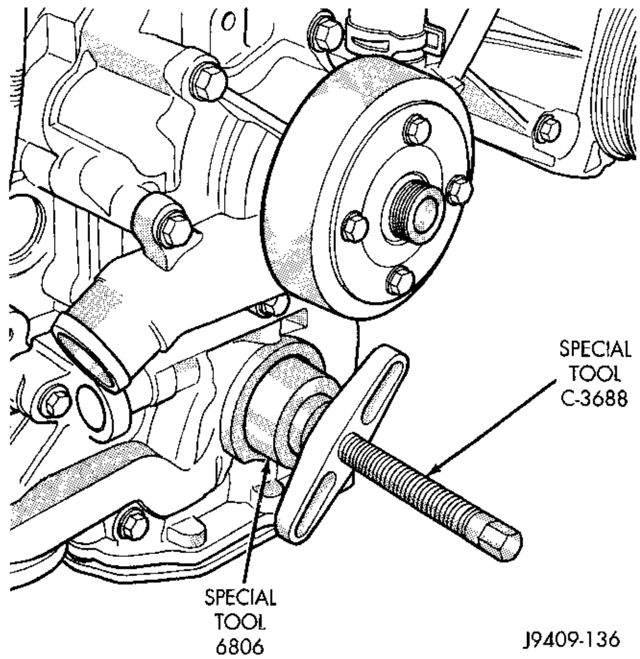

Fig. 36 Timing Chain Cover and Oil Seal

(2) Install crankshaft pulley/damper using tool C-3688.

(3) Install serpentine belt (refer to Group 7, Cooling System).

(4) Install cooling fan and shroud.

(5) Connect negative cable to the battery.

TIMING CHAIN COVER OIL SEAL (COVER REMOVED)

REMOVAL

(1) With timing cover removed from engine place a suitable tool behind the lips of the oil seal to pry the oil seal outward. Be careful not to damage the crankshaft seal surface of the cover.

INSTALLATION

(1) Position the crankshaft front oil seal onto seal installer special tool 6806.

(2) Use tool 6761 to support timing chain cover when installing oil seal with tool 6806 (Fig. 37), install seal.

REMOVAL AND INSTALLATION (Continued)

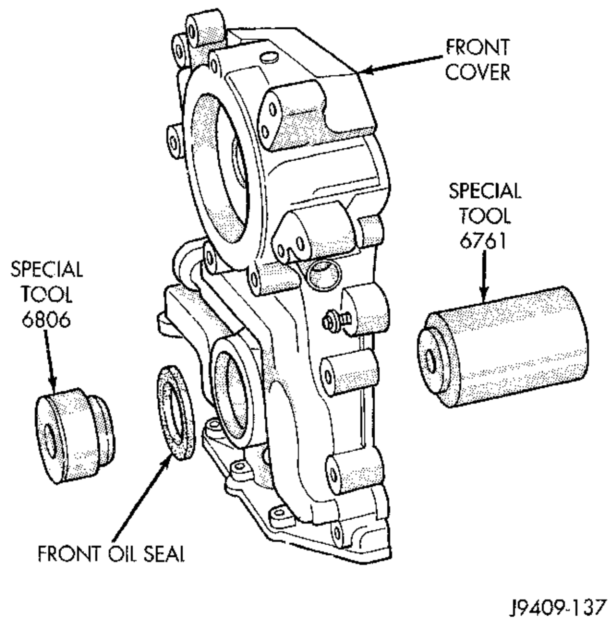

Fig. 37 Oil Seal, Tools—6806 and 6761

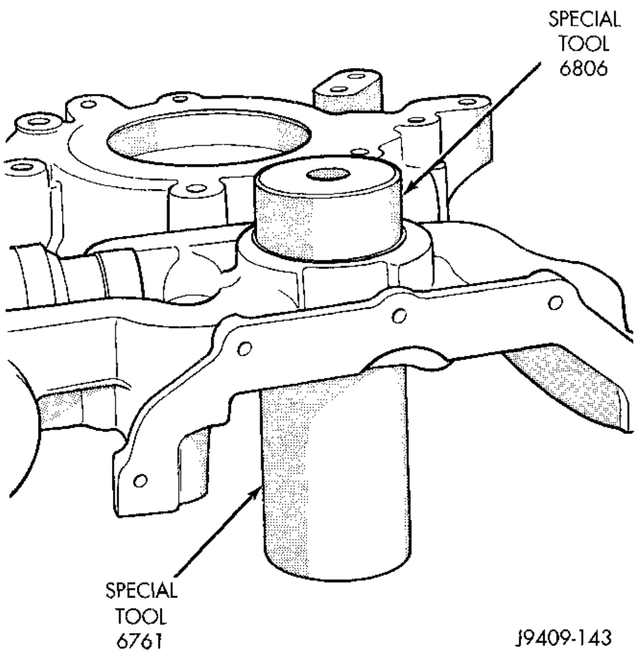

Fig. 38 Oil Seal Installed

CAMSHAFT

The camshaft has an integral oil pump and distributor drive gear (Fig. 39).

REMOVAL

(1) Remove cylinder head covers.

(2) Remove rocker arm assemblies, identify each part so it can be installed in its original location..

(3) Remove push rods and tappets. Identify each part so it can be installed in its original location.

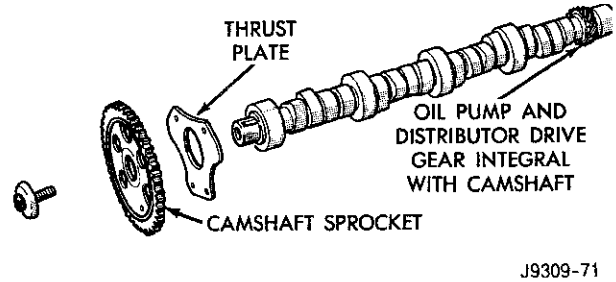

Fig. 39 Camshaft and Sprocket Assembly

(4) The 4 corner tappets can not be removed without removing the cylinder heads and gaskets. They can be lifted and retained for camshaft removal.

(5) Remove upper and lower intake manifold (refer to Group 11 Intake and Exhaust Systems).

(6) Remove timing chain cover and timing chain.

(7) Remove camshaft thrust plate (Fig. 40).

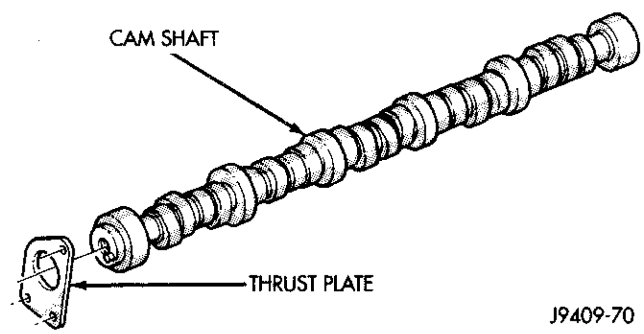

Fig. 40 Camshaft

(8) Install a long bolt into front of camshaft to facilitate removal of the camshaft. Remove camshaft, being careful not to damage cam bearings with the cam lobes.

INSTALLATION

(1) Lubricate camshaft lobes and camshaft bearing journals. Using a long bolt, insert the camshaft into the cylinder block.

NOTE: Whenever an engine has been rebuilt, a new camshaft and/or new tappets installed, add 1 pint of Mopar® Crankcase Conditioner, or equivalent. The oil mixture should be left in engine for a minimum of 805 km (500 miles). Drain at the next normal oil change.

(2) Install camshaft thrust plate. Tighten the torx bolts to 22 N·m (16 ft. lbs.) torque.

(3) Check camshaft end play. The end play should be 0.051-0.152 mm (0.002-0.006 inch) with a new thrust plate and up to 0.254 mm (0.010 inch) with a used thrust plate. If not within these limits install a new thrust plate.

REMOVAL AND INSTALLATION (Continued)

(4) Line up key with keyway in sprocket, press on crankshaft timing sprocket, use tools C-3688, C-3718 and MB990799, to seat sprocket against crankshaft shoulder (Fig. 41).

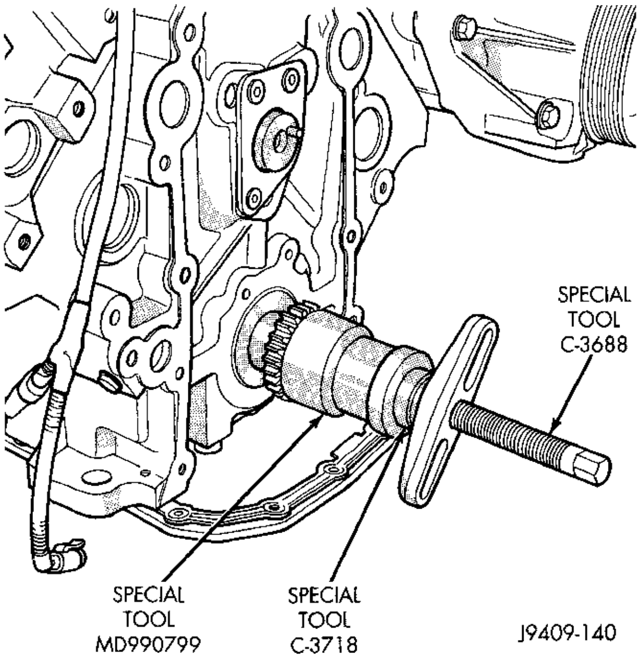

Fig. 41 Crankshaft Sprocket Installation

(5) Align timing mark on crankshaft sprocket with center line of crankshaft and camshaft.

(6) Put chain on camshaft sprocket.

(7) Take chain and camshaft sprocket and align mark with centerline of crankshaft and camshaft install camshaft sprocket and chain to camshaft.

(8) Install the camshaft bolt. Tighten bolt to 75 N·m (55 ft. lbs.) torque.

(9) Install the timing chain cover.

(10) Install the crankshaft pulley/damper use tool C-3688.

(11) Prime oil pump by squirt oil in the oil filter mounting hole and filling the J-trap of the front timing cover. When oil is running out, install oil filter that has been filled with oil.

(12) Each tappet reused must be installed in the same position from which it was removed. **When camshaft is replaced, all of the tappets must be replaced.**

(13) Install tappets and push rods in their original location.

(14) Install the rocker arms.

(15) The cylinder head cover gasket can be used again. Install the gasket onto the head rail. **For the left side the number tab is at the front of engine with the number up. For the right side the number tab is at the rear of engine with the number up.**

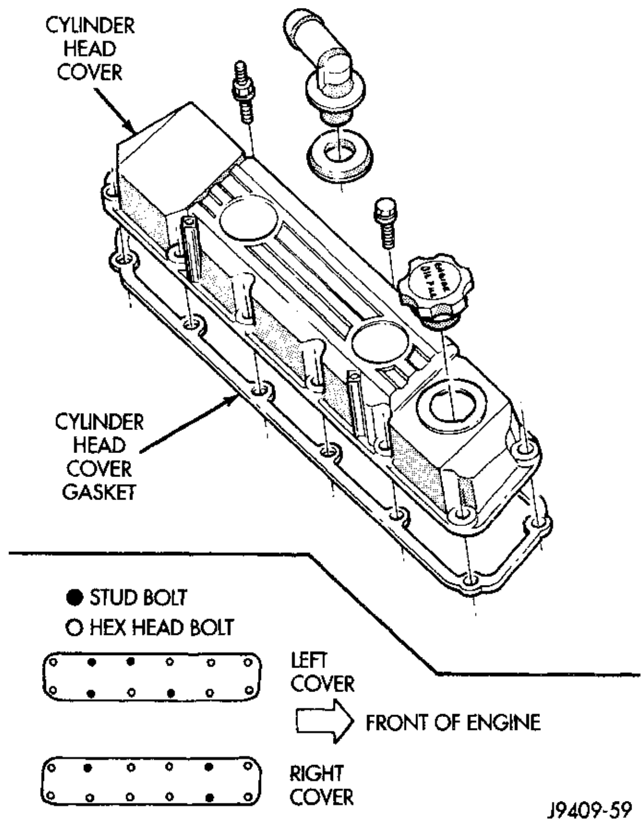

Fig. 42 Cylinder Head Cover

CAUTION: The cylinder head cover fasteners have a special plating. DO NOT use alternative fasteners.

(16) Position the cylinder head cover onto the gasket. Install the stud bolts and hex head bolts in the proper positions (Fig. 42). Tighten the stud bolts and the bolts to 16 N·m (144 in. lbs.) torque.

(17) Install the intake manifolds, (refer to Group 11 Intake and Exhaust Systems).

CAMSHAFT BEARING

REMOVAL

This procedure requires that the engine is removed from the vehicle.

(1) With engine completely disassembled, drive out rear cam bearing core hole plug.

(2) Install proper size adapters and horseshoe washers (part of Camshaft Bearing Remover/Installer Tool C-3132-A) at back of each bearing shell. Drive out bearing shells (Fig. 43).

INSTALLATION

(1) Install new camshaft bearings with Camshaft Bearing Remover/Installer Tool C-3132-A by sliding the new camshaft bearing shell over proper adapter.

REMOVAL AND INSTALLATION (Continued)

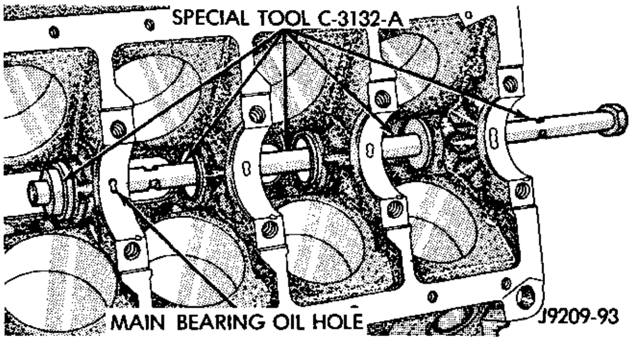

Fig. 43 Camshaft Bearings Removal and Installation with Tool C-3132-A

(2) Position rear bearing in the tool. Install horseshoe lock and by reversing removal procedure, carefully drive bearing shell into place.

(3) Install remaining bearings in the same manner. Bearings must be carefully aligned to bring oil holes into full register with oil passages from the main bearing. If the camshaft bearing shell oil holes are not in exact alignment, remove and install them correctly. Install a new core hole plug at the rear of camshaft. **Be sure this plug does not leak.**

OIL PAN

REMOVAL

(1) Disconnect the negative cable from the battery.

(2) Raise vehicle.

(3) Drain engine oil.

(4) Remove left engine to transmission strut.

(5) Remove oil pan and one-piece gasket. The engine may have to be raised slightly on 2WD vehicles.

(6) Remove the oil pick-up tube assembly (Fig. 44). Discard the gasket.

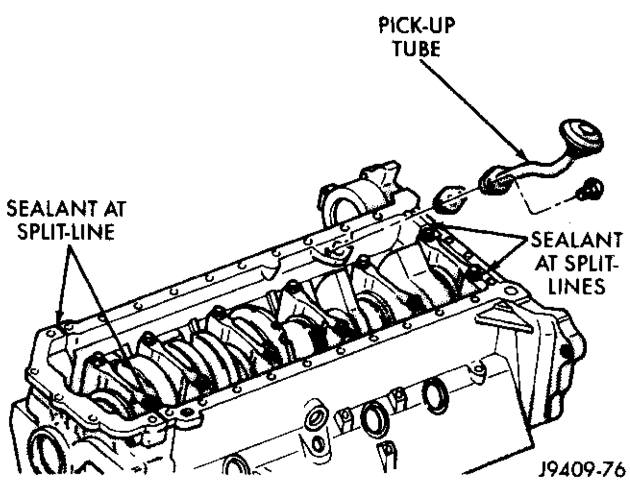

Fig. 44 Oil Pick-Up Tube

INSTALLATION

(1) Fabricate 4 alignment dowels from 5/16 x 1 1/2 inch bolts. Cut the head off the bolts and cut a slot into the top of the dowel. This will allow easier installation and removal with a screwdriver (Fig. 45).

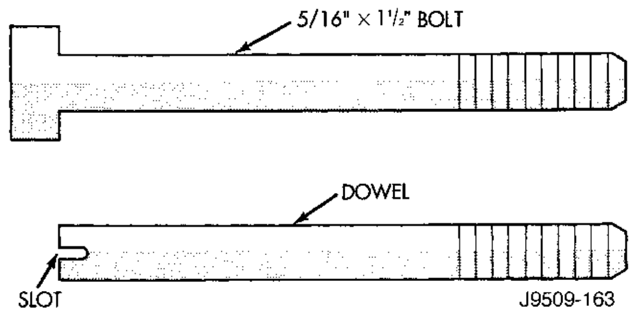

Fig. 45 Fabrication of Alignment Dowels

(2) Install the dowels in the cylinder block at the four corners.

(3) Apply small amount of Mopar® Silicone Rubber Adhesive Sealant, or equivalent at the split lines. The split lines are between the cylinder block, the timing chain cover and the rear crankshaft seal assembly (Fig. 44). **After the sealant is applied you have 3 minutes to install the gasket and oil pan.**

(4) Slide the one-piece gasket over the dowels and onto the block.

(5) Position the oil pan over the dowels and onto the gasket. The engine may have to be slightly raised on 2WD vehicles.

(6) Install the oil pan bolts (Fig. 46). Tighten the 1/4 inch bolts to 11 N·m (96 in. lbs.) torque. Tighten the stud bolts to 16 N·m (144 in. lbs.) torque. Tighten the 5/16 inch bolts to 16 N·m (144 in. lbs.) torque.

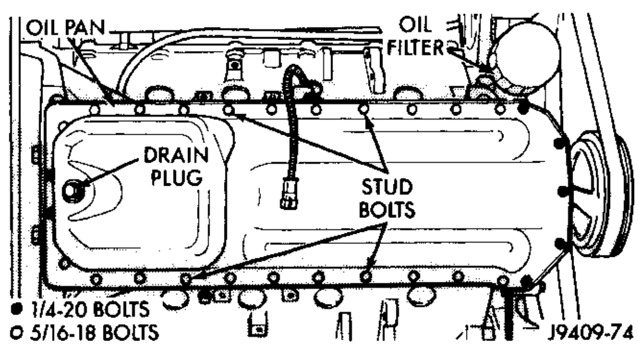

Fig. 46 Oil Pan Bolt Location

(7) Remove the dowels. Install the remaining 5/16 inch oil pan bolts. Tighten these bolts to 16 N·m (144 in. lbs.) torque.

(8) Install the drain plug. Tighten drain plug to 34 N·m (25 ft. lbs.) torque.

(9) Install the engine to transmission strut.

(10) Lower vehicle.

REMOVAL AND INSTALLATION (Continued)

(11) Connect the negative cable to the battery.
(12) Fill crankcase with oil to proper level.

PISTON AND CONNECTING ROD ASSEMBLY

REMOVAL

(1) Remove the engine from the vehicle (refer to Engine Removal of this manual).

(2) Remove the valve cover, rocker arms, push rods and cylinder head. Mark parts as removed.

(3) Remove the oil pan and oil pump pick-up tube.

(4) Remove top ridge of cylinder bores with a reliable ridge reamer before removing pistons from cylinder block. Be sure to keep tops of pistons covered during this operation.

(5) Be sure the connecting rod and connecting rod cap are identified with the cylinder number. Remove connecting rod cap. Install connecting rod bolt guide set on connecting rod bolts.

(6) Pistons and connecting rods must be removed from top of cylinder block. When removing piston and connecting rod assemblies, rotate crankshaft center the connecting rod in the cylinder bore and at BDC. **Be careful not to nick crankshaft journals. DO NOT try to remove black coating on skirt. This is the dry film lubricant.**

(7) After removal, install bearing cap on the mating rod.

INSTALLATION

(1) Check the crankshaft connecting rod journal for excessive wear, taper and scoring.

(2) Check the cylinder block bore for out-of-round, taper, scoring and scuffing.

(3) Be sure that compression ring gaps are staggered so that neither is in line with oil ring rail gap.

(4) Before installing the ring compressor, make sure the oil ring expander ends are butted and the rail gaps located properly (Fig. 47).

(5) Immerse the piston head and rings in clean engine oil. Slide Piston Ring Compressor Tool C-385 over the piston and tighten with the special wrench (part of Tool C-385). **Be sure position of rings does not change during this operation.**

(6) Install connecting rod bolt protectors on rod bolts, a long protector should be installed on the numbered side of the connecting rod.

(7) Rotate crankshaft so that the connecting rod journal is on the center of the cylinder bore in the bottom dead center position. Be sure connecting rod and cylinder bore number are the same. Insert rod and piston into cylinder bore. Be sure the piston and rod assemblies are installed in the proper orientation (Fig. 48).

(8) The notch, groove or arrow on top of piston must be pointing toward front of engine. The larger chamfer of the connecting rod bore must be installed toward crankshaft journal fillet.

(9) While tapping the piston down in cylinder bore with the handle of a hammer, guide the connecting rod over the crankshaft journal.

(10) Install rod caps. Install nuts on cleaned and oiled rod bolts and tighten nuts to 61 N·m (45 ft. lbs.) torque.

(11) Install the oil pump pick-up tube and oil pan.

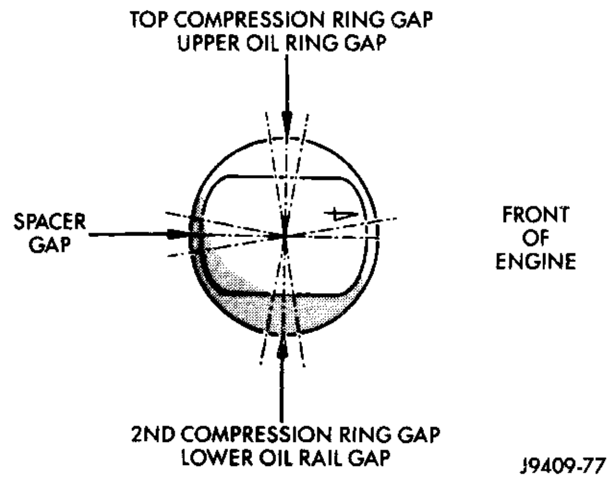

Fig. 47 Proper Ring Installation

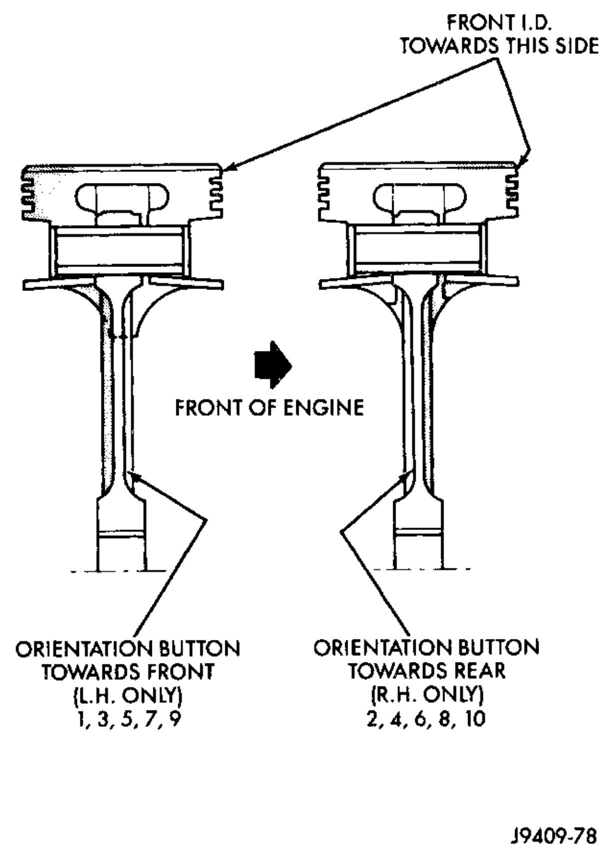

Fig. 48 Piston and Rod Orientation

REMOVAL AND INSTALLATION (Continued)

(12) Install the cylinder head, push rods, rocker arms and valve cover.

(13) Install lower intake manifold.

(14) Install the engine into the vehicle.(refer to Engine Installation of this manual).

CRANKSHAFT MAIN BEARINGS

REMOVAL

(1) Remove the oil pan and oil pump pick-up tube.

(2) Identify bearing caps before removal. Remove bearing caps one at a time.

(3) Remove upper half of bearing by inserting Crankshaft Main Bearing Remover/Installer Tool C-3059 into the oil hole of crankshaft (Fig. 49).

(4) Slowly rotate crankshaft clockwise, forcing out upper half of bearing shell.

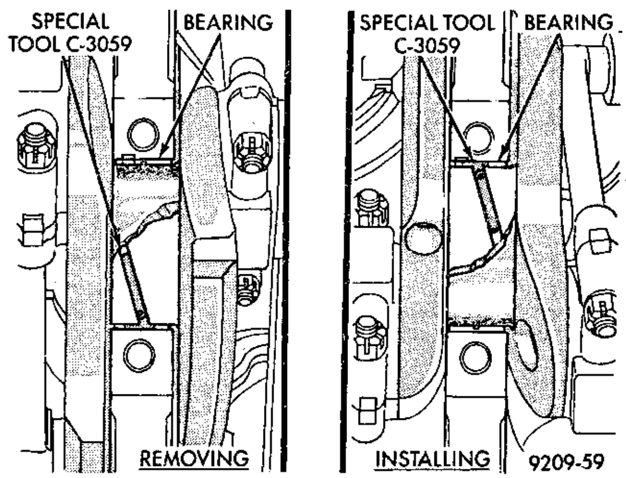

Fig. 49 Upper Main Bearing Removal and Installation with Tool C-3059

INSTALLATION

Only one main bearing should be selectively fitted while all other main bearing caps are properly tightened. All bearing capbolts removed during service procedures are to be cleaned and oiled before installation.

When installing a new upper bearing shell, slightly chamfer the sharp edges from the plain side.

(1) Start bearing in place, and insert Crankshaft Main Bearing Remover/Installer Tool C-3059 into oil hole of crankshaft (Fig. 49).

(2) Slowly rotate crankshaft counterclockwise sliding the bearing into position. Remove Tool C-3059.

(3) Lubricate the main journals with clean engine oil. Install main bearing caps and bolts. Follow the 2 step tightening sequence.

- Step 1—Starting with bearing cap No.1, tighten the bolts to 27 N·m (20 ft. lbs.) torque.
- Step 2—Starting with bearing cap No.1, tighten the bolts to 115 N·m (85 ft. lbs.) torque.

(4) Apply a rearward axial load of 667 N (150 lbs-f) on crankshaft centerline, driving No.3 main cap and thrust bearing against No.3 bulkhead. Repeat procedure, driving crankshaft forward to align rear flange of thrust bearings in a common plane. Front face of No.1 main cap must not extend forward in front of face of No.1 bulkhead.

(5) Install the oil pump pick-up tube and oil pan.

CRANKSHAFT

When a crankshaft is replaced, all main and connecting rod bearings should be replaced with new bearings. Therefore, selective fitting of the bearings is not required when a crankshaft and bearings are replaced.

REMOVAL

(1) Remove the oil pan.

(2) Remove the oil pickup tube.

(3) Remove the timing chain cover and gasket. Remove and discard the front crankshaft oil seal and cover gasket.

(4) Remove Transmission (refer to Group 21, Transmission).

(5) Remove the rear seal retainer. Remove and discard the crankshaft rear oil seal and retainer gasket.

(6) Identify main bearing caps before removal (Fig. 50). Remove bearing caps and bearings one at a time.

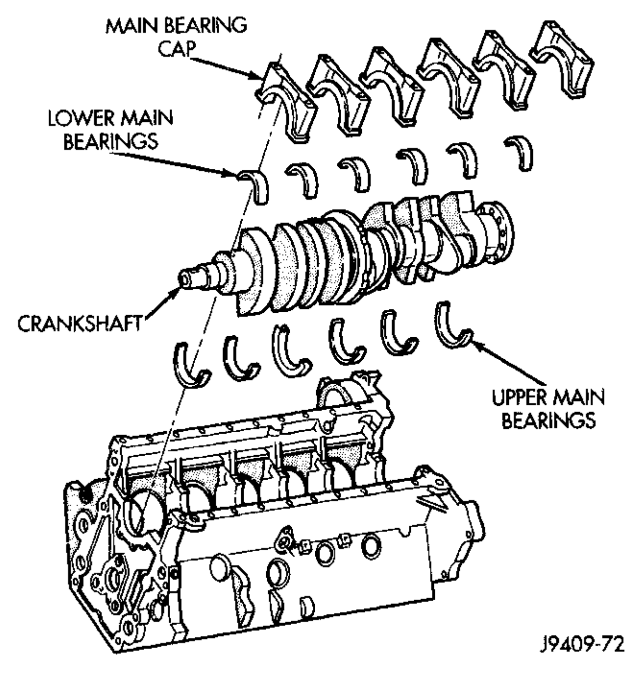

Fig. 50 Main Bearing Identification

(7) Remove the connecting rod bearing caps.

(8) Lift the crankshaft straight out of the block.

REMOVAL AND INSTALLATION (Continued)

INSTALLATION

(1) Lubricate crankshaft main bearings with clean engine oil.

(2) Install the crankshaft into the cylinder block.

(3) Lubricate the main journals with clean engine oil. Install main bearing caps and bolts. Follow the 2 step tightening sequence.

- Step 1—Starting with bearing cap No.1, tighten the bolts to 27 N·m (20 ft. lbs.) torque.
- Step 2—Starting with bearing cap No.1, tighten the bolts to 115 N·m (85 ft. lbs.) torque.

(4) Lubricate the connecting rod bearings and journals with clean engine oil. Carefully install connecting rods to the crankshaft.

(5) Install the rear seal retainer with a new gasket and oil seal. Use seal installer 6687 when installing the oil seal.

(6) Install the timing chain cover with a new gasket and oil seal.

(7) Prime oil pump by squirt oil in the oil filter mounting hole and filling the J-trap of the front timing cover. When oil is running out, install oil filter that has been filled with oil.

(8) Apply a rearward axial load of 667 N (150 lbs-f) on crankshaft centerline, driving No.3 main cap and thrust bearing against No.3 bulkhead. Repeat procedure, driving crankshaft forward to align rear flange of thrust bearings in a common plane. Front face of No.1 main cap must not extend forward in front of face of No.1 bulkhead.

(9) Install the oil pickup tube. Tighten the bolts to 16 N·m (144 in. lbs.) torque.

(10) Install the oil pan.

OIL PUMP

REMOVAL

(1) Remove the timing chain cover.

(2) Remove the relief valve plug, gasket, spring and valve (Fig. 51). Discard the gasket.

(3) Remove oil pump cover (Fig. 52).

(4) Remove pump rotors (Fig. 52).

INSTALLATION

(1) Lubricate the pump rotors using petroleum jelly or lubriplate and install in the timing chain cover. Use new parts as required (Fig. 53).

(2) Position the oil pump cover onto the timing chain cover. Tighten cover bolts to 14 N·m (125 in. lbs.) torque.

(3) Make sure that inner ring moves freely after cover is installed.

(4) Install the timing chain cover.

(5) Squirt oil into relief valve hole until oil runs out.

(6) Install the relief valve and spring.

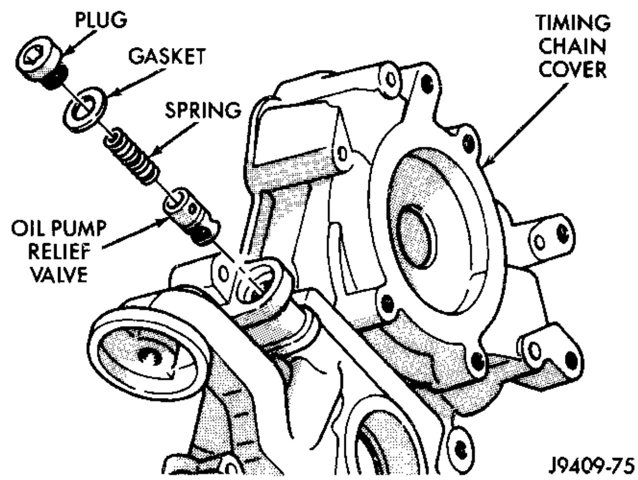

Fig. 51 Oil Pressure Relief Valve

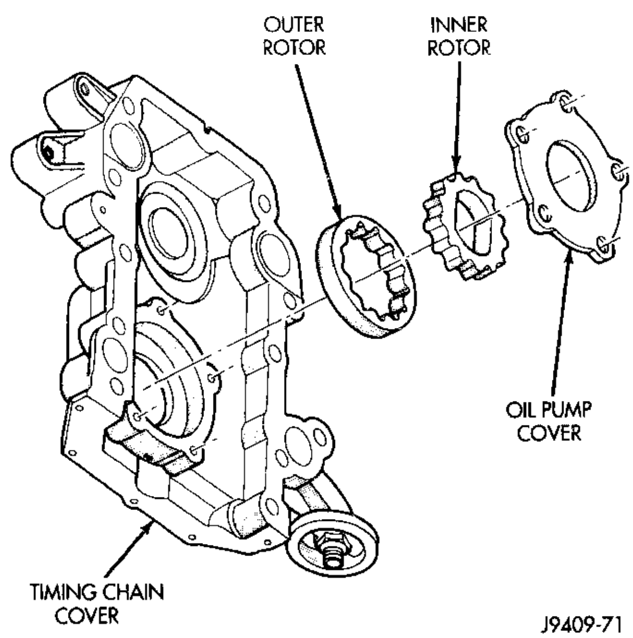

Fig. 52 Oil Pump

(7) Using a new pressure relief valve gasket, install the relief valve plug. Tighten the plug to 20 N·m (15 ft. lbs.) torque.

(8) Install oil filter that has been filled with oil.

CRANKSHAFT REAR SEAL/ RETAINER

REMOVAL

(1) Remove the transmission (refer to Group 21, Transmissions).

(2) Remove the oil pan.

(3) Remove the rear seal retainer. Discard the oil seal and the gasket (Fig. 54).

REMOVAL AND INSTALLATION (Continued)

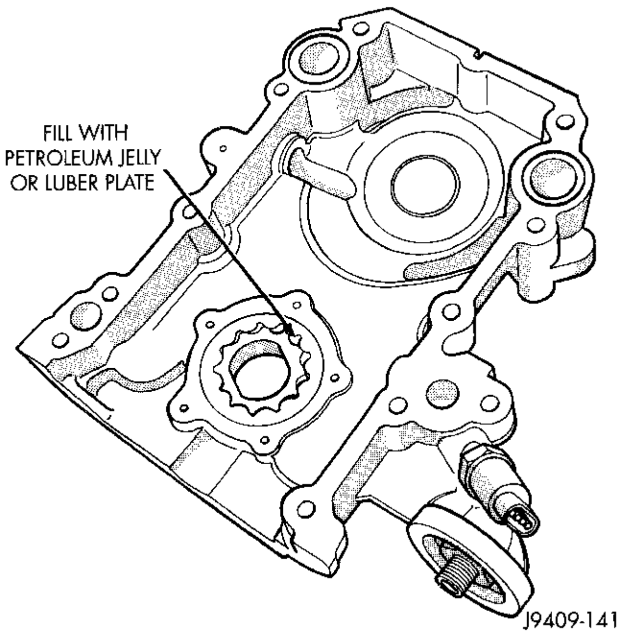

Fig. 53 Priming Oil Pump.

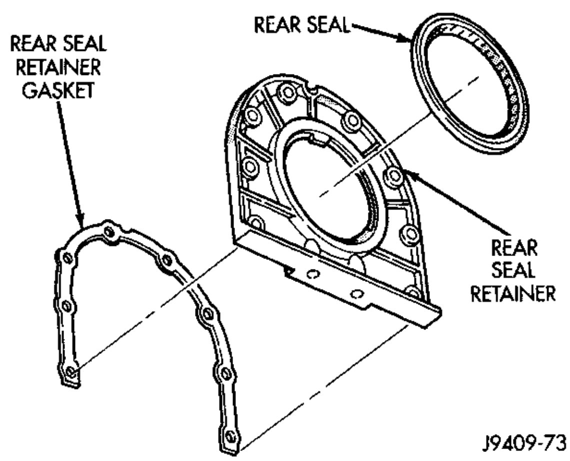

Fig. 54 Crankshaft Rear Seal Retainer

INSTALLATION

(1) Wash all parts in a suitable solvent and inspect carefully for damage or wear.

(2) Position the rear seal in the retainer.

(3) Using Special Tool 6687, position the retainer and oil seal over the crankshaft. Install the bolts and tighten to 22 N·m (16 ft. lbs.) torque.

(4) The seal face surface must be within 0.508 mm (0.020 in) full indicator movement relative to rear face of crankshaft. If out of limits, gently tap the high side into the retainer.

(5) Add a small amount of Mopar® Silicone Rubber Adhesive Sealant at split-line.

(6) Install the oil pan.

(7) Install the transmission (refer to group 21, Transmissions).

ENGINE CORE OIL—CAMSHAFT PLUGS

Engine core plugs have been pressed into the oil galleries behind the camshaft thrust plate. This will reduce internal leakage and help maintain higher oil pressure at idle.

REMOVAL

(1) Using a blunt tool such as a drift or a screwdriver and a hammer, strike the bottom edge of the cup plug (Fig. 55).

(2) With the cup plug rotated, grasp firmly with pliers or other suitable tool and remove plug (Fig. 55).

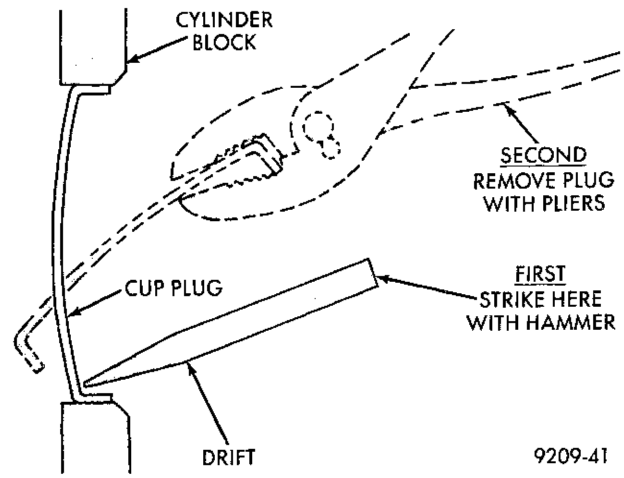

Fig. 55 Core Hole Plug Removal

INSTALLATION

(1) Thoroughly clean inside of cup plug hole in cylinder block or head. Be sure to remove old sealer.

(2) Make certain the new plug is cleaned of all oil or grease.

(3) Coat edges of plug and core hole with Mopar® Gasket Maker, or equivalent.

CAUTION: DO NOT drive cup plug into the casting as restricted coolant flow can result and cause serious engine problems.

(4) Using proper drive plug, drive plug into hole. The sharp edge of the plug should be at least 0.50 mm (0.020 inch) inside the lead-in chamfer.

It is not necessary to wait for curing of the sealant. The cooling system can be filled and the vehicle placed in service immediately.

DISASSEMBLY AND ASSEMBLY

VALVE SERVICE

VALVE GUIDES

Measure valve stem guide clearance as follows:

(1) Install Black Valve Guide Sleeve Tool C-6819 over valve stem for the **INTAKE** valve and install valve (Fig. 56). The special sleeve places the valve at the correct height for checking with a dial indicator.

(2) Install Silver Valve Guide Sleeve Tool C-6818 over valve stem for the **EXHAUST** valve and install valve. The special sleeve places the valve at the correct height for checking with a dial indicator.

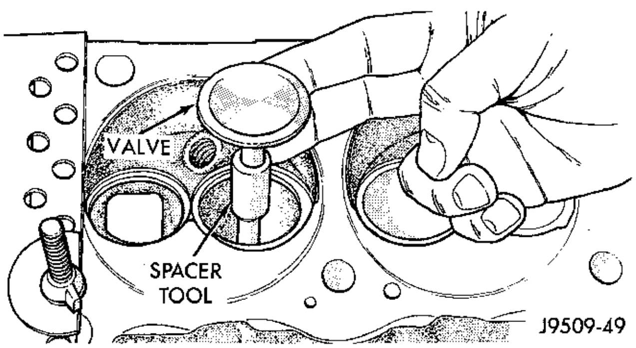

Fig. 56 Positioning Valve Spacer Tool (Typical)

(3) Attach Dial Indicator Tool C-3339 to cylinder head and set it at right angle of valve stem being measured (Fig. 57).

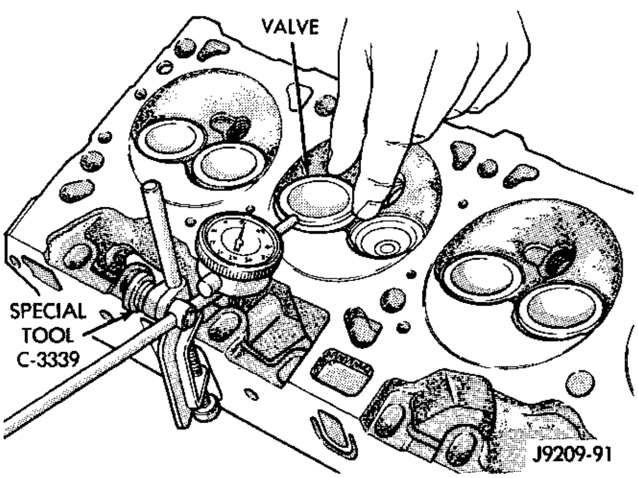

Fig. 57 Measuring Valve Guide Wear

(4) Move valve to and from the indicator. The total dial indicator reading should not exceed 0.432 mm (0.017 inch). Ream the guides for valves with oversize stems if dial indicator reading is excessive or if the stems are scuffed or scored.

Service valves with oversize stems are available (Fig. 58).

Reamer O/S	Valve Guide Size
0.076 mm (0.003 in.)	8.026 – 8.052 mm (0.316 – 0.317 in.)
0.381 mm (0.015 in.)	8.331 – 8.357 mm (0.328 – 0.329 in.)

J9309-30

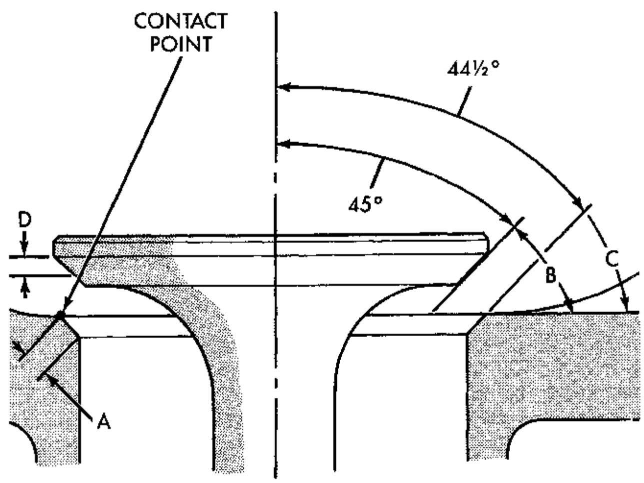
Fig. 58 Reamer Sizes

(5) Slowly turn reamer by hand and clean guide thoroughly before installing new valve. **Ream the valve guides from standard to 0.381 mm (0.015 inch). Use a 2 step procedure so the valve guides are reamed true in relation to the valve seat:**

- Step 1—Ream to 0.0763 mm (0.003 inch).
- Step 2—Ream to 0.381 mm (0.015 inch).

REFACING VALVES AND VALVE SEATS

The intake and exhaust valves have a 45° face angle and a 45° to 44 1/2° seat angle (Fig. 59).



A - SEAT WIDTH — INTAKE 1.016–1.524 mm (0.040–0.060 in.)
EXHAUST 1.016–1.524 mm (0.040–0.060 in.)
B - FACE ANGLE (INTAKE & EXHAUST)
C - SEAT ANGLE (INTAKE & EXHAUST)
D - CONTACT SURFACE

J9409-133

Fig. 59 Valve Face and Seat Angles

VALVES

Inspect the remaining margin after the valves are refaced (Fig. 17). Valves with less than 1.190 mm (0.047 inch) margin should be discarded.

VALVE SEATS

(1) When refacing valve seats, it is important that the correct size valve guide pilot be used for reseat-

DISASSEMBLY AND ASSEMBLY (Continued)

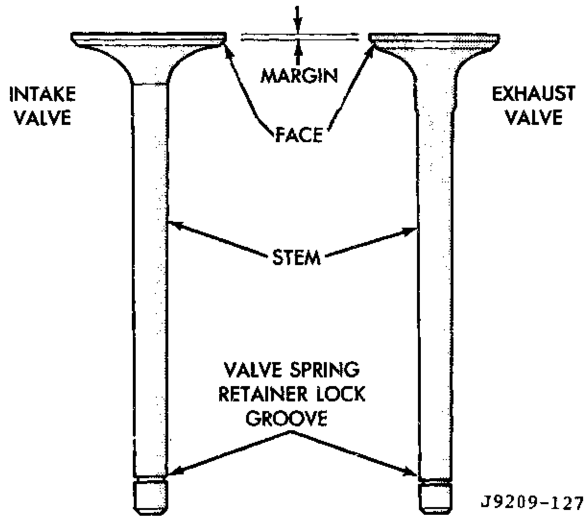


Fig. 60 Intake and Exhaust Valves

ing stones. A true and complete surface must be obtained.

(2) Measure the concentricity of valve seat using a dial indicator. Total runout should not exceed 0.038 mm (0.0015 inch) total indicator reading.

(3) Inspect the valve seat with Prussian blue to determine where the valve contacts the seat. To do this, coat valve seat LIGHTLY with Prussian blue then set valve in place. Rotate the valve with light pressure. If the blue is transferred to the center of valve face, contact is satisfactory. If the blue is transferred to the top edge of valve face, lower valve seat with a 15° stone. If the blue is transferred to bottom edge of valve face raise valve seat with a 60° stone.

(4) When seat is properly positioned the width of valve seats should be 1.016-1.524 mm (0.040-0.060 inch).

VALVE SPRING INSPECTION

Whenever valves have been removed for inspection, reconditioning or replacement, valve springs should be tested. As an example the compression length of the spring to be tested is 1-5/16 inch. Turn table of Universal Valve Spring Tester Tool until surface is in line with the 1-5/16 inch mark on the threaded stud. Be sure the zero mark is to the front (Fig. 61). Place spring over stud on the table and lift compressing lever to set tone device. Pull on torque wrench until ping is heard. Take reading on torque wrench at this instant. Multiply this reading by 2. This will give the spring load at test length. Fractional measurements are indicated on the table for finer adjustments. Refer to specifications to obtain specified height and allowable tensions. Discard the springs that do not meet specifications.

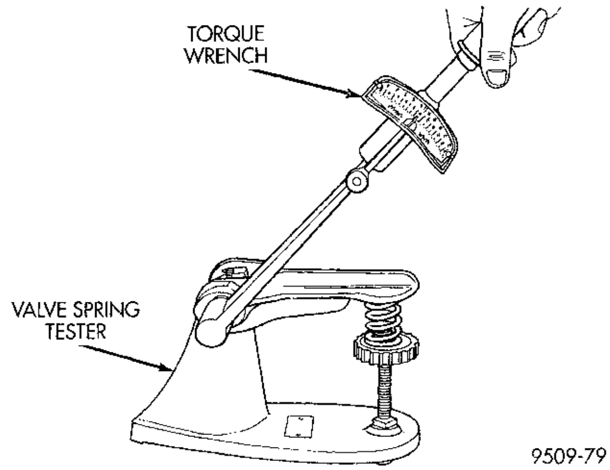

Fig. 61 Testing Valve Spring for Compressed Length

CYLINDER BLOCK

Remove the engine assembly from the vehicle.

DISASSEMBLE

(1) Remove the cylinder head and valve train.
(2) Remove the intake system.
(3) Remove the timing cover and timing chain with sprockets.
(4) Remove the oil pan.
(5) Remove the piston-connecting rod assemblies.
(6) Remove the crankshaft and bearings.

ASSEMBLE

(1) Install crankshaft and bearings.
(2) Install the piston/connecting rod assembly.
(3) Install the oil pan.
(4) Install timing cover, timing chain and sprockets.
(5) Install the cylinder head and valve train.
(6) Install the engine into the vehicle.
(7) Install intake system.

CLEANING AND INSPECTION

CYLINDER HEADS

CLEANING

Clean all surfaces of cylinder block and cylinder heads. Be sure material does not fall into the lifters and surrounding valley.

Clean cylinder block front and rear gasket surfaces using a suitable solvent.

Clean the exhaust manifold to cylinder head mating areas.

INSPECTION

Inspect all surfaces with a straightedge if there is any reason to suspect leakage. The out-of-flatness

CLEANING AND INSPECTION (Continued)

specifications are 0.0007 mm/mm (0.0004 inch/inch), 0.127 mm/152 mm (0.005 inch/6 inches) any direction or 0.254 mm (0.010 inch) overall across head. If exceeded, either replace head or lightly machine the head surface.

The cylinder head surface finish should be 1.78-4.57 microns (15-80 microinches).

Inspect push rods. Replace worn or bent rods.

Inspect rocker arms. Replace if worn or scored.

OIL PAN

CLEANING

Clean the block and pan gasket surfaces.

If present, trim excess sealant from inside the engine.

Clean oil pan in solvent and wipe dry with a clean cloth.

Clean oil screen and pipe thoroughly in clean solvent. Inspect condition of screen.

INSPECTION

Inspect oil drain plug and plug hole for stripped or damaged threads. Repair as necessary.

Inspect oil pan mounting flange for bends or distortion. Straighten flange, if necessary.

OIL PUMP

CLEANING

Wash all parts in a suitable solvent and inspect carefully for damage or wear.

INSPECTION

Mating surface of the oil pump cover should be smooth. Replace pump cover if scratched or grooved.

Lay a straightedge across the pump cover surface (Fig. 62). If a 0.076 mm (0.003 inch) feeler gauge can be inserted between cover and straightedge, cover should be replaced.

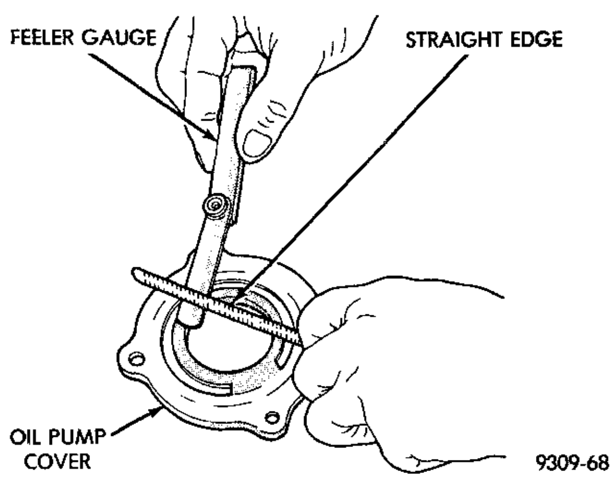

Fig. 62 Checking Oil Pump Cover Flatness

Measure thickness (Fig. 63) (Fig. 64)and diameter of rotors. If either rotor thickness measures 14.956 mm (0.5876 inch) or less, or if the diameter is 82.45 mm (3.246 inches) or less, replace rotor set.

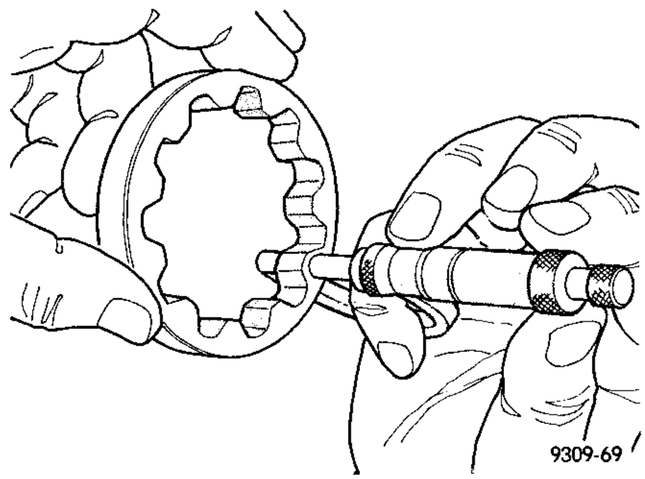

Fig. 63 Measuring Outer Rotor Thickness

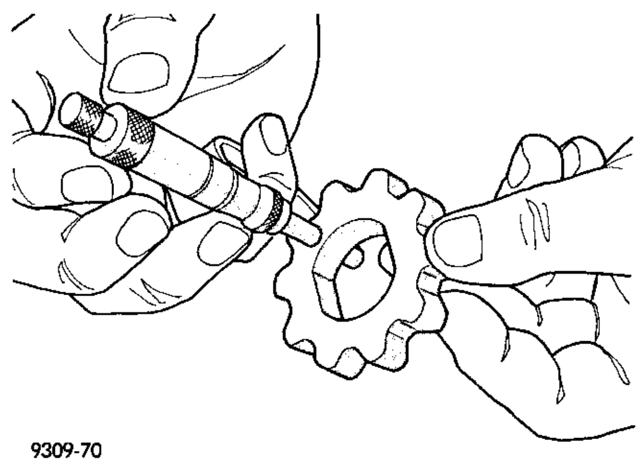

Fig. 64 Measuring Inner Rotor Thickness

Slide outer rotor into timing chain cover pump body. Press rotor to the side with your fingers and measure clearance between rotor and pump body (Fig. 65). If clearance is 0.19 mm (0.007 inch) or more, and outer rotor is within specifications, replace timing chain cover.

Install inner rotor into timing chain cover pump body (Fig. 66). Inner rotor should be positioned with chamfer up or toward engine when cover is installed. This allows easy installation over crankshaft. If clearance between inner and outer rotors is 0.150 mm (0.006 inch) or more, replace both rotors.

Place a straightedge across the face of the timing chain cover pump body, between bolt holes (Fig. 67). If a feeler gauge of 0.077 mm (0.003 inch) or more can be inserted between rotors and the straightedge,

CLEANING AND INSPECTION (Continued)

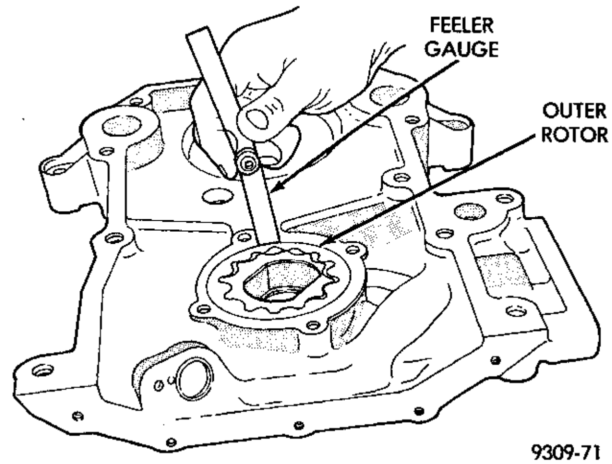

Fig. 65 Measuring Outer Rotor Clearance in Cover

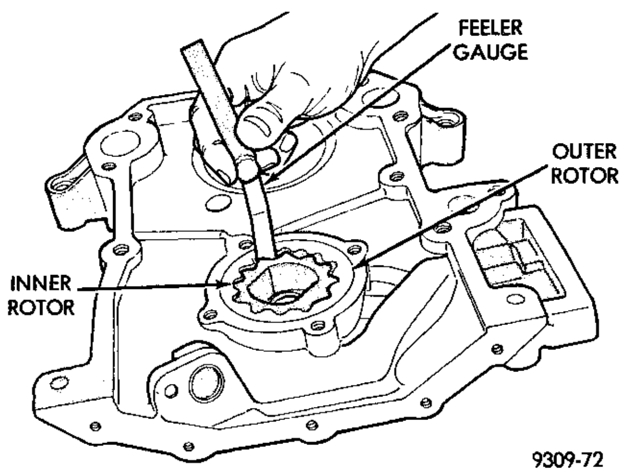

Fig. 66 Measuring Inner Rotor Clearance in Cover

and the rotors are within specifications, replace timing chain cover.

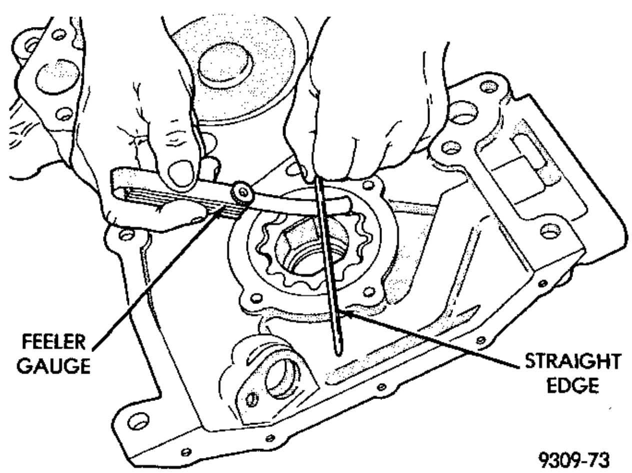

Fig. 67 Measuring Clearance Over Rotors

Inspect oil pressure relief valve plunger for scoring and free operation in its bore. Small marks may be removed with 400-grit wet or dry sandpaper.

The relief valve spring has a free length of approximately 49.5 mm (1.95 inches). The spring should test between 100 and 109 N (22.5 and 24.5 pounds) when compressed to 34 mm (1-11/32 inches). Replace spring that fails to meet these specifications.

If oil pressure was low and pump is within specifications, inspect for worn engine bearings or other reasons for oil pressure loss.

CYLINDER BLOCK

CLEANING

Clean cylinder block thoroughly and check all core hole plugs for evidence of leaking.

INSPECTION

Examine block for cracks or fractures.

The cylinder walls should be checked for out-of-round and taper with Cylinder Bore Indicator Tool, Special tool 6879 or equivalent. The cylinder block should be bored and honed with new pistons and rings fitted if:

- The cylinder bores show more than 0.127 mm (0.005 inch) out-of-round.
- The cylinder bores show a taper of more than 0.254 mm (0.010 inch).
- The cylinder walls are badly scuffed or scored.

Boring and honing operation should be closely coordinated with the fitting of pistons and rings so specified clearances may be maintained.

SPECIFICATIONS

8.0L ENGINE SPECIFICATIONS

GENERAL INFORMATION

Engine Type . . . . .90° V-10 OHV
Bore and Stroke . . .101.6 x 98.6 mm (4.00 x 3.88 in.)
Displacement .8.0L (488 c.i.)

5.9L DIESEL ENGINE

INDEX

GENERAL INFORMATION

PISTON GRADING

When rebuilding an engine with the original cylinder block, crankshaft and pistons, make sure the pistons are installed in the original cylinder.

If replacing the piston(s), make sure the replacement piston(s) are the same grade as the original piston.

If a new cylinder block or crankshaft is used, the piston grading procedure MUST be performed to determine the proper piston grade for each cylinder.

OIL FILTER

When replacing the oil filter, use replacement filter specified in your Operator's Manual.

CAUTION: The internal filtering medium of some filters has been known to disintegrate. Debris from failed filters may plug the piston oil cooling nozzles, resulting in scuffed pistons and eventual engine failure.

mopar AUTHENTIC RESTORATION PRODUCT

DESCRIPTION AND OPERATION

ENGINE DESCRIPTION

The 5.9 Liter (359 CID) six-cylinder diesel engine is an In-line valve in head type.

Engine type	In line 6 (Diesel Turbo)
Bore and Stroke	102.0 x 120.0 (4.02 x 4.72 in.)
Displacement	5.9L (359 cu. in.)
Compression Ratio	17.5:1
Horsepower (automatic)	180 @ 2500 rpm
Horsepower (manual)	215 @ 2600 rpm
Torque (automatic)	569 N·m (420 ft. lbs) @ 1500 rpm
Torque (manual)	596 N·m (440 ft. lbs.) @ 1600 rpm
Firing Order	1–5–3–6–2–4
Lubrication	Pressure Feed-Full Flow Filtration w/Bypass Valve
Engine Oil Capacity	10.4 L (11.0 Qts.) w/filter
Cooling System	Liquid Cooled – Forced Circulation
Cooling Capacity	23L (24 Qts.)
Cylinder Block	Cast Iron
Crankshaft	Induction Hardened Forged Steel
Cylinder Head	Cast Iron
Combustion Chambers	High Swirl Bowl
Camshaft	Chilled Ductile Iron
Pistons	Cast Aluminum
Connecting Rods	Forged Steel

This engine is designed for No.2 Diesel Fuel. Only use No.1 Diesel Fuel where extended arctic conditions exist (below -23°C or -10°F).

Engine lubrication system consists of a gerotor type oil pump and a full flow oil filter with a bypass valve.

The cylinders are numbered from front to rear; 1 to 6. The firing order is 1-5-3-6-2-4 (Fig. 1).

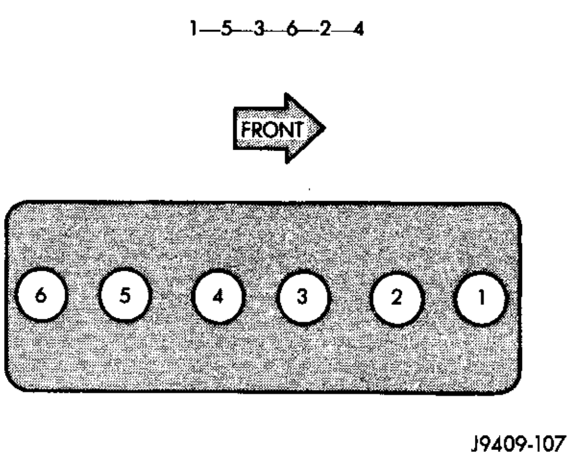

Fig. 1 Firing Order

The engine data plate is located on the driver side of the engine forward of the fuel injection pump.

LUBRICATION SYSTEM

The engine uses a gerotor type lubricating pump. The machined cavity in the block is the same for all engines. The pressure regulating valve is designed to keep the lubricating oil pressure from exceeding 449 kPa (65 PSI). When the lubricating oil pressure from the pump is greater the 499 kPa (65 PSI), The valve opens uncovering the dump port so part of the lubricating oil is routed to the oil pan. Because of manufacturing tolerances of the components and the oil passages, the lubricating oil pressure can differ as much as 69 kPa (10 PSI) between engines.

The engines use full flow, plate type oil coolers. The oil flows through a cast passage in the cooler cover and through the element where it is cooled by the engine coolant flowing past the plates of the elements. After the oil is cooled, it flows through the full flow oil filter.

The lubricating oil cooler cover contains a bypass valve the will let the lubricating oil flow bypass a plugged filter. The valve is designed to open when the pressure drop across the filter is more than 172 kPa (25 PSI), as with a plugged filter and lets the lubricating oil continue on through the engine. When a filter becomes plugged, an oil pressure decrease of 60 kPa (10 PSI) or less from normal operating pressure can be observed on the vehicle lubricating oil pressure gauge. This allows unfiltered oil into the engine. This condition should be avoided by changing the filter at each oil change.

The turbocharger receives filtered, cooled and pressurized lubricating oil through a supply line from the filter head. A drain line connected to the bottom of the turbocharger housing returns the lubricating oil to the lubricating oil pan through a fitting in the cylinder block.

The main bearings and the valve train are lubricated by pressurized oil directly from the main oil gallery. the other power components, connecting rods, pistons, and camshaft receive pressurized oil directly from the main oil gallery. Passages in the crankshaft supply oil to the connecting rods bearings. The oil is supplied to the camshaft journals through passages in the main bearings saddles. Smaller passages in the main bearings saddles supply oil to the pistons cooling nozzles. The spray from the nozzles also provides lubrication for the piston pins.

Lubrication for the valve train is supplied through separate passages in the cylinder block. Oil flows through the passages and across the oil transfer slot in the cylinder head gasket. From the transfer slot, the oil flows around the outside diameter at the cylinder capscrew, across a slot in the bottom of the rocker lever support, and up the vertical passage in the support. From these passages, oil flows through passages in the rocker lever shaft to lubricate the rocker levers. The oil from the channel lubricates the valves stems, push rods, and tappets.

AUTHENTIC RESTORATION PRODUCT

DESCRIPTION AND OPERATION (Continued)

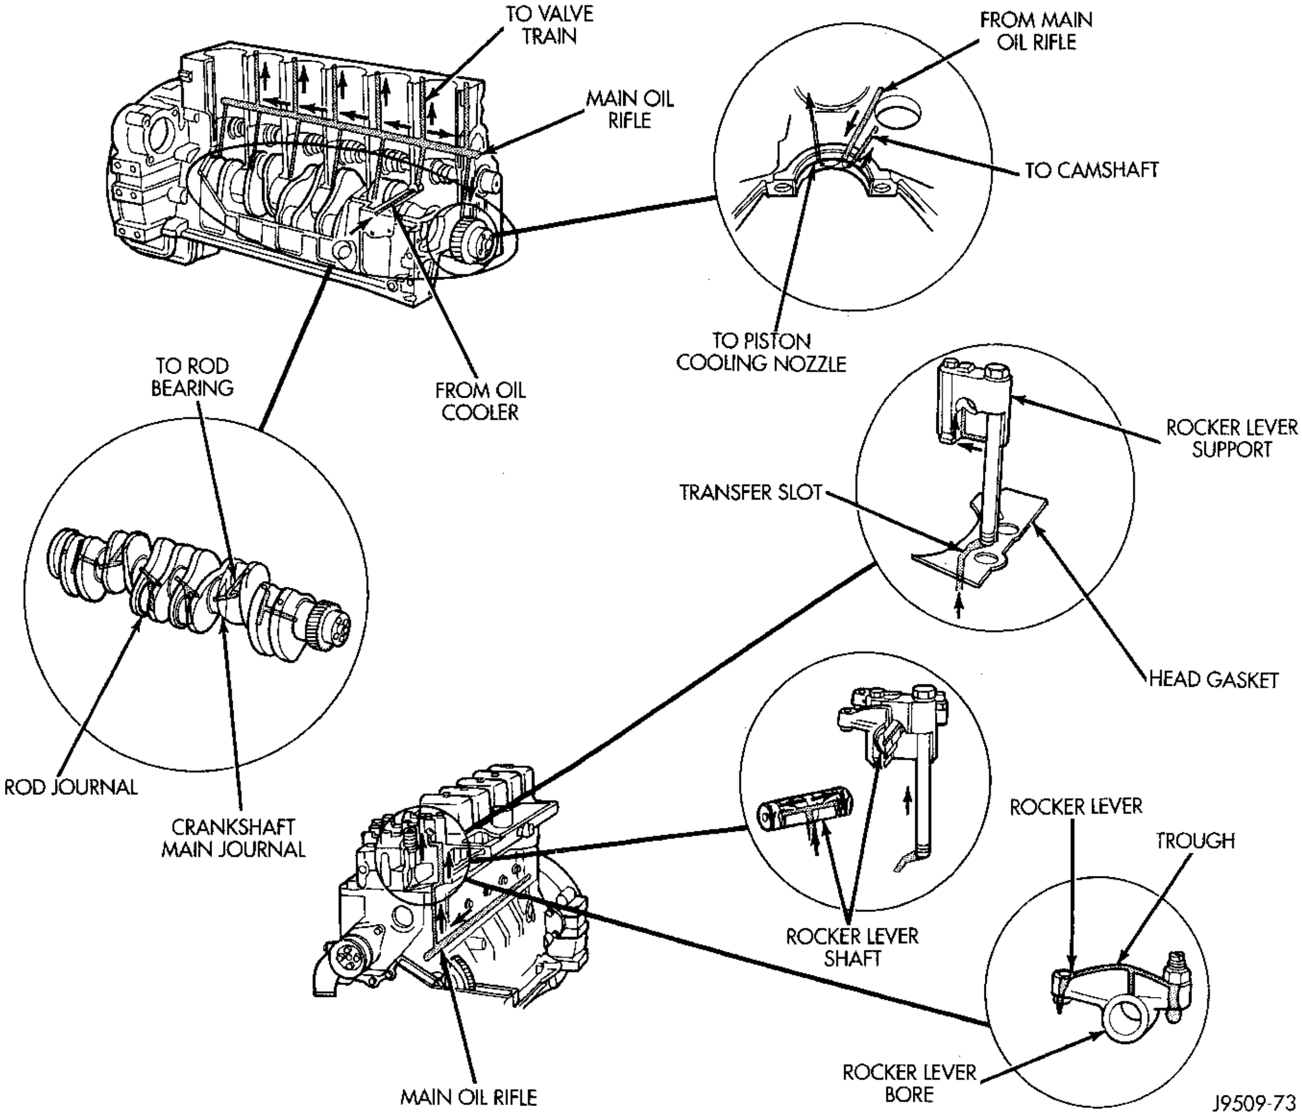

Fig. 2 Lubricating System Components

DESCRIPTION AND OPERATION (Continued)

OIL PRESSURE REGULATOR VALVE

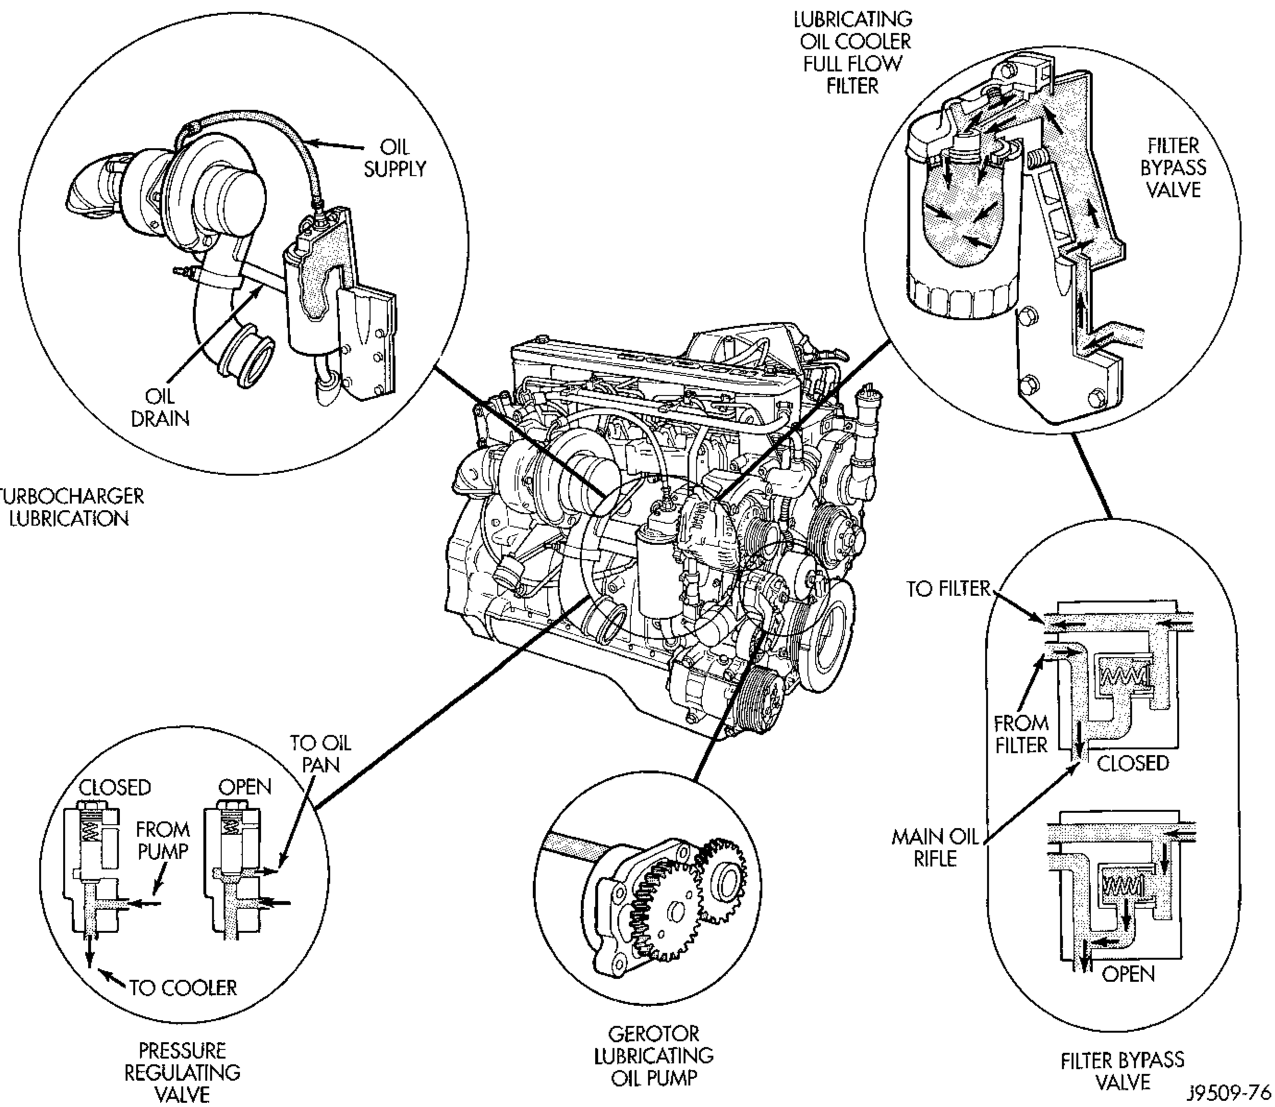

Fig. 3 Lubricating System Passages

When oil pressure from the oil pump exceeds 448 kPa (65 psi), the regulator valve opens to allow oil to drain back into the pan.

TIMING PIN

The timing pin is used for three different procedures:
- Valve adjustment
- Top Dead Center (TDC) location
- Fuel injector pump timing procedure

VACUUM PUMP

The vacuum pump and the power steering pump are combined into a single assembly on diesel engine models (Fig. 4). Both pumps are operated by a drive gear attached to the vacuum pump shaft. The shaft gear is driven by the camshaft gear.

The vacuum pump is a constant displacement, vane-type pump. Vacuum is generated by four vanes mounted in the pump rotor. The rotor is located in the pump housing and is pressed onto the pump shaft.

The vacuum and steering pumps are operated by a single drive gear pressed onto the vacuum pump shaft. The drive gear is operated by the engine camshaft gear.

The vacuum and power steering pump shafts are connected by a coupling. Each pump shaft has an adapter with drive lugs that engage in the coupling.

The vacuum pump rotating components are lubricated by engine oil. Lubricating oil is supplied to the pump through an oil line at the underside of the pump housing.

The complete assembly must be removed in order to service either pump. However, the power steering

AUTHENTIC RESTORATION PRODUCT

DESCRIPTION AND OPERATION (Continued)

pump can be removed and serviced separately when necessary.

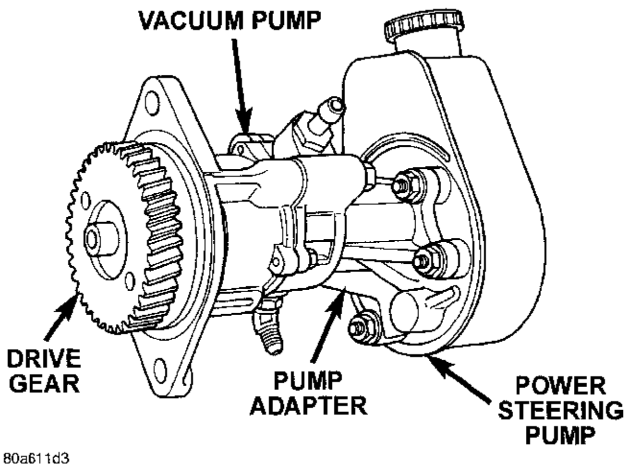

Fig. 4 Diesel Vacuum & Power Steering Pump Assembly

The vacuum pump is not a serviceable component. If diagnosis indicates a pump malfunction, the pump must be replaced as an assembly. Do not disassemble or attempt to repair the pump.

The combined vacuum and steering pump assembly must be removed for access to either pump. However, the vacuum pump can be removed without having to disassemble the power steering pump.

If the power steering pump requires service, simply remove the assembly and separate the two pumps. Refer to the pump removal and installation procedures in this section.

VACUUM PUMP OPERATION

Vacuum pump output is transmitted to the HEVAC, speed control, and EGR systems through a supply hose. The hose is connected to an outlet port on the pump housing and uses an in-line check valve to retain system vacuum when vehicle is not running.

Pump output ranges from a minimum of 8.5 to 25 inches vacuum.

The pump rotor and vanes are rotated by the pump drive gear. The drive gear is operated by the camshaft gear.

SERVICE PROCEDURES

ENGINE OIL SERVICE

When replacing the oil filter, use replacement filter specified in your Operator's Manual.

CAUTION: The internal filtering medium of some filters has been known to disintegrate. Debris from failed filters may plug the piston oil cooling nozzles, resulting in scuffed pistons and eventual engine failure.

REMOVAL

WARNING: HOT OIL CAN CAUSE PERSONAL INJURY.

(1) Operate the engine until the water temperature reaches 60°C (140°F). Shut the engine off.

(2) Use a container that can hold at least 14 liters (15 quarts) to hold the used oil. Remove the oil drain plug and drain the used engine oil into the container.

(3) Always check the condition of the used oil. This can give you an indication of some engine problems that might exist.

- Thin, black oil indicates fuel dilution.
- Milky discoloration indicates coolant dilution.

(4) Clean the area around the lubricating oil filter head. Remove the filter using a 90-95 mm filter wrench.

(5) Clean the gasket surface of the filter head. The filter canister O-Ring seal can stick on the filter head. Make sure it is removed.

INSTALLATION

(1) Fill the oil filter element with clean oil before installation. Use the same type oil that will be used in the engine.

(2) Apply a light film of lubricating oil to the sealing surface before installing the filter.

CAUTION: Mechanical over-tightening may distort the threads or damage the filter element seal.

(3) Install the filter as specified by the filter manufacturer.

(4) Clean the drain plug and the sealing surface of the pan. Check the condition of the threads and sealing surface on the oil pan and drain plug.

(5) Install the drain plug. Tighten the plug to 60 N·m (44 ft. lbs.) torque.

(6) Use only High-Quality Multi-Viscosity lubricating oil in the Cummins Turbo Diesel engine. Choose the correct oil for the operating conditions outlined in Group 0, Lubrication and Maintenance.

(7) Fill the engine with the correct grade of new oil. Refer to Group 0, Lubrication and Maintenance for the correct oil fill capacity.

(8) Start the engine and operate it at idle for several minutes. Check for leaks at the filter and drain plug.

(9) Stop engine. Wait several minutes to allow the oil to drain back to the pan and check the level again.

SERVICE PROCEDURES (Continued)

VALVE SERVICE

VALVE GUIDE INSTALLATION

THIN WALL—SERVICE GUIDES

Machine the cylinder head valve guide bores to 11.125 ±0.013 mm (0.4380 ±0.0005 inch) in diameter (Fig. 5).

Service valve guides must be centered with valve seats within 0.35 mm (0.01378 inch) diameter. They must also be square with the combustion face within 0.10 mm (0.004 inch) at 50.0 mm (1.9685 inch) radius.

Lubricate the valve guides with oil and press the guides flush to the bottom of the bosses.

Trim off the top of the valve guides flush to top of guide bosses, if necessary.

Machine the valve guide bores to 8.029 ±0.010 mm (0.3161 ±0.0004 inch) - (Fig. 5).

The valve guide bore must be centered with the valve seat within 0.35 mm (0.0138 inch) diameter. It also must be square with the combustion face within 0.010 mm (0.0004 inch) at 50.0 mm (2.0 inch) radius.

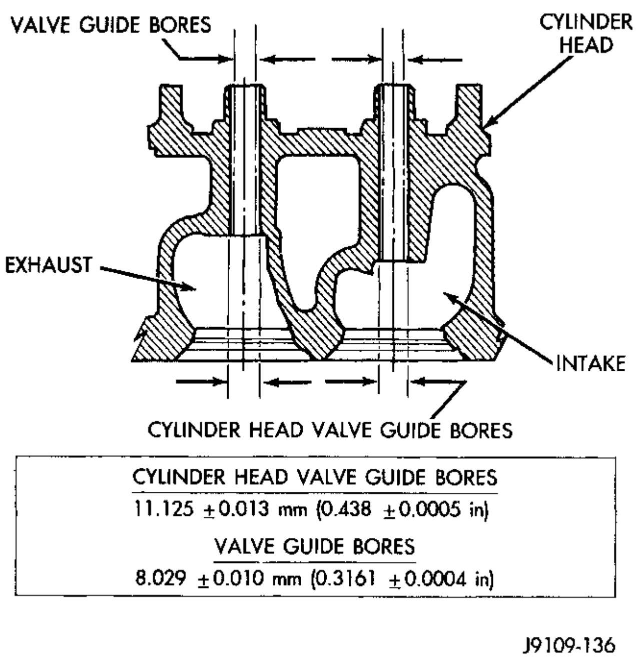

Fig. 5 Service Valve Guides—Thin Wall

THICK WALL—SERVICE GUIDES

Machine the cylinder head valve guide bores to 14.000 ±0.013 mm (0.5512 ±0.0005 inch) diameter (Fig. 6).

Valve guides must be centered with valve seats within 0.35 mm (0.01378 inch) diameter. Valve guides must also be square with the combustion face within 0.10 mm (0.004 inch) at 50.0 mm (2.0 inch) radius.

Lubricate the valve guides with oil and press in the guides to 12.25 ±0.50 mm (0.4823 ±0.020 inch) protrusion above the cylinder head.

Ream the bores to 8.029 ±0.010 mm (0.3161 ±0.0004 inch) - (Fig. 6).

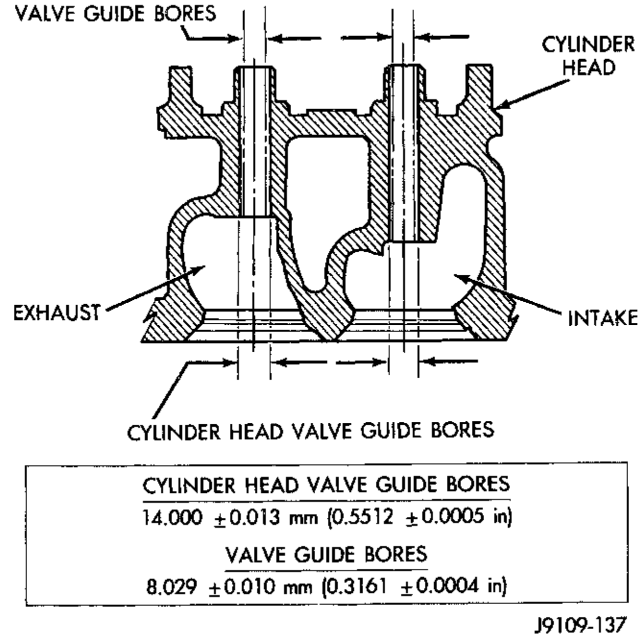

Fig. 6 Service Valve Guides—Thick Wall

VALVE SEATS

INTEGRAL VALVE SEAT GRINDING

After resurfacing the valves and determining that all valves meet specifications, install the valves in their designated locations and measure valve depth (Fig. 7). The valve depth is the distance from the valve face to the head deck. Record the depth of each valve.

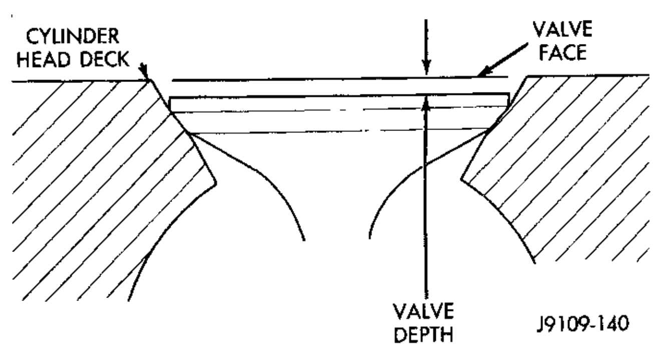

Fig. 7 Valve Depth

Grind the valve seats to remove scores, scratches and burns. The seat angle should be—Intake 30° and Exhaust 45°.

SERVICE PROCEDURES (Continued)

Install the valves in their respective bores and measure the depth again (Fig. 7). Record the depth of each valve.

The grinding depth is the difference between the measurement before grinding and the measurement after grinding. The grinding depth maximum limit (integral seats only) is 0.254 mm (0.010 inch). Service valve seats are available for over limit integral valve seats.

Identify ground valve seats by stamping the cylinder head.

Install the valves in their designated locations and measure the depth of each. The valve depth limit (Integral and Inserted Seats) is 0.99 mm to 1.52 mm (0.039 inch to 0.060 inch). Replace the valve if the depth is over this limit.

Apply a light coat of valve lapping compound to each valve and lap each valve to its mating seat.

Remove the valves and clean lapping compound from the valves and seats.

Measure the valve seat width indicated by the lapping surface. The valve seat width limit is 1.50-2.00 mm (0.060-0.080 inch).

If required, grind the areas with a 60° stone and a 15° stone to center the seat on the valve face. Maintain the valve seat width limits (Fig. 8).

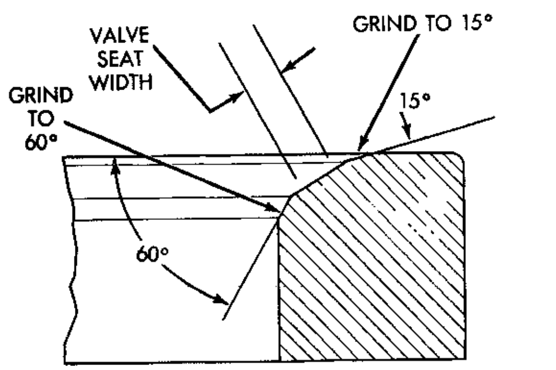

Fig. 8 Grind Valve Seat

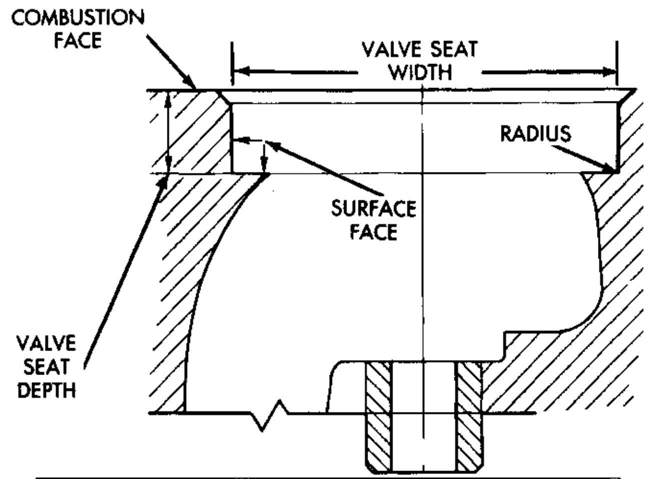
SERVICE VALVE SEAT INSTALLATION

Inspect the valve guide bores as described in the Cleaning and Inspection section of this group. If it is necessary to install valve guides, install the guides before installing the service seats.

Replacement valve seat inserts must be installed if the valve seats have been ground previously. The illustrated marks indicate valve seats have been ground previously.

Machine the cylinder head to install the service valve seats (Fig. 9) (Fig. 10).

Press service seats into the machined pockets. Stake the valve seats into the pockets.



VALVE SEAT DEPTH
10.40 ±0.10 mm (0.4094 ±0.004 inch)
VALVE SEAT WIDTH
47.0 ±0.013 mm (1.8504 ±0.0005 in)
MAXIMUM RADIUS
0.40 mm (0.0157 inch) MAX.
SURFACE FINISH
3.2 micrometers (128.0 microinch)

J9409-115

Fig. 9 Machining for Service Valve Seats—Intake Valve

SERVICE VALVE SEAT GRINDING

Install the valves in their designated location and measure the valve depth. The valve depth is the distance from the valve face to the head deck.

Record the depth of each valve (Fig. 11). The depth is 0.99-1.52 mm (0.039-0.060 inch).

Grind the valve seats to remove scores, scratches and burns. The valve seat angle is 30° (Intake) and 45° (Exhaust).

Install the valves in their respective bores and measure the depth again (Fig. 11). The valve depth limit is 0.99-1.52 mm (0.039-0.060 inch). Replace the valve if the depth is over the limit.

Apply a light coat of valve lapping compound to each valve and lap each valve to its companion seat. Remove the valves and clean the lapping compound from the valve and seats.

Measure the valve seat width indicated by the lapped surface (Fig. 12). The width limits are 1.5-2.0 mm (0.060-0.080 inch). If required, grind lower area with 60° stone and upper area with 15° stone (Fig. 12). Be sure to center the seat on the valve face. Maintain the valve seat within limits.

SERVICE PROCEDURES (Continued)

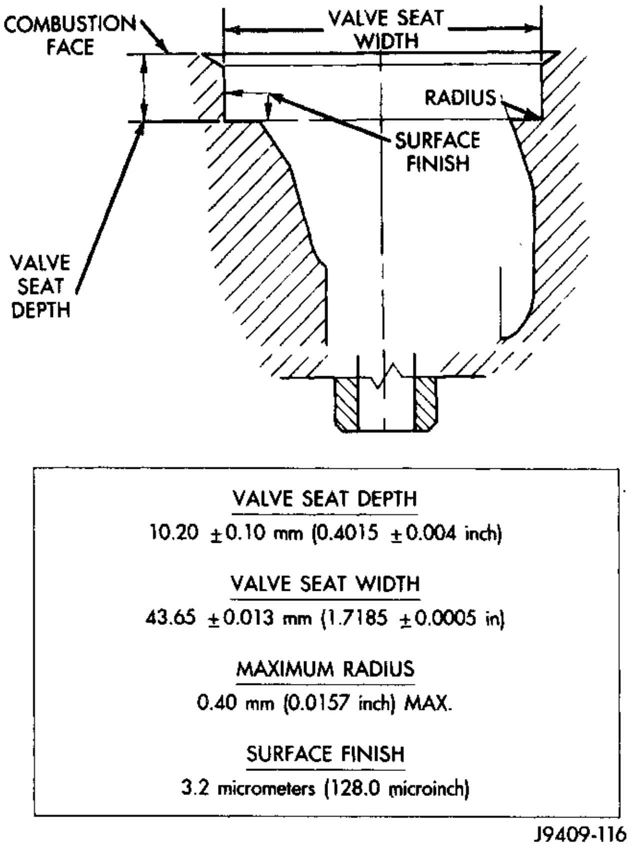


Fig. 10 Machining for Service Valve Seats—Exhaust Valve

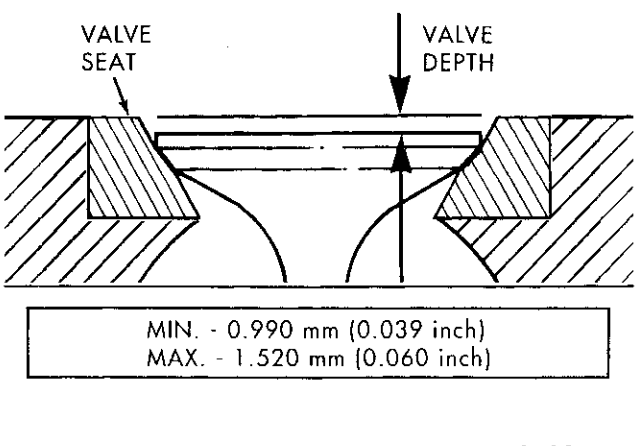

Fig. 11 Valve Depth with Seat Insert

SERVICE VALVE SEAT REPLACEMENT

To replace service seat inserts, machine the insert in the same manner as if machining out the internal seat. Hold the same tolerances and follow the same installation procedures.

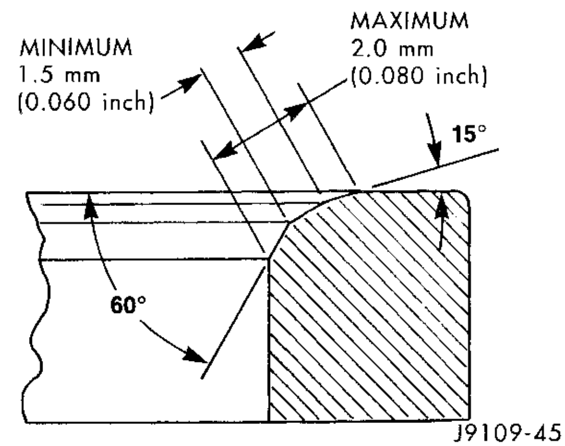

Fig. 12 Valve Seat Width

CYLINDER BORES—DE-GLAZE

(1) New piston rings may not seat in glazed cylinder bores.

(2) De-glazing gives the bore the correct surface finish required to seat the rings. The size of the bore is not changed by proper de-glazing.

(3) Cover the lube holes in the top of the block with waterproof tape.

(4) A correctly honed surface will have a crosshatch appearance with the lines at 15° to 25° angles (Fig. 13). For the rough hone, use 80 grit honing stones. To finish hone, use 280 grit honing stones.

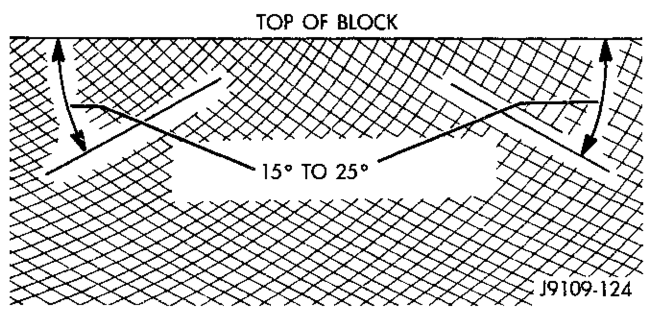

Fig. 13 Cylinder Bore Crosshatch Pattern

(5) Use a drill, a fine grit Flex-hone and a mixture of equal parts of mineral spirits and SAE 30W engine oil to de-glaze the bores.

(6) The crosshatch angle is a function of drill speed and how fast the hone is moved vertically (Fig. 14).

(7) Vertical strokes MUST be smooth continuous passes along the full length of the bore (Fig. 14).

(8) Inspect the bore after 10 strokes.

(9) Use a strong solution of hot water and laundry detergent to clean the bores. Clean the cylinder bores immediately after de-glazing.

(10) Rinse the bores until the detergent is removed and blow the block dry with compressed air.

AUTHENTIC RESTORATION PRODUCT

SERVICE PROCEDURES (Continued)

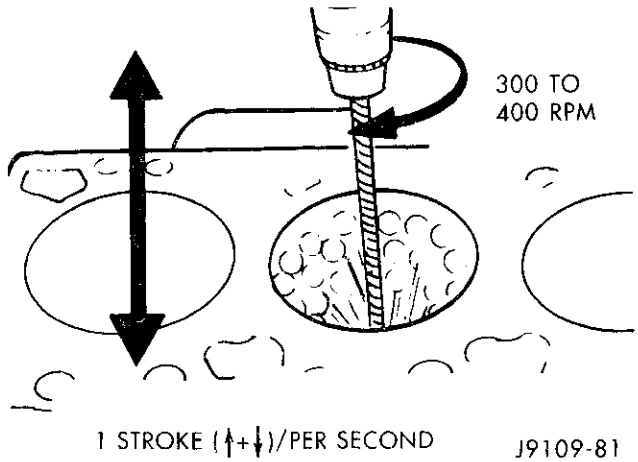

Fig. 14 De-Glazing Drill Speed and Vertical Speed

(11) Check the bore cleanliness by wiping with a white, lint free, lightly oiled cloth. If grit residue is still present, repeat the cleaning process until all residue is removed. Wash the bores and the complete block assembly with solvent and dry with compressed air.

(12) Be sure to remove the tape covering the lube holes after the cleaning process is complete.

CYLINDER BLOCK REFACING

(1) The combustion deck can be refaced twice. The first reface should be 0.25 mm (0.0098 inch). If additional refacing is required, an additional 0.25 mm (0.0098 inch) can be removed. Total allowed refacing is 0.50 mm (0.0197 inch) - (Fig. 15).

CYLINDER BLOCK REFACING DIMENSIONS

DIMENSION "A"		
1st Reface	0.25mm	(0.0098 in.)
2nd Reface	0.25mm	(0.0098 in.)
Dim (A) Total	0.50 mm	(0.0197 in.)
DIMENSION "B"		
Dim. "B" (STD.)	323.00 mm ± 0.10 mm	(12.7165 in. ± 0.0039 in.)
1st Reface	322.75 mm ± 0.10 mm	(12.7067 in. ± 0.0039 in.)
2nd Reface	322.50 mm ± 0.10 mm	(12.6968 in. ± 0.0039 in.)

(2) The upper right corner of the rear face of the block must be stamped with a X when the block is refaced to 0.25 mm (0.0098 inch). A second X must be stamped beside the first when the block is refaced to 0.50 mm (0.0197 inch) - (Fig. 16).

(3) Consult the parts catalog for the proper head gaskets which must be used with refaced blocks to ensure proper piston-to-valve clearance.

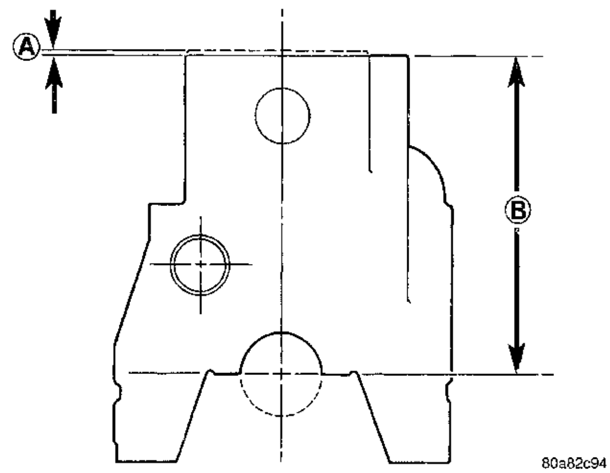

Fig. 15 Refacing Dimensions of the Cylinder Block

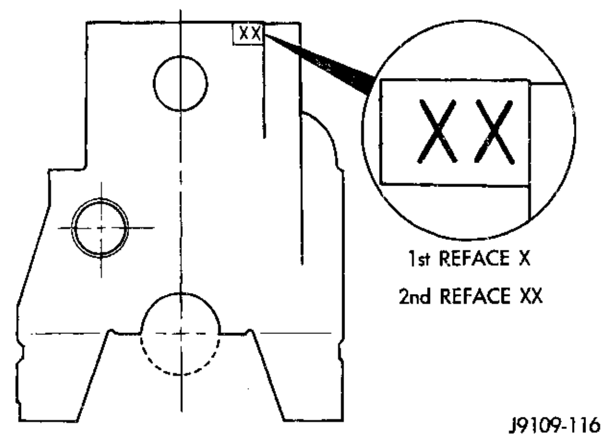

Fig. 16 Stamp Block after Reface

CYLINDER BORE REPAIR

Cylinder bore(s) can be repaired by one of two methods:

- Method 1:—Over boring and using oversize pistons and rings.
- Method 2:—Boring and installing a repair sleeve to return the bore to standard dimensions.

METHOD 1—OVERSIZE BORE

Oversize pistons and rings are available in two sizes - 0.50 mm (0.0197 inch) and 1.00 mm (0.0393 inch).

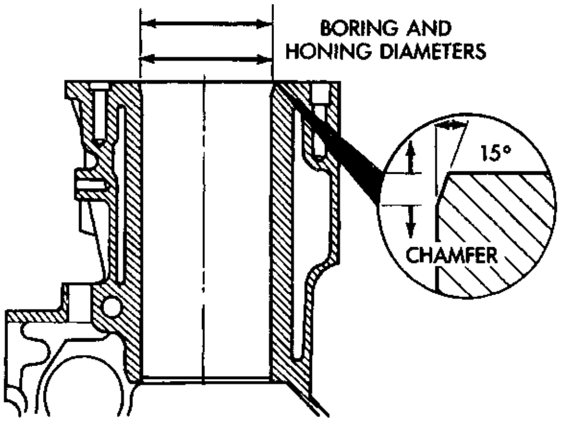
Any combination of standard, 0.50 mm (0.0197 inch) or 1.00 mm (0.0393 inch) overbore may be used in the same engine.

If more than 1.00 mm (0.0393 inch) overbore is needed, a repair sleeve can be installed (refer to Method 2—Repair Sleeve).

Cylinder block bores may be bored twice before use of a repair sleeve is required (Fig. 17). The first bore is 0.50 mm (0.0197 inch) oversize. The second bore is 1.00 mm (0.0393 inch) oversize.

SERVICE PROCEDURES (Continued)

After boring to size, use a honing stone to chamfer the edge of the bore (Fig. 17).



BORING DIAMETER DIMENSION

1st REBORE – 102.469 mm
(4.0342 inch)
2nd REBORE – 102.969 mm
(4.0539 inch)

HONING DIAMETER DIMENSIONS

STANDARD 102.020 ±0.020 mm
(4.0165 ±0.0008 inch)
1st REBORE 102.520 ±0.020 mm
(4.0362 ±0.0008 inch)
2nd REBORE 103.020 ±0.020 mm
(4.0559 ±0.0008 inch)

CHAMFER DIMENSIONS

Approx. 1.25 mm (0.049 inch)
by 15°

J9109-119

Fig. 17 Cylinder Bore Dimensions

A correctly honed surface will have a crosshatch appearance with the lines at 15° to 25° angles with the top of the cylinder block (Fig. 18). For the rough hone, use 80 grit honing stones. To finish hone, use 280 grit honing stones.

A maximum of 1.2 micrometer (48 microinch) surface finish must be obtained.

After finish honing is complete, immediately clean the cylinder bores with a strong solution of laundry detergent and hot water.

After rinsing, blow the block dry.

Check the bore cleanliness by wiping with a white, lint-free, lightly- oiled cloth. There should be no grit residue present.

If the block is not to be used right away, coat it with a rust- preventing compound.

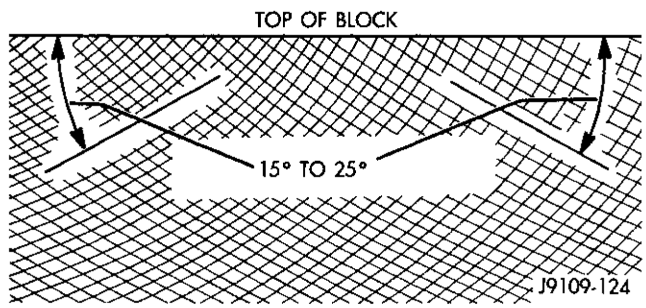


Fig. 18 Crosshatch Pattern of Repaired Sleeve(s)

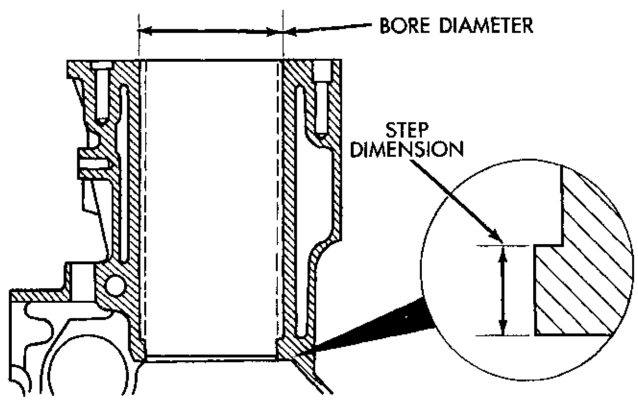
METHOD 2—REPAIR SLEEVE

If more than a 1.00 mm (0.03937 inch) diameter oversize bore is required, the block must be bored and a repair sleeve installed.

Bore the block cylinder bore to 104.500-104.515 mm (4.1142-4.1148 inch) - (Fig. 19).

Repair sleeves can be replaced by using a boring bar to bore out the old sleeve. DO NOT cut the cylinder bore beyond the oversize limit.



BLOCK REBORE FOR REPAIR SLEEVE

BORE DIA. – 104.500 +0.015 mm
(4.1142 +0.0006 inch)
STEP DIM. – 6.35 mm (0.25 inch)

J9109-120

Fig. 19 Block Bore for Repair Sleeve Dimensions

After machining the block for the new repair sleeve, thoroughly clean the bore of all metal chips, debris and oil residue before installing the sleeve.

Cool the repair sleeve(s) to a temperature of -12°C (10°F) or below for a minimum of one hour. Be ready to install the sleeve immediately after removing it from the freezer.

Apply a coat of Loctite 620, or equivalent to the bore that is to be sleeved.

Wear protective gloves to push the cold sleeve into the bore as far as possible.

SERVICE PROCEDURES (Continued)

Using a sleeve driver, drive the sleeve downward until it contacts the step at the bottom of the bore (Fig. 20).

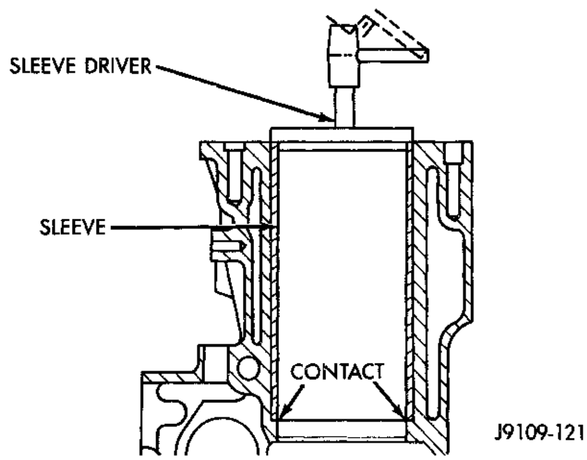


Fig. 20 Sleeve Installation

A sleeve driver can be constructed as follows (Fig. 21).

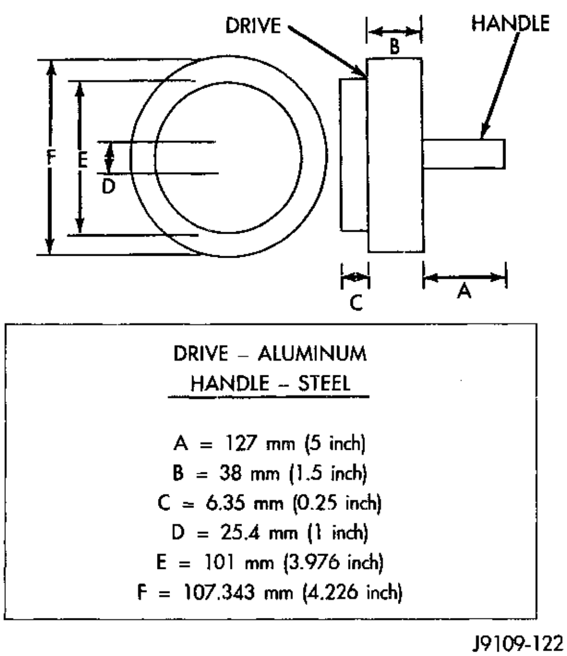

Fig. 21 Sleeve Driver Construction

Set up a boring bar and machine the sleeve to 101.956 mm (4.014 inch) - (Fig. 22).

After removing the boring bar, use a honing stone to chamfer the corner of the repair sleeve(s) - (Fig. 22).

A correctly honed surface will have a crosshatch appearance with the lines at 15° to 25° angles with the top of the cylinder block. For the rough hone, use 80 grit honing stones. To finish hone, use 280 grit honing stones.

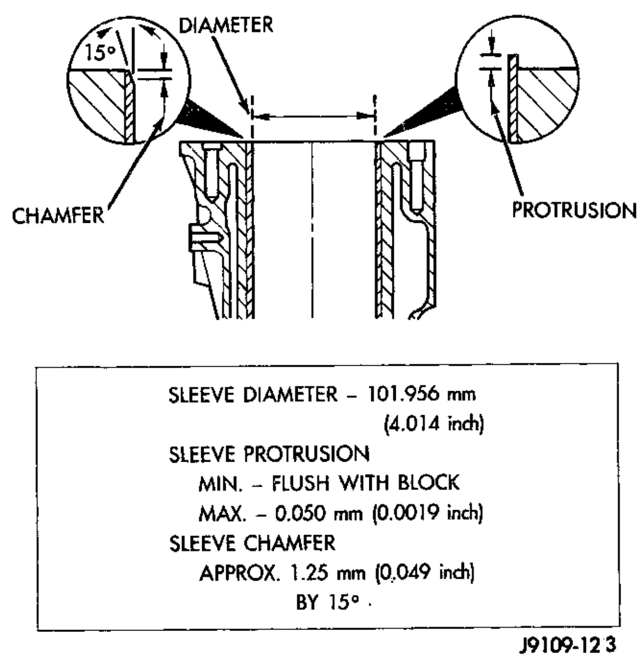

Fig. 22 Sleeve Machining Dimensions

Finished bore inside dimension is 102.020 ±0.020 mm (4.0165 ±0.0008 inch).

A maximum of 1.2 micrometer (48 microinch) surface finish must be obtained.

After finish honing is complete, immediately clean the cylinder bores with a strong solution of laundry detergent and hot water.

After rinsing, blow the block dry with compressed air.

Wipe the bore with a white, lint-free, lightly oiled cloth. Make sure there is no grit residue present.

Apply a rust-preventing compound if the block will not be used immediately.

A standard diameter piston and a piston ring set must be used with a sleeved cylinder bore.

CAM BORE REPAIR

The front cam bushing bore can be bored to 59.235 Mm ±0.013 mm (2.332 inch ±0.0006 inch) oversize. DO NOT bore the intermediate or rear cam bore to the front cam bore oversize dimensions. Intermediate and rear cam bores may be bored to 57.235 mm ±0.013 mm (2.253 inch ±0.0006 inch) oversize.

A surface finish of 2.3 micrometers (92 microinch) must be maintained. Not more than 20% of an area of any one bore may be 3.2 micrometers (126 microinch).

Camshaft bores can be repaired individually. It is not necessary to repair undamaged cam bores in order to repair individually damaged cam bores. The standard front bushing cannot be used to repair intermediate or rear bores.

SERVICE PROCEDURES (Continued)

Install all cam bushings flush or below the front cam bore surface. The oil hole must align to allow a 3.2 mm (0.125 inch) rod to pass through freely (Fig. 23).

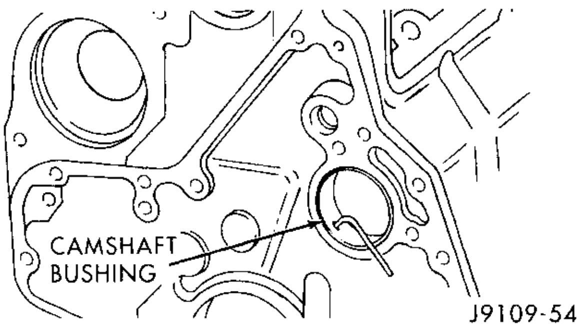

Fig. 23 Oil Hole Alignment

CYLINDER BLOCK CUP PLUG REPLACEMENT

(1) Remove the cup plugs from the oil passages (Fig. 24).

(2) Apply a bead of Loctite 277 around the outside diameter of the oil passage cup plugs.

(3) Drive the cup plugs in until they bottom in the bore (Fig. 24).

(4) Fill the engine with oil. Run the engine and check for leaks.

(5) Stop the engine and check the oil level with the dipstick.

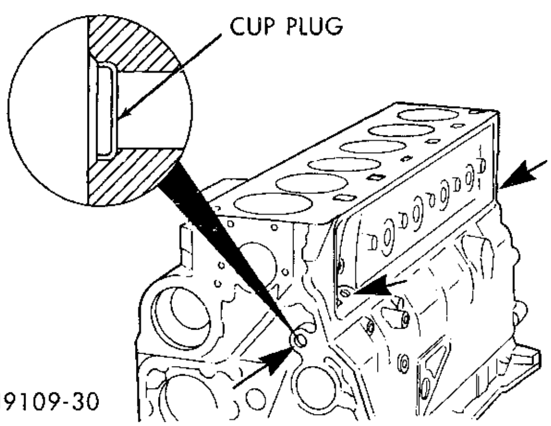

Fig. 24 Cup Plug Locations in Cylinder Block

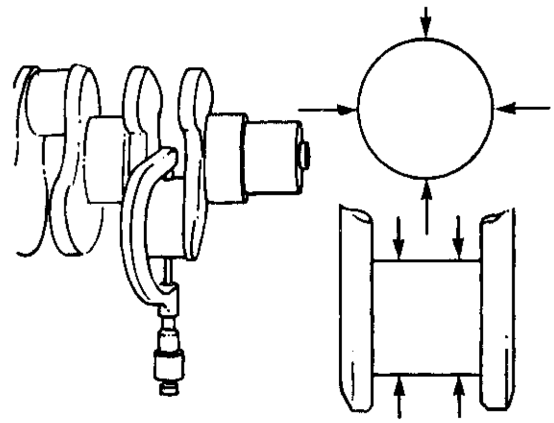
CONNECTING ROD BEARING AND CRANKSHAFT JOURNAL CLEARANCE

Measure the connecting rod bore with the bearings installed and the bolts tightened to 100 N·m (73 ft. lbs.) torque.

Record the smaller diameter.

Measure the diameter of the rod journal at the location shown (Fig. 25). Calculate the average diameter for each side of the journal.

The clearance is the difference between the connecting rod bore (smallest diameter) and the average diameter for each side of the crankshaft journal.



MIN.	68.962 mm	(2.715 inch)
MAX.	69.013 mm	(2.717 inch)

Out-of-Round - Max.
0.050 mm (0.002 inch)

Taper - Max.
0.013 mm (0.0005 inch)

Bearing Clearance - Max.
0.089 mm (0.0035 inch)

J9109-91

Fig. 25 Connecting Rod Journal Diameter Limits

If the crankshaft is within limits, replace the bearing. If the crankshaft is out of limits, grind the crankshaft to the next smaller size and use oversize rod bearings.

PISTON GRADING PROCEDURE

- When rebuilding an engine with the original cylinder block, crankshaft and pistons, make sure the pistons are installed in their original cylinder.
- If replacing the piston(s), make sure the replacement piston(s) are the same grade as the one being replaced.
- If a new cylinder block and/or crankshaft is used, the piston grading procedure **MUST** be performed to determine the proper piston grade for each cylinder.

(1) Install any of the original connecting rod and piston assemblies into the No.1 cylinder. DO NOT install the piston rings.

(2) Install the upper bearing shell in the connecting rod with the tang of the bearing in the slot of the connecting rod. The connecting rod bearing shell must be installed in the original connecting rod and

AUTHENTIC RESTORATION PRODUCT

SERVICE PROCEDURES (Continued)

cap. Use clean lubricating oil to coat the inside diameter of the connecting rod bearing shell.

(3) Install the bearing shell in the connecting rod cap with the tang of the bearing in the slot to the cap. Use clean lubricating oil to coat the inside diameter of the bearing shell.

(4) The four digit number stamped on the connecting rod and cap at the parting line must match and be installed on the oil cooler side of the engine. Install the connecting rod cap and capscrews. Tighten the capscrews to 35 N·m (26 ft. lbs.) torque.

(5) Use a fine grit stone to remove any burrs from the cylinder block head deck. Zero the dial indicator to the cylinder block head deck.

(6) Move the dial indicator directly over the piston pin to eliminate any side-to-side movement.

(7) Rotate the crankshaft to top dead center (TDC). Rotate the crankshaft clockwise and counterclockwise to find the highest dial indicator reading. Record the reading.

(8) Remove the piston and connecting rod assembly from the No.1 cylinder and install the assembly into the No.2 cylinder. Repeat the procedure for every cylinder using the same piston and connecting rod assembly.

(9) Determine the grade of the piston being used by referring to the Piston Protrusion Chart below. Four digits on top of the piston can be cross referenced to a Chrysler part number for replacement (Fig. 26). If the number on the piston cannot be seen, measure from the top of the piston to the top of the piston pin to see what grade piston is used (Fig. 27).

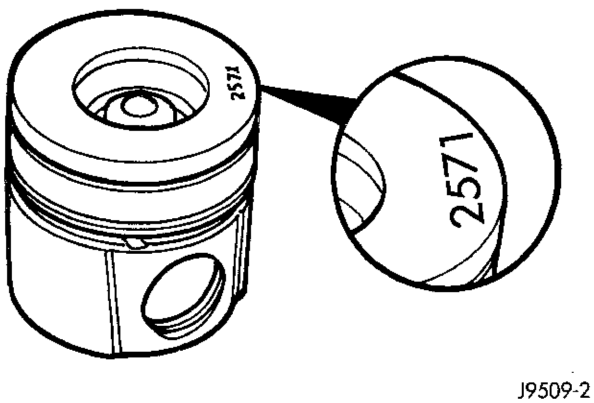


Fig. 26 Piston Grading Number Location

NOTE: Use the table below when piston grading numbers are missing or not legible.

PISTON PROTRUSION CHART

CRANKSHAFT REWORK

Crankshaft main and rod journals may be ground in increments of 0.25 mm (0.0098 inch) up to a total of 1.00 mm (0.0394 inch).

The only exception is the main journal thrust width surface. This journal must be ground in increments of 0.50 mm (0.0197 inch) up to a total of 1.00 mm (0.0394 inch). The thrust surface is located on the No.6 main bearing. When the thrust surface

SERVICE PROCEDURES (Continued)

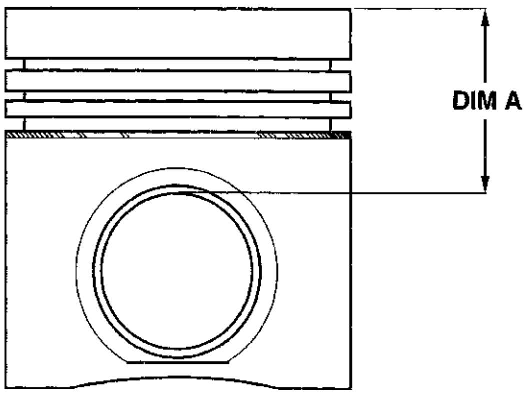

Fig. 27 Piston Grading Measurement

requires grinding, the main journal must be ground to the same undersize dimension.

CAUTION: Welding of the crankshaft is not allowed. Failure of the crankshaft will result.

MAIN JOURNAL

All main journals are to be ground in the opposite direction of engine rotation (clockwise as viewed from the front of crankshaft). Polish the journals in the same direction as engine rotation.

The main bearing grinding specifications are shown in (Fig. 28).

STANDARD MAIN JOURNAL DIAMETER	
83.000 ±0.013 mm (3.2677 ±0.0005 inch)	
WORN MAIN JOURNAL DIAMETER LIMIT	
82.962 (3.2662 inch)

OUT-OF ROUND & TAPER (MAX.)	
0.005 mm (0.0002 inch)	
ALL MAIN JOURNALS ARE TO BE PARALLEL TO THE FRONT AND REAR MAINS WITHIN: 0.030 mm (0.001 inch)	

J9109-125

Fig. 28 Crankshaft Main Journal Dimensions

Thrust journals can be ground in the same increments and using the same specifications as all other main journals. The main journal radius may be ground using either the preferred or the alternative procedure providing the thrust surface width is not being ground. The preferred procedure must be used when the main bearing thrust width surface is ground. When the thrust surface width requires grinding, the main journal must be ground to the same undersize dimension (Fig. 29).

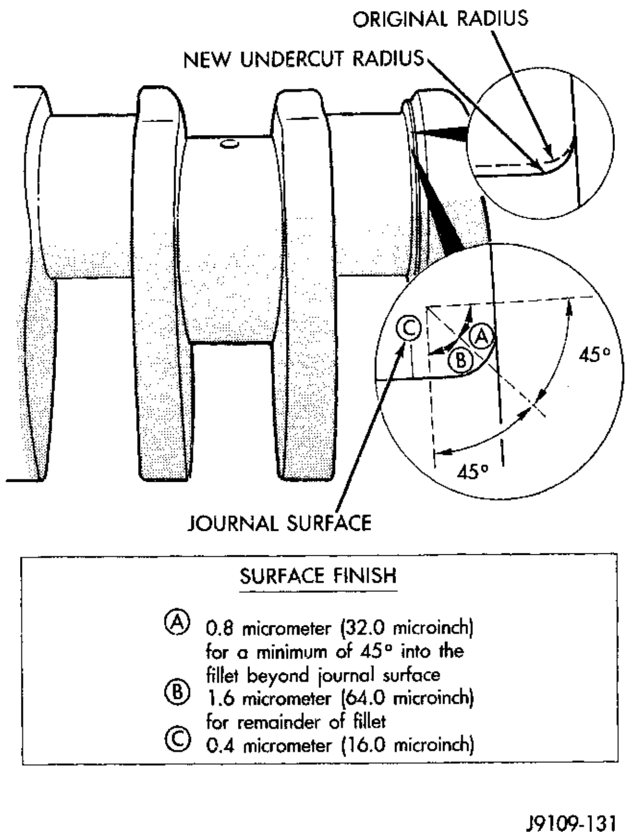

Fig. 34 Crankshaft Rod Journal Grind—Preferred Method

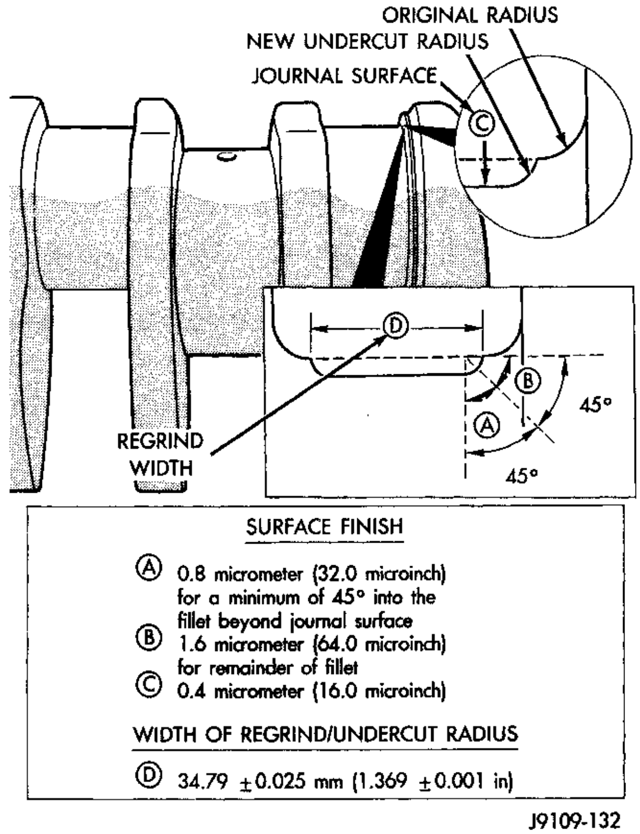

Fig. 35 Grind Crankshaft Rod Journal—Alternative Method

Install the crankshaft main bearings and measure main bearing bore diameter with the main bolts tightened to 176 N·m (130 ft. lbs.) torque (Fig. 36).

Measure the diameter of the main journal at the locations shown (Fig. 37). Calculate the average diameter for each side of the journal.

Calculate the main bearing journal to bearing clearance. the clearance specifications are 0.119 mm (0.00475 inch). If the crankshaft journal is within limits, replace the main bearings. If not within specifications, grind the crankshaft to next size and use oversize bearings.

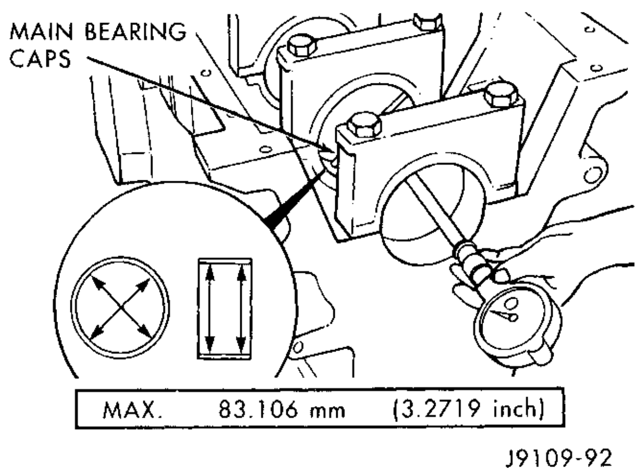

Fig. 36 Crankshaft Main Bearing Bore Diameter

REMOVAL AND INSTALLATION

ENGINE FRONT MOUNTS

REMOVAL

(1) Disconnect the negative cable from the battery.

(2) Position fan to assure clearance for radiator top tank and hose.

(3) Install engine support/lifting fixture.

(4) Raise vehicle on hoist.

(5) Lift the engine SLIGHTLY and remove the thru-bolt and nut (Fig. 38).

(6) Remove engine support bracket/cushion bolts (Fig. 38). Remove the support bracket/cushion.

INSTALLATION

(1) With engine raised SLIGHTLY, position the engine support bracket/cushion to the block. Install new bolts and tighten to 189 N·m (140 ft. lbs.) torque.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

MAX.	83.103 mm	(3.2682 inch)

J9109-93

Fig. 37 Crankshaft Main Journal Diameter

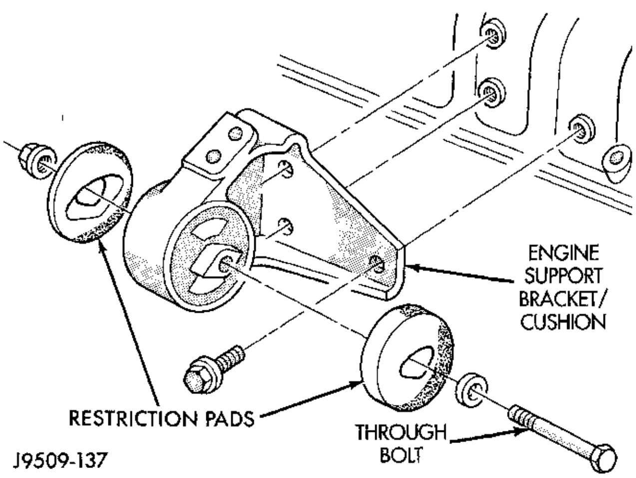

Fig. 38 Front Engine Mounts

(2) Install the thru-bolt into the engine support bracket/cushion.

(3) Lower engine with support/lifting fixture while guiding the engine bracket/cushion and thru-bolt into support cushion brackets (Fig. 39).

(4) Install thru-bolt nuts and tighten the nuts to 68 N·m (50 ft. lbs.) torque.

(5) Lower the vehicle.

(6) Remove lifting fixture.

ENGINE REAR MOUNT

REMOVAL

(1) Raise the vehicle on a hoist.

(2) Position a transmission jack in place.

(3) Remove support cushion stud nuts (Fig. 40).

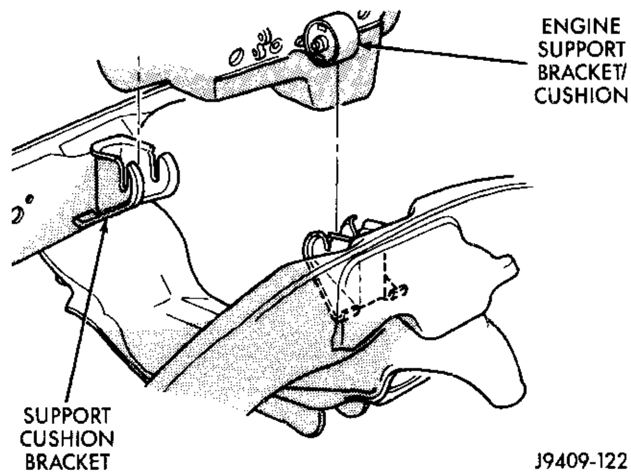

Fig. 39 Positioning Engine Front Mounts

(4) Raise rear of transmission and engine SLIGHTLY.

(5) Remove the bolts holding the support cushion to the transmission support bracket. Remove the support cushion.

(6) If necessary, remove the bolts holding the transmission support bracket to the transmission.

INSTALLATION

(1) If removed, position the transmission support bracket to the transmission. Install new attaching bolts and tighten to 102 N·m (75 ft. lbs.) torque.

(2) Position support cushion to transmission support bracket. Install stud nuts and tighten to 47 N·m (35 ft. lbs.) torque.

(3) Using the transmission jack, lower the transmission and support cushion onto the crossmember (Fig. 40).

(4) Install the support cushion bolts and tighten to 47 N·m (35 ft. lbs.) torque.

(5) Remove the transmission jack.

(6) Lower the vehicle.

ENGINE ASSEMBLY

REMOVAL

(1) Remove the battery.

(2) Drain cooling system (refer to Group 7, Cooling System for the proper procedure).

(3) Remove the upper crossmember and top core support.

(4) Remove the transmission oil cooler.

(5) Discharge the air conditioning system, if equipped (refer to Group 24, Heating and Air Conditioning for service procedures).

(6) Remove the serpentine belt (refer to Group 7, Cooling System).

(7) Remove the A/C compressor with the lines attached. Set aside.

REMOVAL AND INSTALLATION (Continued)

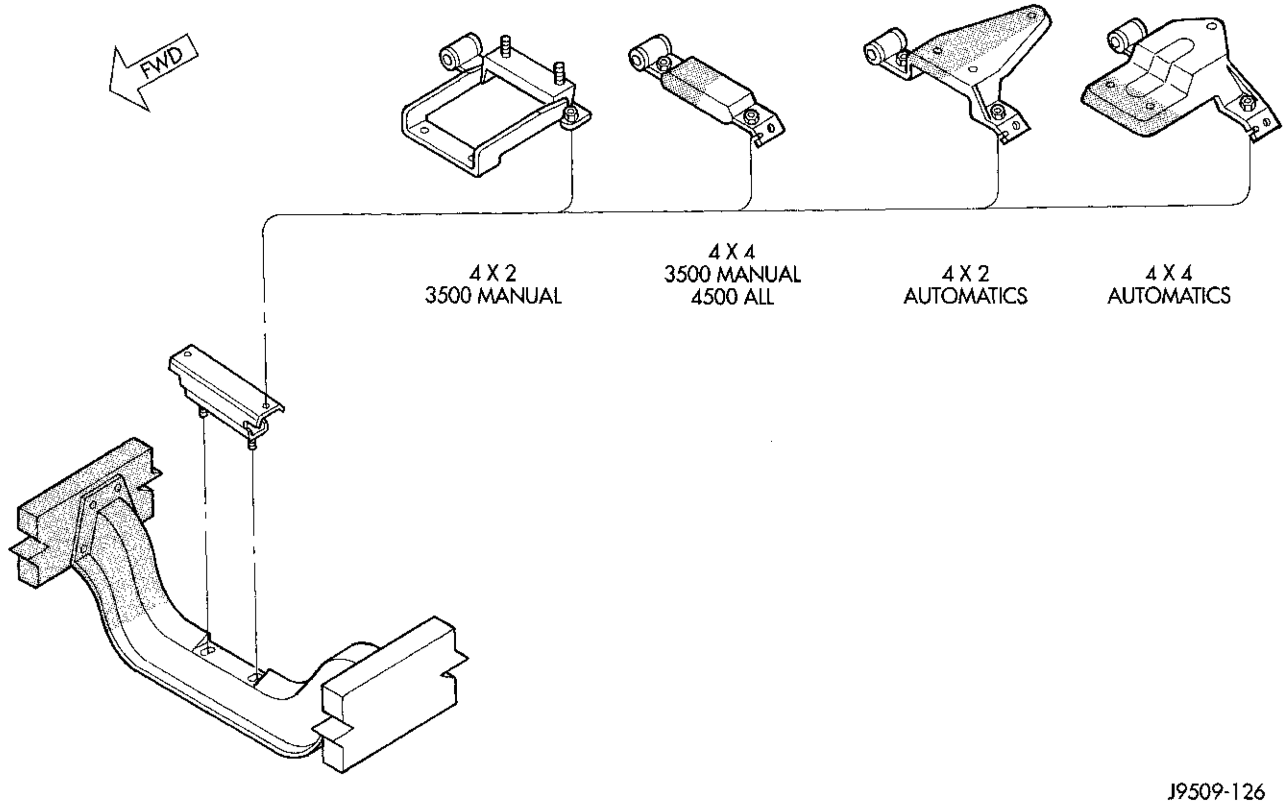

Fig. 40 Engine Rear Support Cushion Assemblies

(8) If equipped, remove the condenser.

(9) Remove the washer bottle.

(10) Remove the radiator overflow bottle.

(11) Disconnect the top radiator hose.

(12) Remove the fan.

(13) Remove the fan shroud.

(14) Disconnect the lower radiator hose.

(15) Remove radiator (refer to Group 7, Cooling System).

(16) Remove the generator (Fig. 41) with the wire connections (refer to Group 8B, Battery/Starter/Generator Service).

(17) Disconnect the heater hoses at the dash panel and at the water valve (Fig. 42).

(18) Disconnect the air inlet tube from the turbocharger (Fig. 43) and the air intake housing. Remove the tube.

(19) Remove the exhaust pipe from the turbocharger outlet flange (Fig. 43).

(20) Disconnect the intercooler inlet duct from the turbocharger and the intercooler. Remove the inlet duct.

(21) Disconnect the intercooler outlet duct from the air inlet housing and the intercooler. Remove the outlet duct.

(22) Disconnect the accelerator linkage, the speed control linkage and the throttle valve linkage.

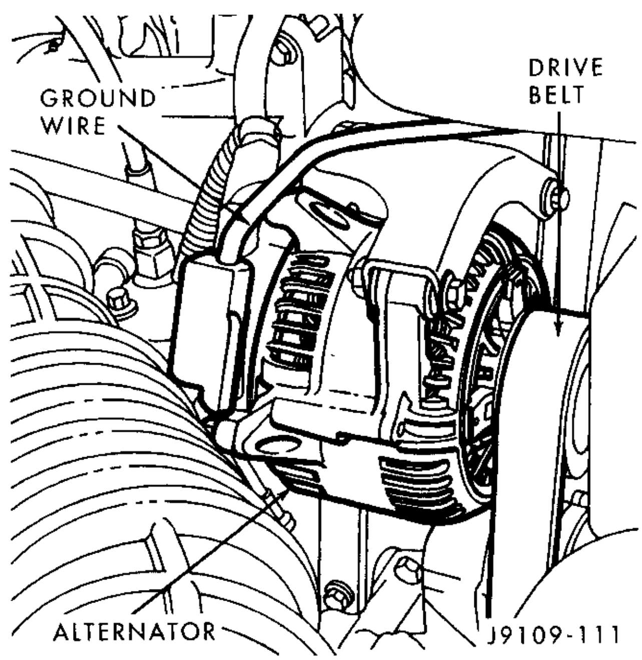

Fig. 41 Generator Removal

(23) Disconnect the power steering hoses, if equipped.

(24) Disconnect the transmission cooler lines.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

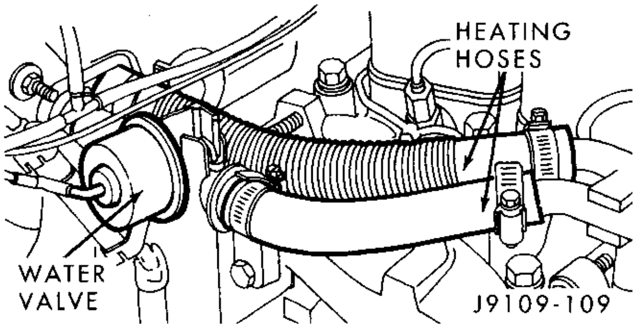

Fig. 42 Heater Hoses

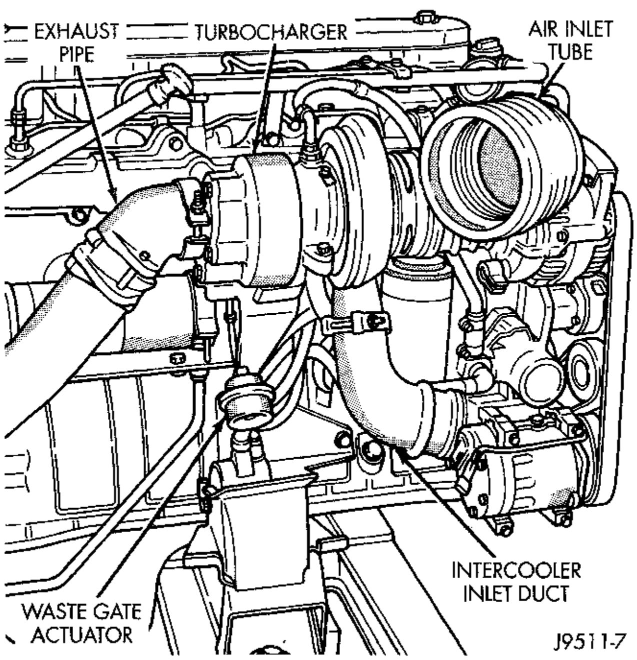

Fig. 43 Air Inlet Tube and Exhaust Pipe Connection

(25) Disconnect all electrical connections from the engine. Put tags on the connections to identify their locations.

(26) Disconnect the fuel lines to the lift pump and fuel return. Use tags to identify the lines.

(27) On Manual Transmission vehicles, remove the shift lever (refer to Group 21, Transmissions).

(28) Raise and support the vehicle on a hoist.

(29) Drain the engine lubricating oil. Dispose of the oil according to all applicable regulations.

(30) Remove the oil pan.

(31) Remove engine front mount thru-bolt nuts.

(32) Remove the transmission cooler line brackets from oil pan.

(33) Disconnect exhaust pipe at manifold.

(34) Disconnect the starter wires. Remove starter motor (refer to Group 8B, Battery/Starter/Generator Service).

(35) Remove the dust shield and transmission cover.

(36) Refer to Group 21, Transmissions for transmission removal.

(37) Lower the vehicle.

(38) Put a cover or tape over all engine openings.

(39) Lift the engine out of the vehicle.

(40) Install the engine on a suitable stand.

(41) Remove all accessories and brackets not previously removed for use with the replacement engine.

INSTALLATION

(1) Check the data plate to verify that the replacement engine is the same model and rating as the engine that was removed.

(2) Install all accessories and brackets that had been removed from the previous engine.

(3) Use the lifting brackets to lift the engine off of the stand.

(4) Position the engine in the chassis with the thru-bolt installed.

(5) Remove the covers or tape covering the engine openings.

(6) Raise and support the vehicle.

(7) Refer to Group 21, Transmissions for transmission installation.

(8) Install the dust shield and transmission cover.

(9) Install the prop shaft (refer to Group 16, Propeller Shaft).

(10) Install the starter motor (refer to Group 8B, Battery/Starter/Generator Service). Connect the starter wires.

(11) Install the transmission cooler line brackets to oil pan.

(12) Install and tighten engine front mount thru-bolt nuts.

(13) Install the oil pan. Install the drain plug.

(14) Lower the vehicle.

(15) On Manual Transmission vehicles, install the shift lever (refer to Group 21, Transmissions).

(16) Connect the fuel lines to the lift pump and fuel return. Use tags to identify the lines.

(17) Connect all electrical connections to the engine. Use tags to identify their locations.

(18) Connect the transmission cooler lines.

(19) Connect the power steering hoses, if equipped.

(20) Connect the accelerator linkage, the speed control linkage and the throttle valve linkage.

(21) Install the outlet duct. Connect the intercooler outlet duct to the air inlet housing and the intercooler.

(22) Install the inlet duct. Connect the intercooler inlet duct to the turbocharger and the intercooler.

(23) Install the exhaust pipe to the turbocharger outlet flange.

(24) Install the air inlet tube. Connect the air inlet tube to the turbocharger and the air intake housing.

(25) Connect the heater hoses at the dash panel and at the water valve.

REMOVAL AND INSTALLATION (Continued)

(26) Install the generator and wire connections (refer to Group 8B, Battery/Starter/Generator Service).

(27) Install the radiator (refer to Group 7, Cooling System).

(28) Connect the lower radiator hose.

(29) Install the fan shroud.

(30) Install the fan.

(31) Connect the top radiator hose.

(32) Install the radiator overflow bottle.

(33) Install the washer bottle.

(34) If equipped, install the condenser.

(35) Install the A/C compressor with the lines attached.

(36) Evacuate and charge the air conditioning system, if equipped (refer to Group 24, Heating and Air Conditioning for service procedures).

(37) Install the transmission oil cooler.

(38) Install the upper crossmember and top core support.

(39) Install the serpentine belt (refer to Group 7, Cooling System).

(40) Fill the cooling system with a mixture of 50% water and 50% ethylene-glycol base antifreeze (refer Group 7, Cooling System for the proper procedure).

(41) Fill the engine with the required amount of clean engine lubricating oil (refer to Group 0, Lubrication and Maintenance).

(42) Install the battery and connect the battery cables.

(43) Check the oil level after the engine has run for 2 or 3 minutes. Oil held in the oil filter and oil passages will cause the oil level in the pan to be lower than normal for a short period of time.

(44) Operate the engine at idle for 5 to 10 minutes and check for leaks and loose parts.

ROCKER LEVERS AND PUSH RODS

REMOVAL

(1) Remove the EGR tube and gaskets.

(2) Remove the valve covers.

(3) Loosen the adjusting screw locknuts. Loosen the adjusting screws until they stop (Fig. 44).

(4) Remove the bolts from the rocker lever pedestals. Remove the pedestals and rocker lever assemblies (Fig. 44).

(5) Remove the push rods. The rear two push rods must be raised through holes in cab overhang.

INSTALLATION

(1) Make sure the dowel rings in the pedestals are installed into the dowel bores in the cylinder head.

(2) If the push rod is holding pedestal off head, bar the engine until the pedestal will set on the head surface without interference.

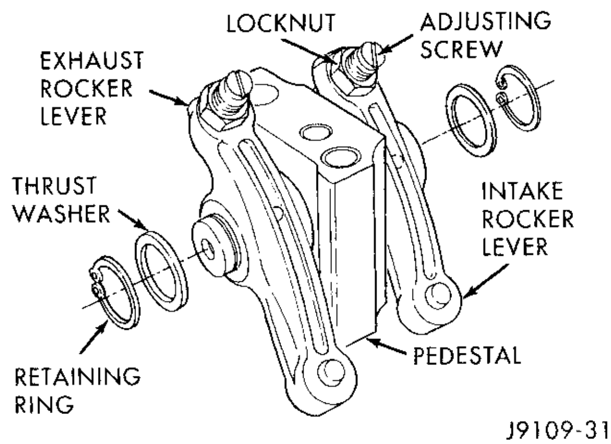

Fig. 44 Location of Rocker Lever Components

(3) Use clean engine oil to lubricate the cylinder head bolt threads and under the bolt heads.

(4) Install the long bolts (12 mm) into the rocker lever pedestals. Tighten the bolts as follows:

• Step 1—Tighten the bolts, in sequence (Fig. 45), to 90 N·m (66 ft. lbs.) torque. Check the torque. If lower than 90 N·m (66 ft. lbs.), tighten to this torque.

• Step 2—Tighten the bolts, in sequence (Fig. 45), to 120 N·m (89 ft. lbs.) torque. Check the torque. If lower than 120 N·m (89 ft. lbs.), tighten to this torque.

• Step 3—Tighten the bolts, in sequence (Fig. 45), an additional 90°.

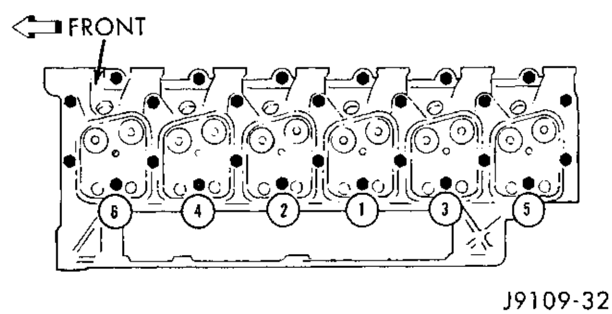

Fig. 45 Rocker Lever (Head Bolts) Tightening Sequence

(5) Tighten the 8 mm bolts to 24 N·m (18 ft. lbs.) torque.

(6) Install the valve cover. Tighten the valve cover bolt to 24 N·m (18 ft. lbs.) torque.

(7) Install the EGR tube and start fasteners by hand.

(8) Tighten all bolts/nuts to 24 N·m (212 in. lbs.) torque. **When tightening bolts at EGR valve end of tube, alternate between the upper and lower bolt to allow face of EGR valve to remain square to tube mounting flange on EGR tube.**

REMOVAL AND INSTALLATION (Continued)

CYLINDER HEAD

These cylinder heads can only be used on engines with an intercooler. DO NOT interchange with earlier models.

REMOVAL

(1) Drain the coolant. DO NOT waste reusable coolant. If the solution is clean, drain the coolant into a clean container for reuse.

(2) Drain the engine oil. Dispose of the used oil properly.

(3) Disconnect the radiator and heater hoses (refer to Group 7, Cooling System).

(4) Remove the turbocharger.

(5) Remove the EGR tube and gaskets.

(6) Remove the exhaust manifold (Fig. 46).

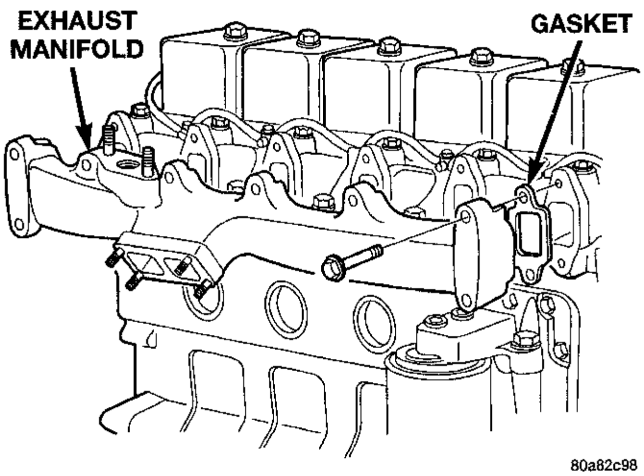

Fig. 46 Exhaust Manifold

(7) Remove the fuel lines and injector nozzles as an assembly (refer to Group 14, Fuel System).

(8) Remove the valve covers.

(9) Remove the rocker levers and push rods.

(10) Remove the fuel filter/water separator (Fig. 47). Refer to Group 14, Fuel System, for the proper procedures. Remove the remote fuel filter/water separator head.

(11) If the engine is hot, remove the cylinder head bolts in the sequence shown in (Fig. 48). The removal sequence is not important if the engine is cold. There are 3 sizes of head bolts. Note the position of each bolt for future installation.

(12) Remove the cylinder head and gasket from the cylinder block.

INSTALLATION

(1) The cylinder block and head must be clean and dry.

(2) Position the gasket onto the dowels (Fig. 49). Make sure the gasket is correctly aligned with the holes in the cylinder block.

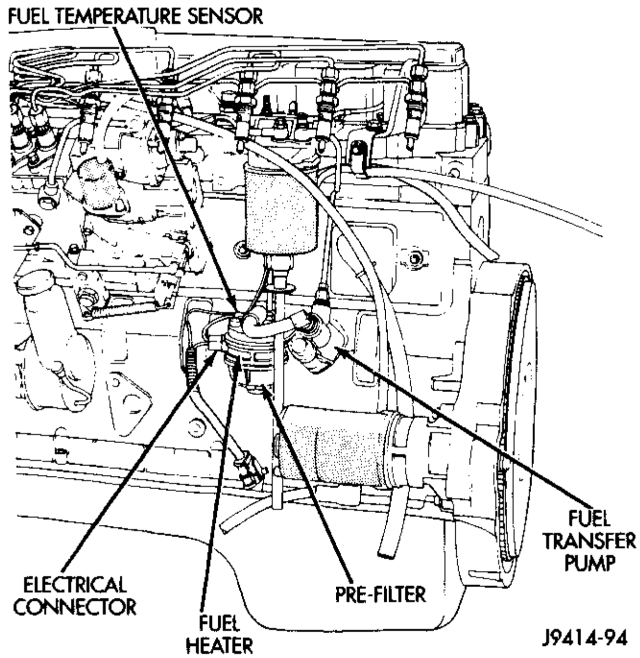

Fig. 47 Fuel/Water Separator Filter

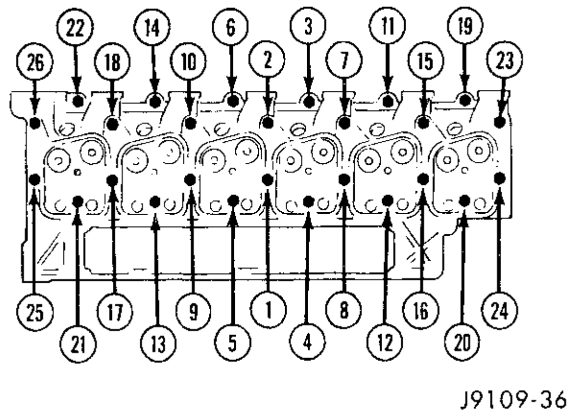

Fig. 48 Cylinder Head Bolt Removal Sequence—Cylinder Head Hot

(3) Carefully put the cylinder head onto the gasket and cylinder block. Make sure the cylinder head is installed onto the dowels in the cylinder block (Fig. 49).

(4) Install the push rods and rocker levers.

(5) Use clean engine oil to lubricate the cylinder head bolt threads and under the bolt heads.

(6) The cylinder head bolts are 3 different sizes. Install the bolts in the proper hole. Tighten the bolts as follows:

- Step 1—Tighten all bolts, in sequence (Fig. 10), to 90 N·m (66 ft. lbs.) torque. Check the torque. If lower than 90 N·m (66 ft. lbs.), tighten to this torque.
- Step 2—Tighten all long 12 mm bolts (Nos. 4, 5, 12, 13, 20 and 21), in sequence (Fig. 50), to 120 N·m

REMOVAL AND INSTALLATION (Continued)

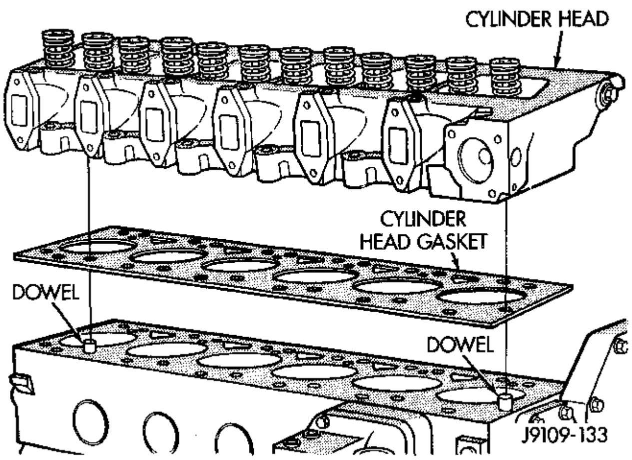

Fig. 49 Cylinder Head/Gasket Alignment

(89 ft. lbs.) torque. Check the torque. If lower than 120 N·m (89 ft. lbs.), tighten to this torque.

• Step 3—Tighten all bolts, in sequence (Fig. 50), an additional 90°.

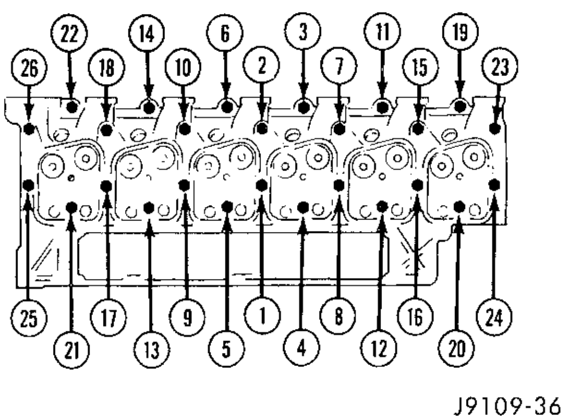

Fig. 50 Cylinder Head Tightening Sequence

(7) Be sure to lubricate the push rod sockets with clean engine oil. Be sure push rod is seated properly in the tappet.

(8) Install the rocker lever pedestal bolts and tighten to 24 N·m (18 ft. lbs.) torque.

(9) Adjust the valve clearance.

(10) Install the valve covers. Tighten the bolts to 24 N·m (18 ft. lbs.) torque.

(11) Install the injector nozzles and fuel lines (refer to Group 14, Fuel System).

(12) Install the remote fuel filter/water separator head. Install the fuel filter/water separator (refer to Group 14, Fuel System for the proper procedures).

(13) Install the exhaust manifold (refer to Group 11, Exhaust System and Intake Manifold).

(14) Install the EGR tube and start fasteners by hand.

(15) Tighten all bolts/nuts to 24 N·m (212 in. lbs.) torque. **When tightening bolts at EGR valve end of tube, alternate between the upper and lower bolt to allow face of EGR valve to remain square to tube mounting flange on EGR tube.**

(16) Install the turbocharger.

(17) Connect the radiator and heater hoses.

(18) Fill the engine with new coolant or the clean drained coolant (refer to Group 7, Cooling System for the proper procedure).

(19) Fill the engine with clean lubricating oil (refer to Group 0, Lubrication and Maintenance).

VALVES AND VALVE SPRINGS

REMOVAL

(1) Remove the cylinder head (Refer to Cylinder Head Removal and Installation in this section).

(2) Mark the valves to identify their position.

(3) Compress the valve spring and remove the valve stem collets (Fig. 51).

(4) Release valve spring and remove the retainer and spring (Fig. 51).

(5) Remove the remaining collets, retainers, springs and valves. Keep the valves in a labeled rack.

(6) Remove the valve stem seals (Fig. 51).

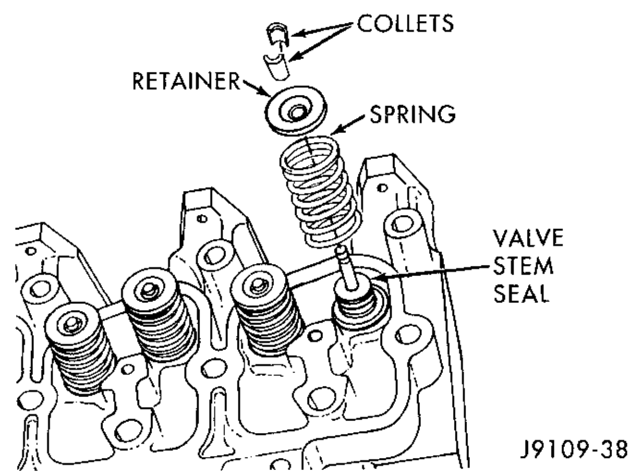

Fig. 51 Valve Removal

INSTALLATION

(1) Clean all cylinder head components before assembling.

(2) Install the valve stem seals (Fig. 52). The intake and exhaust valve seals are the same.

(3) Lubricate the stems with SAE 90W oil before installing the valves. Install the valves in the same positions as removed.

(4) Compress the valve spring after installing the spring and retainer (Fig. 53).

(5) Install new valve collets and release the spring tension (Fig. 53).

REMOVAL AND INSTALLATION (Continued)

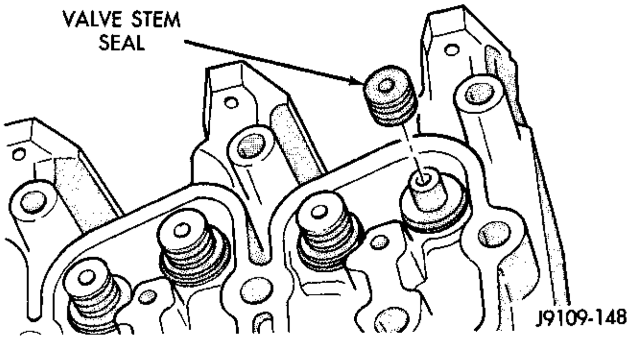

Fig. 52 Valve Stem Seal Installation

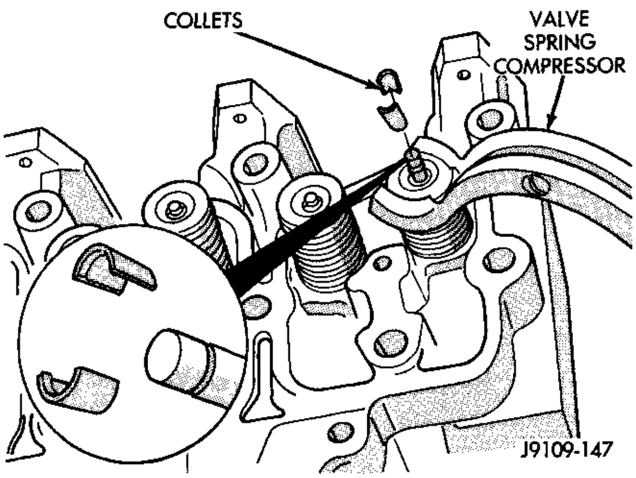

Fig. 53 Valve, Valve Spring and Collet Installation

WARNING: WEAR PROTECTIVE EQUIPMENT AND DO NOT STAND IN LINE WITH THE VALVE STEM WHEN TAPPING THE VALVES.

(6) Tap the ends of the valve stems with a mallet to verify the collets are seated.

(7) Install the cylinder head (Refer to Cylinder Head Removal and Installation in this section).

(8) Check the valve clearance adjustment.

GEAR HOUSING COVER

REMOVAL

(1) Remove fan drive assembly.

(2) Remove the fan belt (Fig. 54).

(3) Remove belt tensioner (Fig. 54).

(4) Remove oil fill tube and adaptor (Fig. 55).

(5) Remove vibration damper.

(6) Remove the bolts that hold the gear cover to the gear housing.

(7) Gently pry the cover away from the housing, taking care not to mar the gasket surfaces (Fig. 56).

(8) Clean the old gasket residue from the back of the gear cover and front of the gear housing.

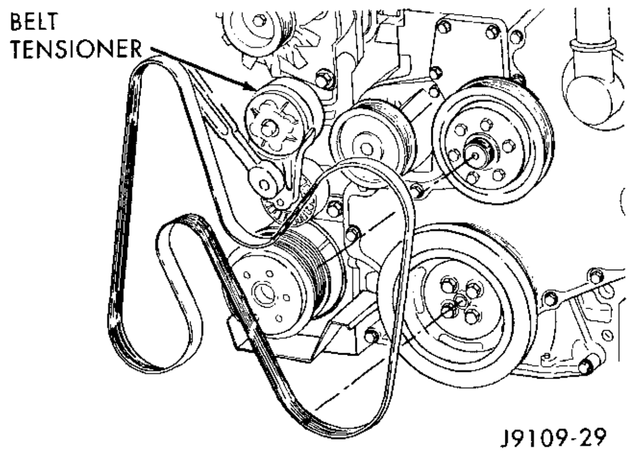

Fig. 54 Drive Belt Installation

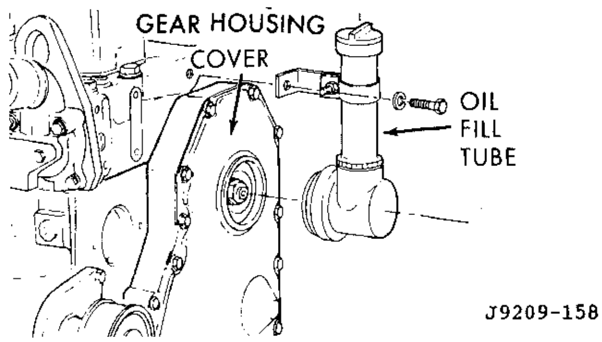

Fig. 55 Oil Fill Tube

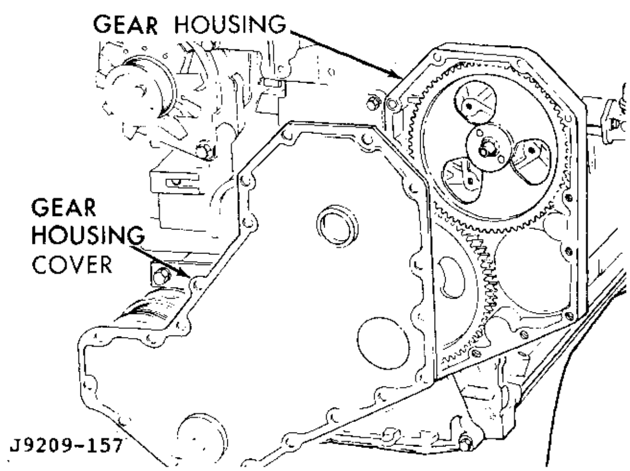

Fig. 56 Gear Housing and Cover

INSTALLATION

(1) Lubricate the front gear train with clean engine oil.

(2) Thoroughly clean the front seal area of the crankshaft. The seal lip and the sealing surface on the crankshaft must be free from all oil residue to prevent seal leaks.

(3) Apply a bead of Loctite 277 to the outside diameter of the seal.

REMOVAL AND INSTALLATION (Continued)

(4) Install the seal into the rear of the cover using a plastic hammer and the alignment/installation tool provided in the seal kit to prevent damage to the seal carrier, hit the alignment/installation tool alternately at the 12, 3, 6 and 9 o'clock positions.

(5) Install the pilot from the seal kit onto the crankshaft.

(6) Using the pilot as an alignment tool, install the cover and a new gasket.

(7) Install the cover bolts and tighten to 24 N·m (18 ft. lbs.) torque. Remove pilot tool.

(8) Install the oil fill tube and mounting bolts. Tighten the bolts to 43 N·m (32 ft. lbs.) torque.

(9) Install the vibration damper. DO NOT tighten the bolts to the correct torque value at this time.

(10) Install the belt tensioner. Tighten the mounting bolts to 43 N·m (32 ft. lbs.) torque.

(11) Raise the belt tensioner to install the belt.

(12) Tighten the vibration damper bolts to 125 N·m (92 ft. lbs.) torque. Use an engine barring tool to keep the engine from rotating during tightening operation.

(13) Install the fan drive assembly.

GEAR HOUSING

REMOVAL

(1) Remove the engine assembly from the vehicle.

(2) Remove the front end components and the gear housing cover (refer to Gear Housing Cover Removal for the proper procedures).

(3) Remove the following:

- Camshaft
- Gear driven accessories
- Fuel injection pump (refer to Group 14, Fuel System)
- Fan hub assembly (refer to Group 7, Cooling System)

(4) Remove the gear housing and gasket (Fig. 57).

(5) Clean the gasket material from the cylinder block.

INSTALLATION

(1) Install a new gasket and the gear housing. Tighten the bolts to 24 N·m (18 ft. lbs.) torque.

(2) Install the camshaft. Make sure the alignment marks on the camshaft and crankshaft gears are aligned (Fig. 58).

(3) If a new housing is installed, the timing pin assembly must be accurately located.

(4) Install the following:

- Fan hub assembly (refer to Group 7, Cooling System)
- Fuel injection pump (refer to Group 14, Fuel System)
- Gear driven accessories

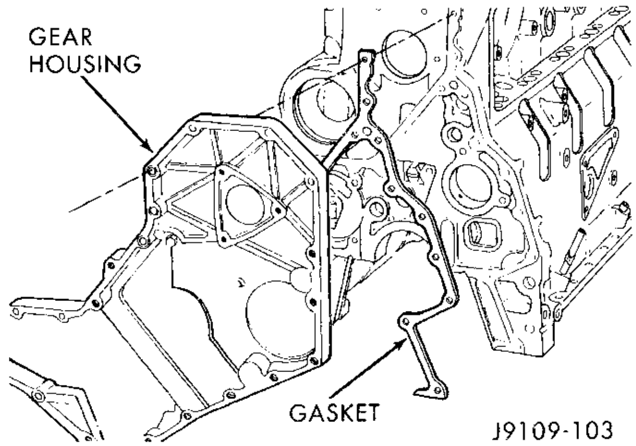

Fig. 57 Gear Housing/Gasket

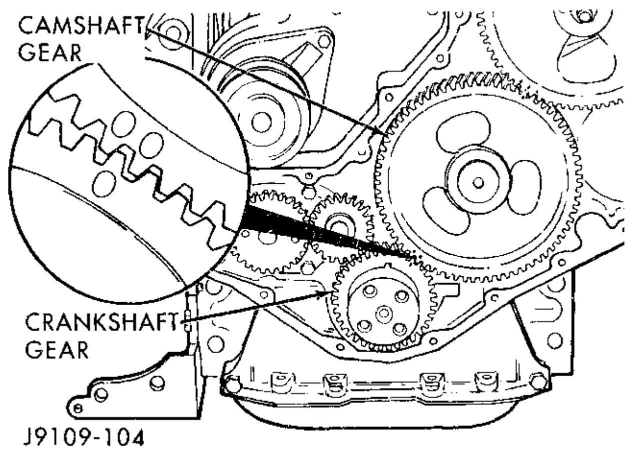

Fig. 58 Camshaft/Crankshaft Gear Alignment

(5) Install the gear housing cover (refer to Gear Housing Cover Installation for the proper procedures).

(6) Install the front end components.

(7) Install the engine assembly into the vehicle.

TIMING PIN

The timing pin can be replaced without removing the assembly from the gear housing.

REMOVAL

(1) Remove the timing pin by prying the retaining ring out with a small screwdriver. Replace the retaining ring if it is damaged during removal.

INSTALLATION

(1) If timing pin assembly is removed from gear housing, it must be precisely reset to obtain exact TDC.

(2) Install a new O-Ring, lubricate the pin and position in the housing (Fig. 59). Install the new retaining ring to 1.5 mm (0.059 inch).

REMOVAL AND INSTALLATION (Continued)

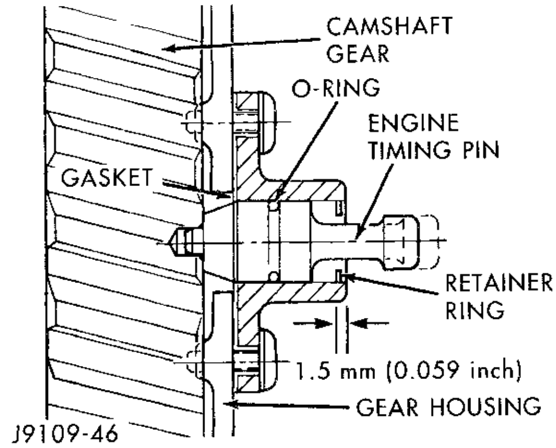

Fig. 59 Engine Timing Pin Location

TIMING PIN HOUSING ASSEMBLY

REMOVAL

(1) Locate TDC for cylinder No.1.

(2) Remove the timing pin housing assembly and gasket.

(3) Clean any gasket material from the gear housing and from the timing pin housing assembly.

INSTALLATION—CYLINDER HEAD ON

The location of the timing pin assembly on the gear housing is critical for correct engine adjustment. Follow this procedure to install the assembly so that it corresponds to TDC for cylinder No.1.

(1) Look through the hole in the gear housing and rotate the engine until the hole in the cam gear can be seen.

(2) Remove the injector nozzles from all of the cylinders. This step is important to vent the cylinders so the crankshaft can be rotated smoothly to locate TDC for cylinder No.1.

(3) Temporarily install the vibration damper.

(4) Fabricate and install a wire pointer (Fig. 60). This can be done by forming a piece of wire that can be tighten under one of the gear housing capscrews. The wire should extend from the gear cover to a place on the crankshaft vibration damper that is easily seen.

(5) Rotate the crankshaft one-quarter rotation in the direction of engine rotation.

(6) Tighten the adjusting screw for the No.1 intake valve to zero lash plus 5 turns.

CAUTION: Use extreme care when rotating the crankshaft. Use of too much force could damage the valve or push rod (Fig. 61).

(7) Rotate the crankshaft slowly in the opposite direction of normal engine rotation until the piston touches the intake valve (Fig. 61).

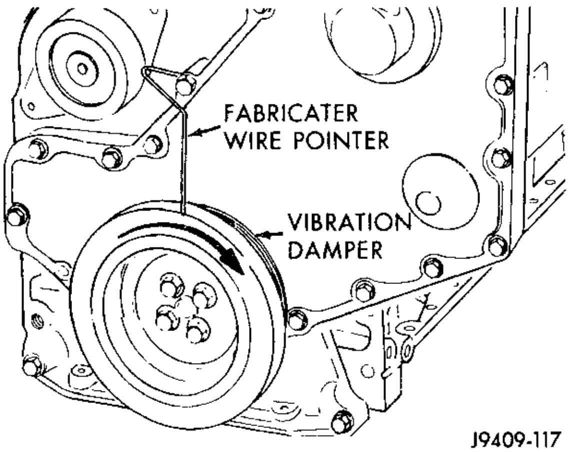

Fig. 60 Fabricated Wire Pointer

(8) Mark the vibration damper at the wire pointer (Fig. 61).

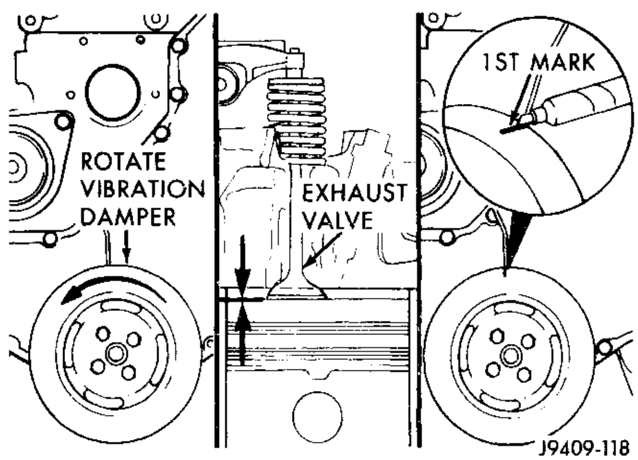

Fig. 61 Locate and Mark Vibration Damper—First Mark

(9) Rotate the crankshaft in the direction of normal engine rotation until the piston touches the intake valve (Fig. 62). **Make sure that the piston touches the intake valve with approximately the same amount of force as in the previous step (Fig. 62).**

(10) Mark the vibration damper at the wire pointer (Fig. 62).

(11) Measure the distance and mark the vibration damper at one-half that distance between the two marks. This mark is the TDC mark (Fig. 63).

(12) Completely loosen the intake valve adjusting screw. If not done, damage to the intake valve or push rod could occur when the crankshaft is rotated.

(13) Rotate the crankshaft in the direction of normal engine rotation until the pointer is aligned with the TDC mark. Rotate crankshaft one additional turn.

REMOVAL AND INSTALLATION (Continued)

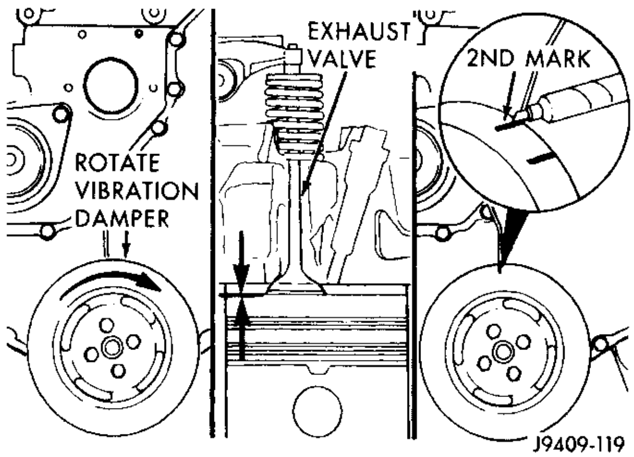

Fig. 62 Mark Vibration Damper—Second Mark

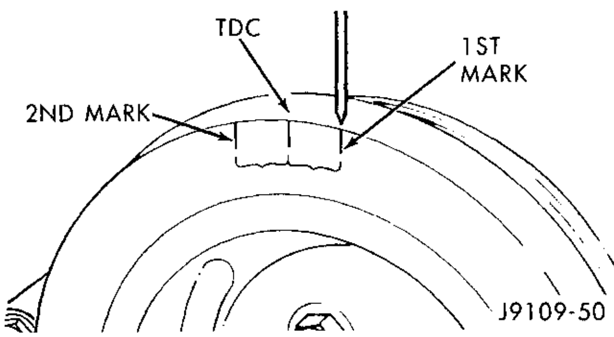

Fig. 63 Location of Top Dead Center (TDC)

(14) The timing pin hole in the cam gear should be visible or felt through the back side of the gear housing. If not, the crankshaft must be rotated one revolution in the direction of engine rotation.

(15) Apply a coat of Loctite® 59241 (Liquid Teflon), or equivalent to the threads of the Torx head bolts. Install the timing pin assembly and new O-ring.

(16) Hold the timing pin in the hole to align the housing and install the Torx head bolts. Tighten the Torx bolts to 5 N·m (44 in. lbs.) torque.

(17) Install the remaining rocker lever pedestal assemblies. Tighten the rocker lever pedestal mounting capscrews.

(18) Adjust the valves.

(19) Install the injectors and bleed the fuel system (refer to Group 14, Fuel System).

(20) Install the fuel pump (refer to Group 14, Fuel System).

(21) Install the gear cover.

(22) Remove the pointer. Install the crankshaft vibration damper.

INSTALLATION—CYLINDER HEAD REMOVED

The timing pin assembly is precisely located on the gear housing to correspond to TDC for Cylinder No.1. The timing pin assembly must be relocated if the gear housing is interchanged.

(1) Temporarily install the vibration damper and a fabricated wire pointer (Fig. 64). Put a flat washer between the pointer and gear housing to prevent damage to the gear housing.

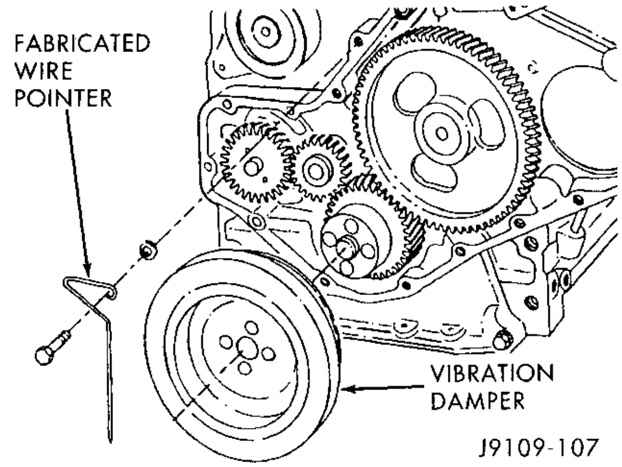

Fig. 64 Fabricated Wire Pointer

(2) Fabricate a steel plate (Fig. 65).

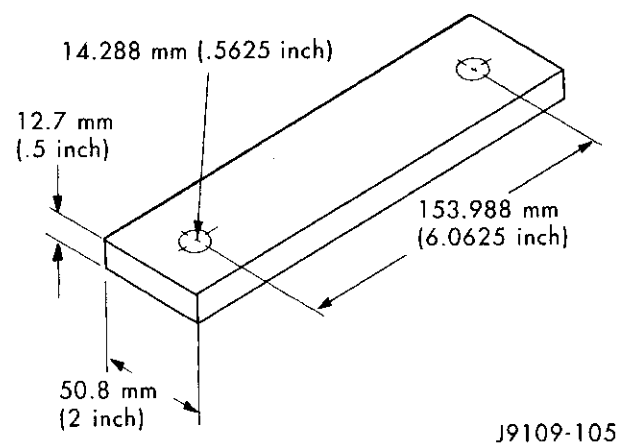

Fig. 65 Fabricated Steel Plate

(3) Use two flywheel housing bolts to assemble the plate over No.1 cylinder (Fig. 66).

(4) Rotate the crankshaft in the direction of rotation until the piston contacts the plate.

(5) Mark the vibration damper (Fig. 63).

(6) Rotate the engine in the opposite direction until the piston contacts the plate.

(7) Mark the vibration damper (Fig. 63).

(8) Mark the vibration damper for TDC. TDC will be one-half the distance between the first two marks (Fig. 63).

(9) Remove the plate and rotate the engine in the direction of rotation until the pointer aligns with the TDC mark.

REMOVAL AND INSTALLATION (Continued)

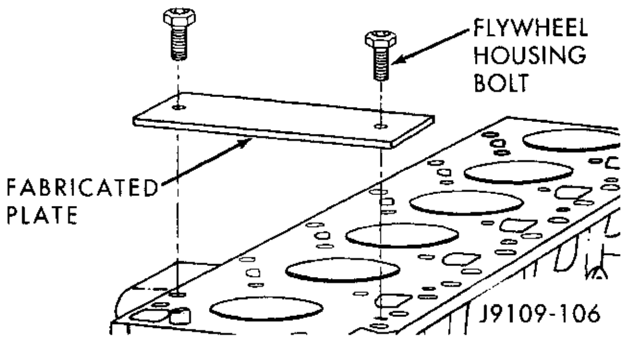

Fig. 66 Fabricated Plate Location on No.1 Cylinder

(10) Look for the timing pin hole in the camshaft gear. If it is not visible, rotate the crankshaft one complete rotation. Align the pointer with the TDC mark.

(11) Install the timing pin housing assembly with a new gasket.

(12) Apply a coat of Loctite 59241 liquid teflon, or equivalent to the threads of the torx head bolts.

(13) Push the pin into the hole in the cam gear to align the timing pin housing.

(14) Hold the pin in while tightening the torx head bolts to 5 N·m (44 in. lbs.) torque. Be sure timing pin is disengaged before rotating the engine.

(15) Remove the vibration damper and wire pointer.

CAMSHAFT

REMOVAL

(1) Disconnect battery negative cable.

(2) Drain cooling system.

(3) Remove the following parts:
- Fan Shroud
- Radiator
- A/C Condenser (if equipped)
- Intercooler
- Auxiliary Transmission Cooler
- Upper Radiator Support
- EGR Tube
- Name Plate
- Valve covers
- Rocker lever assemblies
- Push rods
- Drive belt
- Fan hub assembly
- Vibration damper
- Gear housing cover
- Lift pump

(4) Insert the dowels through the push tube holes and into the top of each tappet. When properly installed, the dowels can be used to pull the tappets up (Fig. 67).

(5) Pull the tappets up and wrap a rubber band around the top of the dowel rods (Fig. 67). This will prevent the tappets from dropping down.

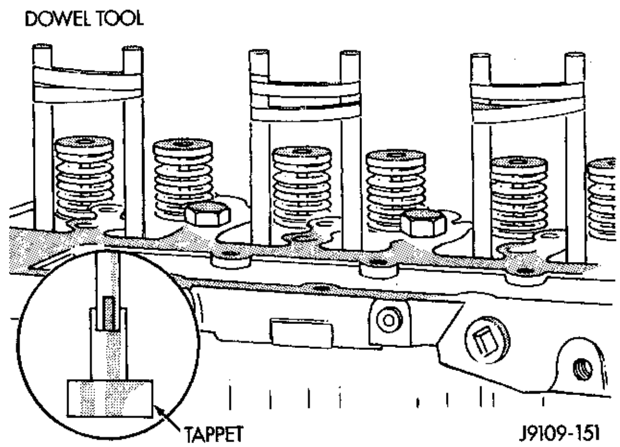

Fig. 67 Holding Tappets in Place

(6) Rotate the crankshaft to align the crankshaft to camshaft timing marks. (Fig. 68)

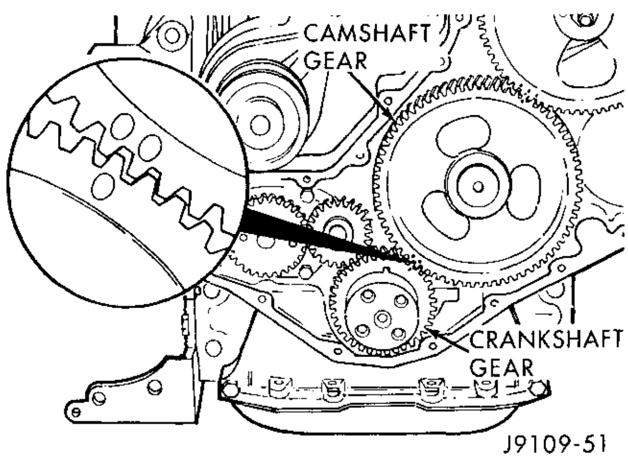

Fig. 68 Align Crankshaft to Camshaft

(7) Remove the bolts from the thrust plate (Fig. 69).

(8) Remove the camshaft, gear and thrust plate.

BUSHING REPLACEMENT

(1) Measure the diameter of each bore. (The limit for the bushing in the No.1 bore is the same as for the other bores without bushings). The limit of the inside diameter is 54.133 mm (2.1312 inch). If the camshaft bore for the first cam bushing is worn beyond the limit, install a new service bushing. Inspect the rest of the camshaft bores for damage or excessive wear.

(2) If the bores without a bushing are worn beyond the limit, the engine must be removed for machining and installation of service bushings. If badly worn, replace the cylinder block.

REMOVAL AND INSTALLATION (Continued)

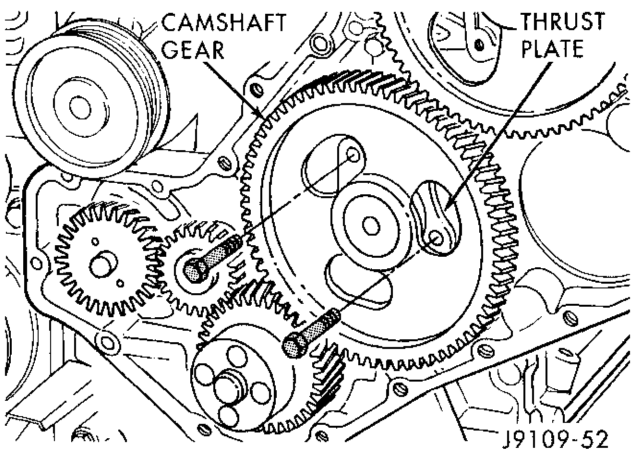

Fig. 69 Thrust Plate Bolt Location

(3) Remove the bushing from the No.1 bore, using a universal cam bushing tool.

(4) Mark the cylinder block so you can align the oil hole in the cylinder block with the oil hole in the bushing.

Apply a coating of Loctite® 609 to the backside of the new bushing. Avoid getting Loctite® in the oil hole.

(5) Use a universal cam bushing installation tool and install the bushing so that it is even with the front face of the cylinder block. The oil hole must be aligned. A 3.2 mm (0.128 inch) diameter rod must be able to pass through the hole (Fig. 70).

(6) Measure the installed bushing. The limit of the inside diameter is 54.133 mm (2.1312 inch).

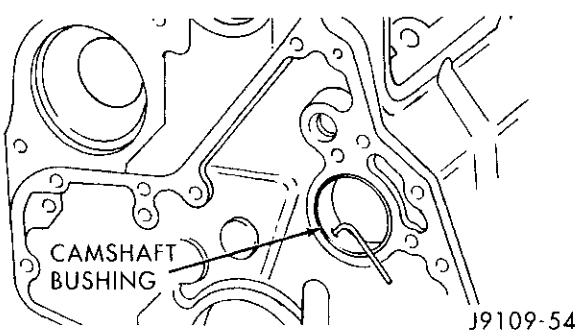

Fig. 70 Oil Hole Alignment

GEAR REPLACEMENT

(1) Press the camshaft out of the gear.

(2) Remove all burrs and smooth any rough surfaces caused by removing the gear.

(3) Install the camshaft key.

(4) Lubricate the camshaft surface with Lubriplate 105, or equivalent.

CAUTION: The camshaft gear will be permanently distorted if overheated. The oven temperature should never exceed 177°C (350°F).

(5) Heat the gear in an oven at 177°C (350°F) for 45 minutes.

WARNING: WEAR PROTECTIVE GLOVES TO HANDLE THE HOT GEAR.

(6) Install the gear with the timing marks visible. Be sure the gear is seated against the camshaft shoulder.

(7) If the camshaft is not to be used immediately, lubricate the lobes and journals to prevent rust.

INSTALLATION

(1) Apply a coat of Lubriplate 105 to the camshaft bores.

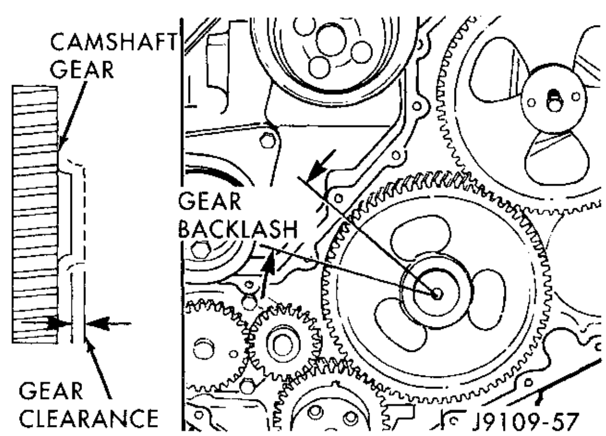
(2) Lubricate the camshaft lobes, journals and thrust washer with Lubriplate 105, or equivalent.

CAUTION: When installing the camshaft, DO NOT push it in farther than it will go with the thrust washer in place. Pushing it too far can dislodge the plug in the rear of the camshaft bore and cause an oil leak.

(3) Install the camshaft/thrust washer. Align the timing marks as illustrated (Fig. 68).

(4) Install the thrust washer bolts and tighten to 24 N·m (18 ft. lbs.) torque.

(5) Verify the camshaft has the correct amount of backlash and end clearance (Fig. 71).



BACKLASH - 0.080-0.330 mm (0.003-0.013 inch)
CLEARANCE - 0.152-0.254 mm (0.006-0.010 inch)

Fig. 71 Camshaft Backlash and End Clearance

(6) Install the following parts:
- Lift pump
- Gear housing cover
- Vibration damper
- Fan hub assembly
- Drive belt

REMOVAL AND INSTALLATION (Continued)

- Push rods
- Rocker lever assemblies
- Valve covers
- Name Plate
- Upper Radiator Support
- A/C Condenser (if equipped)
- Auxiliary Transmission Cooler
- Intercooler
- Radiator
- Fan Shroud

(7) Install the EGR tube and start fasteners by hand.

(8) Tighten all bolts/nuts to 24 N·m (212 in. lbs.) torque. **When tightening bolts at EGR valve end of tube, alternate between the upper and lower bolt to allow face of EGR valve to remain square to tube mounting flange on EGR tube.**

(9) Refill cooling system.

(10) Operate the engine at idle for five to ten minutes and check for leaks and loose parts.

TAPPET

REMOVAL

(1) Remove the camshaft.

(2) Insert a trough the full length of the cam bore (Fig. 72). Cummins Tappet Changing Tool 3822513 is available for this job.

(3) Make sure the trough is positioned so it will catch the tappet when the wooden dowel is removed.

(4) Identify the location of each tappet as it is removed. The tappets must be installed in their original locations.

(5) Only remove one tappet at a time. Remove the rubber band from the two companion tappets, securing the tappet not to be removed with the rubber band.

(6) Pull the wooden dowel from the tappet bore allowing the tappet to fall into the trough (Fig. 72).

(7) Normally the tappet will fall over when it drops into the trough. Use a flashlight to determine this. If the tappet does not fall over, shake the trough gently to get it to do so.

(8) Special care should be taken, when removing the No.6 cylinder tappets. DO NOT knock or shake the tappet over the end barrier of the trough.

(9) Carefully pull the trough and tappet from the cam bore and remove the tappet. Repeat the process until all tappets are removed.

INSTALLATION

(1) Insert the trough the full length of the cam bore.

(2) Feed the installation tool down the tappet bore and into the trough (Fig. 73).

(3) Feed the installation tool cord through the cam bores. Carefully pull the trough and installation tool out the front. The barrier at the rear of the trough will assure the tool will be pulled out with it.

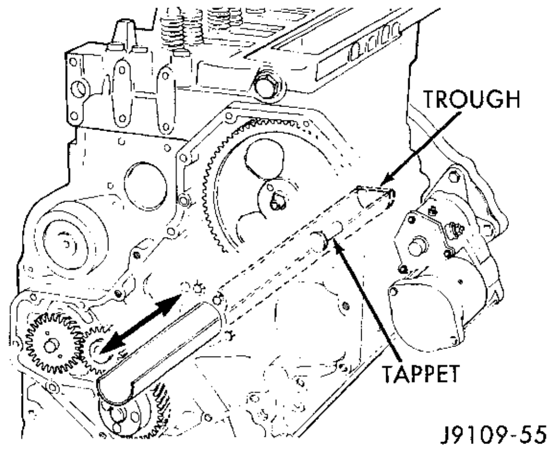


Fig. 72 Tappet Removal using a Trough

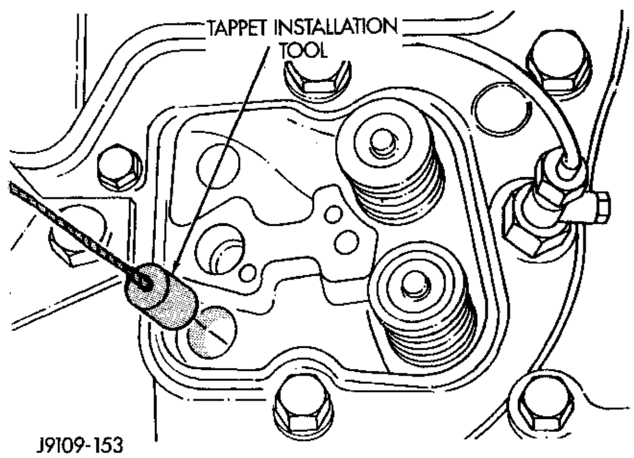

Fig. 73 Tappet Installation Tool

(4) Lubricate the tappets with Lubriplate 105, or equivalent.

(5) Insert the installation tool into the tappet (Fig. 74). To aid in removing the installation tool after the tappets is installed, work the tool in and out of the tappet several times before installing the tappets.

(6) Place the tappet and tool in the trough and slide the trough back into the cam bore (Fig. 74).

(7) Pull the tool/tappet through the cam bore and up into the tappet bore (Fig. 75).

(8) Difficulty could be experienced in getting the tappet to make the bend from the trough up to the tappet bore (due to the webbing of the block). If this occurs, pull the trough out enough to allow the tappet to drop down and align itself. Now pull the tappet up into the bore carefully.

(9) After the tappet has been pulled up into position, slide the trough back into the cam bore and rotate it 1/2 turn. This will position the round side of the trough up, which will hold the tappet in place.

REMOVAL AND INSTALLATION (Continued)

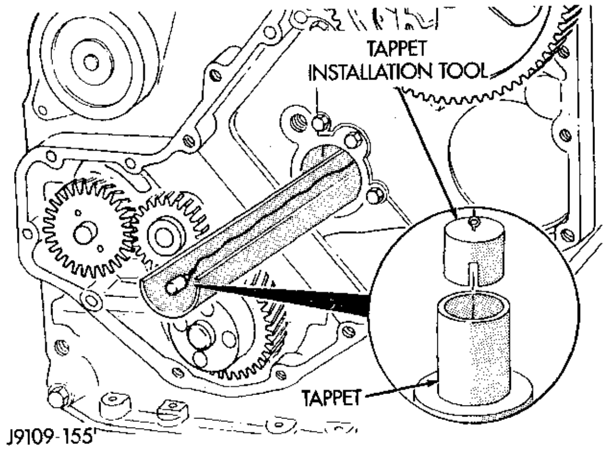

Fig. 74 Insert Installation Tool into Tappet

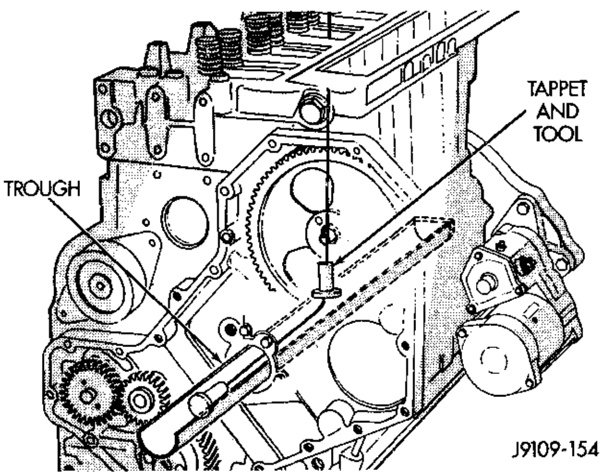

Fig. 75 Pull Tappet/Tool into Position

(10) Remove the installation tool from the tappet.

(11) Install a wooden dowel into the top of the tappet and secure it with a rubber band.

(12) Repeat this process until all tappets have been installed.

(13) Install the camshaft.

OIL PAN AND SUCTION TUBE

REMOVAL

(1) Disconnect the negative cable from the battery.

(2) Remove transmission from vehicle, refer to Group 21 Transmission and Transfer Case.

(3) Remove flywheel ring gear assembly.

(4) Disconnect starter cables from starter motor.

(5) Remove transmission oil cooler bolts.

(6) Remove starter motor and spacer plate assembly.

WARNING: HOT OIL CAN CAUSE PERSONAL INJURY.

(7) Drain the used engine oil. Dispose of the used oil properly.

(8) Remove oil pan bolts, lower pan slightly and remove oil suction tube.

(9) Remove oil pan.

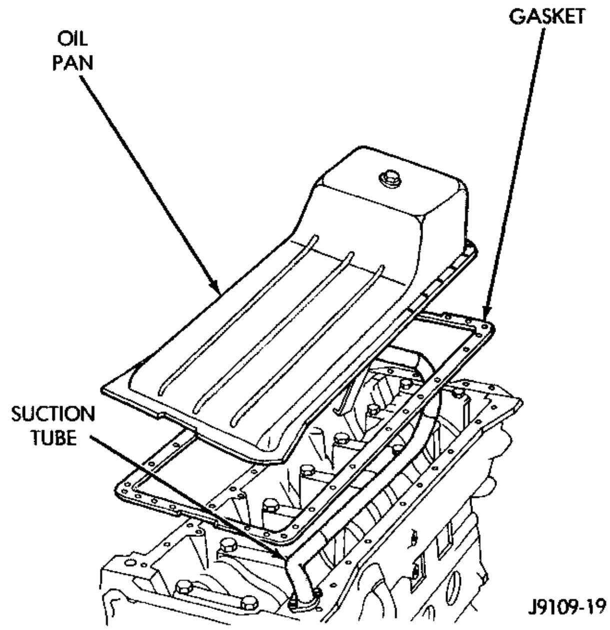

Fig. 76 Oil Pan, Suction Tube and Gasket

INSTALLATION

(1) Clean the oil pan and engine block sealing surfaces.

(2) Install the suction tube and gasket. Tighten the bolts to 24 N·m (18 ft. lbs.) torque.

(3) Fill the joint between the pan rail/gear housing and pan rail/rear cover with sealant. Use Three Bond 1207-C, or equivalent.

(4) Install the pan and gasket (Fig. 76). Tighten the bolts to 24 N·m (18 ft. lbs.) torque.

(5) Install the drain plug with a new sealing washer and tighten to 60 N·m (44 ft. lbs.) torque.

(6) Install the spacer plate assembly with the starter motor attached.

(7) Install transmission oil cooler tank bolts. Tighten bolts to 35 N·m (25 ft. lbs.) torque.

(8) Install transmission assy. and transfer case (if equipped). Refer to Group 21 Transmission and Transfer Case.

(9) Install battery negative cable.

(10) Fill the engine with clean lubrication oil. Run the engine and check for leaks.

(11) Stop the engine for five minutes. Check the oil level, and add oil if needed.

PISTON AND CONNECTING ROD ASSEMBLY

The turbocharged intercooler piston has a Ni-Resist insert with a keystone profile for the top com-

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

pression ring. The new piston has a new design bowl and a 7 mm longer piston pin. These pistons can not be interchanged with earlier models.

REMOVAL

(1) Remove the engine assembly from the vehicle (Refer to Engine Remove and Install procedure in this section).

(2) Remove the cylinder head from the block.

(3) Remove the oil pan and suction tube.

(4) If the cylinder bores have ridges, use a ridge reamer to cut the ridge from the top of the cylinder bore before removing the piston. Make sure the ridge reamer does not make a deep cut into the bore. DO NOT remove more metal than is necessary to remove the ridge.

(5) If cylinders have ridges, the cylinders are oversize and will need boring.

(6) Use a hammer and a steel stamp to mark the cylinder number onto each connecting rod cap. Mark the cylinder number onto the top of each piston.

(7) Remove the connecting rod bolts and rod caps. Use care so the cylinder bores and connecting rods are not damaged.

(8) Use a hammer handle or similar object to push the piston and connecting rod through the cylinder bore.

(9) Store the piston/rod assemblies in a rack.

(10) If a piston must be replaced, replace with the same part number (grading) that was removed.

INSTALLATION

(1) Lubricate the cylinder bore with clean engine oil.

(2) Generously lubricate the rings and piston skirts with clean engine oil.

(3) Compress the rings using a piston ring compressor tool (Fig. 77). If using a strap-type ring compressor, make sure the inside end of the strap does not hook on a ring gap and break the ring.

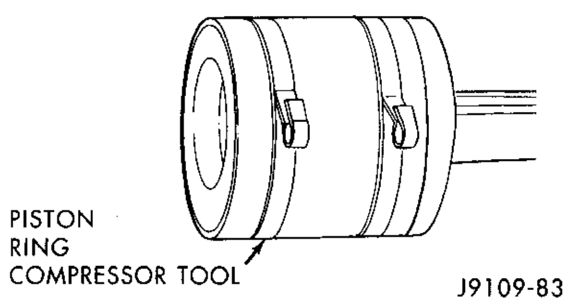

Fig. 77 Piston Ring Compressor Tool

(4) Bar the crankshaft so the rod journal for the piston to be installed is at BDC (Bottom Dead Center) - (Fig. 78).

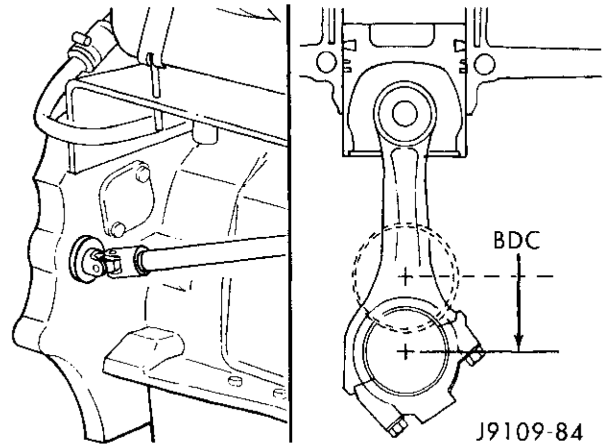

Fig. 78 Piston/Rod Assembly at BDC

(5) Be sure the FRONT marking on the piston and the numbers on the rod and cap are oriented as illustrated.

(6) Position the piston and rod assembly into the cylinder bore with the word FRONT on the piston towards the front of the cylinder block. Use care when you install the piston and connecting rod so the cylinder bore is not damaged.

(7) Push the piston into the bore until the top of the piston is approximately 50 mm (2 inch) below the top of the block. Carefully pull the connecting rod onto the crankshaft journal.

(8) Use clean engine oil to lubricate the threads and under the heads of the connecting rod bolts.

(9) The 4 digit number stamped on the rod cap at the parting line must match and be installed towards the oil cooler side of the engine (Fig. 79).

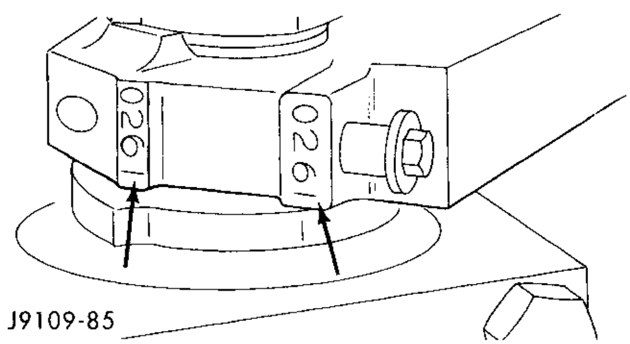

Fig. 79 Correct Rod Cap Installation

(10) Install the rod cap and bolts to the connecting rod. Tighten the connecting rod and bolt evenly in 3 steps.

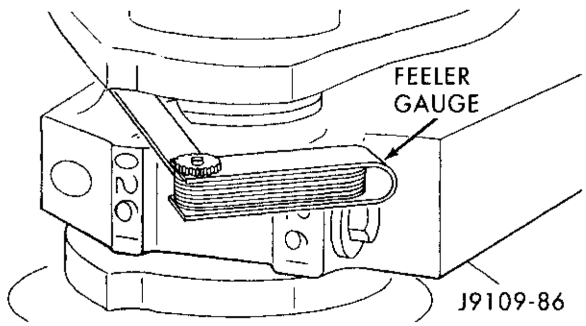
- Tighten the bolts to 35 N·m (26 ft. lbs.) torque.
- Tighten the bolts to 70 N·m (51 ft. lbs.) torque.
- Tighten the bolts to 100 N·m (73 ft. lbs.) torque.

(11) The crankshaft must rotate freely. Check for freedom of rotation as the caps are installed. If the

REMOVAL AND INSTALLATION (Continued)

crankshaft does not rotate freely, check the installation of the rod bearing and the bearing size.

(12) Measure the side clearance between the connecting rod and the crankshaft (Fig. 80). DO NOT measure the clearance between the cap and crankshaft.



SIDE CLEARANCE LIMITS		
MIN.	0.100 mm	(0.004 inch)
MAX.	0.300 mm	(0.012 inch)

Fig. 80 Side Clearance between Connecting Rod/Crankshaft

(13) Install the suction tube and oil pan.
(14) Install the cylinder head onto the block.
(15) Install the engine assembly into the vehicle.

CRANKSHAFT

REMOVAL

(1) Remove the rear crankshaft seal housing.
(2) Remove the gear housing.
(3) Rotate the engine to a horizontal position and remove the main bearing bolts.
(4) The main bearing caps should be numbered. If they are not, be sure to mark them, beginning with number one at the front and ending with number seven at the rear (Fig. 81).

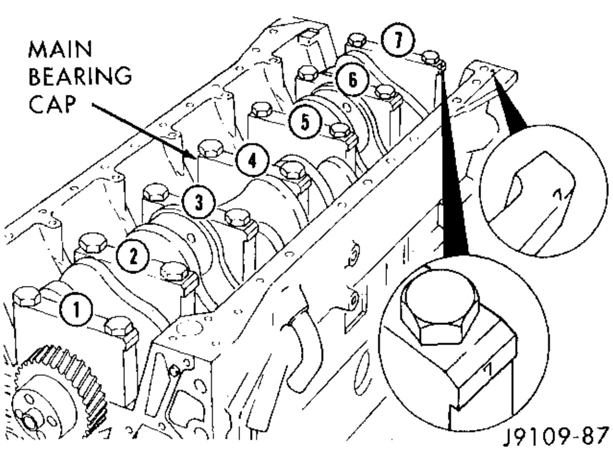


Fig. 81 Numbering Main Bearing Caps

CAUTION: DO NOT pry on the main caps to free them from the cylinder block.

(5) Use two of the main bearing cap bolts to wiggle the main cap loose, being careful not to damage the bolt threads (Fig. 82). Remove the caps.

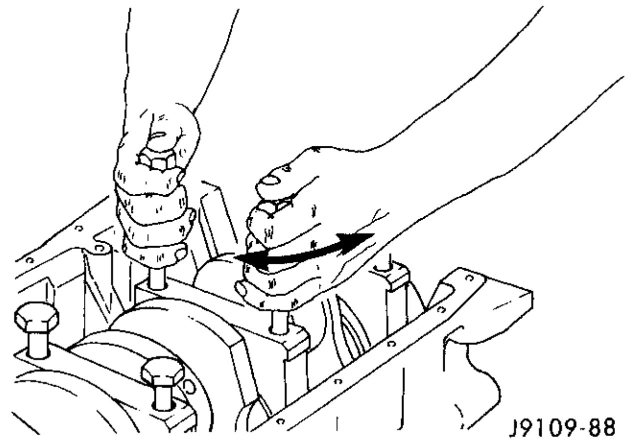

Fig. 82 Main Bearing Cap Removal

WARNING: USE A HOIST TO AVOID INJURY.

(6) Lift the crankshaft and gear from the cylinder block (Fig. 83).

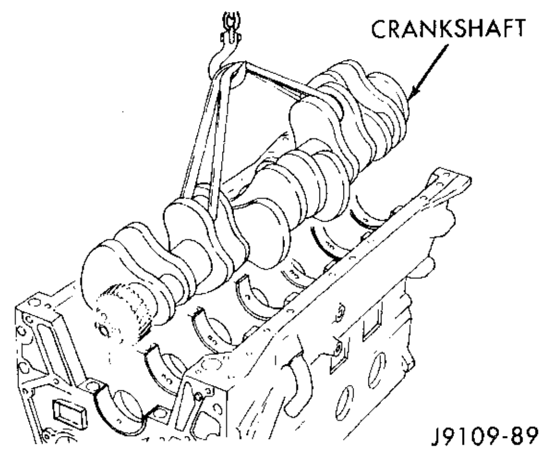

Fig. 83 Lifting Crankshaft out of Cylinder Block

(7) Remove the main bearings from the block and the main caps.
(8) Remove the piston cooling nozzles by using a 3/16 inch pin punch to push them out (Fig. 84).

INSTALLATION

CAUTION: Use only hand force to push the nozzle in place. If driven with a hammer, the nozzle will be damaged.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

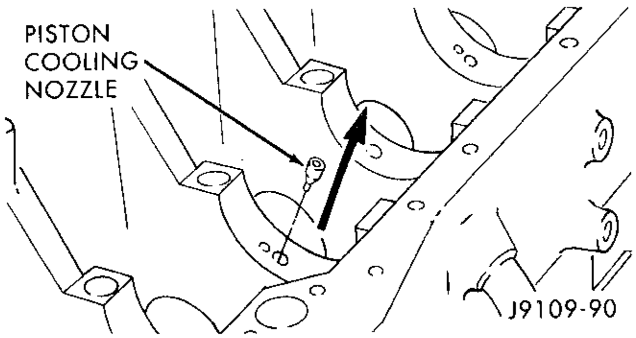

Fig. 84 Piston Cooling Nozzles

(1) Use a center punch to push the piston cooling nozzle into place. Install nozzles so they are even with or slightly below the saddle surface.

(2) Make sure the saddle surface is clean and dry. Install the upper main bearings.

(3) Install the combination thrust/main bearing in the number six main bearing location.

(4) Lubricate the bearings with Lubriplate 105, or equivalent.

WARNING: TO AVOID INJURY, USE A HOIST TO INSTALL THE CRANKSHAFT.

(5) Install the crankshaft.

CAUTION: Crankshaft must be lowered onto the bearings straight to prevent damage to thrust bearings.

(6) Install the ring dowels in the main bearing caps (Fig. 85).

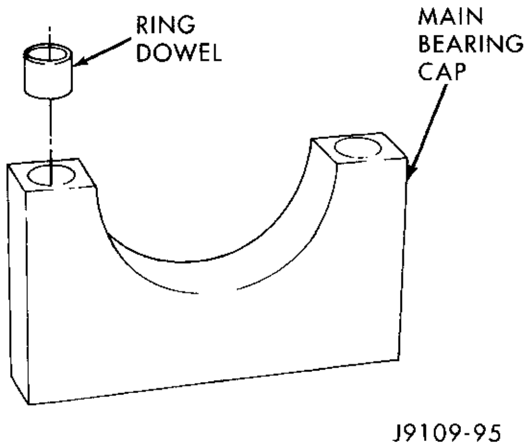

Fig. 85 Install Ring Dowels

(7) Install the lower main bearings in the caps.

(8) Lubricate the bearings with Lubriplate, or equivalent.

(9) Numbers on the main bearings caps face the oil cooler side of the engine with number one at the front of the engine.

(10) Place the caps in their respective positions.

(11) Lubricate the main bearing bolt threads and underside of the bolt head with clean engine oil.

(12) Tighten the bolts evenly in the sequence shown using the following torque steps (Fig. 86).

- STEP 1—Tighten all bolts in sequence to 60 N·m (44 ft. lbs.) torque.
- STEP 2—Tighten all bolts in sequence to 90 N·m (60 ft. lbs.) torque.
- STEP 3—Tighten all bolts in sequence an additional 90°.

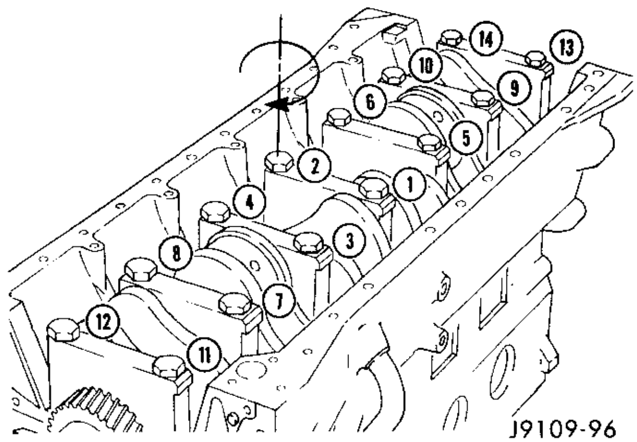

Fig. 86 Main Bearing Bolt Tightening Sequence

(13) Turn the crankshaft to determine that it will rotate freely all 360°. Check the main bearing cap installations and/or the bearing sizes if the shaft does not turn easily.

(14) Push the crankshaft towards one end of its thrust and place a dial indicator as shown (Fig. 87).

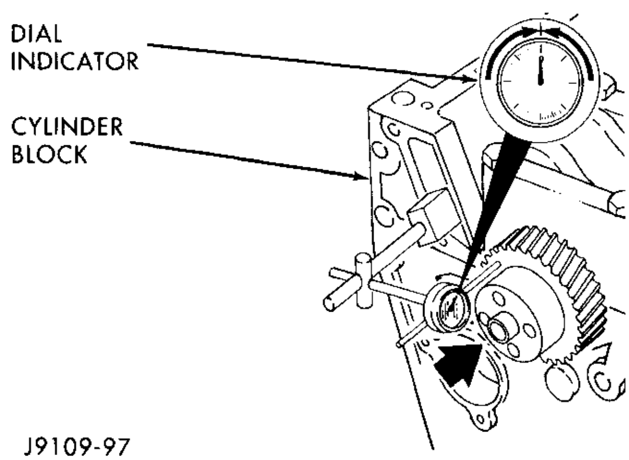

Fig. 87 Position of Dial Indicator

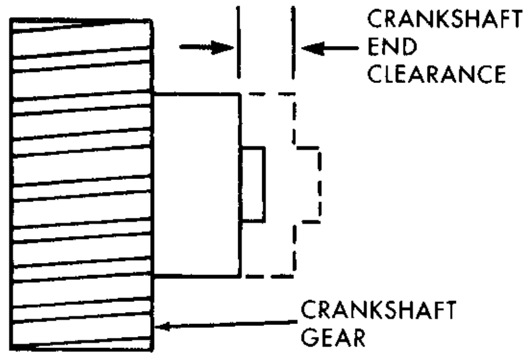
(15) Zero the indicator needle and push the crankshaft towards the other end of its thrust and record the crankshaft end clearance (Fig. 88).

REMOVAL AND INSTALLATION (Continued)



MIN.	0.100 mm	(0.004 inch)
MAX.	0.430 mm	(0.017 inch)

J9409-120

Fig. 88 Crankshaft End Clearance

CRANKSHAFT FRONT SEAL

REMOVAL

(1) Remove fan drive assembly.
(2) Remove the fan belt (Fig. 89).
(3) Remove belt tensioner (Fig. 89).

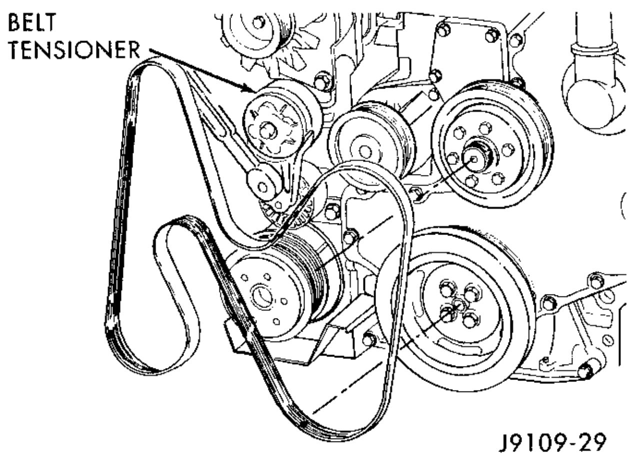


Fig. 89 Drive Belt Installation

(4) Remove oil fill tube and adaptor (Fig. 90).

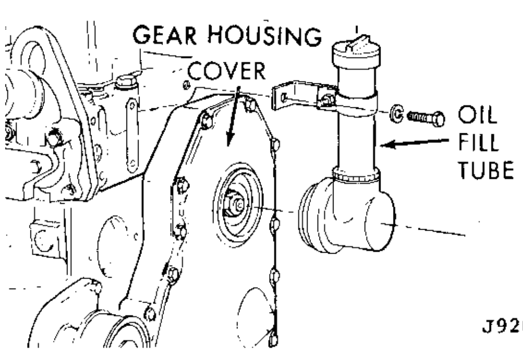

Fig. 90 Oil Fill Tube

(5) Remove vibration damper.

(6) Remove the bolts that hold the gear cover to the gear housing.

(7) Gently pry the cover away from the housing, taking care not to mar the gasket surfaces (Fig. 91).

(8) Clean the old gasket residue from the back of the gear cover and front of the gear housing.

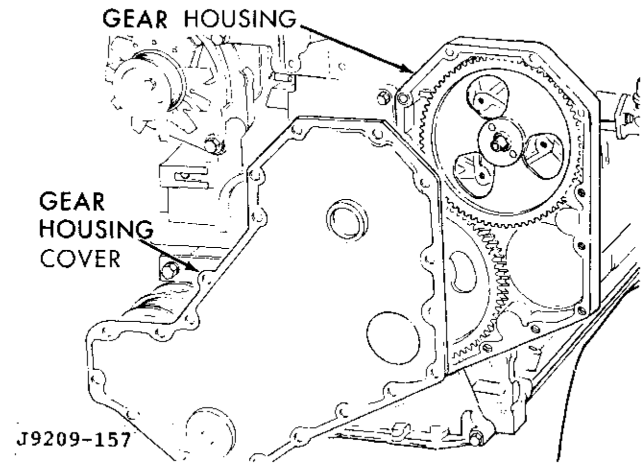

Fig. 91 Gear Housing and Cover

INSTALLATION

(1) Lubricate the front gear train with clean engine oil.

(2) Thoroughly clean the front seal area of the crankshaft. The seal lip and the sealing surface on the crankshaft must be free from all oil residue to prevent seal leaks.

(3) Apply a bead of Loctite 277 to the outside diameter of the seal.

(4) Install the seal into the rear of the cover using a plastic hammer and the alignment/installation tool provided in the seal kit to prevent damage to the seal carrier, hit the alignment/installation tool alternately at the 12, 3, 6 and 9 o'clock positions.

(5) Install the pilot from the seal kit onto the crankshaft.

(6) Using the pilot as an alignment tool, install the cover and a new gasket.

(7) Install the cover bolts and tighten to 24 N·m (18 ft. lbs.) torque. Remove pilot tool.

(8) Install the oil fill tube and mounting bolts. Tighten the bolts to 43 N·m (32 ft. lbs.) torque.

(9) Install the vibration damper. DO NOT tighten the bolts to the correct torque value at this time.

(10) Install the belt tensioner. Tighten the mounting bolts to 43 N·m (32 ft. lbs.) torque.

(11) Raise the belt tensioner to install the belt.

(12) Tighten the vibration damper bolts to 125 N·m (92 ft. lbs.) torque. Use an engine barring tool to keep the engine from rotating during tightening operation.

(13) Install the fan drive assembly.

REMOVAL AND INSTALLATION (Continued)

CRANKSHAFT REAR SEAL

REMOVAL

(1) Remove the transmission (refer to Group 21, Transmission for the proper procedure).
(2) Remove the clutch cover.
(3) Remove the clutch plate.
(4) Remove the flywheel.
(5) Drill holes 180° apart into the seal. Be careful not to get the drill against the crankshaft.
(6) Install #10 sheet metal screws in the drilled holes and remove the rear seal with a slide hammer (Fig. 92).

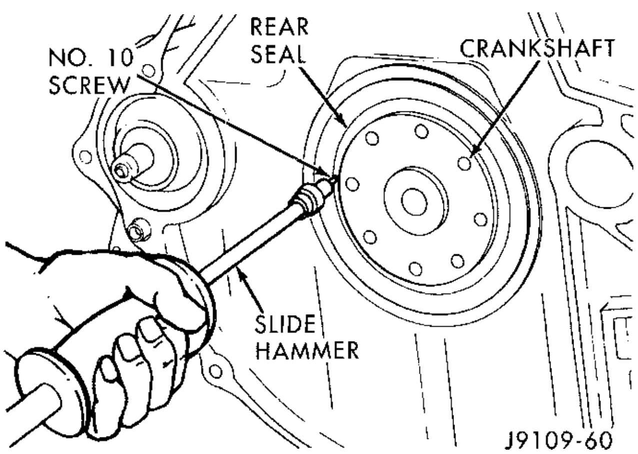

Fig. 92 Crankshaft Rear Seal Removal

INSTALLATION

CAUTION: The seal lip and the sealing surface on the crankshaft must be free from all oil residue to prevent seal leaks.

The crankshaft and seal must be dry when the seal is installed.
(1) Install the seal pilot, provided in the replacement kit, on the crankshaft. Push the seal on the pilot and crankshaft.
(2) Remove the seal pilot.
(3) Use the alignment tool to install the seal to the correct depth in the housing. Use a hammer to drive the seal into the housing until the alignment tool stops against the housing (Fig. 93).
(4) Hit the tool at the 12, 3, 6 and 9 o'clock positions to drive the seal evenly and prevent bending the seal housing.

CRANKSHAFT REAR SEAL HOUSING

REMOVAL

(1) Remove the rear seal housing and gasket (Fig. 94).

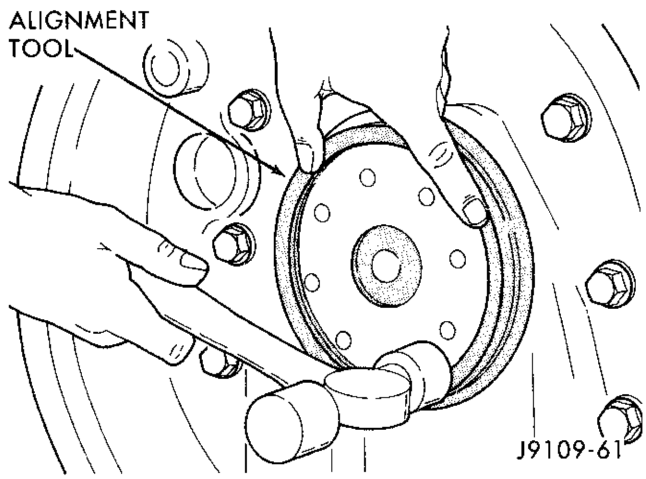

Fig. 93 Seal Installation using Alignment Tool

(2) Support the seal area of the rear seal housing and press/drive out the seal using a hammer and a pin pinch.
(3) Clean the rear seal housing.

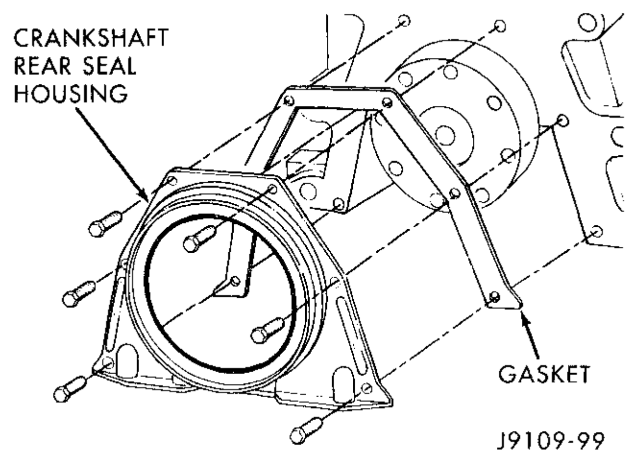

Fig. 94 Crankshaft Rear Seal Housing/Gasket

INSTALLATION

(1) Clean and dry the rear crankshaft sealing surface. The seal lip and the sealing surface on the crankshaft must be free from all oil residue to prevent seal leaks.
(2) Assemble the rear seal housing and gasket to the cylinder block with the bolts.
(3) Align the seal housing to the crankshaft with the alignment tool provided in the seal kit (Fig. 14). Make sure the seal housing is level with both sides of the block oil pan rail. Tighten the bolts to 9 N·m (7 ft. lbs.) torque.
(4) Remove the alignment tool and trim the gasket even with the oil pan mounting surface (Fig. 95).
(5) Install the seal pilot (provided with the replacement kit) onto the crankshaft. Push the seal onto the crankshaft (Fig. 96).
(6) Remove the seal pilot.

REMOVAL AND INSTALLATION (Continued)

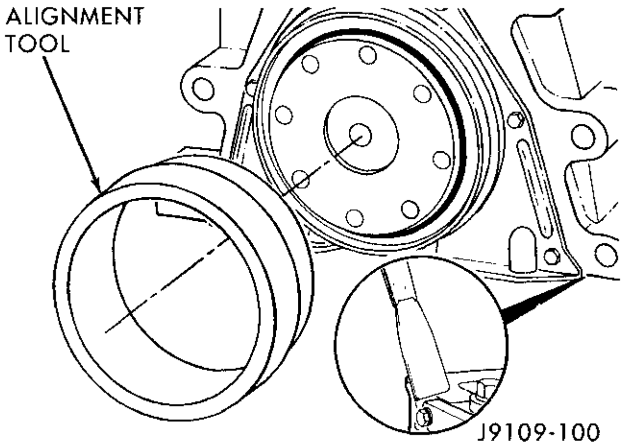

Fig. 95 Crankshaft Rear Seal Housing Alignment Tool

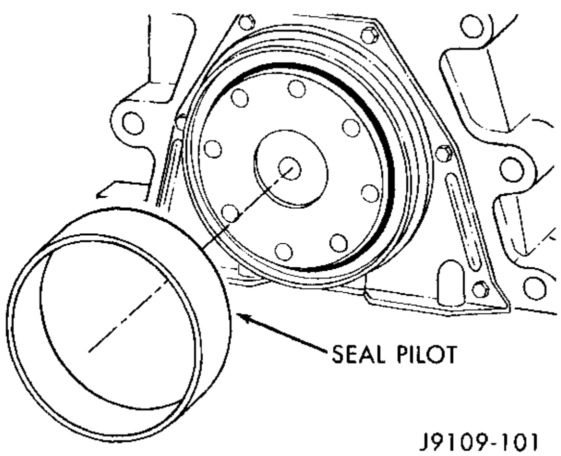

Fig. 96 Crankshaft Rear Seal Pilot

(7) Use alignment and installation tool packaged in the seal kit (Fig. 97). Alternately, drive the seal at the 12, 3, 6 and 9 o'clock positions to prevent bending the seal carrier during installation.

FLYWHEEL RING GEAR

REMOVAL

(1) Remove the transmission.
(2) Remove the clutch cover.
(3) Remove the clutch plate.
(4) Remove the flywheel.
(5) Use a drift pin to drive the ring gear from the flywheel (Fig. 19). Strike the gear at several points around the wheel until it is off.
(6) Heat the new ring for 20 minutes in an oven preheated to 127°C (250°F).
(7) Install the gear. The gear must be installed so the bevel on the teeth is towards the crankshaft side of the flywheel (Fig. 98).

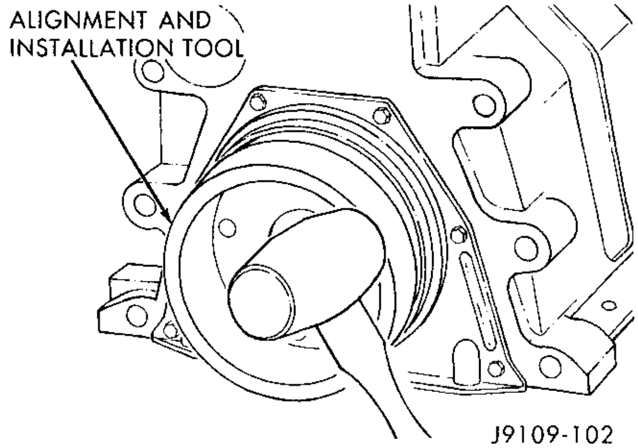

Fig. 97 Crankshaft Rear Seal Alignment/Installation Tool

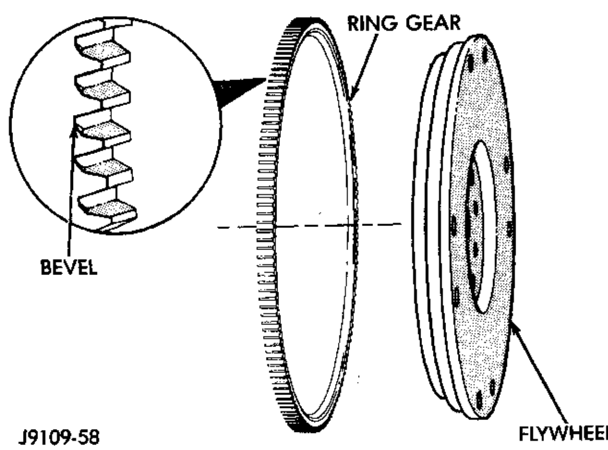

Fig. 98 Flywheel/Ring Gear Position

INSTALLATION

CAUTION: Never use the timing pin to hold the crankshaft in position.

(1) Use the engine barring tool to hold the crankshaft when the flywheel bolts are being tightened.
(2) Tighten the bolts in a criss-cross pattern to 137 N·m (101 ft. lbs.) torque.

CRANKSHAFT GEAR

REMOVAL

Remove the crankshaft gear using a heavy duty puller.

INSTALLATION

Remove all burrs and make sure the gear surface on the end of the crankshaft is smooth.

If removed, install a new alignment pin. Drive the pin in using a ball- peen hammer, leaving it protrud-

REMOVAL AND INSTALLATION (Continued)

ing 1.60 mm (0.063 inch) to 2.39 mm (0.094 inch) above the crankshaft (Fig. 99).

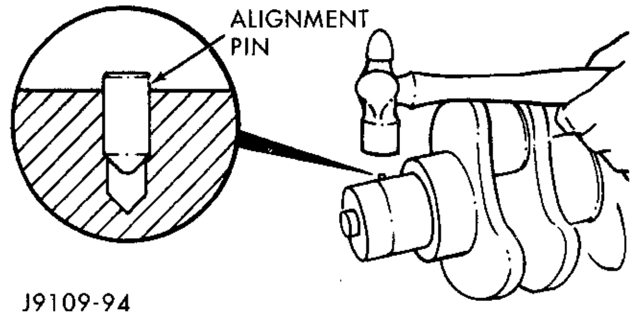

Fig. 99 Installing Alignment Pin

Heat the crankshaft gear for 45 minutes at a temperature of 121°C (250°F).

CAUTION: DO NOT heat the gear longer than 45 minutes.

WARNING: WEAR PROTECTIVE GLOVES TO PREVENT INJURY.

Position the gear with the timing mark out and install it on the crankshaft using the alignment pin. Make sure the gear contacts the shoulder.

OIL PUMP

The non-intercooled turbocharged engine oil pumps can not be used on intercooled engines.

REMOVAL

(1) Remove the radiator (refer to Group 7, Cooling System for the proper procedure).

(2) Loosen the crankshaft vibration damper and remove the drive belt.

(3) Remove the fan clutch assembly.

(4) Remove the fan hub.

(5) Remove the oil fill tube.

(6) Remove the crankshaft vibration damper.

(7) Remove the gear housing cover.

(8) Remove the four mounting bolts and pull the pump from the bore in the cylinder block (Fig. 100).

INSTALLATION

(1) Lubricate the pump with clean engine oil. Filling the pump with clean engine oil during installation will help to prime the pump at engine start up.

Make sure the idler gear pin is installed in the locating bore in the cylinder block.

(2) Install the pump. Tighten the oil pump mounting bolts in two steps and in the sequence shown (Fig. 100).

- Step 1—Tighten to 5 N·m (44 in. lbs.) torque.
- Step 2—Tighten to 24 N·m (18 ft. lbs.) torque.

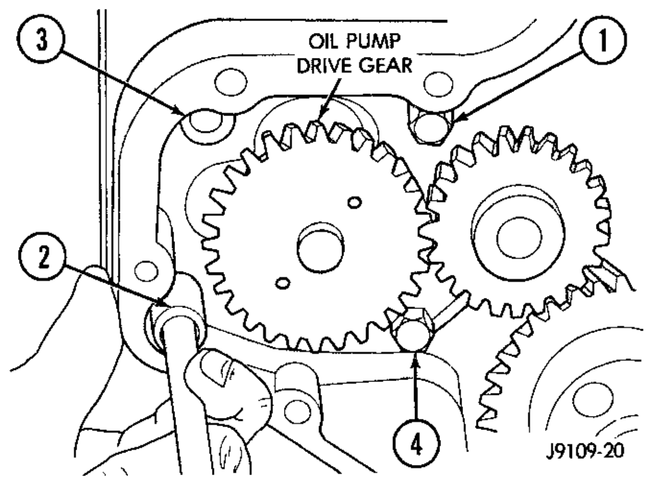

Fig. 100 Oil Pump Removal

(3) The back plate on the pump seats against the bottom of the bore in the cylinder block. When the pump is correctly installed, the flange on the pump will not touch the cylinder block.

(4) Measure the idler gear to pump drive gear backlash and the idler gear to crankshaft gear backlash (Fig. 101). The backlash should be 0.080- 0.330 mm (0.003-0.013 inch). If the backlash is out of limits, replace the oil pump drive gear and the idler gear.

(5) If the adjoining gear moves when you measure the backlash, the reading will be incorrect.

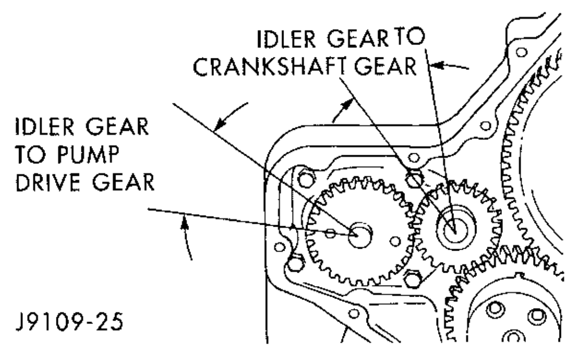

Fig. 101 Idler Gear to Pump Drive Gear and Crankshaft Gear Backlash

OIL FILTER BYPASS VALVE

REMOVAL

(1) Remove the oil cooler cover (Fig. 102).

(2) Remove the valve from the cooler cover (Fig. 102).

INSTALLATION

(1) Drive the new valve in until it bottoms against the step in the bypass valve bore (Fig. 103).

(2) Install the oil cooler cover.

REMOVAL AND INSTALLATION (Continued)

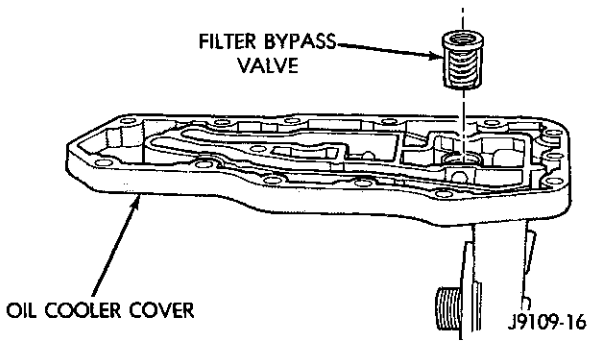

Fig. 102 Removing Filter Bypass Valve

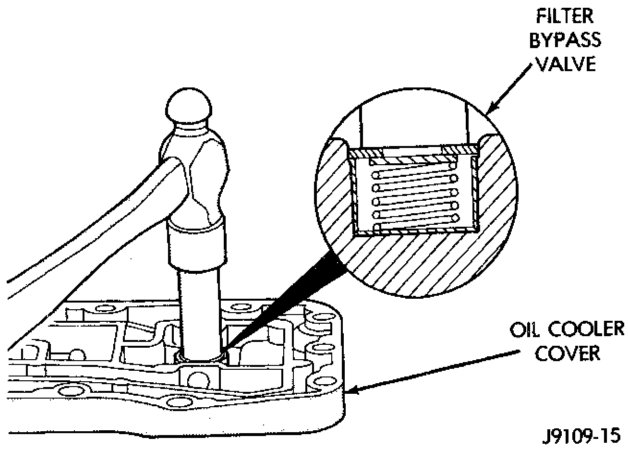

Fig. 103 Installing New Filter Bypass Valve

OIL PRESSURE REGULATOR VALVE AND SPRING

REMOVAL

(1) Remove the threaded plug, gasket, spring and valve (Fig. 104).

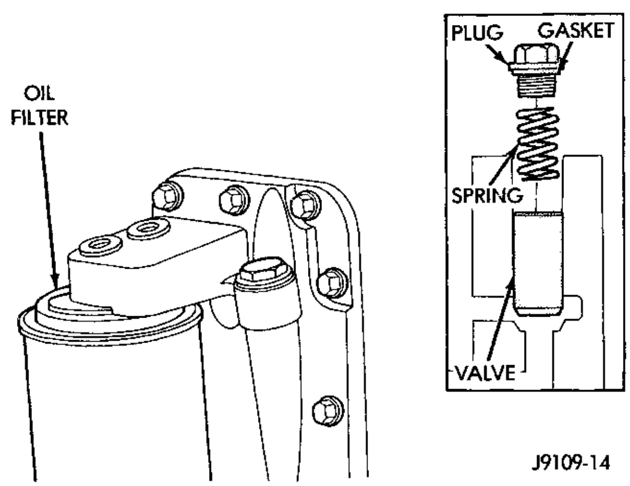

Fig. 104 Oil Pressure Regulator

(2) Check the spring for height and load limitations (Fig. 105). Replace the spring if out of limits.

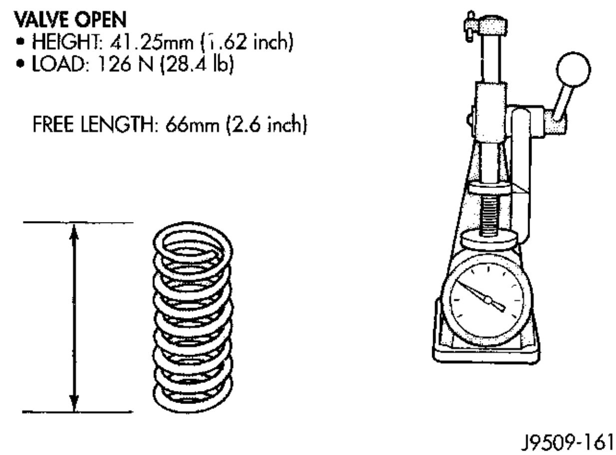

Fig. 105 Oil Pressure Regulator Spring Check

INSTALLATION

(1) Clean and inspect the plunger, bore and seat before assembly. The plunger must move freely in the valve bore.

(2) Install the valve, spring, gasket and plug. Tighten the plug to 80 N·m (60 ft. lbs.) torque.

VACUUM PUMP

REMOVAL

(1) Disconnect battery negative cable.

(2) Position drain pan under power steering pump.

(3) Disconnect vacuum and steering pump hoses.

(4) Disconnect oil pressure sender wires and remove sending unit (Fig. 106).

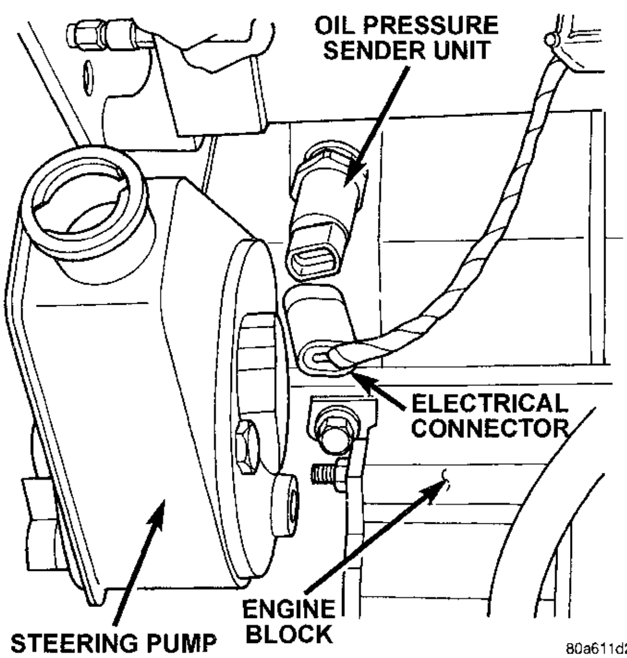

Fig. 106 Oil Pressure Sender Unit

REMOVAL AND INSTALLATION (Continued)

(5) Disconnect lubricating oil feed line from fitting at underside of vacuum pump (Fig. 107).

(6) Remove lower bolt that attaches pump assembly to engine block (Fig. 108).

(7) Remove bottom, inboard nut that attaches adapter to steering pump. This nut secures a small bracket to engine block. Nut and bracket must be removed before pump assembly can be removed from block.

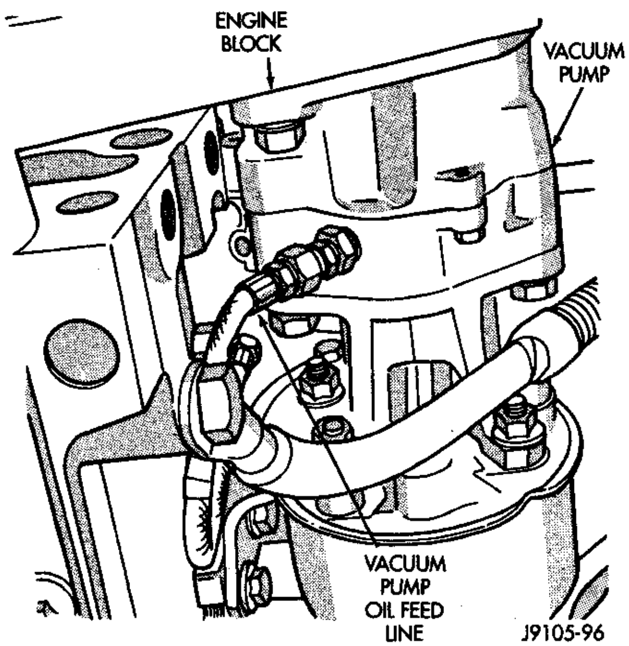

Fig. 107 Vacuum Pump Oil Feed Line

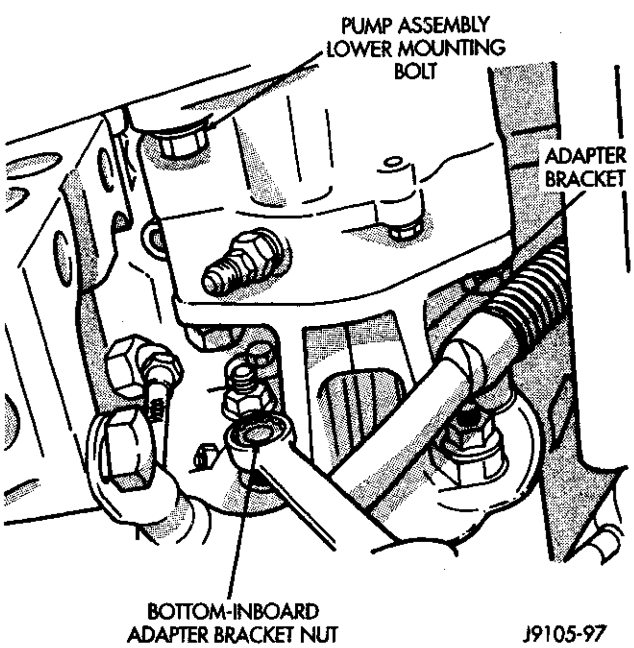

Fig. 108 Vacuum Pump Mounting

(8) Remove upper bolt that attaches pump assembly to engine block (Fig. 109).

(9) Remove pump assembly from vehicle.

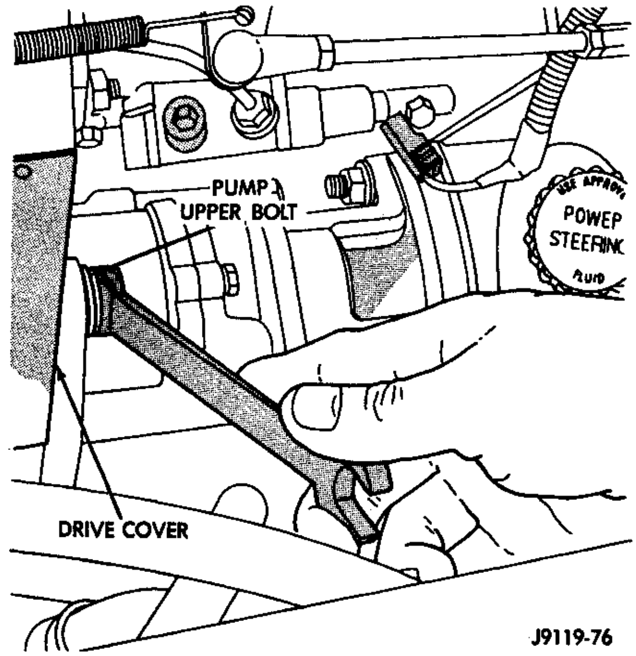

Fig. 109 Pump Assembly Upper Mounting Bolt

(10) Remove nuts attaching vacuum pump to adapter (Fig. 110).

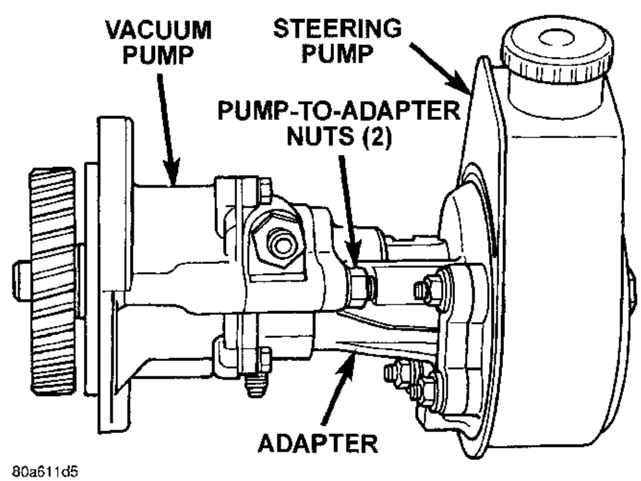

Fig. 110 Pump Assembly

(11) Remove vacuum pump from adapter (Fig. 111). Turn pump gear back and forth to disengage pump shaft from coupling.

(12) Remove coupling from adapter (Fig. 112).

(13) Remove remaining adapter attaching nuts and remove adapter from steering pump (Fig. 113). If steering pump will be serviced, remove spacer from each inboard mounting stud on pump.

REMOVAL AND INSTALLATION (Continued)

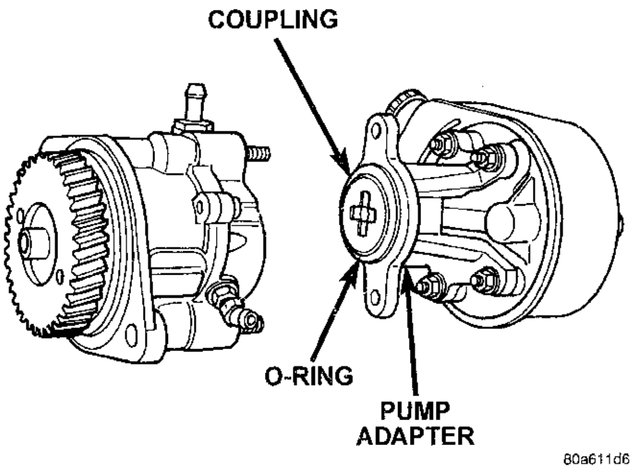

Fig. 111 Vacuum Pump Adapter

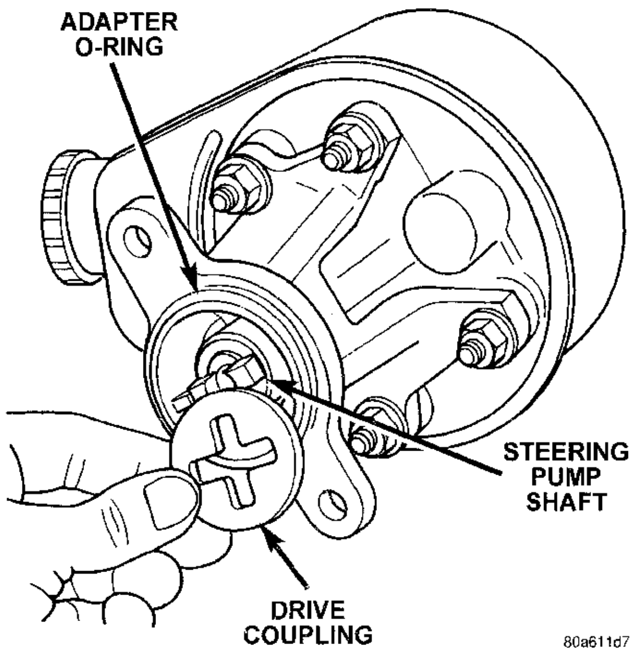

Fig. 112 Pump Drive Coupling

INSTALLATION

(1) Clean and lubricate pump shaft with engine oil.

(2) Install spacers on steering pump studs.

(3) Install O-ring on adapter.

(4) Position adapter on pump studs.

(5) Install attaching nuts on outboard stud and on the two upper pump studs. Do **not** install nut on lower, inboard stud at this time. Tighten nuts to 24 N·m (18 ft. lbs.).

(6) Install coupling on pump shaft. Be sure coupling is securely engaged in shaft drive tangs.

(7) Install vacuum pump on adapter. Rotate drive gear until tangs on pump shaft engage in coupling.

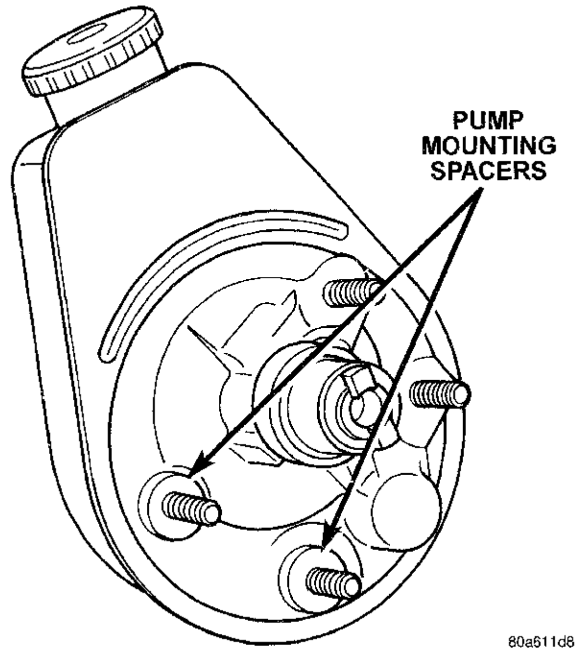

Fig. 113 Steering Pump Mounting Stud Spacers

Verify that pump is seated before installing attaching nuts.

(8) Install and tighten vacuum pump attaching nuts.

(9) Inspect adapter O-ring and replace O-ring if cut or torn.

(10) Lubricate adapter O-ring with engine oil.

(11) Note position of drive slots in coupling (Fig. 114). Then rotate drive gear to align tangs on vacuum pump shaft with coupling.

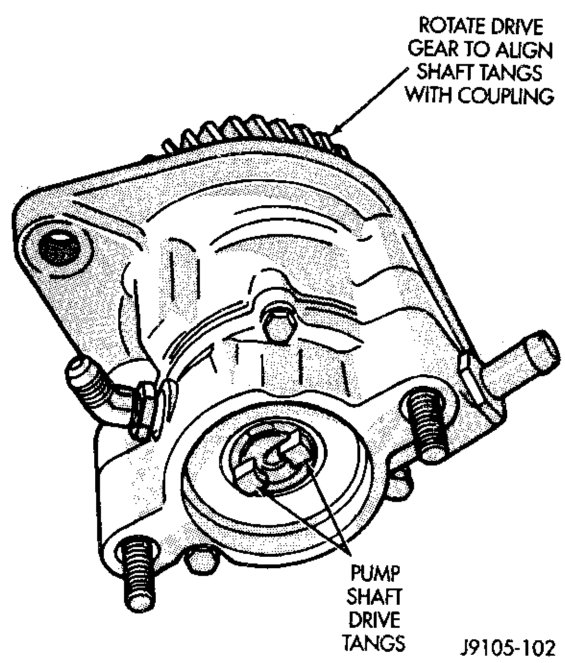

Fig. 114 Pump Shaft Drive Tangs

REMOVAL AND INSTALLATION (Continued)

(12) Verify that pump is seated in adapter and coupling.

(13) Install and tighten pump attaching nuts and washers.

(14) Position new gasket on vacuum pump mounting flange (Fig. 115). Use Mopar Perfect Seal, or silicone adhesive/sealer to hold gasket in place.

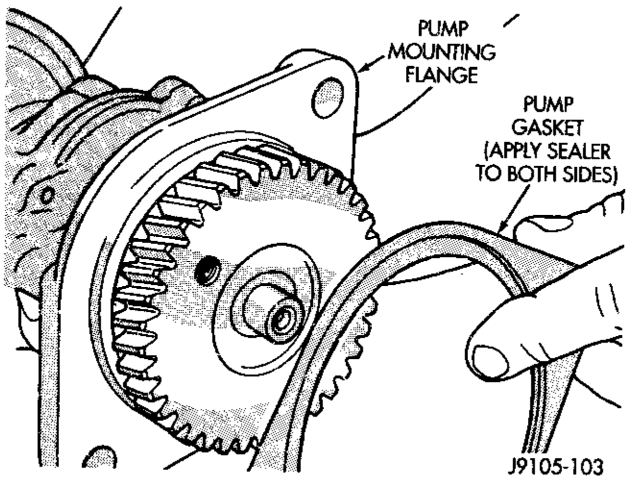

Fig. 115 Pump Mounting Flange Gasket

(15) Insert pump assembly upper attaching bolt in mounting flange and gasket. Use sealer or grease to hold bolt in place if necessary.

(16) Position pump assembly on engine and install upper bolt (Fig. 116). Tighten upper bolt only enough to hold assembly in place at this time.

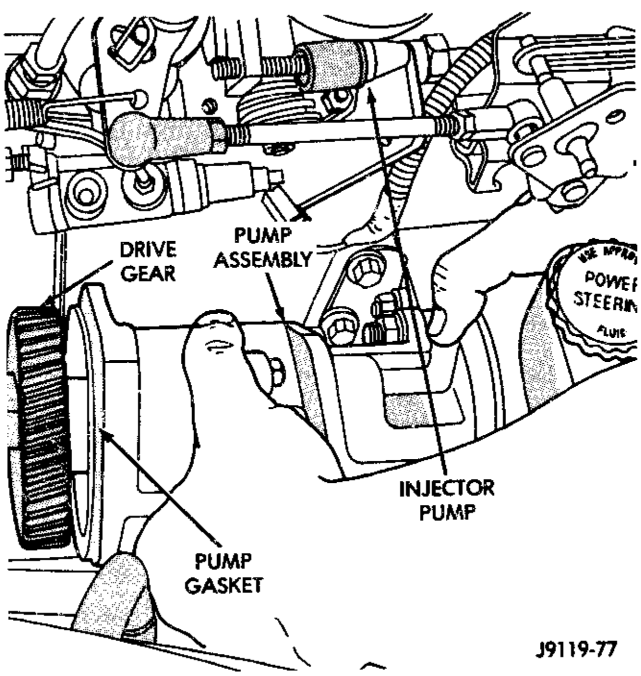

Fig. 116 Installing Pump Assembly On Engine

(17) Working from under vehicle, install pump assembly lower attaching bolt. Then tighten upper and lower bolt to 77 N·m (57 ft. lbs.).

(18) Position bracket on steering pump inboard stud. Then install remaining adapter attaching nut on stud. Tighten nut to 24 N·m (18 ft. lbs.).

(19) Connect oil feed line to vacuum pump connector and tighten line fitting.

(20) Install oil pressure sender and connect sender wires.

(21) Connect steering pump pressure and return lines to pump. Tighten pressure line fitting to 30 N·m (22 ft. lbs.).

(22) Connect vacuum hose to vacuum pump.

(23) Connect battery cables, if removed.

(24) Fill power steering pump reservoir.

(25) Purge air from steering pump lines. Start engine and slowly turn steering wheel left and right to circulate fluid and purge air from system.

(26) Stop engine and top off power steering reservoir fluid level.

(27) Start engine and verify that steering action is correct. Do this before moving vehicle.

DISASSEMBLY AND ASSEMBLY

ROCKER LEVERS

DISASSEMBLE

(1) Remove the retaining rings and thrust washers (Fig. 117).

(2) Remove the rocker levers (Fig. 117). DO NOT disassemble the rocker lever shaft and pedestal. The pedestal and shaft must be replaced as an assembly.

(3) Remove the locknut and adjusting screw (Fig. 117).

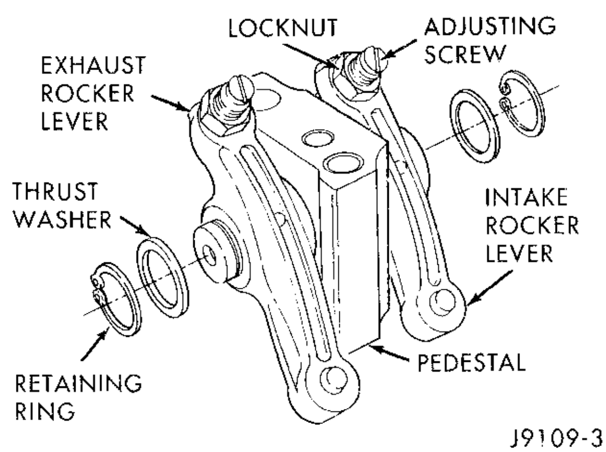

Fig. 117 Rocker Lever Components

(4) Clean all parts in a strong solution of laundry detergent in hot water.

DISASSEMBLY AND ASSEMBLY (Continued)

(5) Use compressed air to dry the parts after rinsing in clean hot water. The pedestals are made from powdered metal and may continue to show wetness after they have been cleaned and dried.

(6) Inspect for excessive wear in the bore and the contact surface for the valve stem.

(7) Measure the rocker lever bore diameter. The maximum diameter is 19.05 mm (0.75 inch). Replace if out of limits.

(8) Inspect the pedestal and shaft.

(9) Measure the shaft diameter. The minimum diameter is 18.94 mm (0.746 inch). Replace if out of limits.

ASSEMBLE

(1) Install the adjusting screw and locknut.

(2) Lubricate the shaft with clean engine oil. Be sure to assemble the intake and exhaust rocker levers in the correct location.

(3) Position the levers on the rocker shaft. Install the thrust washers.

(4) Clean the push rods in the hot soapy water.

(5) Inspect the push rod ball and socket for signs of scoring or cracks where the ball and the socket are pressed into the tube.

(6) Check the push rods for roundness and straightness.

(7) Install the push rods into the sockets of the valve tappets. Lubricate the push rod sockets with clean engine oil.

(8) Make sure the rocker lever adjusting screws are completely backed out.

PISTON AND CONNECTING ROD ASSEMBLY

DISASSEMBLE

(1) Remove the retainer rings from the piston (Fig. 118).

(2) Remove the piston pin. Heating the piston is not required.

(3) Remove the piston rings (Fig. 118).

ASSEMBLE

(1) Be sure the FRONT marking on the piston and the numbers on the rod and cap are oriented (Fig. 119). Install the retaining ring into the pin groove on the FRONT side of the piston.

(2) Lubricate the pin and bore with engine oil.

(3) Install the piston pin in the opposite side of the installed retaining pin. Pistons do not require heating to install the pin, however, the piston does need to be at room temperature or above.

(4) Determine the piston diameter and obtain the appropriate ring set. The piston rings can be identified as shown in (Fig. 120).

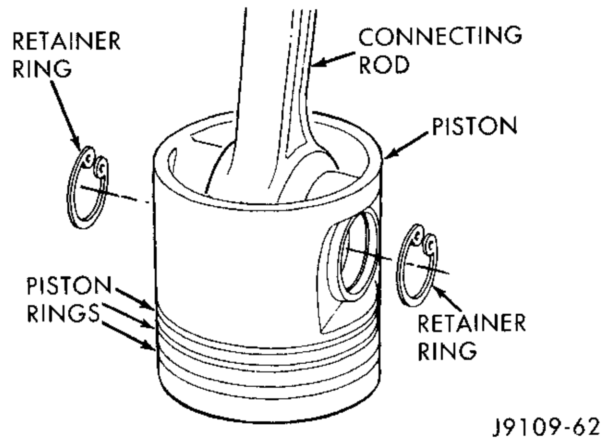

Fig. 118 Retainer Rings

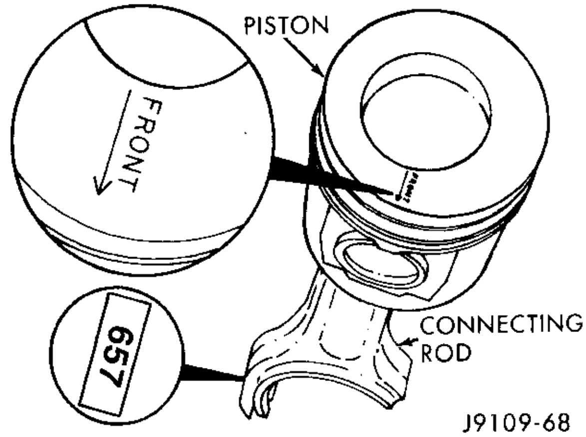

Fig. 119 Proper Markings on the Piston and Connecting Rod

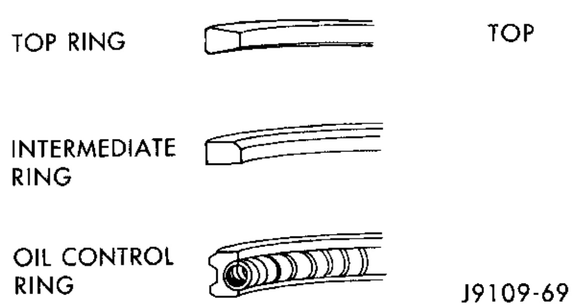

Fig. 120 Piston Ring Identification

(5) Position each ring in the cylinder and use a piston to square it with the bore at a depth of 89.0 mm (3.5 inch) - (Fig. 121).

(6) Use a feeler gauge to measure the piston ring gap (Fig. 122).

(7) The top surface of all of the rings are identified with the word TOP or the supplier's MARK. Assemble the rings with the word TOP or the supplier's MARK up.

DISASSEMBLY AND ASSEMBLY (Continued)

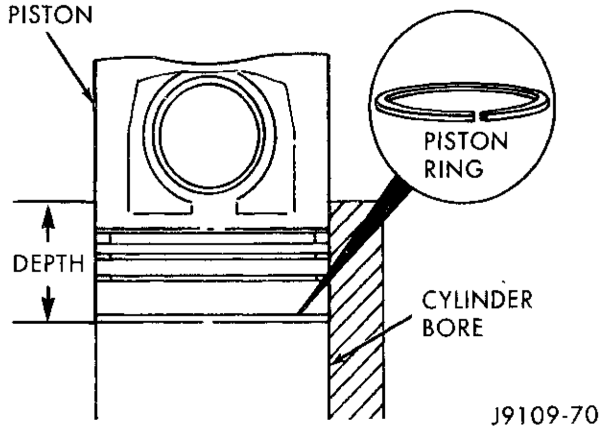

Fig. 121 Position of Ring in Cylinder Bore

	MINIMUM	MAXIMUM
TOP	0.400 mm (0.0160 inch)	0.700 mm (0.0275 inch)
INTERMEDIATE	0.250 mm (0.0100 inch)	0.550 mm (0.0215 inch)
OIL CONTROL	0.250 mm (0.0100 inch)	0.550 mm (0.0215 inch)

J9109-71

Fig. 122 Piston Ring Gap

(8) Position the oil ring expander in the oil control ring groove (bottom groove).

(9) Install the oil control ring with the end gap OPPOSITE the ends on the expander (Fig. 123).

(10) Install the intermediate piston ring in the second groove (Fig. 121).

(11) Install the top piston ring in the top groove (Fig. 124).

(12) Position the rings as shown in (Fig. 125).

(13) Install the original bearings as removed or install new bearings. If new bearings are used, be sure to obtain the proper bearing clearance (Fig. 126).

(14) DO NOT lubricate the side of the bearing that is against the connecting rod or cap. Apply a coat of Lubriplate 105, or equivalent to the new upper and lower connecting rod bearings.

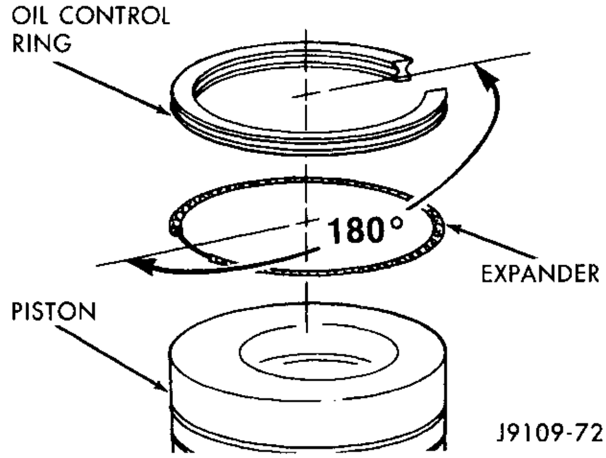

Fig. 123 Oil Control Ring/Expander Location in Groove

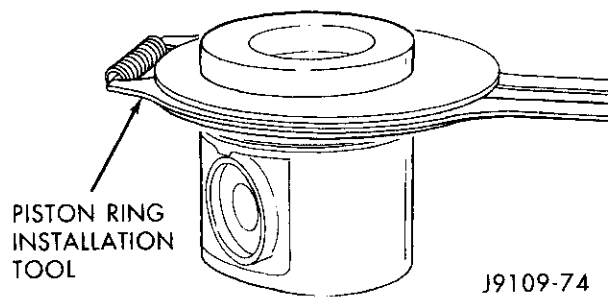

Fig. 124 Piston Ring Installation Tool

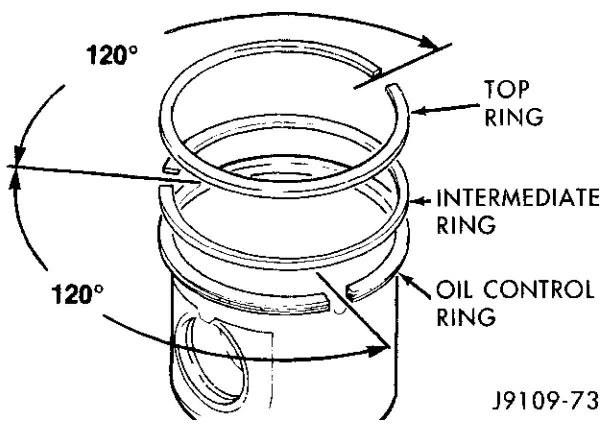

Fig. 125 Piston Ring Positioning

mopar AUTHENTIC RESTORATION PRODUCT

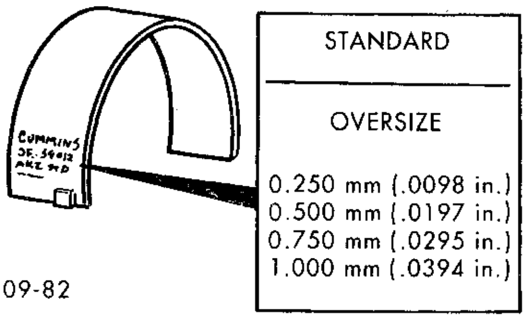

Fig. 126 Connecting Rod Bearing Size Location

CLEANING AND INSPECTION

OIL COOLER ELEMENT AND GASKET

CLEANING AND INSPECTION

Clean the sealing surfaces.

Apply 483 kPa (70 psi) air pressure to the element to check for leaks. If the element leaks, replace the element.

CYLINDER HEAD

INSPECTION

Remove the cup plugs and inspect the coolant passages. A large build up of rust and lime will require removal of the cylinder block for cleaning in a hot tank.

Inspect the cylinder bores for damage or excessive wear. Rotate the crankshaft so the piston is at Bottom Dead Center (BDC) to inspect the bores.

Measure the cylinder bores (Fig. 127). DO NOT proceed with in-chassis repair if the bores are damaged or worn beyond the limits (refer to Cylinder Bore Repair - Cylinder Block).

Check the top surface for damage caused by the cylinder head gasket leaking between cylinders.

Inspect the block and head surface for nicks, erosion, etc.

Check the head distortion (Fig. 128). The distortion of the combustion deck face is not to exceed 0.010 mm (0.0004 inch) in any 50.8 mm (2.00 inch) diameter. Overall variation end to end or side to side 0.30 mm (0.012 inch).

DO NOT proceed with the in-chassis overhaul if the cylinder head or block surface is damaged or not flat (within specifications).

REFACING HEAD SURFACE

The cylinder head combustion deck may be refaced in whatever increments necessary to clean up the surface and maintain the surface finish and flatness tolerances. The combined total of stock removed must not exceed 1.00 mm (0.03937 inch). The amount of stock removed each time must be steel stamped above combustion deck edge, on the lower right hand corner of the rear face (Fig. 129). Check valve protrusion after head surface refacing.

Surface finish requirements are 1.5-3.2 micrometers (60-126 microinch).

CLEANING

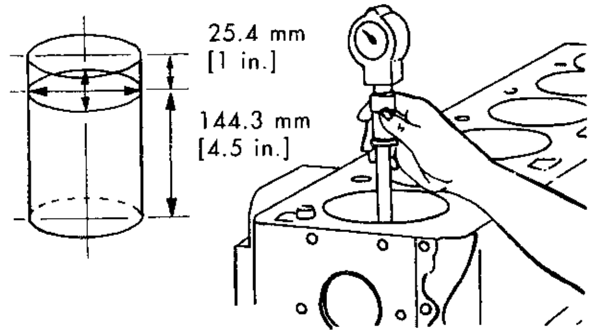
Clean the carbon from the injector nozzle seat with a nylon or brass brush.

Scrape the gasket residue from all gasket surfaces.

Wash the cylinder head in hot soapy water solution (88°C or 140°F).

After rinsing, use compressed air to dry the cylinder head.

Polish the gasket surface with 400 grid paper. Use an orbital sander or sanding block to maintain a flat surface.



MIN.	102.0 mm	(4.0157 inch)
MAX.	102.116 mm	(4.0203 inch)
Out-of-Round	0.038 mm	(0.0015 inch)
Taper	0.76 mm	(0.003 inch)
Oversize pistons and rings are available for bored cylinder blocks.		

J9109-75

Fig. 127 Cylinder Bore Diameter

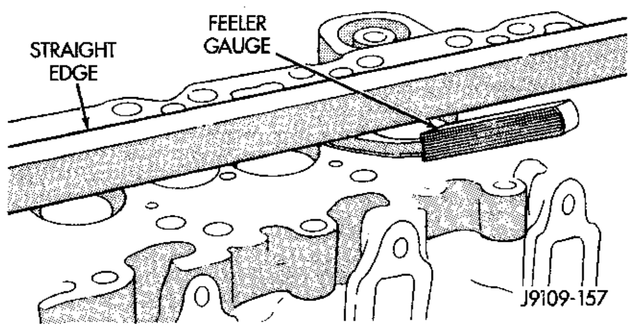


Fig. 128 Cylinder Head Combustion Deck Face Measurement

CLEANING AND INSPECTION (Continued)

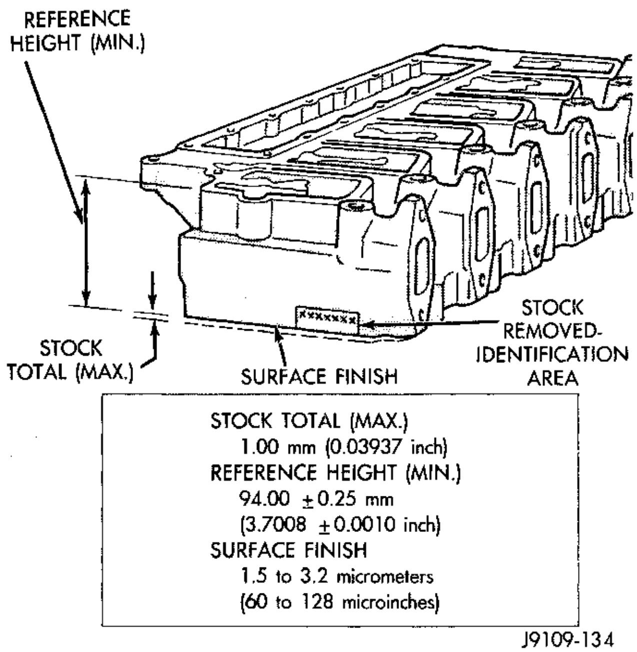

Fig. 129 Cylinder Head Stock Removal

VALVES AND VALVE SPRINGS

VALVES

CLEANING AND INSPECTION

Before cleaning, note the valve number. Clean the valve heads with a soft wire wheel. Mark the valve with the number noted above.

Polish the valve stems with crocus cloth.

Inspect for abnormal wear on the valve heads and stems. Replace badly worn valves.

Check for bent valves. Replace bent valves.

Measure the valve stem diameter (Fig. 130). The valve stem diameter should be 7.935-7.960 mm (0.3126-0.3134 inch). If out of limits, replace the valve. Mark the new valves with the replacement location.

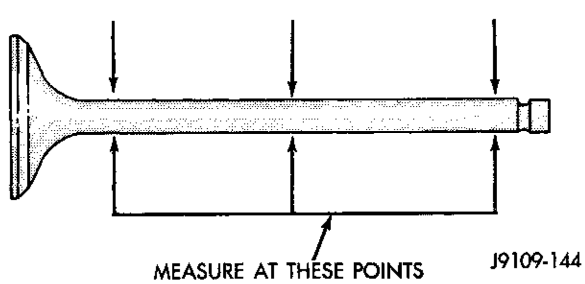

Fig. 130 Measure Valve Stem Diameter

Inspect the end of the valve stem for flatness. If required, resurface the valve end.

VALVE GRINDING

The valve seat angle should be 30° (Intake Valve) and 45° (Exhaust Valve) - (Fig. 131).

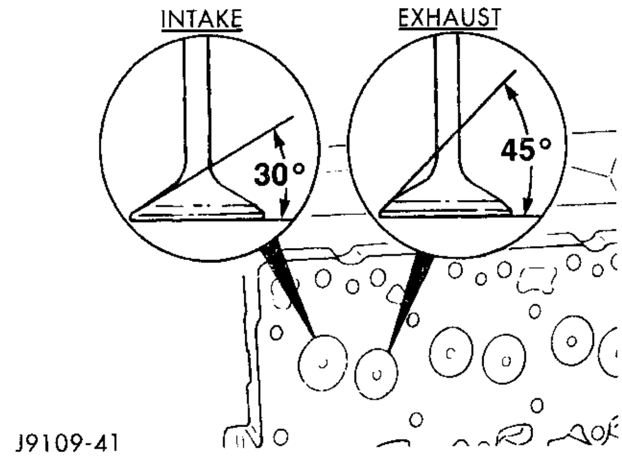

Fig. 131 Valve Seat Angle

Measure the rim thickness (Fig. 132). The minimum valve rim thickness is 0.79 mm (0.031 inch).

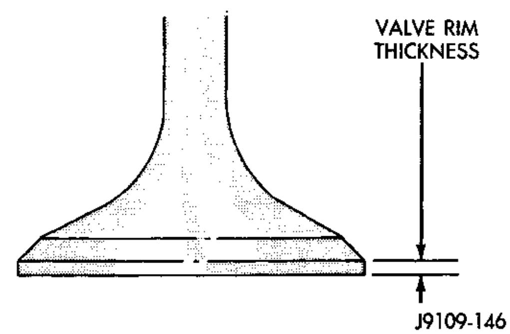

Fig. 132 Valve Rim Thickness

Grind the face of valves to be reused.

Check the valve stem tip for flatness. If required, re-surface the tip.

VALVE GUIDES

INSPECTION

Inspect the valve guides for scuffing or scoring.

Measure the valve guide bore (Fig. 133). The bore diameter should be 8.019-8.089 mm (0.3157-0.3185 inch).

If the valve guide bores are larger than the worn limit, the cylinder head must be machined for service valve guides. New valve guides must be reamed to size after they are installed.

If the cylinder head needs service valve guides and valve seat inserts, the valve guides should be installed first.

CLEANING AND INSPECTION (Continued)

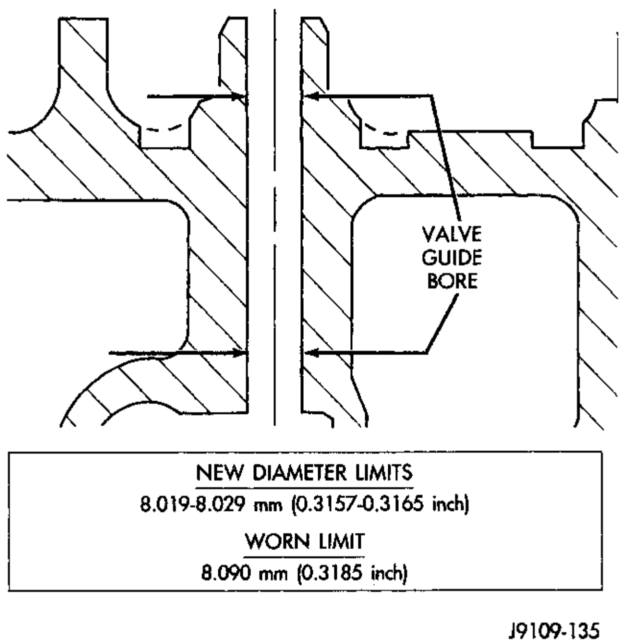

Fig. 133 Valve Guide Bore

VALVE SPRINGS

INSPECTION

Measure the valve spring length. The approximate free length is 60 mm (2.36 inch) with the maximum inclination of 1.0 mm (0.039 inch).

Measure the valve spring force. 359 N (81 lbs.) is the minimum acceptable load required to compress the spring to a height of 49.25 mm (1.94 inch).

If the valve spring does not meet the limits above, replace the spring.

VALVE SEATS

INSPECTION

Cylinder head with integral valve seats can be ground only once. Previously ground integral seats must be replaced with service seats.

One X stamped into the head casting identify seats that have been ground previously (Fig. 134).

Two X's stamped on the head indicate service seats have been installed (Fig. 134). Service seats can be ground.

On the integral seat head, if 0.254 mm (0.010 inch) or more has been removed from the head combustion surface, service seats must be installed.

To determine if the head has been previously resurfaced, before calculating valve depth, process as follows:

(1) Check the rear lower right corner of the head for a stamping that would indicate previous resurfacing (.003).

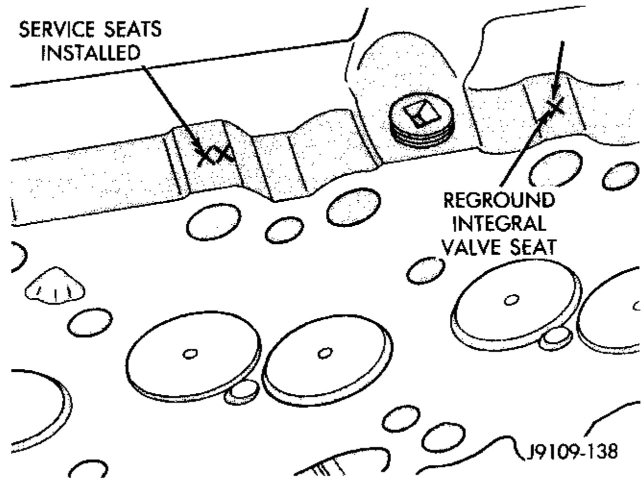

Fig. 134 Reworked Cylinder Head Seats—Stamped Identification

(2) To verify the information, or if no amount is indicated, measure the head height (Fig. 135).

(3) If the head height is 94.75 mm (3.730 inch) or greater, the valve seats may be ground, if they have not been ground previously.

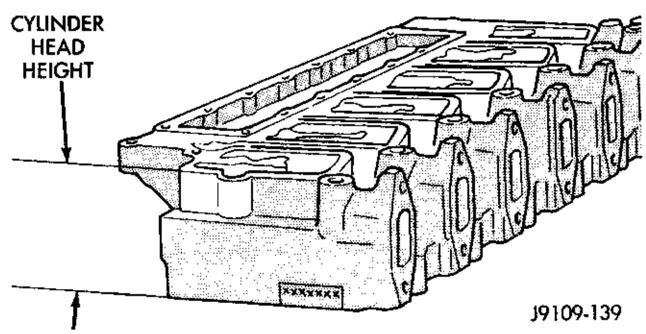

Fig. 135 Cylinder Head Height

TAPPET

INSPECTION

Inspect the tappet socket, stem and face for excessive wear, cracks and other damage (Fig. 136).

The minimum tappet stem diameter is 15.925 mm (0.627 inch) - (Fig. 136). If the tappet is out of limits, replace the tappet.

CAMSHAFT

INSPECTION

Inspect the lift pump lobe, valve lobes and bearing journals for wear, cracking, pitting and other damage.

Clean the camshaft and gear with solvent and a lint free cloth.

Inspect the gear teeth for wear and damage. Look for cracks at the root of the teeth.

AUTHENTIC RESTORATION PRODUCT

CLEANING AND INSPECTION (Continued)

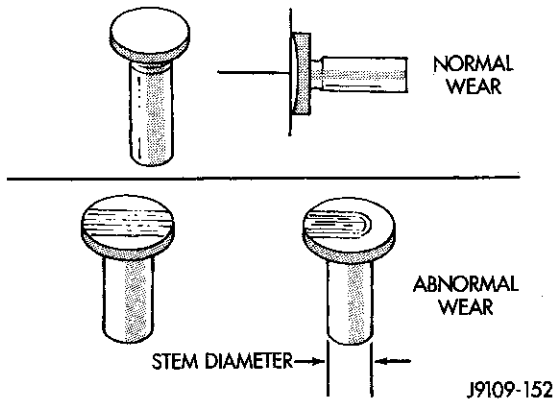

Fig. 136 Tappet Inspection

Measure the bearing journals, lift pump lobe and valve lobes (Fig. 137).

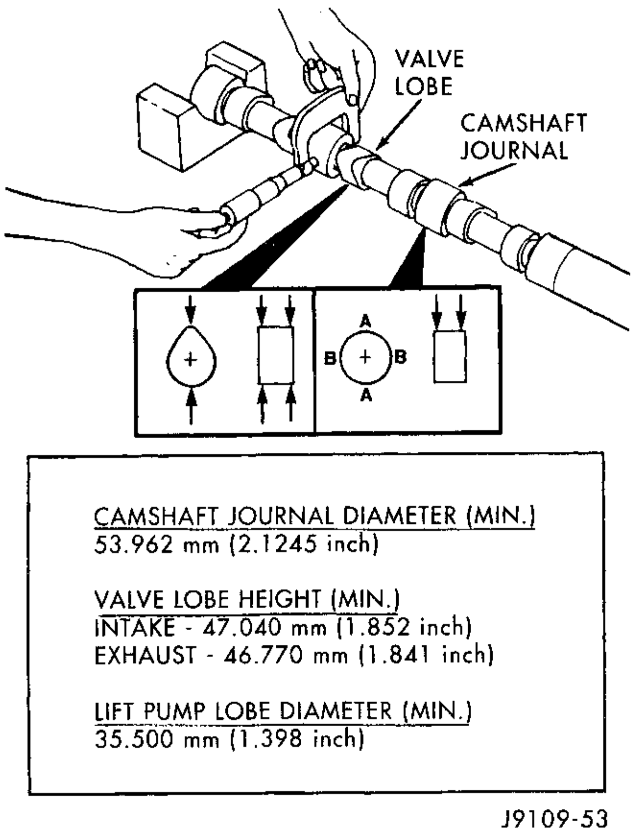

Fig. 137 Bearing Journal/Valve Lobe Measurements

OIL PUMP

CLEAN AND INSPECT

Visually inspect the lube pump gears for chips, cracks or excessive wear.

Remove the back plate (Fig. 138).

Mark TOP on the gerotor planetary using a felt tip pen (Fig. 138).

Remove the gerotor planetary (Fig. 138).

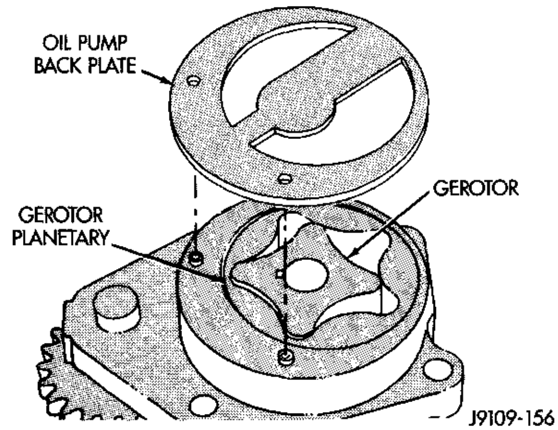

Fig. 138 Gerotor Planetary and Gerotor

Inspect for excessive wear or damage.

Clean all parts in solvent and dry with compressed air.

Inspect the pump housing and gerotor drive for damaged and excessive wear.

Install the gerotor planetary in the original position. The chamfer must be on the O.D. and down.

Measure the tip clearance (Fig. 139). Maximum clearance is 0.1778 mm (0.007 inch). If the oil pump is out of limits, replace the pump.

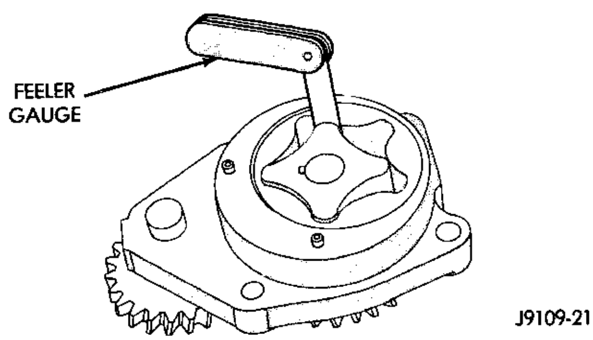

Fig. 139 Tip Clearance

Measure the clearance of the gerotor drive/gerotor planetary to port plate (Fig. 140). Maximum clearance is 0.127 mm (0.005 inch). If the oil pump is out of limits, replace the pump.

Measure the clearance of the gerotor planetary to the body bore (Fig. 141). Maximum clearance is 0.381 mm (0.015 inch). If the oil pump is out of limits, replace the pump.

Measure the gears backlash (Fig. 142). The limits of a used pump is 0.080- 0.380 mm (0.003-0.015 inch). If the backlash is out of limits, replace the oil pump.

Install the back plate.

CLEANING AND INSPECTION (Continued)

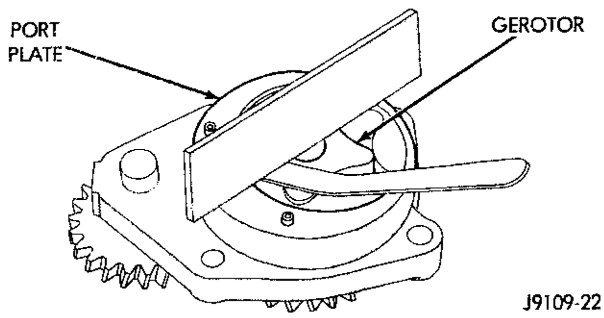

Fig. 140 Gerotor to Port Plate Clearance

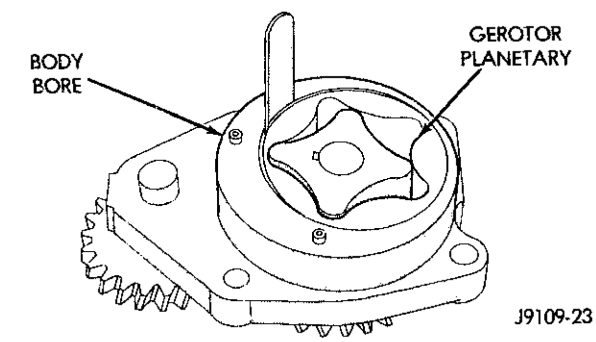

Fig. 141 Gerotor Planetary to Body Bore Clearance

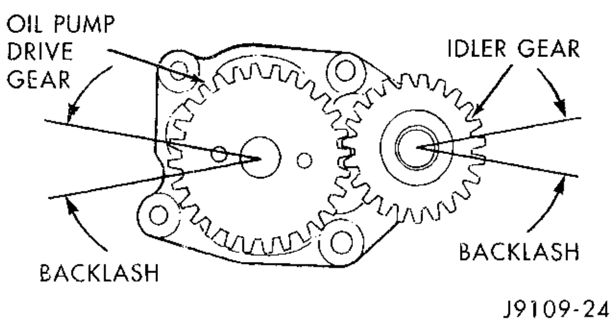

Fig. 142 Measure Gear Backlash

CYLINDER BLOCK

(1) Remove the engine assembly from the vehicle.
(2) Remove the cylinder head from the block.
(3) Remove the camshaft.
(4) Remove the piston/connecting rod assemblies.

INSPECTION

Measure the combustion deck face using a straight edge and a feeler gauge (Fig. 143). The distortion of the combustion deck face is not to exceed 0.010 mm (0.0004 inch) in any 50.00 mm (2.0 inch) diameter. Overall variation end to end or side to side is 0.075 mm (0.003 inch).

If the surface exceeds the limit, refer to Cylinder Block Refacing.

Inspect the cylinder bores for damage or excessive wear.

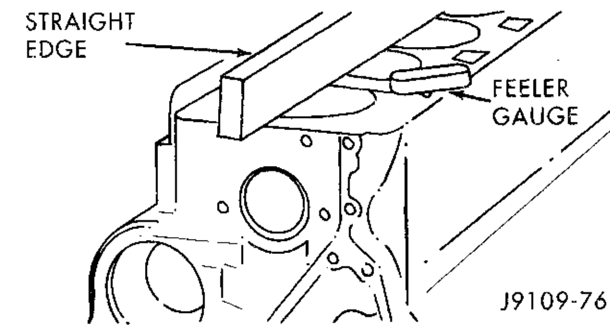

Fig. 143 Combustion Deck Face Measurement

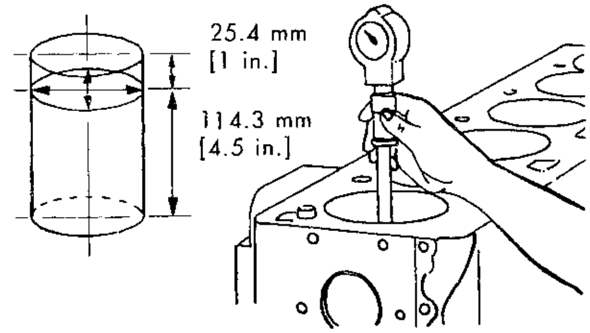
Measure the cylinder bores (Fig. 144). If the cylinder bores exceeds the limit, refer to Cylinder Bore Repair.



MIN.	102.0 mm	(4.0157 inch)
MAX.	102.116 mm	(4.0203 inch)
Out-of-Round	0.038 mm	(0.0015 inch)
Taper	0.076 mm	(0.003 inch)
Oversize pistons and rings are available for bored cylinder blocks.		

J9209-167

Fig. 144 Cylinder Bore Diameter

Inspect the camshaft bores for scoring or excessive wear.

Measure the camshaft bores. Refer to engine specifications at the rear of this section. Limit for the No.1 bore applies to the ID of the bushing.

If a bore exceeds the limit, refer to Camshaft Bore Repair.

Inspect the tappet bores for scoring or excessive wear (Fig. 145). If out of limits, replace the cylinder block.

PISTON AND CONNECTING ROD ASSEMBLY

CLEANING

CAUTION: DO NOT use bead blast to clean the pistons. DO NOT clean the pistons and rods in an acid tank.

Mopar AUTHENTIC RESTORATION PRODUCT

CLEANING AND INSPECTION (Continued)

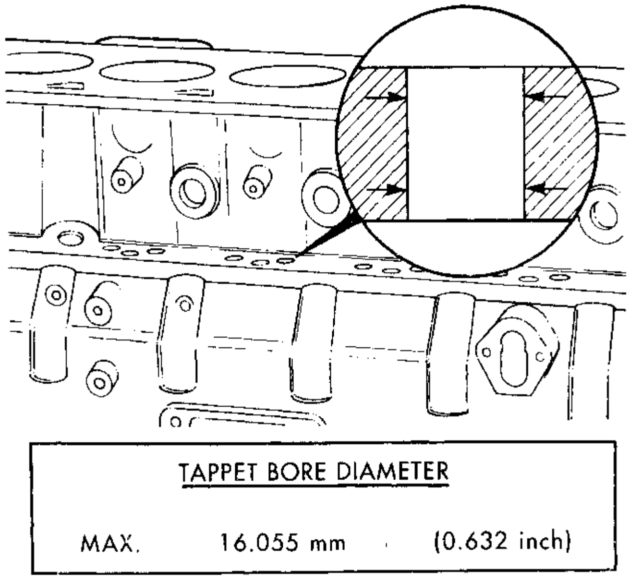


Fig. 145 Tappet Bore Diameter

Soak the pistons in cold parts cleaner. Soaking the pistons overnight will usually loosen the carbon deposits.

Wash the pistons and rods in a strong solution of laundry detergent and hot water.

Clean the remaining deposits from the ring grooves with the square end of a broken ring. DO NOT use a ring groove cleaner and be sure not to scratch the ring sealing surface in the piston groove.

Wash the pistons again in a detergent solution or solvent.

Rinse the pistons. Use compressed air to dry.

INSPECTION

Inspect the rod journals for deep scratches, indication of overheating and other damage.

Inspect the pistons for damage and excessive wear. Check top of the piston, ring grooves, skirt and pin bore.

Measure the piston skirt diameter (Fig. 146). If the piston is out of limits, replace the piston.

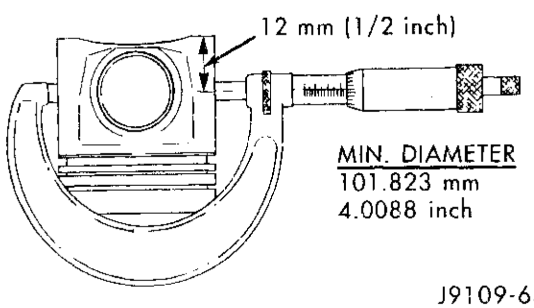

Fig. 146 Piston Skirt Diameter

The upper groove only needs to be inspected for damage.

Use a new piston ring to measure the clearance in the intermediate ring groove (Fig. 147). If the clearance of the intermediate ring exceeds 0.152 mm (0.006 inch), replace the piston.

Use a new oil ring to measure the clearance in the oil groove (Fig. 147). If the clearance exceeds 0.127 mm (0.005 inch), replace the piston.

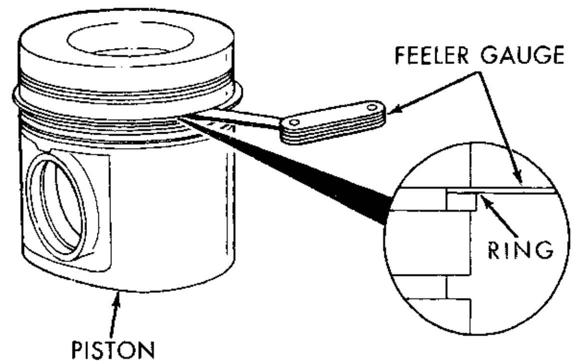

Fig. 147 Intermediate and Oil Ring Clearances

Measure the pin bore (Fig. 148). The maximum diameter is 40.025 mm (1.5758 inch). If the bore is over limits, replace the piston.

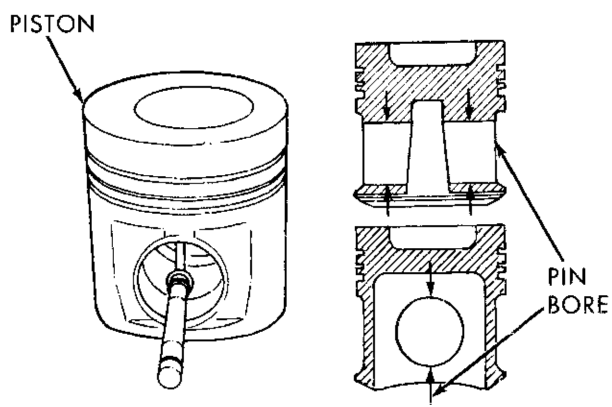

Fig. 148 Piston Pin Bore

Inspect the piston pin for nicks, gouges and excessive wear.

Measure the pin diameter (Fig. 149). The minimum diameter is 39.990 mm (1.5744 inch). If the diameter is out of limits, replace the pin.

Inspect the rod for damage and wear. The I-Beam section of the connecting rod cannot have dents or other damage. Damage to this part can cause stress risers which will progress to breakage.

Measure the connecting rod pin bore (Fig. 150). The maximum diameter is 40.042 mm (1.5764 inch). If out of limits, replace the connecting rod.

CLEANING AND INSPECTION (Continued)

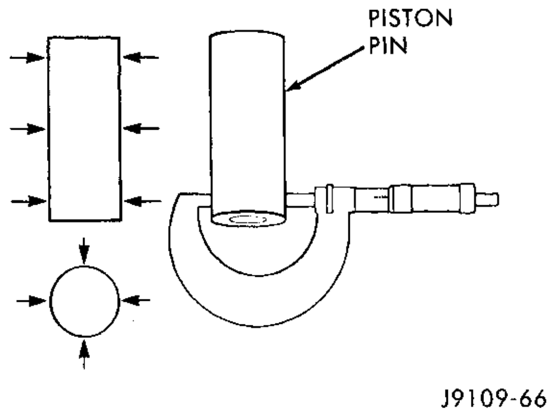

Fig. 149 Piston Pin Diameter

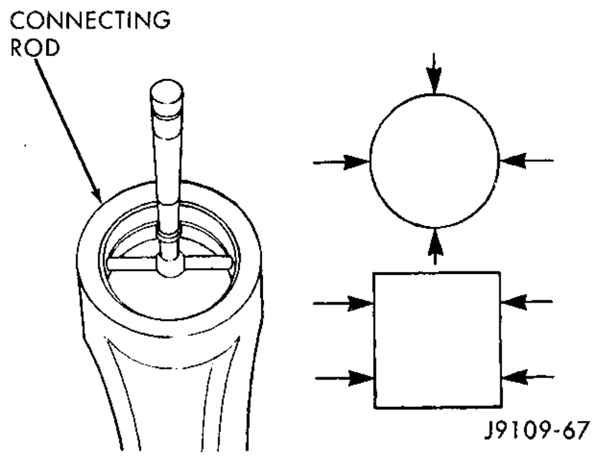

Fig. 150 Connecting Rod Pin Bore

CRANKSHAFT

CLEANING AND INSPECTION

Clean the crankshaft oil galley holes with a nylon brush.

Rinse in clean solvent and dry with compressed air.

Inspect the front and rear seal contact areas of the crankshaft for scratches or grooving.

The service seal kit will position the seal slightly deeper into the seal bore so it will contact the crankshaft at a different location. If this has already been done and the crankshaft has two worn areas, install a wear sleeve to provide a new contact surface for the seal.

Inspect the rod and main journal for deep scores, signs of overheating and other abnormal marks.

ADJUSTMENTS

VALVE CLEARANCE ADJUSTMENT

Use the timing pin to locate Top Dead Center (TDC) for cylinder No.1 (Fig. 151). The timing pin is located at the back of the gear housing and below the injection pump. **Be sure to disengage the timing pin after locating top dead center. Refer to TIMING PIN for more information.**

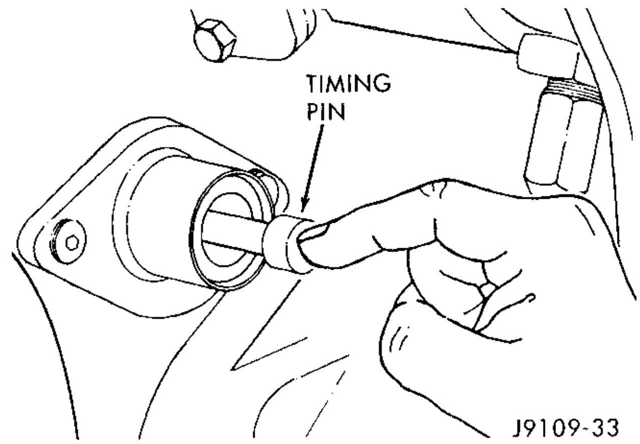

Fig. 151 Locating TDC using Timing Pin

Adjust the valves when the engine is cold, below 60°C (140°F).

STEP 1

Adjust the clearance for the valves shown in (Fig. 152). The valve lash adjustment is 0.254 mm (0.010 inch) for the intake valve. The valve lash adjustment is 0.508 mm (0.020 inch) for the exhaust valve.

Tighten the valve adjusting nuts to 24 N·m (18 ft. lbs.) torque. **Be sure timing pin is disengaged before rotating the crankshaft.** Mark the pulley and rotate the crankshaft 360°.

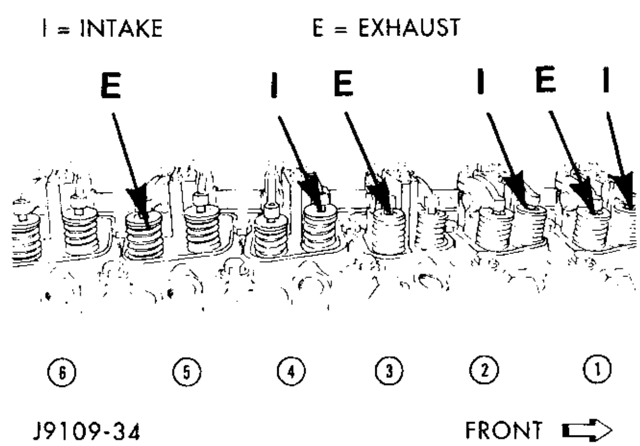

Fig. 152 Adjust Valve Clearance—Step 1

STEP 2

Adjust the clearance for the valves shown in (Fig. 153). The valve lash adjustment is 0.254 mm (0.010 inch) for the intake valve. The valve lash adjustment is 0.508 mm (0.020 inch) for the exhaust valve.

Tighten the bolts to 24 N·m (18 ft. lbs.) torque.

Mopar AUTHENTIC RESTORATION™ PRODUCT

Mopar AUTHENTIC RESTORATION PRODUCT

EXHAUST SYSTEM AND INTAKE MANIFOLD

CONTENTS

GENERAL INFORMATION

EXHAUST SYSTEM

The gasoline engine exhaust system consists of engine exhaust manifolds, exhaust pipes, catalytic converter(s), extension pipe (if needed), exhaust heat shields, muffler and exhaust tailpipe (Fig. 1).

The diesel engine exhaust system consists of an engine exhaust manifold, turbocharger, exhaust pipe, catalytic converter, extension pipe (if needed), muffler and exhaust tailpipe (Fig. 2).

The engine exhaust manifolds on gasoline engines are equipped with ball flange outlets to assure a tight seal and strain free connections.

The exhaust system must be properly aligned to prevent stress, leakage and body contact. If the system contacts any body panel, it may amplify objectionable noises from the engine or body.

When inspecting an exhaust system, critically inspect for cracked or loose joints, stripped screw or bolt threads, corrosion damage and worn, cracked or broken hangers. Replace all components that are badly corroded or damaged. DO NOT attempt to repair.

When replacement is required, use original equipment parts (or their equivalent). This will assure proper alignment and provide acceptable exhaust noise levels.

CAUTION: Avoid application of rust prevention compounds or undercoating materials to exhaust system floor pan exhaust heat shields. Light overspray near the edges is permitted. Application of coating will result in excessive floor pan temperatures and objectionable fumes.

CATALYTIC CONVERTER

There is no regularly scheduled maintenance on any Mopar® stainless steel catalytic converter body. Excessive heat can result in bulging or other distortion, but excessive heat will not be the fault of the

GENERAL INFORMATION (Continued)

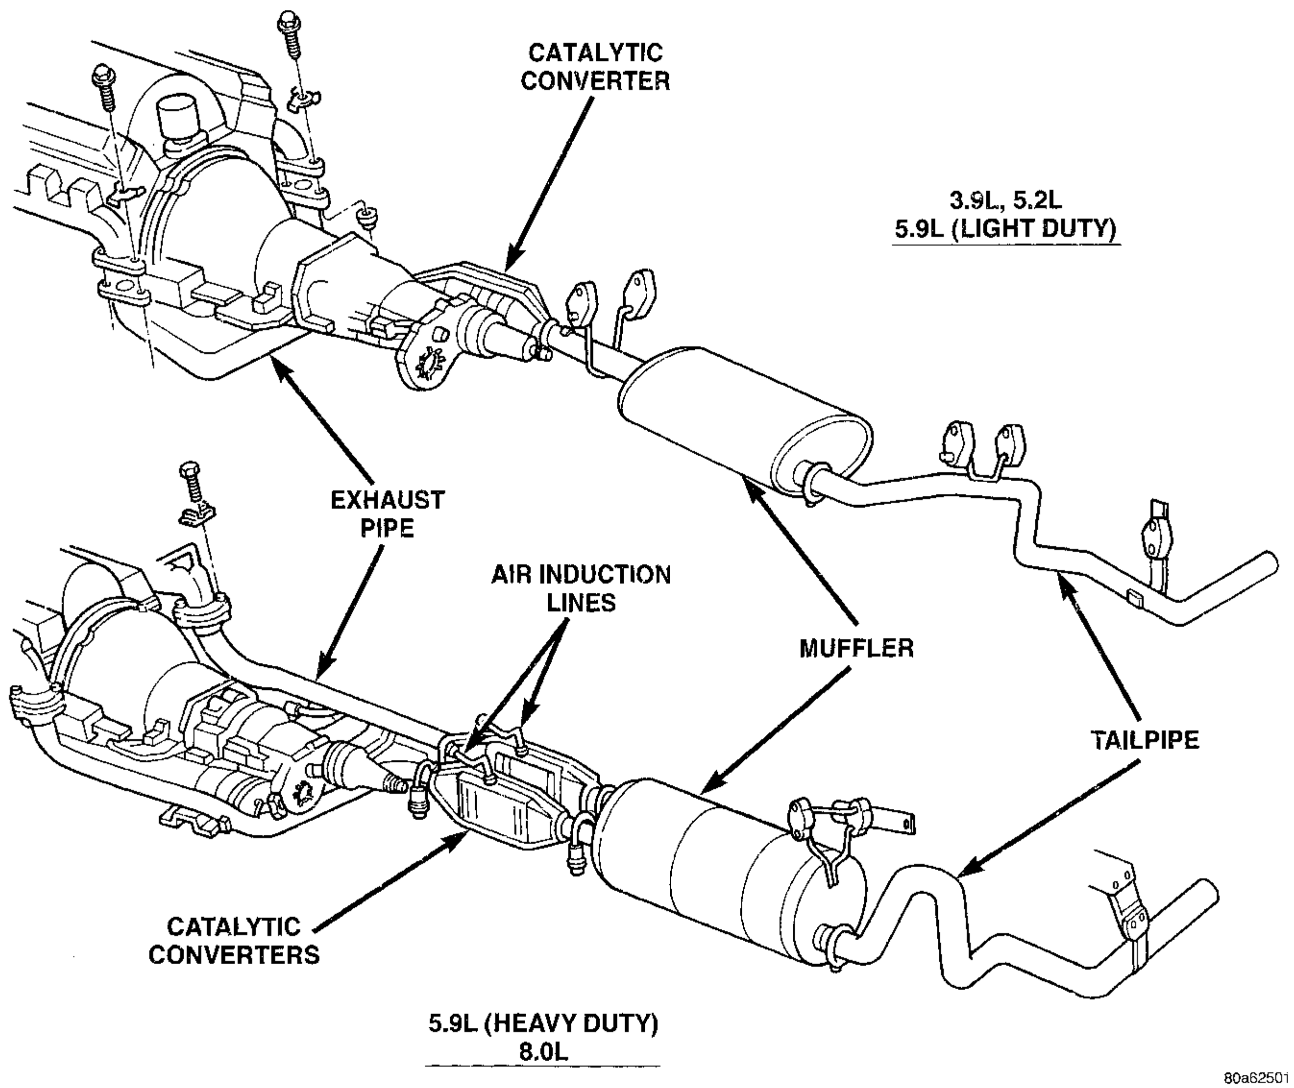

Fig. 1 Exhaust System—Gasoline Engines (Typical)

converter. If unburned fuel enters the converter, overheating may occur. If a converter is heat-damaged, correct the cause of the damage at the same time the converter is replaced. Also, inspect all other components of the exhaust system for heat damage.

Unleaded gasoline must be used in gas engines to avoid contaminating the catalyst core.

EXHAUST HEAT SHIELDS

Exhaust heat shields are needed to protect both the vehicle and the environment from the high temperatures developed by the catalytic converter. The combustion reaction facilitated by the catalyst releases additional heat in the exhaust system. Under severe operating conditions, the temperature increases in the area of the reactor. Such conditions can exist when the engine misfires or otherwise does not operate at peak efficiency. DO NOT remove spark plug wires from plugs or by any other means short out cylinders. Failure of the catalytic converter can occur due to a temperature increase caused by unburned fuel passing through the converter.

DO NOT allow the engine to operate at fast idle for extended periods (over 5 minutes). This condition may result in excessive temperatures in the exhaust system and on the floor pan.

AUTHENTIC RESTORATION PRODUCT

GENERAL INFORMATION (Continued)

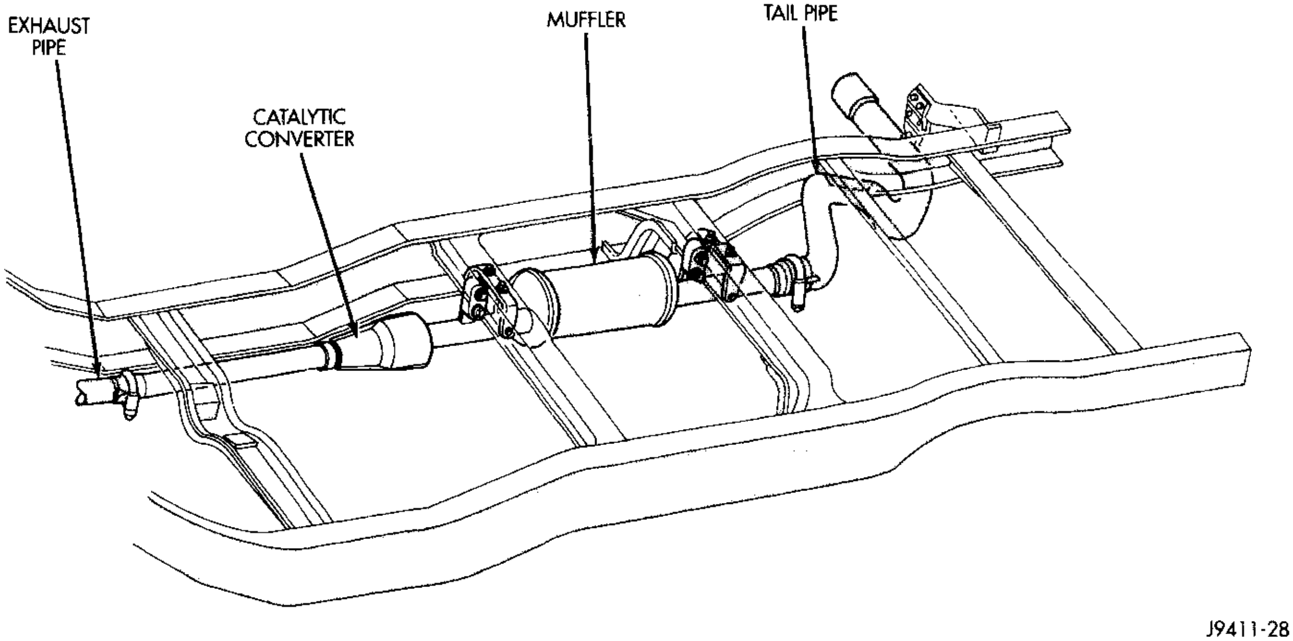

Fig. 2 Exhaust System—Diesel Engines (Typical)

DESCRIPTION AND OPERATION

TURBOCHARGER—5.9L DIESEL ENGINE

A turbocharger is used to force more air into the engine cylinders. Exhaust gas energy is used to turn the turbine wheel and shaft. At the other end of the shaft is the compressor wheel. The compressor wheel draws air in and forces it into the engine cylinders through the intake manifold.

NOTE: Supplying increased air flow to the engine provides:

- Improved engine performance
- Lower exhaust smoke density
- Improved operating economy
- Altitude compensation
- Noise reduction.

INTERCOOLER—CHARGE AIR COOLER

Intake air is drawn through the air cleaner and into the turbocharger compressor housing. Pressurized air from the turbocharger then flows forward through the charge air cooler (intercooler) located in front of the radiator. From the charge air cooler (Intercooler) the air flows back into the intake manifold.

The charge air cooler (Intercooler) is a heat exchanger that uses air flow to dissipate heat from the intake air. As the turbocharger increases air pressure, the air temperature increases. Lowering the intake air temperature increases engine efficiency and power.

INTAKE MANIFOLD—V-6 and V-8 ENGINES

The aluminum intake manifold is a single plane design with equal length runners. The manifold is sealed by flange side gaskets with front and rear cross-over gaskets.

INTAKE MANIFOLD—V-10 ENGINE

The aluminum intake manifold has two plenum chambers an upper and lower which supply air to five runners each. Passages across the longitudinal center of the manifold feed air from the throttle body to the plenum chambers.

ENGINE EXHAUST MANIFOLD—V-6 and V-8 ENGINES

Engine exhaust manifolds are LOG type with porting for air injection into the LOG.

EXHAUST MANIFOLD—V-10 ENGINE

Engine exhaust manifolds are made of high molybdenum ductile cast iron. A special ribbed design helps control permanent dimensional changes during heat cycles.

DIAGNOSIS AND TESTING

INTAKE MANIFOLD DIAGNOSIS

An intake manifold leak is characterized by lower than normal manifold vacuum. Also, one or more cylinder may not be fuctioning.

DIAGNOSIS AND TESTING (Continued)

EXHAUST SYSTEM DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSE	CORRECTION
EXCESSIVE EXHAUST NOISE OR LEAKING EXHAUST GASES	1. Leaks at pipe joints.	1. Tighten clamps/bolts at leaking joints.
	2. Rusted or blown out muffler.	2. Replace muffler. Inspect exhaust system.
	3. Broken or rusted out exhaust pipe.	3. Replace exhaust pipe.
	4. Exhaust pipe leaking at manifold flange.	4. Tighten/replace flange attaching nuts/bolts.
	5. Exhaust manifold cracked or broken.	5. Replace exhaust manifold.
	6. Leak between exhaust manifold and cylinder head.	6. Tighten exhaust manifold to cylinder head bolts.
	7. Catalytic converter rusted or blown out.	7. Replace catalytic converter assy.
	8. Restriction in exhaust system.	8. Remove restriction, if possible. Replace restricted part if necessary.

CAUTION: When servicing and replacing exhaust system components, disconnect the oxygen sensor connector(s). Allowing the exhaust to hang by the oxygen sensor wires will damage the harness and/or sensor.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR THE FAN. DO NOT WEAR LOOSE CLOTHING.

(1) Start the engine allowing it to warm up.
(2) Inspect for disconected vacuum hoses or hardened or cracked vacuum lines.
(3) With a spray bottle, spray a small stream of water on the suspect area.
(4) If there is a change in RPM'S, the suspected leak has been found.
(5) Repair as required.

REMOVAL AND INSTALLATION

EXHAUST PIPE

REMOVAL

(1) Raise and support the vehicle.
(2) Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.
(3) Remove exhaust pipe to manifold bolts, retainers and nuts (Fig. 3) (Fig. 4).
(4) Remove the clamp nuts (Fig. 5).
(5) Disconnect the exhaust pipe from the support hangers on the 5.9L (Heavy Duty) and the 8.0L engines (Fig. 4).
(6) Remove the exhaust pipe.

INSTALLATION

(1) Connect the exhaust pipe support hangers on the 5.9L (Heavy Duty) and the 8.0L engine (Fig. 4).

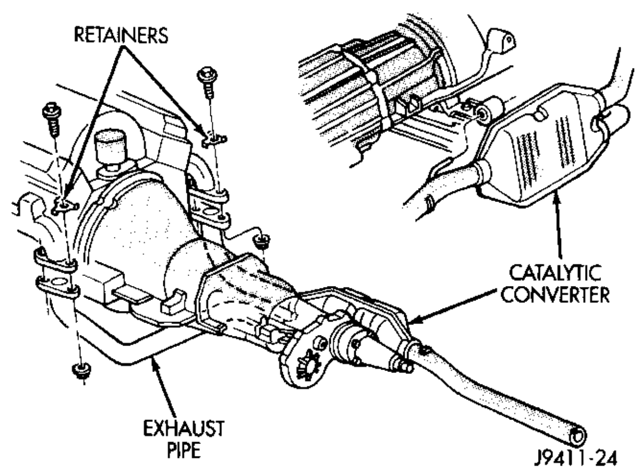

Fig. 3 Exhaust Pipe—3.9/5.2/5.9L (Light Duty)

(2) Position the exhaust pipe for proper clearance with underbody parts.
(3) Position the exhaust pipe to manifold. Install the bolts, retainers and nuts. Tighten the nuts to 34 N·m (25 ft. lbs.) torque.
(4) Tighten the clamp nuts to 54 N·m (40 ft. lbs.) torque.
(5) Lower the vehicle.
(6) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. Adjust the alignment, if needed.

CATALYTIC CONVERTERS

REMOVAL

(1) Raise and support vehicle.

(2) Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.

(3) Remove clamps and nuts (Fig. 5) (Fig. 6).

(4) Disconnect the catalytic converter from the support hanger on the 3.9L, 5.2L and 5.9L—Light Duty engines (Fig. 3).

(5) Remove the catalytic converter.

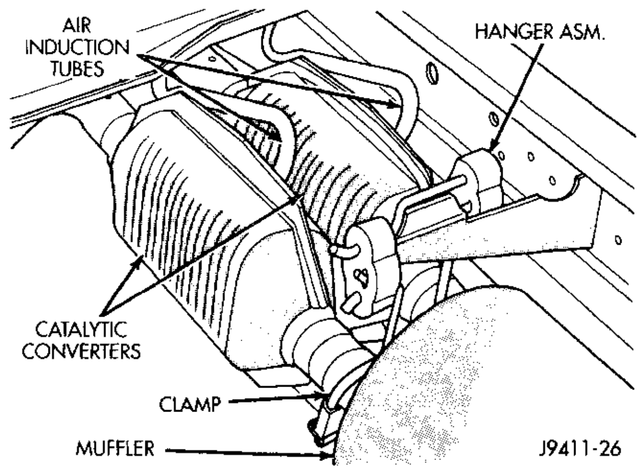

Fig. 6 Catalytic Converter Clamp Location for 5.9L—Heavy Duty and 8.0L

INSTALLATION

(1) Connect the support hanger on the 3.9L, 5.2L and 5.9L—Light Duty engines (Fig. 3).

(2) Assemble converter and clamps loosely to permit proper clearance with exhaust heat shields and underbody parts.

(3) Tighten all clamp nuts to 54 N·m (40 ft. lbs.) torque.

(4) Lower the vehicle.

(5) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. Adjust the alignment, if needed.

MUFFLERS

REMOVAL

(1) Raise and support the vehicle.

(2) Saturate the clamp nuts with heat valve lubricant. Allow 5 minutes for penetration.

(3) Disconnect the muffler hanger (Fig. 6) (Fig. 7).

(4) Remove clamps and nuts (Fig. 6) (Fig. 7).

(5) Remove the muffler.

INSTALLATION

(1) Assemble muffler and clamps loosely to permit proper alignment of all parts.

(2) Connect the muffler hanger.

(3) Tighten the clamp nuts to 54 N·m (40 ft. lbs.) torque.

(4) Lower the vehicle.

(5) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. Adjust the alignment, if needed.

AUTHENTIC RESTORATION

REMOVAL AND INSTALLATION (Continued)

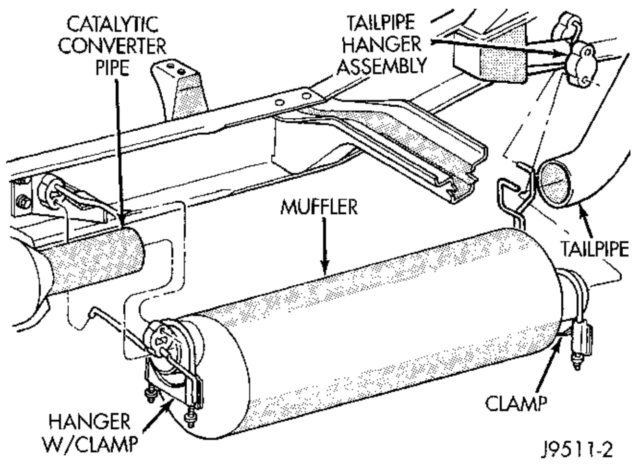

Fig. 7 Muffler for 3.9L, 5.2L and 5.9L-Light Duty Engines

EXHAUST TAILPIPE

REMOVAL

(1) Raise and support the vehicle.

(2) Saturate the clamp nuts with heat valve lubricant. Allow 5 minutes for penetration.

(3) Disconnect the exhaust tailpipe support hanger.

(4) Remove clamps and nuts.

(5) Remove the exhaust tailpipe.

INSTALLATION

(1) Loosely assemble exhaust tailpipe to permit proper alignment of all parts.

(2) Connect the support hangers.

(3) Position the exhaust tailpipe for proper clearance with the underbody parts.

(4) Tighten all clamp nuts to 54 N·m (40 ft. lbs.) torque.

(5) Lower the vehicle.

(6) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. Adjust the alignment, if needed.

EXHAUST HEAT SHIELDS

REMOVAL

(1) Raise and support the vehicle.

(2) Remove the nuts or bolts holding the exhaust heat shield to the floor pan, crossmember or bracket.

(3) Slide the shield out around the exhaust system.

INSTALLATION

(1) Position the exhaust heat shield to the floor pan, crossmember or bracket and install the nuts or bolts.

(2) Tighten the nuts and bolts.

(3) Lower the vehicle.

INTAKE MANIFOLD—V-6 and V-8 ENGINES

REMOVAL

(1) Disconnect the negative cable from the battery.

(2) Drain the cooling system (refer to Group 7, Cooling System for the proper procedures).

(3) Remove the generator.

(4) Remove the air cleaner.

(5) Perform the Fuel System Pressure release procedure (refer to Group 14, Fuel System). Disconnect the fuel lines.

(6) Disconnect the accelerator linkage and if so equipped, the speed control and transmission kickdown cables.

(7) Remove the return spring.

(8) Remove the distributor cap and wires.

(9) Disconnect the coil wires.

(10) Disconnect the heat indicator sending unit wire.

(11) Disconnect the heater hoses and bypass hose.

(12) Remove the closed crankcase ventilation and evaporation control systems.

(13) Remove intake manifold bolts.

(14) Lift the intake manifold and throttle body out of the engine compartment as an assembly.

(15) Remove and discard the flange side gaskets and the front and rear cross-over gaskets.

(16) Remove the throttle body bolts and lift the throttle body off the intake manifold (Fig. 8). Discard the gasket.

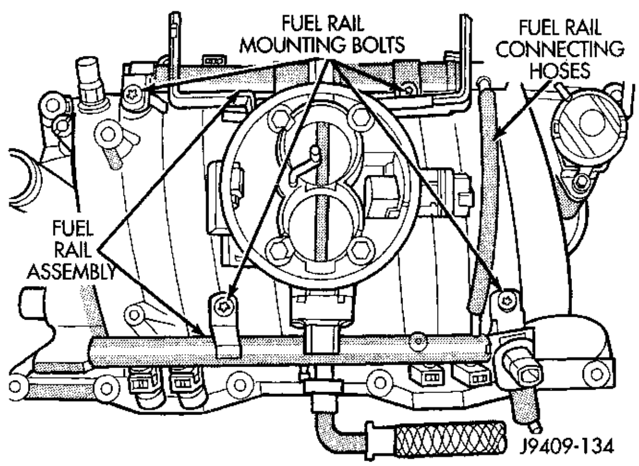

Fig. 8 Throttle Body Assembly

(17) Remove the plenum pan as follows:

(a) Turn the intake manifold upside down. Support the manifold.

(b) Remove the bolts and lift the pan off the manifold. Discard the gasket.

INSTALLATION

(1) Install the plenum pan, if removed, as follows:

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

(a) Turn the intake manifold upside down. Support the manifold.

(b) Place a new plenum pan gasket onto the seal rail of the intake manifold. Position the pan over the gasket. Align all the gasket and pan holes with the intake manifold.

(c) Hand start all bolts.

(d) Tighten the bolts, in sequence (Fig. 9), as follows:

- Step 1—Tighten bolts to 2.7 N·m (24 in. lbs.) torque.
- Step 2—Tighten bolts to 5.4 N·m (48 in. lbs.) torque.
- Step 3—Tighten bolts to 9.5 N·m (84 in. lbs.) torque.
- Step 4—Check that all bolts are tighten to 9.5 N·m (84 in. lbs.) torque.

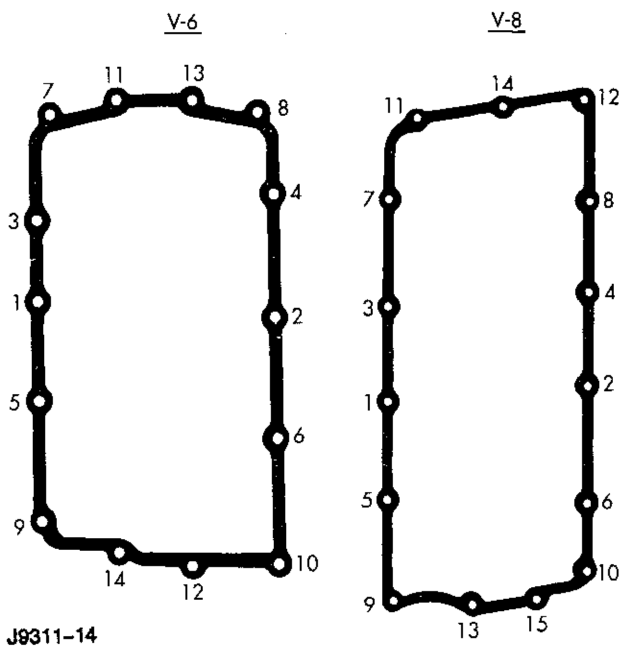

Fig. 9 Plenum Pan Bolt Tightening Sequence

(2) Using a new gasket, install the throttle body onto the intake manifold. Tighten the bolts to 23 N·m (200 in. lbs.) torque.

(3) Place the 4 plastic locator dowels into the holes in the block (Fig. 10).

(4) Apply Mopar® Silicone Rubber Adhesive Sealant, or equivalent, to the four corner joints. An excessive amount of sealant is not required to ensure a leak proof seal. However, an excessive amount of sealant may reduce the effectiveness of the flange gasket. The sealant should be slightly higher than the cross-over gaskets, approximately 5 mm (0.2 in).

(5) Install the front and rear cross-over gaskets onto the dowels (Fig. 10).

(6) Install the flange gaskets. Ensure that the vertical port alignment tab is resting on the deck face of the block. Also the horizontal alignment tabs must be in position with the mating cylinder head gasket tabs (Fig. 11). The words MANIFOLD SIDE should be visible on the center of each flange gasket.

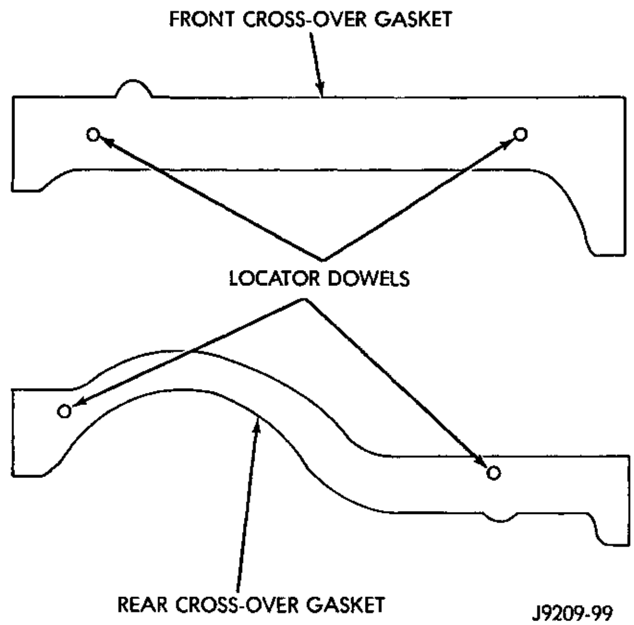

Fig. 10 Cross-Over Gaskets and Locator Dowels

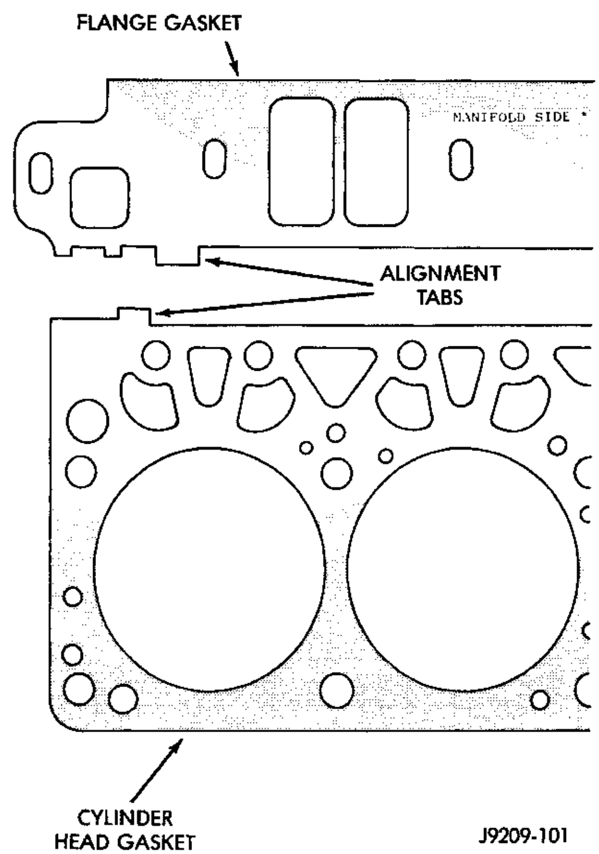

Fig. 11 Intake Manifold Flange Gasket Alignment

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

(7) Carefully lower intake manifold into position on the cylinder block and cylinder heads. Use the alignment dowels in the cross-over gaskets to position the intake manifold. After intake manifold is in place, inspect to make sure seals are in place.

(8) Install the intake manifold bolts and tighten as follows:

(a) V-6 ENGINE— (Fig. 12)

- Step 1—Tighten bolts 1 and 2 to 8 N·m (72 in. lbs.) torque. Tighten in alternating steps 1.4 N·m (12 in. lbs.) torque at a time.
- Step 2—Tighten bolts 3 through 12, in sequence, to 8 N·m (72 in. lbs.) torque.
- Step 3—Check that all bolts are tighten to 8 N·m (72 in. lbs.) torque.
- Step 4—Tighten all bolts, in sequence, to 16 N·m (12 ft. lbs.) torque.
- Step 5—Check that all bolts are tighten to 16 N·m (12 ft. lbs.) torque.

(b) V-8 ENGINE— (Fig. 13)

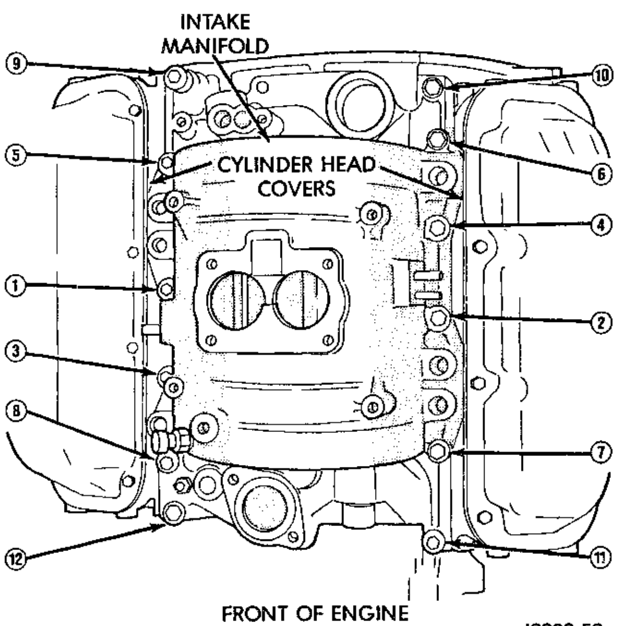

Fig. 12 Intake Manifold Bolt Tightening Sequence—V-6

- Step 1—Tighten bolts 1 through 4, in sequence, to 8 N·m (72 in. lbs.) torque. Tighten in alternating steps 1.4 N·m (12 in. lbs.) torque at a time.
- Step 2—Tighten bolts 5 through 12, in sequence, to 8 N·m (72 in. lbs.) torque.
- Step 3—Check that all bolts are tighten to 8 N·m (72 in. lbs.) torque.
- Step 4—Tighten all bolts, in sequence, to 16 N·m (12 ft. lbs.) torque.
- Step 5—Check that all bolts are tighten to 16 N·m (12 ft. lbs.) torque.

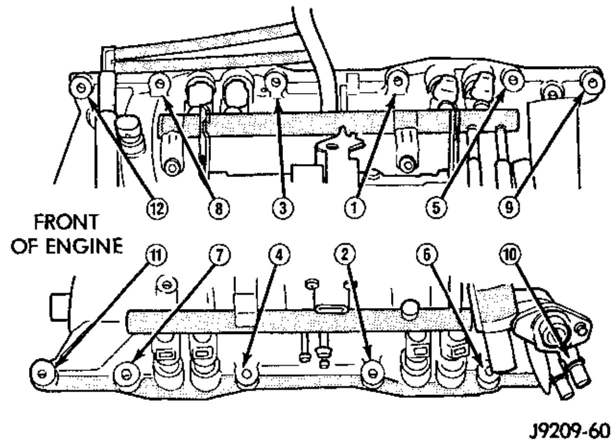

Fig. 13 Intake Manifold Bolt Tightening Sequence—V-8

(9) Install closed crankcase ventilation and evaporation control systems.

(10) Connect the coil wires.

(11) Connect the heat indicator sending unit wire.

(12) Connect the heater hoses and bypass hose.

(13) Install distributor cap and wires.

(14) Hook up the return spring.

(15) Connect the accelerator linkage and if so equipped, the speed control and transmission kick-down cables.

(16) Install the fuel lines.

(17) Install the generator and drive belt. Tighten generator mounting bolt to 41 N·m (30 ft. lbs.) torque.

(18) Install the air cleaner.

(19) Fill cooling system (refer to Group 7, Cooling System for the proper procedure).

(20) Connect the negative cable to the battery.

INTAKE MANIFOLD V-10

REMOVAL

(1) Disconnect the negative cable from the battery.

(2) Drain the cooling system (refer to Group 7, Cooling System for the proper procedures).

(3) Remove the accessory drive belt (refer to Group 7, Cooling System for the proper procedures).

(4) Remove the generator brace and generator (Fig. 14).

(5) Remove the A/C compressor brace (Fig. 14). Remove the compressor and set aside.

(6) Remove the air cleaner cover and filter. Remove the air cleaner housing (Fig. 15). Discard the gasket.

(7) Perform the Fuel System Pressure release procedure (refer to Group 14, Fuel System). Disconnect the fuel lines.

REMOVAL AND INSTALLATION (Continued)

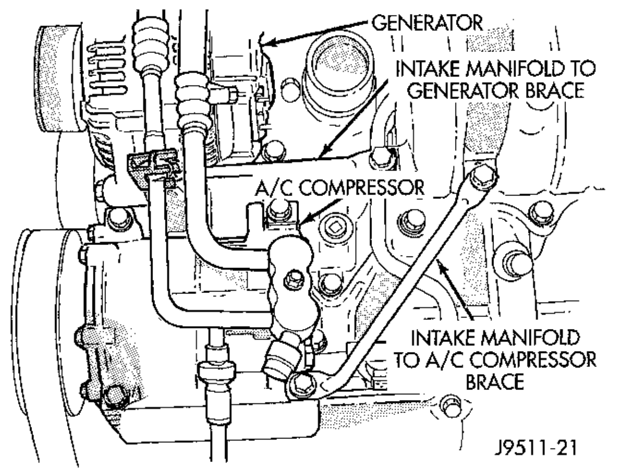

Fig. 14 Generator and A/C Compressor Braces

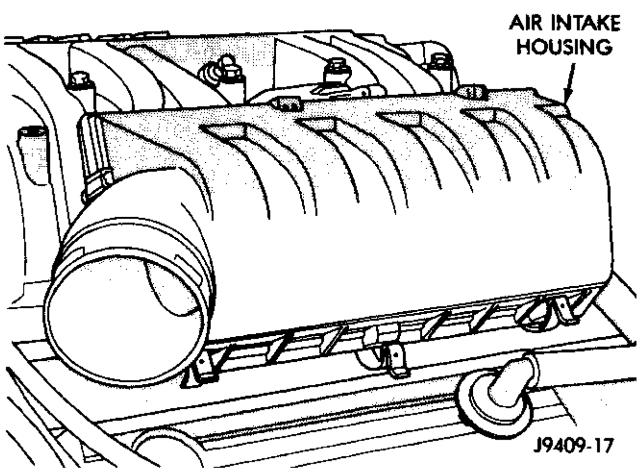

Fig. 15 Air Intake Housing

(8) Disconnect the accelerator linkage and if so equipped, the speed control and transmission kick-down cables.

(9) Remove the coil assemblies with the ignition cables.

(10) Disconnect the vacuum lines.

(11) Disconnect the heater hoses and bypass hose.

(12) Remove the closed crankcase ventilation and evaporation control systems.

(13) Remove the throttle body bolts and lift the throttle body off the upper intake manifold (Fig. 16). Discard the gasket.

(14) Remove upper intake manifold bolts.

(15) Lift the upper intake manifold out of the engine compartment (Fig. 16). Discard the gasket.

(16) Remove the lower intake manifold bolts and remove the manifold (Fig. 17).

(17) Discard the lower intake manifold gaskets (Fig. 18).

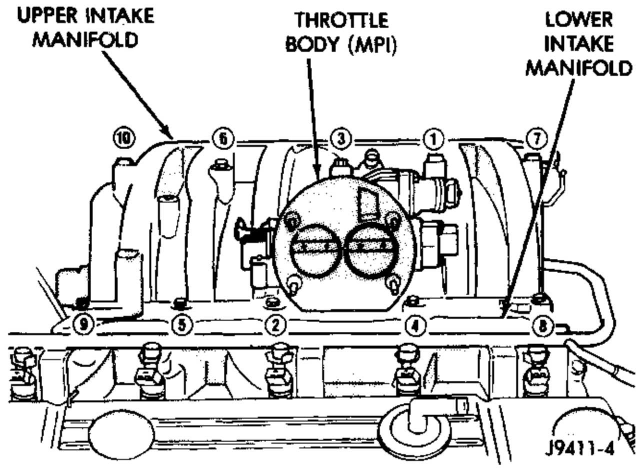

Fig. 16 Upper Intake Manifold and Throttle Body

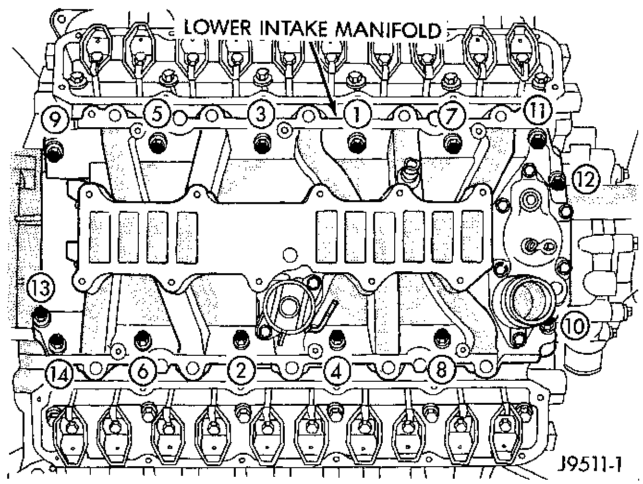

Fig. 17 Lower Intake Manifold

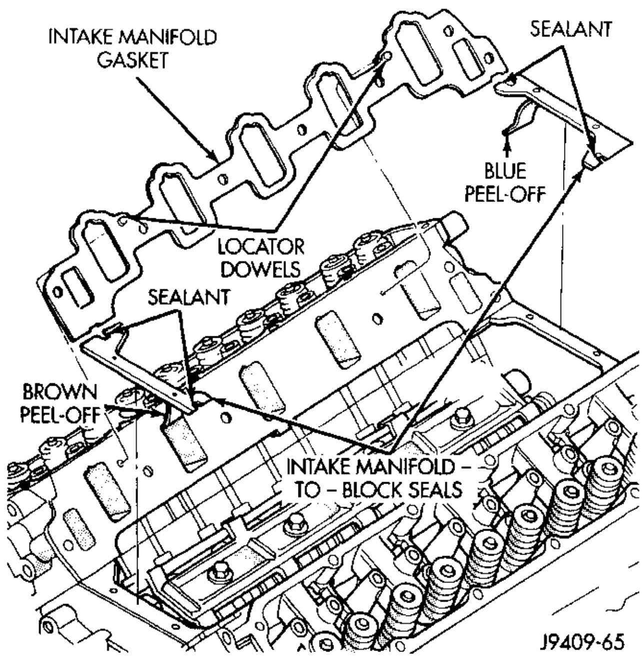

Fig. 18 Lower Intake Manifold Gaskets

REMOVAL AND INSTALLATION (Continued)

INSTALLATION

(1) Install the intake manifold side gaskets. Be sure that the locator dowels are positioned in the head (Fig. 19).

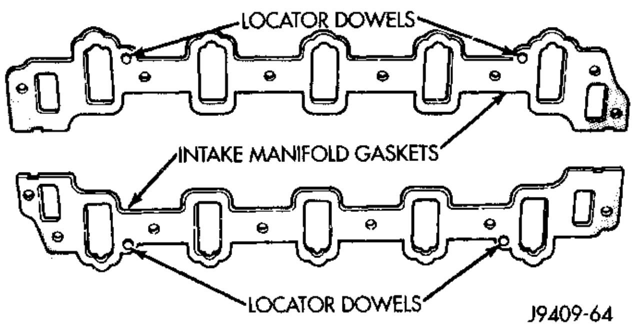

Fig. 19 Intake Manifold Flange Gasket Alignment

(2) Peel off the protective paper (blue - rear and brown - front) and press firmly onto the block (Fig. 18). **BE SURE THE BLOCK IS OIL FREE.**. Aligning slots in end seals with notches in intake manifold gaskets.

(3) Insert Mopar® Silicone Rubber Adhesive Sealant, or equivalent, into the four corner pockets (Fig. 18). **Fill the pocket, but DO NOT overfill.**

(4) The lower intake manifold MUST be installed within 3 minutes of sealant application. Carefully lower intake manifold into position on the cylinder block and heads. After intake manifold is in place, inspect to make sure seals and gaskets are in place. Finger start all the lower intake bolts.

(5) Tighten the lower intake manifold bolts in sequence to 54 N·m (40 ft. lbs.) torque (Fig. 17).

(6) Using a new gasket, position the upper intake manifold onto the lower intake manifold.

(7) Finger start all bolts, alternate one side to the other.

(8) Tighten upper intake manifold bolts in sequence to 22 N·m (16 ft. lbs.) torque (Fig. 16).

(9) Using a new gasket, install the throttle body onto the upper intake manifold. Tighten the bolts to 23 N·m (200 in. lbs.) torque.

(10) Install closed crankcase ventilation and evaporation control systems.

(11) Connect the heater hoses and bypass hose.

(12) Connect the vacuum lines.

(13) Install the coil assemblies and the ignition cables.

(14) Connect the accelerator linkage and if so equipped, the speed control and transmission kickdown cables.

(15) Install the fuel lines.

(16) Using a new gasket, install the air cleaner housing. Tighten the nuts to 11 N·m (96 in. lbs.) torque. Install the air cleaner filter and cover.

(17) Install the A/C compressor. Position the compressor brace and install the bolts. Tighten the brace bolts to 41 N·m (30 ft. lbs.) torque.

(18) Install the generator. Position the generator brace and install the bolts. Tighten the brace bolts to 41 N·m (30 ft. lbs.) torque.

(19) Install the accessory drive belt (refer to Group 7, Cooling System).

(20) Fill cooling system (refer to Group 7, Cooling System for the proper procedure).

(21) Connect the negative cable to the battery.

ENGINE EXHAUST MANIFOLD—V-6 and V-8 ENGINES

REMOVAL

(1) Disconnect the negative cable from the battery.

(2) Raise and support the vehicle.

(3) Remove the bolts and nuts attaching the exhaust pipe to the engine exhaust manifold.

(4) Lower the vehicle.

(5) Remove the exhaust heat shields.

(6) Remove bolts, nuts and washers attaching manifold to cylinder head.

(7) Remove manifold from the cylinder head.

INSTALLATION

CAUTION: If the studs came out with the nuts when removing the engine exhaust manifold, install new studs. Apply sealer on the coarse thread ends. Water leaks may develop at the studs if this precaution is not taken.

(1) Position the engine exhaust manifolds on the two studs located on the cylinder head. Install conical washers and nuts on these studs (Fig. 20) (Fig. 21).

(2) Install two bolts and conical washers at the inner ends of the engine exhaust manifold outboard arms. Install two bolts WITHOUT washers on the center arm of engine exhaust manifold (Fig. 20) (Fig. 21). Starting at the center arm and working outward, tighten the bolts and nuts to 34 N·m (25 ft. lbs.) torque.

(3) Install the exhaust heat shields.

(4) Raise and support the vehicle.

(5) Assemble exhaust pipe to manifold and secure with bolts, nuts and retainers. Tighten the bolts and nuts to 34 N·m (25 ft. lbs.) torque.

(6) Lower the vehicle.

(7) Connect the negative cable to the battery.

REMOVAL AND INSTALLATION (Continued)

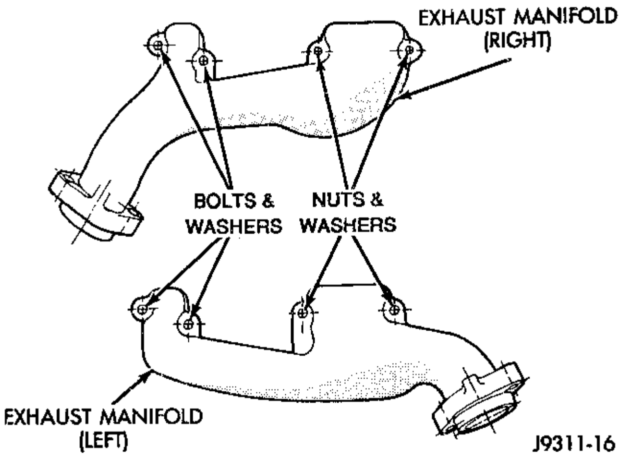

Fig. 20 Engine Exhaust Manifold Installation—3.9L Engine

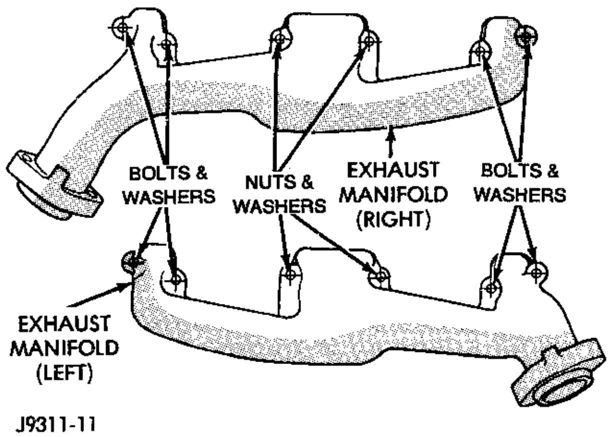

Fig. 21 Engine Exhaust Manifold Installation—5.2L/5.9L Engines

EXHAUST MANIFOLD V-10

REMOVAL

(1) Disconnect the negative cable from the battery.
(2) Raise and support the vehicle.
(3) Remove the bolts and nuts attaching the exhaust pipe to the engine exhaust manifold.
(4) Lower the vehicle.
(5) Remove the exhaust heat shields (Fig. 22).
(6) Right exhaust manifold and discard the gasket.
(7) Right exhaust manifold—Remove the dipstick bracket from the manifold.
(8) Remove bolts attaching manifold to cylinder head.
(9) Remove manifold from the cylinder head. Discard the gasket.

INSTALLATION

(1) Using a new gasket position the engine exhaust manifold onto the cylinder head. Install bolts

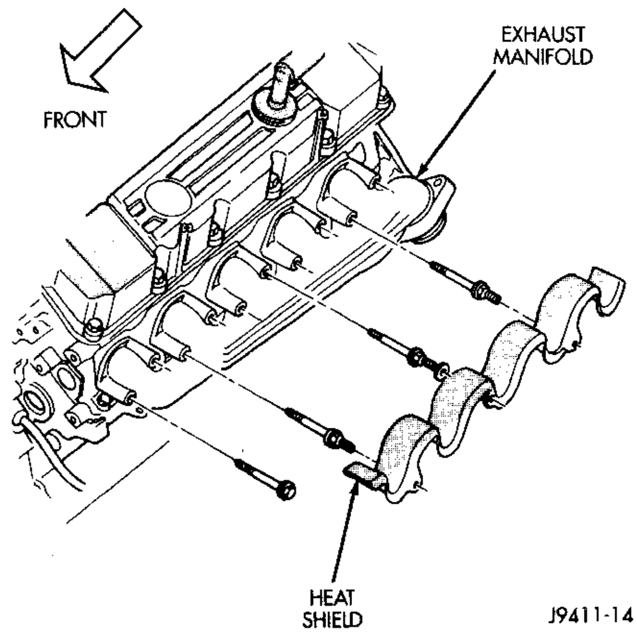

Fig. 22 8.0L Engine Exhaust Manifold—Typical

and stud bolts in the proper position. (Fig. 22) Tighten the bolts to 22 N·m (16 ft. lbs.) torque.
(2) Right exhaust manifold—Install the dipstick bracket to the manifold.
(3) Position washers and exhaust heat shields onto the manifold stud bolts (Fig. 22). Be sure the tabs on the heat shields are hooked over the top of the exhaust gasket. Install the nuts and tighten to 20 N·m (175 in. lbs.) torque.
(4) Raise and support the vehicle.
(5) Assemble exhaust pipe to manifold and secure with bolts. Tighten the bolts to 34 N·m (25 ft. lbs.) torque.
(6) Lower the vehicle.
(7) Connect the negative cable to the battery.

EXHAUST PIPE—DIESEL

REMOVAL

(1) Raise and support the vehicle on a hoist.
(2) Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.
(3) Remove the bolts and nuts from the exhaust pipe to turbocharger exhaust pipe (Fig. 23).
(4) Remove the clamp nuts.
(5) Disconnect the exhaust pipe support hanger.

INSTALLATION

(1) Connect the exhaust pipe support hangers.
(2) Align the exhaust pipe with the turbocharger exhaust pipe and the catalytic converter. Install the bolts and nuts. Tighten the nuts to 34 N·m (25 ft. lbs.) torque.

REMOVAL AND INSTALLATION (Continued)

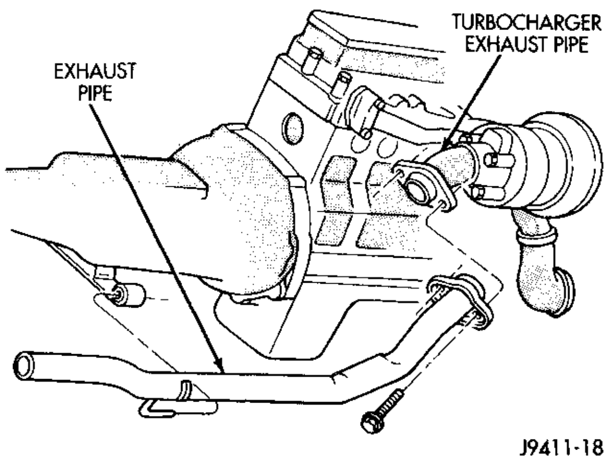

Fig. 23 Exhaust Pipe Mounting

(3) Tighten the clamp nuts to 54 N·m (40 ft. lbs.) torque.

(4) Install the exhaust pipe support clamps and nuts. Tighten the nuts to 54 N·m (40 ft. lbs.) torque.

(5) Lower the vehicle.

(6) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. Adjust the alignment, if needed.

CATALYTIC CONVERTER—DIESEL

REMOVAL

(1) Raise and support vehicle.

(2) Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.

(3) Remove clamps and nuts (Fig. 24).

(4) Remove the catalytic converter.

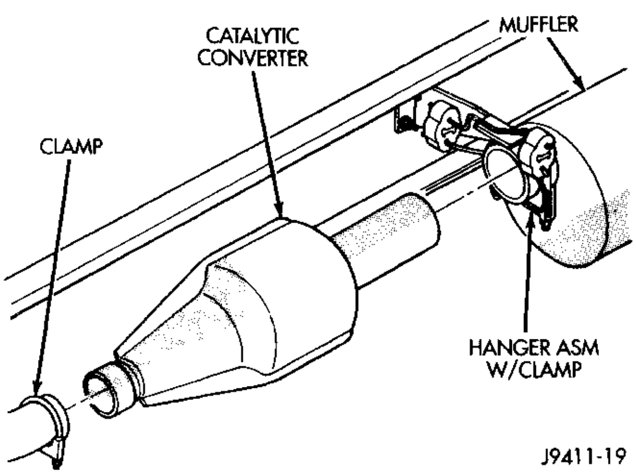

Fig. 24 Catalytic Converter

INSTALLATION

(1) Assemble converter and clamps loosely to permit proper clearance with exhaust heat shields and underbody parts.

(2) Tighten all clamp nuts to 43 N·m (32 ft. lbs.) torque.

(3) Lower the vehicle.

(4) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. Adjust the alignment, if needed.

MUFFLER—DIESEL

REMOVAL

(1) Raise and support the vehicle.

(2) Remove the clamps and nuts.

(3) Disconnect the support hanger (Fig. 25).

(4) Remove the muffler.

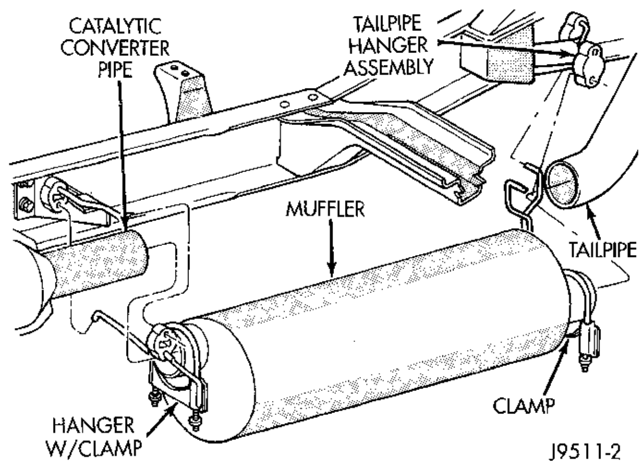

Fig. 25 Muffler

INSTALLATION

(1) Connect the support hanger.

(2) Install the clamps and nuts. Tighten the nuts to 43 N·m (32 ft. lbs.) torque.

(3) Lower the vehicle.

(4) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. Adjust the alignment, if needed.

EXHAUST TAILPIPE—DIESEL

REMOVAL

(1) Raise and support the vehicle.

(2) Saturate the clamp nuts with heat valve lubricant. Allow 5 minutes for penetration.

(3) Disconnect the exhaust tailpipe support hanger (Fig. 26). If used, disconnect the extension pipe support hanger (Fig. 25).

(4) Remove clamps and nuts (Fig. 26).

(5) Remove the exhaust tailpipe and extension pipe, if used.

REMOVAL AND INSTALLATION (Continued)

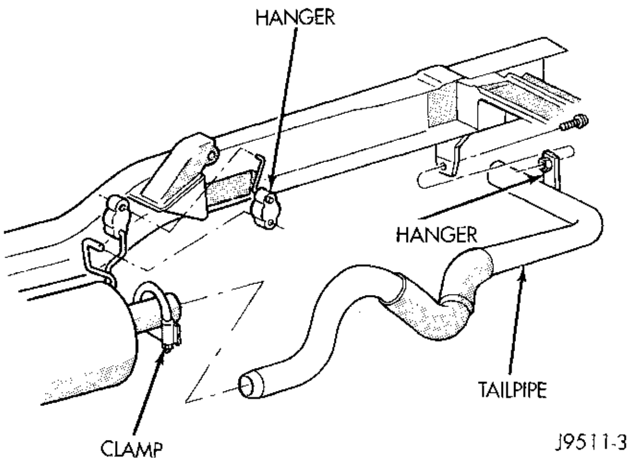

Fig. 26 Exhaust Tailpipe HD

INSTALLATION

(1) Loosely assemble exhaust tailpipe and extension pipe, if used, to permit proper alignment of all parts.
(2) Connect the support hangers.
(3) Position the exhaust tailpipe and extension pipe, if used, for proper clearance with the underbody parts.
(4) Tighten all clamp nuts to 43 N·m (32 ft. lbs.) torque.
(5) Lower the vehicle.
(6) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. Adjust the alignment, if needed.

HEAT SHIELDS—DIESEL

REMOVAL

(1) Raise and support the vehicle.
(2) Remove the nuts or bolts holding the exhaust heat shield to the floor pan, crossmember or bracket.
(3) Slide the shield out around the exhaust system.

INSTALLATION

(1) Position the exhaust heat shield to the floor pan, crossmember or bracket and install the nuts or bolts.
(2) Tighten the nuts and bolts.
(3) Lower the vehicle.

EXHAUST MANIFOLD—DIESEL

REMOVAL

(1) Disconnect the air intake and exhaust pipes (Fig. 27).
(2) Disconnect the turbocharger oil supply line and the oil drain tube from the turbocharger (Fig. 28).
(3) Disconnect the charge air cooler (Intercooler) inlet duct from the turbocharger (Fig. 28).
(4) Remove the turbocharger and gasket.

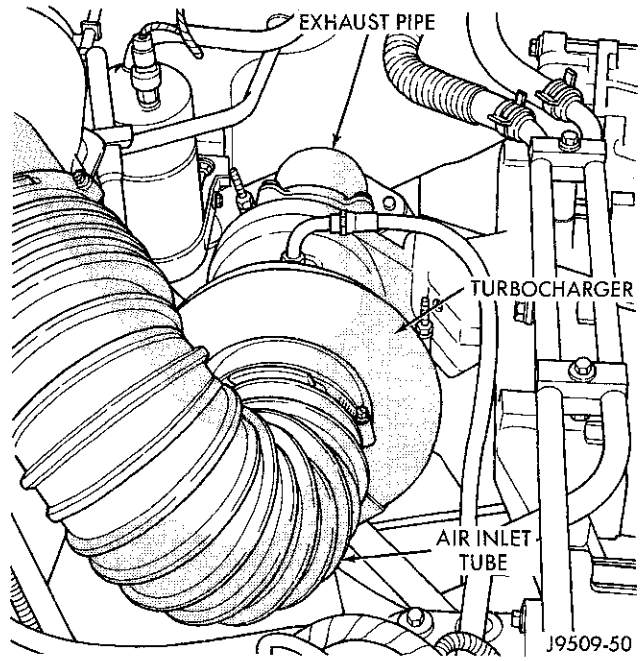

Fig. 27 Air Intake Pipe, Exhaust Pipe and Turbocharger

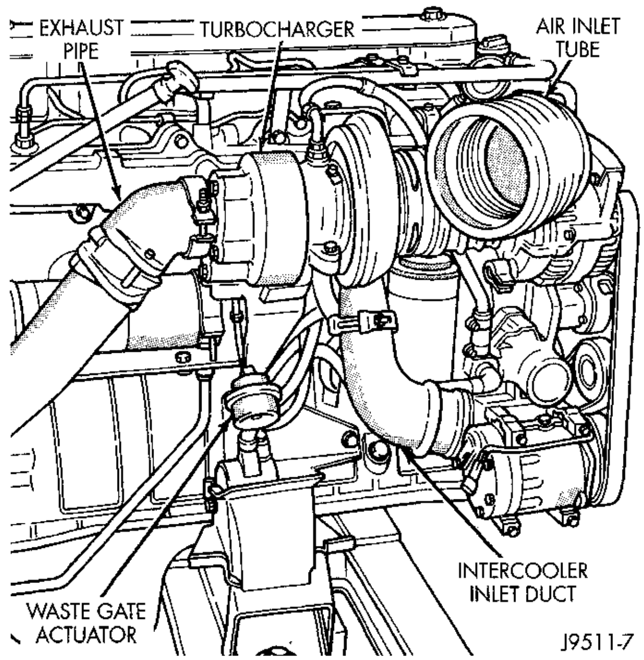

Fig. 28 Oil Supply Line and Charge Air Cooler (Intercooler) Inlet Duct

(5) Remove EGR tube (Fig. 29).
(6) Remove the cab heater supply and return lines.
(7) Remove the engine exhaust manifold and gaskets (Fig. 30).
(8) Clean the sealing surfaces.

REMOVAL AND INSTALLATION (Continued)

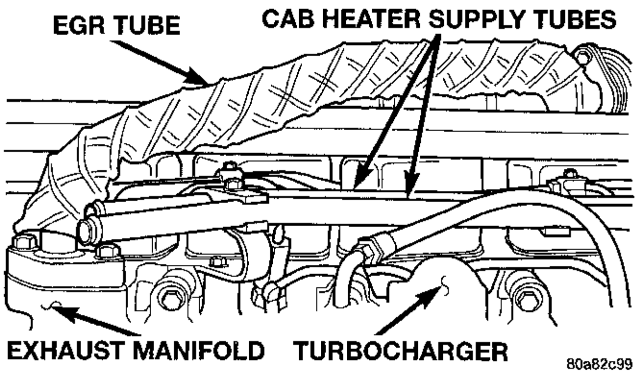

Fig. 29 EGR TUBE

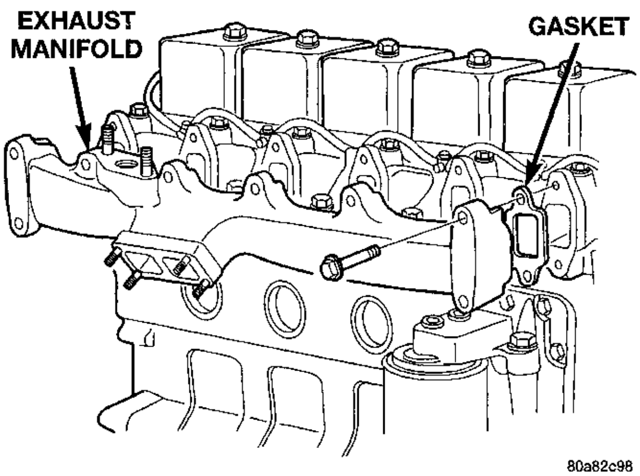

Fig. 30 Engine Exhaust Manifold and Gaskets

INSTALLATION

(1) Install the engine exhaust manifold and gaskets use anti-seize on capscrews. Tighten the exhaust manifold bolts in sequence to 43 N·m (32 ft. lbs.) torque (Fig. 31).

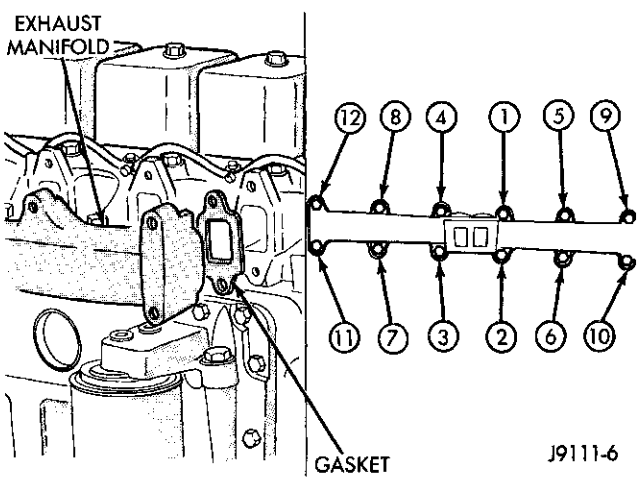

Fig. 31 Engine Exhaust Manifold Bolt Tightening Sequence

(2) Install the turbocharger. Apply anti-seize to the studs and then tighten the turbocharger mounting nuts to 32 N·m (24 ft. lbs.) torque.

(3) Position the charge air cooler (intercooler) inlet duct to the turbocharger. With the clamp in position, tighten the clamp nut to 8 N·m (72 in. lbs.) torque.

(4) Position the air intake pipe and the exhaust pipe onto the turbocharger. Tighten the clamps to 8 N·m (74 in. lbs.) torque.

(5) Install the oil drain tube and oil supply line to the turbocharger. Tighten the drain tube bolts to 24 N·m (18 ft. lbs.) torque. Tighten the oil supply line fitting nut to 15 N·m (11 ft. lbs.) torque.

(6) Connect the cab heater supply and return lines. Tighten the line nuts to 24 N·m (18 ft. lbs.) torque.

(7) Install the EGR tube and start fasteners by hand.

(8) Tighten all bolts/nuts to 24 N·m (212 in. lbs.) torque. **When tightening bolts at EGR valve end of tube, alternate between the upper and lower bolt to allow face of EGR valve to remain square to tube mounting flange on EGR tube (Fig. 32).**

(9) Operate the engine to check for leaks.

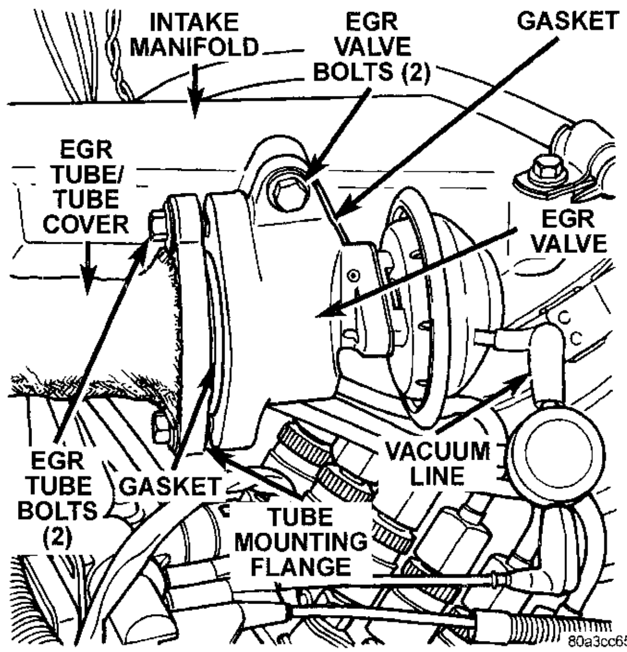

Fig. 32 EGR Tube Connection at Valve

INTAKE MANIFOLD COVER—AIR INTAKE HEATER (DIESEL)

REMOVAL

(1) Disconnect both negative battery cables.

(2) Remove the charge air cooler (intercooler) outlet duct from the air inlet housing (Fig. 33).

REMOVAL AND INSTALLATION (Continued)

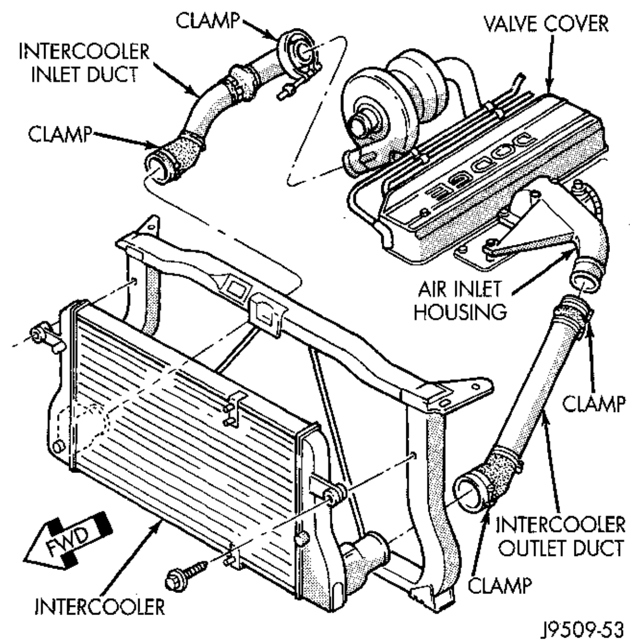

Fig. 33 Intercooler Outlet Duct

(3) Remove the valve cover name plate.

(4) Remove air inlet housing.

(5) Remove the EGR tube (Refer to Group 25, Emission Control Systems for proper procedures).

(6) Remove the high pressure fuel lines as an assembly (refer to Group 14, Fuel System for proper procedures).

(7) Disconnect the air intake heater power supply lines (Fig. 34).

(8) Disconnect the charge air temperature sensor connector.

(9) Remove the manifold intake cover and gasket (Fig. 35). Keep the gasket material and any other material out of the air intake.

(10) Clean the sealing surface.

INSTALLATION

(1) Using a new gasket, install the intake manifold cover.

(2) Some of the intake manifold bolt holes are drilled through and must be sealed. Apply liquid teflon sealant to the bolts. Install the intake manifold cover bolts. Tighten the bolts to 24 N·m (18 ft. lbs.) torque.

(3) Connect the charge air temperature connector to the sensor.

(4) Install a new gasket on top of the air intake heater.

(5) Install the air inlet housing. Tighten the air inlet housing bolts to 24 N·m (18 ft. lbs.) torque.

(6) Install and tighten the air intake heater power supply nuts to 14 N·m (10 ft. lbs.) torque.

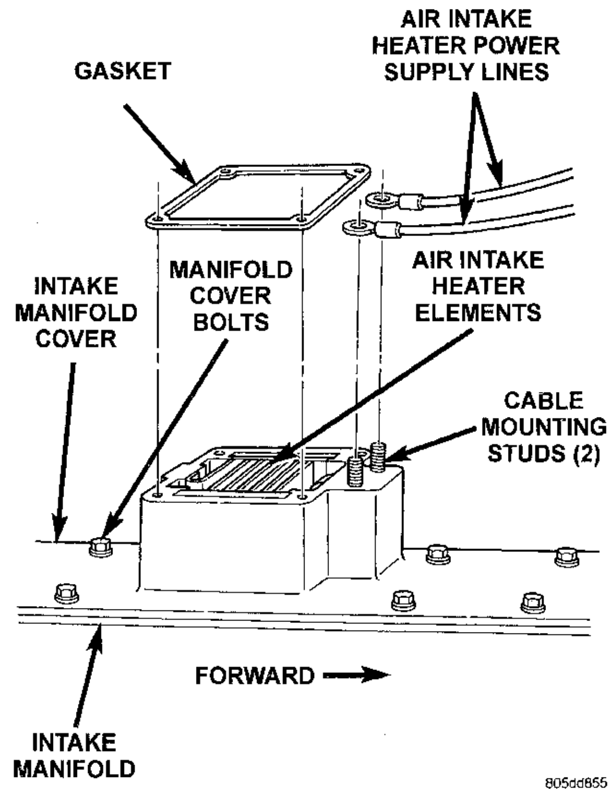

Fig. 34 Air Intake Heater

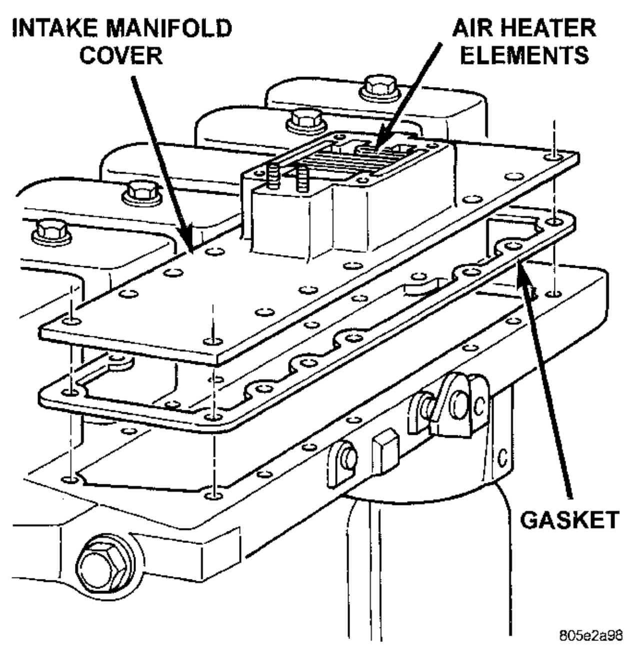

Fig. 35 Manifold Intake Cover

(7) Position the charge air cooler (intercooler) outlet duct onto the air inlet housing. Tighten the charge air cooler (intercooler) outlet duct clamps to 8 N·m (74 in. lbs.) torque.

(8) Install and bleed the high pressure fuel lines (Refer to Group 14, Fuel System for proper proce-

REMOVAL AND INSTALLATION (Continued)

dures). Tighten the high pressure fuel line nuts to 24 N·m (18 ft. lbs.) torque.

(9) Install the valve cover name plate.

(10) Install the EGR tube. Tighten all bolts/nuts to 24 N·m (212 in. lbs.) torque. **When tightening bolts at EGR valve end of tube, alternate between the upper and lower bolt to allow face of EGR valve to remain square to the mounting flange on the EGR tube.**

(11) Connect both negative battery cables.

TURBOCHARGER

REMOVAL

(1) Disconnect the negative cable from the battery.

(2) Disconnect the air intake pipe and exhaust pipe (Fig. 36).

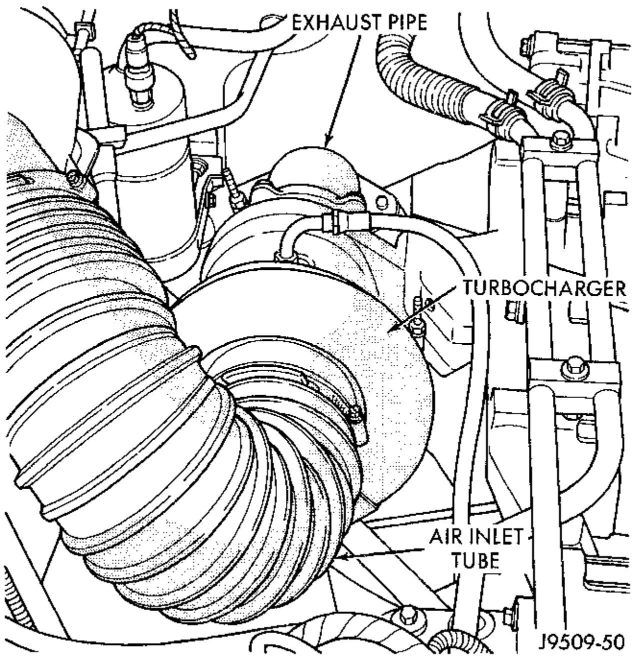

Fig. 36 Air Intake Pipe, Exhaust Pipe and Turbocharger

(3) Remove the oil drain tube bolts.

(4) Remove the oil supply line.

(5) Disconnect the charge air cooler (intercooler) inlet duct from the turbocharger (Fig. 37).

(6) Remove the turbocharger mounting nuts and the turbocharger.

(7) If the turbocharger is not to be installed immediately, cover the opening to prevent material from entering into the manifold.

(8) Clean and inspect the sealing surface.

CAUTION: The turbocharger is a precision piece of equipment and should only be repaired by an authorized facility. Disassembly is not recommended, as engine/turbo failure could result.

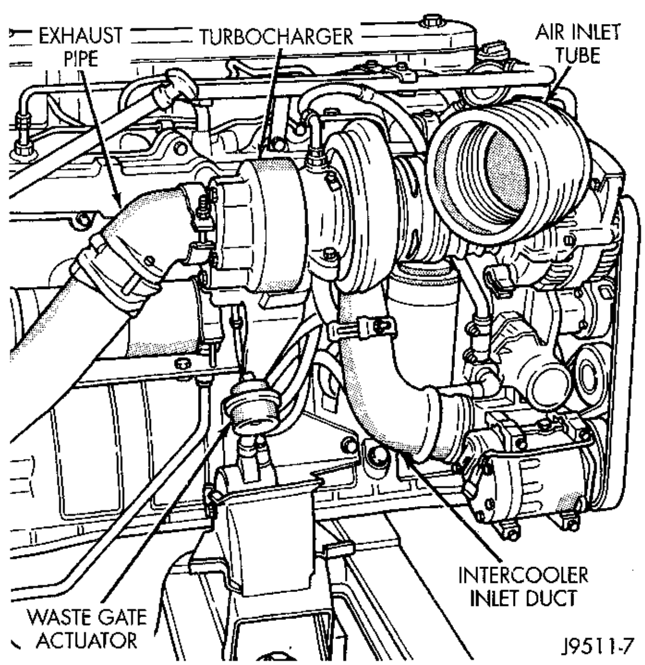

Fig. 37 Air Cooler (Intercooler) Inlet Duct

INSTALLATION

(1) Install a new gasket and apply anti-seize compound to the mounting studs.

(2) Install the turbocharger. Tighten the turbocharger mounting nuts to 32 N·m (24 ft. lbs.) torque.

(3) Use a new gasket and connect the drain line. Tighten the drain line connection bolts to 24 N·m (18 ft. lbs.) torque.

(4) New turbocharger must be pre-lubricated with clean engine lubricating oil before start up. Pour 50-60 cc (2-3 ounces) of oil into supply fitting.

WARNING: DO NOT USE YOUR FINGER TO TURN THE TURBINE WHEEL.

(5) Rotate the turbine wheel to allow oil to enter the turbocharger.

(6) Install the oil supply line. Tighten the oil supply line fitting nut to 15 N·m (11 ft. lbs.) torque.

(7) Position the Charge air cooler (intercooler) inlet duct to the turbocharger. With the clamp in position, tighten the clamp nut to 8 N·m (72 in. lbs.) torque.

(8) Position the air intake pipe and the exhaust pipe onto the turbocharger. Tighten the clamps to 8 N·m (72 in. lbs.) torque.

(9) Connect the negative cable to the battery.

(10) Operate the engine and check for leaks.

WASTEGATE ADJUSTMENT

The wastegate turbocharger provides additional low speed boost without over-boost at high speeds. This increases low speed torque and better driveability.

REMOVAL AND INSTALLATION (Continued)

Proper adjustment of the wastegate assembly is critical to the operation of the wastegate turbocharger (Fig. 38). The control rod is set at the factory and no adjustment should be necessary, unless wastegate assembly is damaged.

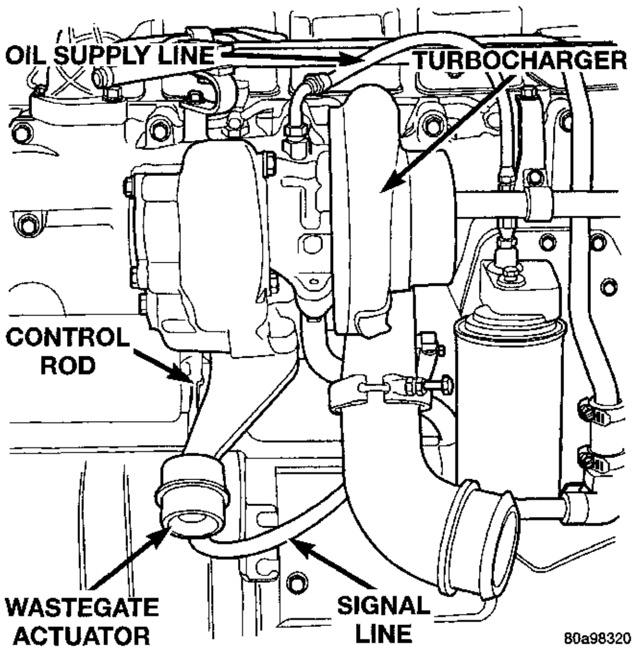

Fig. 38 Wastegate Turbocharger

CAUTION: DO NOT adjust the wastegate so that higher pressures are required to open the wastegate valve. The turbocharger speed will be increased and can cause damage to the turbocharger and cause a loss of engine performance.

(1) Disconnect signal line from wastegate actuator.**The signal line may be installed with tamper-proof clamps. These can be discarded and replaced with standard worm-gear clamps.**

(2) Connect regulated air pressure to the wastegate actuator (Fig. 39). Install a dial indicator to measure the control rod movement. Apply 103 - 138 kPa (15 - 20 psi) to seat the components and take any slack out of the control rod. Release the air pressure and zero the dial indicator gauge.

(3) Apply 193 kPa (28 psi) air pressure to the actuator. The control rod should move 0.33 - 1.33 mm (0.013 - 0.052 in) total travel. If the rod travel is out of limits, the wastegate linkage must be adjusted.

(4) To adjust the wastegate linkage, apply air pressure to the actuator to release the spring tension on the lever. Remove the control rod from the wastegate lever (Fig. 40). Pull the wastegate lever toward the actuator (closed position).

(5) Adjust the length of the clevis end of the control rod to align the clevis pin hole to the wastegate lever. Install the adjusting link and retaining clip (Fig. 40).

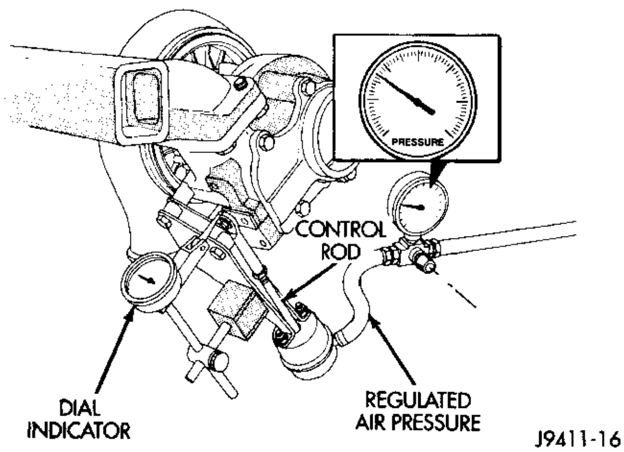

Fig. 39 Wastegate and Dial Indicator

CAUTION: DO NOT pull, push or force the alignment of the clevis pin.

(6) After the adjustment is complete, tighten the actuator rod jam nut.

(7) Recheck the travel on the wastegate control rod. Adjust, if necessary.

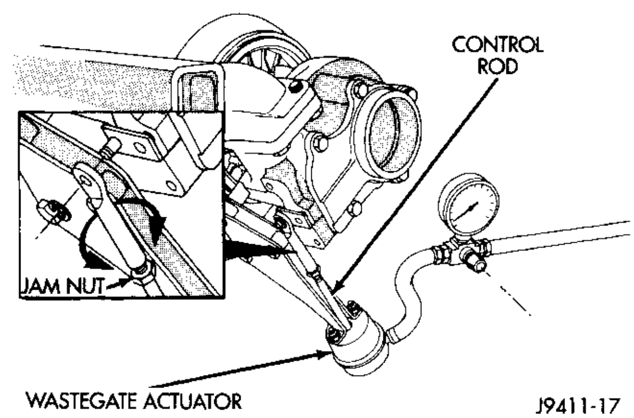

Fig. 40 Adjustment of Wastegate Actuator

CHARGE AIR COOLER—DIESEL

REMOVAL

WARNING: IF THE ENGINE WAS JUST TURNED OFF, THE INTAKE AND OUTLET DUCTS MAY BE HOT.

(1) Remove the front bumper (refer to Group 23, Body for the proper procedure).

(2) Remove the front support bracket (Fig. 41).

(3) If the vehicle is equipped with air conditioning, remove the condenser as follows:

REMOVAL AND INSTALLATION (Continued)

(a) Discharge the air conditioning system (refer to Group 24, Heating and Air Conditioning for the proper procedures).

(b) Remove the bolt from the sealing plate.

(c) Remove the nuts holding the condenser to the charge air cooler. Lift the condenser and sealing plate assembly away from the charge air cooler.

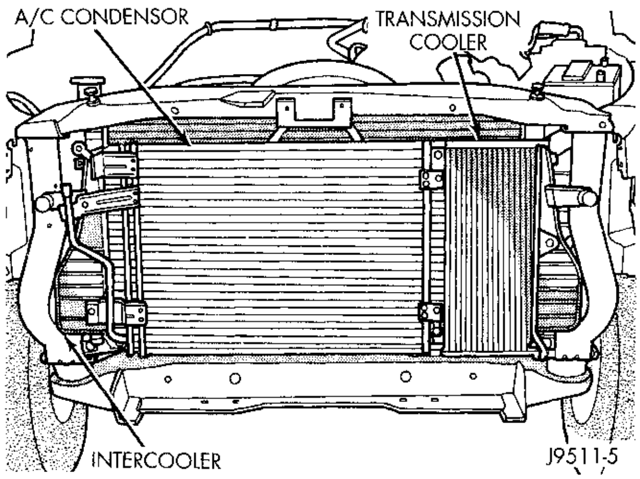

Fig. 41 Condenser and Charge Air Cooler—Intercooler

(4) Remove the inlet and outlet ducts from the charge air cooler (Fig. 42).

(5) Remove the charge air cooler bolts. Pivot the charge air cooler forward and up to remove.

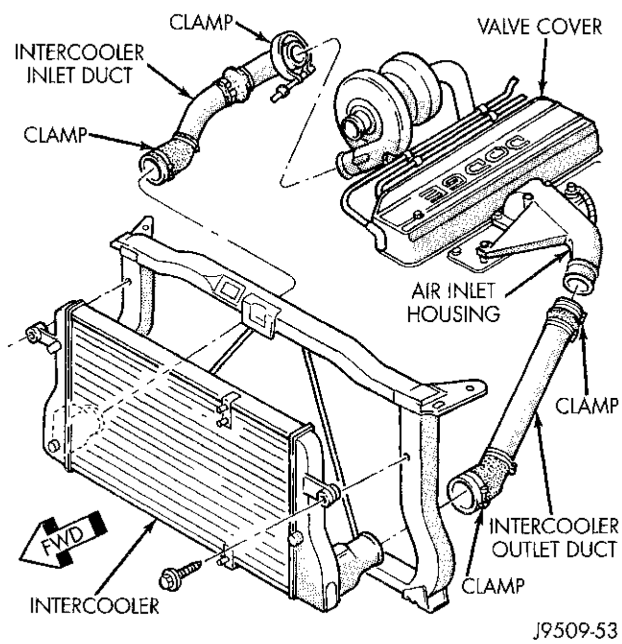

Fig. 42 Charge Air Cooler Intercooler Ducts

INSTALLATION

(1) Position the charge air cooler. Install the bolts and tighten to 2 N·m (17 in. lbs.) torque.

(2) Install the inlet and outlet ducts to the charge air cooler. With the clamps in position, tighten the clamp nut to 8 N·m (72 in. lbs.) torque.

(3) If the vehicle is equipped with air conditioning, install the condenser as follows:

(a) Position the condenser and sealing plate assembly onto the charge air cooler studs. Install the nuts and tighten.

(b) Connect the halves of the sealing plate. Install the bolt and tighten.

(c) Charge the air conditioning system (refer to Group 24, Heating and Air Conditioning for the proper procedures).

(4) Install the front support bracket. Install and tighten the bolts.

(5) Install the front bumper (refer to Group 23, Body for the proper procedure).

CLEANING AND INSPECTION

EXHAUST PIPE

INSPECTION

Discard rusted clamps, broken or worn supports and attaching parts. Replace a component with original equipment parts, or equivalent. This will assure proper alignment with other parts in the system and provide acceptable exhaust noise levels.

CLEANING

Clean ends of pipes to assure mating of all parts.

INTAKE MANIFOLD

CLEANING INTAKE

Clean manifold in solvent and blow dry with compressed air.

Clean cylinder block front and rear gasket surfaces using a suitable solvent.

The plenum pan rail must be clean and dry (free of all foreign material).

INSPECTION

Inspect manifold for cracks.

Inspect mating surfaces of manifold for flatness with a straightedge.

EXHAUST MANIFOLD

CLEANING

Clean mating surfaces on cylinder head and manifold. Wash with solvent and blow dry with compressed air.

CLEANING AND INSPECTION (Continued)

INSPECTION

Inspect manifold for cracks.

Inspect mating surfaces of manifold for flatness with a straight edge. Gasket surfaces must be flat within 0.2 mm per 300 mm (0.008 inch per foot).

CHARGE AIR COOLER

CLEANING

If the engine experiences a turbocharger failure or any other occasion where oil or debris is put into the charge air cooler, the charge air cooler must be cleaned.

(1) Remove the charge air cooler from the vehicle, refer Charge Air Cooler in this section.

(2) Flush the charge air cooler internally with a non caustic solvent in the opposite direction of normal air flow. Shake the charge air cooler and LIGHTLY tap on the end tanks with a rubber mallet to dislodge trapped debris. Continue flushing until all debris or oil is removed.

(3) Use a flashlight and mirror to visually inspect the charge air cooler for internal debris.

CAUTION: If internal debris cannot be removed, scrap the charge air cooler. DO NOT USE CAUSTIC CLEANERS TO CLEAN THE CHARGE AIR COOLER. DAMAGE TO THE CHARGE AIR COOLER WILL RESULT.

(4) After the charge air cooler has been thoroughly cleaned of all oil and debris with the non caustic solvent, wash the charge air cooler internally with hot soapy water to remove the remaining solvent.

(5) Rinse thoroughly with clean water.

(6) Blow compressed air into the charge air cooler in the opposite direction of normal air flow until the charge air cooler is dry internally.

INSPECTION

(1) Visually inspect the charge air cooler

(2) Inspect the tubes, fins and welds for tears, breaks or other damage. If any damage causes the charge air cooler to fail, the charge air cooler must replaced.

CATALYTIC CONVERTER

INSPECTION

Look at the stainless steel body of the converter, inspect for bulging or other distortion that could be a result of overheating. If the converter has a heat shield attached make sure it is not bent or loose.

WARNING: UNLEADED FUEL MUST BE USED TO PREVENT BLOCKAGE OR CONTAMINATION TO THE CATALYST CORE.

If you suspect internal damage to the catalyst, tapping the bottom of the catalyst with a rubber mallet may indicate a damaged core.

CLEANING

Clean ends of pipes and muffler to assure a good seal at mating surfaces.

ADJUSTMENTS

WASTEGATE ADJUSTMENT

The wastegate turbocharger provides additional low speed boost without over-boost at high speeds. This increases low speed torque and better driveability.

Proper adjustment of the wastegate assembly is critical to the operation of the wastegate turbocharger (Fig. 43). The control rod is set at the factory and no adjustment should be necessary, unless wastegate assembly is damaged.

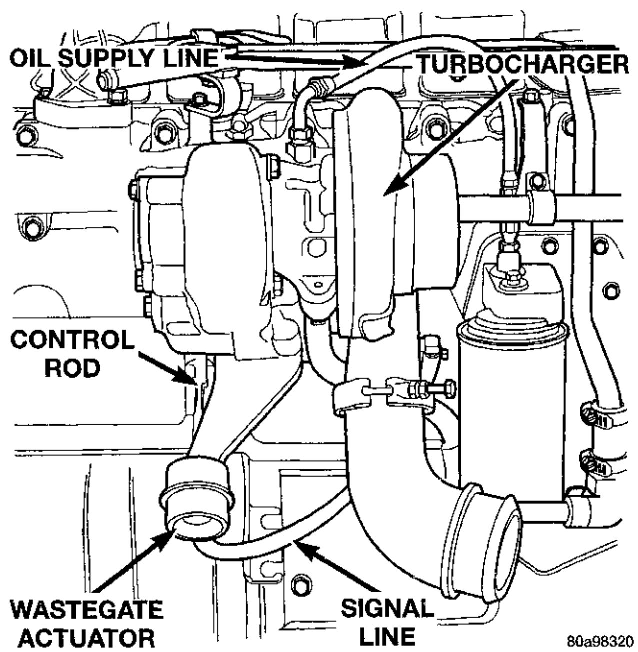

Fig. 43 Wastegate Turbocharger

CAUTION: DO NOT adjust the wastegate so that higher pressures are required to open the wastegate valve. The turbocharger speed will be increased and can cause damage to the turbocharger and cause a loss of engine performance.

(1) Remove signal line from wastegate actuator.**The signal line may be installed with tamper-proof clamps. These can be discarded and replaced with standard worm-gear clamps.**

(2) Connect regulated air pressure to the wastegate actuator (Fig. 44). Install a dial indicator to

ADJUSTMENTS (Continued)

measure the control rod movement. Apply 103 - 138 kPa (15 - 20 psi) to seat the components and take any slack out of the control rod. Release the air pressure and zero the dial indicator gauge.

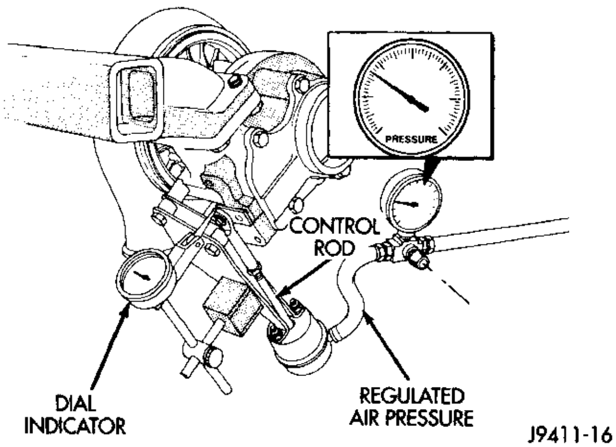

Fig. 44 Wastegate and Dial Indicator

(3) Apply 193 kPa (28 psi) air pressure to the actuator. The control rod should move 0.33 - 1.33 mm (0.013 - 0.052 in) total travel. If the rod travel is out of limits, the wastegate linkage must be adjusted.

(4) To adjust the wastegate linkage, apply air pressure to the actuator to release the spring tension on the lever. Remove the control rod from the wastegate lever (Fig. 45). Pull the wastegate lever toward the actuator (closed position).

(5) Adjust the length of the clevis end of the control rod to align the clevis pin hole to the wastegate lever. Install the adjusting link and retaining clip (Fig. 45).

CAUTION: DO NOT pull, push or force the alignment of the clevis pin.

(6) After the adjustment is complete, tighten the actuator rod jam nut.

(7) Recheck the travel on the wastegate control rod. Adjust, if necessary.

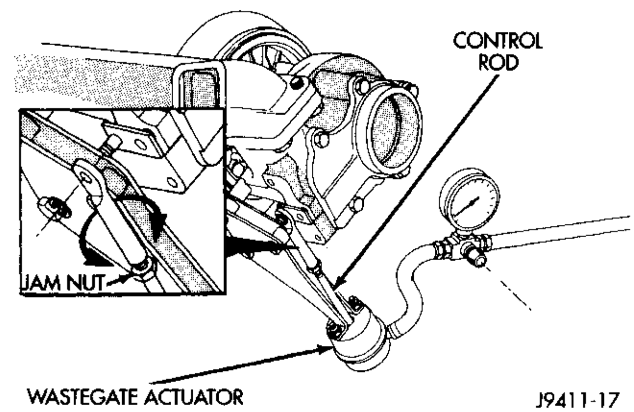

Fig. 45 Adjustment of Wastegate Actuator

FRAME

INDEX

GENERAL INFORMATION

GENERAL INFORMATION

BR trucks have a ladder-type frame (Fig. 1) with Box-section front rails, dropped center section and open-channel side rails in the rear.

Cross members attached to the frame side rails with rivets, welds or bolts form a ladder-type construction (Fig. 1). The cab is isolated from the frame with rubber load cushions (Fig. 2) with through-bolts. The cargo box or bed is attached to the frame with bolts. Refer to Group 23, Body for cargo box service procedures.

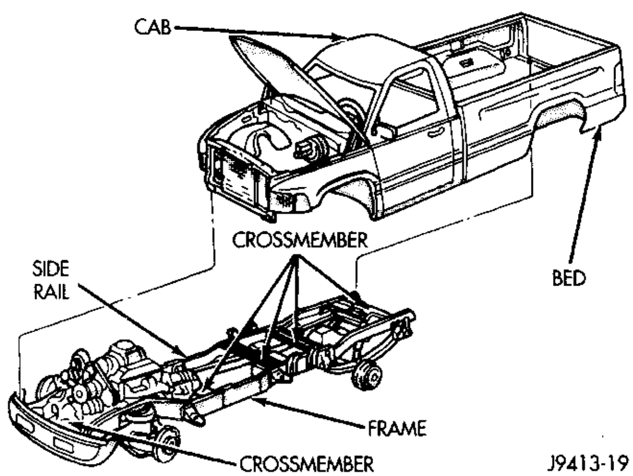

Fig. 1 Frame

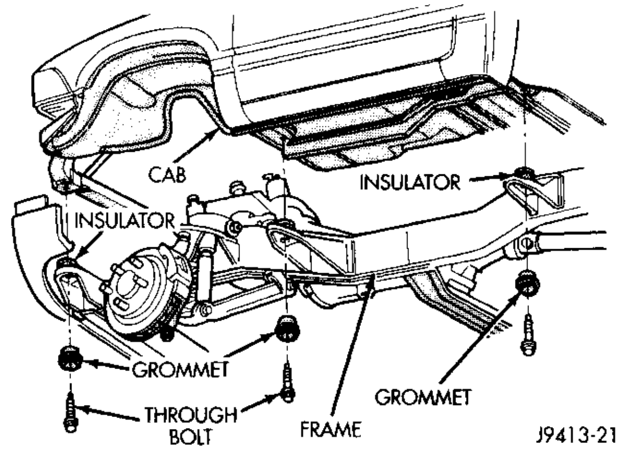

Fig. 2 Cab Mounts

The frame is designed to absorb and dissipate flexing and twisting due to acceleration, braking, cornering and road surface variances without bending when subjected to normal driving conditions. The frame is the mounting platform for the following systems and components:

- Front and rear suspension systems.
- Engine, transmission, and transfer case.
- Steering gear and linkage.
- Exhaust system and heat shields.
- Fuel cell and fuel line tubing.
- Front end sheet metal and radiator closure panel.
- Skid plate.
- Passenger cab.
- Cargo box or bed.
- Spare tire winch.
- Front and rear bumper systems.

Mopar AUTHENTIC RESTORATION PRODUCT

SERVICE PROCEDURES

FRAME SERVICE

SAFETY PRECAUTIONS AND WARNINGS

WARNING: USE EYE PROTECTION WHEN GRINDING OR WELDING METAL, SERIOUS EYE INJURY CAN RESULT. BEFORE PROCEEDING WITH FRAME REPAIR INVOLVING GRINDING OR WELDING, VERIFY THAT VEHICLE FUEL SYSTEM IS NOT LEAKING OR IN CONTACT WITH REPAIR AREA, PERSONAL INJURY CAN RESULT. DO NOT ALLOW OPEN FLAME TO CONTACT PLASTIC BODY PANELS. FIRE OR EXPLOSION CAN RESULT. WHEN WELDED FRAME COMPONENTS ARE REPLACED, 100% PENETRATION WELD MUST BE ACHIEVED DURING INSTALLATION. IF NOT, DANGEROUS OPERATING CONDITIONS CAN RESULT. STAND CLEAR OF CABLES OR CHAINS ON PULLING EQUIPMENT DURING FRAME STRAIGHTENING OPERATIONS, PERSONAL INJURY CAN RESULT. DO NOT VENTURE UNDER A HOISTED VEHICLE THAT IS NOT SUPPORTED ON SAFETY STANDS, PERSONAL INJURY CAN RESULT.

CAUTION: Do not reuse damaged fasteners, quality of repair would be suspect. Do not drill holes in top or bottom frame rail flanges, frame rail failure can result. Do Not use softer than Grade 5 bolts to replace production fasteners, loosening or failure can result. When using heat to straighten frame components do not exceed 566°C (1050°F), metal fatigue can result. Welding the joints around riveted cross members and frame side rails can weaken frame.

FRAME STRAIGHTENING

When necessary, a conventional frame that is bent or twisted can be straightened by application of heat. The temperature must not exceed 566°C (1050°F). The metal will have a dull red glow at the desired temperature. Excessive heat will decrease the strength of the metal and result in a weakened frame.

Welding the joints around riveted cross members and frame side rails is not recommended.

A straightening repair process should be limited to frame members that are not severely damaged. The replacement bolts, nuts and rivets that are used to join the frame members should conform to the same specifications as the original bolts, nuts and rivets.

FRAME REPAIRS

DRILLING HOLES

Do not drill holes in frame side rail top and bottom flanges, metal fatigue can result causing frame failure. Holes drilled in the side of the frame rail must be at least 38 mm (1.5 in.) from the top and bottom flanges.

Additional drill holes should be located away from existing holes.

WELDING

Use MIG, TIG or arc welding equipment to repair welded frame components.

Frame components that have been damaged should be inspected for cracks before returning the vehicle to use. If cracks are found in accessible frame components perform the following procedures.

(1) Drill a hole at each end of the crack with a 3 mm (0.125 in.) diameter drill bit.

(2) Using a suitable die grinder with 3 inch cut off wheel, V-groove the crack to allow 100% weld penetration.

(3) Weld the crack.

(4) If necessary when a side rail is repaired, grind the weld smooth and install a reinforcement channel (Fig. 3) over the repaired area.

NOTE: If a reinforcement channel is required, the top and bottom flanges should be 0.250 inches narrower than the side rail flanges. Weld only in the areas indicated (Fig. 3).

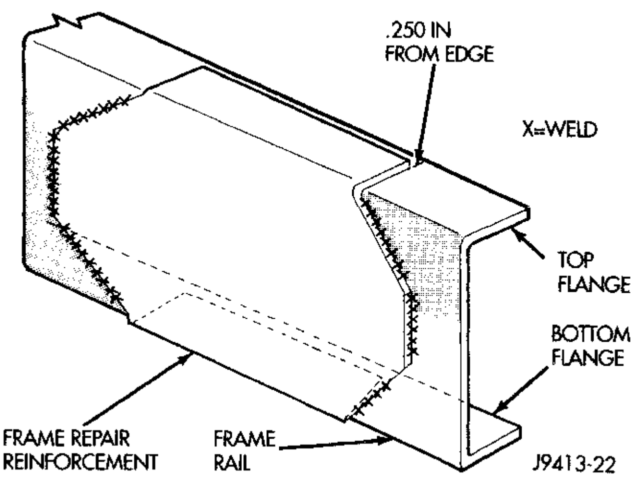

Fig. 3 Frame Reinforcement

FRAME FASTENERS

Bolts, nuts and rivets can be used to repair frames or to install a reinforcement section on the frame. Bolts can be used in place of rivets. When replacing rivets with bolts, install the next larger size diameter

SERVICE PROCEDURES (Continued)

bolt to assure proper fit. If necessary, ream the hole out just enough to sufficiently receive the bolt.

Conical-type washers are preferred over the split-ring type lock washers. Normally, grade-5 bolts are adequate for frame repair. **Grade-3 bolts or softer should not be used.** Tightening bolts/nuts with the correct torque, refer to the Introduction Group at the front of this manual for tightening information.

REMOVAL AND INSTALLATION

CAB CHASSIS ADAPTER BRACKET

REMOVAL

(1) Remove bolts attaching cab chassis adapter brackets to frame rail (Fig. 4)

(2) Separate cab chassis adapter brackets from frame rail

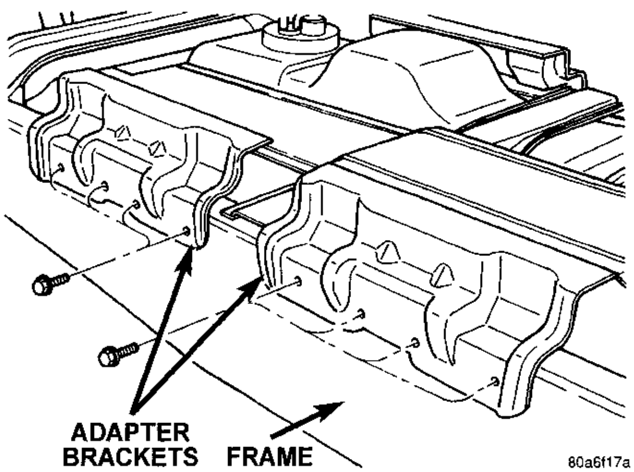

Fig. 4 Cab Chassis Adapter Brackets

FUEL SYSTEM

CONTENTS

GENERAL INFORMATION

INDEX

GENERAL INFORMATION

INTRODUCTION

Throughout this group, references may be made to a particular vehicle by letter or number designation. A chart showing the breakdown of these designations is included in the Introduction Section at the front of this service manual.

The Evaporation Control System, is also considered part of the fuel system. The system reduces the emission of fuel vapor into the atmosphere.

The description and function of the Evaporation Control System is found in Group 25 of this manual.

FUEL REQUIREMENTS

Your vehicle was designed to meet all emission regulations and provide excellent fuel economy when using high quality unleaded gasoline.

Use unleaded gasolines having a minimum posted octane of 87.

If your vehicle develops occasional light spark knock (ping) at low engine speeds this is not harmful. However; continued heavy knock at high speeds can cause damage and should be reported to your dealer immediately. Engine damage as a result of heavy knock operation may not be covered by the new vehicle warranty.

In addition to using unleaded gasoline with the proper octane rating, those that contain detergents, corrosion and stability additives are recommended. Using gasolines that have these additives will help improve fuel economy, reduce emissions, and maintain vehicle performance.

Poor quality gasoline can cause problems such as hard starting, stalling, and stumble. If you experience these problems, try another brand of gasoline before considering service for the vehicle.

GASOLINE/OXYGENATE BLENDS

Some fuel suppliers blend unleaded gasoline with materials that contain oxygen such as alcohol, MTBE (Methyl Tertiary Butyl Ether) and ETBE (Ethyl Tertiary Butyl Ether). Oxygenates are required in some areas of the country during winter months to reduce carbon monoxide emissions. The type and amount of oxygenate used in the blend is important.

The following are generally used in gasoline blends:

Ethanol - (Ethyl or Grain Alcohol) properly blended, is used as a mixture of 10 percent ethanol and 90 percent gasoline. Gasoline blended with ethanol may be used in your vehicle.

MTBE/ETBE - Gasoline and MTBE (Methyl Tertiary Butyl Ether) blends are a mixture of unleaded gasoline and up to 15 percent MTBE. Gasoline and ETBE (Ethyl Tertiary Butyl Ether) are blends of gasoline and up to 17 percent ETBE. Gasoline blended with MTBE or ETBE may be used in your vehicle.

Methanol - Methanol (Methyl or Wood Alcohol) is used in a variety of concentrations blended with unleaded gasoline. You may encounter fuels contain-

GENERAL INFORMATION (Continued)

ing 3 percent or more methanol along with other alcohols called cosolvents.

DO NOT USE GASOLINES CONTAINING METHANOL.

Use of methanol/gasoline blends may result in starting and driveability problems and damage critical fuel system components.

Problems that are the result of using methanol/gasoline blends are not the responsibility of Chrysler Corporation and may not be covered by the vehicle warranty.

Reformulated Gasoline

Many areas of the country are requiring the use of cleaner-burning fuel referred to as **Reformulated Gasoline**. Reformulated gasolines are specially blended to reduce vehicle emissions and improve air quality.

Chrysler Corporation strongly supports the use of reformulated gasolines whenever available. Although your vehicle was designed to provide optimum performance and lowest emissions operating on high quality unleaded gasoline, it will perform equally well and produce even lower emissions when operating on reformulated gasoline.

Materials Added to Fuel

Indiscriminate use of fuel system cleaning agents should be avoided. Many of these materials intended for gum and varnish removal may contain active solvents of similar ingredients that can be harmful to fuel system gasket and diaphragm materials.

FUEL REQUIREMENTS—DIESEL ENGINE

WARNING: Do not use alcohol or gasoline as a fuel blending agent. They can be unstable under certain conditions and hazardous or explosive when mixed with diesel fuel.

Use good quality diesel fuel from a reputable supplier in your Dodge truck. For most year-round service, number 2 diesel fuel meeting ASTM specification D-975 will provide good performance. If the vehicle is exposed to extreme cold (below 0°F/-18°C), or is required to operate at colder-than-normal conditions for prolonged periods, use climatized No. 2 diesel fuel or dilute the No. 2 diesel fuel with 50% kerosene or No. 1 diesel fuel. This will provide better protection from fuel gelling or wax-plugging of the fuel filters.

Diesel fuel is seldom completely free of water. To prevent fuel system trouble, including fuel line freezing in winter, drain the accumulated water from the fuel/water separator using the fuel/water separator drain provided. If you buy good-quality fuel and follow the cold-weather advice above, fuel conditioners should not be required in your vehicle If available in your area, a high cetane “premium” diesel fuel may offer improved cold starting and warm-up performance

Mopar AUTHENTIC RESTORATION PRODUCT

FUEL DELIVERY SYSTEM-GASOLINE ENGINE

INDEX

DESCRIPTION AND OPERATION

FUEL DELIVERY SYSTEM—GASOLINE POWERED ENGINES

The fuel delivery system consists of:

- the fuel pump module containing the electric fuel pump, fuel filter/fuel pressure regulator, rollover valve (certain modules), fuel gauge sending unit (fuel level sensor) and a separate fuel filter located at bottom of pump module
- fuel tubes/lines/hoses
- quick-connect fittings
- fuel injector rail
- fuel injectors
- fuel tank
- fuel tank filler/vent tube assembly
- fuel tank filler tube cap
- accelerator pedal
- throttle cable

Fuel is returned through the fuel pump module and back into the fuel tank through the fuel filter/fuel pressure regulator. A separate fuel return line from the engine to the tank is not used with any gasoline powered engine.

The fuel tank assembly consists of: the fuel tank, fuel pump module assembly, fuel pump module locknut/gasket and rollover valve(s) (refer to Group 25, Emission Control System for rollover valve information).

A fuel filler/vent tube assembly using a pressure/vacuum fuel filler cap is used. On vehicles equipped with the California emissions package, the fuel filler tube contains a spring-loaded flap (door) located below the fuel fill cap. The flap is used as a secondary way of sealing the fuel tank if the fuel fill cap has not been properly tightened. It is part of EVAP monitor system when vehicle is equipped with a Leak Detection Pump (LDP).

Also to be considered part of the fuel system is the evaporation control system. This is designed to reduce the emission of fuel vapors into the atmosphere. The description and function of the Evaporative Control System is found in Group 25, Emission Control Systems.

Both fuel filters (at bottom of fuel pump module and within fuel pressure regulator) are designed for

DESCRIPTION AND OPERATION (Continued)

extended service. They do not require normal scheduled maintenance. Filters should only be replaced if a diagnostic procedure indicates to do so.

FUEL PUMP MODULE

The fuel pump module on all gas powered engines is installed in the top of the fuel tank (Fig. 1) or (Fig. 2). The fuel pump module (Fig. 1), (Fig. 2) or (Fig. 3) contains the following:

- A combination fuel filter/fuel pressure regulator
- Electric fuel pump
- Fuel pump reservoir
- A separate in-tank fuel filter (at bottom of module)
- Rollover valve (certain modules)
- Fuel gauge sending unit (fuel level sensor)
- Fuel supply line connection at filter/regulator
- A threaded locknut retaining pump module to fuel tank
- A gasket between tank flange and module
- Auxiliary non-pressurized fuel supply fitting (not all engines)

The fuel gauge sending unit (fuel level sensor), and pick-up filter (at bottom of module) may be serviced separately. If the electrical fuel pump requires service, the entire fuel pump module must be replaced. The fuel filter/fuel pressure regulator may be serviced separately. Refer to Fuel Filter/Fuel Pressure Regulator Removal/Installation for additional information.

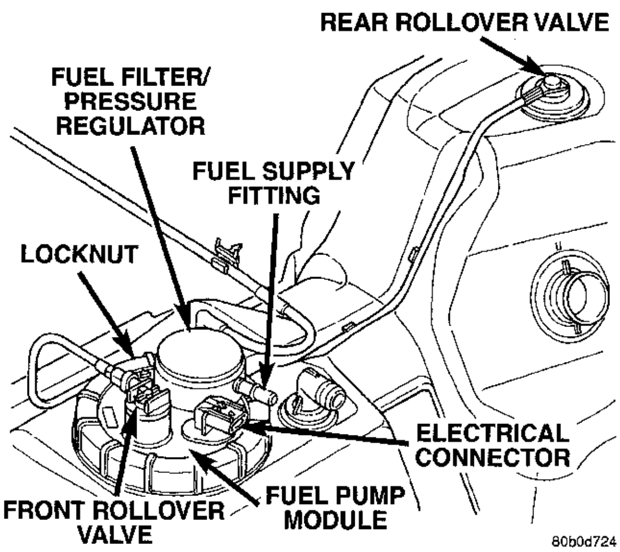

Fig. 1 Top View Fuel Pump Module—Gas Powered With 26 or 34 Gallon Tank—Typical

FUEL PUMP

The fuel pump used in this system has a permanent magnet electric motor. The pump is part of the fuel pump module. Fuel is drawn in through a filter

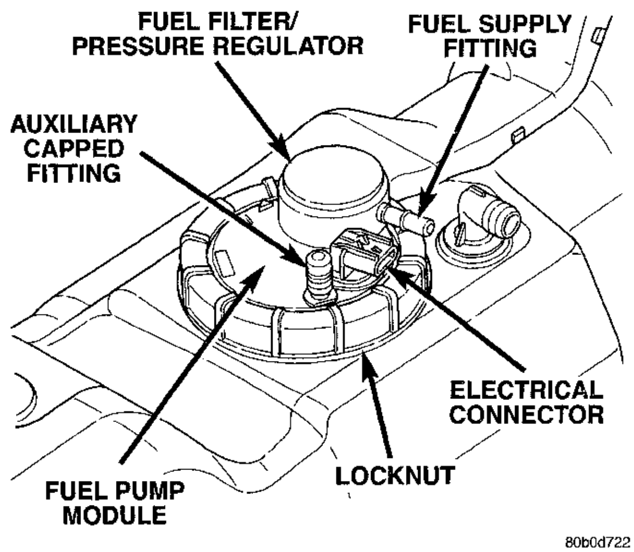

Fig. 2 Top View Fuel Pump Module—Gas Powered With 35 Gallon Tank—Typical

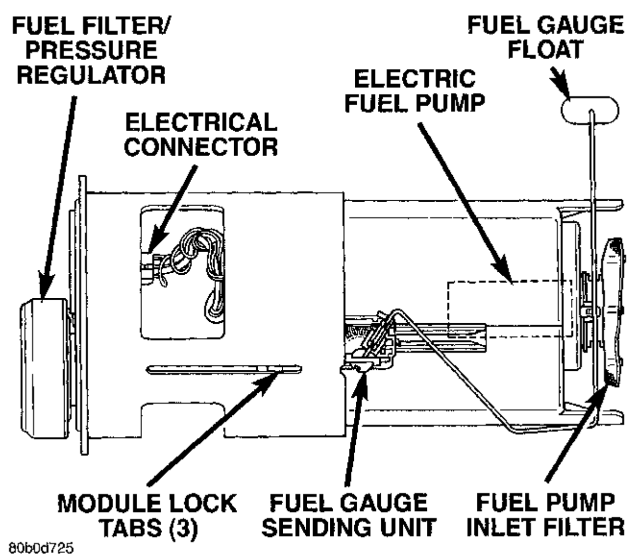

Fig. 3 Fuel Pump Module Components—Gas Powered Engines (Typical Module Shown)

at the bottom of the module and pushed through the electric motor gearset to the pump outlet.

Check Valve Operation: The pump outlet contains a one-way check valve to prevent fuel flow back into the tank and to maintain fuel supply line pressure (engine warm) when pump is not operational. It is also used to keep the fuel supply line full of gasoline when pump is not operational. After the vehicle has cooled down, fuel pressure may drop to 0 psi (cold fluid contracts), but liquid gasoline will remain in fuel supply line between the check valve and fuel injectors. **Fuel pressure that has dropped to 0 psi on a cooled down vehicle (engine off) is a**

AUTHENTIC RESTORATION PRODUCT mopar

DESCRIPTION AND OPERATION (Continued)

normal condition. Refer to the Fuel Pressure Leak Down Test in this group for more information.

Voltage to operate the electric pump is supplied through the fuel pump relay.

FUEL GAUGE SENDING UNIT

The fuel gauge sending unit (fuel level sensor) is attached to the side of the fuel pump module. The sending unit consists of a float, an arm, and a variable resistor (track). The resistor track is used to send electrical signals to the Powertrain Control Module (PCM) for fuel gauge operation and for OBD II emission requirements.

For fuel gauge operation: As fuel level increases, the float and arm move up. This decreases the sending unit resistance, causing the fuel gauge to read full. As fuel level decreases, the float and arm move down. This increases the sending unit resistance causing the fuel gauge to read empty.

After this fuel level signal is sent to the PCM, the PCM will transmit the data across the CCD bus circuits to the instrument panel. Here it is translated into the appropriate fuel gauge level reading.

For OBD II emission monitor requirements: A voltage signal is sent from the resistor track on the sending unit to the PCM to indicate fuel level. The purpose of this feature is to prevent the OBD II system from recording/setting false misfire and fuel system monitor trouble codes. The feature is activated if the fuel level in the tank is less than approximately 15 percent of its rated capacity. If equipped with a Leak Detection Pump (EVAP system monitor), this feature will also be activated if the fuel level in the tank is more than approximately 85 percent of its rated capacity.

FUEL FILTER/FUEL PRESSURE REGULATOR

A combination fuel filter and fuel pressure regulator (Fig. 4) is used on all engines. It is located on the top of the fuel pump module. A separate frame mounted fuel filter is not used with any engine.

Both fuel filters (at bottom of fuel pump module and within fuel pressure regulator) are designed for extended service. They do not require normal scheduled maintenance. Filters should only be replaced if a diagnostic procedure indicates to do so.

Fuel Pressure Regulator Operation: The pressure regulator is a mechanical device that is not controlled by engine vacuum or the powertrain control module (PCM).

The regulator is calibrated to maintain fuel system operating pressure of approximately 339 kPa ± 34 kPa (49.2 psi ± 5 psi) at the fuel injectors. It contains a diaphragm, calibrated springs and a fuel return valve. The internal fuel filter (Fig. 4) is also part of the assembly.

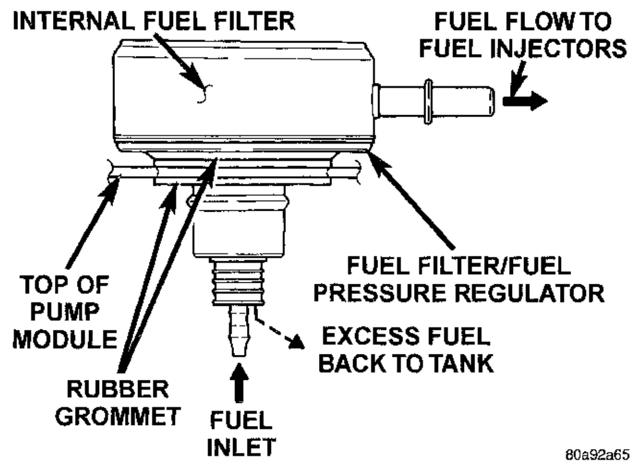

Fig. 4 Side View—Filter/Regulator

Fuel is supplied to the filter/regulator by the electric fuel pump through an opening tube at the bottom of filter/regulator (Fig. 4).

The regulator acts as a check valve to maintain some fuel pressure when the engine is not operating. This will help to start the engine. A second check valve is located at the outlet end of the electric fuel pump. **Refer to Fuel Pump—Description and Operation for more information. Also refer to the Fuel Pressure Leak Down Test and the Fuel Pump Pressure Tests.**

If fuel pressure at the pressure regulator exceeds approximately 49.2 psi, an internal diaphragm opens and excess fuel pressure is routed back into the tank through the bottom of pressure regulator.

FUEL TANK

All models pass a full 360 degree rollover test without fuel leakage. To accomplish this, fuel and vapor flow controls are required for all fuel tank connections.

All models are equipped with either one or two rollover valves mounted into the top of the fuel tank (or pump module). Refer to Group 25, Emission Control System for rollover valve information.

An evaporation control system is connected to the rollover valve(s) to reduce emissions of fuel vapors into the atmosphere. When fuel evaporates from the fuel tank, vapors pass through vent hoses or tubes to a charcoal canister where they are temporarily held. When the engine is running, the vapors are drawn into the intake manifold. Certain models are also equipped with a self-diagnosing system using a Leak Detection Pump (LDP). Refer to Group 25, Emission Control System for additional information.

ROLLOVER VALVE(S)

Refer to Group 25, Emission Control System for information.

DESCRIPTION AND OPERATION (Continued)

FUEL INJECTORS

The fuel injectors (Fig. 5) are electrical solenoids. The injector contains a pintle that closes off an orifice at the nozzle end. When electric current is supplied to the injector, the armature and needle move a short distance against a spring, allowing fuel to flow out the orifice. Because the fuel is under high pressure, a fine spray is developed in the shape of a pencil stream. The spraying action atomizes the fuel, adding it to the air entering the combustion chamber.

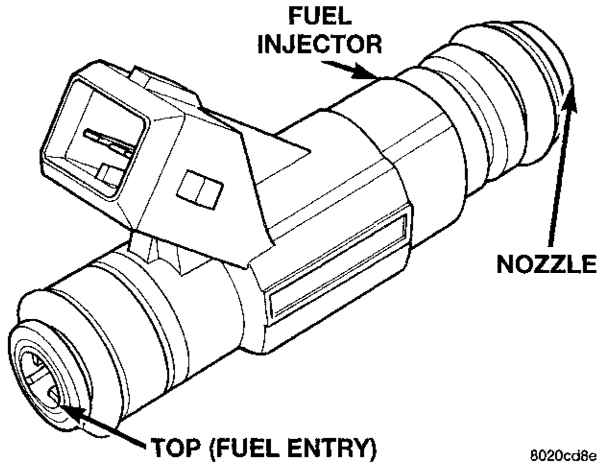

Fig. 5 Fuel Injector—Typical

An individual fuel injector is used for each individual cylinder. The top (fuel entry) end of the injector is attached into an opening on the fuel rail.

The nozzle (outlet) ends of the injectors are positioned into openings in the intake manifold just above the intake valve ports of the cylinder head. The engine wiring harness connector for each fuel injector is equipped with an attached numerical tag (INJ 1, INJ 2 etc.). This is used to identify each fuel injector.

The injectors are energized individually in a sequential order by the powertrain control module (PCM). The PCM will adjust injector pulse width by switching the ground path to each individual injector on and off. Injector pulse width is the period of time that the injector is energized. The PCM will adjust injector pulse width based on various inputs it receives.

During start up, battery voltage is supplied to the injectors through the ASD relay. When the engine is operating, voltage is supplied by the charging system. The PCM determines injector pulse width based on various inputs.

FUEL RAIL—3.9/5.2/5.9L ENGINES

The fuel rail supplies the necessary fuel to each individual fuel injector and is mounted to the intake manifold (Fig. 6). The fuel pressure regulator is not mounted to the fuel rail on any engine. It is located on the fuel tank mounted fuel pump module. Refer to Fuel Filter/Fuel Pressure Regulator in this section of group for information.

The fuel rail is not repairable.

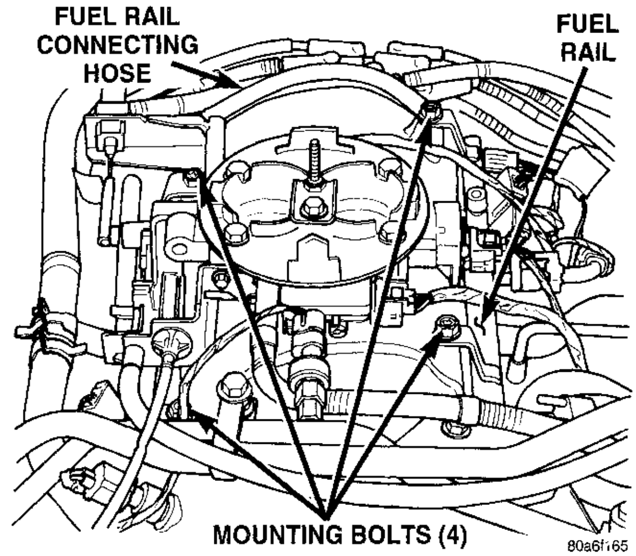

Fig. 6 Fuel Rail—3.9/5.2/5.9L Engine—Typical

CAUTION: The left and right sections of the fuel rail are connected with a flexible connecting hose. Do not attempt to separate the rail halves at this connecting hose. Due to the design of this connecting hose, it does not use any clamps. Never attempt to install a clamping device of any kind to the hose. When removing the fuel rail assembly for any reason, be careful not to bend or kink the connecting hose.

FUEL RAIL—8.0L ENGINE

The fuel rail supplies the necessary fuel to each individual fuel injector and is mounted to the lower half of the two-piece intake manifold (Fig. 7). The metal, one-piece fuel rail is not repairable.

FUEL TANK FILLER TUBE CAP

The loss of any fuel or vapor out of filler neck is prevented by the use of a pressure-vacuum fuel tank filler tube cap. Relief valves inside the cap will release fuel tank pressure at predetermined pressures. Fuel tank vacuum will also be released at predetermined values. This cap must be replaced by a similar unit if replacement is necessary. This is in order for the system to remain effective.

DESCRIPTION AND OPERATION (Continued)

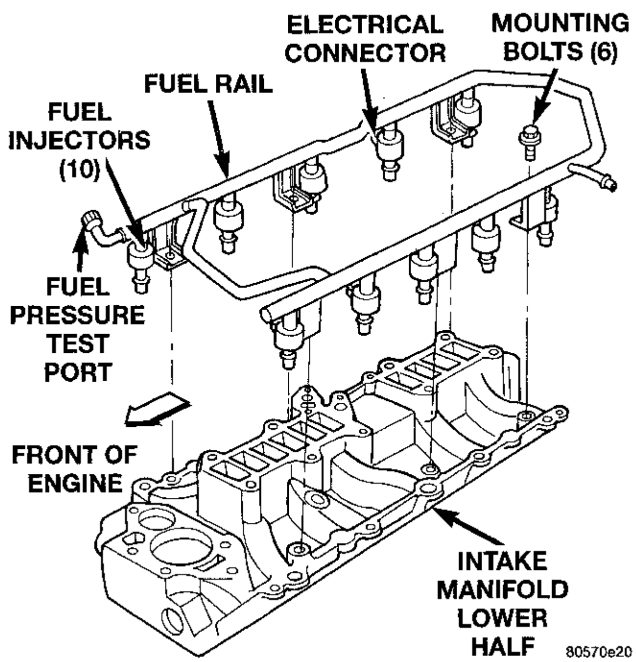

Fig. 7 Fuel Rail—8.0L Engine

CAUTION: Remove fuel tank filler tube cap before servicing any fuel system component. This is done to help relieve tank pressure. If equipped with a California emissions package and a Leak Detection Pump (LDP), the secondary seal below the fill cap must be pressed (opened) to relieve fuel tank pressure.

QUICK-CONNECT FITTINGS

Different types of quick-connect fittings are used to attach various fuel system components. These are: a single-tab type, a two-tab type or a plastic retainer ring type. Some are equipped with safety latch clips. Refer to the Removal/Installation section for more information.

CAUTION: The interior components (o-rings, spacers) of quick-connect fitting are not serviced separately, but new pull tabs are available for some types. Do not attempt to repair damaged fittings or fuel lines/tubes. If repair is necessary, replace the complete fuel tube assembly.

DIAGNOSIS AND TESTING

FUEL PUMP PRESSURE TEST—ALL ENGINES WITH PRESSURE TEST PORT

Use this test in conjunction with the Fuel Pump Capacity Test, Fuel Pressure Leak Down Test and Fuel Pump Amperage Test found elsewhere in this group.

Check Valve Operation: The electric fuel pump outlet contains a one-way check valve to prevent fuel flow back into the tank and to maintain fuel supply line pressure (engine warm) when pump is not operational. It is also used to keep the fuel supply line full of gasoline when pump is not operational. After the vehicle has cooled down, fuel pressure may drop to 0 psi (cold fluid contracts), but liquid gasoline will remain in fuel supply line between the check valve and fuel injectors. **Fuel pressure that has dropped to 0 psi on a cooled down vehicle (engine off) is a normal condition.** When the electric fuel pump is activated, fuel pressure should **immediately** (1–2 seconds) rise to specification.

All fuel systems are equipped with a fuel tank module mounted, combination fuel filter/fuel pressure regulator. The fuel pressure regulator is not controlled by engine vacuum.

WARNING: THE FUEL SYSTEM IS UNDER CONSTANT FUEL PRESSURE EVEN WITH THE ENGINE OFF. BEFORE DISCONNECTING FUEL LINE AT FUEL RAIL, THIS PRESSURE MUST BE RELEASED. REFER TO THE FUEL SYSTEM PRESSURE RELEASE PROCEDURE.

(1) Remove protective cap at fuel rail test port. Connect the 0–414 kPa (0-60 psi) fuel pressure gauge (from gauge set 5069) to test port pressure fitting on fuel rail (Fig. 8).

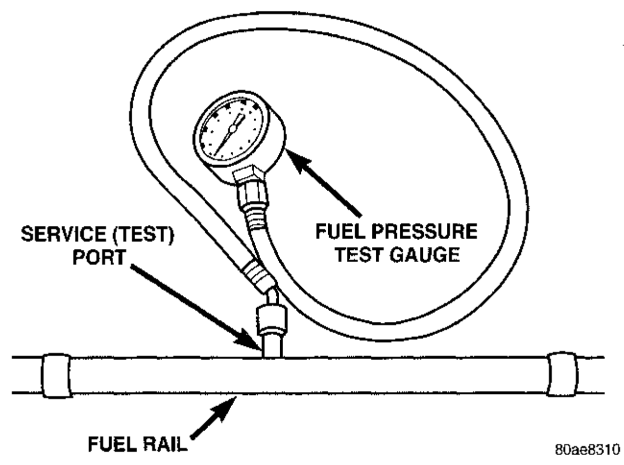

Fig. 8 Fuel Pressure Test Gauge (Typical Gauge Installation at Test Port)

(2) Start and warm engine and note pressure gauge reading. Fuel pressure should be 339 kPa ± 34 kPa (49.2 psi ± 5 psi) at idle.

(3) If engine runs, but pressure is below 44.2 psi, check for a kinked fuel supply line somewhere between fuel rail and fuel pump module. If line is not kinked, but specifications for either the Fuel Pump Capacity, Fuel Pump Amperage or Fuel Pressure

DIAGNOSIS AND TESTING (Continued)

Leak Down Tests were not met, replace fuel pump module assembly. Refer to Fuel Pump Module Removal/Installation.

(4) If operating pressure is above 54.2 psi, electric fuel pump is OK, but fuel pressure regulator is defective. Replace fuel filter/fuel pressure regulator. Refer to Fuel Filter/Fuel Pressure Regulator Removal/Installation for more information.

(5) Install protective cap to fuel rail test port.

FUEL PUMP CAPACITY TEST

Before performing this test, verify fuel pump pressure by performing the Fuel Pump Pressure Test. Use this test in conjunction with the Fuel Pressure Leak Down Test found elsewhere in this group.

(1) Release fuel system pressure. Refer to the Fuel Pressure Release Procedure in this group.

(2) Disconnect fuel supply line at fuel rail. Refer to Quick-Connect Fittings in the Service Procedures section of this group for procedures. Some engines may require air cleaner housing removal before line disconnection.

(3) Connect appropriate Fuel Line Pressure Test Adapter Tool Hose (number 6631, 6923, 6541 or 6539) into disconnected fuel supply line. Insert other end of Adaptor Tool hose into a graduated container.

(4) Remove fuel fill cap.

(5) To activate fuel pump and pressurize system, obtain DRB scan tool and actuate ASD Fuel System Test.

(6) A good fuel pump will deliver at least 1/4 liter of fuel in 7 seconds. Do not operate fuel pump for longer than 7 seconds with fuel line disconnected as fuel pump module reservoir may run empty.

(a) If capacity is lower than specification, but fuel pump can be heard operating through fuel fill cap opening, check for a kinked/damaged fuel supply line somewhere between fuel rail and fuel pump module.

(b) If line is not kinked/damaged, and fuel pressure is OK, but capacity is low, replace fuel filter/fuel pressure regulator. The filter/regulator may be serviced separately on certain applications. Refer to Fuel Filter/Fuel Pressure Regulator Removal/Installation for additional information.

(c) If both fuel pressure and capacity are low, replace fuel pump module assembly. Refer to Fuel Pump Module Removal/Installation.

FUEL PRESSURE LEAK DOWN TEST

Use this test in conjunction with the Fuel Pump Pressure Test and Fuel Pump Capacity Test.

Check Valve Operation: The electric fuel pump outlet contains a one-way check valve to prevent fuel flow back into the tank and to maintain fuel supply line pressure (engine warm) when pump is not operational. It is also used to keep the fuel supply line full of gasoline when pump is not operational. After the vehicle has cooled down, fuel pressure may drop to 0 psi (cold fluid contracts), but liquid gasoline will remain in fuel supply line between the check valve and fuel injectors. **Fuel pressure that has dropped to 0 psi on a cooled down vehicle (engine off) is a normal condition.** When the electric fuel pump is activated, fuel pressure should **immediately** (1–2 seconds) rise to specification.

Abnormally long periods of cranking to restart a **hot** engine that has been shut down for a short period of time may be caused by:

- Fuel pressure bleeding past a fuel injector(s).
- Fuel pressure bleeding past the check valve in the fuel pump module.

(1) Disconnect the fuel inlet line at fuel rail. Refer to Fuel Tubes/Lines/Hoses and Clamps in this section of the group for procedures. On some engines, air cleaner housing removal may be necessary before fuel line disconnection.

(2) Connect the appropriate Fuel Line Pressure Test Adapter Tool (number 6539, 6631, 6541 or 6923) between the disconnected fuel line and fuel rail (Fig. 9) or (Fig. 10).

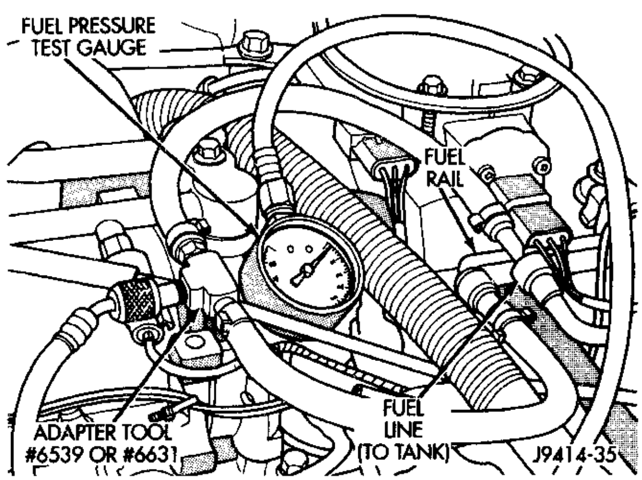

Fig. 9 Connecting Adapter Tool—Typical

(3) Connect the 0-414 kPa (0-60 psi) fuel pressure test gauge (from Gauge Set 5069) to the test port on the appropriate Adaptor Tool. **The fittings on both tools must be in good condition and free from any small leaks before performing the proceeding test.**

(4) Start engine and bring to normal operating temperature.

(5) Observe test gauge. Normal operating pressure should be 339 kPa ± 34 kPa (49.2 psi ± 5 psi).

(6) Shut engine off.

DIAGNOSIS AND TESTING (Continued)

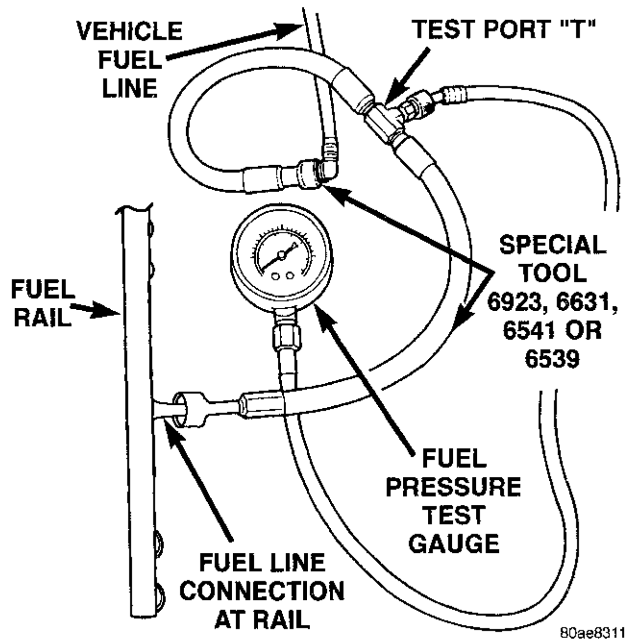

Fig. 10 Connecting Adapter Tool—Typical

(7) Pressure should not fall below **30 psi for five minutes.**

(8) If pressure falls below 30 psi, it must be determined if a fuel injector, the check valve within the fuel pump module, or a fuel tube/line is leaking.

(9) Again, start engine and bring to normal operating temperature.

(10) Shut engine off.

(11) **Testing for fuel injector or fuel rail leakage:** Clamp off the rubber hose portion of Adaptor Tool between the fuel rail and the test port "T" on Adapter Tool. If pressure now holds at or above 30 psi, a fuel injector or the fuel rail is leaking.

(12) **Testing for fuel pump check valve, filter/regulator check valve or fuel tube/line leakage:** Clamp off the rubber hose portion of Adaptor Tool between the vehicle fuel line and test port "T" on Adapter Tool. If pressure now holds at or above 30 psi, a leak may be found at a fuel tube/line. If no leaks are found at fuel tubes or lines, one of the check valves in either the electric fuel pump or filter/regulator may be leaking.

Note: A quick loss of pressure usually indicates a defective check valve in the filter/regulator. A slow loss of pressure usually indicates a defective check valve in the electric fuel pump.

The electric fuel pump is not serviced separately. Replace the fuel pump module assembly. The filter/regulator may be replaced separately on certain applications. Refer to Fuel Filter/Fuel Pressure Regulator Removal/Installation for additional information.

FUEL PUMP AMPERAGE TEST

This amperage (current draw) test is to be done in conjunction with the Fuel Pump Pressure Test, Fuel Pump Capacity Test and Fuel Pressure Leak Down Test. Before performing the amperage test, be sure the temperature of the fuel tank is above 50° F (10° C).

The DRB Scan Tool along with the DRB Low Current Shunt (LCS) adapter (Fig. 11) and its test leads will be used to check fuel pump amperage specifications.

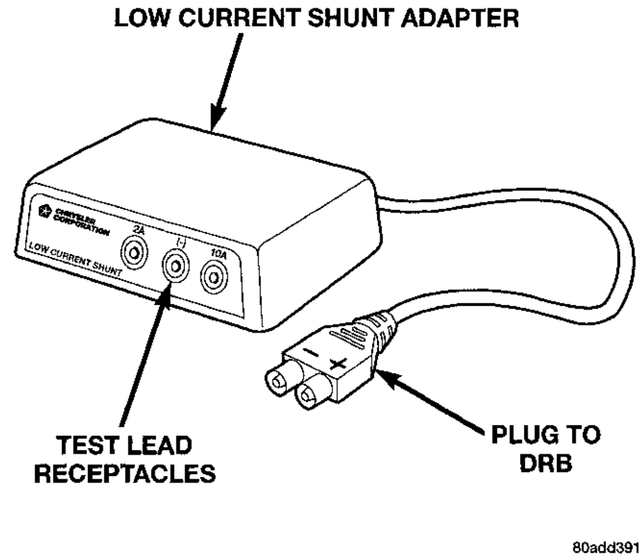

Fig. 11 Low Current Shunt Adapter

(1) Obtain LCS adapter.

(2) Plug cable from LCS adapter into DRB scan tool at SET 1 receptacle.

(3) Plug DRB into vehicle 16–way connector (data link connector).

(4) Connect (-) and (+) test cable leads into LCS adapter receptacles. Use **10 amp (10A +)** receptacle and common (-) receptacles.

(5) Gain access to MAIN MENU on DRB screen.

(6) Press DVOM button on DRB.

(7) Using left/right arrow keys, highlight CHANNEL 1 function on DRB screen.

(8) Press ENTER three times.

(9) Using up/down arrow keys, highlight RANGE on DRB screen (screen will default to 2 amp scale).

(10) Press ENTER to change 2 amp scale to 10 amp scale. **This step must be done to prevent damage to DRB scan tool or LCS adapter (blown fuse).**

(11) Remove cover from Power Distribution Center (PDC).

(12) Remove fuel pump relay from PDC. Refer to label on PDC cover for relay location.

DIAGNOSIS AND TESTING (Continued)

WARNING: BEFORE PROCEEDING TO NEXT STEP, NOTE THE FUEL PUMP WILL BE ACTIVATED AND SYSTEM PRESSURE WILL BE PRESENT. THIS WILL OCCUR AFTER CONNECTING TEST LEADS FROM LCS ADAPTER INTO FUEL PUMP RELAY CAVITIES. THE FUEL PUMP WILL OPERATE EVEN WITH IGNITION KEY IN OFF POSITION. BEFORE ATTACHING TEST LEADS, BE SURE ALL FUEL LINES AND FUEL SYSTEM COMPONENTS ARE CONNECTED.

CAUTION: TO PREVENT POSSIBLE DAMAGE TO THE VEHICLE ELECTRICAL SYSTEM AND LCS ADAPTER, THE TEST LEADS MUST BE CONNECTED INTO RELAY CAVITIES EXACTLY AS SHOWN IN FOLLOWING STEPS.

Depending upon vehicle model, year or engine configuration, three different types of relays may be used: Type-1, type-2 and type–3.

(13) If equipped with **type–1 relay** (Fig. 12), attach test leads from LCS adapter into PDC relay cavities number 30 and 87. For location of these cavities, refer to numbers stamped to bottom of relay (Fig. 12).

(14) If equipped with **type–2 relay** (Fig. 13), attach test leads from LCS adapter into PDC relay cavities number 30 and 87. For location of these cavities, refer to numbers stamped to bottom of relay (Fig. 13).

(15) If equipped with **type–3 relay** (Fig. 14), attach test leads from LCS adapter into PDC relay cavities number 3 and 5. For location of these cavities, refer to numbers stamped to bottom of relay (Fig. 14).

NUMBER	IDENTIFICATION
30	COMMON FEED
85	COIL GROUND
86	COIL BATTERY
87	NORMALLY OPEN
87A	NORMALLY CLOSED

Fig. 12 Type–1 Relay

(16) When LCS adapter test leads are attached into relay cavities, fuel pump **will be activated.** Determine fuel pump amperage on DRB screen. Amperage should be below 10.0 amps. If amperage is below 10.0 amps, and specifications for the Fuel Pump Pressure, Fuel Pump Capacity and Fuel Pressure Leak Down tests were met, the fuel pump module is OK.

Fig. 14 Type–3 Relay

(17) If amperage is more than 10.0 amps, replace fuel pump module assembly. The electric fuel pump is not serviced separately.

(18) Disconnect test leads from relay cavities immediately after testing.

FUEL GAUGE SENDING UNIT

The fuel gauge sending unit contains a variable resistor (track). As the float moves up or down, electrical resistance will change. Refer to Group 8E, Instrument Panel and Gauges for Fuel Gauge testing. To test the gauge sending unit only, it must be removed from vehicle. The unit is part of the fuel pump module. Refer to Fuel Pump Module Removal/ Installation for procedures. Measure the resistance across the sending unit terminals. With float in up position, resistance should be 20 ohms ±6 ohms.

AUTHENTIC RESTORATION PRODUCTS

DIAGNOSIS AND TESTING (Continued)

With float in down position, resistance should be 220 ohms ±6 ohms.

FUEL INJECTOR TEST

To perform a complete test of the fuel injectors and their circuitry, refer to DRB scan tool and appropriate Powertrain Diagnostics Procedures manual. To test the injector only, refer to the following:

Disconnect the fuel injector wire harness connector from the injector. Place an ohmmeter across the injector electrical terminals. Resistance reading should be approximately 12 ohms ±1.2 ohms at 20°C (68°F).

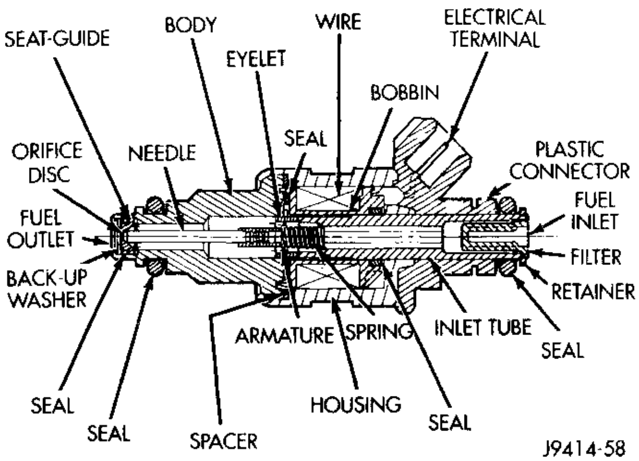

Fig. 15 Fuel Injector Internal Components—Typical

SERVICE PROCEDURES

FUEL SYSTEM PRESSURE RELEASE PROCEDURE

Use following procedure if fuel rail is or is not equipped with fuel pressure test port.

(1) Remove fuel fill cap.

(2) The fuel filler tube contains a spring-loaded flap (door) located below fuel fill cap. The flap is used as a secondary way of sealing fuel tank if fuel fill cap has not been properly tightened. It is part of EVAP monitor system when vehicle is equipped with a Leak Detection Pump (LDP). **The vehicle may be equipped with flap installed into fuel filler tube even though vehicle is not equipped with LDP and EVAP monitor system.** Place a nonmetallic object into fuel fill tube and press on flap to relieve any tank pressure.

(3) Remove Fuel Pump relay from Power Distribution Center (PDC). For location of relay, refer to label on underside of PDC cover.

(4) Start and run engine until it stalls.

(5) Attempt restarting engine until it will no longer run.

(6) Turn ignition key to OFF position.

CAUTION: Steps 1, 2, 3 and 4 must be performed to relieve high pressure fuel from within fuel rail. Do not attempt to use following steps to relieve this pressure as excessive fuel will be forced into a cylinder chamber.

(7) Unplug connector from any injector.

(8) Attach one end of a jumper wire with alligator clips (18 gauge or smaller) to either injector terminal.

(9) Connect other end of jumper wire to positive side of battery.

(10) Connect one end of a second jumper wire to remaining injector terminal.

CAUTION: Powering an injector for more than a few seconds will permanently damage the injector.

(11) Momentarily touch other end of jumper wire to negative terminal of battery for no more than a few seconds.

(12) Place a rag or towel below fuel line quick-connect fitting at fuel rail.

(13) Disconnect quick-connect fitting at fuel rail. Refer to Quick-Connect Fittings in this section.

(14) Return fuel pump relay to PDC.

(15) One or more Diagnostic Trouble Codes (DTC's) may have been stored in PCM memory due to fuel pump relay removal. The DRB scan tool must be used to erase a DTC. Refer to Group 25, Emission Control System. See On-Board Diagnostics.

FUEL TUBES/LINES/HOSES AND CLAMPS

Also refer to the section on Quick-Connect Fittings.

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE OFF). BEFORE SERVICING ANY FUEL SYSTEM HOSES, FITTINGS OR LINES, THE FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO THE FUEL SYSTEM PRESSURE RELEASE PROCEDURE IN THIS GROUP.

Inspect all hose connections such as clamps, couplings and fittings to make sure they are secure and leaks are not present. The component should be replaced immediately if there is any evidence of degradation that could result in failure.

Never attempt to repair a plastic fuel line/tube. Replace as necessary.

Avoid contact of any fuel tubes/hoses with other vehicle components that could cause abrasions or scuffing. Be sure that the plastic fuel lines/tubes are properly routed to prevent pinching and to avoid heat sources.

The lines/tubes/hoses used on fuel injected vehicles are of a special construction. This is due to the higher fuel pressures and the possibility of contami-

SERVICE PROCEDURES (Continued)

nated fuel in this system. If it is necessary to replace these lines/tubes/hoses, only those marked EFM/EFI may be used.

If equipped: The hose clamps used to secure rubber hoses on fuel injected vehicles are of a special rolled edge construction. This construction is used to prevent the edge of the clamp from cutting into the hose. Only these rolled edge type clamps may be used in this system. All other types of clamps may cut into the hoses and cause high-pressure fuel leaks.

Use new original equipment type hose clamps. Tighten hose clamps to 3 N·m (25 in. lbs.) torque.

QUICK-CONNECT FITTINGS

Also refer to the Fuel Tubes/Lines/Hoses and Clamps section.

Different types of quick-connect fittings are used to attach various fuel system components. These are: a single-tab type, a two-tab type, a plastic retainer ring type or a latch clip type. Certain fittings may require the use of a special tool for disconnection.

SINGLE-TAB TYPE

This type of fitting is equipped with a single pull tab (Fig. 16). The tab is removable. After the tab is removed, the quick-connect fitting can be separated from the fuel system component.

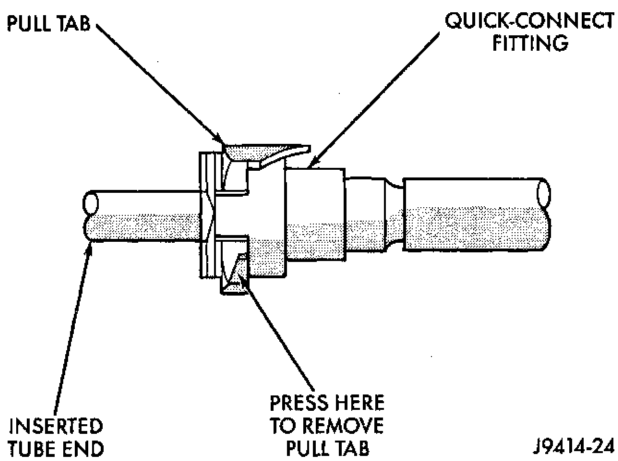

Fig. 16 Single-Tab Type Fitting

CAUTION: The interior components (o-rings, spacers) of this type of quick-connect fitting are not serviced separately, but new pull tabs are available. Do not attempt to repair damaged fittings or fuel lines/ tubes. If repair is necessary, replace the complete fuel tube assembly.

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE OFF). BEFORE SERVICING ANY FUEL SYSTEM HOSES, FITTINGS OR LINES, THE FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO THE FUEL SYSTEM PRESSURE RELEASE PROCEDURE IN THIS GROUP.

DISCONNECTION/CONNECTION

(1) Perform fuel pressure release procedure. Refer to Fuel Pressure Release Procedure in this group.

(2) Disconnect negative battery cable from battery.

(3) Clean fitting of any foreign material before disassembly.

(4) Press release tab on side of fitting to release pull tab (Fig. 17).

CAUTION: If this release tab is not pressed prior to releasing the pull tab, the pull tab will be damaged.

(5) While pressing release tab on side of fitting, use a screwdriver to pry up pull tab (Fig. 17).

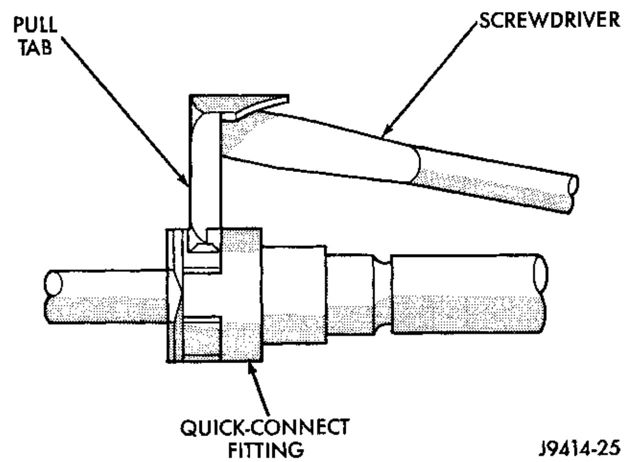

Fig. 17 Disconnecting Single-Tab Type Fitting

(6) Raise pull tab until it separates from quick-connect fitting (Fig. 18). Discard old pull tab.

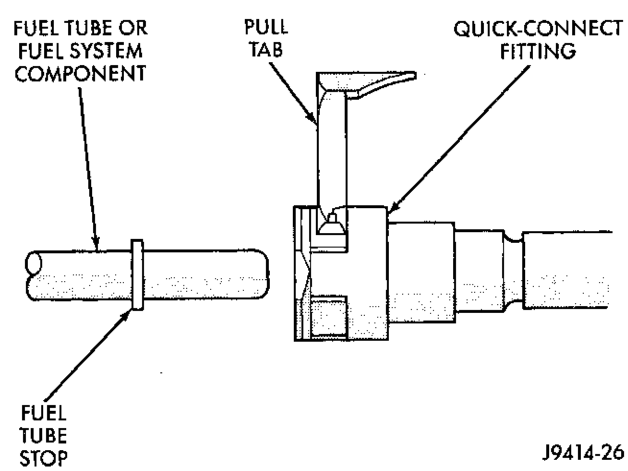

Fig. 18 Removing Pull Tab

SERVICE PROCEDURES (Continued)

(7) Disconnect quick-connect fitting from fuel system component being serviced.

(8) Inspect quick-connect fitting body and fuel system component for damage. Replace as necessary.

(9) Prior to connecting quick-connect fitting to component being serviced, check condition of fitting and component. Clean parts with a lint-free cloth. Lubricate with clean engine oil.

(10) Insert quick-connect fitting into fuel tube or fuel system component until built-on stop on fuel tube or component rests against back of fitting.

(11) Obtain a new pull tab. Push new tab down until it locks into place in quick-connect fitting.

(12) Verify a locked condition by firmly pulling on fuel tube and fitting (15-30 lbs.).

(13) Connect negative cable to battery.

(14) Start engine and check for leaks.

TWO-TAB TYPE FITTING

This type of fitting is equipped with tabs located on both sides of the fitting (Fig. 19). These tabs are supplied for disconnecting the quick-connect fitting from component being serviced.

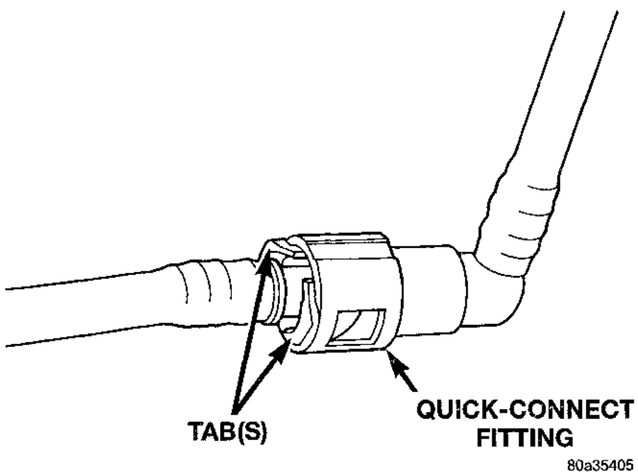

Fig. 19 Typical Two-Tab Type Quick-Connect Fitting

CAUTION: The interior components (o-rings, spacers) of this type of quick-connect fitting are not serviced separately, but new plastic retainers are available. Do not attempt to repair damaged fittings or fuel lines/tubes. If repair is necessary, replace the complete fuel tube assembly.

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE OFF). BEFORE SERVICING ANY FUEL SYSTEM HOSES, FITTINGS OR LINES, THE FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO THE FUEL PRESSURE RELEASE PROCEDURE IN THIS GROUP.

DISCONNECTION/CONNECTION

(1) Perform fuel pressure release procedure. Refer to Fuel Pressure Release Procedure in this group.

(2) Disconnect negative battery cable from battery.

(3) Clean fitting of any foreign material before disassembly.

(4) To disconnect quick-connect fitting, squeeze plastic retainer tabs (Fig. 19) against sides of quick-connect fitting with your fingers. Tool use is not required for removal and may damage plastic retainer. Pull fitting from fuel system component being serviced. The plastic retainer will remain on component being serviced after fitting is disconnected. The o-rings and spacer will remain in quick-connect fitting connector body.

(5) Inspect quick-connect fitting body and component for damage. Replace as necessary.

CAUTION: When the quick-connect fitting was disconnected, the plastic retainer will remain on the component being serviced. If this retainer must be removed, very carefully release the retainer from the component with two small screwdrivers. After removal, inspect the retainer for cracks or any damage.

(6) Prior to connecting quick-connect fitting to component being serviced, check condition of fitting and component. Clean parts with a lint-free cloth. Lubricate with clean engine oil.

(7) Insert quick-connect fitting to component being serviced and into plastic retainer. When a connection is made, a click will be heard.

(8) Verify a locked condition by firmly pulling on fuel tube and fitting (15-30 lbs.).

(9) Connect negative cable to battery.

(10) Start engine and check for leaks.

PLASTIC RETAINER RING TYPE FITTING

This type of fitting can be identified by the use of a full-round plastic retainer ring (Fig. 20) usually black in color.

CAUTION: The interior components (o-rings, spacers, retainers) of this type of quick-connect fitting are not serviced separately. Do not attempt to repair damaged fittings or fuel lines/tubes. If repair is necessary, replace the complete fuel tube assembly.

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE OFF). BEFORE SERVICING ANY FUEL SYSTEM HOSES, FITTINGS OR LINES, THE FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO THE FUEL SYSTEM PRESSURE RELEASE PROCEDURE IN THIS GROUP.

SERVICE PROCEDURES (Continued)

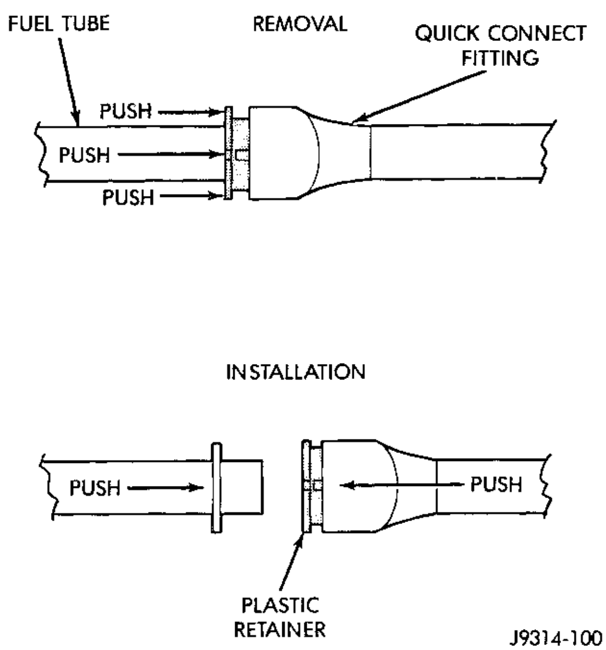

Fig. 20 Plastic Retainer Ring Type Fitting

DISCONNECTION/CONNECTION

(1) Perform fuel pressure release procedure. Refer to Fuel Pressure Release Procedure in this section.

(2) Disconnect negative battery cable from battery.

(3) Clean fitting of any foreign material before disassembly.

(4) To release fuel system component from quick-connect fitting, firmly push fitting towards component being serviced while firmly pushing plastic retainer ring into fitting (Fig. 20). With plastic ring depressed, pull fitting from component. **The plastic retainer ring must be pressed squarely into fitting body. If this retainer is cocked during removal, it may be difficult to disconnect fitting. Use an open-end wrench on shoulder of plastic retainer ring to aid in disconnection.**

(5) After disconnection, plastic retainer ring will remain with quick-connect fitting connector body.

(6) Inspect fitting connector body, plastic retainer ring and fuel system component for damage. Replace as necessary.

(7) Prior to connecting quick-connect fitting to component being serviced, check condition of fitting and component. Clean parts with a lint-free cloth. Lubricate with clean engine oil.

(8) Insert quick-connect fitting into component being serviced until a click is felt.

(9) Verify a locked condition by firmly pulling on fuel tube and fitting (15-30 lbs.).

(10) Connect negative battery cable to battery.

(11) Start engine and check for leaks.

LATCH CLIP FITTING (FUEL LINE-TO-FUEL RAIL)

A tethered latch clip (Fig. 21) is used to secure the fuel line to the fuel rail. A special tool will be necessary to separate fuel line from fuel rail after latch clip is removed. This same latch clip may also be used to secure other different fuel system components.

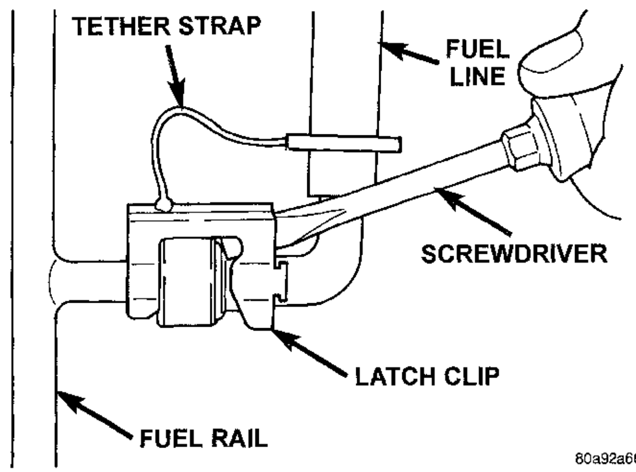

Fig. 21 Latch Clip Removal

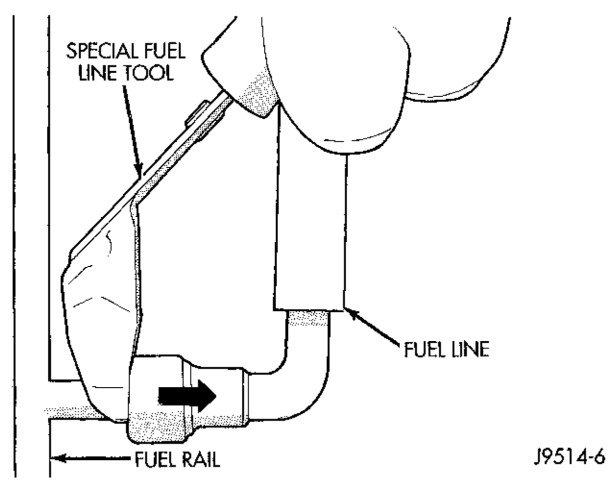

Fig. 22 Fuel Line Disconnection

CAUTION: The interior components (o-rings, spacers, retainers) of this type of quick-connect fitting are not serviced separately. Do not attempt to repair damaged fittings or fuel lines/tubes. If repair is necessary, replace the complete fuel tube assembly.

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE OFF). BEFORE SERVICING ANY FUEL SYSTEM HOSES, FITTINGS OR LINES, THE FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO THE FUEL SYSTEM PRESSURE RELEASE PROCEDURE IN THIS GROUP.

Mopar AUTHENTIC RESTORATION PRODUCT

SERVICE PROCEDURES (Continued)

DISCONNECTION/CONNECTION

(1) Perform fuel pressure release procedure. Refer to Fuel Pressure Release Procedure in this group.

(2) Disconnect negative battery cable from battery.

(3) Clean fitting of any foreign material before disassembly.

(4) Pry up on latch clip with a screwdriver (Fig. 21).

(5) Slide latch clip toward fuel rail while lifting with screwdriver.

(6) Insert special fuel line removal tool (Snap-On number FIH 9055-1 or equivalent) into fuel line (Fig. 22). Use this tool to release locking fingers in end of line.

(7) With special tool still inserted, pull fuel line from fuel rail.

(8) After disconnection, locking fingers will remain within quick-connect fitting at end of fuel line.

(9) Prior to connecting fuel line to fuel rail, check condition of both fittings. Clean parts with a lint-free cloth. Lubricate with clean engine oil.

(10) Insert fuel line onto fuel rail until a click is felt.

(11) Install latch clip (snaps into position). **If latch clip will not fit, this indicates fuel line is not properly installed to fuel rail. Recheck fuel line connection.**

(12) Verify a locked condition by firmly pulling on fuel line and fitting (15-30 lbs.).

(13) Connect negative battery cable to battery.

(14) Start engine and check for leaks.

REMOVAL AND INSTALLATION

FUEL FILTER/FUEL PRESSURE REGULATOR

REMOVAL

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE, EVEN WITH ENGINE OFF. BEFORE SERVICING FUEL FILTER/FUEL PRESSURE REGULATOR, FUEL SYSTEM PRESSURE MUST BE RELEASED.

Refer to Fuel System Pressure Release in Fuel Delivery System section of this group.

The fuel filter/fuel pressure regulator is located at top of fuel pump module (Fig. 24) or (Fig. 25).

Fuel pump module removal is not necessary.

(1) Drain fuel tank and remove tank. Refer to Fuel Tank Removal/Installation.

(2) The fuel filter/regulator is pressed into a rubber grommet. Remove by twisting and pulling straight up (Fig. 26).

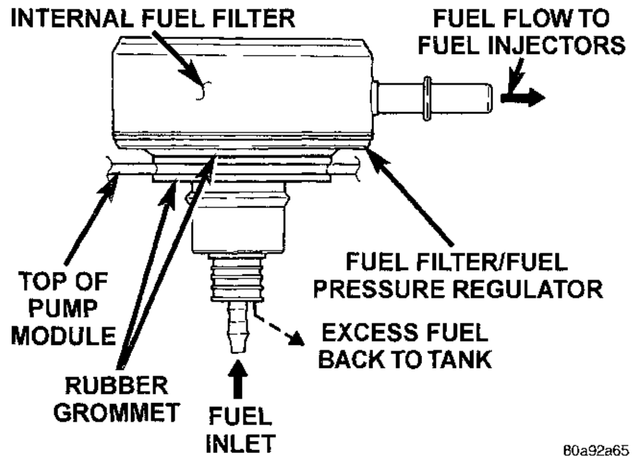

Fig. 23 Fuel Filter/Fuel Pressure Regulator

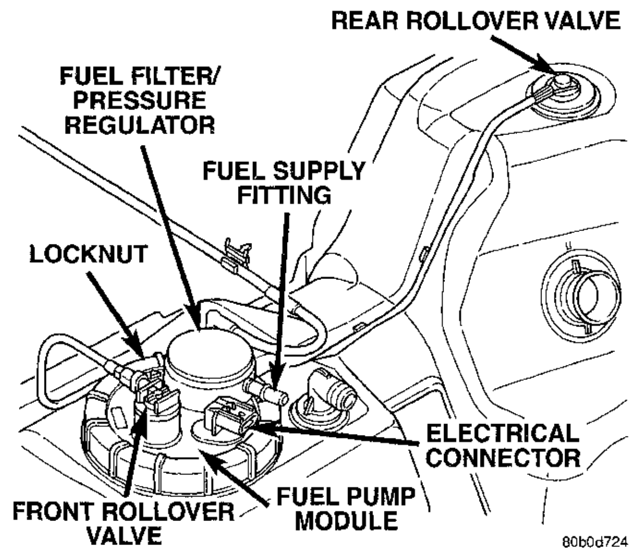

Fig. 24 Filter/Regulator Location—With 26 or 34 Gallon Fuel Tank

CAUTION: Do not pull filter/regulator more than three inches from fuel pump module. Damage to coiled fuel tube (line) may result.

(3) Gently cut old fuel tube (line) clamp (Fig. 27) taking care not to damage plastic fuel tube. Remove and discard old fuel tube clamp.

(4) Remove plastic fuel tube from filter/regulator by gently pulling downward. Remove filter/regulator from fuel pump module.

INSTALLATION

(1) Install a new clamp over plastic fuel tube.

(2) Install filter/regulator to fuel tube. Rotate filter/regulator in fuel tube (line) (Fig. 28) until it is pointed to drivers side of vehicle (Fig. 24) or (Fig. 25).

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

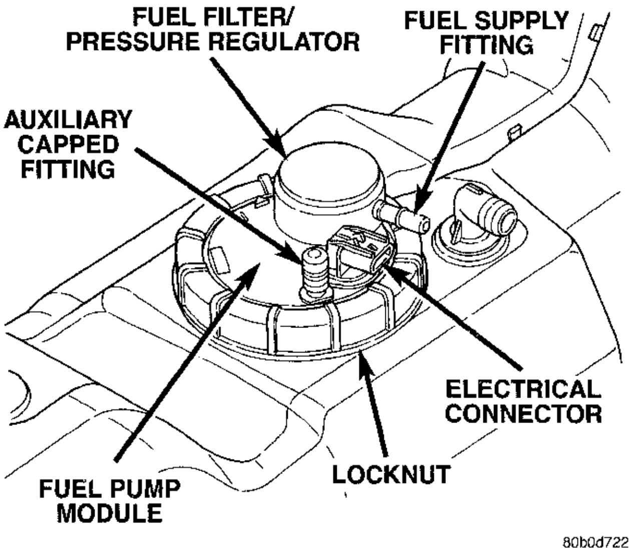

Fig. 25 Filter/Regulator Location—With 35 Gallon Fuel Tank

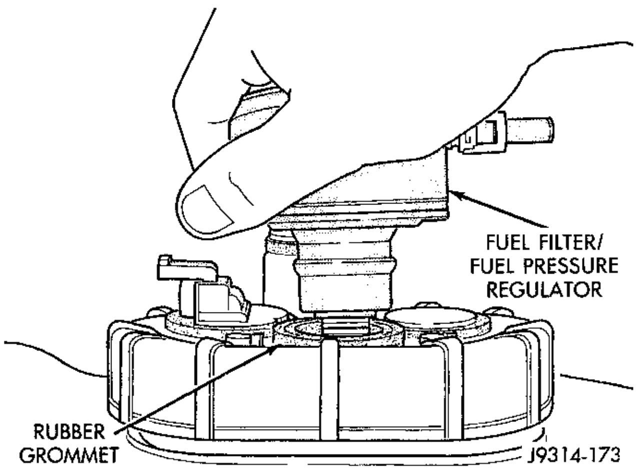

Fig. 26 Filter/Regulator Removal and Installation—TYPICAL

(3) Tighten line clamp to fuel line using special Hose Clamp Pliers number C-4124 or equivalent (Fig. 28). **Do not use conventional side cutters to tighten this type of clamp.**

(4) Press filter/regulator (by hand) into rubber grommet. The assembly should be pointed towards drivers side of vehicle (Fig. 24) or (Fig. 25).

(5) Install fuel tank. Refer to Fuel Tank Removal/Installation.

(6) Check for fuel leaks.

FUEL PUMP MODULE

REMOVAL

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE OFF).

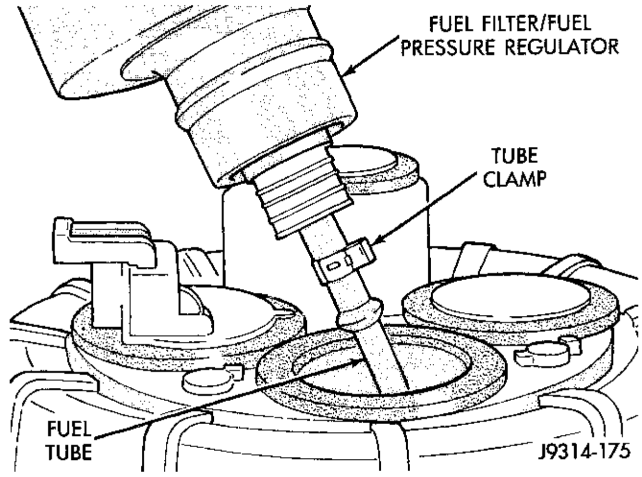

Fig. 27 Fuel Tube and Clamp—TYPICAL

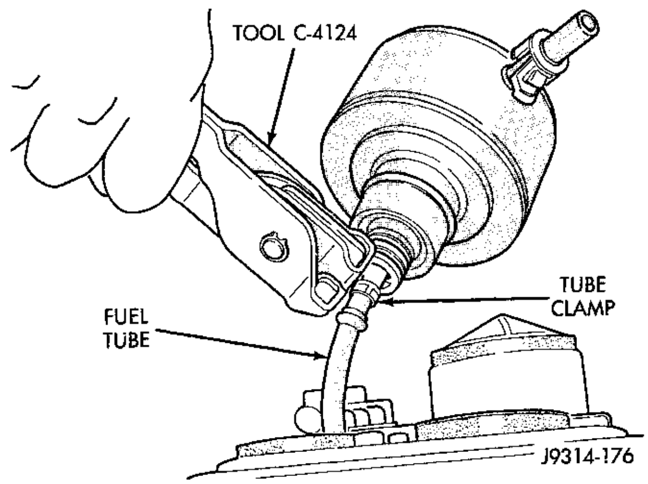

Fig. 28 Tightening Fuel Tube Clamp—TYPICAL

BEFORE SERVICING THE FUEL PUMP MODULE, THE FUEL SYSTEM PRESSURE MUST BE RELEASED.

(1) Drain and remove fuel tank. Refer to Fuel Tank—All Engines in the Removal/Installation section.

(2) The plastic fuel pump module locknut is threaded onto fuel tank (Fig. 29) or (Fig. 30). Install Special Tool 6856 to locknut and remove locknut (Fig. 31). The fuel pump module will spring up when locknut is removed.

(3) Remove module from fuel tank.

INSTALLATION

CAUTION: Whenever the fuel pump module is serviced, the rubber gasket must be replaced.

(1) Using a new gasket, position fuel pump module into opening in fuel tank.

AUTHENTIC RESTORATION

REMOVAL AND INSTALLATION (Continued)

(2) Position locknut over top of fuel pump module. Install locknut finger tight.

(3) Rotate module until positioned as shown in (Fig. 29) or (Fig. 30). This step must be performed to prevent float from contacting side of fuel tank. Be sure fuel filter/fuel pressure regulator is pointed to drivers side of vehicle.

(4) Install Special Tool 6856 to locknut.

(5) Tighten locknut to 24–44 N·m (18–32 ft. lbs.) torque.

(6) Install fuel tank. Refer to Fuel Tank—All Engines in the Removal/Installation section.

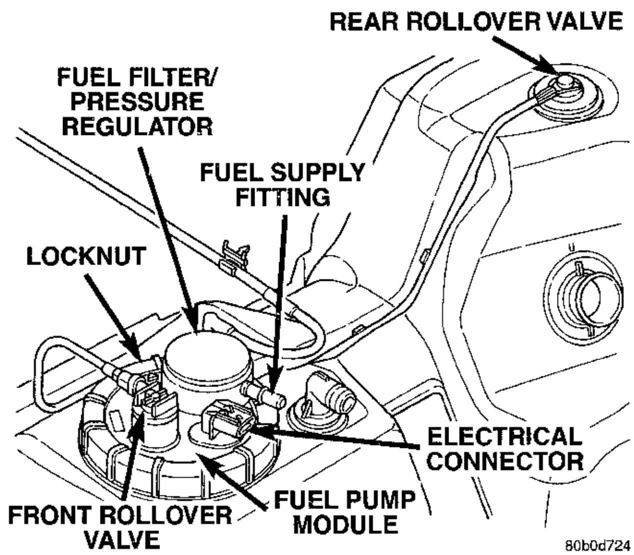

Fig. 29 Fuel Pump Module—26 or 34 Gallon Fuel Tank

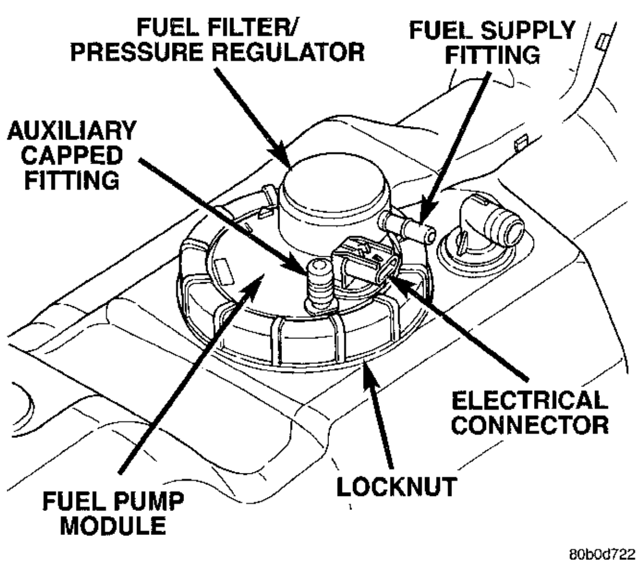

Fig. 30 Fuel Pump Module—35 Gallon Fuel Tank

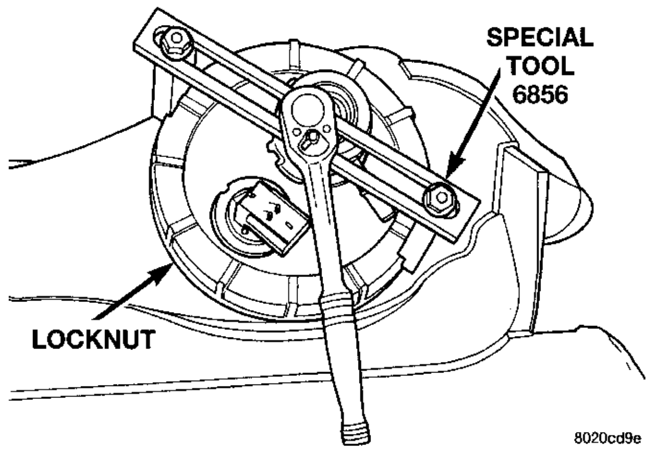

Fig. 31 Locknut Removal/Installation—TYPICAL

FUEL PUMP INLET FILTER

The fuel pump inlet filter (strainer) is located on the bottom of the fuel pump module (Fig. 32). The fuel pump module is located inside of fuel tank.

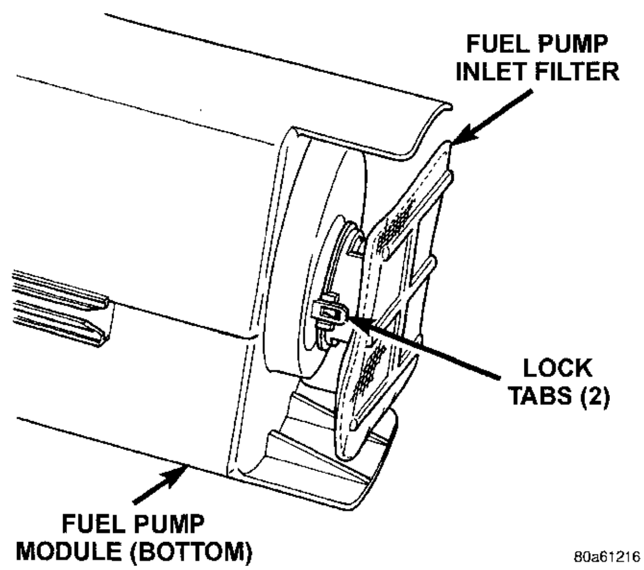

Fig. 32 Fuel Pump Inlet Filter

REMOVAL

(1) Remove fuel tank. Refer to Fuel Tank Removal/ Installation.

(2) Remove fuel pump module. Refer to Fuel Pump Module Removal/Installation.

(3) Remove filter by carefully prying 2 lock tabs at bottom of module with 2 screwdrivers. Filter is snapped to module.

(4) Clean bottom of pump module.

INSTALLATION

(1) Snap new filter to bottom of module. Be sure o-ring is in correct position.

REMOVAL AND INSTALLATION (Continued)

(2) Install fuel pump module. Refer to Fuel Pump Module Removal/Installation.

(3) Install fuel tank. Refer to Fuel Tank Removal/ Installation.

FUEL GAUGE SENDING UNIT

The fuel gauge sending unit (fuel level sensor) and float assembly is located on the side of fuel pump module (Fig. 33). The fuel pump module is located inside of fuel tank.

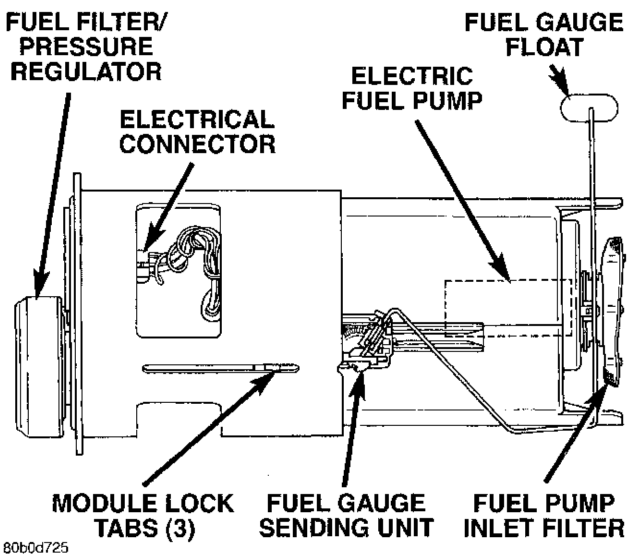

Fig. 33 Fuel Gauge Sending Unit Location—TYPICAL Module

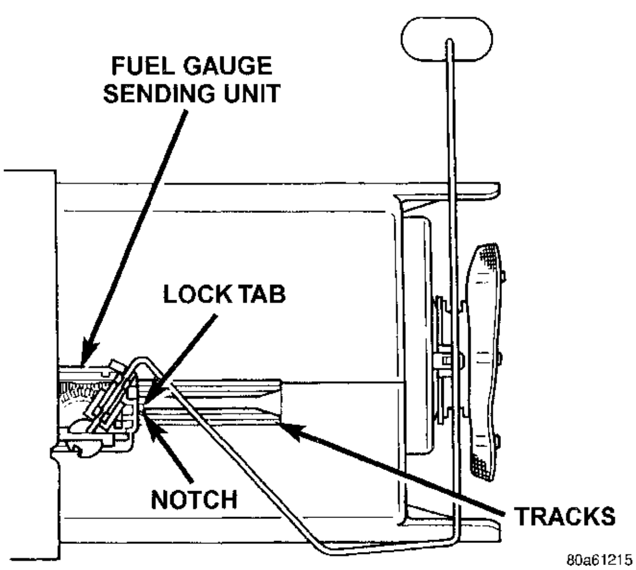

Fig. 34 Fuel Gauge Sending Unit Lock Tab/Tracks

REMOVAL

(1) Remove fuel tank. Refer to Fuel Tank–All Engines in the Removal/Installation section.

(2) Remove fuel pump module. Refer to Fuel Pump Module Removal/Installation.

(3) Unplug 4–way electrical connector (Fig. 33).

(4) Disconnect 2 sending unit wires at 4–way connector. The locking collar of connector must be removed before wires can be released from connector. Note location of wires within 4–way connector.

(5) The sending unit is retained to pump module with a small lock tab and notch (Fig. 34). Carefully push lock tab to the side and away from notch while sliding sending unit downward on tracks for removal. Note wire routing while removing unit from module.

INSTALLATION

(1) Position sending unit into tracks. Note wire routing.

(2) Push unit on tracks until lock tab snaps into notch.

(3) Connect 2 sending unit wires into 4–way connector and install locking collar.

(4) Connect 4–way electrical connector to module.

(5) Install fuel pump module. Refer to Fuel Pump Module Removal/Installation.

(6) Install fuel tank. Refer to Fuel Tank–All Engines in the Removal/Installation section.

FUEL INJECTOR RAIL—3.9L/5.2L/5.9L ENGINES

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH ENGINE TURNED OFF). BEFORE SERVICING FUEL RAIL ASSEMBLY, FUEL SYSTEM PRESSURE MUST BE RELEASED.

To release fuel pressure, refer to Fuel System Pressure Release Procedure found in this group.

CAUTION: The left and right fuel rails are replaced as an assembly. Do not attempt to separate the rail halves at the connecting hose (Fig. 35). Due to the design of this connecting hose, it does use any clamps. Never attempt to install a clamping device of any kind to the hose. When removing the fuel rail assembly for any reason, be careful not to bend or kink the connecting hose.

REMOVAL

(1) Remove negative battery cable at battery.

(2) Remove air cleaner.

(3) Perform fuel pressure release procedure.

(4) Remove throttle body from intake manifold. Refer to Throttle Body removal in this group.

(5) If equipped with air conditioning, remove the A-shaped A/C compressor-to-intake manifold support bracket (three bolts) (Fig. 36).

(6) Disconnect electrical connectors at all fuel injectors (Fig. 37). The factory fuel injection wiring

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

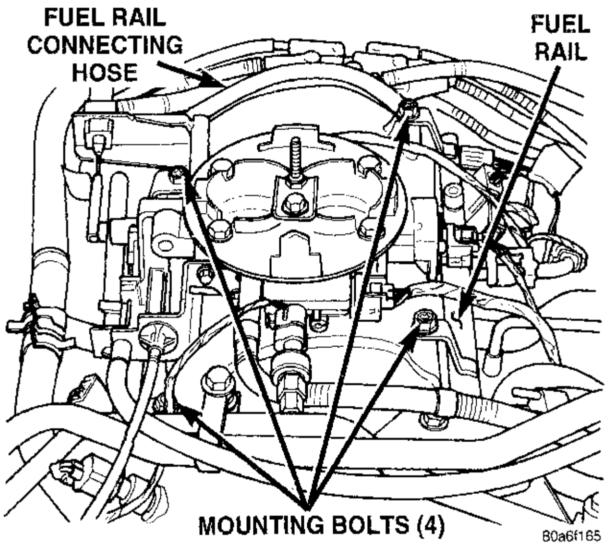

Fig. 35 Fuel Rail Assembly—Typical

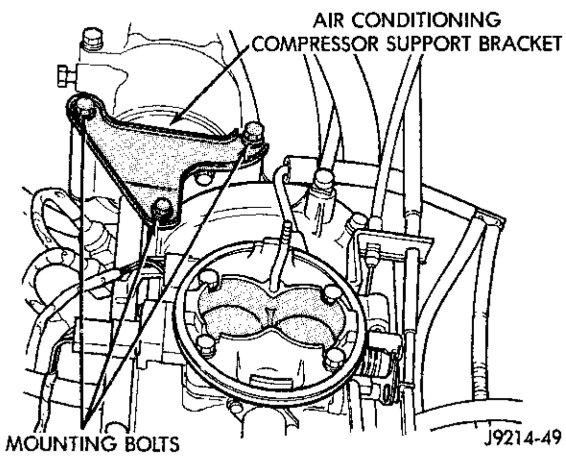

Fig. 36 A/C Compressor Support Bracket—Typical

harness is numerically tagged (INJ 1, INJ 2, etc.) for injector position identification.

(7) 3.9L (V-6) engine only: Disconnect electrical connector at intake manifold air temperature sensor. Do not remove sensor.

(8) Disconnect fuel tube (line) at side of fuel rail. Refer to Quick-Connect Fittings for procedures,

(9) Remove the remaining fuel rail mounting bolts.

(10) Gently rock and pull the **left** fuel rail until the fuel injectors just start to clear the intake manifold. Gently rock and pull the **right** fuel rail until the fuel injectors just start to clear the intake manifold. Repeat this procedure (left/right) until all fuel injectors have cleared the intake manifold.

(11) Remove fuel rail (with injectors attached) from engine.

(12) Remove the clip(s) retaining the injector(s) to fuel rail (Fig. 38) or (Fig. 39).

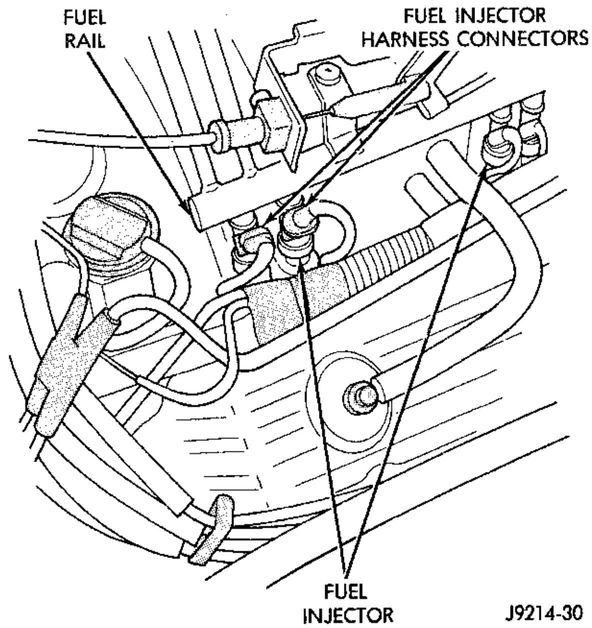

Fig. 37 Fuel Injector Connectors—Typical

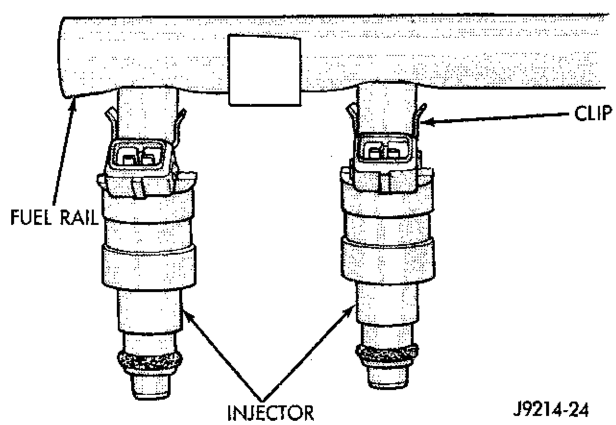

Fig. 38 Fuel Injector Mounting—Typical

INSTALLATION

(1) Apply a small amount of engine oil to each fuel injector o-ring. This will help in fuel rail installation.

(2) Install injector(s) and injector clip(s) to fuel rail.

(3) Position the fuel rail/fuel injector assembly to the injector openings on the intake manifold.

(4) Guide each injector into the intake manifold. Be careful not to tear the injector o-ring.

(5) Push the **right** fuel rail down until fuel injectors have bottomed on injector shoulder. Push the **left** fuel rail down until fuel injectors have bottomed on injector shoulder.

(6) Install fuel rail mounting bolts.

(7) Connect electrical connector to intake manifold air temperature sensor.

AUTHENTIC RESTORATION

REMOVAL AND INSTALLATION (Continued)

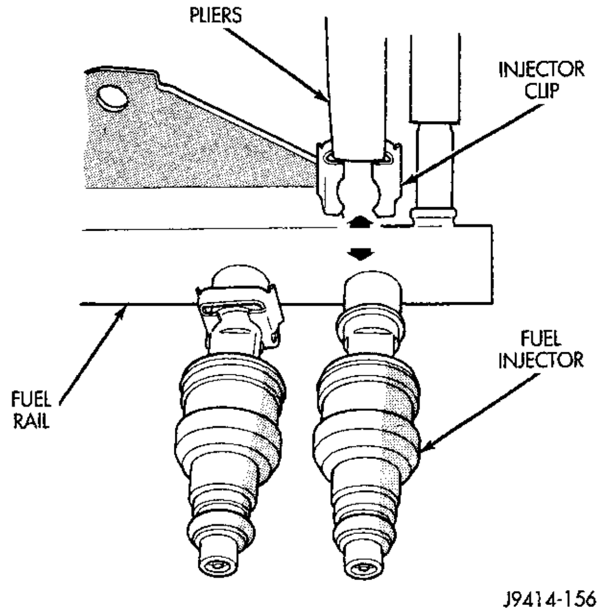

Fig. 39 Injector Retaining Clips—Typical Injector

(8) Connect wiring to all fuel injectors. The injector wiring harness is numerically tagged.

(9) Install the A/C support bracket (if equipped).

(10) Install throttle body to intake manifold. Refer to Throttle Body installation in this section of the group.

(11) Install fuel tube (line) at side of fuel rail. Refer to Quick-Connect Fittings for procedures.

(12) Install air cleaner.

(13) Connect battery cable to battery.

(14) Start engine and check for leaks.

FUEL INJECTOR RAIL—8.0L V-10 ENGINE

REMOVAL

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE EVEN WITH THE ENGINE OFF. BEFORE SERVICING FUEL RAIL, FUEL SYSTEM PRESSURE MUST BE RELEASED.

(1) Remove negative battery cable at battery.

(2) Remove air cleaner housing and tube.

(3) Perform fuel pressure release procedure. Refer to Fuel Delivery System section of this group.

(4) Disconnect throttle body linkage and remove throttle body from intake manifold. Refer to Throttle Body removal in this group.

(5) Remove ignition coil pack and bracket assembly (Fig. 40) at intake manifold and right engine valve cover (four bolts).

(6) Remove upper half of intake manifold. Refer to Group 11, Exhaust System and Intake Manifold for procedures.

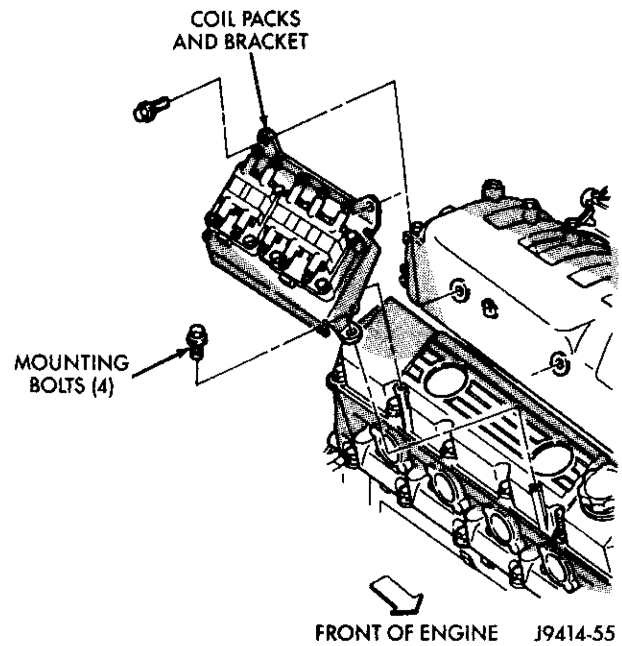

Fig. 40 Ignition Coil Pack and Mounting Bracket—8.0L V-10 Engine

(7) Disconnect electrical connectors at all fuel injectors. The factory fuel injection wiring harness is numerically tagged (INJ 1, INJ 2, etc.) for injector position identification.

(8) Disconnect fuel line quick-connect fitting at left-rear end of fuel rail. A special 3/8 inch fuel line disconnection tool will be necessary.

(9) Remove the six fuel rail mounting bolts from the lower half of intake manifold (Fig. 41).

(10) Gently rock and pull the **left** fuel rail until the fuel injectors just start to clear the intake manifold. Gently rock and pull the **right** fuel rail until the fuel injectors just start to clear the intake manifold. Repeat this procedure (left/right) until all fuel injectors have cleared the intake manifold.

(11) Remove fuel rail (with injectors attached) from engine.

(12) Remove the clip(s) retaining the injector(s) to fuel rail (Fig. 38) or (Fig. 39).

INSTALLATION

(1) Apply a small amount of engine oil to each fuel injector o-ring. This will help in fuel rail installation.

(2) Install injector(s) and injector clip(s) to fuel rail.

NOTE: The fuel injector electrical connectors on all 10 injectors should be facing to the right (passenger) side of the vehicle (Fig. 41).

(3) Position the fuel rail/fuel injector assembly to the injector openings on the intake manifold.

mopar AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

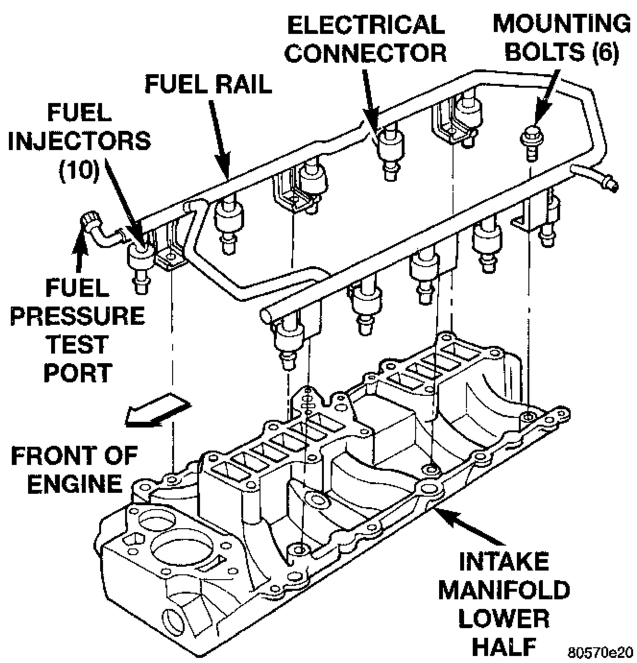

Fig. 41 Fuel Rail Mounting Bolts—8.0L V-10 Engine—Typical

(4) Guide each injector into the intake manifold. Be careful not to tear the injector o-ring.

(5) Push the **right** fuel rail down until fuel injectors have bottomed on injector shoulder. Push the **left** fuel rail down until fuel injectors have bottomed on injector shoulder.

(6) Install the six fuel rail mounting bolts into the lower half of intake manifold. Tighten bolts to 15 N·m (136 in. lbs.) torque.

(7) Connect wiring to all fuel injectors. The injector wiring harness is numerically tagged.

(8) Install upper half of intake manifold. Refer to Group 11, Exhaust System and Intake Manifold for procedures.

(9) Connect main fuel line at fuel rail. Refer to Quick-Connect Fittings for procedures.

(10) Install ignition coil pack and bracket assembly at intake manifold and right engine valve cover (four bolts).

(11) Install throttle body to intake manifold. Refer to Throttle Body removal in this group.

(12) Install throttle body linkage to throttle body.

(13) Install air cleaner tube and housing.

(14) Install negative battery cable at battery.

(15) Start engine and check for leaks.

FUEL INJECTOR(S)—ALL GAS ENGINES

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE EVEN WITH THE ENGINE TURNED OFF. BEFORE SERVICING THE FUEL INJECTOR(S), THE FUEL SYSTEM PRESSURE MUST BE RELEASED.

To release fuel pressure, refer to the Fuel System Pressure Release Procedure.

To remove one or more fuel injectors, the fuel rail assembly must be removed from engine.

REMOVAL

(1) Remove air cleaner assembly.

(2) Remove fuel injector rail assembly. Refer to Fuel Injector Rail removal in this section.

(3) Remove the clip(s) retaining the injector(s) to fuel rail (Fig. 38) or (Fig. 39).

(4) Remove injector(s) from fuel rail.

INSTALLATION

(1) Apply a small amount of engine oil to each fuel injector o-ring. This will help in fuel rail installation.

(2) Install injector(s) and injector clip(s) to fuel rail.

(3) Install fuel rail assembly. Refer to Fuel Injector Rail installation.

(4) Install air cleaner.

(5) Start engine and check for leaks.

FUEL TANK—ALL ENGINES

WARNING: GASOLINE POWERED ENGINES: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE EVEN WITH THE ENGINE OFF. BEFORE SERVICING THE FUEL TANK, FUEL SYSTEM PRESSURE MUST BE RELEASED. REFER TO THE FUEL SYSTEM PRESSURE RELEASE PROCEDURE BEFORE SERVICING THE FUEL TANK.

Two different procedures may be used to drain fuel tank (lowering tank or using DRB scan tool). When equipped with a diesel engine, the DRB scan tool cannot be used (no electric fuel pump).

The quickest draining procedure involves lowering the fuel tank.

Gasoline Powered Engines: As an alternative procedure, the electric fuel pump may be activated allowing tank to be drained at fuel rail connection. Refer to DRB scan tool for fuel pump activation procedures. Before disconnecting fuel line at fuel rail, release fuel pressure. Refer to the Fuel System Pressure Release Procedure in this group for procedures. Attach end of special test hose tool number 6541, 6539, 6631 or 6923 at fuel rail disconnection (tool number will depend on model and/or engine application). Position opposite end of this hose tool to an approved gasoline draining station. Activate fuel pump and drain tank until empty.

REMOVAL AND INSTALLATION (Continued)

If electric fuel pump is not operating, tank must be lowered for fuel draining. Refer to following procedures.

REMOVAL

(1) Remove fuel tank filler tube cap.

(2) Perform Fuel System Pressure Release procedure as described in this group.

(3) Gasoline Engines: Disconnect negative battery cable at battery. Diesel Engines: Disconnect both negative battery cables at both batteries.

(4) Raise vehicle on hoist.

(5) Open fuel fill door and remove screws mounting fuel filler tube assembly to body. Do not disconnect rubber fuel fill or vent hoses from tank at this time.

(6) Place a transmission jack under center of fuel tank. Apply a slight amount of pressure to fuel tank with transmission jack.

(7) Remove fuel tank mounting strap nuts from mounting strap studs (Fig. 42). If equipped, remove fuel tank shield bolts.

(8) Lower fuel tank only enough to allow access to top of tank. The 2 tank fittings (where rubber fuel fill and vent hose connections are made) must be positioned above tank level. Rotate tank slightly to allow these fittings to be above tank level.

WARNING: WRAP SHOP TOWELS AROUND HOSES TO CATCH ANY GASOLINE SPILLAGE.

(9) While working over left rear tire/wheel, disconnect rubber fuel vent hose at fuel tank (Fig. 42) (vent hose is the smallest of 2 hoses). Position fuel siphoning/drain hose into this fitting at tank. Drain fuel into an approved portable holding tank or a properly labeled gasoline (or diesel fuel) safety container.

(10) Disconnect rubber fuel fill hose at fuel tank (Fig. 42).

(11) **Gas Powered Engines:**

(a) While working over left rear tire/wheel, disconnect wiring harness connector from electrical connector at top of fuel pump module (Fig. 43) or (Fig. 44).

(b) If equipped with 26 or 34 gallon fuel tank, two EVAP lines are connected to rollover valves. Disconnect EVAP line from rollover valve at top of module (Fig. 43). Disconnect other EVAP line from rollover valve near rear of tank (Fig. 43).

(c) If equipped with 35 gallon fuel tank, two EVAP lines are connected to rollover valves. Disconnect EVAP lines from rollover valves at top-front and top-rear of fuel tank (Fig. 45).

(d) Disconnect fuel supply line at fuel filter/fuel pressure regulator supply fitting (Fig. 43) or (Fig. 44). Refer to Quick-Connect Fittings for procedures.

(12) **Diesel Powered Engines:**

(a) While working over left rear tire/wheel, disconnect wiring harness connector from electrical connector at top of fuel tank module (Fig. 46).

(b) Disconnect fuel supply and fuel return lines at the fuel tank module fittings (Fig. 46). Refer to Quick-Connect Fittings for procedures.

(13) Gasoline Engines: If fuel pump module removal is necessary, refer to Fuel Pump Module Removal/Installation in this group. Diesel Engines: If fuel tank module removal is necessary, refer to Fuel Tank Module Removal/Installation in this group.

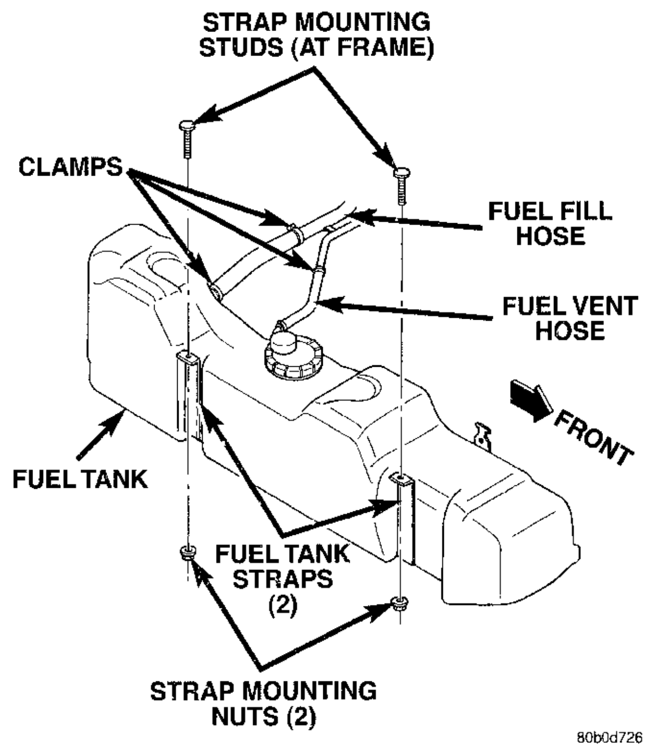

Fig. 42 Fuel Tank Mounting—Typical

INSTALLATION

(1) Gasoline Engines: If fuel pump module is being installed, refer to Fuel Pump Module Removal/Installation in this group. Diesel Engines: If fuel tank module is being installed, refer to Fuel Tank Module Removal/Installation in this group.

(2) Place fuel tank on top of transmission jack.

(3) Install rubber fill and vent lines to tank. Tighten hose clamps to 2.3 N·m (20 in. lbs.) torque.

(4) Raise tank into position while guiding fill and vent hoses to body. Raise tank only enough to allow access to top of tank.

(5) **Gas Powered Engines:**

(a) Connect electrical connector to fuel pump module.

(b) Connect EVAP hoses at rollover valves.

REMOVAL AND INSTALLATION (Continued)

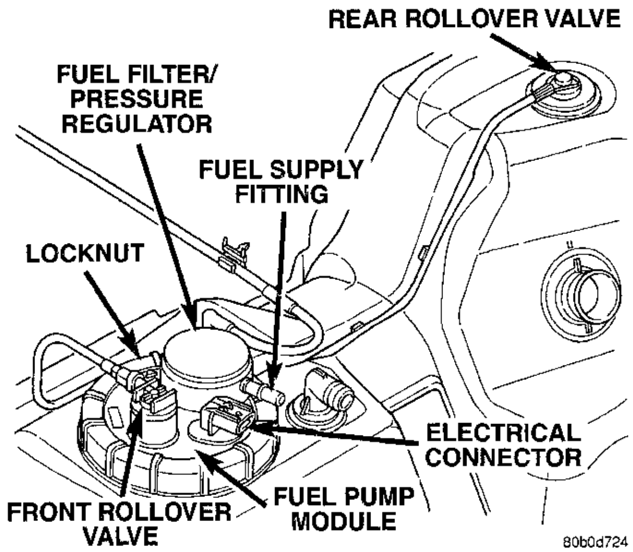

Fig. 43 Fuel Pump Module—Gas Engine With 26 or 34 Gallon Tank

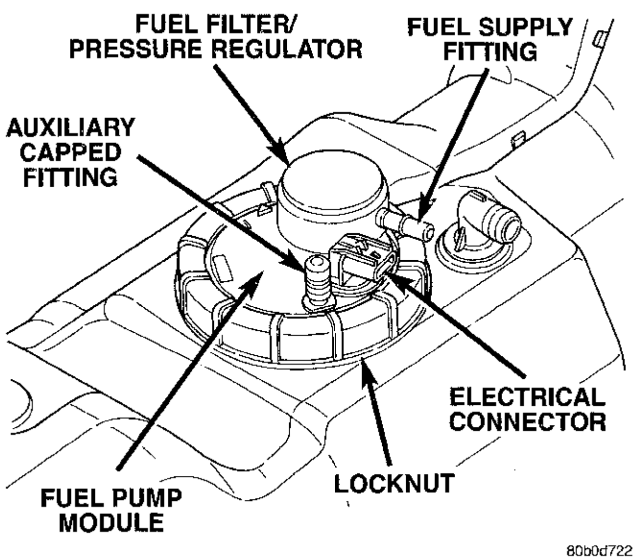

Fig. 44 Fuel Pump Module—Gas Engine With 35 Gallon Tank

(c) Connect fuel supply line at fuel filter/fuel pressure regulator. Refer to Quick-Connect Fittings for procedures.

(6) **Diesel Powered Engines:**

(a) Connect electrical connector to fuel tank module.

(b) Connect fuel supply and fuel return lines to fuel tank module fittings. Refer to Quick-Connect Fittings in this group.

(7) Connect two mounting straps and mounting strap nuts.

(8) Tighten strap nuts to 41 N·m (30 ft. lbs.) torque. Do not over tighten retaining strap nuts.

(9) Remove transmission jack.

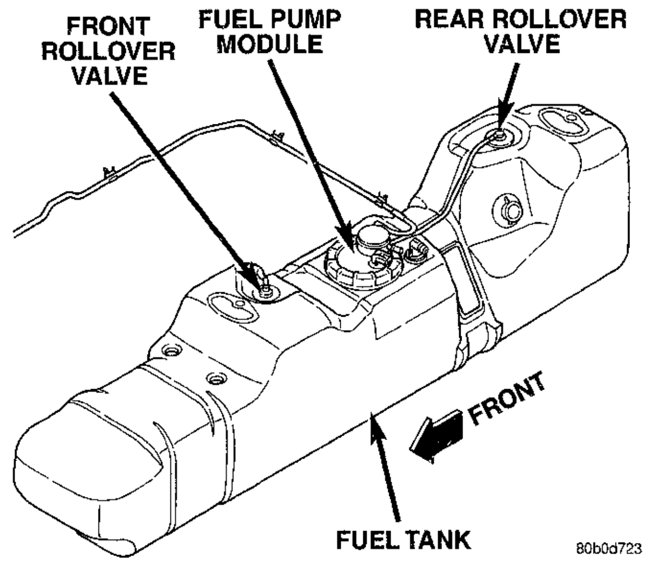

Fig. 45 Rollover Valve Locations—Gas Engine With 35 Gallon Tank

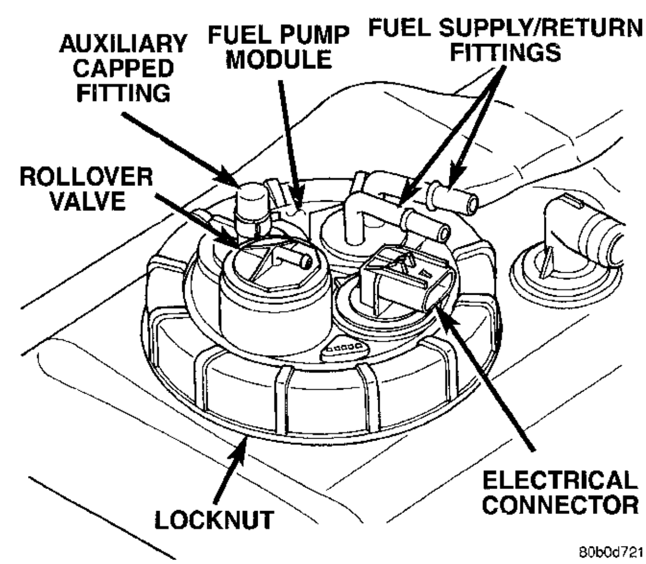

Fig. 46 Fuel Tank Module—Diesel Engine

(10) Connect fuel filler tube assembly to body.

(11) Refill fuel tank and inspect all hoses and lines for leaks.

(12) Connect negative battery cable(s) to battery(s).

FUEL TANK FILLER TUBE CAP

If replacement of the fuel tank filler tube cap is necessary, it must be replaced with an identical cap to be sure of correct system operation.

CAUTION: Remove the fuel tank filler tube cap to relieve fuel tank pressure. The cap must be removed prior to disconnecting any fuel system component or before draining the fuel tank.

REMOVAL AND INSTALLATION (Continued)

ACCELERATOR PEDAL

REMOVAL

CAUTION: Be careful not to damage or kink the cable core wire (within the cable sheathing) while servicing accelerator pedal or cables.

(1) From inside the vehicle, hold up the accelerator pedal. Remove the plastic cable retainer and throttle cable core wire from upper end of pedal arm (Fig. 47). The plastic cable retainer snaps into pedal the arm.

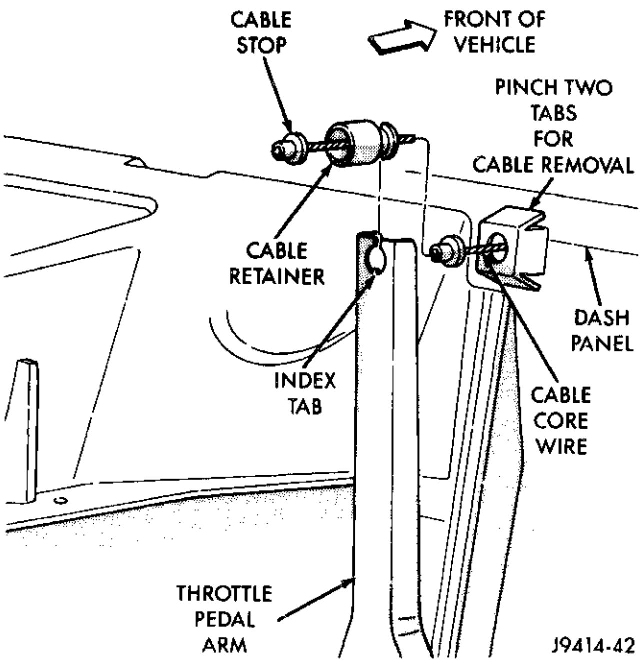

Fig. 47 Cable Removal/Installation

(2) Insert a small screwdriver into the square holes located on the pivots/bushings (Fig. 48). Twist the screwdriver to disengage the pivot locks from the pivot pin. Pivots will be damaged when removing. Discard old pivots.

(3) Remove pedal/bracket assembly from vehicle.

INSTALLATION

(1) Position pedal/bracket assembly over the pivot pin (Fig. 48).

(2) Install two new pivots/bushings. Using large pliers, press both of the bushings together until they bottom on the sides of the pedal/bracket assembly. Bushing retaining ears will snap into position when properly installed.

(3) From inside the vehicle, hold up the accelerator pedal. Install the throttle cable core wire and plastic cable retainer into and through the upper end of the pedal arm (the plastic retainer is snapped into the pedal arm). When installing the plastic retainer to

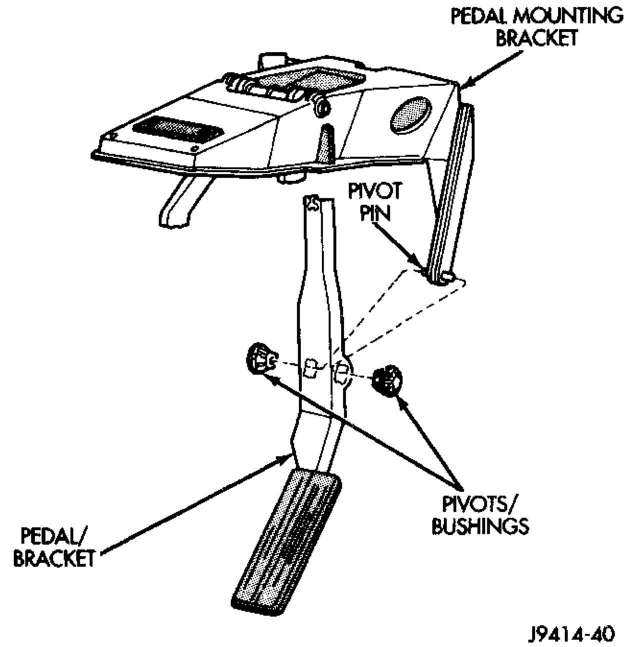

Fig. 48 Accelerator Pedal—Removal or Installation

the accelerator pedal arm, note the index tab on the pedal arm (Fig. 47). Align the index slot on the plastic cable retainer to this index tab.

THROTTLE CABLE

CAUTION: Be careful not to damage or kink the cable core wire (within the cable sheathing) while servicing accelerator pedal or cables.

REMOVAL

(1) From inside the vehicle, hold up the accelerator pedal. Remove the plastic cable retainer and throttle cable core wire from upper end of pedal arm (Fig. 47). The plastic cable retainer snaps into pedal the arm.

(2) Remove the cable core wire at the pedal arm.

(3) Remove the air cleaner housing.

(4) From inside the vehicle, pinch both sides of the plastic cable housing retainer tabs at the dash panel (Fig. 47).

(5) Remove cable housing from dash panel and pull the cable into the engine compartment.

(6) **3.9L/5.2L/5.9L Engines:** Disconnect the cable from the routing/holddown clip at the radiator fan shroud.

(7) **8.0L V-10 Engine:** Remove the throttle cable socket at throttle lever ball. (Fig. 50) (snaps off).

(8) **3.9L/5.2L/5.9L Engines:** Slip the cable end rearward from pin on throttle body (Fig. 49).

(9) Remove cable housing at throttle body mounting bracket by pressing on release tab with a small

REMOVAL AND INSTALLATION (Continued)

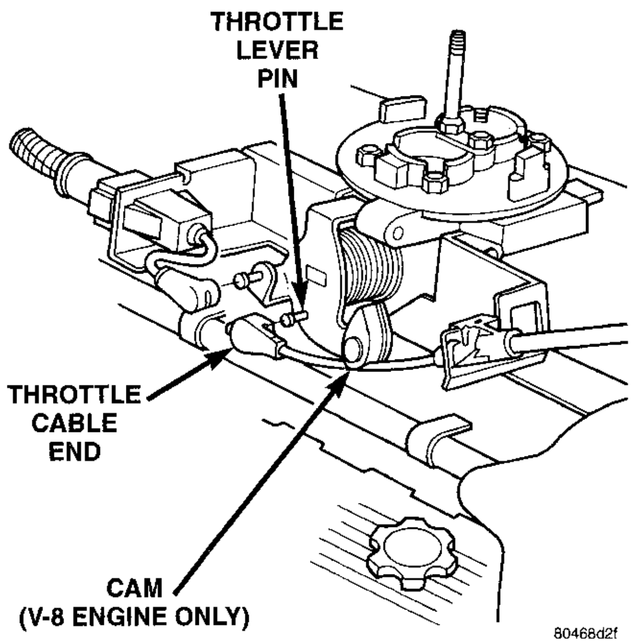

Fig. 49 Throttle Cable at Throttle Body—3.9L/5.2L/5.9L Engines—Typical

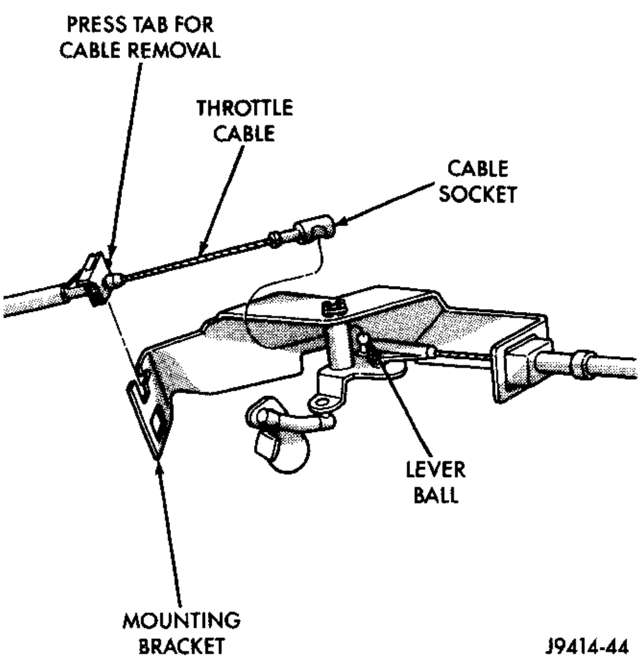

Fig. 50 Throttle Cable at Throttle Body—8.0L V-10 Engine

screwdriver (Fig. 51) or (Fig. 50). **To prevent cable housing breakage, press on the tab only enough to release the cable from the bracket.** Lift the cable housing straight up from bracket while pressing on release tab. Remove throttle cable from vehicle.

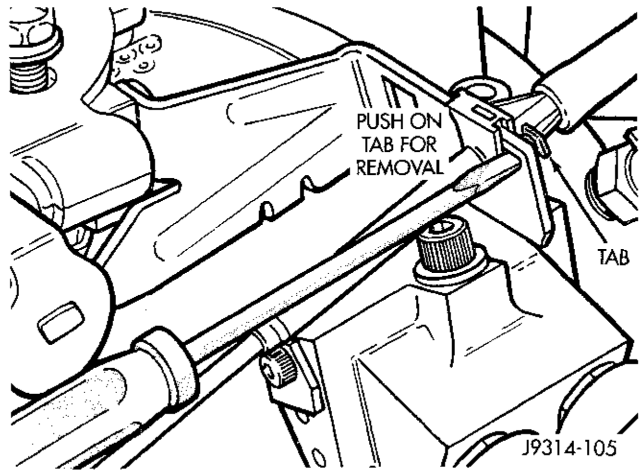

Fig. 51 Cable Release Tab—3.9L/5.2L/5.9L Engines—Typical

INSTALLATION

(1) **3.9L/5.2L/5.9L Engines:**

(a) Rotate and hold the throttle cam in the full wide open position. Snap the cable end onto lever pin (Fig. 49).

(b) Connect cable to throttle body mounting bracket (push down and lock).

(c) Connect cable to fan shroud routing clip.

(2) **8.0L V-10 Engine:**

(a) Connect cable end socket to throttle body lever ball (snaps on) (Fig. 50).

(b) Connect cable to throttle body mounting bracket (push down and lock).

(3) Install the remaining cable housing end into and through the dash panel opening (snaps into position). The two plastic pinch tabs (Fig. 47) should lock the cable to dash panel.

(4) From inside the vehicle, hold up the accelerator pedal. Install the throttle cable core wire and plastic cable retainer into and through the upper end of the pedal arm (the plastic retainer is snapped into the pedal arm). When installing the plastic retainer to the accelerator pedal arm, note the index tab on the pedal arm (Fig. 47). Align the index slot on the plastic cable retainer to this index tab.

SPECIFICATIONS

VECI LABEL

If anything differs between the specifications found on the Vehicle Emission Control Information (VECI) label and the following specifications, use specifications on VECI label. The VECI label is located in the engine compartment.

FUEL TANK CAPACITY—GAS ENGINES

MODEL	LITERS	U.S. GALLONS
Standard (Gas Powered)	98	26
138″ Wheelbase With Extended Cab (Gas Powered)	129	34
Optional/Heavy-Duty Engines (Gas Powered)	132	35
Nominal refill capacities are shown. A variation may be observed from vehicle to vehicle due to manufacturing tolerance and refill procedure.		

FUEL SYSTEM PRESSURE—GAS ENGINES

All Gasoline Powered Engines: 339 kPa ± 34 kPa (49.2 psi ± 5 psi)

Mopar AUTHENTIC RESTORATION PRODUCT

FUEL INJECTION SYSTEM-GASOLINE ENGINES

INDEX

AUTHENTIC RESTORATION PRODUCT

GENERAL INFORMATION

INTRODUCTION

All gasoline powered engines are equipped with sequential Multi-Port Fuel Injection (MFI). The MFI system provides precise air/fuel ratios for all driving conditions.

The powertrain control module (PCM) (Fig. 1) operates the fuel system.

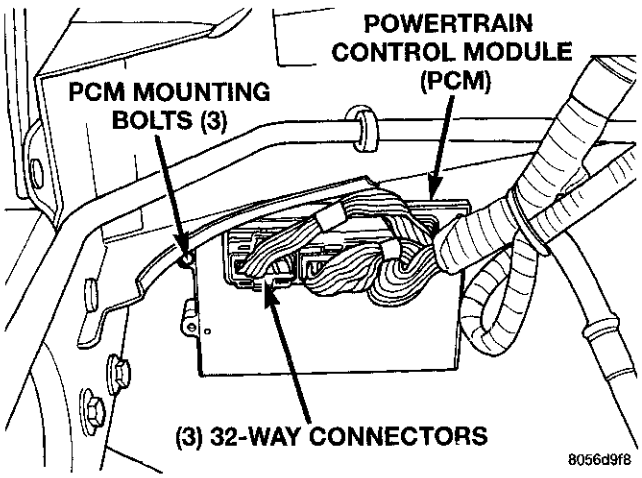

Fig. 1 Powertrain Control Module (PCM)

MODES OF OPERATION

As input signals to the powertrain control module (PCM) change, the PCM adjusts its response to the output devices. For example, the PCM must calculate different injector pulse width and ignition timing for idle than it does for wide open throttle (WOT).

The PCM will operate in two different modes: **Open Loop and Closed Loop**.

During Open Loop modes, the powertrain control module (PCM) receives input signals and responds only according to preset PCM programming. Input from the oxygen (O2S) sensors is not monitored during Open Loop modes.

During Closed Loop modes, the PCM will monitor the oxygen (O2S) sensors input. This input indicates to the PCM whether or not the calculated injector pulse width results in the ideal air-fuel ratio. This ratio is 14.7 parts air-to-1 part fuel. By monitoring the exhaust oxygen content through the O2S sensor, the PCM can fine tune the injector pulse width. This is done to achieve optimum fuel economy combined with low emission engine performance.

The fuel injection system has the following modes of operation:

- Ignition switch ON
- Engine start-up (crank)
- Engine warm-up
- Idle
- Cruise
- Acceleration
- Deceleration
- Wide open throttle (WOT)
- Ignition switch OFF

The ignition switch On, engine start-up (crank), engine warm-up, acceleration, deceleration and wide open throttle modes are Open Loop modes. The idle and cruise modes, (with the engine at operating temperature) are Closed Loop modes.

IGNITION SWITCH (KEY-ON) MODE

This is an Open Loop mode. When the fuel system is activated by the ignition switch, the following actions occur:

- The powertrain control module (PCM) pre-positions the idle air control (IAC) motor.
- The PCM determines atmospheric air pressure from the MAP sensor input to determine basic fuel strategy.
- The PCM monitors the engine coolant temperature sensor input. The PCM modifies fuel strategy based on this input.
- Intake manifold air temperature sensor input is monitored.
- Throttle position sensor (TPS) is monitored.
- The auto shutdown (ASD) relay is energized by the PCM for approximately three seconds.
- The fuel pump is energized through the fuel pump relay by the PCM. The fuel pump will operate for approximately three seconds unless the engine is operating or the starter motor is engaged.
- The O2S sensor heater element is energized via the ASD relay. The O2S sensor input is not used by the PCM to calibrate air-fuel ratio during this mode of operation.

ENGINE START-UP MODE

This is an Open Loop mode. The following actions occur when the starter motor is engaged.

The powertrain control module (PCM) receives inputs from:

- Battery voltage
- Engine coolant temperature sensor
- Crankshaft position sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Starter motor relay
- Camshaft position sensor signal

The PCM monitors the crankshaft position sensor. If the PCM does not receive a crankshaft position sensor signal within 3 seconds of cranking the engine, it will shut down the fuel injection system.

The fuel pump is activated by the PCM through the fuel pump relay.

Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control

GENERAL INFORMATION (Continued)

the injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off.

The PCM determines the proper ignition timing according to input received from the crankshaft position sensor.

ENGINE WARM-UP MODE

This is an Open Loop mode. During engine warm-up, the powertrain control module (PCM) receives inputs from:

- Battery voltage
- Crankshaft position sensor
- Engine coolant temperature sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal (in the distributor)
- Park/neutral switch (gear indicator signal--auto. trans. only)
- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)

Based on these inputs the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control the injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off.
- The PCM adjusts engine idle speed through the idle air control (IAC) motor and adjusts ignition timing.
- The PCM operates the A/C compressor clutch through the clutch relay. This is done if A/C has been selected by the vehicle operator and requested by the A/C thermostat.
- When engine has reached operating temperature, the PCM will begin monitoring O2S sensor input. The system will then leave the warm-up mode and go into closed loop operation.

IDLE MODE

When the engine is at operating temperature, this is a Closed Loop mode. At idle speed, the powertrain control module (PCM) receives inputs from:

- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)
- Battery voltage
- Crankshaft position sensor
- Engine coolant temperature sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal (in the distributor)
- Battery voltage
- Park/neutral switch (gear indicator signal—auto. trans. only)
- Oxygen sensors

Based on these inputs, the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off.
- The PCM monitors the O2S sensor input and adjusts air-fuel ratio by varying injector pulse width. It also adjusts engine idle speed through the idle air control (IAC) motor.
- The PCM adjusts ignition timing by increasing and decreasing spark advance.
- The PCM operates the A/C compressor clutch through the clutch relay. This happens if A/C has been selected by the vehicle operator and requested by the A/C thermostat.

CRUISE MODE

When the engine is at operating temperature, this is a Closed Loop mode. At cruising speed, the powertrain control module (PCM) receives inputs from:

- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)
- Battery voltage
- Engine coolant temperature sensor
- Crankshaft position sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal (in the distributor)
- Park/neutral switch (gear indicator signal—auto. trans. only)
- Oxygen (O2S) sensors

Based on these inputs, the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then adjust the injector pulse width by turning the ground circuit to each individual injector on and off.
- The PCM monitors the O2S sensor input and adjusts air-fuel ratio. It also adjusts engine idle speed through the idle air control (IAC) motor.
- The PCM adjusts ignition timing by turning the ground path to the coil on and off.
- The PCM operates the A/C compressor clutch through the clutch relay. This happens if A/C has been selected by the vehicle operator and requested by the A/C thermostat.

ACCELERATION MODE

This is an Open Loop mode. The powertrain control module (PCM) recognizes an abrupt increase in throttle position or MAP pressure as a demand for increased engine output and vehicle acceleration. The

GENERAL INFORMATION (Continued)

PCM increases injector pulse width in response to increased throttle opening.

DECELERATION MODE

When the engine is at operating temperature, this is an Open Loop mode. During hard deceleration, the powertrain control module (PCM) receives the following inputs.

- Air conditioning select signal (if equipped)
- Air conditioning request signal (if equipped)
- Battery voltage
- Engine coolant temperature sensor
- Crankshaft position sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal (in the distributor)
- Park/neutral switch (gear indicator signal—auto. trans. only)
- Vehicle speed sensor

If the vehicle is under hard deceleration with the proper rpm and closed throttle conditions, the PCM will ignore the oxygen sensor input signal. The PCM will enter a fuel cut-off strategy in which it will not supply a ground to the injectors. If a hard deceleration does not exist, the PCM will determine the proper injector pulse width and continue injection.

Based on the above inputs, the PCM will adjust engine idle speed through the idle air control (IAC) motor.

The PCM adjusts ignition timing by turning the ground path to the coil on and off.

WIDE OPEN THROTTLE MODE

This is an Open Loop mode. During wide open throttle operation, the powertrain control module (PCM) receives the following inputs.

- Battery voltage
- Crankshaft position sensor
- Engine coolant temperature sensor
- Intake manifold air temperature sensor
- Manifold absolute pressure (MAP) sensor
- Throttle position sensor (TPS)
- Camshaft position sensor signal (in the distributor)

During wide open throttle conditions, the following occurs:

- Voltage is applied to the fuel injectors with the ASD relay via the PCM. The PCM will then control the injection sequence and injector pulse width by turning the ground circuit to each individual injector on and off. The PCM ignores the oxygen sensor input signal and provides a predetermined amount of additional fuel. This is done by adjusting injector pulse width.
- The PCM adjusts ignition timing by turning the ground path to the coil on and off.

IGNITION SWITCH OFF MODE

When ignition switch is turned to OFF position, the PCM stops operating the injectors, ignition coil, ASD relay and fuel pump relay.

DESCRIPTION AND OPERATION

POWERTRAIN CONTROL MODULE (PCM)

The powertrain control module (PCM) (Fig. 1) operates the fuel system. The PCM was formerly referred to as the SBEC or engine controller. The PCM is a pre-programmed, triple microprocessor digital computer. It regulates ignition timing, air-fuel ratio, emission control devices, charging system, certain transmission features, speed control, air conditioning compressor clutch engagement and idle speed. The PCM can adapt its programming to meet changing operating conditions.

The PCM receives input signals from various switches and sensors. Based on these inputs, the PCM regulates various engine and vehicle operations through different system components. These components are referred to as Powertrain Control Module (PCM) Outputs. The sensors and switches that provide inputs to the PCM are considered Powertrain Control Module (PCM) Inputs.

The PCM adjusts ignition timing based upon inputs it receives from sensors that react to: engine rpm, manifold absolute pressure, engine coolant temperature, throttle position, transmission gear selection (automatic transmission), vehicle speed and the brake switch.

The PCM adjusts idle speed based on inputs it receives from sensors that react to: throttle position, vehicle speed, transmission gear selection, engine coolant temperature and from inputs it receives from the air conditioning clutch switch and brake switch.

Based on inputs that it receives, the PCM adjusts ignition coil dwell. The PCM also adjusts the generator charge rate through control of the generator field and provides speed control operation.

NOTE: PCM Inputs:

- A/C request (if equipped with factory A/C)
- A/C select (if equipped with factory A/C)
- Auto shutdown (ASD) sense
- Battery temperature
- Battery voltage
- Brake switch
- CCD bus (+) circuits
- CCD bus (-) circuits
- Camshaft position sensor signal

DESCRIPTION AND OPERATION (Continued)

- Crankshaft position sensor
- Data link connection for DRB scan tool
- Engine coolant temperature sensor
- Fuel level
- Generator (battery voltage) output
- Ignition circuit sense (ignition switch in on/off/crank/run position)
- Intake manifold air temperature sensor
- Leak detection pump (switch) sense (if equipped)
- Manifold absolute pressure (MAP) sensor
- Oil pressure
- Output shaft speed sensor
- Overdrive/override switch
- Oxygen sensors
- Park/neutral switch (auto. trans. only)
- Power ground
- Sensor return
- Signal ground
- Speed control multiplexed single wire input
- Throttle position sensor
- Transmission governor pressure sensor
- Transmission temperature sensor
- Vehicle speed inputs from ABS or RWAL system

NOTE: PCM Outputs:

- A/C clutch relay
- Auto shutdown (ASD) relay
- CCD bus (+) circuits
- CCD bus (-) circuits
- Data link connection for DRB scan tool
- EGR valve control solenoid (if equipped)
- EVAP canister purge solenoid
- Five volt sensor supply (primary)
- Five volt sensor supply (secondary)
- Fuel injectors
- Fuel pump relay
- Generator field driver (-)
- Generator field driver (+)
- Generator lamp (if equipped)
- Idle air control (IAC) motor
- Ignition coil
- Leak detection pump (if equipped)
- Malfunction indicator lamp (Check engine lamp). Driven through CCD circuits.
- Overdrive indicator lamp (if equipped)
- Service Reminder Indicator (SRI) Lamp (MAINT REQ'D lamp). Driven through CCD circuits.
- Speed control vacuum solenoid
- Speed control vent solenoid
- Tachometer (if equipped). Driven through CCD circuits.
- Transmission convertor clutch circuit
- Transmission 3–4 shift solenoid
- Transmission relay
- Transmission temperature lamp (if equipped)
- Transmission variable force solenoid

AIR CONDITIONING (A/C) CONTROLS—PCM INPUT

The A/C control system information applies to factory installed air conditioning units.

A/C SELECT SIGNAL: When the A/C switch is in the ON position, an input signal is sent to the powertrain control module (PCM). The signal informs the PCM that the A/C has been selected. The PCM adjusts idle speed to a pre-programmed rpm through the idle air control (IAC) motor to compensate for increased engine load.

A/C REQUEST SIGNAL: Once A/C has been selected, the powertrain control module (PCM) receives the A/C request signal from the clutch cycling pressure switch. The input indicates that the evaporator pressure is in the proper range for A/C application. The PCM uses this input to cycle the A/C compressor clutch (through the A/C relay). It will also determine the correct engine idle speed through the idle air control (IAC) motor position.

If the A/C low-pressure switch or high-pressure switch opens (indicating a low or high refrigerant pressure), the PCM will not receive an A/C request signal. The PCM will then remove the ground from the A/C relay. This will deactivate the A/C compressor clutch.

If the switch opens, (indicating that evaporator is not in proper pressure range), the PCM will not receive the A/C request signal. The PCM will then remove the ground from the A/C relay, deactivating the A/C compressor clutch.

AUTOMATIC SHUTDOWN (ASD) RELAY SENSE—PCM INPUT

A 12 volt signal at this input indicates to the PCM that the ASD has been activated. The ASD relay is located in the Power Distribution Center (PDC). The PDC is located in the engine compartment (Fig. 2). Refer to label on PDC cover for relay location. The relay is used to connect the oxygen sensor heater element(s), ignition coil(s) and fuel injectors to 12 volt + power supply.

This input is used to sense that the ASD relay is energized. If the powertrain control module (PCM) does not see 12 volts at this input when the ASD should be activated, it will set a Diagnostic Trouble Code (DTC).

BATTERY TEMPERATURE SENSOR—PCM INPUT

Provides a signal to the PCM corresponding to the battery temperature. Refer to Group 8C, Charging System for additional information.

BATTERY VOLTAGE—PCM INPUT

The battery voltage input provides power to the Powertrain Control Module (PCM). It also informs

DESCRIPTION AND OPERATION (Continued)

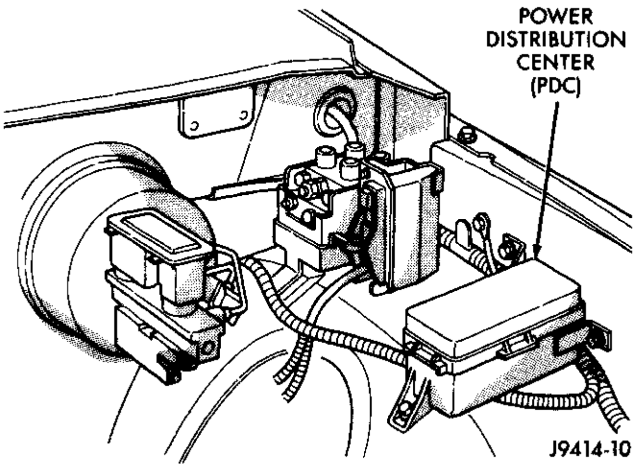

Fig. 2 Power Distribution Center (PDC)

the PCM what voltage level is supplied to the ignition coil and fuel injectors.

If battery voltage is low, the PCM will increase injector pulse width (period of time that the injector is energized). This is done to compensate for the reduced flow through injector caused by the lowered voltage.

BRAKE SWITCH—PCM INPUT

When the brake light switch is activated, the Powertrain Control Module (PCM) receives an input indicating that the brakes are being applied. After receiving this input, the PCM maintains idle speed to a scheduled rpm through control of the Idle Air Control (IAC) motor. The brake switch input is also used to supply/deny power to the speed control servo solenoids.

CAMSHAFT POSITION SENSOR—3.9L/5.2L/5.9L ENGINES—PCM INPUT

A sync signal is provide by the camshaft position sensor located in the distributor (Fig. 3). The sync signal from this sensor works in conjunction with the crankshaft position sensor to provide the powertrain control module (PCM) with inputs. This is done to establish and maintain correct injector firing order.

Refer to Camshaft Position Sensor in Group 8D, Ignition System for more information.

CAMSHAFT POSITION SENSOR—8.0L ENGINÈ—PCM INPUT

A sync signal is provide by the camshaft position sensor. The sensor is located on the side of the timing chain case/cover (Fig. 4). The sync signal from this sensor works in conjunction with the crankshaft position sensor to provide the powertrain control module (PCM) with inputs. This is done to establish and maintain correct injector firing order.

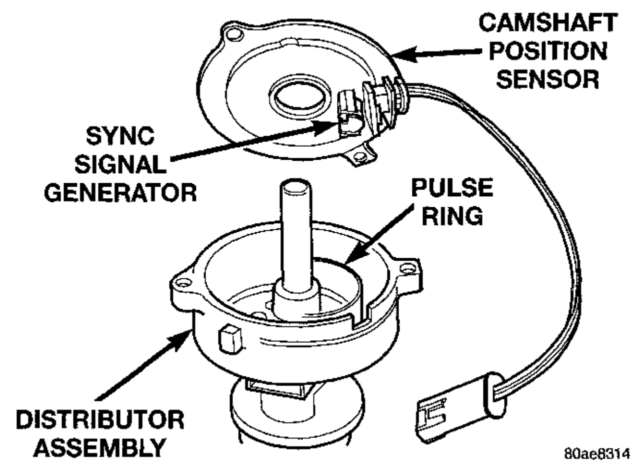

Fig. 3 Camshaft Position Sensor—3.9L/5.2L/5.9L Engines

Refer to Camshaft Position Sensor in Group 8D, Ignition System for more information.

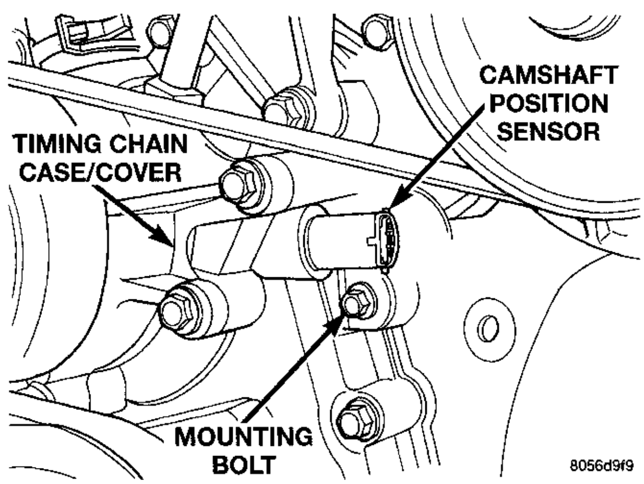

Fig. 4 Camshaft Position Sensor—8.0L Engine

CRANKSHAFT POSITION SENSOR—3.9L/5.2L/5.9L ENGINES—PCM INPUT

This sensor is a hall effect device that detects notches in the flywheel (manual transmission) or flexplate (automatic transmission).

This sensor is used to indicate to the powertrain control module (PCM) that a spark and or fuel injection event is to be required. The output from this sensor, in conjunction with the camshaft position sensor signal, is used to differentiate between fuel injection and spark events. It is also used to synchronize the fuel injectors with their respective cylinders.

The sensor is bolted to the cylinder block near the rear of the right cylinder head (Fig. 5).

Refer to Group 8D, Ignition System for more crankshaft position sensor information.

The engine will not operate if the PCM does not receive a crankshaft position sensor input.

DESCRIPTION AND OPERATION (Continued)

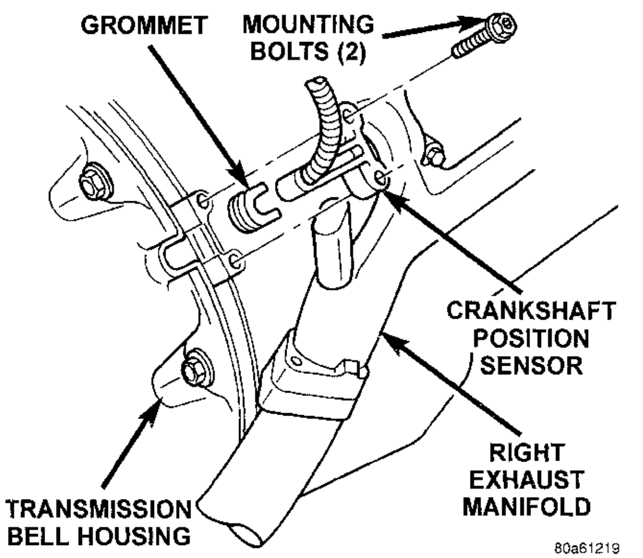

Fig. 5 Crankshaft Position Sensor—3.9L/5.2L/5.9L Engines—Typical

CRANKSHAFT POSITION SENSOR—8.0L ENGINE—PCM INPUT

This sensor is a hall effect device that detects notches in the engine crankshaft.

It is used to indicate to the powertrain control module (PCM) that a spark and or fuel injection event is to be required. The output from this sensor, in conjunction with the camshaft position sensor signal, is used to differentiate between fuel injection and spark events. It is also used to synchronize the fuel injectors with their respective cylinders.

The sensor is bolted to the side of the cylinder block (Fig. 6).

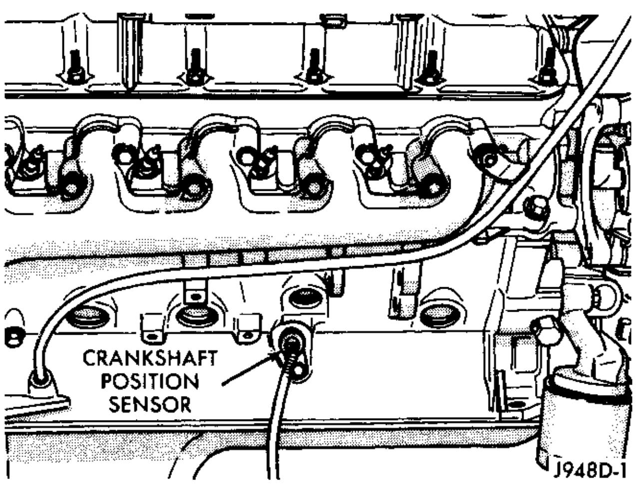

Fig. 6 Crankshaft Position Sensor—8.0L Engine—Typical

Refer to Group 8D, Ignition System for more crankshaft position sensor information.

The engine will not operate if the PCM does not receive a crankshaft position sensor input.

ENGINE COOLANT TEMPERATURE SENSOR—3.9L/5.2L/5.9L ENGINES—PCM INPUT

The engine coolant temperature sensor is installed next to the thermostat housing (Fig. 7) and protrudes into the water jacket. The sensor provides an input voltage to the powertrain control module (PCM) relating coolant temperature. The PCM uses this input along with inputs from other sensors to determine injector pulse width and ignition timing. As coolant temperature varies, the coolant temperature sensor resistance will change. This change in resistance results in a different input voltage to the PCM.

When the engine is cold, the PCM will operate in Open Loop cycle. It will demand slightly richer air-fuel mixtures and higher idle speeds. This is done until normal operating temperatures are reached.

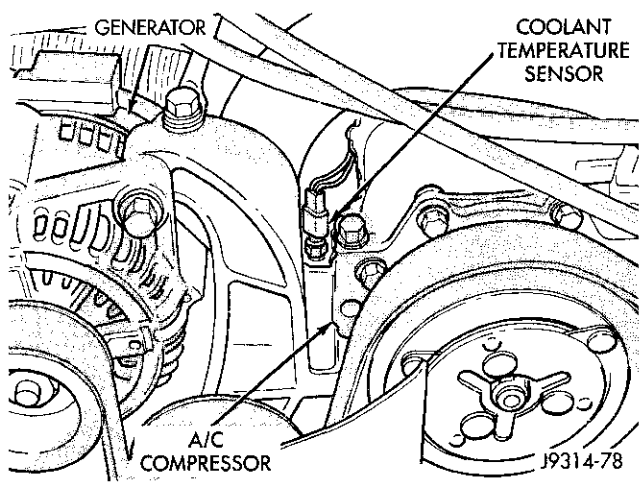

Fig. 7 Engine Coolant Temperature Sensor—3.9L/5.2L/5.9L Engines—Typical

ENGINE COOLANT TEMPERATURE SENSOR—8.0L ENGINE—PCM INPUT

The engine coolant temperature sensor is installed in the thermostat housing (Fig. 8) and protrudes into the water jacket. The sensor provides an input voltage to the powertrain control module (PCM) relating coolant temperature. The PCM uses this input along with inputs from other sensors to determine injector pulse width and ignition timing. As coolant temperature varies, the coolant temperature sensor resistance will change. This change in resistance results in a different input voltage to the PCM.

When the engine is cold, the PCM will operate in Open Loop cycle. It will demand slightly richer air-fuel mixtures and higher idle speeds. This is done until normal operating temperatures are reached.

AUTHENTIC RESTORATION PRODUCT

DESCRIPTION AND OPERATION (Continued)

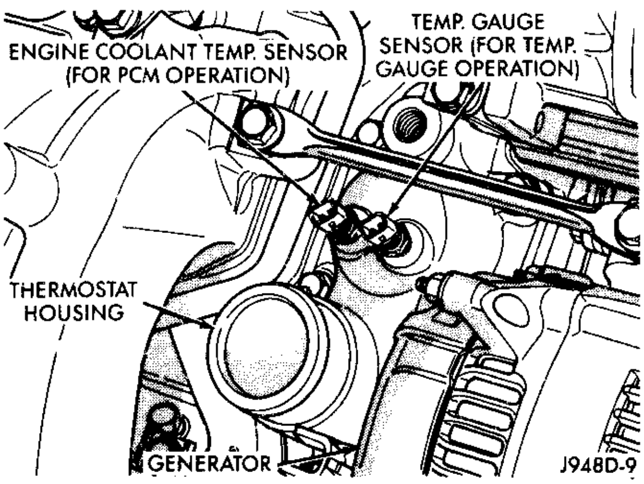

Fig. 8 Engine Coolant Temperature Sensor—8.0L Engine—Typical

FIVE VOLT SENSOR SUPPLY—PRIMARY

Supplies the required 5 volt power source to the crankshaft position sensor, camshaft position sensor, MAP sensor and throttle position sensor.

FIVE VOLT SENSOR SUPPLY—SECONDARY

Supplies the required 5 volt power source to the transmission pressure sensor (if equipped).

FUEL LEVEL SENSOR—PCM INPUT

The Powertrain Control Module (PCM) sends a 5 volt signal to the fuel level sensor (fuel gauge sending unit). The fuel level sensor will then return a signal to the PCM to indicate fuel level. The purpose of this feature is to prevent a false setting of misfire and fuel system monitor trouble codes. This is if the fuel level is less than approximately 15 percent, or, if equipped with a Leak Detection Pump (LDP), more than approximately 85 percent of its rated capacity. This input is also used to send a signal to the PCM for fuel gauge operation via the CCD bus circuits.

IGNITION CIRCUIT SENSE—PCM INPUT

The ignition circuit sense input tells the Powertrain Control Module (PCM) the ignition switch has energized the ignition circuit. Refer to the wiring diagrams for circuit information.

INTAKE MANIFOLD AIR TEMPERATURE SENSOR—3.9L/5.2L/5.9L ENGINES—PCM INPUT

The intake manifold air temperature sensor is installed in the intake manifold with the sensor element extending into the air stream (Fig. 9). The sensor provides an input voltage to the powertrain control module (PCM) indicating intake manifold air temperature. The input is used along with inputs from other sensors to determine injector pulse width. As the temperature of the air-fuel stream in the manifold varies, the sensor resistance changes. This results in a different input voltage to the PCM.

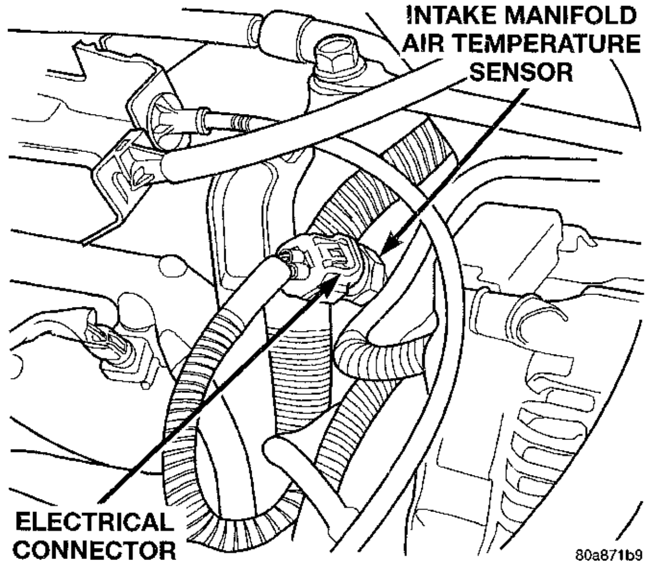

Fig. 9 Intake Manifold Air Temperature Sensor—3.9L/5.2L/5.9L Engine—Typical

INTAKE MANIFOLD AIR TEMPERATURE SENSOR—8.0L ENGINE—PCM INPUT

The intake manifold air temperature sensor is installed in the intake manifold with the sensor element extending into the air stream (Fig. 10). The sensor provides an input voltage to the powertrain control module (PCM) indicating intake manifold air temperature. The input is used along with inputs from other sensors to determine injector pulse width. As the temperature of the air-fuel stream in the manifold varies, the sensor resistance changes. This results in a different input voltage to the PCM.

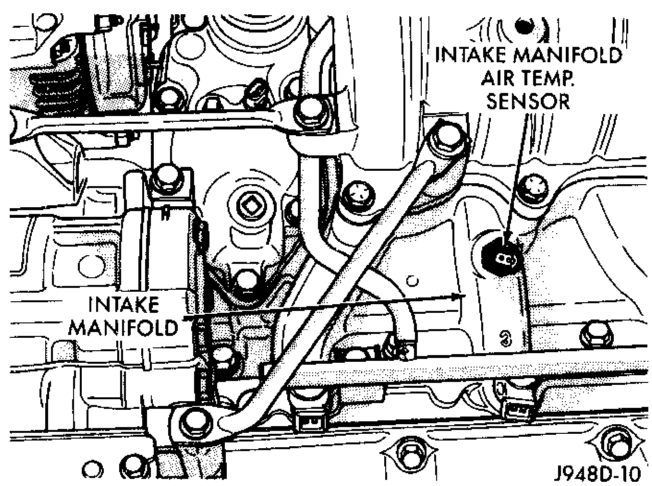

Fig. 10 Intake Manifold Air Temperature Sensor—8.0L Engine—Typical

DESCRIPTION AND OPERATION (Continued)

MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR—3.9L/5.2L/5.9L ENGINES—PCM INPUT

The MAP sensor reacts to absolute pressure in the intake manifold. It provides an input voltage to the powertrain control module (PCM). As engine load changes, manifold pressure varies. The change in manifold pressure causes MAP sensor voltage to change. The change in MAP sensor voltage results in a different input voltage to the PCM. The input voltage level supplies the PCM with information about ambient barometric pressure during engine start-up (cranking) and engine load while the engine is running. The PCM uses this input along with inputs from other sensors to adjust air-fuel mixture.

The MAP sensor is mounted on the side of the engine throttle body (Fig. 11). The sensor is connected to the throttle body with a rubber L-shaped fitting.

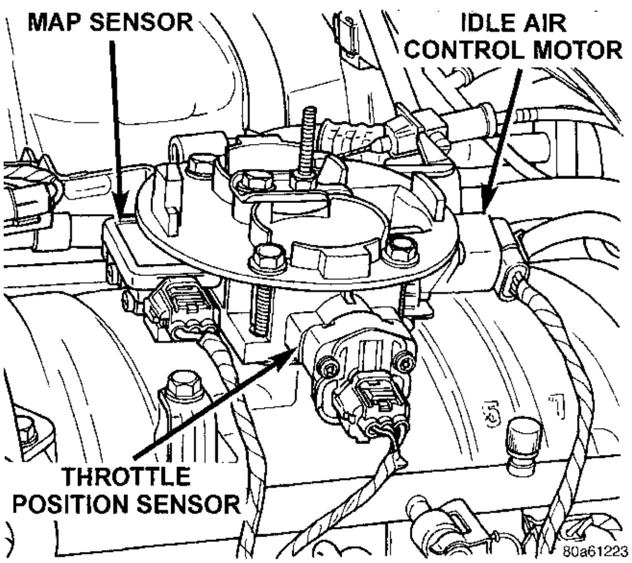

Fig. 11 MAP and Throttle Position Sensor Location—3.9L/5.2L/5.9L Engines—Typical

MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR—8.0L ENGINE—PCM INPUT

The MAP sensor reacts to absolute pressure in the intake manifold. It provides an input voltage to the powertrain control module (PCM). As engine load changes, manifold pressure varies. The change in manifold pressure causes MAP sensor voltage to change. The change in MAP sensor voltage results in a different input voltage to the PCM. The input voltage level supplies the PCM with information about ambient barometric pressure during engine start-up (cranking) and engine load while the engine is running. The PCM uses this input along with inputs from other sensors to adjust air-fuel mixture.

The MAP sensor is mounted into the right side of the intake manifold. (Fig. 12).

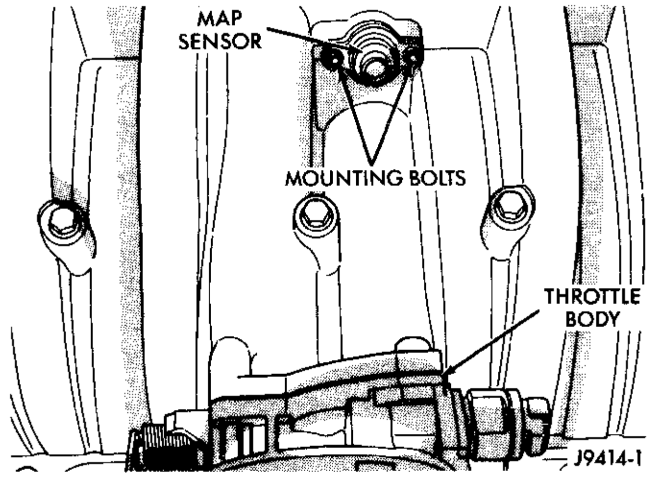

Fig. 12 MAP Sensor Location—8.0L Engine—Typical

OIL PRESSURE SENSOR—PCM INPUT

Sends a signal from the oil pressure sending unit to the Powertrain Control Module (PCM) relating to engine oil pressure.

OUTPUT SHAFT SPEED SENSOR—PCM INPUT

This sensor generates a signal to the PCM relating to the speed of the transmission main drive shaft. This input is used with 4–speed electronic transmissions only.

OVERDRIVE/OVERRIDE SWITCH—PCM INPUT

On vehicles equipped with an automatic transmission and overdrive, the powertrain control module (PCM) regulates the 3-4 overdrive up-shift and downshift through the overdrive solenoid. This solenoid is located in the transmission. An overdrive/override push-button switch is located at the end of transmission shift lever.

The overdrive/override push-button switch is normally open (overdrive allowed) when the lamp is not illuminated. It momentarily closes (overdrive not allowed) when the operator presses the switch and the lamp is illuminated. Overdrive will revert to ON (lamp off) each time the ignition switch in turned on. The transmission downshifts if the operator presses the override switch while in overdrive.

Refer to Group 21 for more transmission information.

OXYGEN SENSOR (O2S)—3.9L/5.2L/5.9L LDC ENGINES—PCM INPUT

Two heated O2S sensors are used (upstream and downstream). The sensors produce voltages from 0 to 1 volt, depending upon the oxygen content of the exhaust gas in the exhaust manifold. When a large amount of oxygen is present (caused by a lean air/fuel mixture), the sensors produces a low voltage.

Mopar AUTHENTIC RESTORATION PRODUCT

DESCRIPTION AND OPERATION (Continued)

When there is a lesser amount present (rich air/fuel mixture) it produces a higher voltage. By monitoring the oxygen content and converting it to electrical voltage, the sensors act as a rich-lean switch.

The oxygen sensors are equipped with a heating element that keeps the sensors at proper operating temperature during all operating modes. Maintaining correct sensor temperature at all times allows the system to enter into closed loop operation sooner. Also, it allows the system to remain in closed loop operation during periods of extended idle.

In Closed Loop operation, the PCM monitors the O2S sensor input (along with other inputs) and adjusts the injector pulse width accordingly. During Open Loop operation, the PCM ignores the O2 sensor input. The PCM adjusts injector pulse width based on preprogrammed (fixed) values and inputs from other sensors.

The Automatic Shutdown (ASD) relay supplies battery voltage to both the upstream and downstream heated oxygen sensors. The oxygen sensors are equipped with a heating element. The heating elements reduce the time required for the sensors to reach operating temperature.

UPSTREAM HEATED OXYGEN SENSOR

The upstream O2S sensor is located in the exhaust downpipe (Fig. 13). It provides an input voltage to the PCM. The input tells the PCM the oxygen content of the exhaust gas. The PCM uses this information to fine tune fuel delivery to maintain the correct oxygen content at the downstream oxygen sensor. The PCM will change the air/fuel ratio until the upstream sensor inputs a voltage that the PCM has determined will make the downstream sensor output (oxygen content) correct.

The upstream oxygen sensor also provides an input to determine catalyst efficiency. Refer to Group 25 Emissions, On-Board Diagnostics, Catalyst Monitor for more information.

DOWNSTREAM HEATED OXYGEN SENSOR

The downstream heated oxygen sensor is located near the outlet end of the catalytic convertor (Fig. 13). The downstream is also used to determine the correct air fuel ratio. As the oxygen content changes at the downstream the PCM calculates how much air fuel ratio change is required. The PCM then looks at the upstream oxygen sensor voltage and changes fuel delivery until the upstream sensor voltage changes enough to correct the downstream sensor voltage (oxygen content).

The downstream oxygen sensor also provides an input to determine catalyst efficiency. Refer to Group 25 Emissions Control Systems, On-Board Diagnostics, Catalyst Monitor for more information.

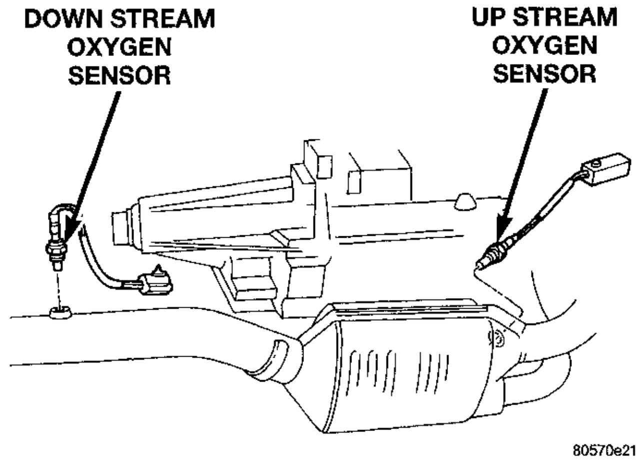

Fig. 13 Upstream/Downstream Oxygen Sensors—LDC Engines

OXYGEN SENSOR (O2S)—HDC ENGINES—PCM INPUT

A total of two heated O2S sensors are used (left and right) on HDC engines. On the 5.9L HDC engine, the left O2S sensor will monitor cylinders 1, 3, 5 and 7. The right sensor will monitor cylinders 2, 4, 6 and 8. On the 8.0L V-10 HDC engine, the left O2S sensor will monitor cylinders 1, 3, 5, 7 and 9. The right sensor will monitor cylinders 2, 4, 6, 8 and 10.

The sensors produce voltages from 0 to 1 volt, depending upon the oxygen content of the exhaust gas in the exhaust manifold. When a large amount of oxygen is present (caused by a lean air/fuel mixture), the sensors produces a low voltage. When there is a lesser amount present (rich air/fuel mixture) it produces a higher voltage. By monitoring the oxygen content and converting it to electrical voltage, the sensors act as a rich-lean switch.

The oxygen sensors are equipped with a heating element that keeps the sensors at proper operating temperature during all operating modes. Maintaining correct sensor temperature at all times allows the system to enter into closed loop operation sooner. Also, it allows the system to remain in closed loop operation during periods of extended idle.

In Closed Loop operation, the PCM monitors the O2S sensor input (along with other inputs) and adjusts the injector pulse width accordingly. During Open Loop operation, the PCM ignores the O2 sensor input. The PCM adjusts injector pulse width based on preprogrammed (fixed) values and inputs from other sensors.

The Automatic Shutdown (ASD) relay supplies battery voltage to both oxygen sensors. The oxygen sensors are equipped with a heating elements. The heating elements reduce the time required for the sensors to reach operating temperature.

DESCRIPTION AND OPERATION (Continued)

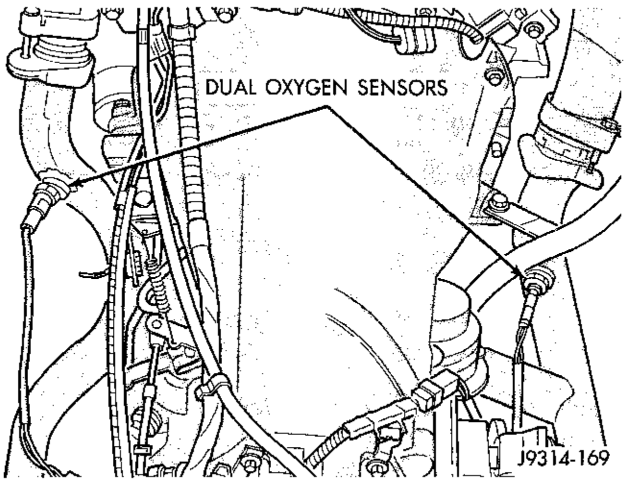

Fig. 14 Left/Right Heated Oxygen Sensors—HDC Engines

OXYGEN SENSOR (O2S)—8.0L MDC ENGINES—PCM INPUT

The 8.0L V-10 engine, when equipped with a Medium Duty Emission Cycle (MDC) package, will use four heated O2S sensors. They are: Left, right, pre-catalyst and post catalyst. The left, right and post catalyst sensors will fine-tune air-fuel ratio. The pre-catalyst and post catalyst sensors will determine catalytic converter efficiency.

Two of these sensors are installed into the left and right exhaust manifold downpipes (Fig. 14). On the 8.0L V-10 MDC engine, the left O2S sensor will monitor cylinders 1, 3, 5, 7 and 9. The right sensor will monitor cylinders 2, 4, 6, 8 and 10.

The sensors produce voltages from 0 to 1 volt, depending upon the oxygen content of the exhaust gas in the exhaust manifold. When a large amount of oxygen is present (caused by a lean air/fuel mixture), the sensors produces a low voltage. When there is a lesser amount present (rich air/fuel mixture) it produces a higher voltage. By monitoring the oxygen content and converting it to electrical voltage, the sensors act as a rich-lean switch.

The oxygen sensors are equipped with a heating element that keeps the sensors at proper operating temperature during all operating modes. Maintaining correct sensor temperature at all times allows the system to enter into closed loop operation sooner. Also, it allows the system to remain in closed loop operation during periods of extended idle.

In Closed Loop operation, the PCM monitors the O2S sensor input (along with other inputs) and adjusts the injector pulse width accordingly. During Open Loop operation, the PCM ignores the O2 sensor input. The PCM adjusts injector pulse width based on preprogrammed (fixed) values and inputs from other sensors.

The Automatic Shutdown (ASD) relay supplies battery voltage to both oxygen sensors. The oxygen sensors are equipped with a heating elements. The heating elements reduce the time required for the sensors to reach operating temperature.

PRE-CATALYST OXYGEN SENSOR

The pre-catalyst O2S sensor is located in the inlet end of the catalytic converter (Fig. 15). It provides an input voltage to the PCM. By comparing the input from the pre-catalyst O2S sensor, with the input from the post catalyst oxygen sensor, the PCM calculates catalytic convertor efficiency.

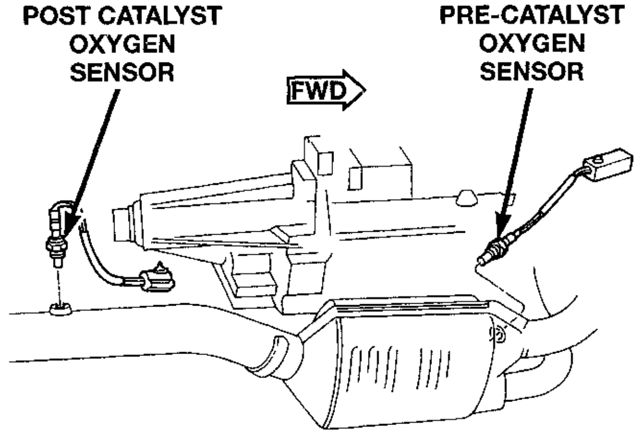

Fig. 15 Pre-Catalyst/Post Catalyst Oxygen Sensors—MDC Engines

POST CATALYST OXYGEN SENSOR

The post catalyst heated oxygen sensor threads into the outlet end of the catalytic convertor (Fig. 15). The post catalyst heated oxygen sensor input is used to detect catalytic convertor deterioration and fine tune the air fuel ratio. As the convertor deteriorates, the input from this sensor begins to match the pre-catalyst sensor input except for a slight time delay. By comparing the inputs from both of these sensors, the PCM calculates catalytic convertor efficiency.

When the catalytic converter efficiency drops below emission standards, the PCM stores a diagnostic trouble code and illuminates the Malfunction Indicator Lamp (MIL). For more information, refer to Group 25, Emission Control Systems.

POWER GROUND

The power ground is used to control ground circuits for the following powertrain control module (PCM) loads:

- Generator field winding
- Fuel injectors
- Ignition coil
- Certain relays/solenoids

AUTHENTIC RESTORATION PRODUCT

DESCRIPTION AND OPERATION (Continued)

PTO SWITCH SENSE—PCM INPUT

This Powertrain Control Module (PCM) input is used only on models equipped with aftermarket Power Take Off (PTO) units.

The input is used only to tell the PCM that the PTO has been engaged. The PCM will disable (temporarily shut down) certain OBD II fault codes when the PTO is engaged.

Operation: When the aftermarket PTO switch has been engaged, a 12V + signal is sent through circuit G113 to PCM pin A13. The PCM will then sense and determine that the PTO has been activated.

SENSOR RETURN—PCM INPUT

Sensor Return provides a low noise ground reference for all engine control system sensors.

SIGNAL GROUND—PCM INPUT

Signal ground provides a low noise ground to the data link connector.

SPEED CONTROL SWITCHES—PCM INPUT

Six different speed control functions, using three momentary contact switches, are monitored through this **multiplexed** input. The resistance monitored at this input, in combination with the length of time the PCM measures the resistance, determines which switch feature has been selected. The three switches are: On/Off, Set/Coast, Cancel and Resume/Accelerate.

Refer to Group 8H, Vehicle Speed Control System for further speed control information.

TRANSMISSION PARK/NEUTRAL SWITCH—PCM INPUT

The park/neutral switch is located on the transmission housing and provides an input to the powertrain control module (PCM). This will indicate that the automatic transmission is in Park, Neutral or a drive gear selection. This input is used to determine idle speed (varying with gear selection), fuel injector pulse width, ignition timing advance and vehicle speed control operation. Refer to Group 21, Transmissions, for testing, replacement and adjustment information.

TRANSMISSION GOVERNOR PRESSURE SENSOR—PCM INPUT

Provides a signal proportional to the transmission governor pressure. It provides feedback for control of the governor pressure solenoid, which regulates transmission governor pressure. This input is used with 4–speed electronic transmissions only.

TRANSMISSION TEMPERATURE SENSOR—PCM INPUT

This input is used in the shift operation for 4–speed electronic transmissions only. The temperature data is used for: torque converter clutch operation, overdrive shift, low temperature shift compensation, wide open throttle shift strategy and governor pressure transducer calibration.

THROTTLE POSITION SENSOR (TPS)—3.9L/5.2L/5.9L ENGINES—PCM INPUT

The throttle position sensor (TPS) is mounted on the throttle body (Fig. 11). The TPS is a variable resistor that provides the powertrain control module (PCM) with an input signal (voltage) that represents throttle blade position. The sensor is connected to the throttle blade shaft. As the position of the throttle blade changes, the resistance of the TPS changes.

The PCM supplies approximately 5 volts to the TPS. The TPS output voltage (input signal to the PCM) represents the throttle blade position. The PCM receives an input signal voltage from the TPS. This will vary in an approximate range of from .25 volts at minimum throttle opening (idle), to 4.8 volts at wide open throttle. Along with inputs from other sensors, the PCM uses the TPS input to determine current engine operating conditions. In response to engine operating conditions, the PCM will adjust fuel injector pulse width and ignition timing.

THROTTLE POSITION SENSOR (TPS)—8.0L ENGINE—PCM INPUT

The throttle position sensor (TPS) is mounted on the throttle body (Fig. 16). The TPS is a variable resistor that provides the powertrain control module (PCM) with an input signal (voltage) that represents throttle blade position. The sensor is connected to the throttle blade shaft. As the position of the throttle blade changes, the resistance of the TPS changes.

The PCM supplies approximately 5 volts to the TPS. The TPS output voltage (input signal to the PCM) represents the throttle blade position. The PCM receives an input signal voltage from the TPS. This will vary in an approximate range of from .25 volts at minimum throttle opening (idle), to 4.8 volts at wide open throttle. Along with inputs from other sensors, the PCM uses the TPS input to determine current engine operating conditions. In response to engine operating conditions, the PCM will adjust fuel injector pulse width and ignition timing.

VEHICLE SPEED AND DISTANCE—PCM INPUT

The Vehicle Speed Sensor (VSS) is no longer used for any Dodge truck in the 1998 model year.

Vehicle speed and distance covered are measured by the Rear Wheel Speed Sensor. The sensor is

DESCRIPTION AND OPERATION (Continued)

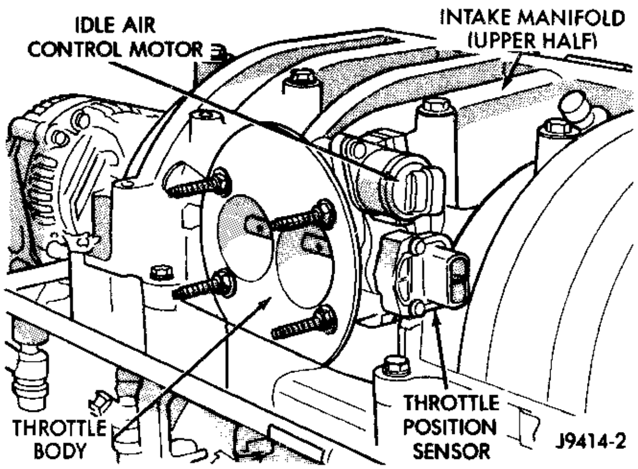

Fig. 16 Sensor Location—8.0L Engine

mounted to the rear axle. A signal is sent from this sensor to the Controller Antilock Brake (CAB) computer. A signal is then sent from the CAB to the Powertrain Control Module (PCM) to determine vehicle speed and distance covered. The PCM will then determine strategies for fuel system and speed control system operation.

Refer to Odometer and Trip Odometer in Group 8E, Instrument Panel for additional information.

AIR CONDITIONING (A/C) CLUTCH RELAY—PCM OUTPUT

The A/C relay is located in the Power Distribution Center (PDC) (Fig. 17). Refer to label on PDC cover for relay location.

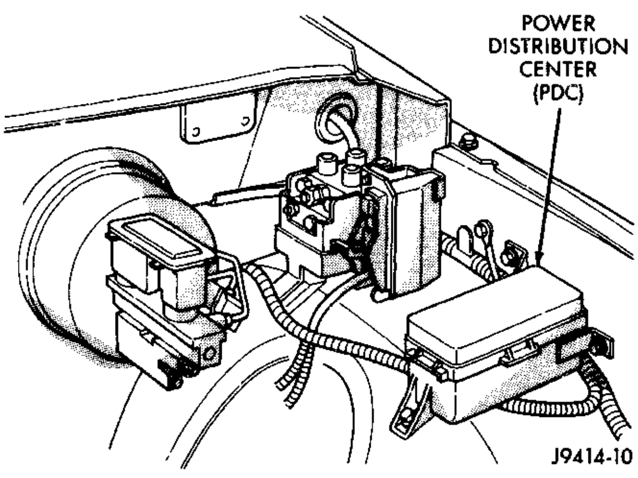

Fig. 17 Power Distribution Center (PDC)

The powertrain control module (PCM) activates the A/C compressor through the A/C clutch relay. The PCM regulates A/C compressor operation by switching the ground circuit for the A/C clutch relay on and off.

When the PCM receives a request for A/C, it will adjust idle air control (IAC) motor position. This is done to increase idle speed. The PCM will then activate the A/C clutch through the A/C clutch relay. The PCM adjusts idle air control (IAC) stepper motor position to compensate for increased engine load from the A/C compressor.

By switching the ground path for the relay on and off, the PCM is able to cycle the A/C compressor clutch. This is based on changes in engine operating conditions. If, during A/C operation, the PCM senses low idle speeds or a wide open throttle condition, it will de-energize the relay. This prevents A/C clutch engagement. The relay will remain de-energized until the idle speed increases or the wide open throttle condition exceeds 15 seconds or no longer exists. The PCM will also de-energize the relay if coolant temperature exceeds 125°C (257°F) or low or high system pressure exists.

AUTO SHUTDOWN (ASD) RELAY—PCM OUTPUT

The ASD relay is located in the Power Distribution Center (PDC) (Fig. 17).

The ASD supplies battery voltage to the fuel injectors, ignition coil and oxygen (O2S) sensor heating elements. The ground circuit for the coil in the ASD relay is controlled by the powertrain control module (PCM). The PCM operates the relay by switching the ground circuit on and off.

CCD BUS (+/-) CIRCUITS-PCM OUTPUTS

The Powertrain Control Module (PCM) sends certain output signals through the CCD bus circuits. These signals are used to control certain instrument panel located items and to determine certain identification numbers.

Refer to Group 8E, Instrument Panel and Gauges for additional information.

DATA LINK CONNECTOR—PCM INPUT AND OUTPUT

The 16–way data link connector (diagnostic scan tool connector) links the Diagnostic Readout Box (DRB) scan tool or the Mopar Diagnostic System (MDS) with the powertrain control module (PCM). The data link connector (Fig. 18) is located at lower edge of instrument panel near steering column. For operation of the DRB scan tool, refer to the appropriate Powertrain Diagnostic Procedures service manual.

DUTY CYCLE EVAP PURGE SOLENOID VALVE-PCM OUTPUT

Refer to Group 25, Emission Control System for information.

DESCRIPTION AND OPERATION (Continued)

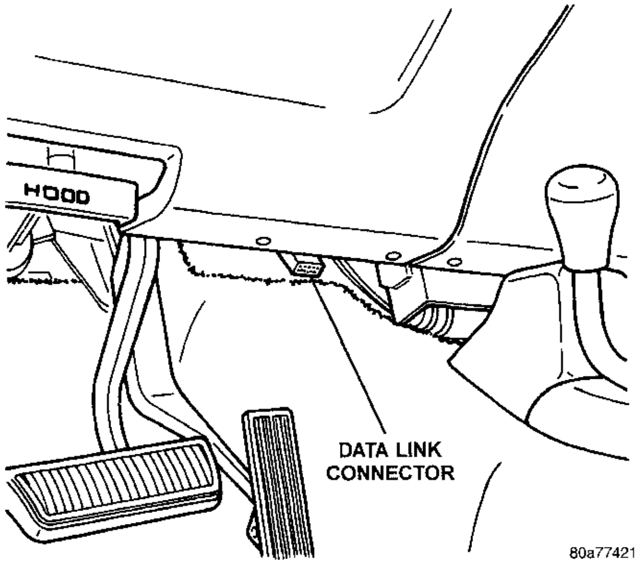

Fig. 18 16–Way Data Link Connector

FUEL INJECTORS—3.9L/5.2L/5.9L ENGINES—PCM OUTPUT

The fuel injectors are attached to the fuel rail (Fig. 19). 3.9L engines use six injectors. 5.2L and 5.9L engines use eight injectors.

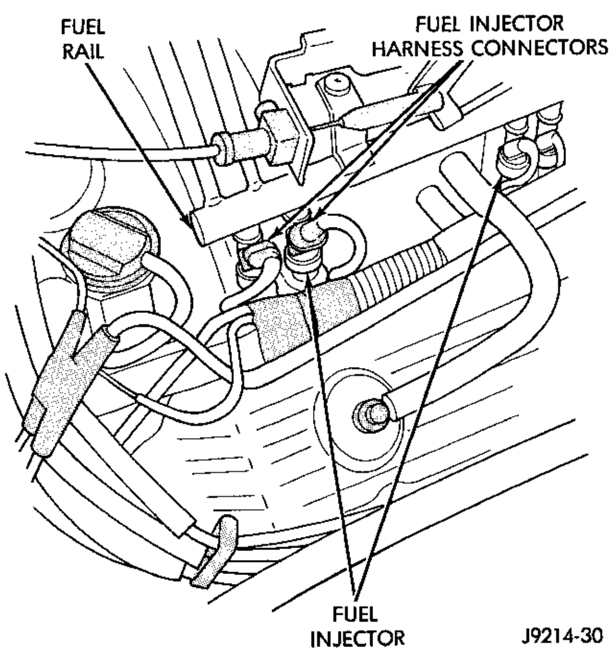

Fig. 19 Fuel Injectors—3.9L/5.2L/5.9L Engines—Typical

The nozzle ends of the injectors are positioned into openings in the intake manifold just above the intake valve ports of the cylinder head. The engine wiring harness connector for each fuel injector is equipped with an attached numerical tag (INJ 1, INJ 2 etc.). This is used to identify each fuel injector with its respective cylinder number.

The injectors are energized individually in a sequential order by the powertrain control module (PCM). The PCM will adjust injector pulse width by switching the ground path to each individual injector on and off. Injector pulse width is the period of time that the injector is energized. The PCM will adjust injector pulse width based on various inputs it receives.

During start up, battery voltage is supplied to the injectors through the ASD relay. When the engine is operating, voltage is supplied by the charging system. The PCM determines injector pulse width based on various inputs.

FUEL INJECTORS—8.0L ENGINE—PCM OUTPUT

The fuel injectors are attached to the fuel rail (Fig. 20). 8.0L V–10 engines use 10 injectors.

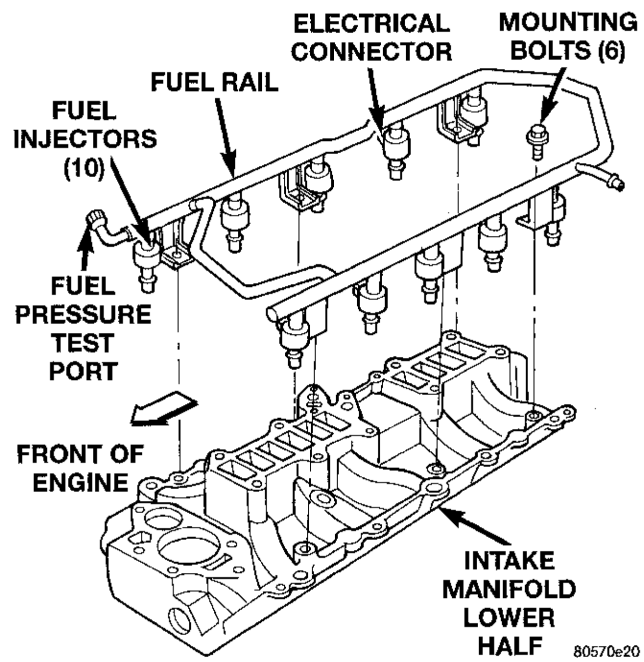

Fig. 20 Fuel Injectors—8.0L Engine—Typical

The nozzle ends of the injectors are positioned into openings in the intake manifold just above the intake valve ports of the cylinder head. The engine wiring harness connector for each fuel injector is equipped with an attached numerical tag (INJ 1, INJ 2 etc.). This is used to identify each fuel injector with its respective cylinder number.

The 10 injectors are energized individually in a sequential order by the powertrain control module (PCM). The PCM will adjust injector pulse width by switching the ground path to each individual injector on and off. Injector pulse width is the period of time that the injector is energized. The PCM will adjust

DESCRIPTION AND OPERATION (Continued)

injector pulse width based on various inputs it receives.

During start up, battery voltage is supplied to the injectors through the ASD relay. When the engine is operating, voltage is supplied by the charging system. The PCM determines injector pulse width based on various inputs.

FUEL PUMP RELAY—PCM OUTPUT

The PCM energizes the electric fuel pump through the fuel pump relay. Battery voltage is applied to the fuel pump relay when the ignition key is ON. The relay is energized when a ground signal is provided by the PCM.

The fuel pump will operate for approximately one second unless the engine is operating or the starter motor is engaged.

The fuel pump relay is located in the Power Distribution Center (PDC) (Fig. 17).

GENERATOR FIELD SOURCE (+)—PCM OUTPUT

This output from the Powertrain Control Module (PCM) regulates charging system voltage to the generator field source (+) circuit. The voltage range is 12.9 to 15.0 volts. Models of previous years had used the ASD relay (directly) to apply the 12 volt + power supply to the generator field source (+) circuit. Refer to Groups 8A and 8C for charging system information.

GENERATOR FIELD DRIVER (-)—PCM OUTPUT

This output from the Powertrain Control Module (PCM) regulates charging system ground control to the generator field driver (-) circuit. Refer to Groups 8A and 8C for charging system information.

GENERATOR LAMP—PCM OUTPUT

If the powertrain control module (PCM) senses a low charging condition in the charging system, it will illuminate the generator lamp (if equipped) on the instrument panel. For example, during low idle with all accessories turned on, the lamp may momentarily go on. Once the PCM corrects idle speed to a higher rpm, the lamp will go out. Refer to Groups 8A and 8C for charging system information.

IDLE AIR CONTROL (IAC) MOTOR—3.9L/5.2L/5.9L ENGINES—PCM OUTPUT

The IAC motor is mounted to the back of the throttle body (Fig. 11) and is controlled by the powertrain control module (PCM).

The throttle body has an air control passage that provides air for the engine at idle (the throttle plate is closed). The IAC motor pintle protrudes into the air control passage (Fig. 21) and regulates air flow through it. Based on various sensor inputs, the powertrain control module (PCM) adjusts engine idle speed by moving the IAC motor pintle in and out of the air control passage. The IAC motor is positioned when the ignition key is turned to the On position.

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the PCM.

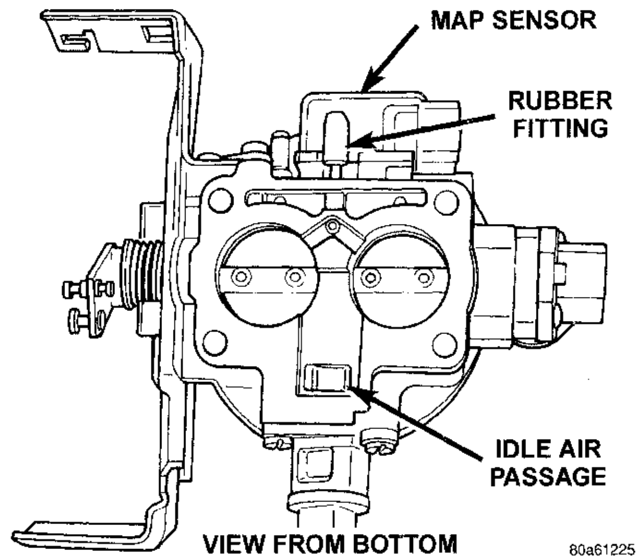

Fig. 21 Throttle Body Air Control Passage—3.9L/5.2L/5.9L Engines

IDLE AIR CONTROL (IAC) MOTOR—8.0L ENGINE—PCM OUTPUT

The IAC motor is mounted to the side of the throttle body (Fig. 22) and is controlled by the powertrain control module (PCM).

The throttle body has an air control passage that provides air for the engine at idle (the throttle plate is closed). The IAC motor pintle protrudes into the air control passage (Fig. 23) and regulates air flow through it. Based on various sensor inputs, the powertrain control module (PCM) adjusts engine idle speed by moving the IAC motor pintle in and out of the air control passage. The IAC motor is positioned when the ignition key is turned to the On position.

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the PCM.

IGNITION COIL—3.9L/5.2L/5.9L ENGINES—PCM OUTPUT

System voltage is supplied to the ignition coil positive terminal. The powertrain control module (PCM) operates the ignition coil. **Base (initial) ignition**

DESCRIPTION AND OPERATION (Continued)

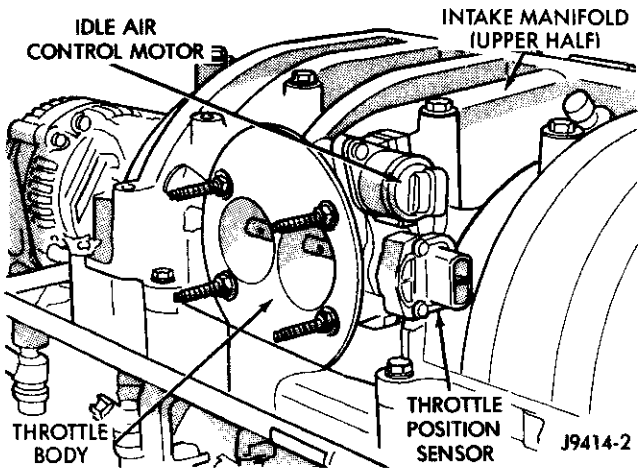

Fig. 22 Idle Air Control Motor Location—8.0L Engine

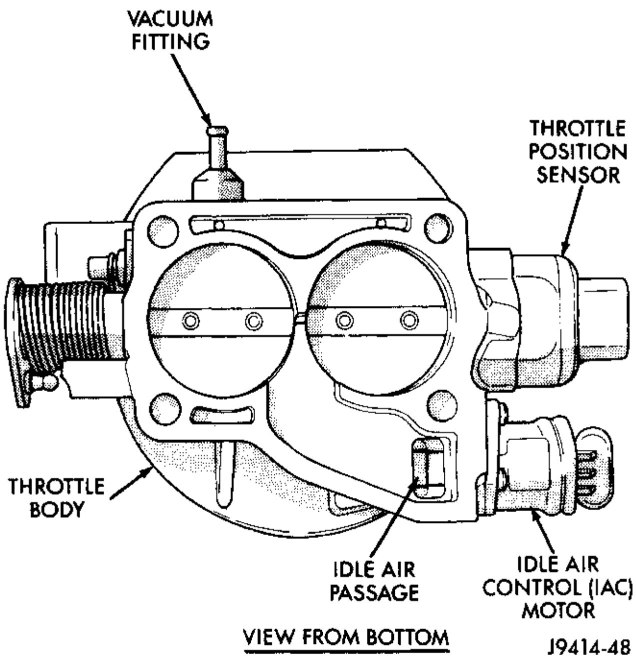

Fig. 23 Idle Air Control Passage—8.0L Engine

timing is not adjustable. The PCM adjusts ignition timing to meet changing engine operating conditions.

The ignition coil is located near the front of the right cylinder head (Fig. 24).

Refer to Group 8D, Ignition System for additional information.

IGNITION COILS—8.0L ENGINE—PCM OUTPUTS

System voltage is supplied to each of the five ignition coil positive terminals. The powertrain control module (PCM) operates the 5 paired ignition coils. **Base (initial) ignition timing is not adjustable.** The PCM adjusts ignition timing to meet changing engine operating conditions.

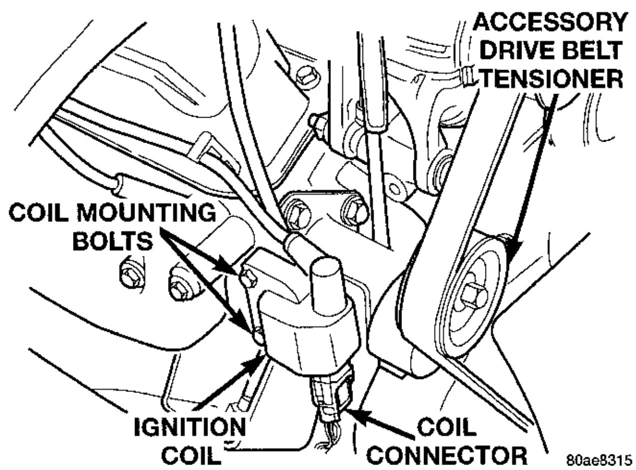

Fig. 24 Ignition Coil—3.9L/5.2L/5.9L Engines—Typical (5.2L Shown)

The ignition coil pack is located above the right engine valve cover (Fig. 25).

Refer to Group 8D, Ignition System for additional information.

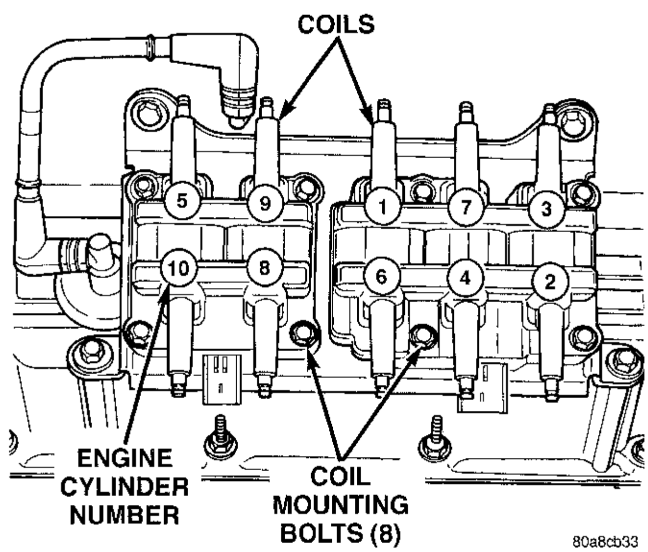

Fig. 25 Ignition Coil Packs—8.0L Engine

MALFUNCTION INDICATOR LAMP—PCM OUTPUT

Refer to Group 25, Emission Control System for information.

OVERDRIVE LAMP—PCM OUTPUT

This circuit controls a signal for the operation of the push-button overdrive lamp switch. When the lamp is illuminated, the overdrive is disengaged.

SPEED CONTROL SOLENOIDS—PCM OUTPUT

Speed control operation is regulated by the powertrain control module (PCM). The PCM controls the vacuum to the throttle actuator through the speed

DESCRIPTION AND OPERATION (Continued)

control vacuum and vent solenoids. Refer to Group 8H for Speed Control Information.

SERVICE REMINDER INDICATOR (SRI) LAMP—PCM OUTPUT

This circuit controls operation of the SRI lamp.

The instrument panel mounted service reminder indicator (SRI) lamp is used only on vehicles equipped with 5.9L V-8 heavy duty cycle (HDC) engines. The lamp is displayed on the instrument panel as the MAINT REQ'D lamp. When the lamp has been activated, certain service/maintenance must be performed.

For required service/maintenance stated in time or mileage, refer to Group 0, Lubrication and Maintenance. Also refer to Group 25, Emission Control System for additional information.

The SRI lamp is not used with diesel engines.

TACHOMETER—PCM OUTPUT

The powertrain control module (PCM) supplies engine rpm values to the instrument cluster tachometer. Refer to Group 8E for tachometer information.

THREE-FOUR SHIFT SOLENOID—PCM OUTPUT

This output is used to control the transmission three-four shift solenoid. It is used on 4–speed electronically controlled automatic transmissions only.

TORQUE CONVERTOR CLUTCH (TCC) SOLENOID—PCM OUTPUT

This circuit controls operation of the transmission mounted torque convertor clutch (TCC) solenoid used for torque convertor engagement.

The powertrain control module (PCM) will determine when to engage and disengage the solenoid by monitoring vehicle miles per hour (mph) versus the output voltage of the throttle position sensor. Also needed are various inputs from:

- Transmission temperature sensor
- Output shaft speed sensor
- Module timer
- Engine rpm
- MAP sensor
- Brake switch

MANUAL TRANSMISSION

If equipped with a manual transmission, this PCM output will control operation of the shift indicator lamp (if equipped with lamp). The lamp is controlled by the powertrain control module (PCM). The lamp illuminates on the instrument panel to indicate when the driver should shift to the next highest gear for best fuel economy. The PCM will turn the lamp OFF after 3 to 5 seconds if the shift of gears is not performed. The lamp will remain off until vehicle stops accelerating and is brought back to range of up-shift lamp operation. This will also happen if vehicle is shifted into fifth gear.

The indicator lamp is normally illuminated when the ignition switch is turned on and it is turned off when the engine is started up. With the engine running, the lamp is turned ON/OFF depending upon engine speed and load.

TRANSMISSION RELAY—PCM OUTPUT

The output to this relay provides battery voltage to the overdrive (OD), torque converter clutch (TCC) and governor pressure solenoids. Once battery voltage is applied to the solenoids, they are individually activated by the PCM through OD, TCC and governor pressure outputs. The relay is located in the Power Distribution Center (PDC). Refer to label on PDC cover for relay location.

GOVERNOR PRESSURE SOLENOID—PCM OUTPUT

This solenoid regulates the transmission fluid line pressure to produce the governor pressure necessary for transmission shift control. It is used on 4–speed electronic transmissions only.

THROTTLE BODY—3.9L/5.2L/5.9L ENGINES

Filtered air from the air cleaner enters the intake manifold through the throttle body (Fig. 26). Fuel does not enter the intake manifold through the throttle body. Fuel is sprayed into the manifold by the fuel injectors. The throttle body is mounted on the intake manifold. It contains an air control passage (Fig. 27) controlled by an idle air control (IAC) motor. The air control passage is used to supply air for idle conditions. A throttle valve (plate) is used to supply air for above idle conditions.

The throttle position sensor (TPS), idle air control (IAC) motor and manifold absolute pressure sensor (MAP) are attached to the throttle body. The accelerator pedal cable, speed control cable and transmission control cable (when equipped) are connected to the throttle arm.

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the PCM.

THROTTLE BODY—8.0L ENGINE

Filtered air from the air cleaner enters the intake manifold through the side mounted throttle body (Fig. 28). Fuel does not enter the intake manifold through the throttle body. Fuel is sprayed into the manifold by the fuel injectors. The throttle body is mounted on the intake manifold. It contains an air control passage (Fig. 29) controlled by an idle air con-

DESCRIPTION AND OPERATION (Continued)

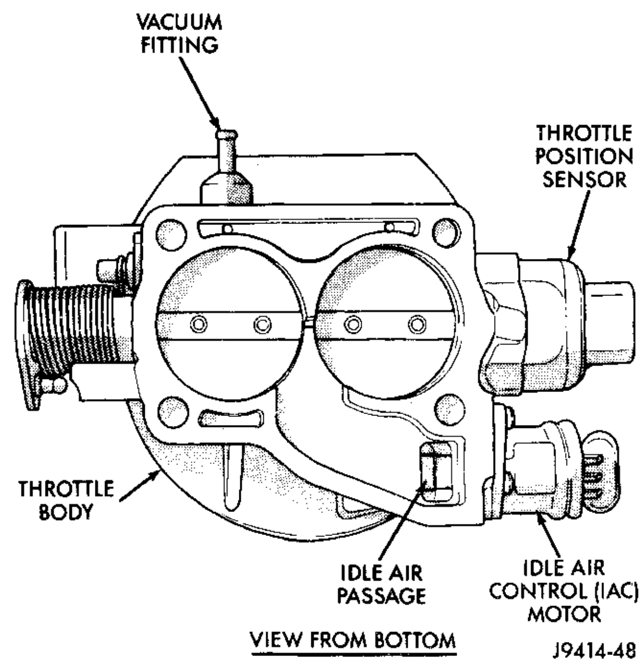

Fig. 29 Air Control Passage—8.0L Engine

speed using this screw. All idle speed functions are controlled by the PCM.

DIAGNOSIS AND TESTING

VISUAL INSPECTION—3.9L/5.2L/5.9L ENGINES

A visual inspection for loose, disconnected or incorrectly routed wires and hoses should be made. This

DIAGNOSIS AND TESTING (Continued)

should be done before attempting to diagnose or service the fuel injection system. A visual check will help spot these faults and save unnecessary test and diagnostic time. A thorough visual inspection will include the following checks:

(1) Verify that the three 32–way electrical connectors are fully inserted into the connector of the powertrain control module (PCM) (Fig. 30).

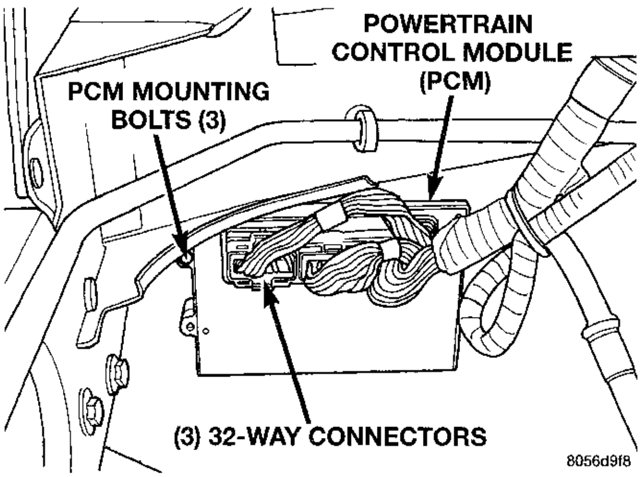

Fig. 30 Powertrain Control Module (PCM)

(2) Inspect the battery cable connections. Be sure that they are clean and tight.

(3) Inspect fuel pump relay and air conditioning compressor clutch relay (if equipped). Inspect the ASD relay connections. Inspect starter motor relay connections. Inspect relays for signs of physical damage and corrosion. The relays are located in the Power Distribution Center (PDC) (Fig. 31). Refer to label on PDC cover for relay location.

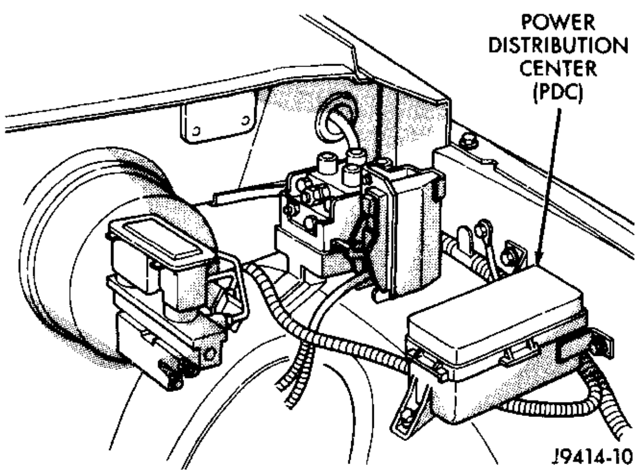

Fig. 31 Power Distribution Center (PDC)

(4) Inspect ignition coil connections. Verify that coil secondary cable is firmly connected to coil (Fig. 32).

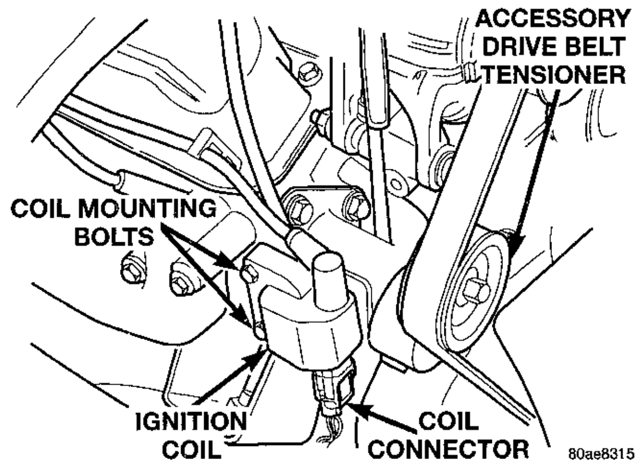

Fig. 32 Ignition Coil—3.9L/5.2L/5.9L Engines—Typical

(5) Verify that distributor cap is correctly attached to distributor. Be sure that spark plug cables are firmly connected to the distributor cap and the spark plugs are in their correct firing order. Be sure that coil cable is firmly connected to distributor cap and coil. Be sure that camshaft position sensor wire connector (at the distributor) is firmly connected to harness connector. Inspect spark plug condition. Refer to Group 8D, Ignition. Connect vehicle to an oscilloscope and inspect spark events for fouled or damaged spark plugs or cables.

(6) Verify that generator output wire, generator connector and ground wire are firmly connected to the generator.

(7) Inspect the system body grounds for loose or dirty connections. Refer to Group 8, Wiring for ground locations.

(8) Verify positive crankcase ventilation (PCV) valve operation. Refer to Group 25, Emission Control System for additional information. Verify PCV valve hose is firmly connected to PCV valve and manifold (Fig. 33).

(9) Inspect fuel tube quick-connect fitting-to-fuel rail connections.

(10) Verify that hose connections to all ports of vacuum fittings on intake manifold are tight and not leaking.

(11) Inspect accelerator cable, transmission throttle cable (if equipped) and cruise control cable connections (if equipped). Check their connections to the throttle arm of throttle body for any binding or restrictions.

(12) If equipped with vacuum brake booster, verify that vacuum booster hose is firmly connected to fitting on intake manifold. Also check connection to brake vacuum booster.

(13) Inspect the air cleaner inlet and air cleaner element for dirt or restrictions.

DIAGNOSIS AND TESTING (Continued)

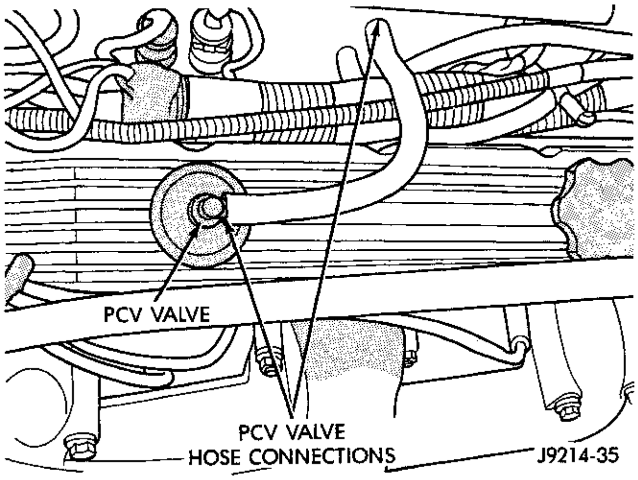

Fig. 33 PCV Valve Hose Connections—3.9L/5.2L/5.9L Engines—Typical

(14) Inspect radiator grille area, radiator fins and air conditioning condenser for restrictions.

(15) Verify that the intake manifold air temperature sensor wire connector is firmly connected to harness connector (Fig. 34).

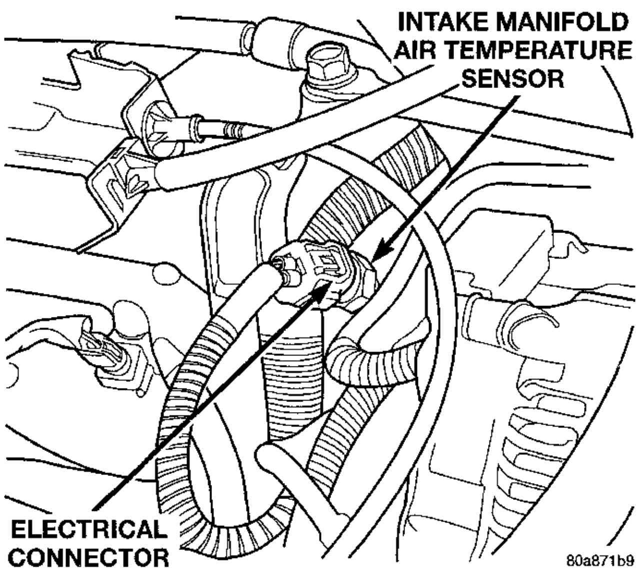

Fig. 34 Air Temperature Sensor—3.9L/5.2L/5.9L—Typical (V-8 Shown)

(16) Verify that MAP sensor electrical connector is firmly connected to MAP sensor (Fig. 35). Also verify that rubber L-shaped fitting from MAP sensor to the throttle body is firmly connected (Fig. 36).

(17) Verify that fuel injector wire harness connectors are firmly connected to injectors in the correct order. Each harness connector is numerically tagged with the injector number (INJ 1, INJ 2 etc.) of its corresponding fuel injector and cylinder number.

(18) Verify harness connectors are firmly connected to idle air control (IAC) motor, throttle position sensor (TPS) and manifold absolute pressure (MAP) sensor (Fig. 35).

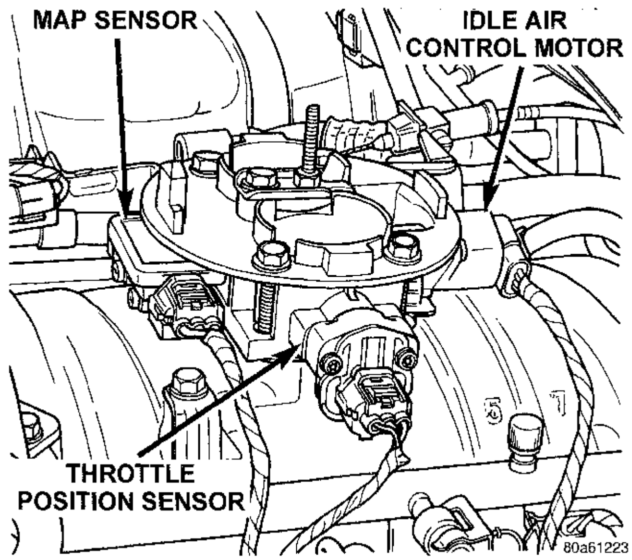

Fig. 35 Sensor and IAC Motor Location—Typical (V-8 Shown)

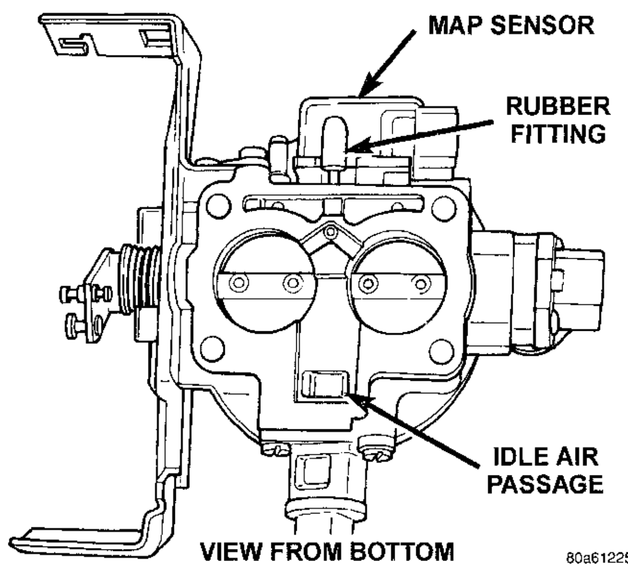

Fig. 36 Rubber L-Shaped Fitting—MAP Sensor-to-Throttle Body—3.9L/5.2L/5.9L Engines

(19) Verify that wire harness connector is firmly connected to the engine coolant temperature sensor (Fig. 37).

(20) Raise and support the vehicle.

(21) On 3.9L/5.2L/5.9L LDC engines, verify that both the upstream and downstream oxygen sensor wire connectors are firmly connected to the sensors. Inspect sensors and connectors for damage (Fig. 38).

(22) On 5.9L HDC engines, verify that both the left and right oxygen sensor wire connectors are

mopar AUTHENTIC RESTORATION

DIAGNOSIS AND TESTING (Continued)

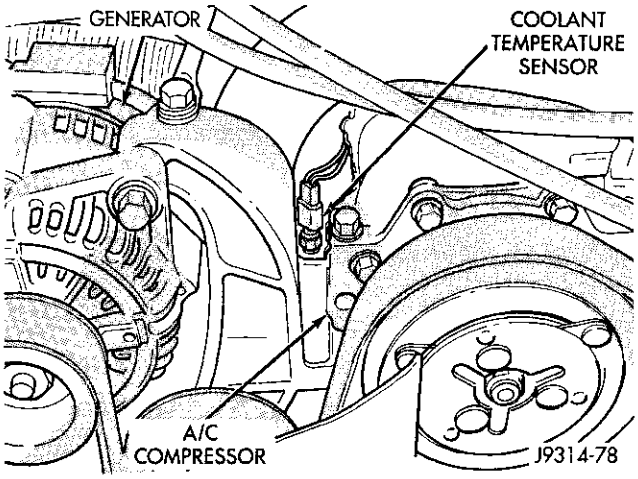

Fig. 37 Engine Coolant Temperature Sensor—3.9L/5.2L/5.9L Engines—Typical

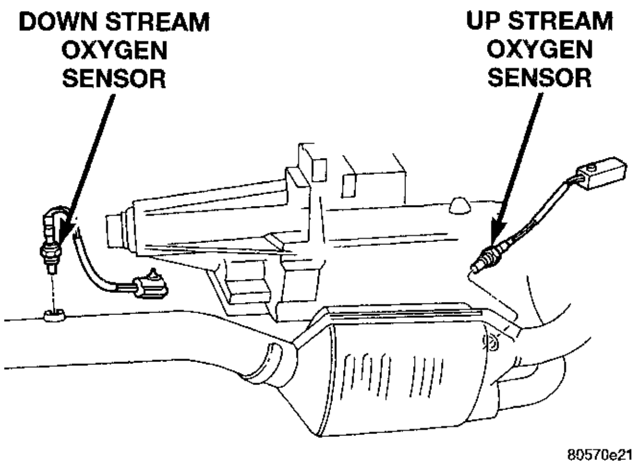

Fig. 38 Upstream/Downstream Oxygen Sensors—3.9L/5.2L/5.9L LDC Engines

firmly connected to the sensors. Inspect sensors and connectors for damage (Fig. 39).

(23) Inspect for pinched or leaking fuel tubes. Inspect for pinched, cracked or leaking fuel hoses.

(24) Inspect for exhaust system restrictions such as pinched exhaust pipes, collapsed muffler or plugged catalytic convertor.

(25) If equipped with automatic transmission, verify that electrical harness is firmly connected to park/neutral switch. Refer to Automatic Transmission section of Group 21.

(26) Verify electrical harness is firmly connected to rear wheel speed sensor. Verify rear wheel speed sensor is firmly attached to rear axle with proper air gap. Refer to Group 5, Brakes for information.

(27) If equipped with 4–wheel antilock brake system, verify electrical harness is firmly connected to each front wheel speed sensor. Verify both front

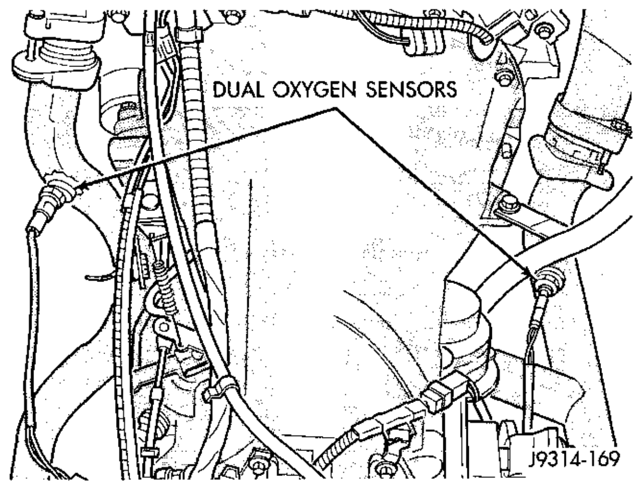

Fig. 39 Left/Right Oxygen Sensors—5.9L HDC Engines

wheel speed sensors are firmly attached. Refer to Group 5, Brakes for information.

(28) Verify that fuel pump/gauge sender unit wire connector is firmly connected to harness connector.

(29) Inspect fuel hoses at fuel pump/gauge sender unit for cracks or leaks.

(30) Inspect transmission torque convertor housing (automatic transmission) or clutch housing (manual transmission) for damage to timing ring on drive plate/flywheel.

(31) Verify that battery cable and solenoid feed wire connections to the starter solenoid are tight and clean. Inspect for chaffed wires or wires rubbing up against other components.

VISUAL INSPECTION—8.0L ENGINE

A visual inspection for loose, disconnected or incorrectly routed wires and hoses should be made. This should be done before attempting to diagnose or service the fuel injection system. A visual check will help spot these faults and save unnecessary test and diagnostic time. A thorough visual inspection will include the following checks:

(1) Verify that the three 32–way electrical connectors are fully inserted into the connector of the powertrain control module (PCM) (Fig. 40).

(2) Inspect the battery cable connections. Be sure that they are clean and tight.

(3) Inspect fuel pump relay and air conditioning compressor clutch relay (if equipped). Inspect the ASD relay connections. Inspect starter motor relay connections. Inspect relays for signs of physical damage and corrosion. The relays are located in the Power Distribution Center (PDC) (Fig. 41). Refer to label on PDC cover for relay location.

DIAGNOSIS AND TESTING (Continued)

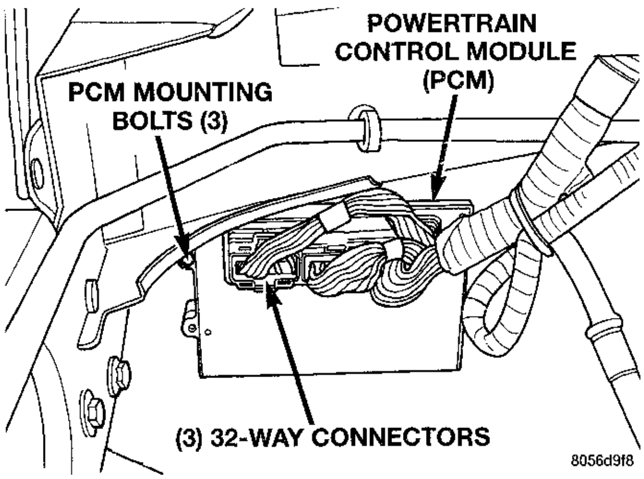

Fig. 40 Powertrain Control Module (PCM)

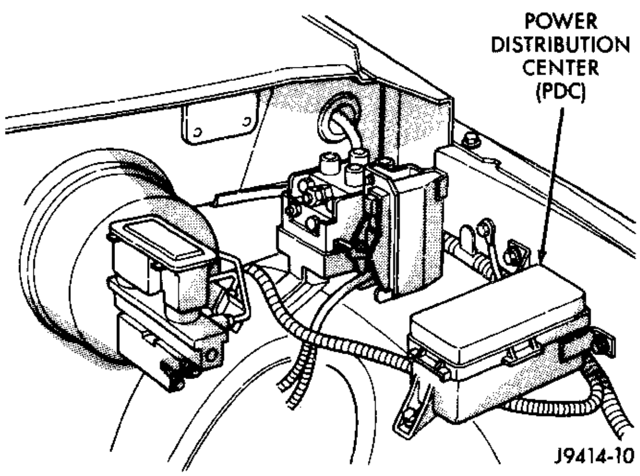

Fig. 41 Power Distribution Center (PDC)

(4) Inspect ignition coil pack primary connections. Verify that secondary cables are firmly connected to coils (Fig. 42).

(5) Be sure that spark plug cables are firmly connected and the spark plugs are in their correct firing order. Be sure that camshaft position sensor wire connector is firmly connected to harness connector. Inspect spark plug condition. Refer to Group 8D, Ignition. Connect vehicle to an oscilloscope and inspect spark events for fouled or damaged spark plugs or cables.

(6) Verify that generator output wire, generator connector and ground wire are firmly connected to the generator.

(7) Inspect the system body grounds for loose or dirty connections. Refer to Group 8, Wiring for ground locations.

(8) Verify crankcase ventilation (CCV) operation. Refer to Group 25, Emission Control System for additional information.

(9) Inspect fuel tube quick-connect fitting-to-fuel rail connections.

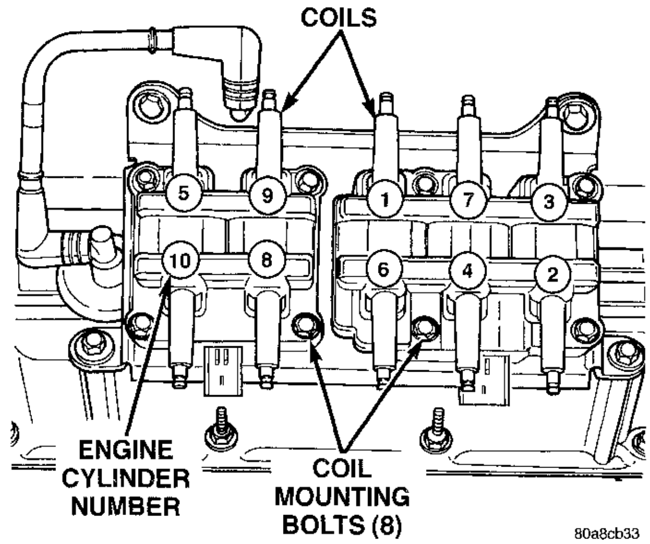

Fig. 42 Ignition Coil Pack—8.0L Engine

(10) Verify that hose connections to all ports of vacuum fittings on intake manifold are tight and not leaking.

(11) Inspect accelerator cable, transmission throttle cable (if equipped) and cruise control cable connections (if equipped). Check their connections to the throttle arm of throttle body for any binding or restrictions.

(12) If equipped with vacuum brake booster, verify that vacuum booster hose is firmly connected to fitting on intake manifold. Also check connection to brake vacuum booster.

(13) Inspect the air cleaner inlet and air cleaner element for dirt or restrictions.

(14) Inspect radiator grille area, radiator fins and air conditioning condenser for restrictions.

(15) Verify that the intake manifold air temperature sensor wire connector is firmly connected to harness connector (Fig. 43).

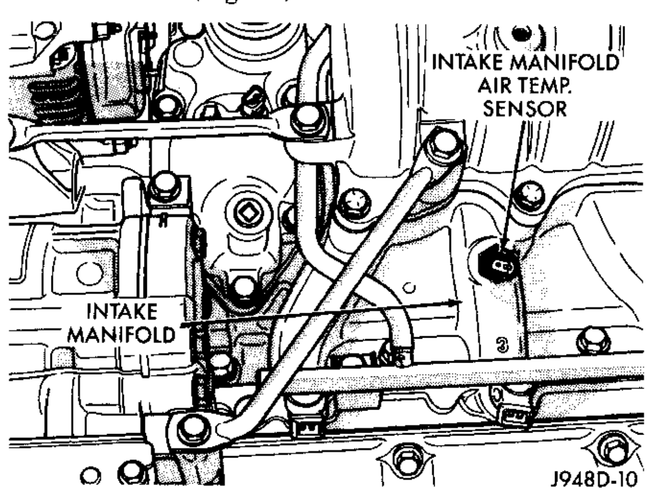

Fig. 43 Air Temperature Sensor—8.0L Engine

DIAGNOSIS AND TESTING (Continued)

(16) Verify that MAP sensor electrical connector is firmly connected to MAP sensor (Fig. 44).

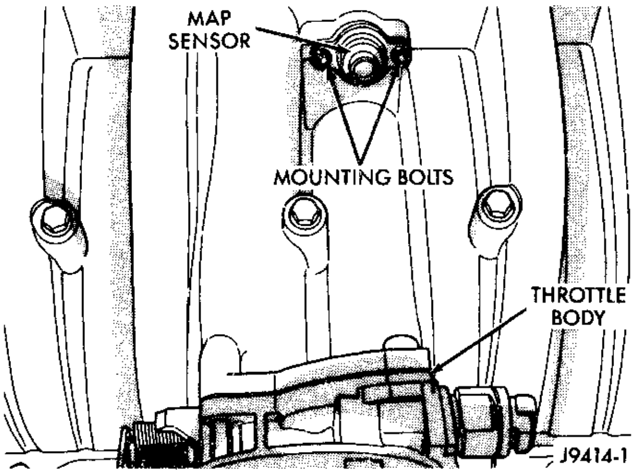

Fig. 44 Map Sensor —8.0L Engine

(17) Verify that fuel injector wire harness connectors are firmly connected to injectors in the correct order. Each harness connector is numerically tagged with the injector number (INJ 1, INJ 2 etc.) of its corresponding fuel injector and cylinder number.

(18) Verify harness connectors are firmly connected to idle air control (IAC) motor and throttle position sensor (TPS).

(19) Verify that wire harness connector is firmly connected to the engine coolant temperature sensor (Fig. 45).

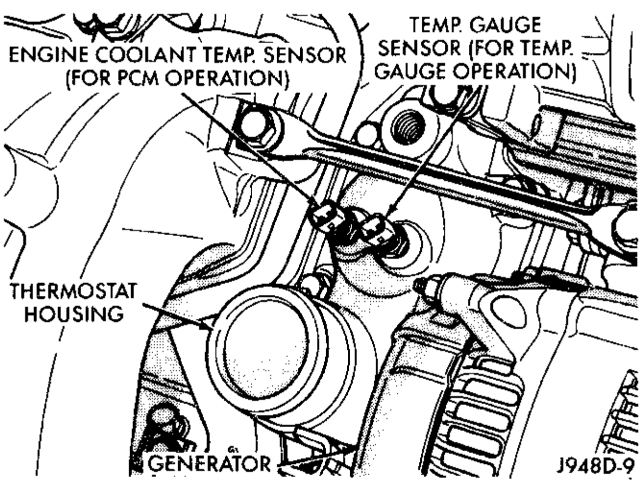

Fig. 45 Engine Coolant Temperature Sensor—8.0L Engine

(20) Raise and support the vehicle.

(21) On all 8.0L engines (HDC or MDC), verify that the left and right oxygen sensor wire connectors are firmly connected to the sensors. Inspect sensors and connectors for damage (Fig. 46).

(22) On 8.0L MDC engine, verify that the pre-catalyst and post catalyst oxygen sensor wire connectors are firmly connected to the sensors. Inspect sensors and connectors for damage (Fig. 47).

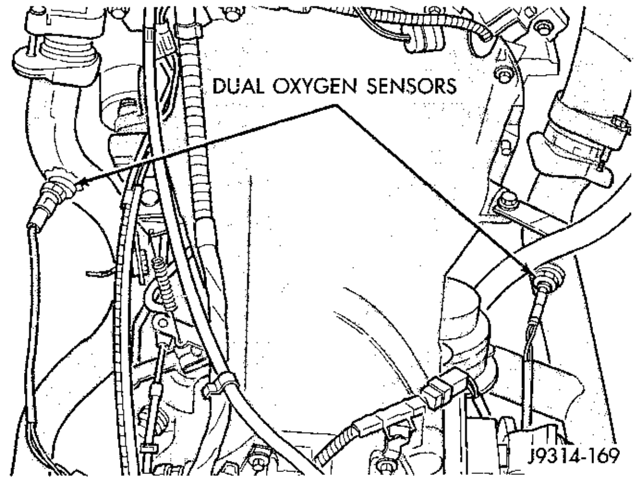

Fig. 46 Left/Right Oxygen Sensors

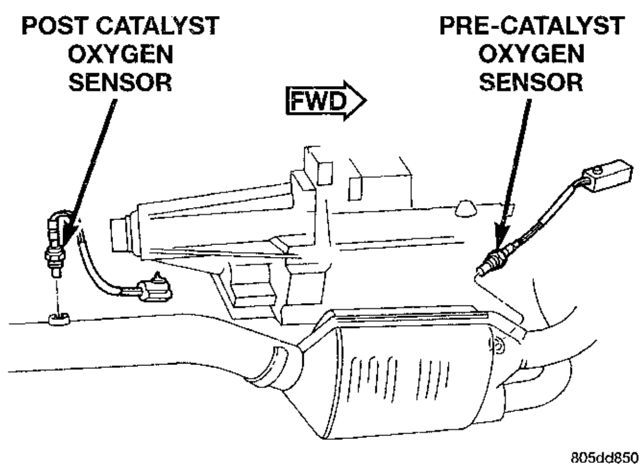

Fig. 47 Pre-Catalyst/Post Catalyst Oxygen Sensors

(23) Inspect for pinched or leaking fuel tubes. Inspect for pinched, cracked or leaking fuel hoses.

(24) Inspect for exhaust system restrictions such as pinched exhaust pipes, collapsed muffler or plugged catalytic convertor.

(25) If equipped with automatic transmission, verify that electrical harness is firmly connected to park/neutral switch. Refer to Automatic Transmission section of Group 21.

(26) Verify electrical harness is firmly connected to rear wheel speed sensor. Verify rear wheel speed sensor is firmly attached to rear axle with proper air gap. Refer to Group 5, Brakes for information.

(27) If equipped with 4–wheel antilock brake system, verify electrical harness is firmly connected to

DIAGNOSIS AND TESTING (Continued)

each front wheel speed sensor. Verify both front wheel speed sensors are firmly attached. Refer to Group 5, Brakes for information.

(28) Verify that fuel pump/gauge sender unit wire connector is firmly connected to harness connector.

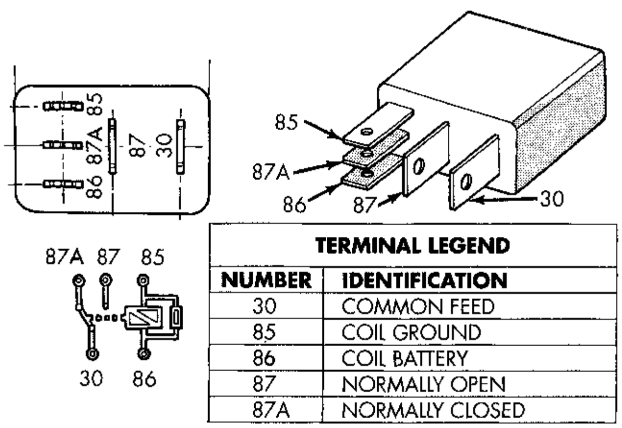
(29) Inspect fuel hoses at fuel pump/gauge sender unit for cracks or leaks.

(30) Inspect transmission torque convertor housing (automatic transmission) or clutch housing (manual transmission) for damage to timing ring on drive plate/flywheel.

(31) Verify that battery cable and solenoid feed wire connections to the starter solenoid are tight and clean. Inspect for chaffed wires or wires rubbing up against other components.

ASD AND FUEL PUMP RELAYS

The following description of operation and tests apply only to the Automatic Shutdown (ASD) and fuel pump relays. The terminals on the bottom of each relay are numbered (Fig. 48).



TERMINAL LEGEND	
NUMBER	**IDENTIFICATION**
30	COMMON FEED
85	COIL GROUND
86	COIL BATTERY
87	NORMALLY OPEN
87A	NORMALLY CLOSED

9514-16

Fig. 48 ASD and Fuel Pump Relay Terminals

OPERATION

- Terminal number 30 is connected to battery voltage. For both the ASD and fuel pump relays, terminal 30 is connected to battery voltage at all times.
- The PCM grounds the coil side of the relay through terminal number 85.
- Terminal number 86 supplies voltage to the coil side of the relay.
- When the PCM de-energizes the ASD and fuel pump relays, terminal number 87A connects to terminal 30. This is the Off position. In the off position, voltage is not supplied to the rest of the circuit. Terminal 87A is the center terminal on the relay.
- When the PCM energizes the ASD and fuel pump relays, terminal 87 connects to terminal 30. This is the On position. Terminal 87 supplies voltage to the rest of the circuit.

TESTING

The following procedure applies to the ASD and fuel pump relays.

(1) Remove relay from connector before testing.

(2) With the relay removed from the vehicle, use an ohmmeter to check the resistance between terminals 85 and 86. The resistance should be 75 ±5 ohms.

(3) Connect the ohmmeter between terminals 30 and 87A. The ohmmeter should show continuity between terminals 30 and 87A.

(4) Connect the ohmmeter between terminals 87 and 30. The ohmmeter should not show continuity at this time.

(5) Connect one end of a jumper wire (16 gauge or smaller) to relay terminal 85. Connect the other end of the jumper wire to the ground side of a 12 volt power source.

(6) Connect one end of another jumper wire (16 gauge or smaller) to the power side of the 12 volt power source. **Do not attach the other end of the jumper wire to the relay at this time.**

WARNING: DO NOT ALLOW OHMMETER TO CONTACT TERMINALS 85 OR 86 DURING THIS TEST.

(7) Attach the other end of the jumper wire to relay terminal 86. This activates the relay. The ohmmeter should now show continuity between relay terminals 87 and 30. The ohmmeter should not show continuity between relay terminals 87A and 30.

(8) Disconnect jumper wires.

(9) Replace the relay if it did not pass the continuity and resistance tests. If the relay passed the tests, it operates properly. Check the remainder of the ASD and fuel pump relay circuits. Refer to group 8W, Wiring Diagrams.

MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR TEST—3.9L/5.2L/5.9L ENGINES

To perform a complete test of MAP sensor (Fig. 49) and its circuitry, refer to DRB scan tool and appropriate Powertrain Diagnostics Procedures manual. To test the MAP sensor only, refer to the following:

(1) Inspect the rubber L-shaped fitting from the MAP sensor to the throttle body (Fig. 50). Repair as necessary.

CAUTION: When testing the MAP sensor, be sure that the harness wires are not damaged by the test meter probes.

(2) Test the MAP sensor output voltage at the MAP sensor connector between terminals A and B (Fig. 51). With the ignition switch ON and the engine OFF, output voltage should be 4-to-5 volts. The voltage should drop to 1-to-2.1 volts with a hot, neutral

DIAGNOSIS AND TESTING (Continued)

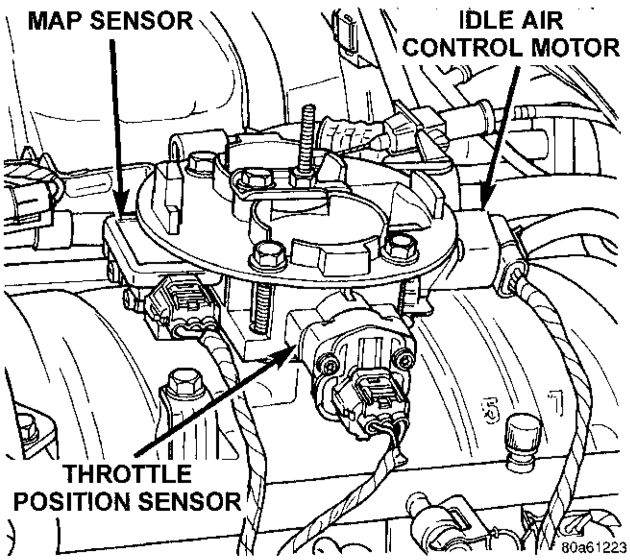


Fig. 49 Manifold Absolute Pressure (MAP) Sensor—3.9L/5.2L/5.9L Engines

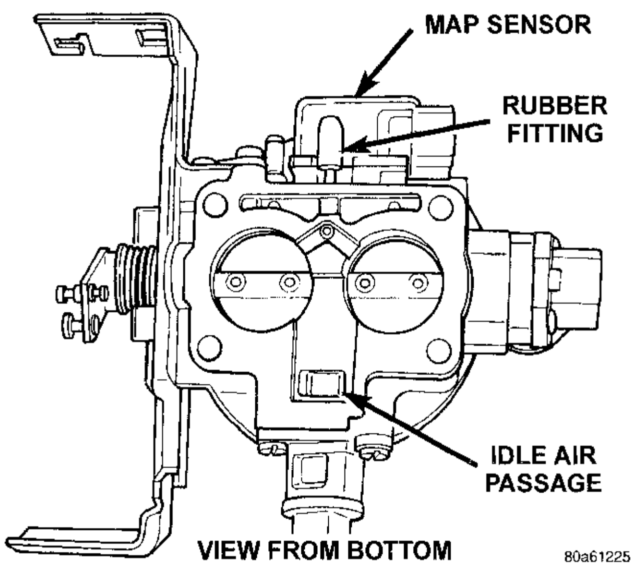

Fig. 50 Rubber L-Shaped Fitting—MAP Sensor-to-Throttle Body—3.9L/5.2L/5.9L Engines

idle speed condition. Voltage at higher elevations may be slightly lower 1–to-2.1 volts.

(3) Test powertrain control module (PCM) cavity A-27 for the same voltage described above to verify the wire harness condition. Repair as necessary.

(4) Test MAP sensor supply voltage at sensor connector between terminals A and C (Fig. 51) with the ignition ON. The voltage should be approximately 5 volts (±0.5V). Five volts (±0.5V) should also be at cavity A-17 of the PCM wire harness connector. Repair or replace the wire harness as necessary.

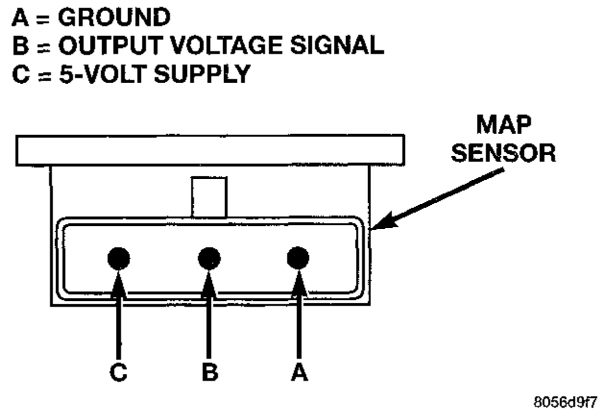

Fig. 51 MAP Sensor Connector Terminals—3.9L/5.2L/5.9L Engines

(5) Test the MAP sensor ground circuit at sensor connector terminal—A (Fig. 51) and PCM connector A-4. Repair the wire harness if necessary.

Refer to Group 8W, Wiring Diagrams for cavity locations.

MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR TEST—8.0L ENGINE

To perform a complete test of the MAP sensor (Fig. 52) and its circuitry, refer to DRB scan tool and appropriate Powertrain Diagnostics Procedures manual. To test the MAP sensor only, refer to the following:

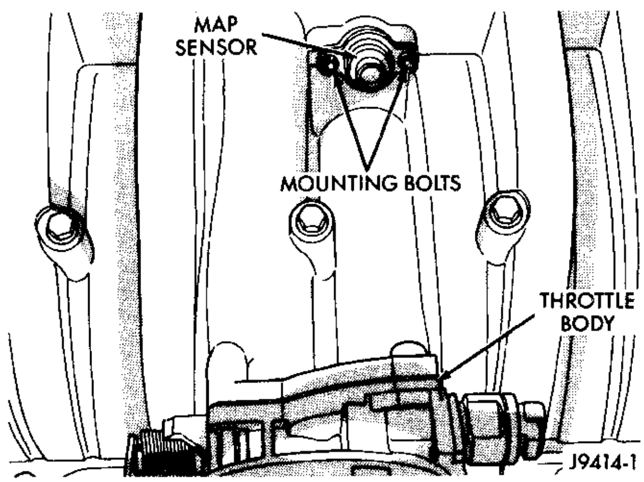

Fig. 52 Manifold Absolute Pressure (MAP) Sensor—8.0L Engine

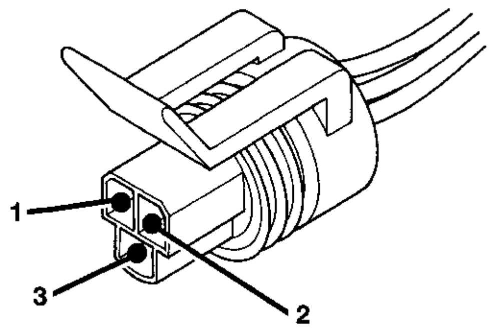
CAUTION: When testing the MAP sensor, be sure that the harness wires are not damaged by the test meter probes.

(1) Test the MAP sensor output voltage at the MAP sensor connector between terminals 1 and 3

DIAGNOSIS AND TESTING (Continued)

(Fig. 53). With the ignition switch ON and the engine OFF, output voltage should be 4-to-5 volts. The voltage should drop to 1.5-to-2.1 volts with a hot, neutral idle speed condition.



CAVITY	FUNCTION
1	5-Volt Supply
2	Sensor Ground
3	Map Sensor Signal

Fig. 53 MAP Sensor Connector Terminals—8.0L Engine

(2) Test powertrain control module (PCM) cavity A-27 for the same voltage described above to verify the wire harness condition. Repair as necessary.

(3) Test MAP sensor supply voltage at sensor connector between terminals 1 and 2 (Fig. 53) with the ignition ON. The voltage should be approximately 5 volts (±0.5V). Five volts (±0.5V) should also be at cavity A-17 of the PCM wire harness connector. Repair or replace the wire harness as necessary.

(4) Test the MAP sensor ground circuit at sensor connector terminal—2 (Fig. 53) and PCM connector A-4. Repair the wire harness if necessary.

Refer to Group 8W, Wiring Diagrams for cavity locations.

OXYGEN (O2S) SENSORS—3.9L/5.2L/5.9L LCD ENGINES

To perform a complete test of the O2S sensors and their circuitry, refer to the DRB scan tool and appropriate Powertrain Diagnostics Procedures manual. To test the O2S sensors only, refer to the following:

The upstream O2S sensor is located on the inlet end of the catalytic converter (Fig. 54).

The downstream O2S sensor is located on the outlet end of the catalytic converter (Fig. 54).

Each O2S heating element can be tested with an ohmmeter as follows:

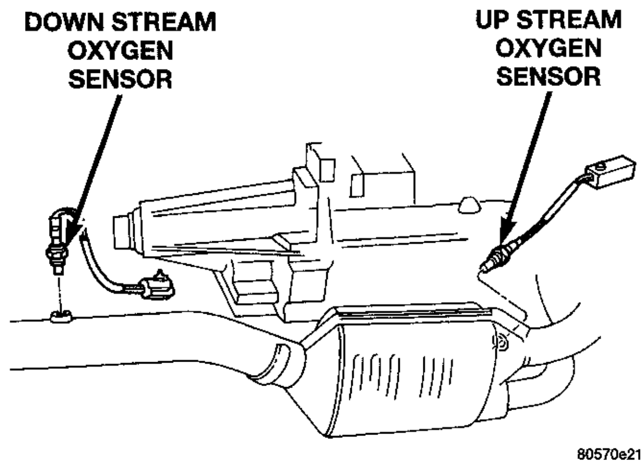


Fig. 54 Upstream/Downstream Oxygen Sensor Location—3.9L/5.2L/5.9L LDC Engines

Disconnect the O2S sensor connector. Connect the ohmmeter test leads across the white wire terminals of the sensor connector. Resistance should be between 4.5 ± .5 ohms and 7 ohms. Replace the sensor if the ohmmeter displays an infinity (open) reading.

OXYGEN (O2S) SENSORS—5.9L HDC ENGINE

To perform a complete test of the dual (left and right) O2S sensors and their circuitry, refer to the DRB scan tool and appropriate Powertrain Diagnostics Procedures manual. To test the O2S sensors only, refer to the following:

The left and right O2S sensors are located on the left and right exhaust downpipes (Fig. 55).

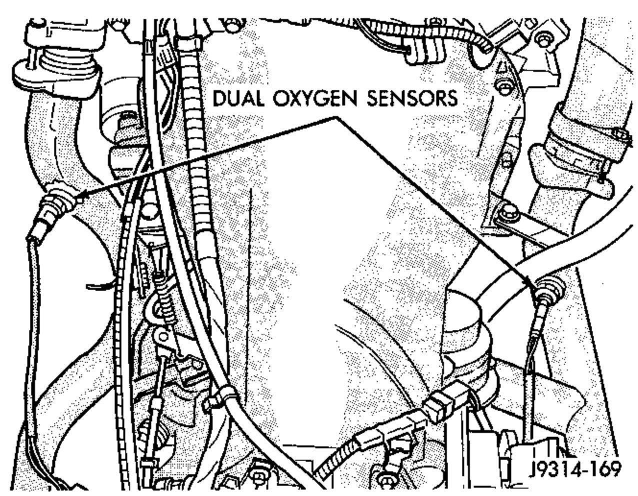

Fig. 55 Left/Right Oxygen Sensor Location—5.9L HDC Engine

Each O2S heating element can be tested with an ohmmeter as follows:

Disconnect the O2S sensor connector. Connect the ohmmeter test leads across the white wire terminals

DIAGNOSIS AND TESTING (Continued)

of the sensor connector. Resistance should be between 4.5 ± .5 ohms and 7 ohms. Replace the sensor if the ohmmeter displays an infinity (open) reading.

OXYGEN (O2S) SENSORS—8.0L HDC/MDC ENGINES

To perform a complete test of the O2S sensors and their circuitry, refer to the DRB scan tool and appropriate Powertrain Diagnostics Procedures manual. To test the O2S sensors only, refer to the following:

A total of 4 oxygen sensors (left, right, pre-catalyst and post catalyst) are used with the 8.0L engine when equipped with the Medium Duty Emission Cycle (MDC) engine package.

Only 2 oxygen sensors (left and right) are used with the 8.0L engine when equipped with the Heavy Duty Emission Cycle (HDC) engine.

The pre-catalyst O2S sensor is located on the inlet end of the catalytic converter (Fig. 56).

The post catalyst O2S sensor is located on the outlet end of the catalytic converter (Fig. 56).

The left and right sensors are located on the left and right exhaust downpipes (Fig. 57).

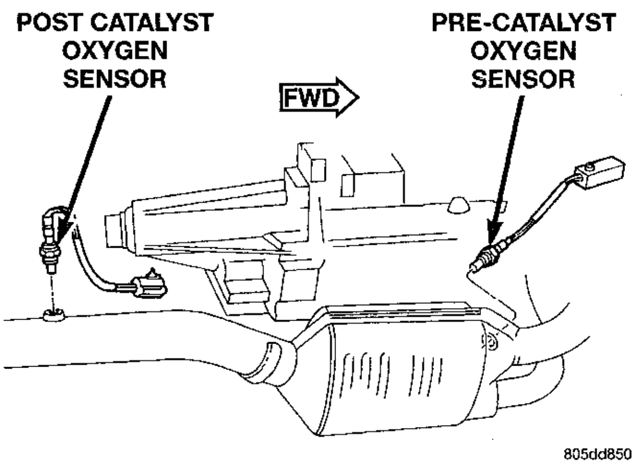

Fig. 56 Pre-Catalyst/Post Catalyst Oxygen Sensor Locations—HDC/MDC Engines

Each O2S heating element can be tested with an ohmmeter as follows:

Disconnect the O2S sensor connector. Connect the ohmmeter test leads across the white wire terminals of the sensor connector. Resistance should be between 4.5 ± .5 ohms and 7 ohms. Replace the sensor if the ohmmeter displays an infinity (open) reading.

CAMSHAFT AND CRANKSHAFT POSITION SENSORS

Refer to Group 8D, Ignition System for information.

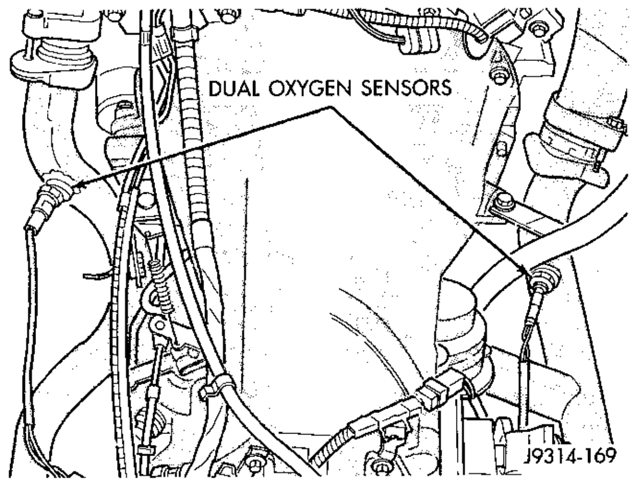

Fig. 57 Left/Right Oxygen Sensor Locations—HDC/MDC Engines

ENGINE COOLANT TEMPERATURE SENSOR—3.9L/5.2L/5.9L ENGINES

To perform a complete test of the engine coolant temperature sensor and its circuitry, refer to DRB scan tool and appropriate Powertrain Diagnostics Procedures manual. To test the sensor only, refer to the following:

(1) Disconnect wire harness connector from coolant temperature sensor (Fig. 58).

(2) **Engines with air conditioning:** When removing the connector from sensor, do not pull directly on wiring harness. Fabricate an L-shaped hook tool from a coat hanger (approximately eight inches long). Place the hook part of tool under the connector for removal. The connector is snapped onto the sensor. It is not equipped with a lock type tab.

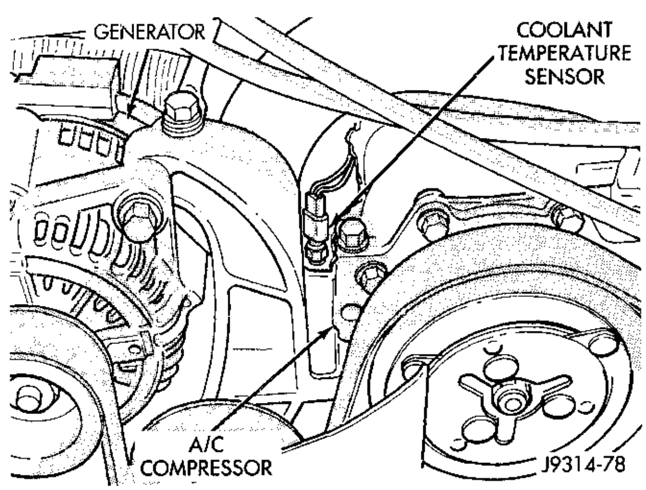

Fig. 58 Engine Coolant Temperature Sensor—3.9L/5.2L/5.9L Engines

(3) Test the resistance of the sensor with a high input impedance (digital) volt-ohmmeter. The resis-

DIAGNOSIS AND TESTING (Continued)

tance (as measured across the sensor terminals) should be as shown in the SENSOR RESISTANCE (OHMS)—COOLANT TEMPERATURE SENSOR/INTAKE AIR TEMPERATURE SENSOR chart. Replace the sensor if it is not within the range of resistance specified in chart.

SENSOR RESISTANCE (OHMS)—COOLANT TEMPERATURE SENSOR/INTAKE AIR TEMPERATURE SENSOR

TEMPERATURE		RESISTANCE (OHMS)	
°CEL.	°FAHR.	MIN.	MAX.
-40	-40	291,490	381,710
-20	-4	85,850	108,390
-10	14	49,250	61,430
0	32	29,330	35,990
10	50	17,990	21,810
20	68	11,370	13,610
25	77	9,120	10,880
30	86	7,370	8,750
40	104	4,900	5,750
50	122	3,330	3,880
60	140	2,310	2,670
70	158	1,630	1,870
80	176	1,170	1,340
90	194	860	970
100	212	640	720
110	230	480	540
120	248	370	410

(4) Test continuity of the wire harness between the PCM wire harness connector and the coolant sensor connector terminals. Refer to Group 8, Wiring for terminal/cavity locations. Repair the wire harness if an open circuit is indicated.

(5) After tests are completed, connect electrical connector to sensor. The sensor connector is symmetrical (not indexed). It can be installed to the sensor in either direction.

ENGINE COOLANT TEMPERATURE SENSOR—8.0L ENGINE

To perform a complete test of the engine coolant temperature sensor and its circuitry, refer to DRB scan tool and appropriate Powertrain Diagnostics Procedures manual. To test the sensor only, refer to the following:

(1) Disconnect wire harness connector from coolant temperature sensor (Fig. 59).

(2) Test the resistance of the sensor with a high input impedance (digital) volt-ohmmeter. The resistance (as measured across the sensor terminals) should be as shown in the SENSOR RESISTANCE (OHMS)—COOLANT TEMPERATURE SENSOR/INTAKE AIR TEMPERATURE SENSOR chart. Replace the sensor if it is not within the range of resistance specified in the chart.

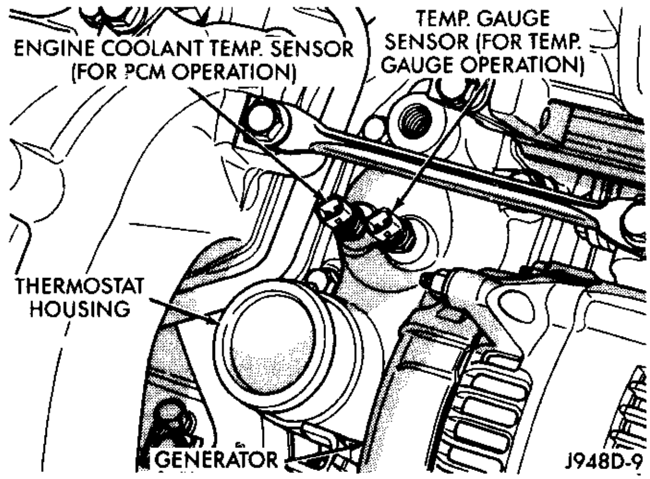

Fig. 59 Engine Coolant Temperature Sensor—8.0L Engine

(3) Test continuity of the wire harness between the PCM wire harness connector and the coolant sensor connector terminals. Refer to Group 8, Wiring for terminal/cavity locations. Repair the wire harness if an open circuit is indicated.

(4) After tests are completed, connect electrical connector to sensor.

IDLE AIR CONTROL (IAC) MOTOR—3.9L/5.2L/5.9L ENGINES

To perform a complete test of the IAC motor and its circuitry, refer to DRB scan tool and appropriate Powertrain Diagnostics Procedures manual.

IDLE AIR CONTROL (IAC) MOTOR—8.0L ENGINE

To perform a complete test of the IAC motor and its circuitry, refer to DRB scan tool and appropriate Powertrain Diagnostics Procedures manual.

INTAKE MANIFOLD AIR TEMPERATURE SENSOR—3.9L/5.2L/5.9L ENGINES

To perform a complete test of the intake manifold air temperature sensor and its circuitry, refer to DRB tester and appropriate Powertrain Diagnostics Procedures manual. To test the sensor only, refer to the following:

(1) Disconnect the wire harness connector from the intake manifold air temperature sensor (Fig. 60).

(2) Test the resistance of the sensor with an input impedance (digital) volt-ohmmeter. The resistance (as measured across the sensor terminals) should be as shown in the SENSOR RESISTANCE (OHMS)—COOLANT TEMPERATURE SENSOR/INTAKE AIR TEMPERATURE SENSOR chart. Replace the sensor

DIAGNOSIS AND TESTING (Continued)

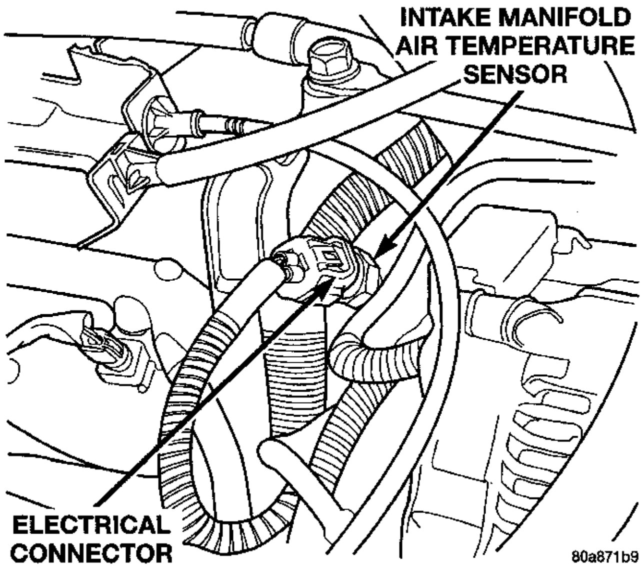

Fig. 60 Intake Manifold Air Temperature Sensor—3.9L/5.2L/5.9L Engines—Typical (V-8 Shown)

if it is not within range of resistance specified in chart.

(3) Test the resistance of the wire harness. Do this between the PCM wire harness connector A-15 and the sensor connector terminal. Also check between PCM connector A-4 to the sensor connector terminal. Repair the wire harness as necessary if the resistance is greater than 1 ohm.

INTAKE MANIFOLD AIR TEMPERATURE SENSOR—8.0L ENGINE

To perform a complete test of the intake manifold air temperature sensor and its circuitry, refer to DRB tester and appropriate Powertrain Diagnostics Procedures manual. To test the sensor only, refer to the following:

(1) Disconnect the wire harness connector from the intake manifold air temperature sensor (Fig. 61).

(2) Test the resistance of the sensor with an input impedance (digital) volt-ohmmeter. The resistance (as measured across the sensor terminals) should be as shown in the SENSOR RESISTANCE (OHMS)—COOLANT TEMPERATURE SENSOR/INTAKE AIR TEMPERATURE SENSOR chart. Replace the sensor if it is not within the range of resistance specified in chart.

(3) Test the resistance of the wire harness. Do this between the PCM wire harness connector A-15 and the sensor connector terminal. Also check between PCM connector A-4 to the sensor connector terminal. Repair the wire harness as necessary if the resistance is greater than 1 ohm.

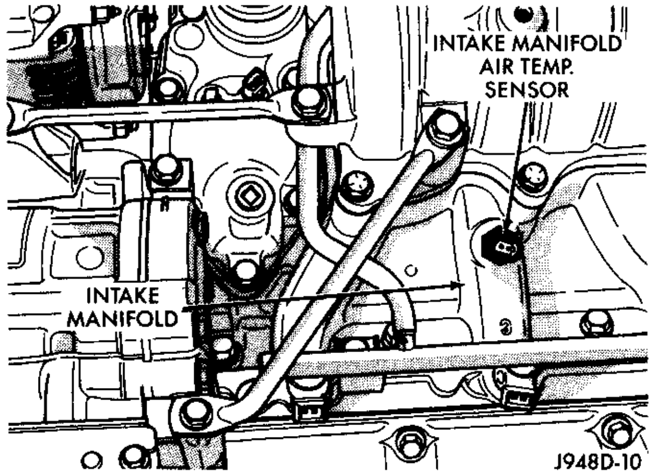

Fig. 61 Intake Manifold Air Temperature Sensor—8.0L Engine

THROTTLE POSITION SENSOR (TPS)—3.9L/5.2L/5.9L ENGINES

To perform a complete test of the TPS and its circuitry, refer to the DRB scan tool and appropriate Powertrain Diagnostics Procedures manual. To test the TPS only, refer to the following:

The TPS can be tested with a digital voltmeter. The center terminal of the TPS is the output terminal (Fig. 62).

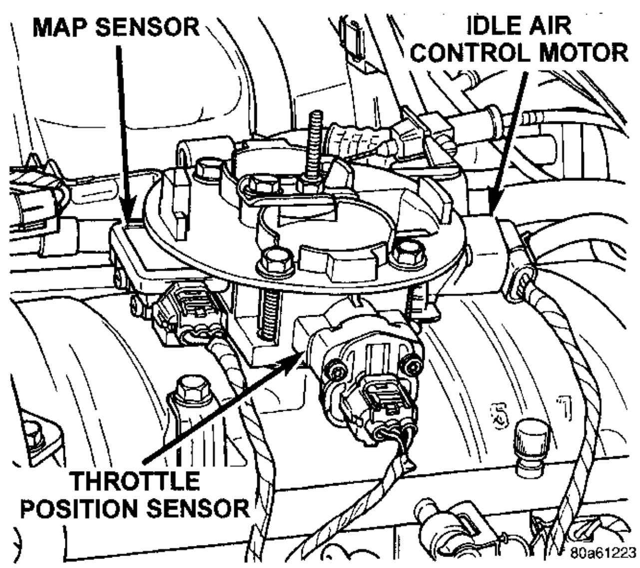

Fig. 62 TPS—3.9L/5.2L/5.9L Engines

With the ignition key in the ON position, check the TPS output voltage at the center terminal wire of the connector. Check this at idle (throttle plate closed) and at wide open throttle (WOT). At idle, TPS output voltage should be greater than .350 millivolts and less than 900 millivolts. At wide open throttle, TPS output voltage must be less than 4.5 volts. The out-

DIAGNOSIS AND TESTING (Continued)

put voltage should increase gradually as the throttle plate is slowly opened from idle to WOT.

THROTTLE POSITION SENSOR (TPS)—8.0L ENGINE

To perform a complete test of the TPS and its circuitry, refer to the DRB scan tool and appropriate Powertrain Diagnostics Procedures manual. To test the TPS only, refer to the following:

The TPS can be tested with a digital voltmeter. The center terminal of the TPS is the output terminal (Fig. 63).

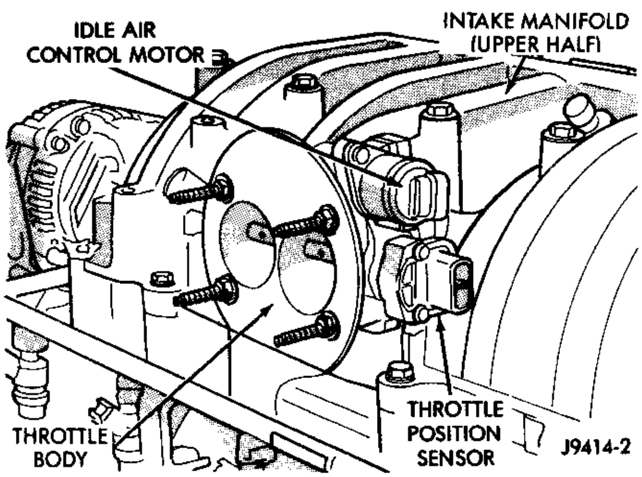

Fig. 63 TPS—8.0L Engine

With the ignition key in the ON position, check the TPS output voltage at the center terminal wire of the connector. Check this at idle (throttle plate closed) and at wide open throttle (WOT). At idle, TPS output voltage should be greater than .350 millivolts and less than 900 millivolts. At wide open throttle, TPS output voltage must be less than 4.5 volts. The output voltage should increase gradually as the throttle plate is slowly opened from idle to WOT.

THROTTLE BODY MINIMUM AIR FLOW CHECK PROCEDURE

3.9/5.2/5.9L ENGINES

The following test procedure has been developed to check throttle body calibrations for correct idle conditions. The procedure should be used to diagnose the throttle body for conditions that may cause idle problems. **This procedure should be used only after normal diagnostic procedures have failed to produce results that indicate a throttle body related problem. Be sure to check for proper operation of the idle air control motor before performing this test.**

A special fixed orifice tool (number 6714) (Fig. 64) must be used for the following test.

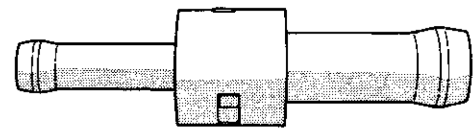

Fig. 64 Fixed Orifice Tool

(1) Start the engine and bring to operating temperature. Be sure all accessories are off before performing this test.

(2) Shut off the engine and remove the air duct at throttle body.

(3) Disconnect the vacuum line at the PCV valve (Fig. 65).

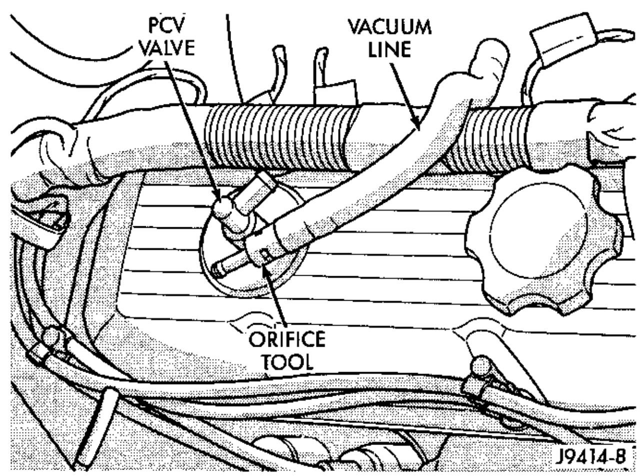

Fig. 65 Install Orifice Tool

(4) Install the 0.185 inch orifice tool (number 6714) into the disconnected vacuum line in place of the PCV valve (Fig. 65).

(5) Disconnect the idle purge vacuum line from fitting at throttle body. This vacuum line is located on the front of throttle body next to the MAP sensor (Fig. 66). Cap the fitting at throttle body after vacuum line has been removed.

(6) Connect the DRB scan tool to the 16–way data link connector. This connector is located under the instrument panel to the left of the steering column. Refer to the appropriate Powertrain Diagnostic Procedures service manual for DRB operation.

(7) Start the engine and allow to warm up.

(8) Using the DRB scan tool, scroll through the menus as follows: select—Stand Alone DRB III, select 1998 Diagnostics, select—Engine, select—System Test, select—Minimum Air Flow.

DIAGNOSIS AND TESTING (Continued)

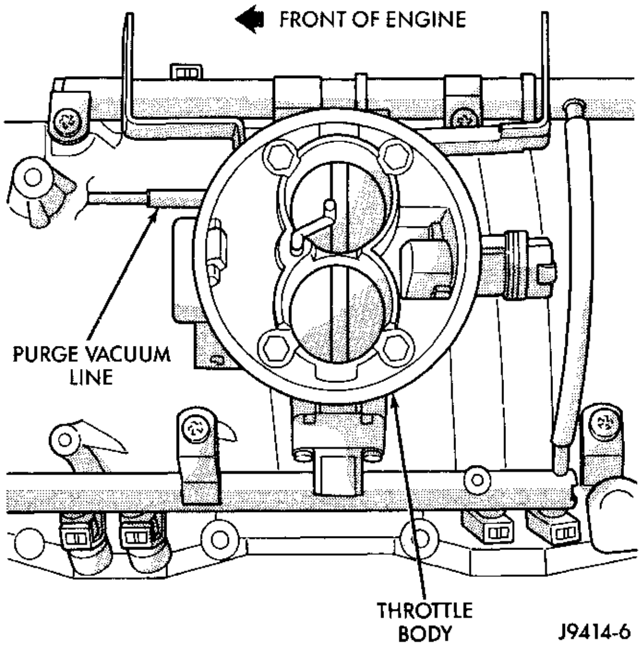

Fig. 66 Idle Purge Line

(9) The DRB scan tool will count down to stabilize the idle rpm and display the minimum air flow idle rpm. The idle rpm should be between **500 and 900 rpm.** If the idle speed is outside of these specifications, replace the throttle body. Refer to Throttle Body in the Component Removal/Installation section of this group.

(10) Disconnect the DRB scan tool from the vehicle.

(11) Remove cap from idle purge fitting at throttle body and install vacuum line.

(12) Remove orifice tool and connect vacuum line to PCV valve.

(13) Install air duct to throttle body.

REMOVAL AND INSTALLATION

AUTOMATIC SHUTDOWN (ASD) RELAY

The ASD relay is located in the Power Distribution Center (PDC) (Fig. 67). Refer to label on PDC cover for relay location.

REMOVAL

(1) Remove PDC cover.

(2) Remove relay from PDC.

(3) Check condition of relay terminals and PDC connector terminals for damage or corrosion. Repair if necessary before installing relay.

(4) Check for pin height (pin height should be the same for all terminals within the PDC connector). Repair if necessary before installing relay.

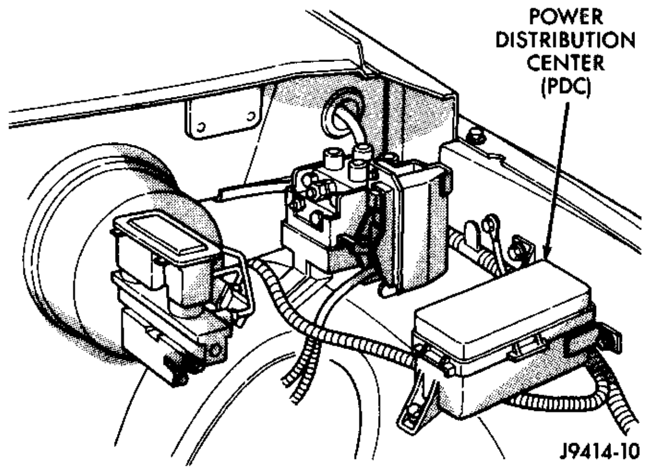

Fig. 67 Power Distribution Center (PDC)

INSTALLATION

(1) Install relay to PDC.

(2) Install cover to PDC.

FUEL PUMP RELAY

The fuel pump relay is located in the Power Distribution Center (PDC) (Fig. 67). Refer to label on PDC cover for relay location.

REMOVAL

(1) Remove PDC cover.

(2) Remove relay from PDC.

(3) Check condition of relay terminals and PDC connector terminals for damage or corrosion. Repair if necessary before installing relay.

(4) Check for pin height (pin height should be the same for all terminals within the PDC connector). Repair if necessary before installing relay.

INSTALLATION

(1) Install relay to PDC.

(2) Install cover to PDC.

THROTTLE BODY—3.9L/5.2L/5.9L ENGINES

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the powertrain control module (PCM).

REMOVAL

(1) Remove the air cleaner.

(2) Disconnect throttle body electrical connectors at MAP sensor, IAC motor and TPS (Fig. 68).

(3) Remove vacuum line at throttle body.

(4) Remove all control cables from throttle body (lever) arm. Refer to the Accelerator Pedal and Throttle Cable section of this group for additional information.

Mopar AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

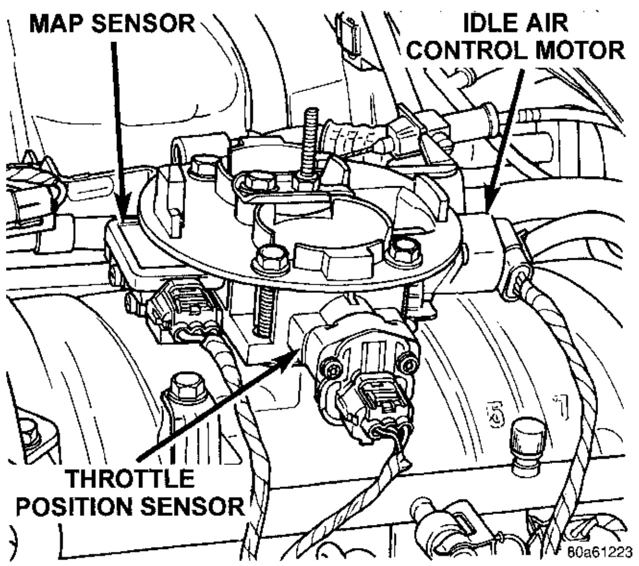

Fig. 68 Sensor Electrical Connectors—3.9L/5.2L/5.9L Engines—Typical

(5) Remove four throttle body mounting bolts (Fig. 69).

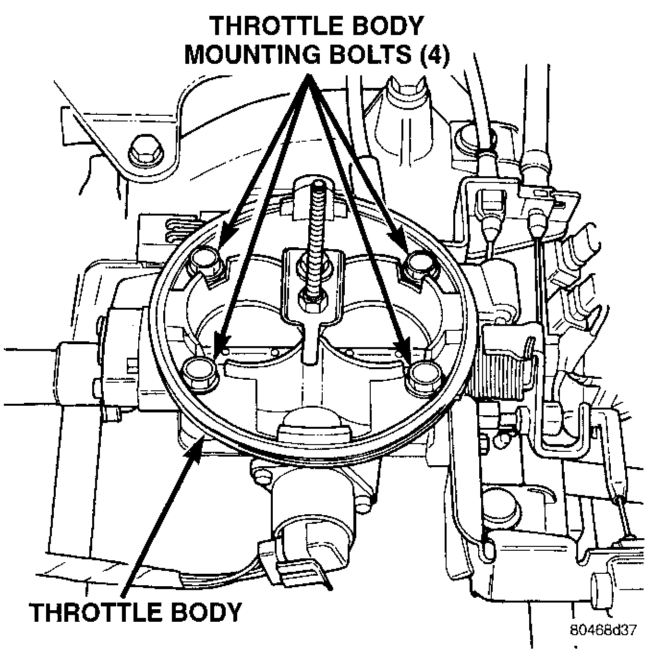

Fig. 69 Throttle Body Mounting Bolts—3.9L/5.2L/5.9L ENGINES—Typical

(6) Remove throttle body from intake manifold.
(7) Discard old throttle body-to-intake manifold gasket.

INSTALLATION

(1) Clean the mating surfaces of the throttle body and the intake manifold.
(2) Install new throttle body-to-intake manifold gasket.
(3) Install throttle body to intake manifold.
(4) Install four mounting bolts. Tighten bolts to 23 N·m (200 in. lbs.) torque.
(5) Install control cables.
(6) Install vacuum line to throttle body.
(7) Install electrical connectors.
(8) Install air cleaner.

THROTTLE BODY—8.0L ENGINE

A (factory adjusted) set screw is used to mechanically limit the position of the throttle body throttle plate. **Never attempt to adjust the engine idle speed using this screw.** All idle speed functions are controlled by the powertrain control module (PCM).

REMOVAL

(1) Remove the air cleaner cover.
(2) Remove the 4 air cleaner housing mounting nuts and remove housing from throttle body.
(3) Disconnect throttle body electrical connectors at the IAC motor and TPS.
(4) Remove all control cables from throttle body (lever) arm. Refer to the Accelerator Pedal and Throttle Cable section of this group for additional information.
(5) Remove four throttle body mounting nuts (Fig. 70).

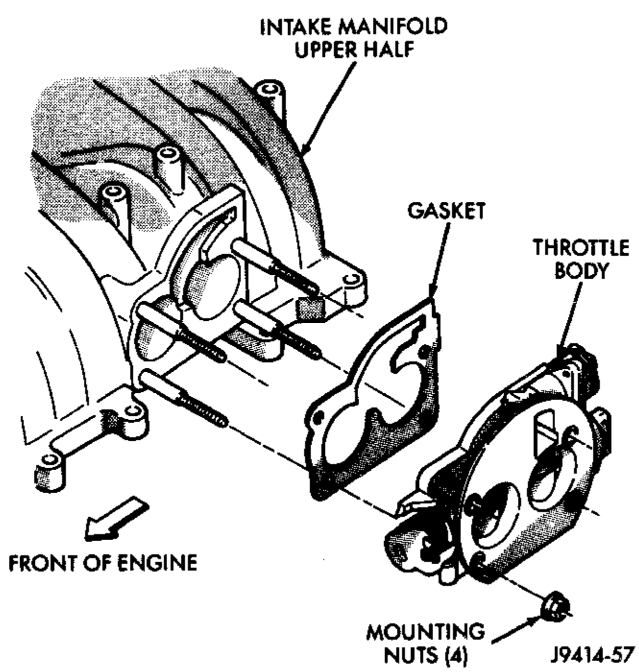

Fig. 70 Throttle Body Mounting Nuts—8.0L Engine

(6) Remove throttle body from intake manifold.
(7) Discard old throttle body-to-intake manifold gasket.

REMOVAL AND INSTALLATION (Continued)

INSTALLATION

(1) Clean the mating surfaces of the throttle body and the intake manifold.

(2) Install new throttle body-to-intake manifold gasket.

(3) Install throttle body to intake manifold.

(4) Install four mounting nuts. Tighten nuts to 22 N·m (192 in. lbs.) torque.

(5) Install control cables.

(6) Install electrical connectors.

(7) Install air cleaner housing to throttle body.

(8) Install 4 air cleaner housing mounting nuts. Tighten nuts to 11 N·m (96 in. lbs.) torque.

(9) Install air cleaner housing cover.

THROTTLE POSITION SENSOR (TPS)—3.9L/5.2L/5.9L ENGINES

REMOVAL

The TPS is located on the side of the throttle body.

(1) Remove air intake tube at throttle body.

(2) Disconnect TPS electrical connector.

(3) Remove two TPS mounting bolts (Fig. 71).

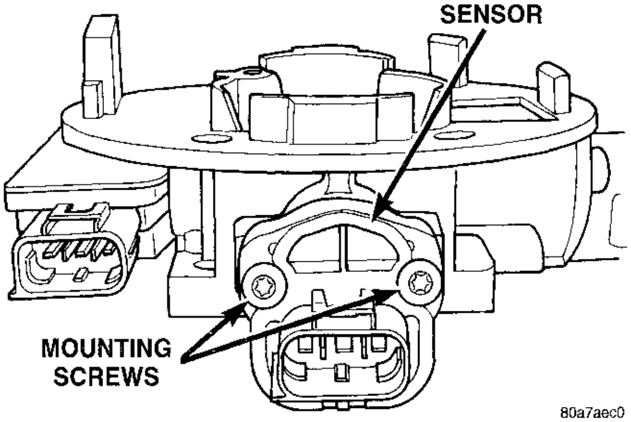

Fig. 71 TPS Mounting Bolts—3.9L/5.2L/5.9L Engines

(4) Remove TPS from throttle body.

INSTALLATION

The throttle shaft end of the throttle body slides into a socket in the TPS (Fig. 72). The TPS must be installed so that it can be rotated a few degrees. If the sensor will not rotate, install the sensor with the throttle shaft on the other side of the socket tangs. The TPS will be under slight tension when rotated.

(1) Install the TPS and two retaining bolts.

(2) Tighten bolts to 7 N·m (60 in. lbs.) torque.

(3) Manually operate the throttle control lever by hand to check for any binding of the TPS.

(4) Connect TPS electrical connector to TPS.

(5) Install air intake tube.

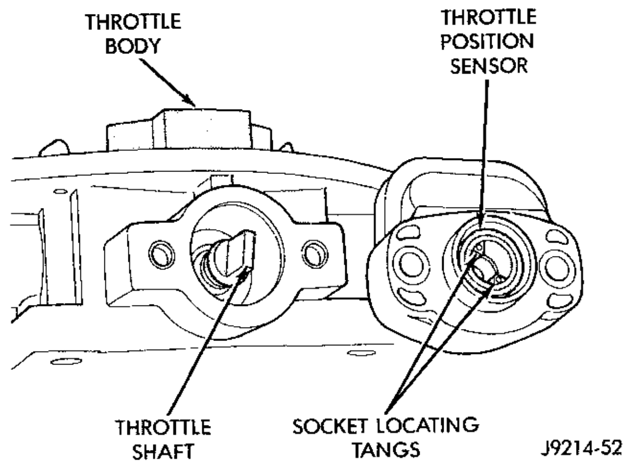

Fig. 72 Installation—3.9L/5.2L/5.9L Engines—Typical

THROTTLE POSITION SENSOR (TPS)—8.0L ENGINE

REMOVAL

The TPS is located on the side of the throttle body (Fig. 73).

(1) Remove air intake tube at air cleaner housing.

(2) Remove the air cleaner cover.

(3) Remove the 4 air cleaner housing mounting nuts and remove housing from throttle body.

(4) Disconnect TPS electrical connector.

(5) Remove two TPS mounting bolts (Fig. 73).

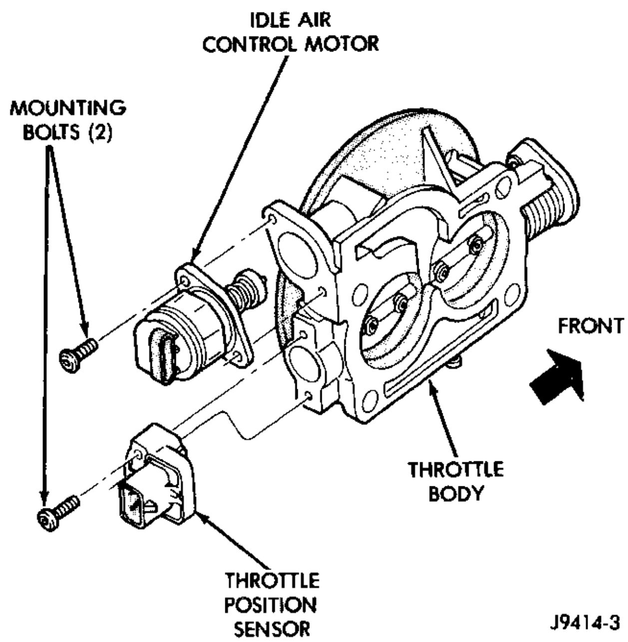

Fig. 73 TPS Mounting Bolts—8.0L Engine

(6) Remove TPS from throttle body.

REMOVAL AND INSTALLATION (Continued)

INSTALLATION

The throttle shaft end of the throttle body slides into a socket in the TPS (Fig. 74). The TPS must be installed so that it can be rotated a few degrees. If the sensor will not rotate, install the sensor with the throttle shaft on the other side of the socket tangs. The TPS will be under slight tension when rotated.

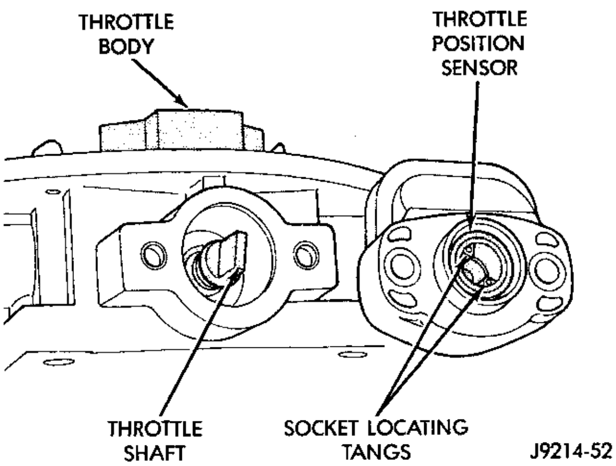

Fig. 74 Installation—Typical Mounting

(1) Install the TPS and two retaining bolts.
(2) Tighten bolts to 7 N·m (60 in. lbs.) torque.
(3) Manually operate the throttle control lever by hand to check for any binding of the TPS.
(4) Connect TPS electrical connector to TPS.
(5) Install air cleaner housing to throttle body.
(6) Install 4 air cleaner housing mounting nuts. Tighten nuts to 11 N·m (96 in. lbs.) torque.
(7) Install air cleaner housing cover.
(8) Install air intake tube to cover.

IDLE AIR CONTROL (IAC) MOTOR—3.9L/5.2L/5.9L ENGINES

The IAC motor is located on the back of the throttle body (Fig. 75).

REMOVAL

(1) Remove air cleaner assembly.
(2) Disconnect electrical connector from IAC motor.
(3) Remove two mounting bolts (screws) (Fig. 75).
(4) Remove IAC motor from throttle body.

INSTALLATION

(1) Install IAC motor to throttle body.
(2) Install and tighten two mounting bolts (screws) to 7 N·m (60 in. lbs.) torque.
(3) Install electrical connector.
(4) Install air cleaner assembly.

IDLE AIR CONTROL (IAC) MOTOR—8.0L ENGINE

The IAC motor is located on the back of the throttle body (Fig. 76).

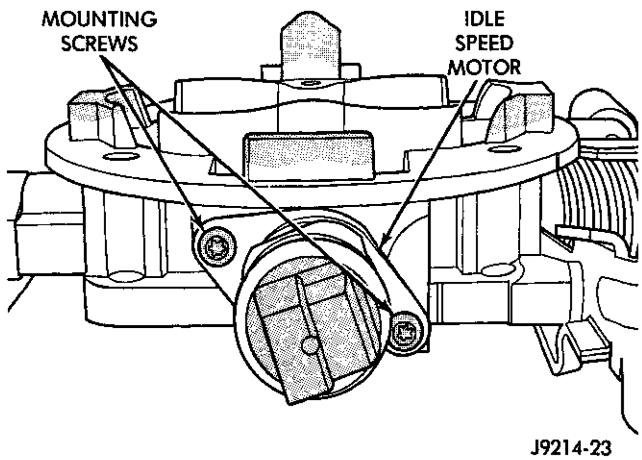

Fig. 75 Mounting Bolts (Screws)—IAC Motor—3.9L/5.2L/5.9L Engines

REMOVAL

(1) Remove the air cleaner cover.
(2) Remove the 4 air cleaner housing mounting nuts and remove housing from throttle body.
(3) Disconnect electrical connector from IAC motor.
(4) Remove two mounting bolts (screw).

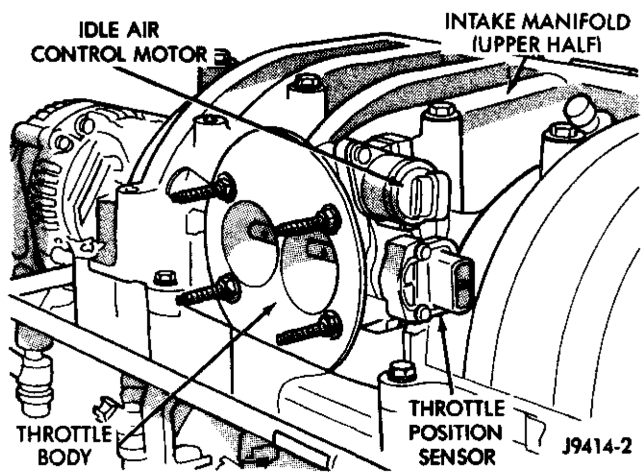

Fig. 76 IAC Motor—8.0L Engine

(5) Remove IAC motor from throttle body.

INSTALLATION

(1) Install IAC motor to throttle body.
(2) Install and tighten two mounting bolts (screws) to 7 N·m (60 in. lbs.) torque.
(3) Install electrical connector.
(4) Install air cleaner housing to throttle body.
(5) Install 4 air cleaner housing mounting nuts. Tighten nuts to 11 N·m (96 in. lbs.) torque.
(6) Install air cleaner housing cover.

REMOVAL AND INSTALLATION (Continued)

MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR—3.9L/5.2L/5.9L ENGINES

The MAP sensor is located on the front of the throttle body (Fig. 77). An L-shaped rubber fitting is used to connect the MAP sensor to throttle body (Fig. 78).

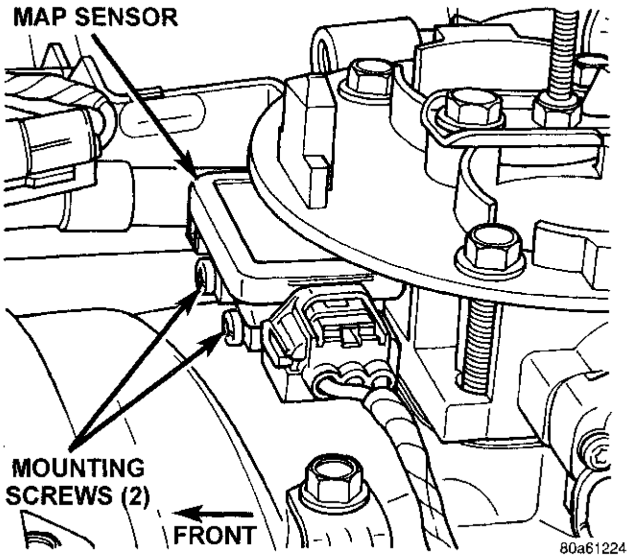

Fig. 77 MAP Sensor Location—3.9L/5.2L/5.9L Engines

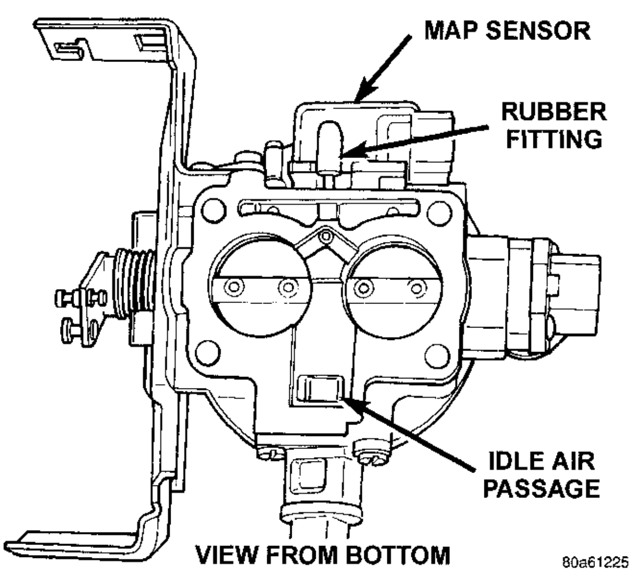

Fig. 78 MAP Sensor L-Shaped Rubber Fitting—3.9L/5.2L/5.9L Engines

REMOVAL

(1) Remove air cleaner assembly.

(2) Remove two MAP sensor mounting bolts (screws) (Fig. 77).

(3) While removing MAP sensor, slide the vacuum rubber L-shaped fitting (Fig. 78) from the throttle body.

(4) Remove rubber L-shaped fitting from MAP sensor.

INSTALLATION

(1) Install rubber L-shaped fitting to MAP sensor.

(2) Position sensor to throttle body while guiding rubber fitting over throttle body vacuum nipple.

(3) Install MAP sensor mounting bolts (screws). Tighten screws to 3 N·m (25 in. lbs.) torque.

(4) Install air cleaner.

MANIFOLD ABSOLUTE PRESSURE (MAP) SENSOR—8.0L ENGINE

The MAP sensor is mounted into the right upper side of the intake manifold (Fig. 79). A rubber gasket is used to seal the sensor to the intake manifold. The rubber gasket is part of the sensor and is not serviced separately.

REMOVAL

(1) Remove the electrical connector at the sensor.

(2) Clean the area around the sensor before removal.

(3) Remove the two sensor mounting bolts.

(4) Remove the sensor from the intake manifold.

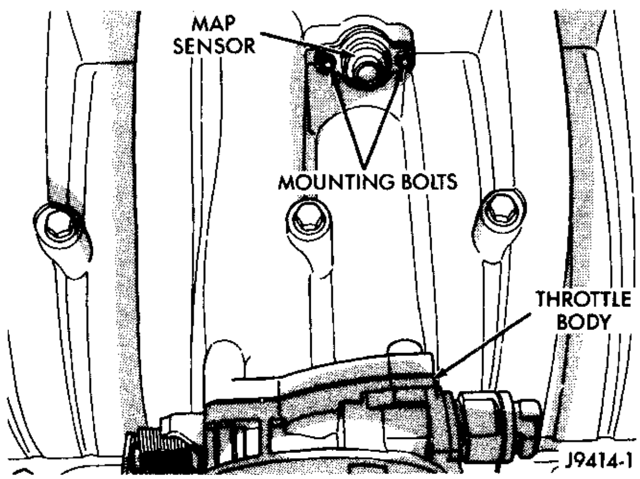

Fig. 79 MAP Sensor Location—8.0L V-10 Engine—Typical

INSTALLATION

(1) Check the condition of the sensor seal. Clean the sensor and lubricate the rubber gasket with clean engine oil.

(2) Clean the sensor opening in the intake manifold.

(3) Install the sensor into the intake manifold.

(4) Install sensor mounting bolts. Tighten bolts to 2 N·m (20 in. lbs.) torque.

(5) Install the electrical connector to sensor.

REMOVAL AND INSTALLATION (Continued)

DUTY CYCLE EVAP CANISTER PURGE SOLENOID

Refer to Group 25, Emission Control System for removal/installation procedures.

POWERTRAIN CONTROL MODULE (PCM)

The PCM is located in the engine compartment (Fig. 80).

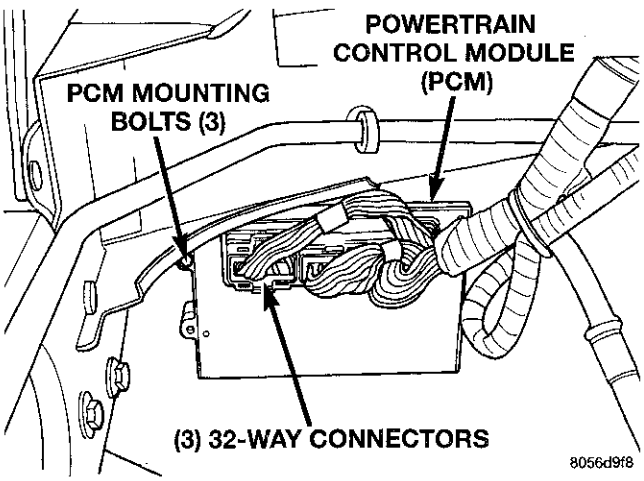

Fig. 80 PCM Location and Mounting

REMOVAL

To avoid possible voltage spike damage to the PCM, ignition key must be off, and negative battery cable must be disconnected before unplugging PCM connectors.

(1) Disconnect negative battery cable(s) at battery(s).

(2) Remove cover over electrical connectors. Cover snaps onto PCM.

(3) Carefully unplug the three 32–way connectors from PCM.

(4) Remove three PCM mounting bolts and remove PCM from vehicle.

INSTALLATION

(1) Install PCM and mounting bolts to vehicle.

(2) Tighten bolts to 4 N·m (35 in. lbs.).

(3) Check pin connectors in the PCM and the three 32–way connectors for corrosion or damage. Repair as necessary.

(4) Install three 32–way connectors.

(5) Install cover over electrical connectors. Cover snaps onto PCM.

(6) Install battery cable(s).

(7) Use the DRB scan tool to reprogram new PCM with vehicles original Identification Number (VIN) and original vehicle mileage. If this step is not done, a Diagnostic Trouble Code (DTC) may be set.

CRANKSHAFT POSITION SENSOR

Refer to Group 8D, Ignition System for removal/installation procedures.

CAMSHAFT POSITION SENSOR

For removal/installation procedures, refer to Group 8D, Ignition System. See Camshaft Position Sensor.

OXYGEN SENSORS—3.9L/5.2L/5.9L LDC/HDC ENGINES

On 3.9L/5.2L/5.9L LDC engines, the upstream and downstream O2S sensors are located at the inlet and outlet ends of the catalytic converter (Fig. 81).

On 5.9L HDC engines, the left and right O2S sensors are located on the left and right exhaust downpipes (Fig. 82).

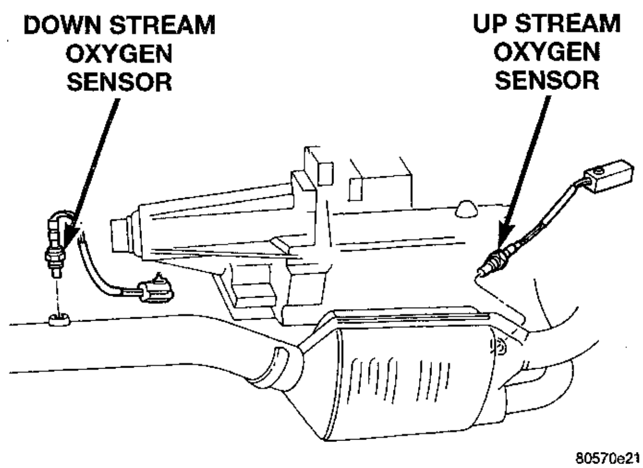

Fig. 81 Oxygen Sensor Location—3.9L/5.2L/5.9L LDC ENGINES

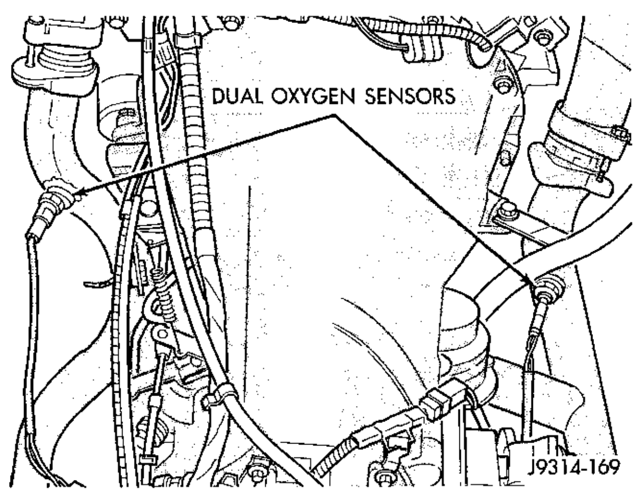

Fig. 82 Oxygen Sensor Location—5.9L HDC ENGINES

REMOVAL

WARNING: THE EXHAUST MANIFOLD, EXHAUST PIPES AND CATALYTIC CONVERTER BECOME VERY HOT DURING ENGINE OPERATION. ALLOW ENGINE TO COOL BEFORE REMOVING OXYGEN SENSOR.

REMOVAL AND INSTALLATION (Continued)

(1) Raise and support the vehicle.

(2) Disconnect the wire connector from the O2S sensor.

CAUTION: When disconnecting the sensor electrical connector, do not pull directly on wire going into sensor.

(3) Remove the O2S sensor. Snap-On oxygen sensor wrench (number YA 8875) may be used for removal and installation.

INSTALLATION

Threads of new oxygen sensors are factory coated with anti-seize compound to aid in removal. **DO NOT add any additional anti-seize compound to the threads of a new oxygen sensor.**

(1) Install the O2S sensor. Tighten to 30 N·m (22 ft. lbs.) torque.

(2) Connect the O2S sensor wire connector.

(3) Lower the vehicle.

OXYGEN SENSORS—8.0L ENGINES

On 8.0L MDC engines, the pre-catalyst and post catalyst O2S sensors are located at the inlet and outlet ends of the catalytic converter (Fig. 83).

On 8.0L MDC or HDC engines, the left and right O2S sensors are located on the left and right exhaust downpipes (Fig. 84).

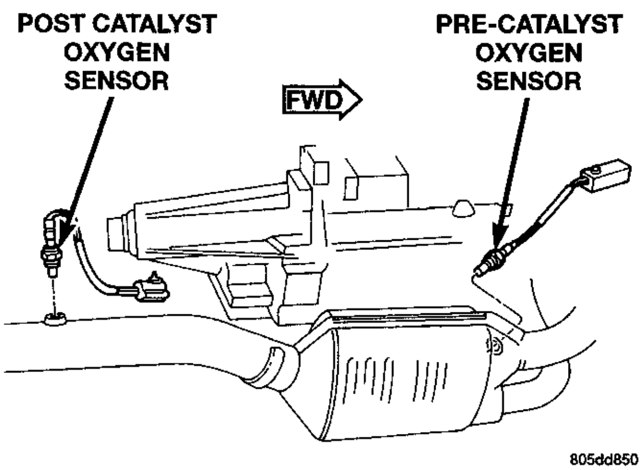

Fig. 83 Pre-Catalyst/Post Catalyst Oxygen Sensor Location—8.0L MDC Engines Only

REMOVAL

WARNING: THE EXHAUST MANIFOLD, EXHAUST PIPES AND CATALYTIC CONVERTER BECOME VERY HOT DURING ENGINE OPERATION. ALLOW ENGINE TO COOL BEFORE REMOVING OXYGEN SENSOR.

(1) Raise and support the vehicle.

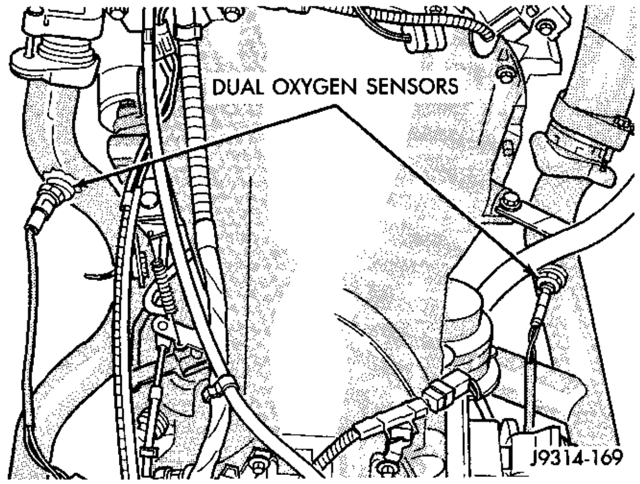

Fig. 84 Left/Right Oxygen Sensor Location—All 8.0L Engines

(2) Disconnect the wire connector from the O2S sensor.

CAUTION: When disconnecting the sensor electrical connector, do not pull directly on wire going into sensor.

(3) Remove the O2S sensor. Snap-On oxygen sensor wrench (number YA 8875) may be used for removal and installation.

INSTALLATION

Threads of new oxygen sensors are factory coated with anti-seize compound to aid in removal. **DO NOT add any additional anti-seize compound to the threads of a new oxygen sensor.**

(1) Install the O2S sensor. Tighten to 30 N·m (22 ft. lbs.) torque.

(2) Connect the O2S sensor wire connector.

(3) Lower the vehicle.

AIR CLEANER HOUSING/AIR CLEANER ELEMENT (FILTER)—3.9L/5.2L/5.9L ENGINES

For air cleaner element required maintenance schedules (listed in time or mileage intervals), refer to Group 0, Lubrication and Maintenance.

REMOVAL/INSTALLATION

CAUTION: Do not attempt to remove the air cleaner element (filter) from the housing by removing the top cover only. To prevent damage to the air cleaner housing, the entire air cleaner housing assembly must be removed from the engine for air cleaner element replacement.

(1) Remove the air inlet tube (Fig. 85) at the side of the air cleaner housing.

REMOVAL AND INSTALLATION (Continued)

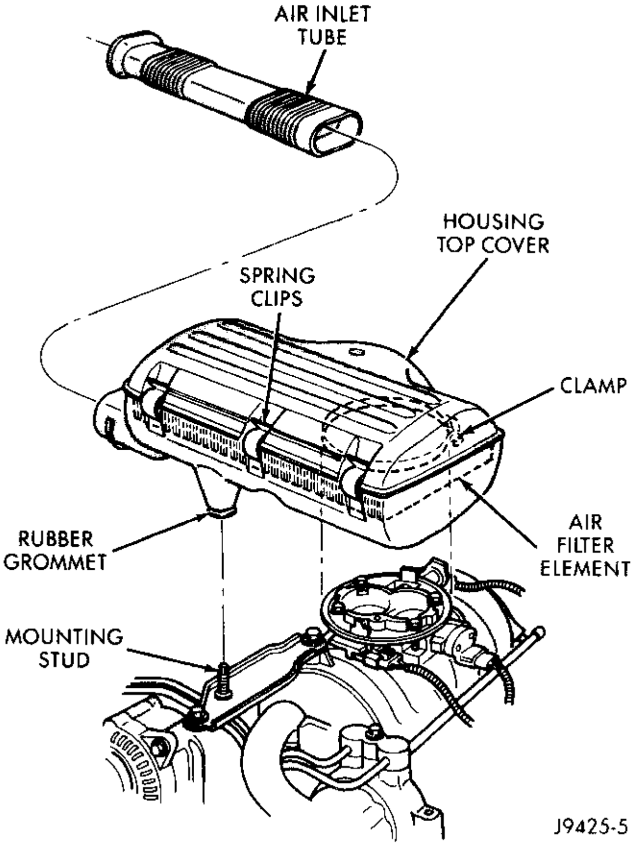

Fig. 85 Air Cleaner Housing—3.9L/5.2L/5.9L Engines

(2) A band-type screw clamp secures the air cleaner housing to the throttle body. Loosen, but do not remove, this screw clamp (Fig. 85). Note the clamp positioning tabs on the air cleaner housing.

(3) All Engines: Disconnect the breather hose at the rear of air cleaner housing.

(4) 5.9L V-8 HDC Engine Only: Disconnect the air pump hose at the air cleaner housing.

(5) The bottom/front of the air cleaner housing is equipped with a rubber grommet (Fig. 85). A mounting stud is attached to the intake manifold (Fig. 85) and is used to position the air cleaner housing into this grommet. Lift the assembly from the throttle body while slipping the assembly from the mounting stud (Fig. 85).

(6) Check condition of gasket at throttle body and replace as necessary.

(7) The housing cover is equipped with three (3) spring clips (Fig. 85) and is hinged at the rear with plastic tabs. Unlatch the clips from the top of air cleaner housing and tilt the housing cover up and rearward for cover removal.

(8) Remove the air cleaner element from air cleaner housing.

(9) Before installing a new air cleaner element, clean inside of air cleaner housing.

(10) Position air cleaner cover to tabs on rear of air cleaner housing. Latch the three spring clips to seal cover to housing.

(11) Position the air cleaner housing assembly to the throttle body while guiding the rubber grommet over the mounting stud. The lower part of the screw clamp should be below the top lip of the throttle body.

(12) Push down on air cleaner housing at rubber grommet to seat housing at intake manifold.

(13) Tighten throttle body-to-air cleaner housing clamp to 4 N·m (35 in. lbs.) torque.

(14) Install the air inlet tube at air cleaner housing inlet.

AIR CLEANER HOUSING/AIR CLEANER ELEMENT (FILTER)—8.0L V-10 ENGINE

For air cleaner element required maintenance schedules (listed in time or mileage intervals), refer to Group 0, Lubrication and Maintenance.

A small amount of engine oil wetting the inside of the air cleaner housing is normal. When servicing, wipe out the oil from the air cleaner housing.

REMOVAL/INSTALLATION

(1) Loosen the clamp (Fig. 86) and remove the air inlet tube (Fig. 87) at the front of the air cleaner housing cover.

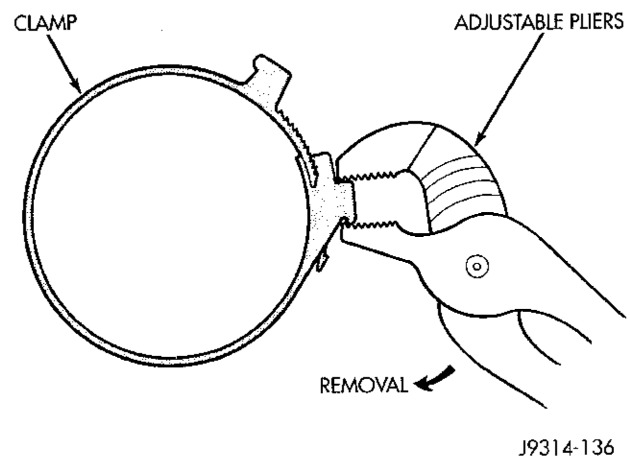

Fig. 86 Clamp Removal—8.0L Engine

(2) The air cleaner housing and air cleaner element cover are equipped with spring clips to seal the cover to housing (Fig. 87). Unlatch the clips from the air cleaner cover and remove cover from air cleaner housing.

(3) Remove the air cleaner element from air cleaner cover.

(4) Before installing a new air cleaner element, clean inside of air cleaner housing.

(5) If housing removal is necessary, remove the 4 housing-to-throttle body nuts.

REMOVAL AND INSTALLATION (Continued)

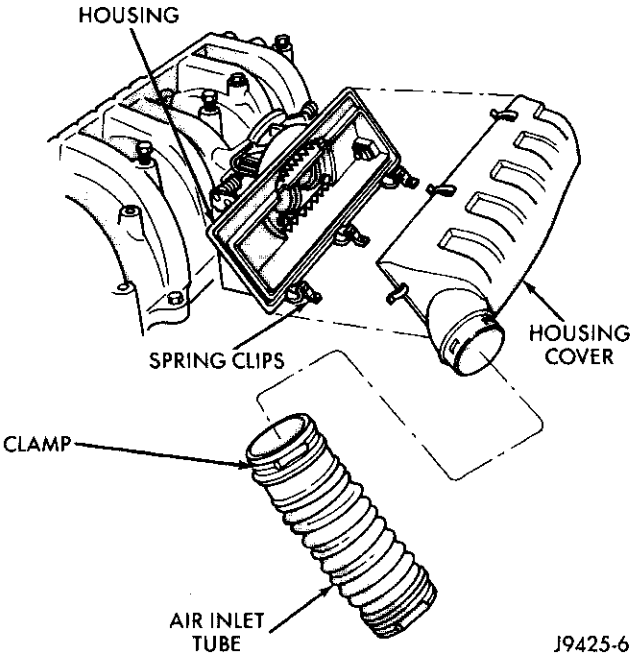

Fig. 87 Air Cleaner Housing—8.0L V-10 Engine

(6) After installing housing, tighten 4 nuts to 11 N·m (96 in. lbs.) torque.

(7) Position air cleaner element (filter) into air cleaner cover. Latch the spring clips to seal cover to housing.

(8) Install the air inlet tube at air cleaner housing inlet.

(9) Install and tighten clamp at air inlet tube (Fig. 88).

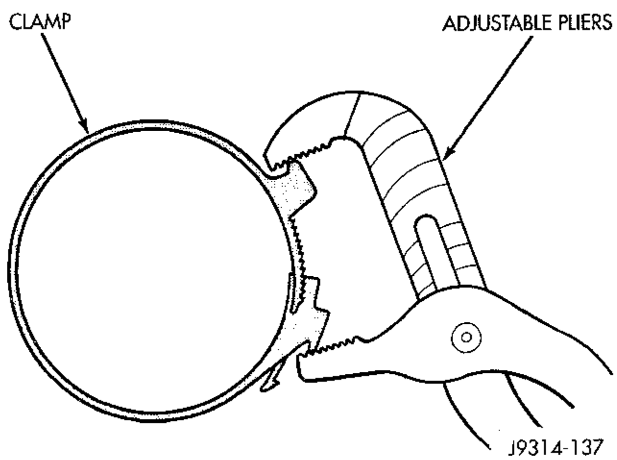

Fig. 88 Clamp Installation—8.0L Engine

ENGINE COOLANT TEMPERATURE SENSOR—3.9L/5.2L/5.9L ENGINES

REMOVAL

WARNING: HOT, PRESSURIZED COOLANT CAN CAUSE INJURY BY SCALDING. COOLING SYSTEM MUST BE PARTIALLY DRAINED BEFORE REMOVING THE COOLANT TEMPERATURE SENSOR. REFER TO GROUP 7, COOLING.

(1) Partially drain cooling system. Refer to Group 7, Cooling.

(2) Remove air cleaner assembly.

(3) Disconnect electrical connector from sensor (Fig. 89).

(4) **Engines with air conditioning:** When removing the connector from sensor, do not pull directly on wiring harness. Fabricate an L-shaped hook tool from a coat hanger (approximately eight inches long). Place the hook part of tool under the connector for removal. The connector is snapped onto the sensor. It is not equipped with a lock type tab.

(5) Remove sensor from intake manifold.

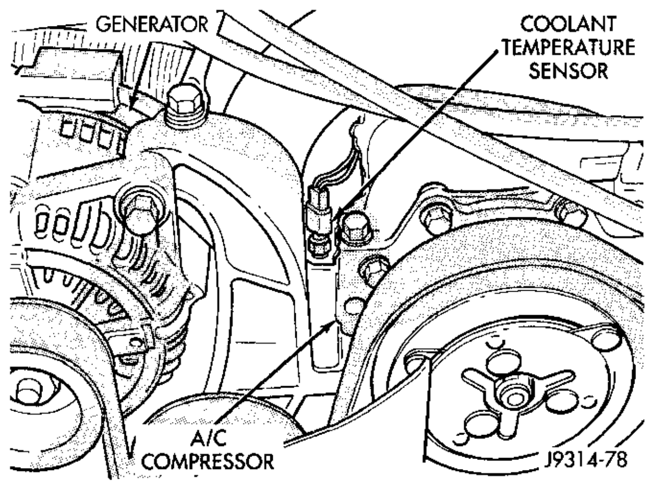

Fig. 89 Engine Coolant Temperature Sensor—3.9L/5.2L/5.9L Engines—Typical

INSTALLATION

(1) Install sensor.

(2) Tighten to 11 N·m (8 ft. lbs.) torque.

(3) Connect electrical connector to sensor. The sensor connector is symmetrical (not indexed). It can be installed to the sensor in either direction.

(4) Install air cleaner assembly.

(5) Replace any lost engine coolant. Refer to Group 7, Cooling System.

AUTHENTIC RESTORATION PRODUCTS

REMOVAL AND INSTALLATION (Continued)

ENGINE COOLANT TEMPERATURE SENSOR—8.0L ENGINE

REMOVAL

WARNING: HOT, PRESSURIZED COOLANT CAN CAUSE INJURY BY SCALDING. COOLING SYSTEM MUST BE PARTIALLY DRAINED BEFORE REMOVING THE COOLANT TEMPERATURE SENSOR. REFER TO GROUP 7, COOLING.

(1) Partially drain cooling system. Refer to Group 7, Cooling.
(2) Disconnect electrical connector from sensor (Fig. 90).
(3) Remove sensor from intake manifold.

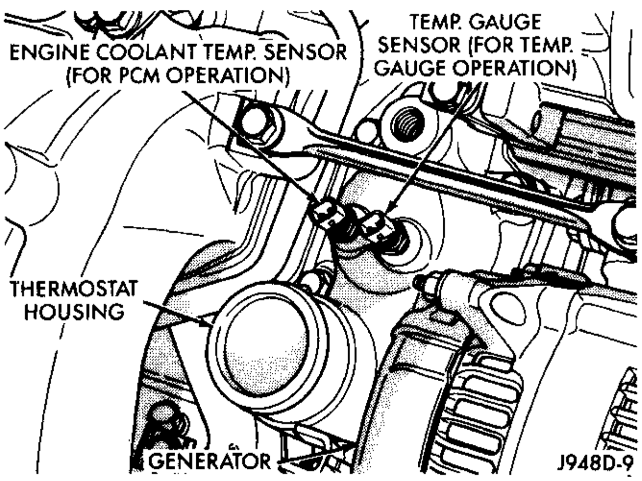

Fig. 90 Engine Coolant Temperature Sensor—8.0L Engine

INSTALLATION

(1) Install sensor.
(2) Tighten to 11 N·m (8 ft. lbs.) torque.
(3) Connect electrical connector to sensor.
(4) Replace any lost engine coolant. Refer to Group 7, Cooling System.

INTAKE MANIFOLD AIR TEMPERATURE SENSOR—3.9L/5.2L/5.9L ENGINES

The intake manifold air temperature sensor is located in the front/side of the intake manifold (Fig. 91).

REMOVAL

(1) Remove air cleaner assembly.
(2) Disconnect electrical connector at sensor (Fig. 91).
(3) Remove sensor from intake manifold.

INSTALLATION

(1) Install sensor to intake manifold. Tighten to 28 N·m (20 ft. lbs.) torque.

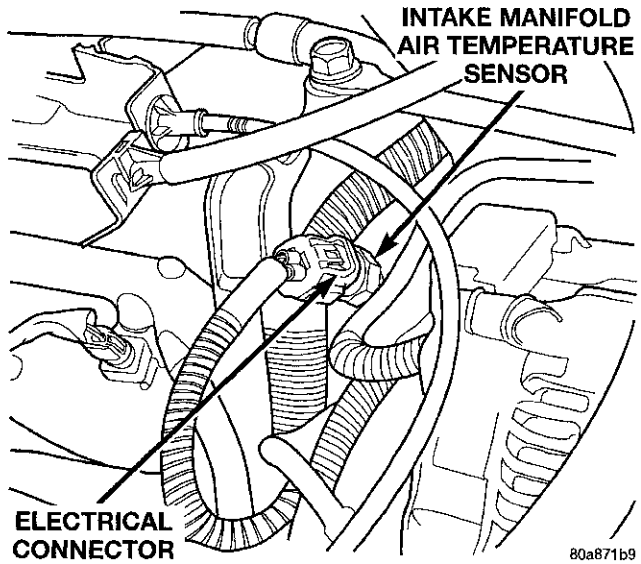

Fig. 91 Air Temperature Sensor—3.9L/5.2L/5.9L Engines—Typical (V-8 Shown)

(2) Install electrical connector.
(3) Install air cleaner.

INTAKE MANIFOLD AIR TEMPERATURE SENSOR—8.0L ENGINE

The intake manifold air temperature sensor is located in the side of the intake manifold near the front of throttle body (Fig. 92).

REMOVAL

(1) Disconnect electrical connector at sensor.
(2) Remove sensor from intake manifold.

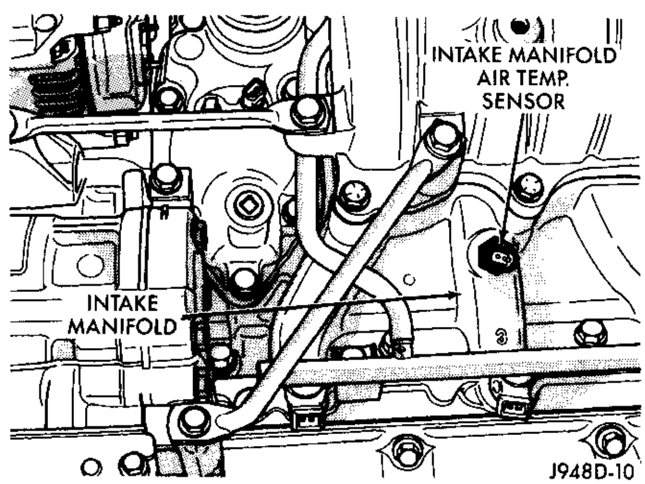

Fig. 92 Air Temperature Sensor—8.0L Engine

INSTALLATION

(1) Install sensor to intake manifold. Tighten to 28 N·m (20 ft. lbs.) torque.
(2) Install electrical connector.

SPECIFICATIONS

VECI LABEL

If anything differs between the specifications found on the Vehicle Emission Control Information (VECI) label and the following specifications, use specifications on VECI label. The VECI label is located in the engine compartment.

TORQUE CHART

DESCRIPTION	TORQUE
Air Cleaner Housing Mount. Nuts—8.0L Engine	11 N·m (96 in. lbs.)
Air Cleaner Housing Metal Clamp—3.9L/5.2L/5.9L Engines	4 N·m (35 in. lbs.)
Crankshaft Position Sensor Mounting Bolts—All Engines	8 N·m (70 in. lbs.)
Camshaft Position Sensor Mounting—8.0L Engine	6 N·m (50 in. lbs.)
Engine Coolant Temperature Sensor—All Engines	11 N·m (96 in. lbs.)
Fuel Tank Mounting Nuts	41 N·m (30 ft. lbs.)
Fuel Hose Clamps	1 N·m (10 in. lbs.)
IAC Motor-To-Throttle Body Bolts	7 N·m (60 in. lbs.)

FUEL DELIVERY SYSTEM-DIESEL ENGINE

INDEX

DESCRIPTION AND OPERATION

FUEL DELIVERY SYSTEM—DIESEL POWERED ENGINE

Two different fuel systems are used for the diesel engine in the 1998 model year. The **early** '98 fuel system, using the two-valve-per-cylinder engine, will retain the mechanical fuel injection pump as used in previous model years. The **late** '98 fuel system, using the four-valve-per-cylinder engine, will use an electronic fuel injection pump with two control modules. This book will include information for the **early** '98 fuel system only.

This section of the group will cover diesel fuel delivery components **not controlled** by the powertrain control module (PCM). Various components, relays and switches are operated by the PCM. Refer to the Fuel Injection System—Diesel Engine sections of this group for components that are operated by the PCM.

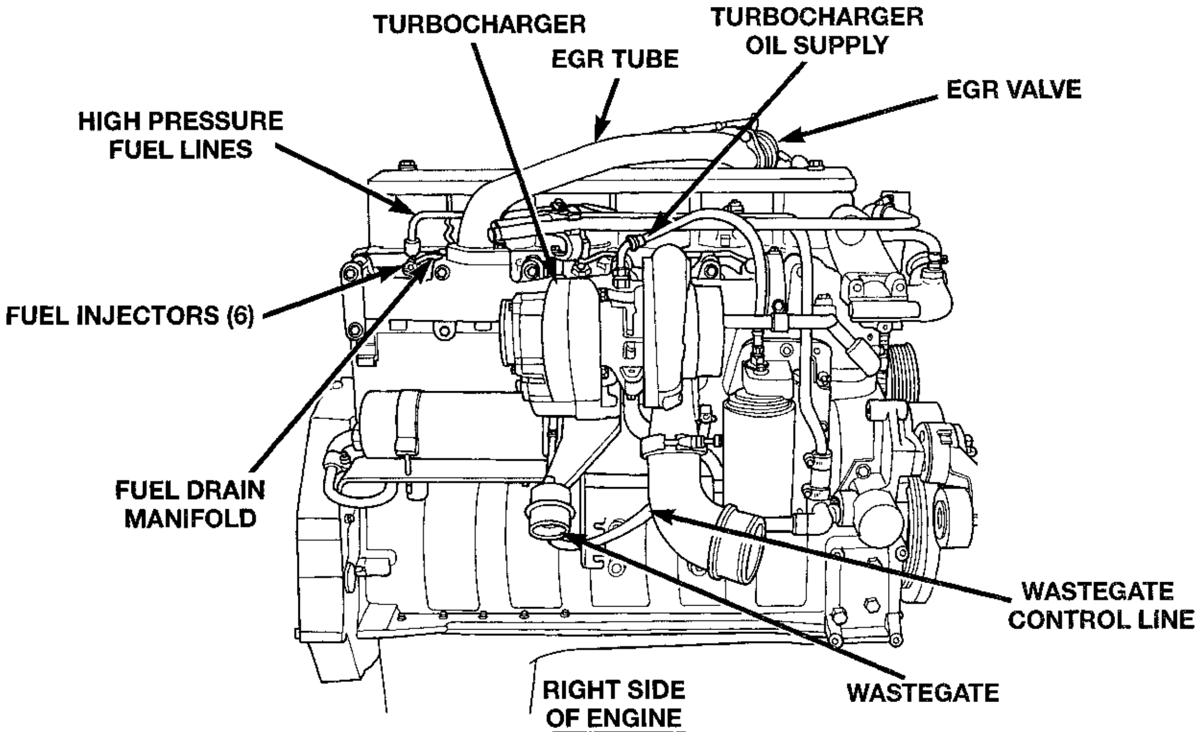
NOTE: Diesel fuel delivery (except for operation of the intake manifold air heater and manifold air heater relays) is not directly regulated by the PCM.

The fuel delivery system of the 5.9L turbo-diesel engine consists of the:

- Accelerator pedal

AUTHENTIC RESTORATION PRODUCT

DESCRIPTION AND OPERATION (Continued)



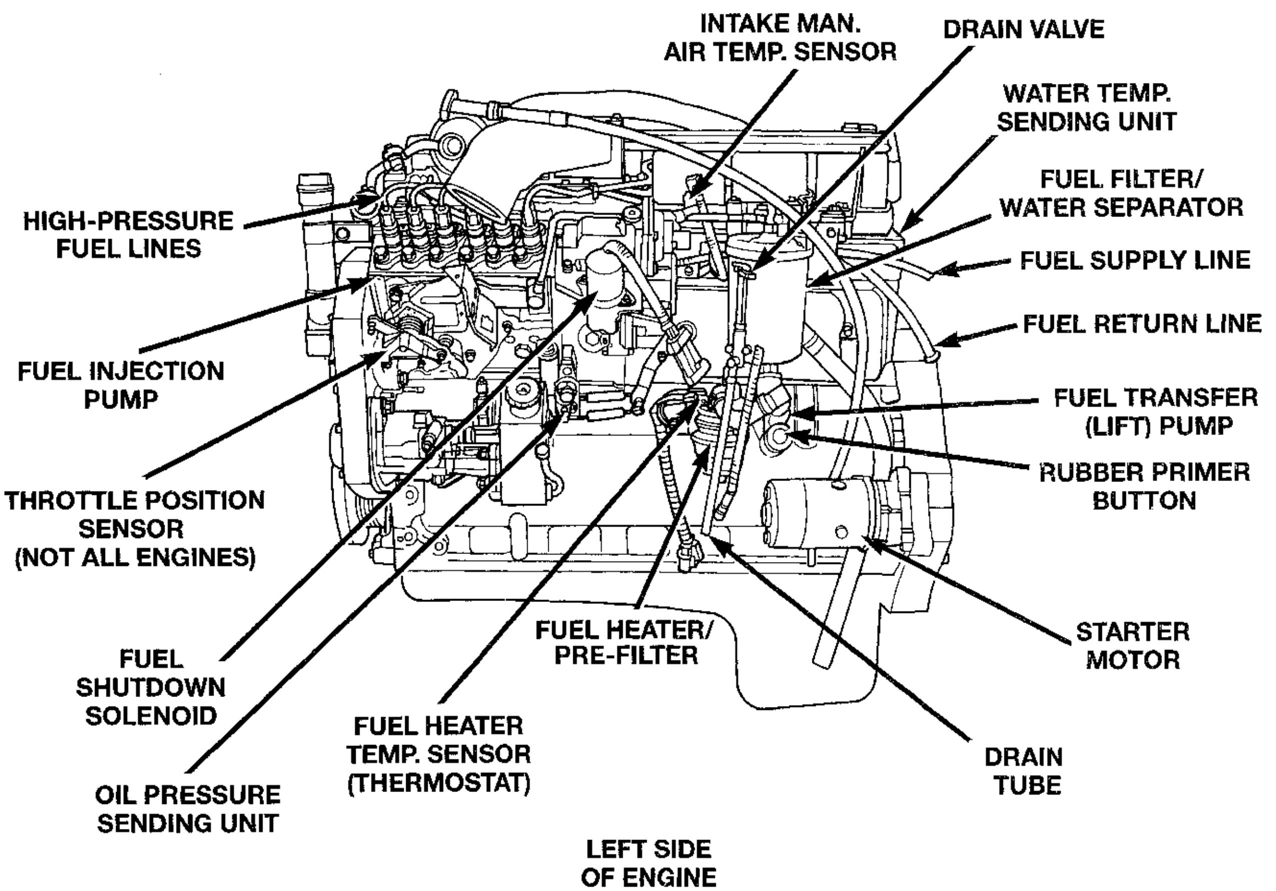


Fig. 1 Fuel System Components—Diesel Engine

DESCRIPTION AND OPERATION (Continued)

- Fuel drain manifold
- Fuel filter/water separator
- Fuel heater
- Fuel heater relay
- Fuel shutdown solenoid
- Fuel shutdown solenoid relay
- Fuel tank
- Fuel tank filler/vent tube assembly
- Fuel tank filler tube cap
- Fuel tank module containing the rollover valve, fuel gauge sending unit (fuel level sensor) and a separate fuel filter located at bottom of tank module
- Fuel tubes/lines/hoses
- High-pressure fuel injection pump
- High-pressure fuel injectors
- High-pressure fuel injector lines
- In-tank fuel filter (at bottom of fuel pump module)
- Low-pressure fuel supply lines
- Low-pressure fuel return line
- Low-pressure, mechanical, fuel transfer pump (fuel lift pump)
- Pre-filter (in the fuel heater)
- Quick-connect fittings
- Throttle cable

FUEL TANK MODULE

An electric fuel pump is **not used** in the fuel tank module for diesel powered engines. Fuel is supplied by the engine mounted fuel transfer pump and the fuel injection pump.

The fuel tank module is installed in the top of the fuel tank (Fig. 2). The fuel tank module (Fig. 2) contains the following components:

- Fuel reservoir
- A separate in-tank fuel filter
- Rollover valve
- Fuel gauge sending unit (fuel level sensor)
- Fuel supply line connection
- Fuel return line connection
- Auxiliary non-pressurized fuel supply fitting

FUEL GAUGE SENDING UNIT

The fuel gauge sending unit (fuel level sensor) is attached to the side of the fuel tank module. The sending unit consists of a float, an arm, and a variable resistor (track). The resistor track is used to send electrical signals to the Powertrain Control Module (PCM) for fuel gauge operation. After this signal is sent to the PCM, the PCM will transmit the data across the CCD bus circuits to the instrument panel. Here it is translated into the appropriate fuel gauge level reading.

As fuel level increases, the float and arm move up. This decreases the sending unit resistance, causing the fuel gauge to read full. As fuel level decreases, the float and arm move down. This increases the sending unit resistance causing the fuel gauge to read empty.

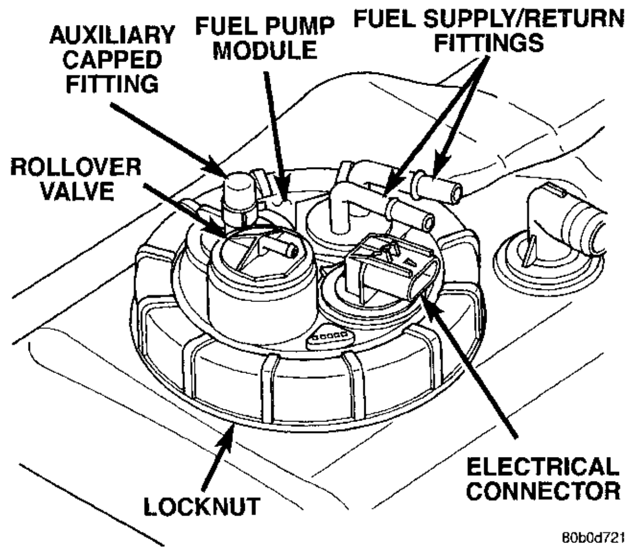

Fig. 2 Top View of Fuel Tank Module—Diesel

FUEL HEATER

The fuel heater is used to prevent diesel fuel from waxing during cold weather operation. The fuel heater is located on the left side of the engine above the starter motor (Fig. 3).

The heater assembly is equipped with a built-in sensor (thermostat) (Fig. 3) that senses fuel temperature. When the temperature is below 40 degrees F, the built-in sensor allows current to flow to the built-in heater element warming the fuel. When the temperature is above 80 degrees F, the sensor stops current flow to the heater element.

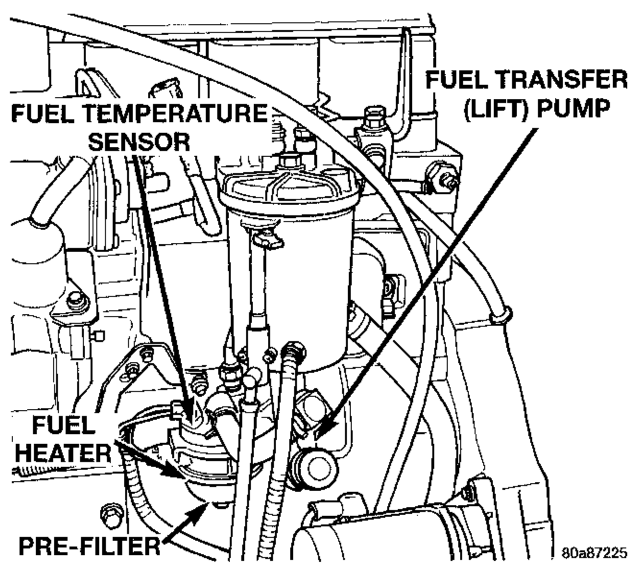

Fig. 3 Fuel Heater and Temperature Sensor Location

DESCRIPTION AND OPERATION (Continued)

Voltage to operate the fuel heater is supplied from the ignition switch and through the fuel heater relay. Also refer to Fuel Heater Relay.

The fuel heater and fuel heater relay are not controlled by the powertrain control module (PCM).

The built-in heater element operates on 12 volts, 300 watts at 0 degrees F.

The fuel heater assembly contains a pre-filter to prevent contaminants from entering the fuel transfer pump.

FUEL HEATER RELAY

Voltage to operate the fuel heater is supplied from the ignition switch through the fuel heater relay. The powertrain control module (PCM) is **not used** to control this relay.

The fuel heater relay is located in the engine compartment near the brake master cylinder (Fig. 4).

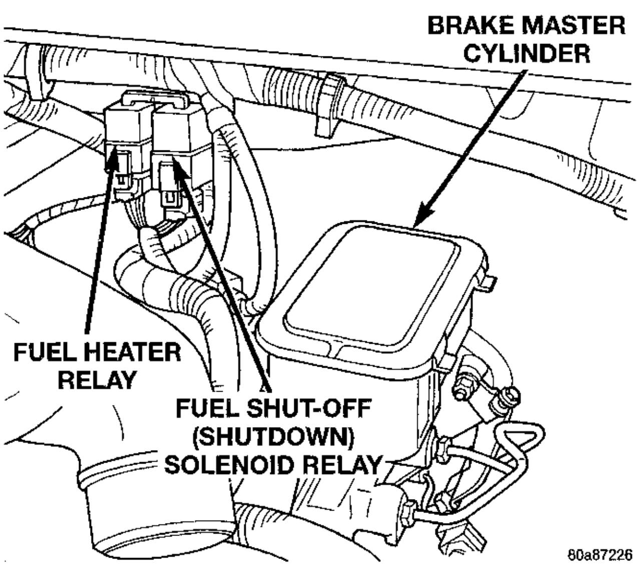

Fig. 4 Fuel Heater Relay—Diesel

FUEL TRANSFER PUMP

The fuel transfer pump (fuel lift pump) is located on the left-rear side of the engine cylinder block above the starter motor (Fig. 1) or (Fig. 3). This mechanically operated pump is not controlled by the powertrain control module (PCM).

The purpose of the fuel transfer pump is to supply (transfer) a low-pressure fuel source of approximately 172 Kpa (25 psi) to the injection pump and fuel filter/water separator from the fuel tank. Here, the low-pressure is raised to a high-pressure by the fuel injection pump for operation of the high-pressure fuel injectors. The transfer pump is driven by an eccentric on the engine camshaft that actuates a spring loaded piston within the pump (Fig. 5). Check valves within the pump, control direction of fuel flow and prevent fuel bleed-back during engine shut down.

The fuel transfer pump should never be operated without the pre-filter installed.

The fuel volume of the transfer pump will vary with engine rpm, but will always provide more fuel than the fuel injection pump requires. Excess fuel is returned to the fuel tank through an overflow valve. The valve is located on the side of the injection pump (Fig. 6) and is used to connect the fuel return line to the side of the injection pump. This valve opens at approximately 152 kPa (22 psi) and returns fuel to the fuel tank through the fuel return line.

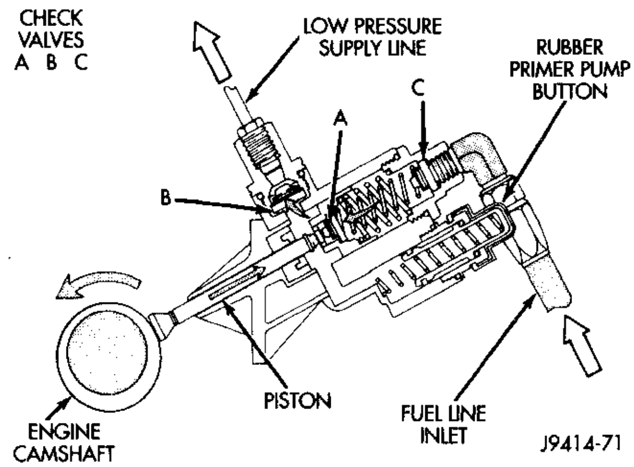

Fig. 5 Transfer Pump Operation—Typical Pump

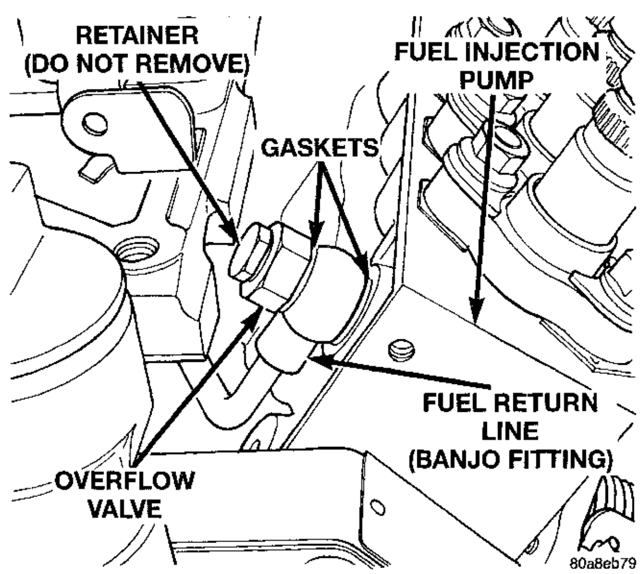

Fig. 6 Injection Pump Overflow Valve

The transfer pump has a primer button (Fig. 5). This rubber primer button is located on the pump housing. The purpose of the button is to prime and bleed air from the fuel system if the vehicle has run out of fuel. Refer to the Air Bleed Procedure in this section of the group for more information.

DESCRIPTION AND OPERATION (Continued)

OVERFLOW VALVE

Fuel volume from the fuel transfer pump will vary with engine rpm, but will always provide more fuel than the fuel injection pump requires. The overflow valve (pressure relief valve) is used to route excess fuel through the fuel return line and back to the fuel tank. The valve is located on the side of the injection pump (Fig. 6). The valve opens at approximately 152 kPa (22 psi). If the check valve within the assembly is sticking, low engine power may result. Refer to Fuel Transfer Pump for additional information.

FUEL TANK

The fuel tank is similar to the tank used with gasoline powered models. The tank is equipped with a separate fuel return line and a different fuel tank module for diesel powered models. A fuel tank mounted, electric fuel pump is not used with diesel powered models. Refer to Fuel Tank Module for additional information.

ROLLOVER VALVE(S)

Refer to Group 25, Emission Control System for information.

FUEL FILTER/WATER SEPARATOR

The fuel filter/water separator protects the fuel injection pump by removing water and contaminants from the fuel. The construction of the filter/separator allows fuel to pass through it, but helps prevent moisture (water) from doing so. Moisture collects at the bottom of the canister.

The fuel filter/water separator assembly is located on left side of engine above starter motor (Fig. 1).

Refer to the maintenance schedules in Group 0 in this manual for the recommended fuel filter replacement intervals.

For draining of water from canister, refer to Fuel Filter/Water Separator in the Removal/Installation section of this group.

A Water-In-Fuel (WIF) sensor is attached to side of canister. Refer to Water-In-Fuel Sensor for additional information.

FUEL SYSTEM PRESSURE WARNING

WARNING: HIGH-PRESSURE FUEL LINES DELIVER DIESEL FUEL UNDER EXTREME PRESSURE FROM THE INJECTION PUMP TO THE FUEL INJECTORS. THIS MAY BE AS HIGH AS 120,000 KPA (17,405 PSI). USE EXTREME CAUTION WHEN INSPECTING FOR HIGH-PRESSURE FUEL LEAKS. INSPECT FOR HIGH-PRESSURE FUEL LEAKS WITH A SHEET OF CARDBOARD. HIGH FUEL INJECTION PRESSURE CAN CAUSE PERSONAL INJURY IF CONTACT IS MADE WITH THE SKIN.

QUICK-CONNECT FITTINGS—DIESEL ENGINE

Refer to Quick-Connect Fittings in the Fuel Delivery System—Gasoline Powered Engine section for information. Also refer to the Fuel Tubes/Lines/Hoses and Clamps section.

HIGH-PRESSURE FUEL LINES

CAUTION: The high-pressure fuel lines must be held securely in place in their holders. The lines cannot contact each other or other components. Do not attempt to weld high-pressure fuel lines or to repair lines that are damaged. Only use the recommended lines when replacement of high-pressure fuel line is necessary.

High-pressure fuel lines deliver fuel under pressure of up to approximately 120,000 kPa (17,405 PSI) from the injection pump to the fuel injectors. The lines expand and contract from the high-pressure fuel pulses generated during the injection process. All high-pressure fuel lines are of the same length and inside diameter. Correct high-pressure fuel line usage and installation is critical to smooth engine operation.

WARNING: USE EXTREME CAUTION WHEN INSPECTING FOR HIGH-PRESSURE FUEL LEAKS. INSPECT FOR HIGH-PRESSURE FUEL LEAKS WITH A SHEET OF CARDBOARD. HIGH FUEL INJECTION PRESSURE CAN CAUSE PERSONAL INJURY IF CONTACT IS MADE WITH THE SKIN.

FUEL INJECTION PUMP

The fuel injection pump is a Bosch P7100 series inline type (Fig. 7). The injection pump is driven by the engine camshaft. A gear on the end of the pump shaft meshes with the camshaft gear. The pump is timed to the engine. Fuel injection occurs near the end of the compression stroke for each cylinder.

The RQV-K governor (Fig. 7) has a pump timing feature. This will allow the pump shaft to be oriented in a position corresponding to top dead center (TDC) for the compression stroke of cylinder number one. Indexing the governor flyweight assembly to the shaft during assembly establishes pump timing.

As engine speed increases, the internal pump pressure increases. An air-fuel control (AFC) (Fig. 8) on the governor ensures that regulated fuel delivery is matched to intake manifold pressure (turbocharger boost) for emission control.

The mechanical fuel transfer pump delivers fuel under a low- pressure of approximately 172 Kpa (25 psi) to the injection pump through the fuel filter/water separator. The injection pump then supplies high-pressure fuel of approximately 120,000 kPa (17,400

AUTHENTIC RESTORATION PRODUCT

DESCRIPTION AND OPERATION (Continued)

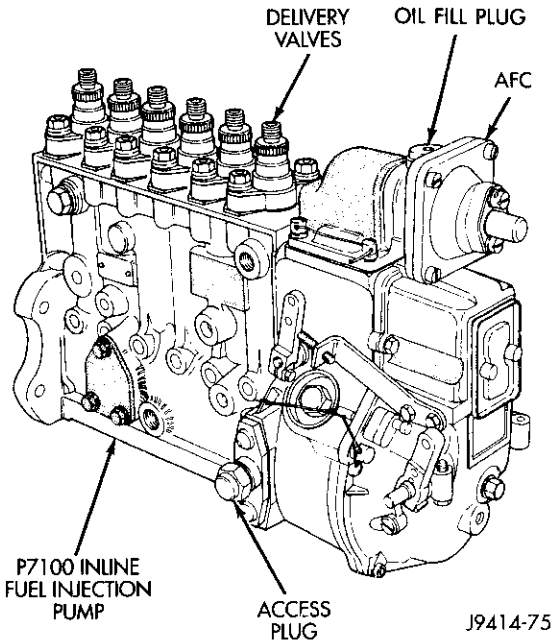

Fig. 7 Fuel Injection Pump

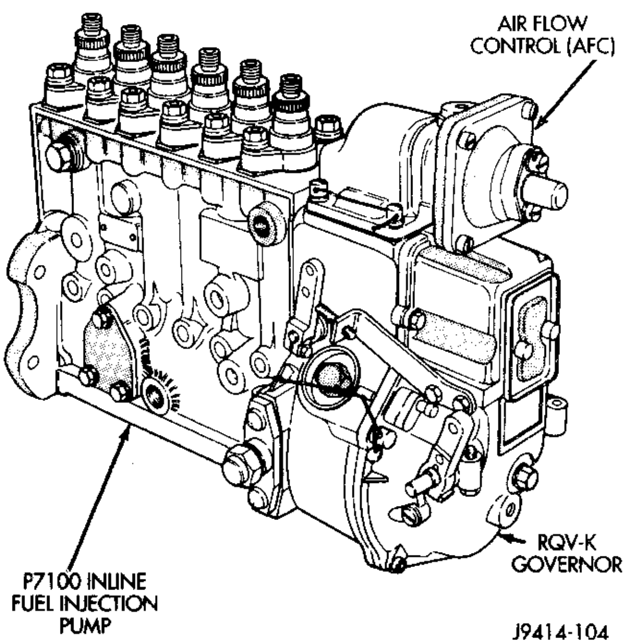

Fig. 8 Injection Pump Governor and AFC

psi) to each injector in precise metered amounts at the correct time.

Excess fuel is returned to the fuel tank by an overflow valve (Fig. 6) on the injection pump. This vent opens at approximately 152 kPa (22 psi) and returns fuel to the fuel tank through the fuel return line.

Diesel fuel and engine oil are used to cool the fuel injection pump. A separate oil feed line from the engine supplies engine oil to the pump. The oil returns to the engine through an opening at the front of pump.

A KSB (cold start) solenoid is not used.

The injection pump high idle speed is factory-sealed and is not adjustable. The low idle speed is adjustable. Refer to Idle Speed Adjustment.

For injection pump timing, refer to Fuel Injection Pump Timing.

FUEL INJECTORS

The fuel injectors are mounted on the left side of the cylinder head (Fig. 9). The injectors are connected to the fuel injection pump by the high-pressure fuel lines. A separate injector is used for each cylinder.

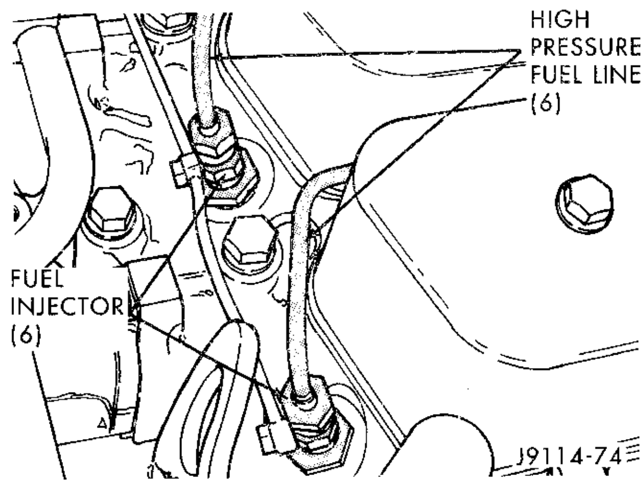

Fig. 9 Fuel Injectors—Typical

The injectors consist of the nozzle holder, o-ring water seal, shims, spring, needle valve and nozzle. Fuel enters the injector at the fuel inlet (top of injector) and is routed to the needle valve bore. When fuel pressure rises to approximately 26,252 kPa (3,822 psi), the needle valve spring tension is overcome. The needle valve rises and fuel flows through the spray holes in the nozzle tip into the combustion chamber. The pressure required to lift the needle valve is the operating pressure setting. This is sometimes referred to as the "pop" pressure setting.

Fuel pressure in the injector circuit decreases after injection. The injector needle valve is immediately closed by the needle valve spring and fuel flow into the combustion chamber is stopped. Exhaust gases are prevented from entering the injector nozzle by the needle valve.

FUEL SHUTDOWN SOLENOID

The fuel shutdown solenoid and fuel shutdown solenoid relay are not controlled by the powertrain control module (PCM).

DESCRIPTION AND OPERATION (Continued)

The fuel shutdown (shut-off) solenoid is used to electrically shut off the diesel fuel supply to the high-pressure fuel injection pump. The solenoid is mounted to the side of the pump (Fig. 10) and is connected to the pump with a lever.

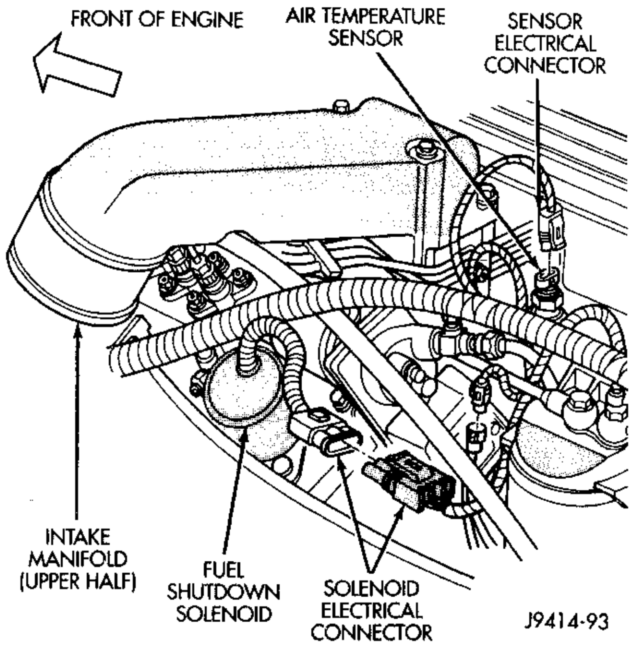

Fig. 10 Fuel Shutdown Solenoid Location

The solenoid controls starting and stopping of the engine regardless of the position of the accelerator pedal. When the ignition switch is off, the solenoid plunger is spring loaded (down) in the shutdown position (Fig. 11) and fuel is shut off to the injection pump.

Two different coils are located within the solenoid and a three-wire pigtail wire harness is attached to the solenoid.

When the ignition switch is turned to the CRANK (starter engaged) position, high-amperage current (approximately 40 amps at 12 volts) is supplied to one of the coils in the shutdown solenoid from the fuel shutdown solenoid relay. This high-amperage current allows the solenoid shaft to pull up on the injection pump lever. The injection pump shutdown lever is then positioned to the run position (Fig. 11).

When the ignition key is released to the ON position, a low-amperage current is supplied to the other coil in the solenoid. This is used to hold the solenoid shaft in the up position. Accelerator pedal position then controls fuel lever position for fuel control at the injection pump.

Voltage to operate the solenoid is supplied from the ignition switch and through the fuel shutdown solenoid relay. Also refer to Fuel Shutdown Solenoid Relay.

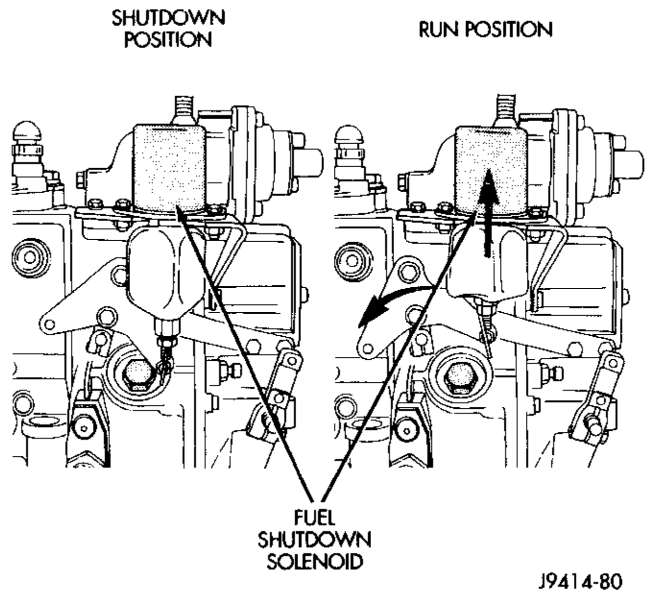

Fig. 11 Fuel Shutdown Solenoid Positions

If the shutdown solenoid is being replaced, its shaft length must be adjusted. For fuel shutdown solenoid removal, installation and solenoid shaft adjustment procedures, refer to Fuel Shutdown Solenoid in the Removal/Installation section of this group.

FUEL SHUTDOWN SOLENOID RELAY

Voltage to operate the fuel shutdown (shut-off) solenoid is supplied from the ignition switch and through the fuel shutdown solenoid relay. The Powertrain Control Module (PCM) has no control over the solenoid. The fuel shutdown solenoid relay is located in the engine compartment near the brake master cylinder (Fig. 12).

FUEL DRAIN MANIFOLD

Some fuel is continually vented from the fuel injection pump to cool the pump and the fuel injectors. During injection, a small amount of fuel flows past the injector nozzle and is not injected into the combustion chamber. This fuel drains into the fuel drain manifold (Fig. 13). Fuel in the drain manifold is then routed back to the fuel filter/water separator.

DIAGNOSIS AND TESTING

LOW-PRESSURE FUEL SYSTEM DIAGNOSIS

The Bosch P7100 inline fuel injection pump is very sensitive to fuel supply pressure variations. If this pressure is low or pulsating excessively, it may cause:

- Low rpm miss/instability
- White smoke

AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING (Continued)

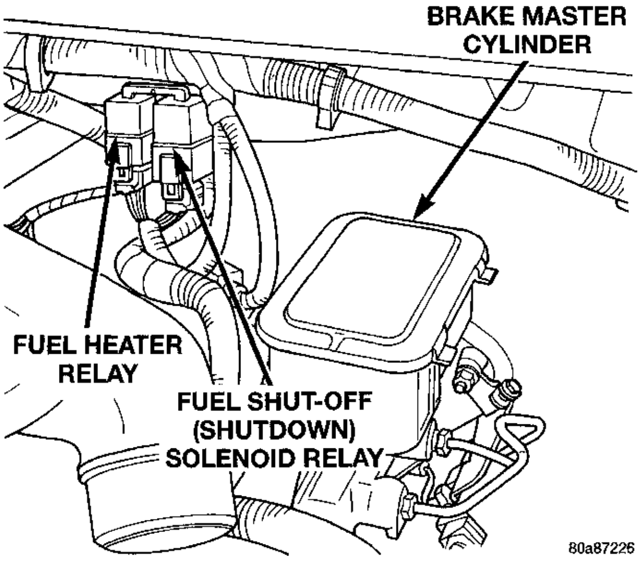

Fig. 12 Fuel Shutdown (Shut-Off) Solenoid Location

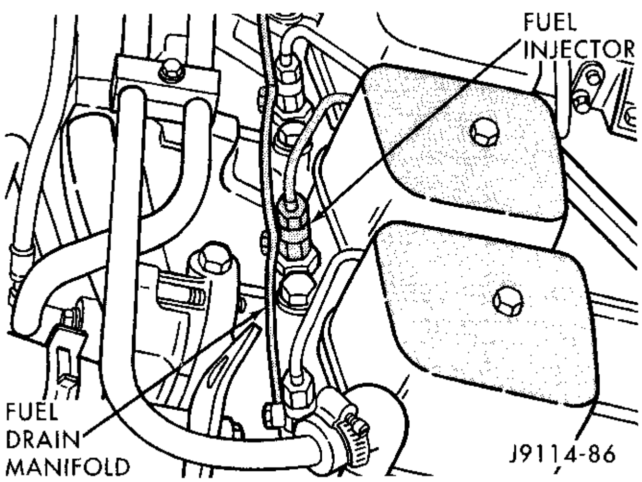

Fig. 13 Fuel Drain Manifold—Typical

- Hard starting
- Engine dies at idle (especially when hot)
- Low power
- Fuel filter cracking (caused by high pressure spikes with restricted overflow valve or fuel return line)

If the preceding symptoms/conditions exist:

(1) Check fuel shutoff solenoid adjustment. Improper adjustment could affect fuel delivery in the injection pump. Refer to Fuel Shutdown (Shutoff) Solenoid Removal/Installation for adjustment procedures.

(2) Visibly check the fuel supply line and fuel return line for kinks, bends or any other damage that would restrict fuel flow.

(3) In addition to contaminants or air, restrictions in the fuel supply to the injection pump caused by a clogged or dirty fuel filter can cause problems. A restricted pre-filter screen within the fuel heater may also have the same results. Refer to Group 0, Lubrication and Maintenance at the front of this manual for recommended filter replacement intervals in time or mileage. Be sure to clean the pre-filter each time the fuel filter is replaced. Refer to Fuel Heater Removal/Installation for pre-filter service procedures.

(4) Check fuel transfer (lift) pump supply pressure to the injection pump. Refer to the Fuel Transfer Pump Pressure/Capacity Test.

(a) Normal pressures are 17–22 psi at idle and 25–30 psi at rated rpm (2500 rpm) with no load.

(b) If supply pressure is low, restrict the fuel return line (pinch off fuel return hose). If pressure returns back to normal or above, the overflow valve must be replaced. Refer to the Fuel Transfer Pump Pressure/Capacity Test.

(c) If fuel supply pressure remains low with the fuel return line pinched, the fuel transfer pump must be replaced. Refer to the Fuel Transfer Pump Pressure/Capacity Test.

(d) High pressure at idle speed indicates a restriction. **Make sure the overflow valve has been installed at the fuel return line (pump outlet) and not at the fuel supply line (pump inlet).**

(e) Fuel pressure must be checked after each corrective action. Other possible causes can be found in the Service Diagnosis, Diesel Performance section of Group 9, Engines.

Whenever the fuel injection pump is being replaced or removed for calibration, the overflow valve must stay with the pump. Make sure a new overflow valve is used with a new injection pump and the old (original) overflow valve is returned to the authorized repair facility with the old injection pump.

AIR IN FUEL SYSTEM

Air will enter the fuel system whenever fuel supply lines, separator filters, injection pump, high-pressure lines or injectors are removed or disconnected. Air trapped in the fuel system can result in hard starting, a rough running engine, engine misfire, low power, excessive smoke and fuel knock. After service is performed, air must be bled from the system before starting the engine.

Inspect the fuel system from the fuel transfer pump to the injectors for loose connections. Leaking fuel is an indicator of loose connections or defective seals. Air can also enter the fuel system between the fuel tank and the transfer pump. Inspect the fuel tank and fuel lines for damage that might allow air into the system.

For air bleeding, refer to the Air Bleed Procedure.

DIAGNOSIS AND TESTING (Continued)

FUEL SUPPLY RESTRICTIONS

LOW-PRESSURE LINES

Fuel supply line restrictions or a defective fuel transfer pump can cause starting problems and prevent the engine from revving up. The starting problems include; low power and blue or white fog like exhaust. Test all fuel supply lines for restrictions or blockage. Flush or replace as necessary. Bleed the fuel system of air once a fuel supply line has been replaced. Refer to the Air Bleed Procedure section of this group for procedures. Also refer to the Fuel Transfer Pump Pressure Test section of this group for restriction tests.

HIGH-PRESSURE LINES

Restricted (kinked or bent) high-pressure lines can cause starting problems, poor engine performance and black smoke from exhaust.

Examine all high-pressure lines for any damage. Each radius on each high-pressure line must be smooth and free of any bends or kinks.

Replace damaged, restricted or leaking high-pressure fuel lines with the correct replacement line.

CAUTION: The high-pressure fuel lines must be clamped securely in place in the holders. The lines cannot contact each other or other components. Do not attempt to weld high-pressure fuel lines or to repair lines that are damaged. Only use the recommended lines when replacement of high-pressure fuel line is necessary.

FUEL TRANSFER PUMP PRESSURE/CAPACITY TEST

For operation of the fuel transfer pump (lift pump) primer button, refer to the Air Bleed Procedure in this group.

The fuel transfer pump is located on the left side of the engine and above the starter motor (Fig. 14).

An improperly operating fuel transfer pump can cause low engine power, excessive white smoke and/or hard engine starting.

Before performing pump pressure testing, inspect the fuel supply and return lines for restrictions, kinks or leaks.

Fuel leaking from the weep hole in the pump casing indicates a leaking pump. The transfer pump must then be replaced.

Low transfer pump output can be caused by a worn eccentric (cam lobe) on the engine camshaft.

In addition to contaminants or air, restrictions in the fuel supply to the injection pump caused by a clogged or dirty fuel filter can cause problems. This may be: low power, poor starting or excessive white smoke. A restricted pre-filter screen within the fuel heater may also have the same results. Refer to Group 0, Lubrication and Maintenance at the front of this manual for recommended filter replacement intervals in time or mileage. Be sure to clean the pre-filter each time the fuel filter is replaced. Refer to Fuel Heater Removal/Installation for pre-filter service procedures.

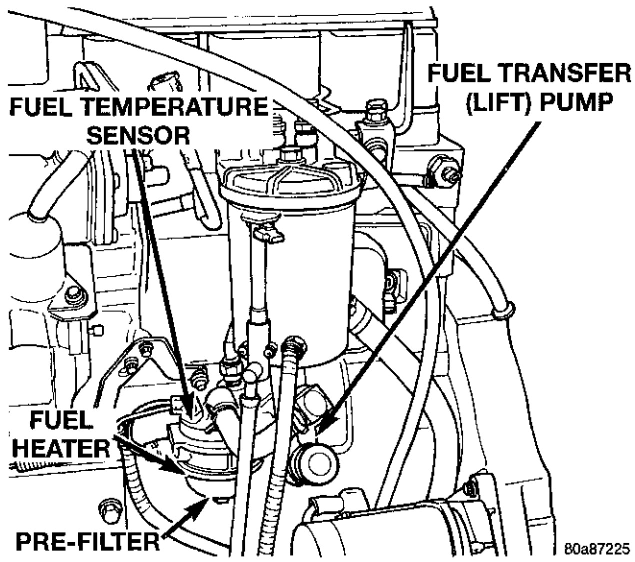

Fig. 14 Fuel Transfer Pump Location

OUTPUT PRESSURE TEST

(1) Place a drain pan below injection pump.

(2) Remove banjo bolt and gaskets from fuel inlet line fitting at side of injection pump (Fig. 15).

(3) Install Special Tool 6976 and tool gaskets from tool kit 6977 in place of the banjo bolt (Fig. 16). Tighten tool into injection pump.

(4) Install a 0-60 or 0-100 psi fuel pressure gauge to adapter tool 6976 (Fig. 16).

(5) Start and warm engine and record fuel pressure. Pressure should be 117–152 kPa (17–22 psi) at idle speed. Pressure of 172–207 kPa (25–30 psi) should be seen after raising engine speed to its rated rpm (2,500 rpm) with no load.

(6) If fuel pressure falls below specifications, do not automatically condemn the transfer pump. The fuel filter or pre-filter may be dirty or clogged. If either of the filters are at fault, the pressure reading will rise after servicing. Recheck fuel pressure after servicing filters.

(7) If pressure is still low, the **overflow valve** (pressure relief valve) (Fig. 17) may be defective. To determine if the overflow valve is causing the low pressure condition:

(a) Locate and disconnect fuel return line quick-connect fitting at left-rear of engine (Fig. 18).

DIAGNOSIS AND TESTING (Continued)

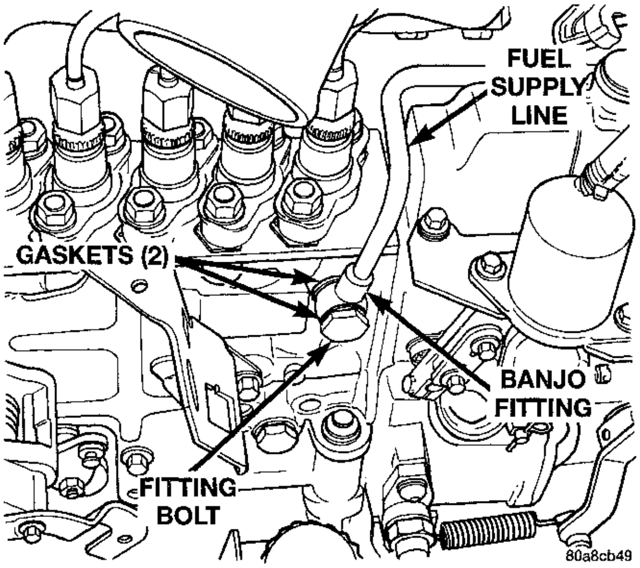

Fig. 15 Fuel Inlet Line at Injection Pump

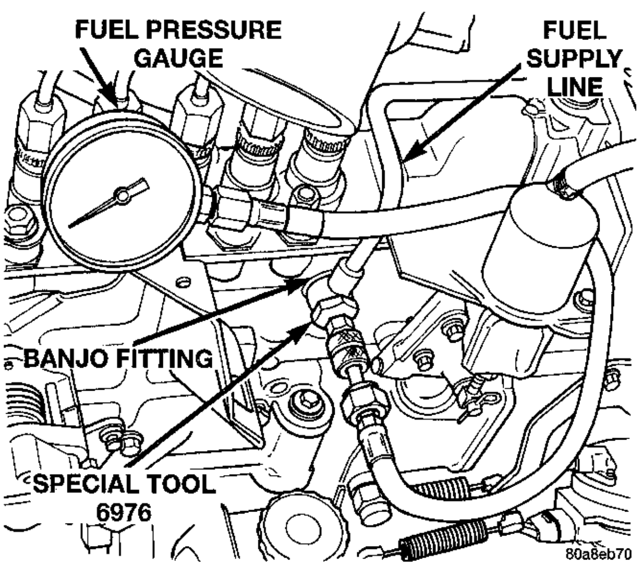

Fig. 16 Checking Fuel Pump Pressure

(b) Install Special Rubber Adapter Hose Tool 6539 into ends of disconnected fuel return line (Fig. 19).

(c) Using smooth-jaw pliers, carefully pinch off rubber hose portion of tool 6539 (Fig. 19). **Tool 6539 MUST be installed for this test. Do not attempt to directly pinch off rubber portion of fuel return line. Although outside of fuel return line is rubber, the inside is not. Damage to fuel return line will result in possible fuel leak.**

(d) If pressure goes back up to normal or above, the overflow valve must be replaced. Before condemning the valve, make sure it is located (has been installed) at the fuel return line (pump outlet) and **not** at the fuel supply line (pump inlet).

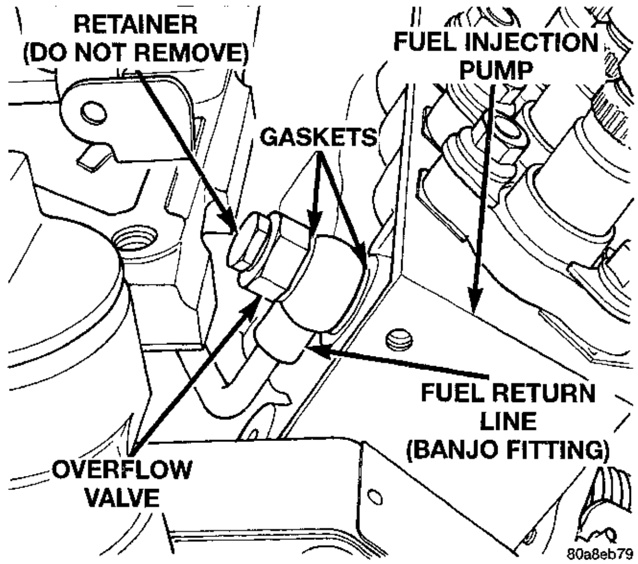

Fig. 17 Overflow Valve Location

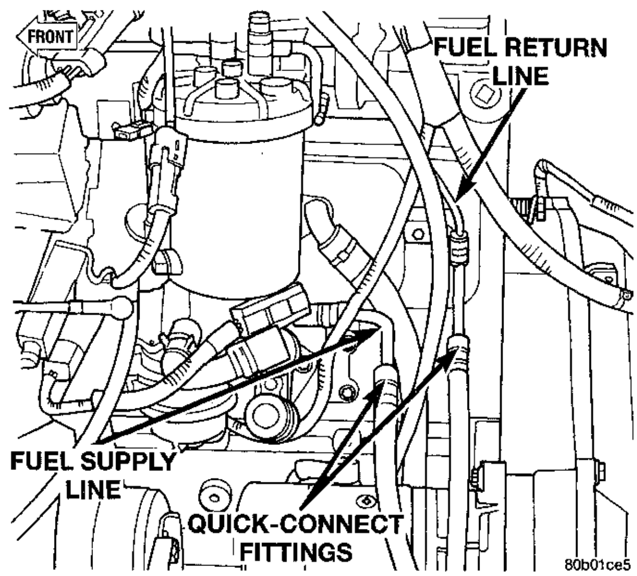

Fig. 18 Fuel Return and Supply Line Quick-Connect Locations

(e) If pressure remains low with return line pinched, the fuel filter or pre-filter may be restricted or the fuel transfer pump may be defective.

(f) If filters are in good condition and pressure is still low, replace the fuel transfer pump.

(8) After testing, install banjo fitting bolt into fuel supply line and tighten to 24 N·m (18 ft. lbs.) torque.

FUEL VOLUME TEST

Fuel volume-versus-engine cranking rpm are used for the test.

DIAGNOSIS AND TESTING (Continued)

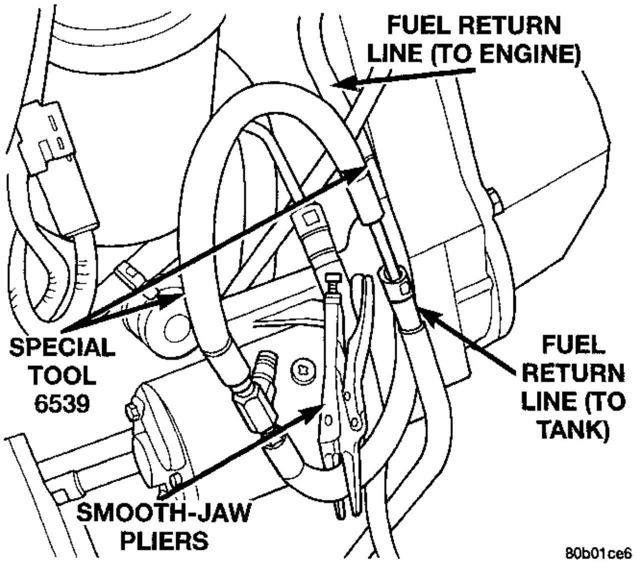

Fig. 19 Pinching Off Fuel Return Hose

WARNING: TO PREVENT THE ENGINE FROM STARTING, DISCONNECT THE PIGTAIL HARNESS AT THE FUEL SHUTDOWN SOLENOID (Fig. 20). USE CAUTION AS RESIDUAL FUEL MAY CAUSE THE ENGINE TO START AND RUN TEMPORARILY. ATTEMPT TO START THE ENGINE A FEW TIMES UNTIL IT QUITS BEFORE PERFORMING THE FUEL VOLUME TEST.

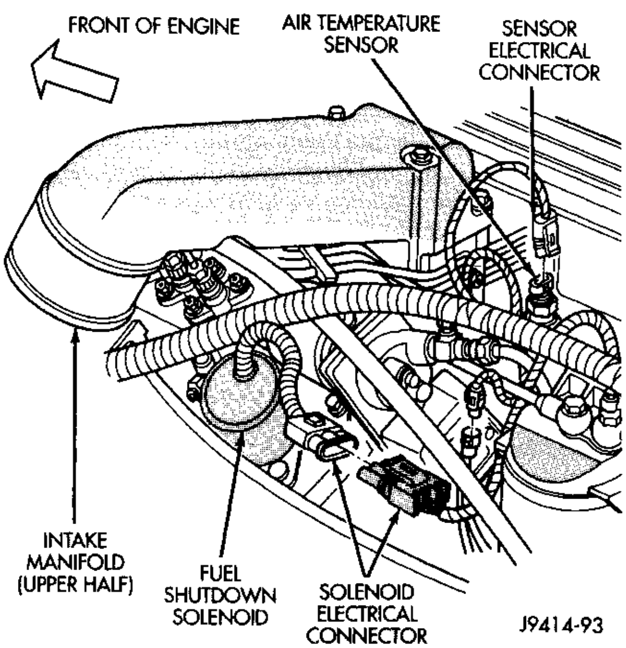

Fig. 20 Fuel Shutdown Solenoid Electrical Connector

(1) Connect a hand held tachometer to the engine. Use Cummins part number 3377462 or an equivalent.

(2) Remove the clamp bolt retaining fuel drain manifold line to cylinder head. This clamp/bolt is located to the left of number–5 cylinder valve cover.

(3) Two fuel lines are attached to top of fuel filter/water separator using banjo fittings and special bolts. Remove the **rear** banjo fitting bolt at the inlet line.

(4) Carefully position the fuel drain manifold line to the side/rear.

(5) Install and tighten Special Adapter Tool 6836 into the top of the fuel inlet line (Fig. 21).

(6) Connect a temporary rubber fuel hose to adapter 6836 (Fig. 21).

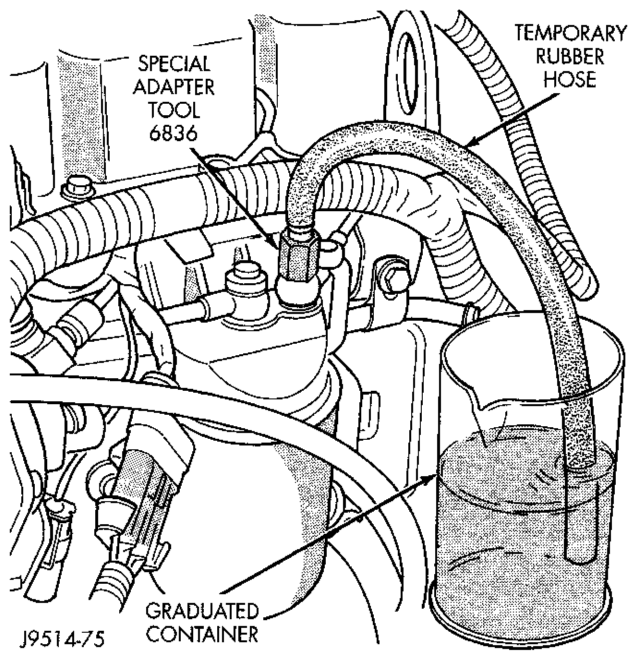

Fig. 21 Performing Fuel Volume Test—Typical

(7) Place the other end of this temporary hose into a graduated container (Fig. 21).

(8) Crank the engine for 30 seconds. Measure the fuel volume in the container after 30 seconds of engine cranking time. **Do not crank the engine for more than 30 seconds at a time. Starter motor damage may result.**

(9) To determine the correct fuel volume, refer to Fuel Volume Specifications (Fig. 22). To use the specifications chart, refer to the following procedure:

- Draw a straight vertical line at the measured rpm.
- Draw a straight horizontal line at the measured fuel volume.
- If these two lines intersect below the flow line (Fig. 22), this indicates a defective fuel transfer pump, a restricted fuel line, or a plugged fuel filter or pre-filter.
- If these two lines intersect above the flow line (Fig. 22), this indicates acceptable fuel flow.

mopar AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING (Continued)

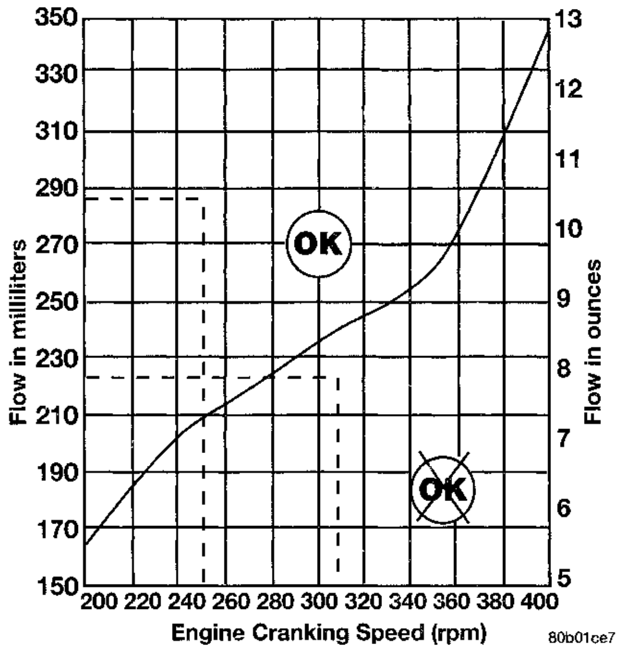

Fig. 22 Fuel Volume Specifications

OVERFLOW VALVE TEST

A sticking check valve within the overflow valve may cause low power. Refer to the Fuel Transfer Pump Pressure/Capacity Test. Overflow valve testing is covered in this test.

Whenever the fuel injection pump is being replaced or removed for calibration, the overflow valve must stay with the pump. Make sure a new overflow valve is used with a new or rebuilt injection pump and the old (original) overflow valve is returned to authorized repair facility with the old injection pump.

Make sure the overflow valve is correctly installed at the fuel return line (pump outlet) (Fig. 17 and not incorrectly installed at the fuel supply li (pump inlet).

FUEL HEATER TEST

The fuel heater is used to prevent diesel fuel from waxing during cold weather operation.

NOTE: The fuel heater element, fuel heater relay and fuel heater temperature sensor are not controlled by the powertrain control module (PCM).

A malfunctioning fuel heater can cause a wax build-up in the fuel filter/water separator. Wax build-up in the filter/separator can cause engine starting problems and prevent the engine from revving up. It can also cause blue or white fog-like exhaust. If the heater is not operating in cold temperatures, the engine may not operate due to fuel waxing.

The fuel heater is located on the left side of the engine above the starter motor (Fig. 23).

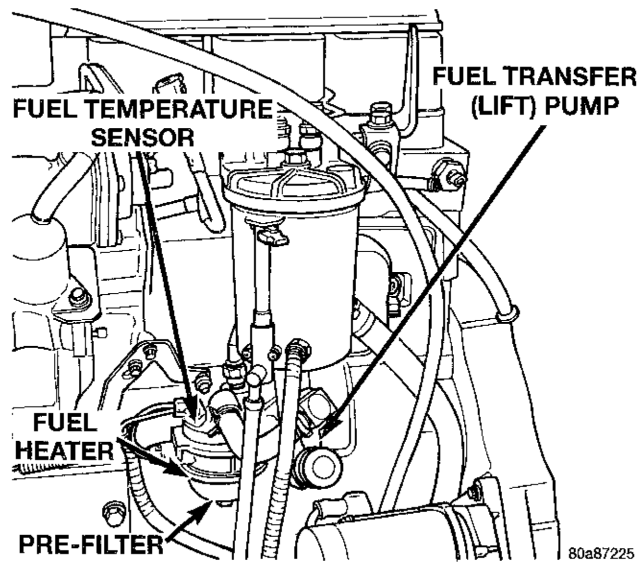

Fig. 23 Fuel Heater Location

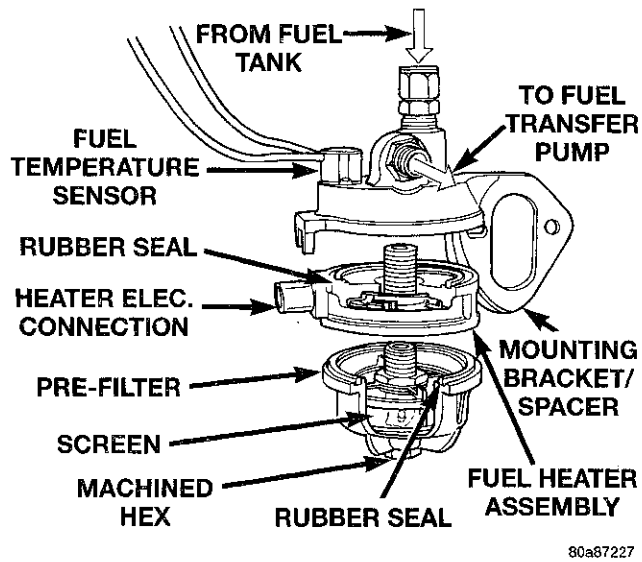

Fig. 24 Fuel Heater Assembly

The heater assembly is equipped with a built-in fuel temperature sensor (thermostat) (Fig. 24) or (Fig. 23) that senses fuel temperature. When the fuel temperature is below 40 degrees F, the sensor allows current to flow to the built-in heater element to warm the fuel. When the fuel temperature is above 80 degrees F, the sensor stops current flow to the heater element (circuit is open).

Voltage to operate the fuel heater element is supplied from the ignition switch, through the fuel heater relay (Fig. 25) (also refer to Fuel Heater Relay), to the fuel temperature sensor and on to the fuel heater element.

DIAGNOSIS AND TESTING (Continued)

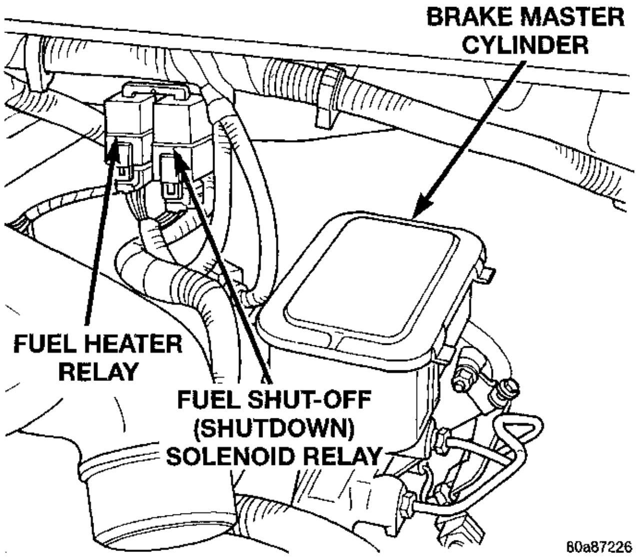

Fig. 25 Fuel Heater Relay Location—Diesel

The built-in heater element operates on 12 volts, 300 watts at 0 degrees F. As temperature increases, power requirements decrease.

The fuel heater assembly contains a pre-filter (Fig. 24) to prevent contaminants from entering the fuel transfer pump.

A minimum of 7 volts is required to operate the fuel heater. The resistance value of the heater element is less than 1 ohm (cold) and up to 1000 ohms warm.

TESTING

(1) Remove the electrical connector at the side of the fuel heater (Fig. 24).

(2) Using an ohmmeter, check the resistance across the two terminals on the side of the heater. Resistance should be approximately 1 ohm (cold) to 1000 ohms (warm).

(3) With the electrical connector still unplugged from the fuel heater, check the electrical operation of the fuel temperature sensor (Fig. 24). Proceed to next step:

(4) Using an ohmmeter, check the resistance across the two terminals in the pigtail wire harness coming from the fuel temperature sensor. The sensor circuit should be open if the fuel temperature is above 80 degrees. The sensor circuit should be closed if the fuel temperature is below 40 degrees.

(5) Check for 12 volts at the disconnected temperature sensor connector with the ignition key ON. Refer to Group 8W, Wiring for electrical schematics.

(6) With ignition ON, check for 12 volts at the fuel heater relay connector. Refer to Group 8W, Wiring for electrical schematics.

(7) Check operation of the fuel heater relay (Fig. 25). Refer to Relay Test—Fuel Heater/Fuel Shutdown Solenoid in this section of the group.

RELAY TEST—FUEL HEATER/FUEL SHUTDOWN SOLENOID

The fuel heater and fuel shutdown solenoid relays are located in the engine compartment near the brake master cylinder (Fig. 25).

To test the fuel heater, refer to Fuel Heater Test in this section of the group. To test the fuel shutdown solenoid, refer to Fuel Shutdown Solenoid Test.

To test either of the relays only, refer to following:

The relay terminal numbers from (Fig. 26) can be found on the bottom of the relay.

- Terminal number 30 is connected to battery voltage and can be switched or B+ (hot) at all times.
- The center terminal number 87A is connected (a circuit is formed) to terminal 30 in the de-energized (normally OFF) position.
- Terminal number 87 is connected (a circuit is formed) to terminal 30 in the energized (ON) position. Terminal number 87 then supplies battery voltage to the component being operated.
- Terminal number 86 is connected to a switched (+) power source.
- Terminal number 85 is grounded by the powertrain control module (PCM).

TESTING

(1) Remove relay before testing.

(2) Using an ohmmeter, perform a resistance test between terminals 85 and 86. Resistance value (ohms) should be 75 ±5 ohms for resistor equipped relays.

(3) Connect the ohmmeter between terminals number 87A and 30. Continuity should be present at this time.

(4) Connect the ohmmeter between terminals number 87 and 30. Continuity should not be present at this time.

(5) Use a set of jumper wires (16 gauge or smaller). Connect one jumper wire between terminal number 85 (on the relay) to the ground side (-) of a 12 Volt power source.

(6) Attach the other jumper wire to the positive side (+) of a 12V power source. Do not connect this jumper wire to relay at this time.

CAUTION: Do not allow the ohmmeter to contact terminals 85 or 86 during these tests. Damage to ohmmeter may result.

(7) Attach the other jumper wire (12V +) to terminal number 86. This will activate the relay. Continuity should now be present between terminals number

DIAGNOSIS AND TESTING (Continued)

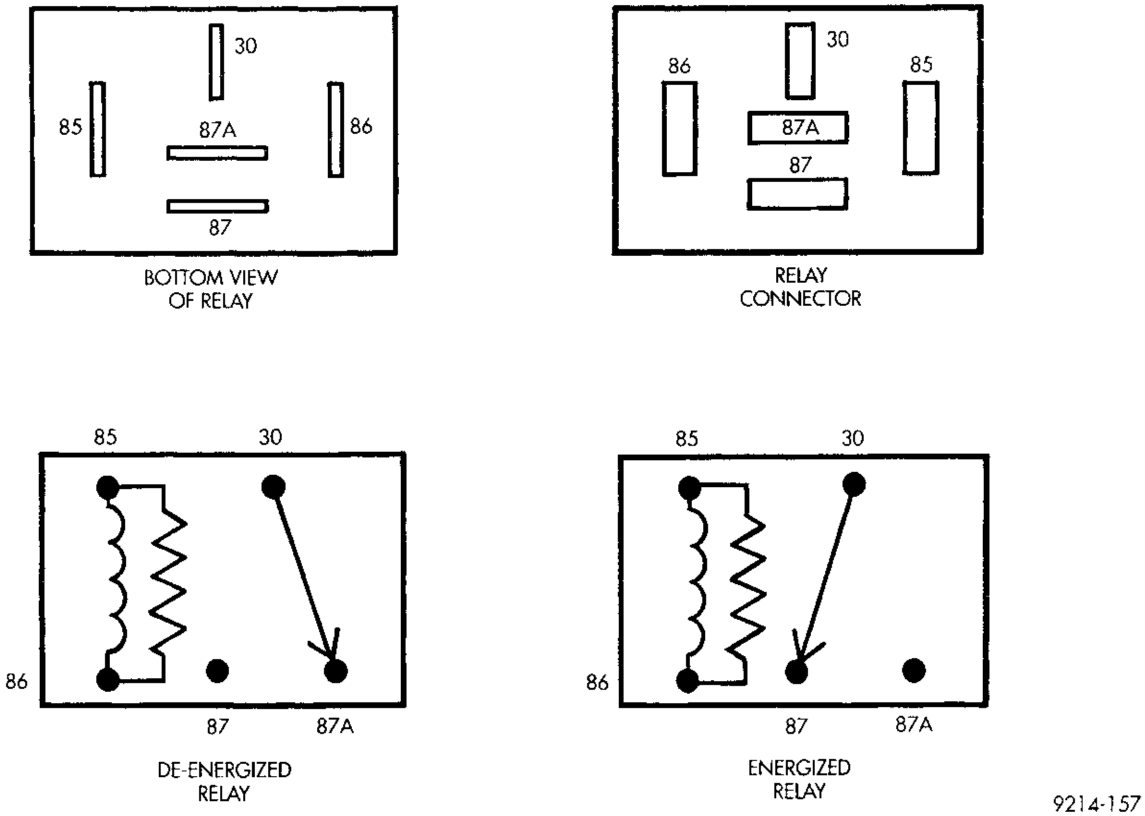

Fig. 26 Relay Terminals

87 and 30. Continuity should not be present between terminals number 87A and 30.

(8) Disconnect jumper wires from relay and 12 Volt power source.

(9) If continuity or resistance tests did not pass, replace relay. If tests passed, refer to Group 8W, Wiring Diagrams for (fuel system) relay wiring schematics and for additional circuit information.

FUEL INJECTOR TEST

A leaking fuel injector can cause fuel knock, poor performance, black smoke, poor fuel economy and rough engine idle. If the fuel injector needle valve does not operate properly, the engine may misfire and produce low power.

A leak in the injection pump-to-injector high-pressure fuel line can cause many of the same symptoms as a malfunctioning injector. Inspect for a leak in the high-pressure lines before checking for a malfunctioning fuel injector.

WARNING: THE INJECTION PUMP SUPPLIES HIGH-PRESSURE FUEL OF UP TO APPROXIMATELY 120,000 KPA (17,400 PSI) TO EACH INDIVIDUAL INJECTOR THROUGH THE HIGH-PRESSURE LINES. FUEL UNDER THIS AMOUNT OF PRESSURE CAN PENETRATE THE SKIN AND CAUSE PERSONAL INJURY. WEAR SAFETY GOGGLES AND ADEQUATE PROTECTIVE CLOTHING. AVOID CONTACT WITH FUEL SPRAY WHEN BLEEDING HIGH-PRESSURE FUEL LINES.

WARNING: DO NOT BLEED AIR FROM THE FUEL SYSTEM OF A HOT ENGINE. DO NOT ALLOW FUEL TO SPRAY ONTO THE EXHAUST MANIFOLD WHEN BLEEDING AIR FROM THE FUEL SYSTEM.

To determine which fuel injector is malfunctioning, run the engine and loosen the high-pressure fuel line nut at the injector (Fig. 27). Listen for a change in engine speed. After testing, tighten the line nut to 30 N·m (22 ft. lbs.) torque. If engine speed drops, the injector was operating normally. If engine speed remains the same, the injector may be malfunctioning. Test all injectors in the same manner one at a time.

Once an injector has been found to be malfunctioning, remove it from the engine and test it. Refer to Fuel Injectors in the Removal/Installation section of this group for procedures.

After the injector has been removed, install it to a bench-mount injector tester (Cummins part number 3376946 or equivalent) (Fig. 28). Position a container

DIAGNOSIS AND TESTING (Continued)

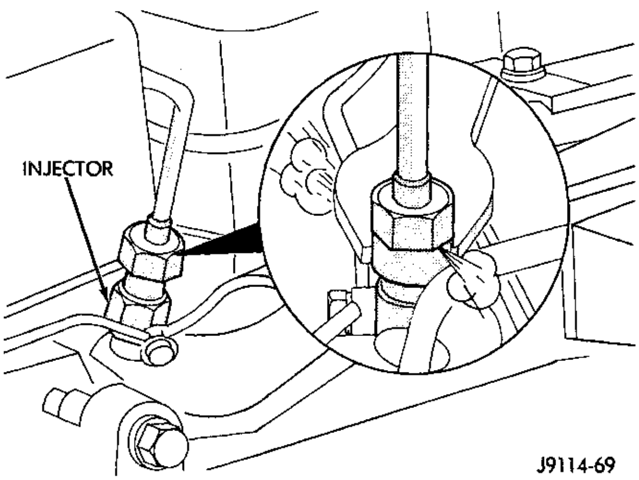

Fig. 27 Inspecting Injector Operation

below the injector before testing. Refer to operating instructions supplied with tester for procedures.

The opening pressure or "pop" pressure should be 23,400–26,800 kPa (234–268 bars) (3394–3887 psi). If the fuel injector needle valve is opening (popping) too early or too late, replace the injector.

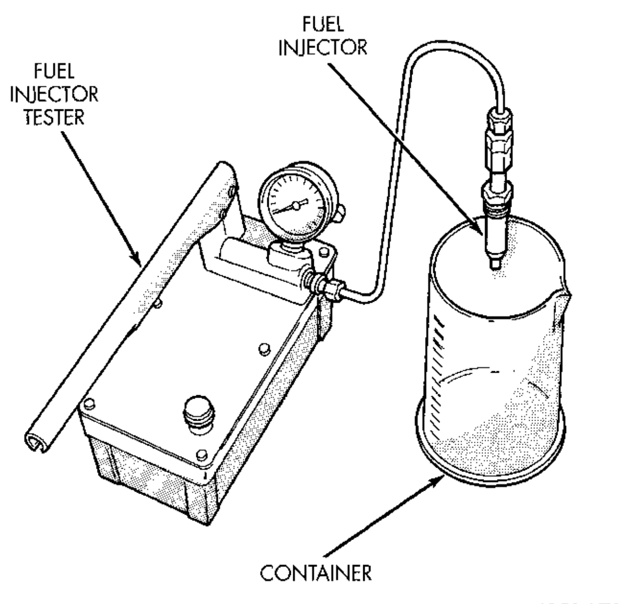

Fig. 28 Typical Fuel Injector Tester

FUEL INJECTION PUMP TEST

The Bosch P7100 inline fuel injection pump is very sensitive to fuel supply pressure variations. If supply pressure is low or pulsating excessively, it may cause problems that appear to be a defective injection pump. Before condemning the injection pump, be sure to check fuel transfer pump pressure. Refer to the Fuel Transfer Pump Pressure/Capacity Test. This test will include testing of the overflow valve. Also be sure fuel filter and pre-filter are in good condition. Visually check the fuel supply line and fuel return line for kinks, bends or any other damage that would restrict fuel flow.

Incorrect injection pump timing can cause poor performance, excessive smoke and emissions and poor fuel economy. Fuel injection pump timing can be checked and adjusted. Refer to Fuel Injection Pump Timing in this group for procedures.

Engine power is also effected by the governor setting and performance. **Do not attempt to adjust the governor. If the governor seals on the external adjustment screw are broken, the fuel rate may be out of adjustment. The warranty of the injection pump and the engine may be void if the seals have been tampered with or removed.**

If all of the preceding tests checked OK, the fuel injection pump must be removed and sent to an authorized diesel injection pump repair facility for testing and calibration. **Whenever the fuel injection pump is being replaced or removed for calibration, the overflow valve must stay with the pump. Make sure a new overflow valve is used with a new injection pump and the old (original) overflow valve is returned to the authorized repair facility with the old injection pump.**

Do not attempt to perform any disassembly of the injection pump. If disassembled, the warranty may be voided. The only serviceable components of the fuel injection pump are the fuel shutdown solenoid, overflow valve, breakover throttle lever, mounting o-ring, banjo washers and oil supply fittings.

FUEL SHUTDOWN SOLENOID TEST

NOTE: The fuel shutdown (shut-off) solenoid (Fig. 29) and fuel shutdown solenoid relay (Fig. 31) are not controlled by the powertrain control module (PCM).

(1) With the ignition switch off, the solenoid shaft should be down and the injection pump lever should be in the shutdown position (no fuel supply to injection pump) (Fig. 30).

(2) Turn the ignition switch to the CRANK (starter engage) position and observe the solenoid shaft and injection pump lever. The shaft should pull up (shaft retracted into the solenoid) and the pump lever should be in the run position (fuel being supplied to injection pump) (Fig. 30).

(3) Release the ignition key from the CRANK to the ON position. The shaft should remain in the up position and the pump lever should remain in the run position (fuel being supplied to injection pump) (Fig. 30). If the solenoid shaft is not moving, refer to the following:

DIAGNOSIS AND TESTING (Continued)

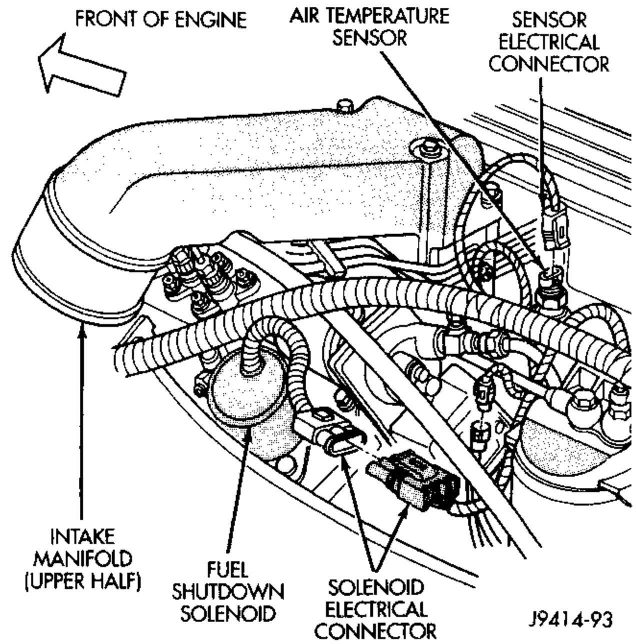

Fig. 29 Fuel Shutdown Solenoid Location

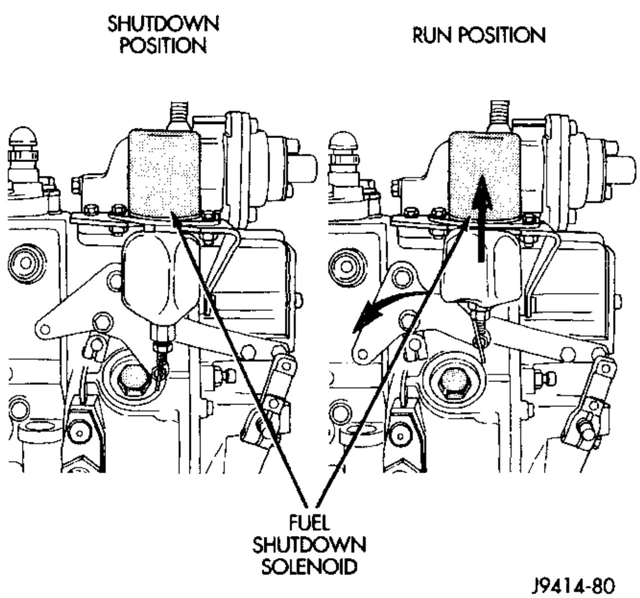

Fig. 30 Fuel Shutdown Solenoid Positions

(4) Disconnect the solenoid three-wire pigtail wire harness from the main engine harness.

(5) If the solenoid shaft did not move up when the ignition switch was in the CRANK position, check for 12 volts at the three-way connector. This will be the circuit coming from the fuel shutdown solenoid relay. Refer to Group 8W, for wire connector pin location and circuit identification. If 12 volts is not present at this circuit when the key is in the CRANK position, check the fuel shutdown solenoid relay. Refer to

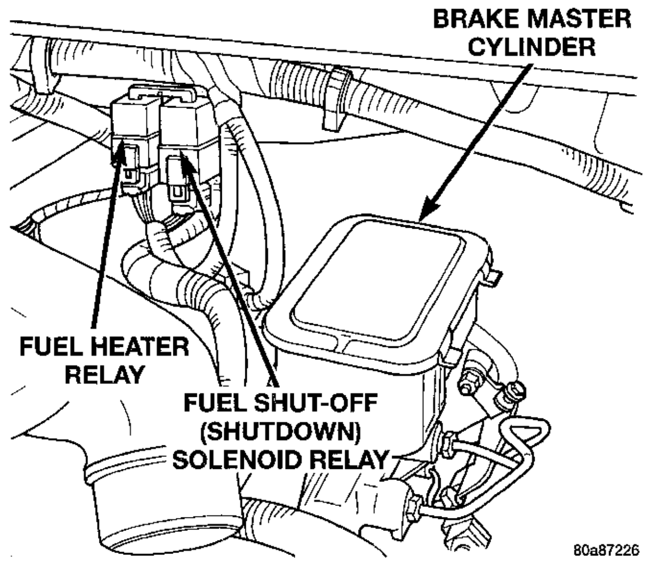

Fig. 31 Fuel Shutdown Solenoid Relay Location

Relay Test—Fuel Heater/Fuel Shutdown Solenoid in this section of the group. Also check the wiring between the relay and the solenoid.

(6) If the solenoid shaft moves up when the ignition switch is in the CRANK position, but moves down when the key is released from the CRANK to the ON position, check the circuit coming from the ignition switch for 12 volts. Refer to Group 8W, for wire connector pin location and circuit identification.

(7) If the shutdown solenoid is being replaced, its shaft length must be adjusted. Refer to Fuel Shutdown Solenoid Removal/Installation for procedures.

HIGH-PRESSURE FUEL LINE LEAK TEST

High-pressure fuel line leaks can cause starting problems and poor engine performance.

WARNING: DUE TO EXTREME FUEL PRESSURES OF UP TO 120,000 kPa (17,400 PSI), USE EXTREME CAUTION WHEN INSPECTING FOR HIGH-PRESSURE FUEL LEAKS. DO NOT GET YOUR HAND NEAR A SUSPECTED LEAK. INSPECT FOR HIGH-PRESSURE FUEL LEAKS WITH A SHEET OF CARDBOARD. HIGH FUEL INJECTION PRESSURE CAN CAUSE PERSONAL INJURY IF CONTACT IS MADE WITH THE SKIN.

Start the engine. Move the cardboard over the high-pressure fuel lines and check for fuel spray onto the cardboard (Fig. 32). If a high-pressure line connection is leaking, bleed the system and tighten the connection. Refer to the Air Bleed Procedure in this group for procedures. Replace damaged, restricted or leaking high-pressure fuel lines with the correct replacement line.

DIAGNOSIS AND TESTING (Continued)

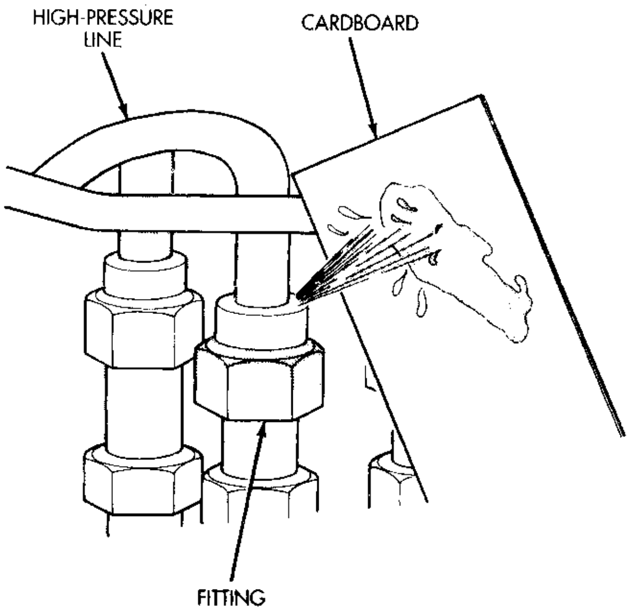

Fig. 32 Typical Test for Leaks with Cardboard

CAUTION: The high-pressure fuel lines must be clamped securely in place in the holders. The lines cannot contact each other or other components. Do not attempt to weld high-pressure fuel lines or to repair lines that are damaged. Only use the recommended lines when replacement of high-pressure fuel line is necessary.

IDLE SPEED ADJUSTMENT

The high idle stop screw is factory sealed and cannot be adjusted. Low-speed idle can be adjusted.

(1) Use an optical tachometer such as Snap-on No. MT139 or MTE (Cummins tool division) No. 3377462 to read the engine rpm.

(2) Bring the engine to normal operating temperature.

(3) Adjust the low idle speed at the low idle speed screw. The screw and locknut are located at the rear of the fuel injection pump (Fig. 33).

(4) Loosen the idle screw lock nut (Fig. 33). Adjust idle screw to obtain specified rpm. Refer to IDLE SPEEDS—DIESEL ENGINE chart.

(5) Tighten the locknut after adjustment.

SERVICE PROCEDURES

AIR BLEED PROCEDURE

A certain amount of air becomes trapped in the fuel system when fuel system components are serviced or replaced. Bleed the system after fuel system service according to the following procedures.

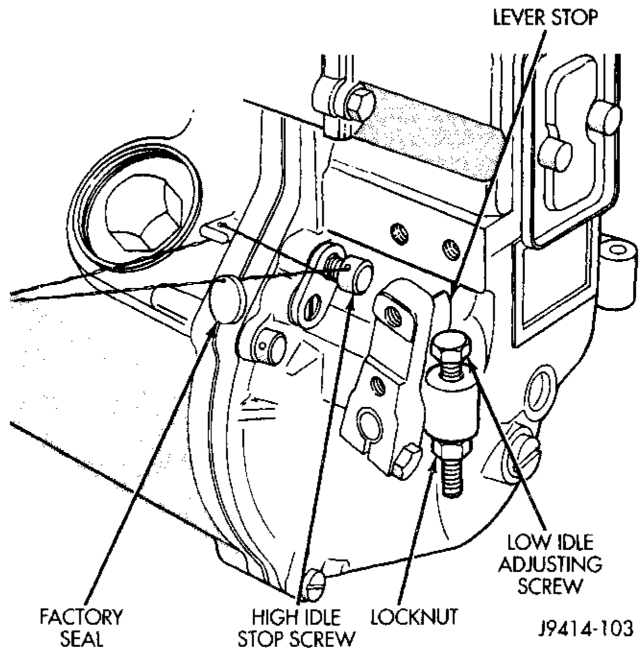

Fig. 33 Low Idle Speed Screw

IDLE SPEEDS—DIESEL ENGINE

LOW IDLE SPEED	HIGH IDLE SPEED
With automatic transmission: * 750-800 RPM with transmission in drive and air conditioning on.	Do not attempt to adjust high idle speed. High idle speed adjustment screw is factory sealed. Breaking seal will void injection pump warranty
With manual transmission: * 780 RPM with transmission in nuetral and air conditioning on.	
* With engine at operating temperature. Refer to text for idle adjustment procedures.	

WARNING: DO NOT BLEED AIR FROM THE FUEL SYSTEM OF A HOT ENGINE. DO NOT ALLOW FUEL TO SPRAY ONTO THE EXHAUST MANIFOLD WHEN BLEEDING AIR FROM THE FUEL SYSTEM.

MANUAL BLEEDING

Some air enters the fuel system when the filters or injection pump supply line are changed. This small amount of air is vented automatically from the injection pump through the fuel drain manifold. This is if the filter was changed according to instructions.

The system may have to be bled manually if:

- The vehicle fuel tank has been allowed to run empty
- The fuel filter is not filled before installation
- The fuel injection pump is replaced

SERVICE PROCEDURES (Continued)

- High-pressure fuel line connections are loosened or lines replaced
- Initial engine start-up or start-up after an extended period of no engine operation.

(1) Loosen the low-pressure bleed bolt (Fig. 34).

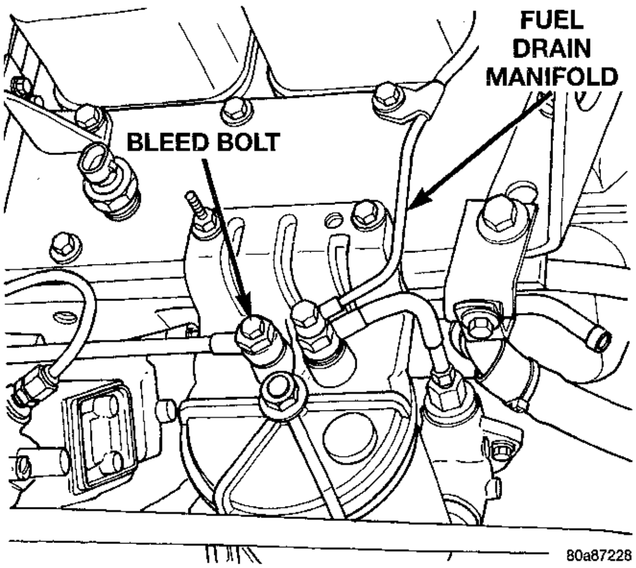

Fig. 34 Low-Pressure Bleed Bolt

(2) Operate the rubber push-button primer on the fuel transfer pump (Fig. 35). Do this until the fuel exiting the low-pressure bleed bolt is free of air.

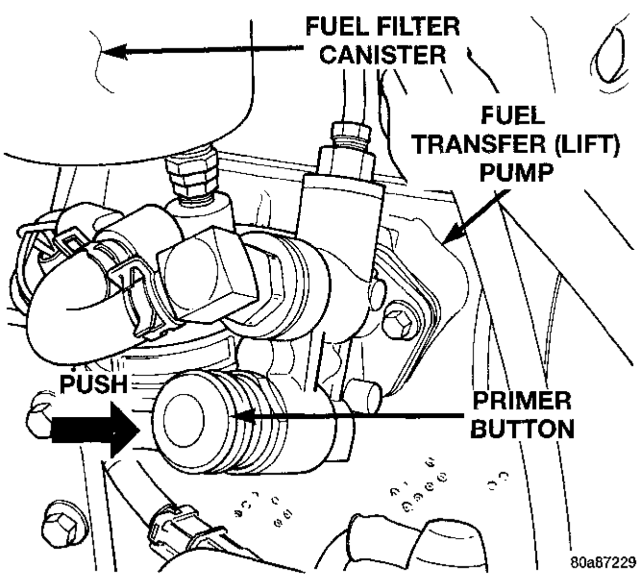

Fig. 35 Fuel Transfer Pump—Manual Operation

(3) Tighten low-pressure bleed screw to 8 N·m (6 ft. lbs.) torque.

FUEL INJECTION PUMP BLEEDING

WARNING: THE ENGINE MAY START WHEN CRANKING TO BLEED AIR FROM THE INJECTION PUMP. PLACE THE TRANSMISSION IN NEUTRAL OR PARK AND SET PARKING BRAKE BEFORE ENGAGING THE STARTER MOTOR.

CAUTION: Do not engage the starter motor for more than 30 seconds at a time. Allow two minutes between cranking intervals.

(1) Perform the previous procedure: Manual Bleeding.

(2) Crank the engine for 30 seconds at a time to allow air trapped in the injection pump to vent out the drain manifold. Observe the previous WARNING and CAUTION.

HIGH-PRESSURE FUEL LINE BLEEDING

WARNING: THE FUEL INJECTION PUMP SUPPLIES HIGH-PRESSURE FUEL OF AS HIGH AS 120,000 KPA (17,405 PSI) TO EACH INDIVIDUAL INJECTOR THROUGH THE HIGH-PRESSURE LINES. FUEL UNDER THIS AMOUNT OF PRESSURE CAN PENETRATE THE SKIN AND CAUSE PERSONAL INJURY. WEAR SAFETY GOGGLES AND ADEQUATE PROTECTIVE CLOTHING AND AVOID CONTACT WITH FUEL SPRAY WHEN BLEEDING HIGH- PRESSURE FUEL LINES.

WARNING: DO NOT BLEED AIR FROM THE FUEL SYSTEM OF A HOT ENGINE. DO NOT ALLOW FUEL TO SPRAY ONTO THE EXHAUST MANIFOLD WHEN BLEEDING AIR FROM THE FUEL SYSTEM.

Bleed air from one injector at time.

(1) Loosen the high-pressure fuel line fitting at the injector (Fig. 36).

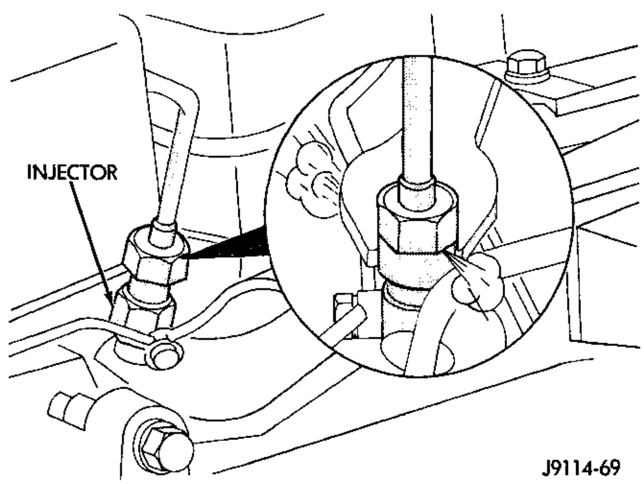

Fig. 36 Bleeding High-Pressure Fuel Lines

(2) Crank the engine until all air is bled from the line. **Do not operate the starter motor for longer**

SERVICE PROCEDURES (Continued)

than 30 seconds. Wait two minutes between cranking intervals.

(3) Start the engine and bleed one injector at a time until the engine runs smoothly.

(4) Tighten fuel line(s) at injector(s) to 30 N·m (22 ft. lbs.) torque.

FUEL INJECTION PUMP TIMING

(1) Thoroughly clean the engine and fuel system before attempting to remove any components. Pay special attention to the top of the fuel injection pump. Use compressed air to remove any water remaining on the fuel pump after the cleaning process.

CAUTION: DO NOT ALLOW ANY DIRT, DEBRIS, OR PAINT CHIPS TO ENTER THE FUEL SYSTEM WHILE IT IS OPEN. IF FOREIGN MATERIAL OF ANY TYPE IS ALLOWED INTO THE PUMP, LINES OR INJECTORS DURING THIS PROCESS IT COULD RESULT IN AN INJECTION PUMP OR FUEL INJECTOR MALFUNCTION.

NOTE: Locate top dead center (TDC) on cylinder #1.

(2) Remove the rubber access plug located in the rear flange of the engine on the exhaust manifold side. (Fig. 37).

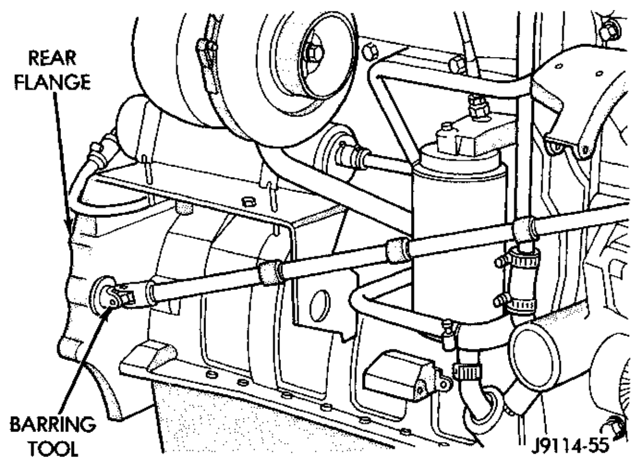

Fig. 37 Rotating Engine With Barring Tool

NOTE: Removing the #1 cylinder valve cover and first barring (rotating) the engine clockwise until both intake and exhaust valves are closed will speed up locating engine TDC as described later in step 4.

(3) Insert the barring tool number 7471B through the access hole and into the flywheel housing (Fig. 37).

(4) While holding tension on the timing pin (toward front of engine), slowly rotate the engine counterclockwise with the barring tool. Hold a slight rearward (pushing) pressure on the barring tool and continue to rotate the tool counterclockwise until the timing pin drops into the machined hole in the back of the camshaft gear. **When the barring tool is rotated counterclockwise, the vibration damper should be rotating clockwise as viewed from front.** When the pin aligns to the gear (Fig. 38), and the intake and exhaust valves are closed at the #1 cylinder, the engine is at the TDC position (compression stroke) at cylinder number 1. Place a paint mark on the dampener to indicate TDC. This mark is to be used as a reference point only and is not to be used for actual pump timing procedure. **Remove the pin. This will prevent damage when barring (rotating) the engine in later steps.**

NOTE: The pin is located above the power steering pump, below and to the inside of the fuel injection pump, on the rear of the cam gear housing (Fig. 39).

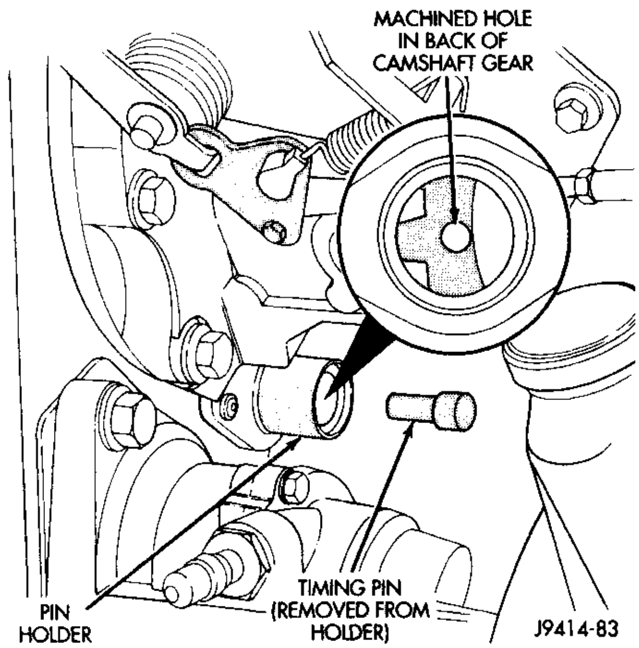

Fig. 38 Back of Camshaft Gear—Typical

(5) Remove #1 fuel injection line from the fuel pump (Fig. 40).

CAUTION: DO NOT BEND THE FUEL LINE. BENDING THE LINE WILL CAUSE LINE OR INJECTOR FAILURE.

(6) With the engine at TDC, loosen but do not remove, the front (#1) delivery valve holder using special socket #6840 (Fig. 41). Remove the socket

mopar AUTHENTIC RESTORATION PRODUCT

SERVICE PROCEDURES (Continued)

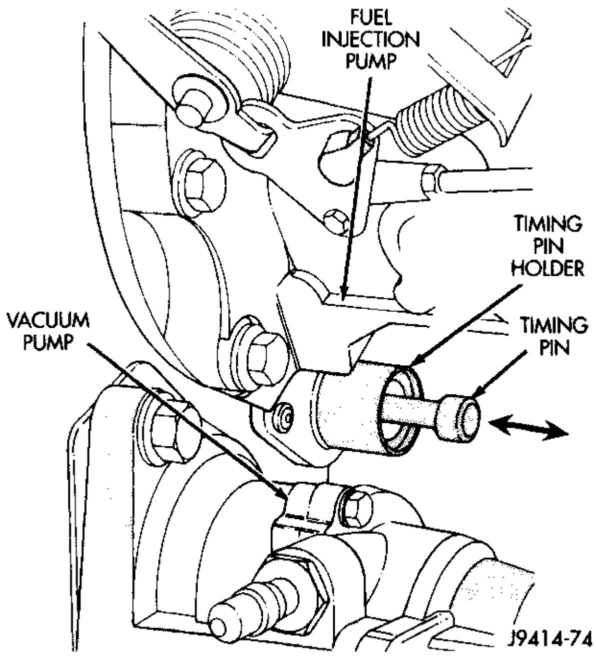

Fig. 39 Timing Pin and Location

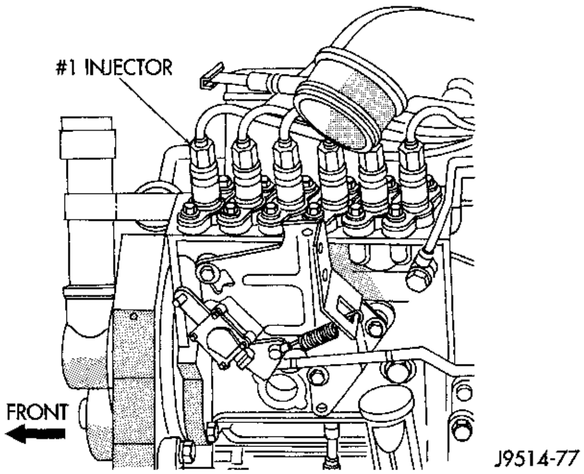

Fig. 40 Number 1 Injection Line

from the valve holder prior to removing the holder from the injection pump.

There is an external o-ring on the holder to help prevent debris from getting into the pump. This may create a slight resistance as the holder is unscrewed.

(7) Remove the delivery valve holder by carefully tipping the holder outboard with one hand while using the other hand to hold the spring, fill piece, and any shims from slipping out of the holder. Place these parts (Fig. 42) as an assembly on a clean surface.

(8) Using a magnet, remove the two piece delivery valve assembly from the pump (Fig. 43). Place these parts on a clean surface.

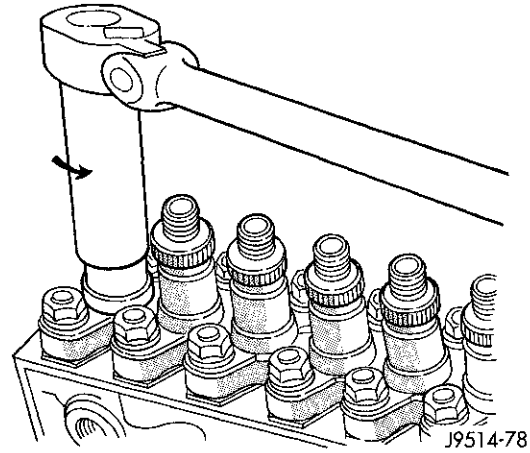

Fig. 41 Delivery Valve Holder Removal

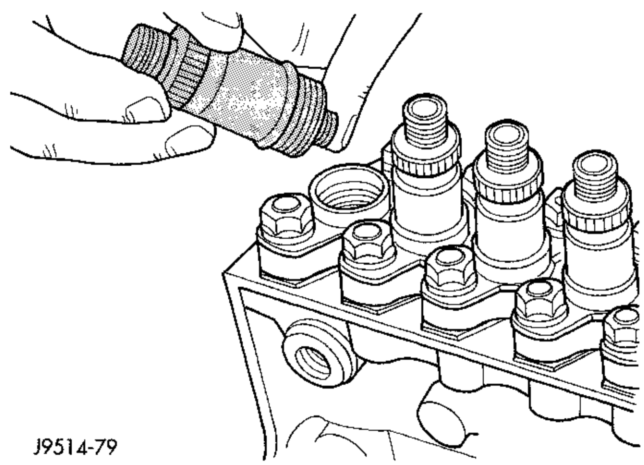

Fig. 42 Delivery Valve Holder

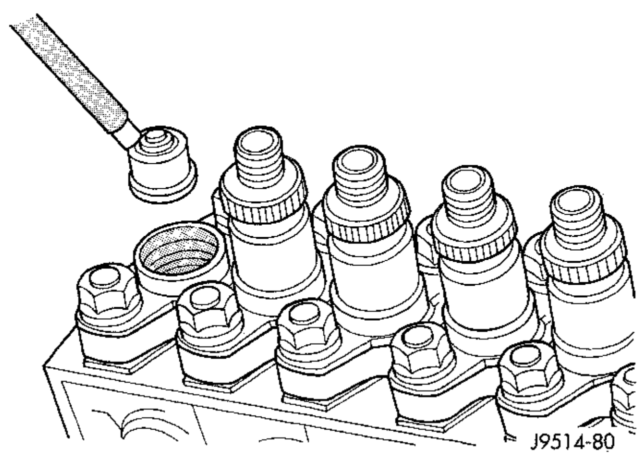

Fig. 43 Delivery Valve Assembly

(9) Install the dial indicator adaptor tool #6842 (Fig. 44) in place of the #1 delivery valve holder and tighten finger tight.

(10) Loosen the set screw on the dial indicator adaptor (Fig. 44). Install the dial indicator #6859 and dial indicator tip #6843 into the adapter. Position the

SERVICE PROCEDURES (Continued)

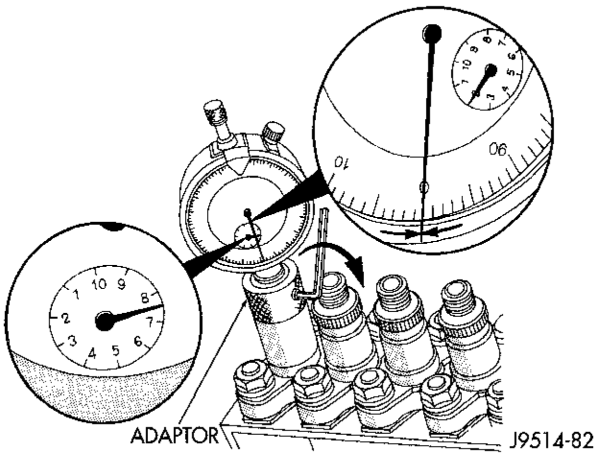

Fig. 44 Installing Special Adapter Tool

dial indicator to read between 7.0 and 9.0 mm and tighten the set screw (Fig. 44). The dial indicator is capable of measuring from 0-20.00 mm lift. The small inner dial is marked in increments of 1 mm. The large outer dial is marked in increments of 0.01 mm. One revolution of the outer dial is equal to 1 mm. The inner dial only indicates 0-10 mm, but will rotate twice as the indicator goes through the full range.

(11) **Be sure the timing pin is disengaged before rotating the engine to avoid damage to the timing pin.**

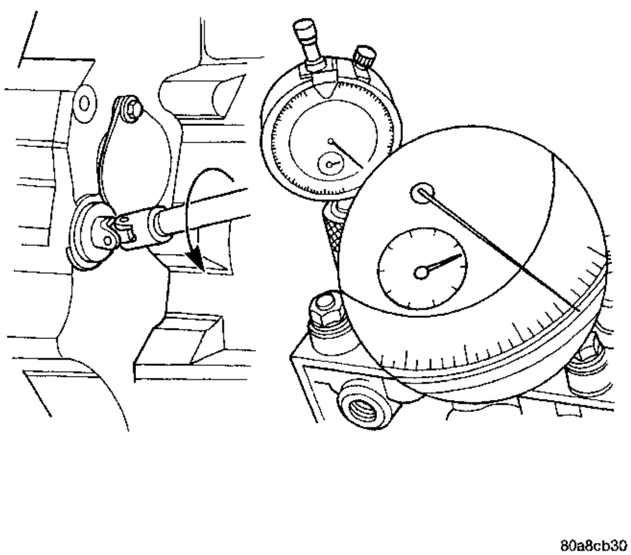

Fig. 45 Setting Dial Indicator

(12) Using the engine barring tool #7471B, rotate the engine in the direction opposite normal direction of engine rotation (counterclockwise from front of engine) 1/4 turn or until you see the dial indicator reading stop dropping. This is the inner base circle of the injection pump cam. Zero the indicator and note the reading on the small inner dial (Fig. 45).

(a) Slowly rotate engine clockwise to TDC. When at TDC, the timing pin should easily push into machined hole in back of camshaft gear. Pull pin from gear after verifying TDC position.

(b) Note the pump lift setting on the dial indicator (Fig. 45).

(c) Note the injection pump CPL number and "Timing-TDC" specification (in degrees) stamped into the engine data plate. The engine data plate is located on the left side of the timing gear cover (Fig. 46).

(d) Refer to the Fuel Injection Pump Plunger Lift charts. The charts contain a nominal timing specification and a pump plunger lift tolerance specification.

(e) If reading on dial indicator, and specification for pump plunger lift match, a fuel timing adjustment **will not** be necessary. Proceed to Step 26.

(f) If reading and specifications **do not match,** a fuel timing adjustment will be necessary. Proceed to next step.

FUEL INJECTION PUMP PLUNGER LIFT—49 STATE AUTO. TRANS. AND ALL CALIFOR. EGR EQUIPPED ENGINES

CPL 2174 AND 2308 (CALIFORNIA)	
STATIC TIMING (DEGREES BTDC)	PLUNGER LIFT AT TDC
14.0 (NOMINAL)	4.29 mm-4.61 mm

FUEL INJECTION PUMP PLUNGER LIFT—49 STATE MANUAL TRANSMISSION

CPL 2175	
STATIC TIMING (DEGREES BTDC)	PLUNGER LIFT AT TDC
13.5 (NOMINAL)	4.89 mm-5.25 mm

Adjusting Timing:

(13) Remove the oil filler tube (Fig. 47) and adapter elbow from the front of the timing gear housing.

(14) Loosen the injection pump shaft nut (use the barring tool to keep the engine from rotating). Before removing pump nut or washer, place a magnet to the end of the injection pump shaft (Fig. 48). This will prevent the nut or washer from falling into the timing gear cover which will require engine disassembly for recovery.

(15) Position a magnet to the end of the injection pump shaft. Install the special bearing and thrust washer kit #6862 (Fig. 49) over the injection pump shaft in this order: 1 thrust washer-1 bearing-1 thrust washer. The thrust washer/bearing kit is used

AUTHENTIC RESTORATION PRODUCT

SERVICE PROCEDURES (Continued)

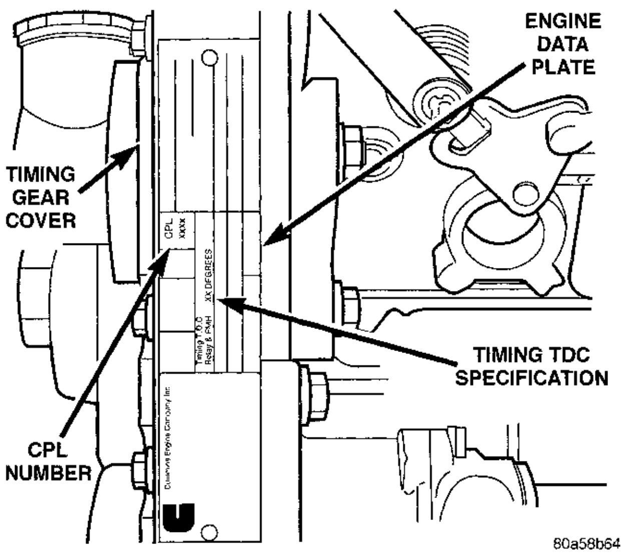

Fig. 46 Engine Data Plate and CPL Number

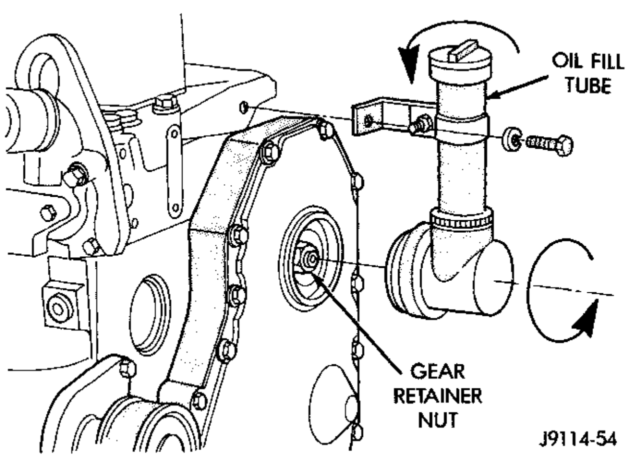

Fig. 47 Oil Filler Tube

to prevent the pump gear from rotating on the pump shaft when tightening the pump nut (step 22). Reinstall pump shaft nut allowing some clearance between the thrust washers. Do not tighten nut at this time.

(16) Slowly rotate the engine clockwise until reaching the required lift setting on the dial indicator. Refer to Fuel Injection Pump Plunger Lift charts. The injection pump should rotate with the engine since the injection pump gear is still locked to the injection pump shaft.

(17) With the injection pump at the correct plunger lift setting, use special gear puller tool #L-4407A to pull the injection pump gear off the taper of the injection pump input shaft. Leave the gear puller installed (Fig. 50). After the gear has been pulled, ensure the lift setting has not changed.

(18) Rotate the engine 20 to 30 degrees counterclockwise, then rotate the engine back clockwise to

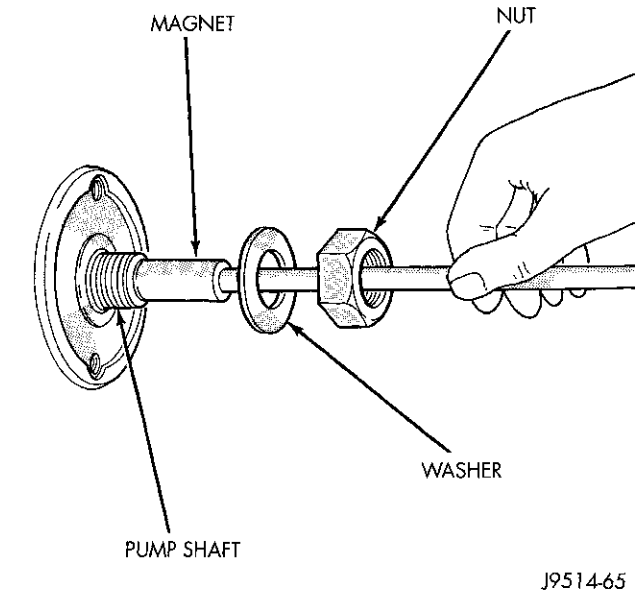

Fig. 48 Positioning Magnet to Pump Shaft

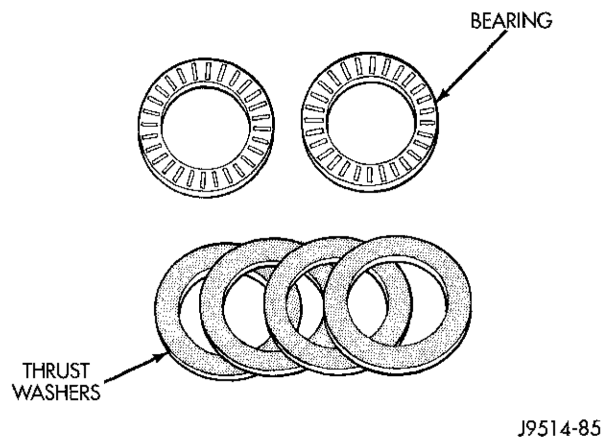

Fig. 49 Bearing/Thrust Washer Tools

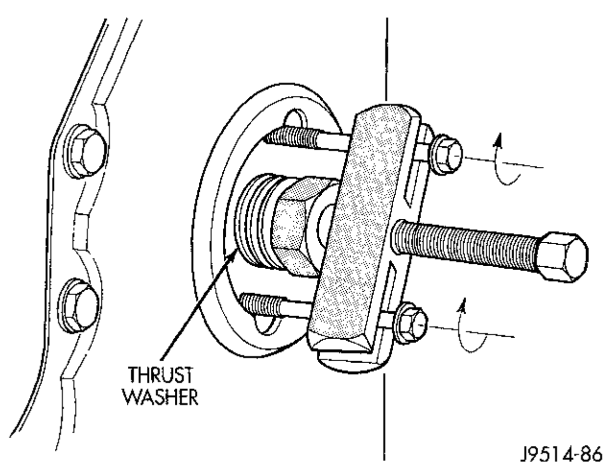

Fig. 50 Gear Puller Tool Installed

SERVICE PROCEDURES (Continued)

TDC (Fig. 51). This removes backlash from the geartrain.

The fuel pump gear and pump shaft tapers must be absolutely clean, dry and free of any oil or dirt. Oil or dirt will prevent seating of the taper and will result in possible slippage of the gear.

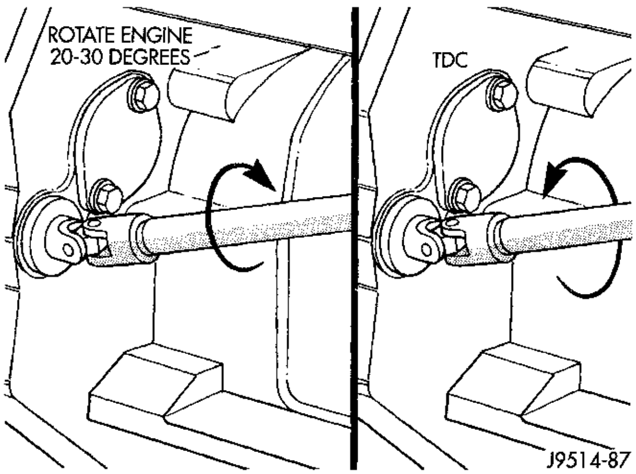

Fig. 51 Rotating Crankshaft

(19) Loosen, but do not remove the gear puller tool bolts. Using the gear puller, rotate pump gear counterclockwise by hand (Fig. 52), while pushing the gear onto the pump shaft. This will remove backlash between the injection pump and camshaft gears.

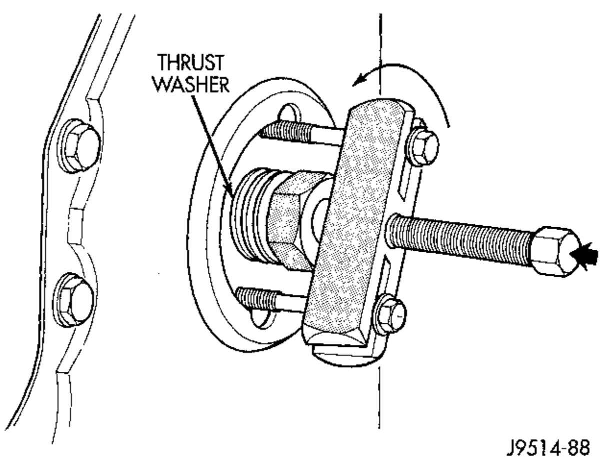

Fig. 52 Rotating Injection Pump Gear

(20) Hand tighten the pump shaft nut (Fig. 53). Remove the gear puller (Fig. 53).

(21) Tighten the pump shaft nut to 15 N·m (11 lb. ft.) torque to seat the gear to the pump shaft taper (Fig. 54).

(22) Remove injection pump shaft nut. Use a magnet on the end of the shaft while removing (Fig. 48).

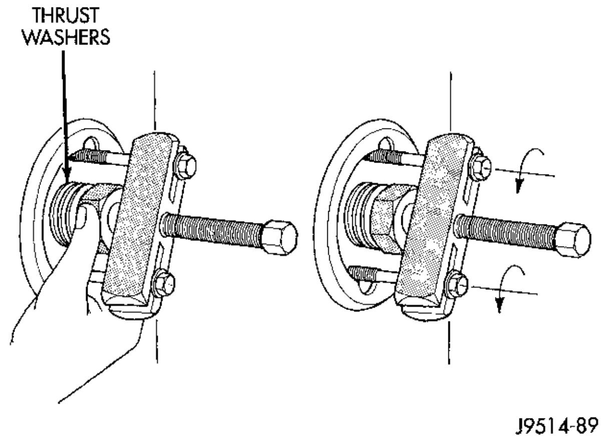

Fig. 53 Removing Gear Puller Tool

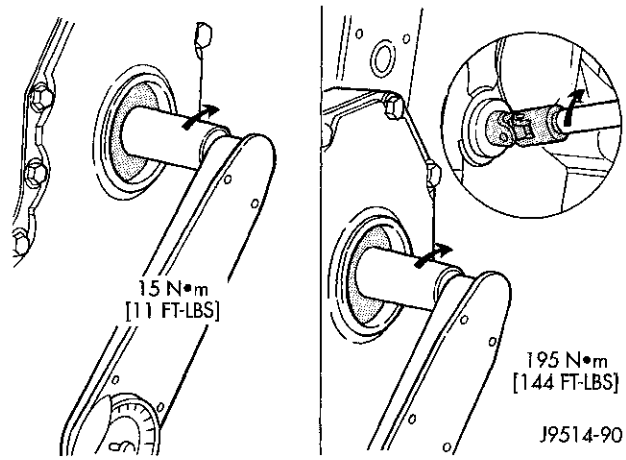

Fig. 54 Tightening Pump Nut

(23) Remove special bearing and thrust washers #6862 from pump shaft. Use a magnet on the end of the shaft while removing.

(24) While preventing the engine from rotating with the barring tool, tighten the shaft nut to 195 N·m (144 lb. ft.) torque (Fig. 54).

(25) Repeat steps 12 and 13 to verify that the final timing setting is correct. If the setting is not correct, repeat steps 15 through 25.

(26) Remove the dial indicator and adaptor from the injection pump.

CAUTION: THE FOLLOWING INSTALLATION AND TORQUING PROCEDURE MUST BE FOLLOWED EXACTLY. IMPROPER INSTALLATION OF THE DELIVERY VALVE WILL RESULT IN DAMAGE OR LEAKS.

(27) Install the delivery valve assembly on top of the sealing washer (Fig. 55) or (Fig. 43).

(28) Lubricate the threads and clamping surface of the delivery valve holder with a few drops of SAE 90

Mopar AUTHENTIC RESTORATION PRODUCT

SERVICE PROCEDURES (Continued)

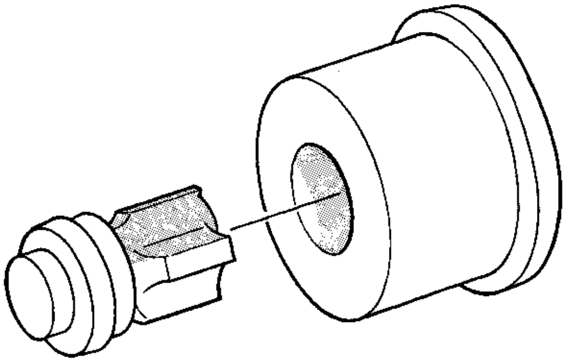

Fig. 55 Delivery Valve Assembly

hypoid gear oil. **Do not lubricate the metal delivery valve washer or its seating area.**

(29) Install the delivery valve holder assembly taking care not to displace the delivery valve spring, fill piece, or any shims (Fig. 56).

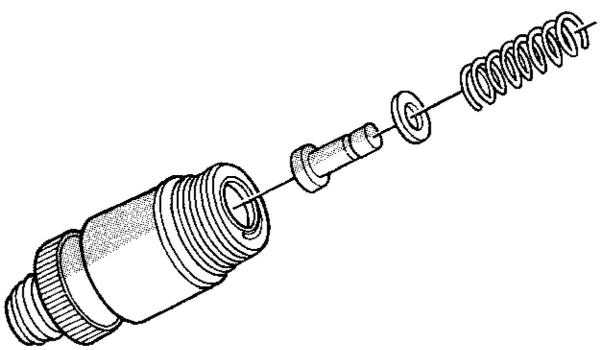

Fig. 56 Delivery Valve Holder

(30) Pre-tighten the delivery valve holder to 40 N·m (29 lb. ft.) torque (Fig. 57). Next, in one motion, tighten the holder to 115 N·m (85 ft. lbs.) torque (Fig. 57).

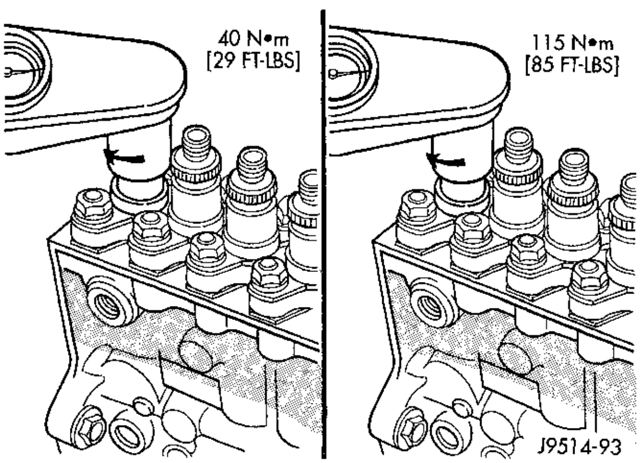

Fig. 57 Tightening Delivery Valve Holder

(31) Install remaining engine components removed during the timing process. Leave the injector end of the #1 high-pressure fuel line loose to facilitate bleeding the air out of the system.

WARNING: THE PRESSURE OF THE FUEL IN THE LINE IS SUFFICIENT TO PENETRATE THE SKIN AND CAUSE SERIOUS BODILY HARM.

(32) Crank the engine until fuel is observed at the #1 injector. Tighten the high-pressure line at the injector. Start the engine and check for leaks.

THROTTLE LINKAGE ADJUSTMENT—DIESEL ENGINE

Refer to WIDE-OPEN-THROTTLE CHECKS—DIESEL ENGINE for linkage adjustment procedures.

If Equipped With Throttle Position Sensor (TPS): Whenever the throttle linkage is adjusted, it will change TPS adjustment. Refer to THROTTLE POSITION SENSOR—DIESEL ENGINE, Removal/Installation/Adjustment in this group for procedures. Adjusting the TPS should always be the **last** adjustment.

WIDE-OPEN-THROTTLE CHECKS—DIESEL ENGINE

If "lack of power" is a complaint, one of the problems may be the inability of attaining wide-open-throttle (WOT). This is observed as throttle lever "breakover". "Breakover" is the continued movement of the throttle lever **after** movement of the throttle lever-to-injection pump lever linkage rod has stopped (Fig. 58). WOT must continue up to, and slightly through throttle lever "breakover". If "breakover" is not attained, WOT is not attained.

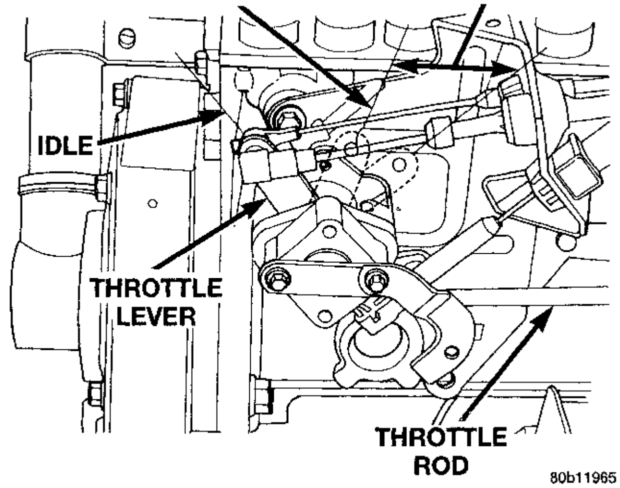

Fig. 58 Throttle Lever "Breakover"—Diesel Engine

SERVICE PROCEDURES (Continued)

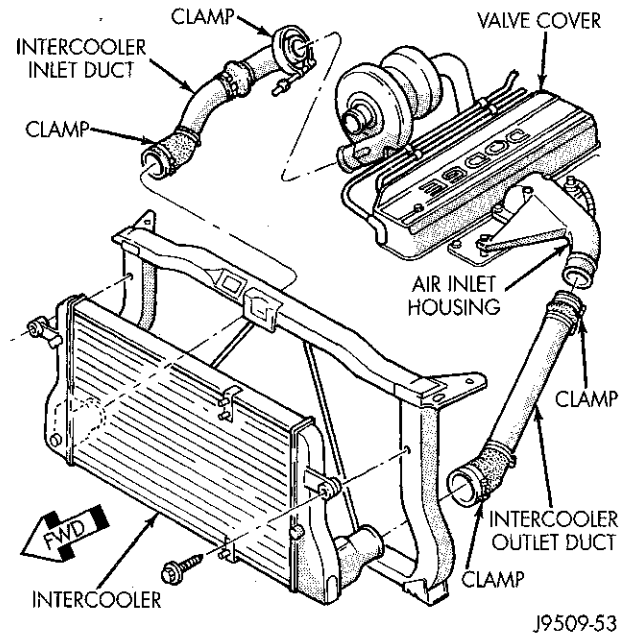

Fig. 59 Intercooler Outlet Duct

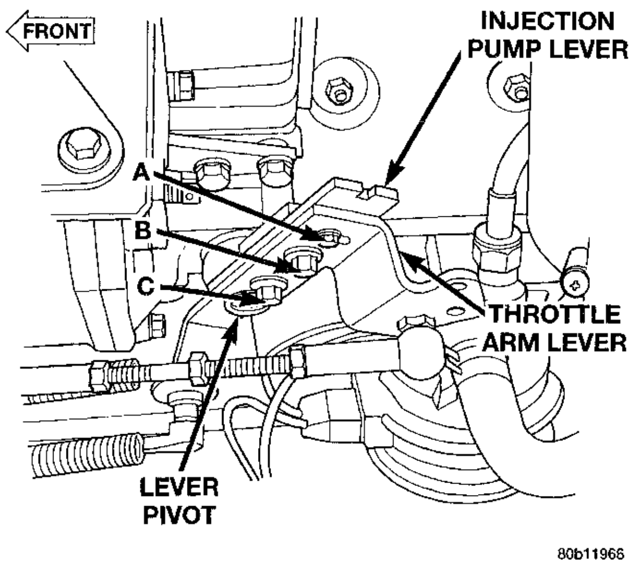

Fig. 60 Fuel Injection Pump Lever / Throttle Arm Lever

(1) Attach DRB scan tool to data link connector.

(2) Start engine and bring to operating temperature.

(3) Use DRB tool to check engine idle speed. Adjust idle speed if necessary. Refer to Idle Speed Adjustment for specifications. This step must be done before checking "breakover".

(4) Key OFF and engine OFF.

(5) Two people are needed for this portion of test. From inside vehicle, press accelerator pedal about half-way to floor. Movement of both throttle lever

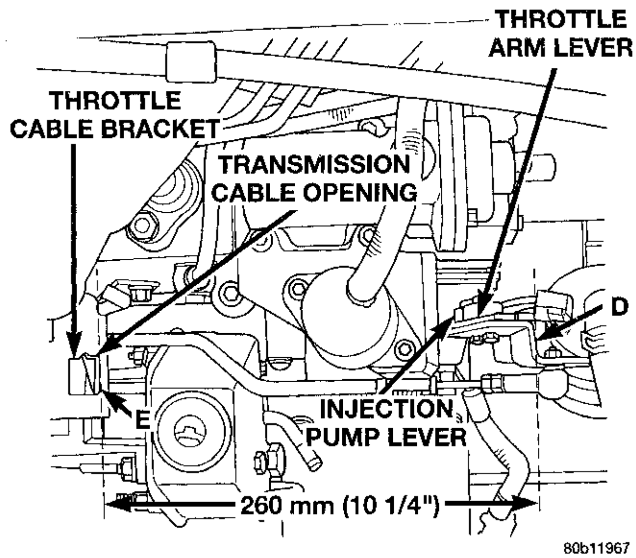

Fig. 61 Breakover Measurement

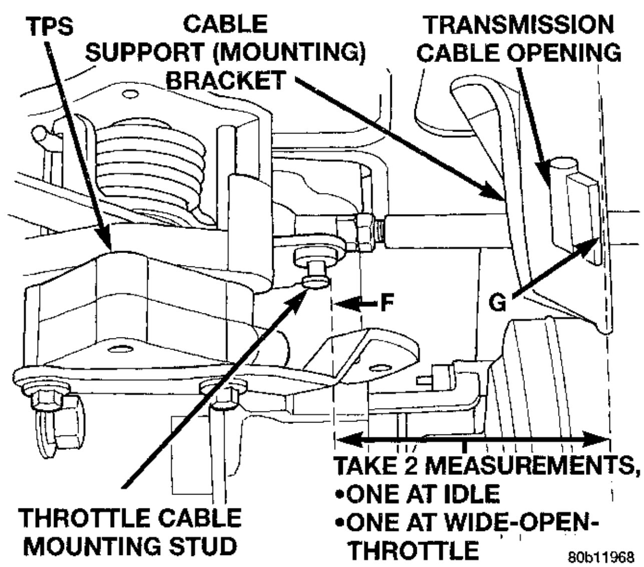

Fig. 62 Breakover Measurement Verification

(Fig. 58) and throttle rod (Fig. 58) should be observed.

(6) Continue to press accelerator pedal to the floor. If throttle lever "breakover" is operating correctly, the throttle rod (Fig. 58) should have stopped moving while the throttle lever (Fig. 58) continues to move towards the rear of vehicle.

(7) If "breakover" is not observed, the throttle linkage must be adjusted. If engine is equipped with a throttle position sensor (TPS), the TPS must also be adjusted **after** "breakover" position is set. Refer to THROTTLE POSITION SENSOR—DIESEL ENGINE in the Removal/Installation section of this group.

(8) At side of fuel injection pump, remove intercooler outlet duct from air inlet housing (Fig. 59).

AUTHENTIC RESTORATION PRODUCTS

SERVICE PROCEDURES (Continued)

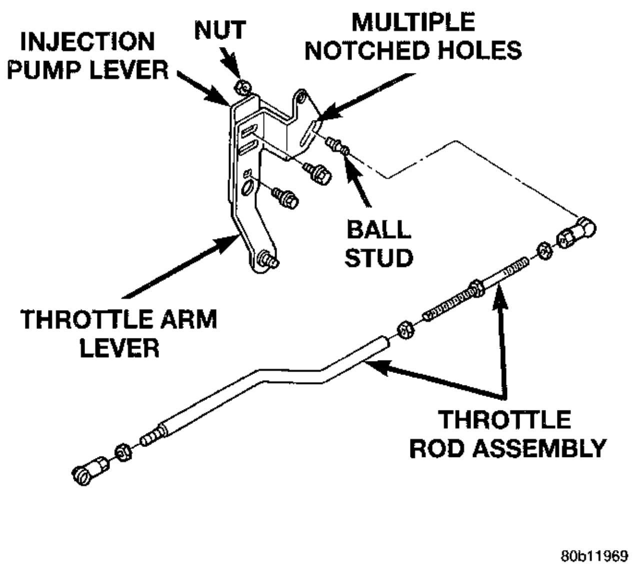

Fig. 63 Ball Stud and Notched Holes at Throttle Arm Lever

(9) Disconnect end of throttle cable at fuel injection pump. Refer to Throttle Cable in the Diesel Removal/Installation section.

(10) Disconnect end of transmission control (throttle valve) cable at fuel injection pump. Refer to Transmission Throttle Valve Cable in Group 21, Transmission.

(11) Disconnect end of speed control cable at fuel injection pump. Refer to Servo Cable in Group 8H, Speed Control System.

(12) Loosen, but do not remove, bolts A, B and C on throttle arm lever (Fig. 60).

(13) Move (pivot) throttle arm lever on injection pump lever (Fig. 60) to attain 260 mm (10 1/4") from point D at back of throttle arm lever, to point E at back of throttle cable bracket (Fig. 61). Take measurement through transmission throttle valve cable opening on throttle cable mounting bracket (Fig. 61). Make sure injection pump lever (Fig. 61) remains at **closed throttle position** during measurement

(14) Tighten bolts A, B and C to 10 N·m (89 in. lbs.) torque.

(15) Verify correct adjustment by measuring distance from back of throttle cable mounting stud on bellcrank (point F) (through transmission throttle valve cable opening) to the rear face of throttle cable mounting bracket (point G) (Fig. 62). This measurement (travel) must be taken twice; once at idle position and once at wide-open-throttle (WOT) position. Be sure injection pump lever (Fig. 61) remains at either idle or WOT position during both measurements. Record both measurements.

(16) The difference between the two measurements (travel) must be 34mm ± 2mm (1 11/32 in. ± 3/64 in.).

(17) If difference in measurement is OK, proceed to Step 22.

(18) If difference in measurement is too small, remove nut securing ball stud to throttle arm lever (Fig. 63) and remove ball stud from lever. Move ball stud upward/rearward one notch on pump lever. Multiple notched holes are provide on lever (Fig. 63). If difference in measurement is too great, move ball stud downward/forward one notch on lever. Each notched hole on throttle arm lever will give approximately a 2mm (3/64 in.) incremental adjustment in chosen direction.

(19) Tighten ball stud nut to 10 N·m (89 in. lbs.) torque.

(20) After repositioning ball stud, again, check for difference in measurement (travel) of 34mm ± 2mm (1 11/32 in. ± 3/64 in.). Readjust if necessary.

(21) After travel has been set, recheck "breakover".

(22) Connect end of throttle cable at fuel injection pump. Refer to Throttle Cable in the Diesel Removal/Installation section.

(23) Connect end of transmission control (throttle valve) cable at fuel injection pump. Refer to Transmission Throttle Valve Cable in Group 21, Transmission.

(24) Connect end of speed control cable at fuel injection pump. Refer to Servo Cable in Group 8H, Speed Control System.

(25) Install intercooler outlet duct to air inlet housing.

(26) If engine is equipped with a throttle position sensor (TPS), the TPS must also be adjusted. Refer to THROTTLE POSITION SENSOR—DIESEL ENGINE in the Removal/Installation section of this group.

REMOVAL AND INSTALLATION

ACCELERATOR PEDAL

Refer to the Fuel Delivery System—Gasoline Engine section for procedures.

FUEL DRAIN MANIFOLD

REMOVAL

(1) Remove two nuts retaining nameplate/cover to top of six engine valve covers (Fig. 64). Remove nameplate/cover from engine.

(2) Remove drain manifold fitting screws (bolts) at each of six injectors (Fig. 65).

(3) Remove fuel drain manifold holdown clamp/bolt (Fig. 66) at top/rear of intake manifold.

(4) Remove fuel drain manifold banjo fitting at top of fuel filter/water separator (one bolt) (Fig. 66).

(5) Remove fuel drain manifold fitting copper gaskets at each fuel injector.

REMOVAL AND INSTALLATION (Continued)

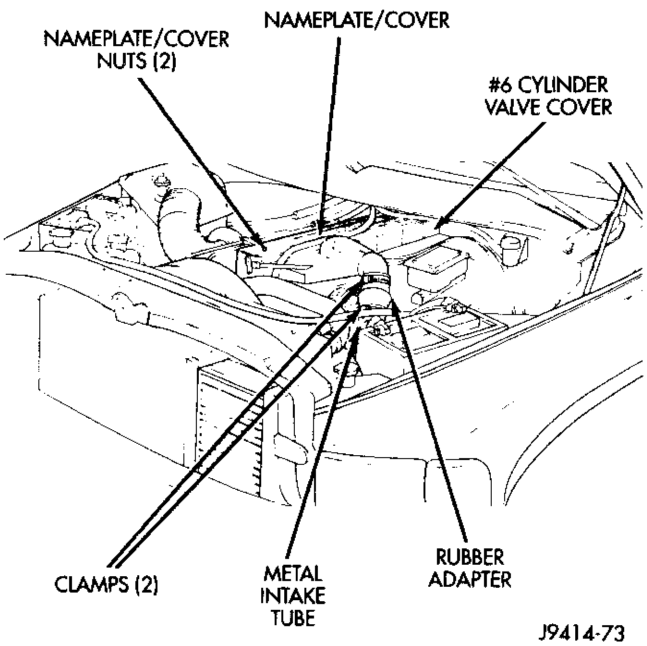

Fig. 64 Nameplate/Cover—Diesel

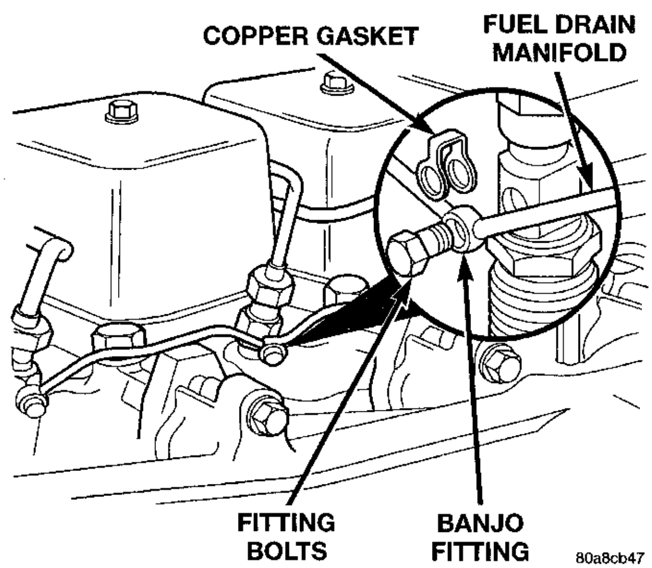

Fig. 65 Fuel Drain Manifold Fittings—Typical

(6) Remove manifold from engine.

INSTALLATION

(1) Using new copper gaskets on all fittings and assemble fuel drain manifold in reverse order of disassembly.

(2) Tighten drain manifold fitting screws (bolts) at injectors to 9 N·m (7 ft. lbs.) torque.

(3) Tighten drain manifold holdown clamp screws (bolts) to 13 N·m (10 ft. lbs.) torque.

(4) Install nameplate/cover.

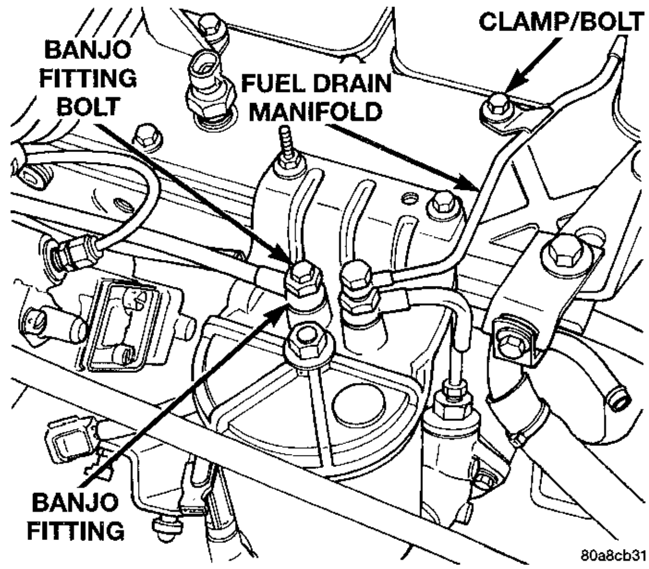

Fig. 66 Fuel Drain Manifold and Fuel Filter/Water Separator

FUEL FILTER/WATER SEPARATOR

Refer to the maintenance schedules in Group 0 in this manual for the recommended fuel filter replacement intervals. Whenever the fuel filter is being replaced, the pre-filter in the fuel heater assembly should be removed and cleaned. Refer to Fuel Heater Removal/Installation for procedures.

The fuel filter/water separator assembly is located on left/rear side of engine above starter motor (Fig. 67). The assembly contains a fuel filter cartridge and Water-In-Fuel (WIF) sensor.

REMOVAL

The canister drain valve (Fig. 67) or (Fig. 68) serves two purposes. One is to partially drain the filter canister of excess water. The other is to completely drain the canister for filter replacement.

DRAINING WATER FROM FILTER CANISTER: The filter should be drained whenever the water-in-fuel warning lamp remains illuminated. (Note that the lamp will be illuminated for approximately two seconds when ignition key is initially placed in ON position for a bulb check).

A drain hose is located at bottom of drain valve (Fig. 69). Place a drain pan under drain hose. **With engine not running,** rotate valve handle forward to DRAIN position (Fig. 68). Hold drain valve open until all water and contaminants have been removed and clean fuel exits the drain hose. If fuel filter or WIF sensor is being replaced, drain the canister completely. Dispose of mixture in drain pan according to applicable regulations. After draining operation, rotate valve handle rearward to CLOSE position (Fig. 68). If fuel filter or WIF sensor is being replaced, proceed to next step.

REMOVAL AND INSTALLATION (Continued)

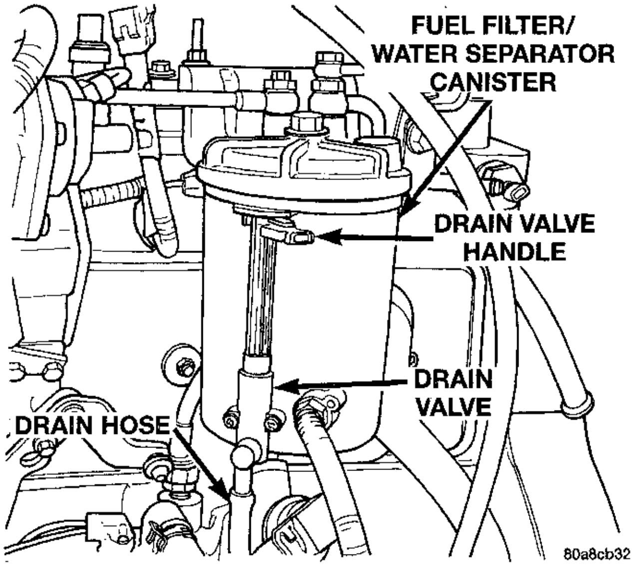

Fig. 67 Fuel Filter/Water Separator Location

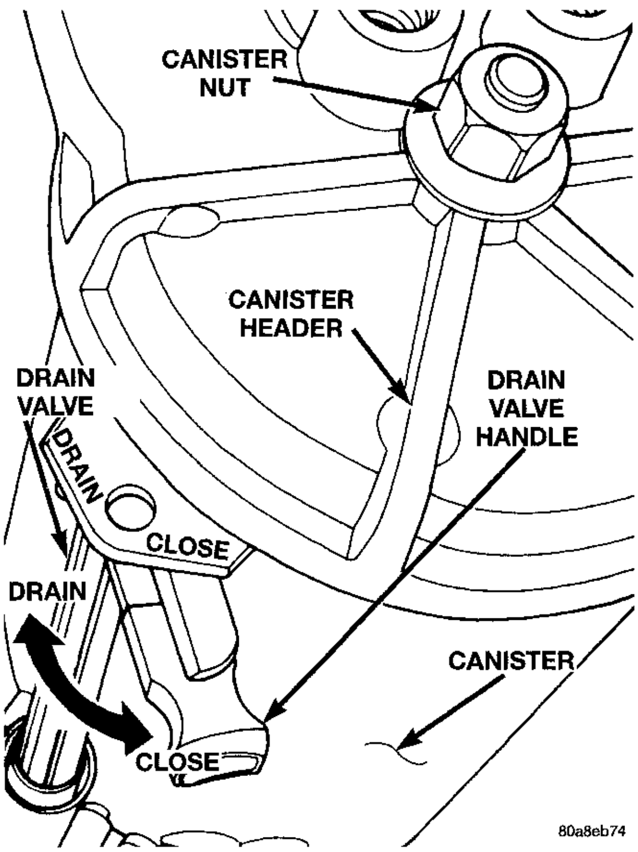

Fig. 68 Drain Valve at Fuel Filter/Water Separator

(1) Remove drain hose at drain valve (Fig. 69).

(2) Disconnect Water-In-Fuel (WIF) sensor electrical connector pigtail harness from main engine wiring harness. The WIF sensor is located at side of filter canister (Fig. 69).

(3) Remove filter canister nut at top of header (Fig. 68).

(4) Lower canister assembly from header.

(5) Remove and discard center o-ring (Fig. 69).

(6) Remove filter element (cartridge) from canister.

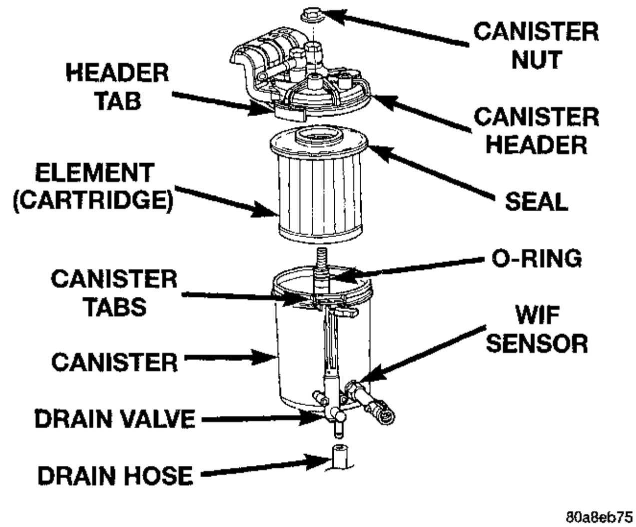

Fig. 69 Fuel Filter/Water Separator Components

(7) Remove WIF sensor and its seal from canister (Fig. 70).

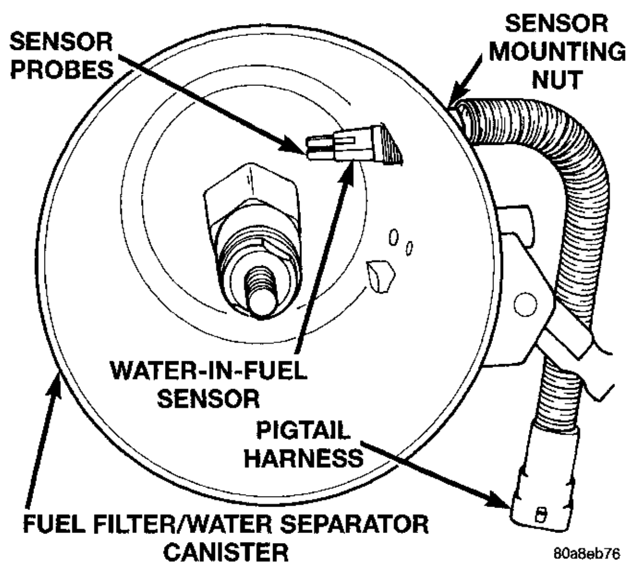

Fig. 70 Water-In-Fuel Sensor

(8) Inspect WIF sensor probes (Fig. 70). Carefully clean contaminants from sensor probes with a cloth if necessary. Replace sensor if probes are covered with contaminants and will not clean up.

INSTALLATION

(1) Clean inside of canister.

(2) Install a new o-ring seal to WIF sensor.

(3) Install WIF sensor to canister. Tighten to 2–3 N·m (15–20 in. lbs.) torque.

REMOVAL AND INSTALLATION (Continued)

(4) If drain valve assembly is being replaced, tighten mounting screws to 3–5 N·m (30–40 in. lbs.) torque.

(5) Install new seal between canister and canister header.

If filter canister is not filled with clean diesel fuel before installation, manual air bleeding of the fuel system may be necessary (temporary rough engine running may occur). If necessary, refer to the Air Bleed Procedure in this group for procedures.

(6) Fill filter canister with clean diesel fuel.

(7) Apply a light film of clean diesel oil to seals.

(8) Position canister assembly to canister header. Note that the locating tabs on canister should align into header tab on canister header (Fig. 69). This step must be followed to prevent damage to canister or header and to prevent contact of drain valve into throttle linkage.

(9) Install canister nut and tighten to 14 N·m (10 ft. lbs.) torque.

(10) Connect electrical connector to WIF sensor.

(11) Connect drain hose to bottom of drain valve.

(12) Start engine and check for leaks.

FUEL TANK

Refer to Fuel Tank—All Engines in the Fuel Delivery System—Gasoline engines section for procedures.

FUEL TANK MODULE

REMOVAL

(1) Drain and remove fuel tank. Refer to Fuel Tanks—All Engines for procedures.

(2) The plastic fuel tank module locknut is threaded onto fuel tank (Fig. 71). Install Special Tool 6856 to locknut and remove locknut (Fig. 72). The fuel tank module will spring up when locknut is removed.

(3) Remove module from fuel tank.

INSTALLATION

CAUTION: Whenever the fuel tank module is serviced, the rubber gasket must be replaced.

(1) Using a new gasket, carefully position fuel tank module into opening in fuel tank.

(2) Position locknut over top of fuel tank module. Install locknut finger tight.

(3) The fuel line connectors, rollover valve and fuel gauge electrical connector should all be pointed to drivers side of vehicle. Rotate module if necessary before tightening locknut. This step must be performed to prevent the float from contacting side of fuel tank.

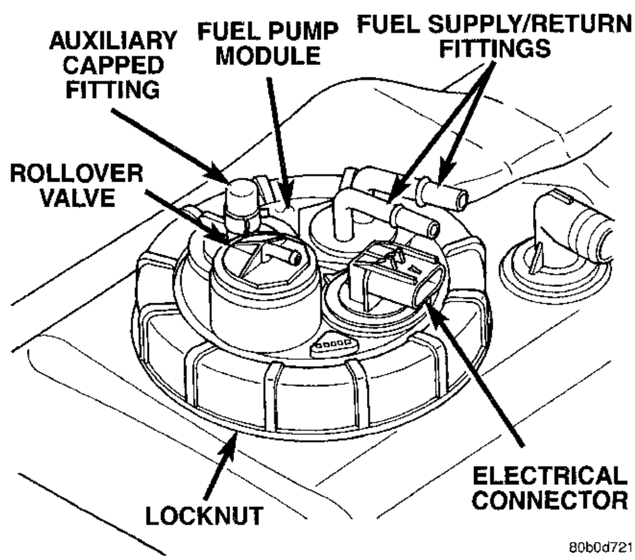

Fig. 71 Top View of Fuel Tank Module—Diesel

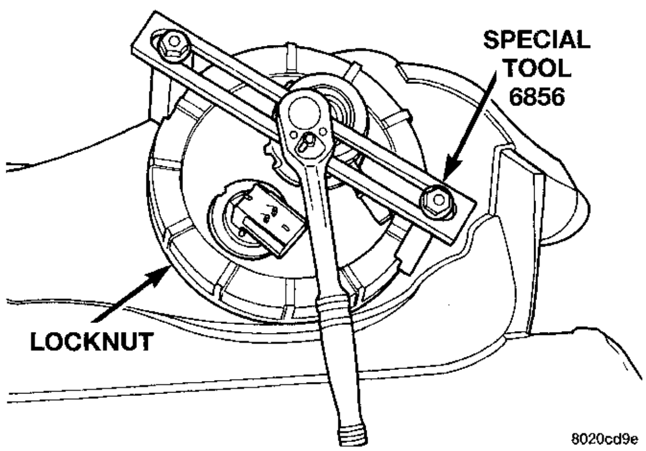

Fig. 72 Locknut Removal/Installation—TYPICAL

(4) Tighten locknut to 24–44 N·m (18–32 ft. lbs.) torque.

(5) Install fuel tank. Refer to Fuel Tanks—All Engines for procedures.

FUEL HEATER

The fuel heater element assembly is located inside of fuel heater housing and above pre-filter (Fig. 73). The fuel temperature sensor is located at top of fuel heater housing (Fig. 73).

If upper section of fuel heater assembly housing is to be removed, the fuel transfer pump must first be removed. The mounting bracket/spacer (Fig. 74) on fuel heater is shared with fuel transfer pump. Refer to Fuel Transfer Pump Removal/Installation for procedures.

REMOVAL AND INSTALLATION (Continued)

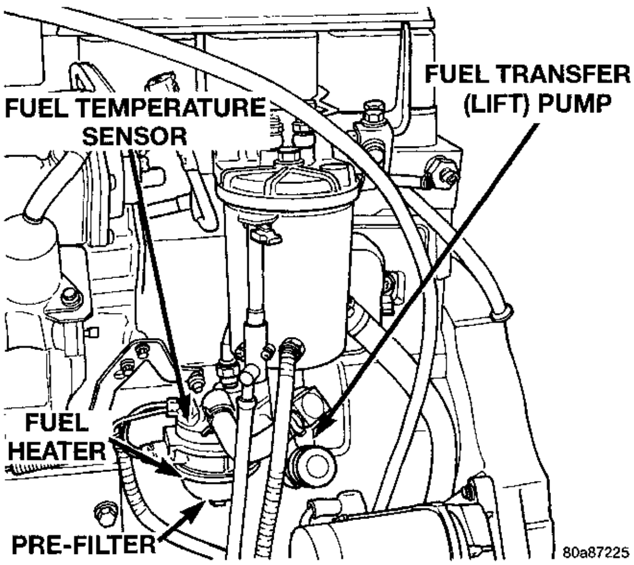

Fig. 73 Fuel Heater and Fuel Temperature Sensor Location

REMOVAL

(1) Disconnect both negative battery cables at both batteries.
(2) Remove starter motor. Refer to Group 8B for procedures.
(3) Disconnect electrical connector at front of fuel heater housing (Fig. 73).
(4) Place a drain pan below fuel heater.
(5) A machined hex is located on bottom of pre-filter housing (Fig. 74). From under vehicle, attach a socket to this hex and remove (unscrew) pre-filter.
(6) Remove fuel heater assembly from housing.
(7) Remove pre-filter and screen from housing.
(8) Remove and discard rubber seals between housing sections.

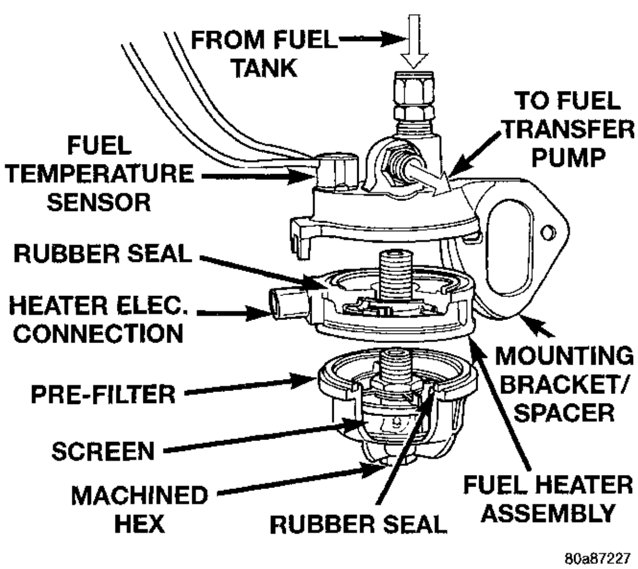

Fig. 74 Fuel Heater and Pre-Filter

INSTALLATION

(1) Clean pre-filter and screen.
(2) Clean all other components before assembly.
(3) Install screen and pre-filter into housing.
(4) Install new rubber seals between housing sections.
(5) Install fuel heater assembly and housing sections.
(6) Rotate fuel heater until fuel temperature sensor is pointed towards front of vehicle.
(7) Tighten hex at bottom of housing.
(8) Connect electrical connector at front of fuel heater housing.
(9) Install starter motor. Refer to Group 8B for procedures.
(10) Connect both negative battery cables at both batteries.

FUEL HEATER RELAY

The fuel heater relay is located in the engine compartment near the brake master cylinder (Fig. 75).

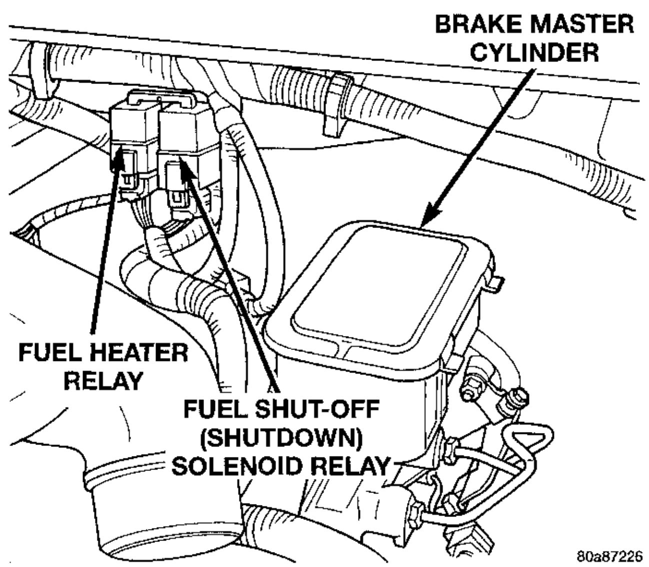

Fig. 75 Fuel Heater Relay—Diesel

REMOVAL

(1) Disconnect both negative battery cables at both batteries.
(2) Disconnect the electrical connector at the relay.
(3) Remove the relay from the mounting bracket.

INSTALLATION

(1) Check the terminals within connector for damage or corrosion. Also check pin height of terminals within connector. Pin heights should be the same. Repair as necessary before connecting relay.
(2) Install the relay to the mounting bracket.
(3) Connect the electrical connector.
(4) Connect battery cables to both batteries.

REMOVAL AND INSTALLATION (Continued)

FUEL INJECTION PUMP

New or remanufactured fuel injection pumps should have a new overflow valve (Fig. 81) temporarily installed into side of pump. **Do not install a used overflow valve into a new or remanufactured injection pump.** If pump is being sent to an authorized repair facility for calibration or testing, be sure to temporarily install old overflow valve into pump.

REMOVAL

(1) Disconnect both negative battery cables at both batteries.

(2) Disconnect electrical connector at throttle position sensor on side of injection pump (if equipped) (Fig. 76).

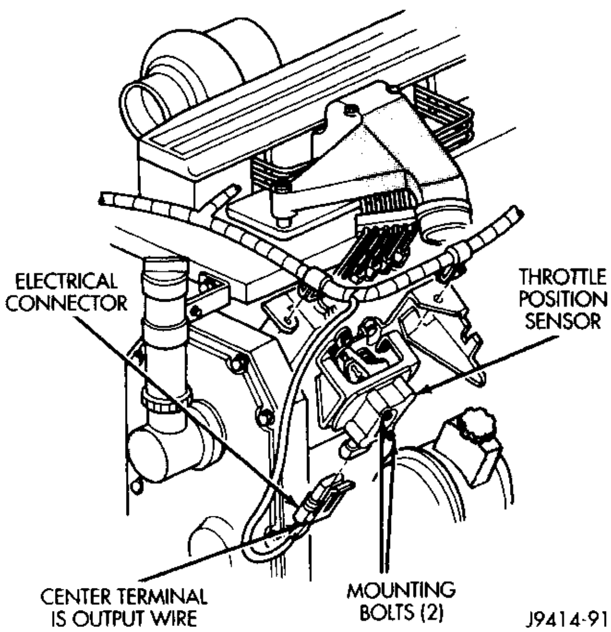

Fig. 76 Throttle Position Sensor—Diesel

(3) Disconnect electrical connector at fuel shutdown solenoid. (Fig. 77).

(4) Remove EGR tube (if equipped). Refer to Group 25, Emission Control System for procedures.

(5) Disconnect main engine wiring harness at top of injection pump and position to side.

(6) Remove metal intake manifold-to-intercooler connecting tube.

(7) Remove engine oil dipstick tube mounting clamp and bolt (Fig. 78). Position dipstick tube to side.

(8) Disconnect two air heater cable nuts (Fig. 78).

(9) Remove five intake manifold bolts (Fig. 78). Discard both old air heater base gaskets.

(10) Remove throttle control bracket, cables and linkage assembly from side of pump (three bolts). Position assembly to side.

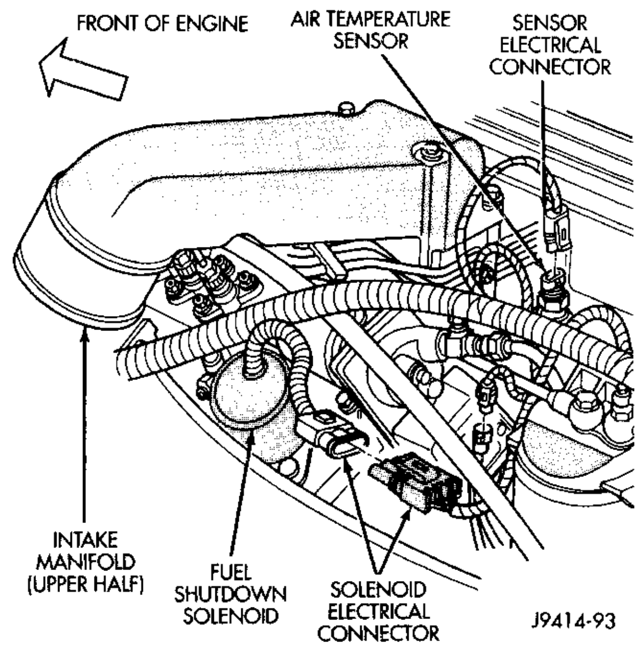

Fig. 77 Fuel Shutdown Solenoid Location

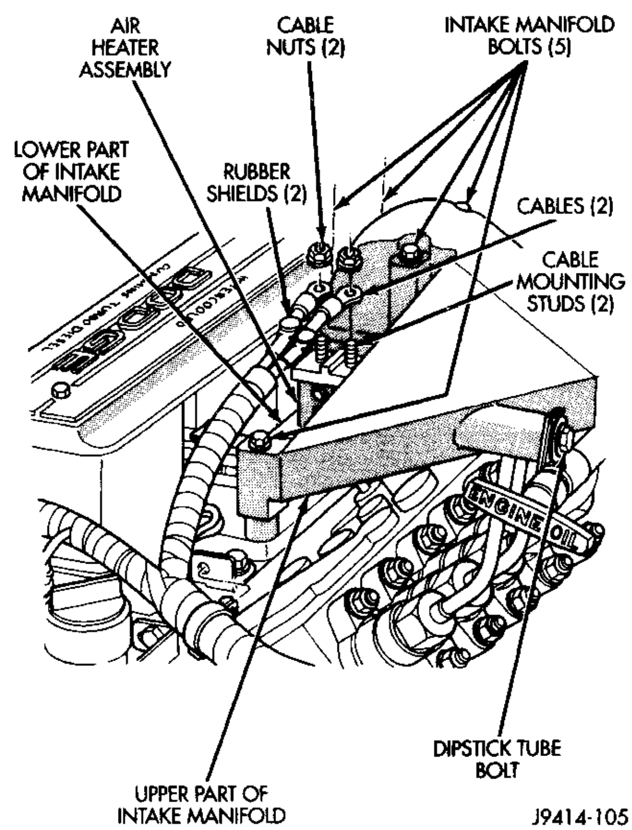

Fig. 78 Intake Manifold Air Heater

(11) Disconnect control line fitting and control from air flow control (AFC) valve at rear of injection pump (Fig. 79).

REMOVAL AND INSTALLATION (Continued)

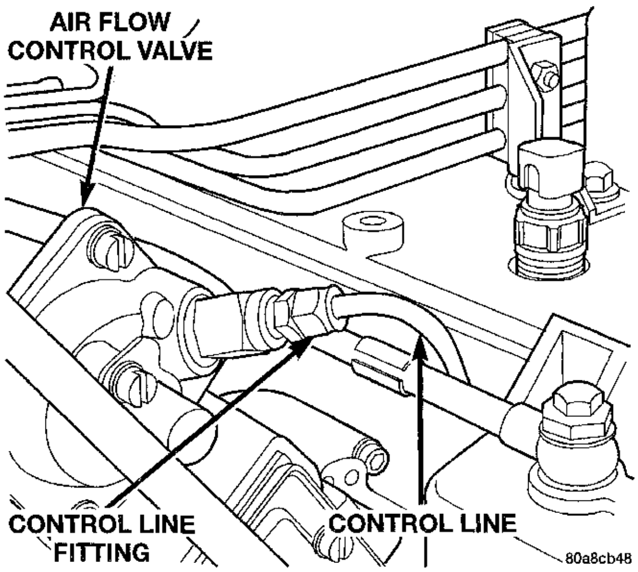

Fig. 79 Control Line at AFC Valve

(12) Remove fuel supply line at both ends (injection pump and fuel filter/water separator) (Fig. 80). For procedures, refer to Fuel Injection Pump Supply Line in this group. Place a rag beneath fitting to catch excess fuel.

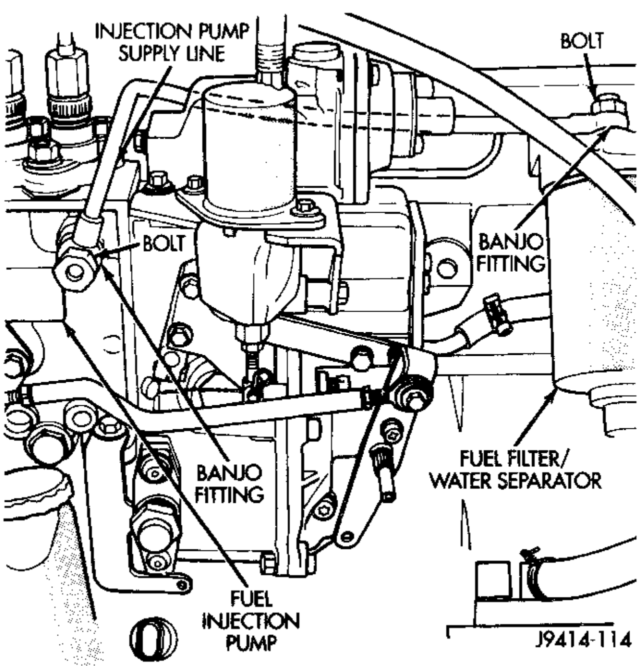

Fig. 80 Fuel Injection Pump Supply Line

(13) The overflow valve is used to retain fuel return line banjo fitting to injection pump. Remove overflow valve and fuel return line at pump (Fig. 81). Place a rag beneath banjo fitting to catch excess fuel.

(14) Disconnect six (6) high-pressure fuel lines from fuel delivery valve holders at top of injection pump (Fig. 82). For procedures, refer to High-Pressure Fuel Lines in this group. Place a rag beneath fittings to catch excess fuel.

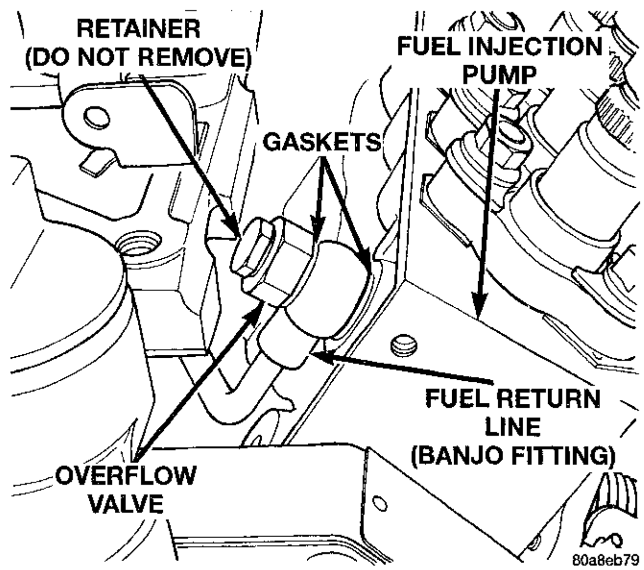

Fig. 81 Injection Pump Overflow Valve

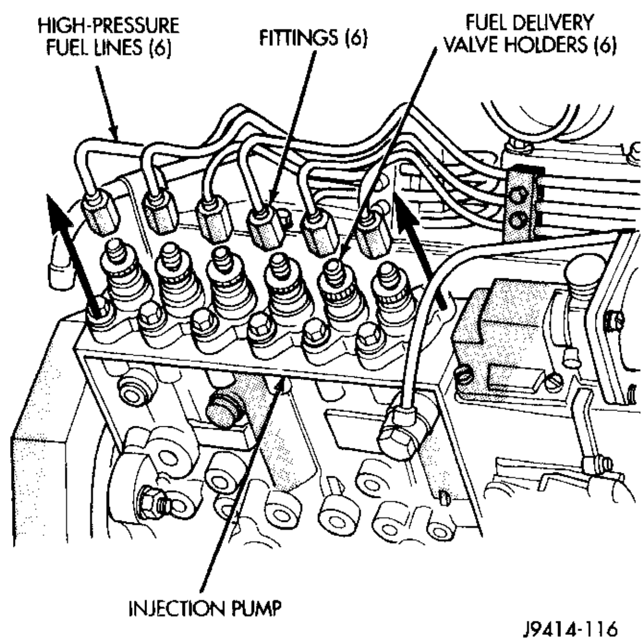

Fig. 82 Fuel Delivery Valve Holders and Pressure Lines

(15) Disconnect engine oil supply line at side of pump (Fig. 83).

(16) Remove oil fill tube bracket mounting bolt (Fig. 84).

(17) Remove oil fill tube from tube-to-gear housing adapter (Fig. 84). Tube is removed by screwing counterclockwise from adapter.

REMOVAL AND INSTALLATION (Continued)

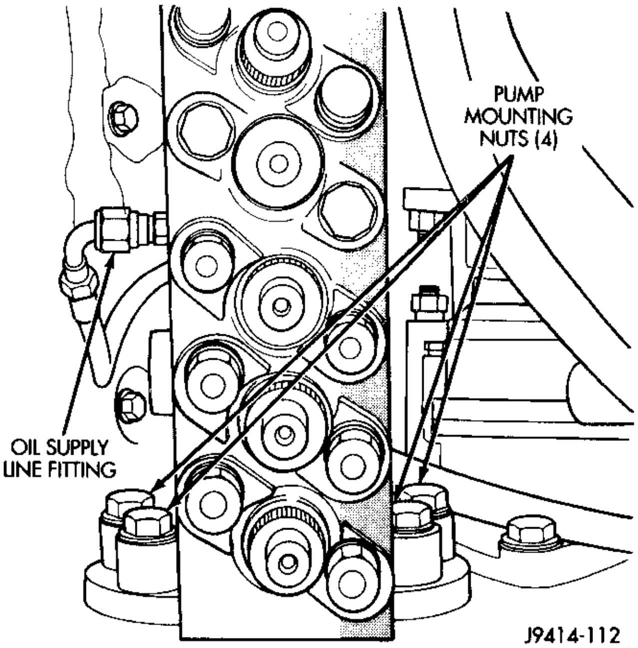

Fig. 83 Engine Oil Supply Line—Pump Mounting Nuts

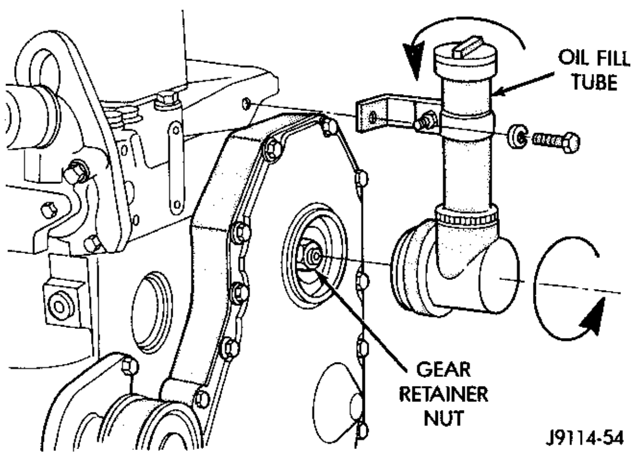

Fig. 84 Oil Fill Tube, Adapter and Mounting Bracket

(18) Remove oil fill tube adapter from gear housing (Fig. 84). Adapter is removed by screwing counterclockwise from gear housing.

(19) **The engine is equipped with a built-in moveable timing pin.** This pin is located above power steering pump, below and to inside of fuel injection pump, on rear of cam gear housing (Fig. 85). The pin will engage into a machined hole in the back of camshaft gear (Fig. 86). It is designed to position engine to TDC (Top Dead Center) on compression stroke of number 1 cylinder.

(20) Remove rubber air tube connecting turbocharger to air cleaner housing.

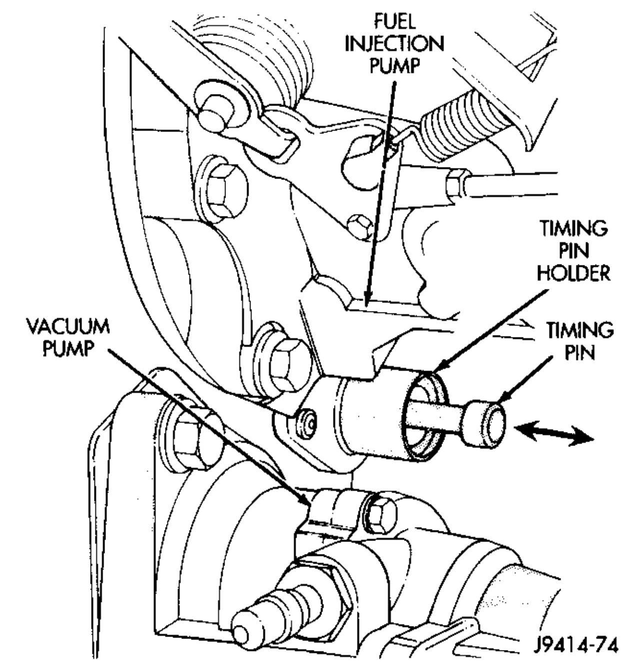

Fig. 85 Timing Pin and Location

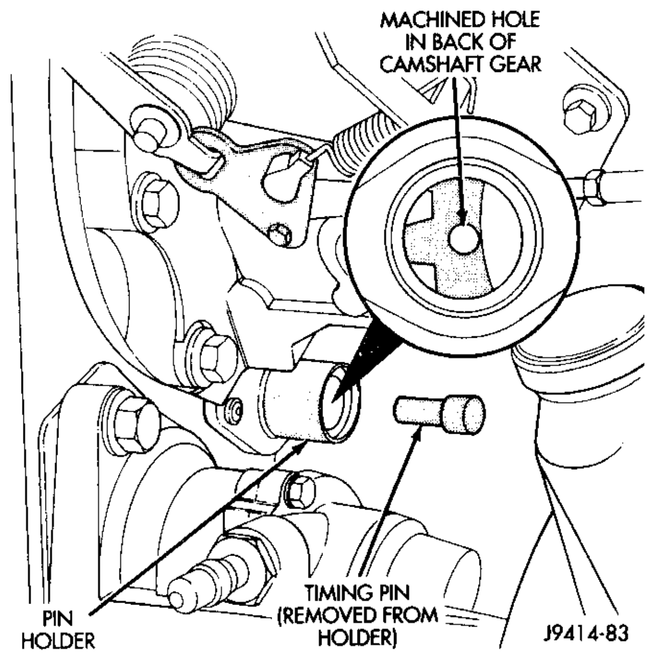

Fig. 86 Back of Camshaft Gear—Typical

(21) The engine can be rotated with a barring tool such as Snap-On No. SP371, MTE No. 3377371 (Cummins Tool Division), or an equivalent.

(22) The opening for barring tool is located in rear flange of engine on exhaust manifold side (Fig. 87). Remove rubber access plug covering this opening.

(23) Insert barring tool into flywheel housing opening (Fig. 87).

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

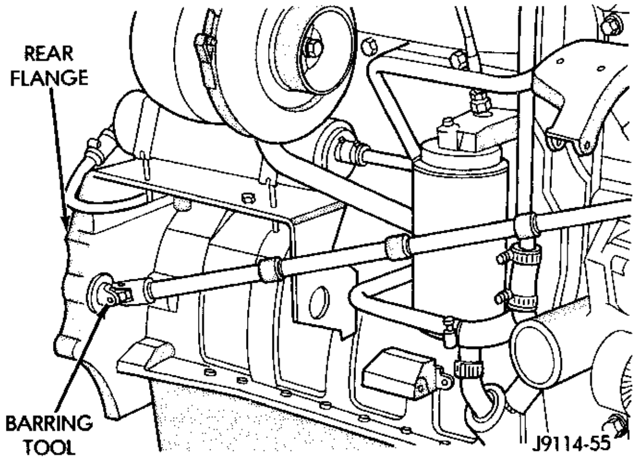

Fig. 87 Rotating Engine with Barring Tool—Typical

(24) While holding tension on timing pin (towards front of engine), very slowly rotate engine (counterclockwise as viewed from front) with barring tool. Rotating barring tool counterclockwise will rotate crankshaft clockwise. Continue to rotate until timing pin drops into machined hole in back of camshaft gear. When pin aligns to gear, engine is now at TDC position (compression stroke) at cylinder number 1.

CAUTION: When installing fuel injection pump and to achieve proper injection pump timing, engine MUST be in TDC position (compression stroke) at cylinder number 1.

Before proceeding to next step, and to prevent shearing of timing pin, temporarily remove timing pin from back of gear.

(25) Remove nut and washer retaining injection pump gear to injection pump shaft (Fig. 88).

(26) Place a shop towel below retainer nut in gear housing cover opening to prevent nut or washer from falling into gear housing.

CAUTION: If gear retainer nut or washer drops into gear housing, cover must be removed to retrieve them before engine is started.

(27) Use a T-bar type puller (Fig. 89) to separate injection pump gear from injection pump shaft. Attach two M8 X 1.24 MM (metric) screws through puller and into the two threaded holes supplied in pump gear. Pull injection pump gear forward until it loosens from injection pump shaft. **Pull on gear only enough to loosen it from injection pump shaft. Pulling gear too far may cause damage or breakage to gear cover.**

(28) Remove two (2) injection pump-to-lower mounting bracket bolts (Fig. 90).

(29) Remove four (4) injection pump-to-gear housing mounting nuts (Fig. 83).

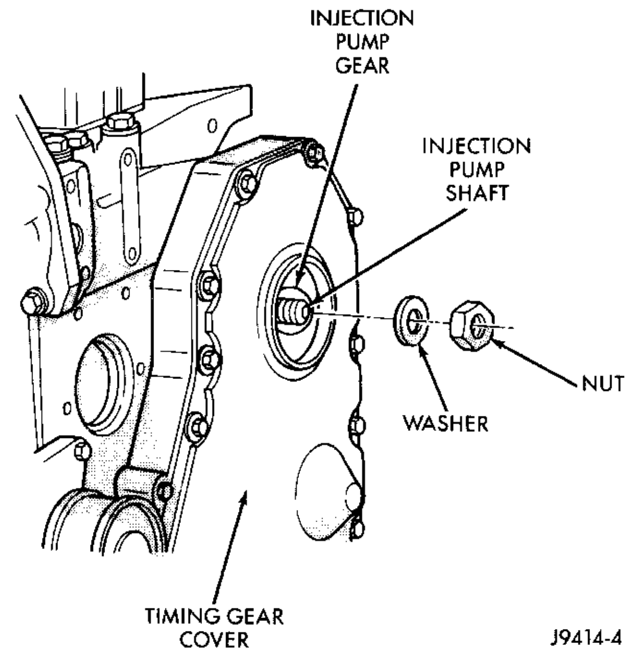

Fig. 88 Injection Pump Gear Washer and Nut

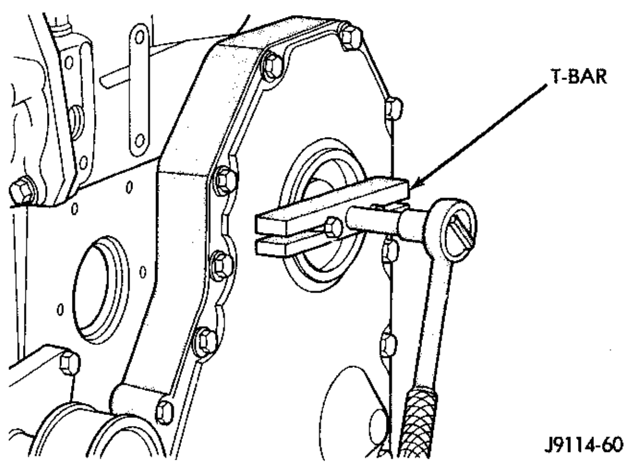

Fig. 89 Separating Injection Pump Gear from Pump Shaft

(30) Remove injection pump from gear housing. **Take care not to nick injection pump shaft on aluminum gear housing when removing pump.**

(31) Clean injection pump o-ring mounting surfaces on both gear housing and pump.

INSTALLATION

CAUTION: Before installing injection pump, be sure that number 1 cylinder is at Top Dead Center (compression stroke) position. Engage timing pin on rear of gear cover (Fig. 85) into rear of camshaft gear. Rotate crankshaft if necessary.

REMOVAL AND INSTALLATION (Continued)

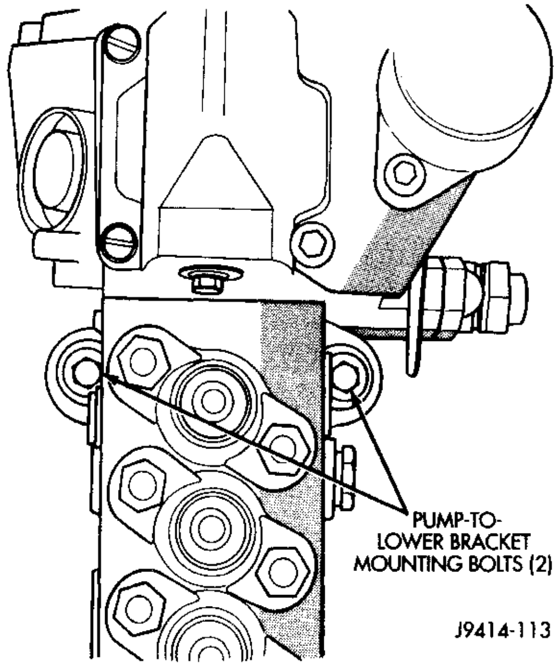

Fig. 90 Pump Mounting Bolts

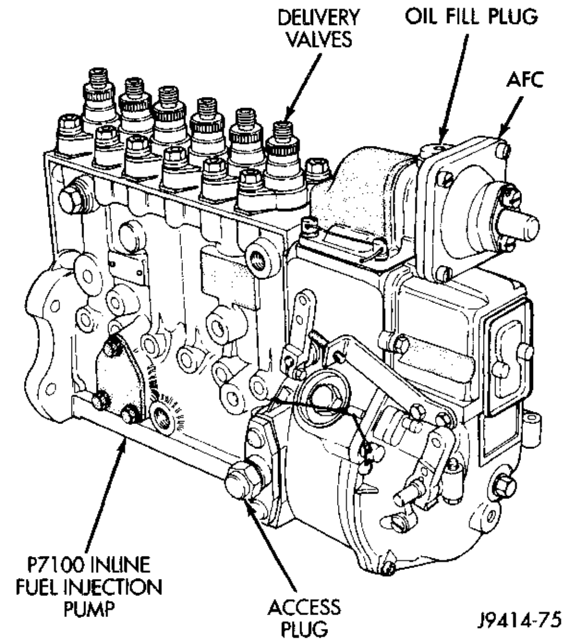

Fig. 91 Injection Pump Access Plug

Before injection pump installation, it must be set (pump shaft rotated) to a certain position to attain accurate pump timing. Remove access plug from side of pump (Fig. 91). Stored behind this access plug is a plastic timing pin tool (Fig. 92). This tool is used to align injection pump timing tooth (Fig. 93) to center of access hole.

Installing Original Pump: If original pump is being reinstalled, the pin tool should already be mounted with slotted end facing outward (Fig. 92). When position of this tool has been reversed, with slotted end facing inward, it is used as a pump timing pin tool.

Installing New or Rebuilt Pump: If a new or rebuilt pump is being installed, the pump should have been shipped with slotted end of timing pin tool engaged to timing tooth in pump.

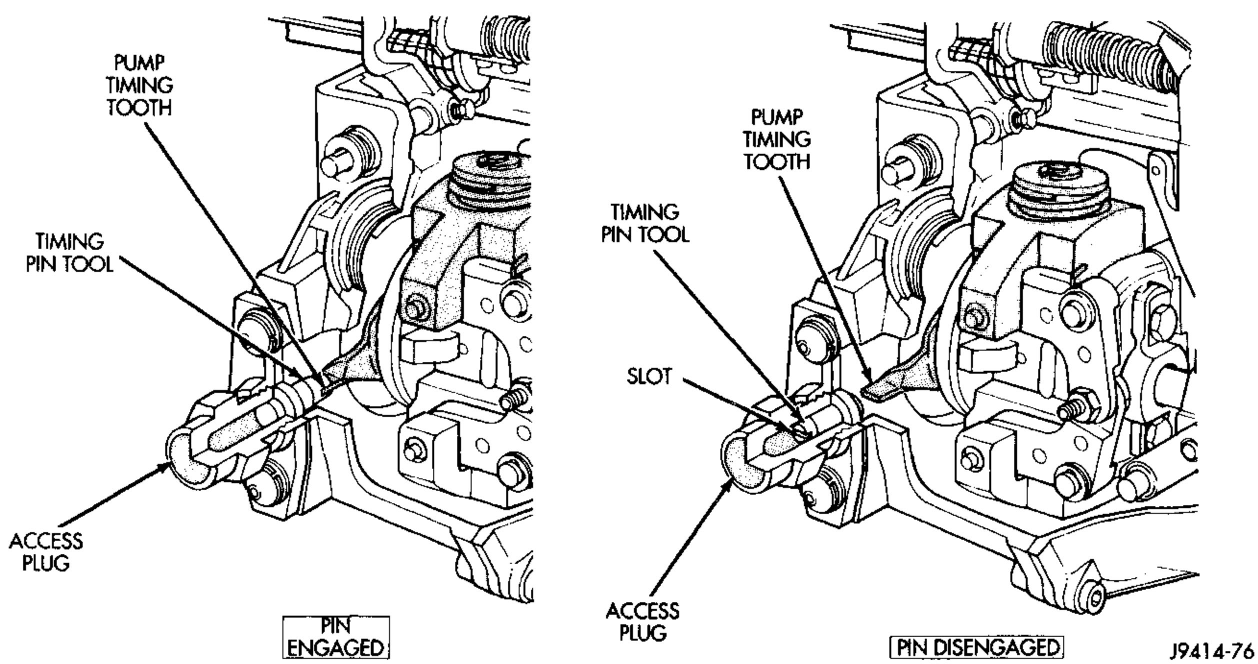

Fig. 92 Injection Pump Timing Pin Tool

Mopar AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

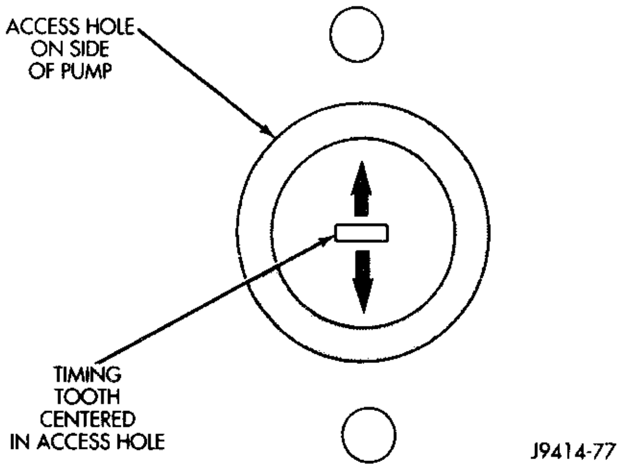

Fig. 93 Injection Pump Timing Tooth

To set injection pump timing on an original pump or when checking timing on a new pump, rotate pump shaft until timing tooth appears in center of plug opening (Fig. 93). Install slotted end of timing pin tool over timing tooth. The pump shaft may have to be rotated slightly to align tool to tooth. Do not force slots in tool over timing tooth.

After tool has been **temporarily** installed to timing tooth, install and loosely tighten access plug. New pumps should have been shipped with this tool already engaged.

(1) If original pump is being installed, check condition of rubber o-ring at pump mounting area. If o-ring has a colored stripe, it must be replaced.

(2) Apply clean engine oil to injection pump mounting flange opening in gear cover housing to allow easier pump installation (Fig. 94), but do not apply engine oil to pump o-ring seal at pump mounting area. **The machined tapers on both injection pump shaft and injection pump gear must be dry, clean and free of any dirt or oil. This will ensure proper gear-to-shaft tightening.**

(3) Position pump assembly to mounting flange on gear cover while aligning injection pump shaft through back of injection pump gear.

(4) Install four pump mounting nuts finger tight. **Do not attempt to tighten (pull) pump to gear cover using mounting nuts. Damage to pump or gear cover may occur. The pump must be positioned flat to its mounting flange before attempting to tighten mounting nuts.**

(5) Install two (vertical) pump mounting bracket bolts finger tight.

(6) Tighten four pump mounting nuts to 43 N·m (32 ft. lbs.) torque. Tighten two pump mounting bracket bolts. **To prevent damage to pump and mounting flange, tighten pump mounting nuts first.**

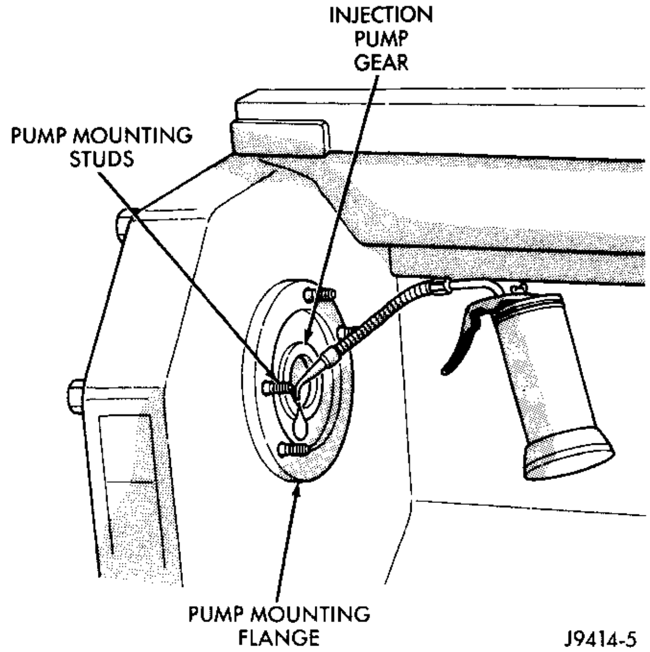

Fig. 94 Apply Oil to Gear Cover

(7) Install injection pump drive shaft-to-injection pump gear retaining nut and washer. **Do a preliminary tightening of this nut to 10 to 15 N·m (7 to 11 ft. lbs.) torque. Do not over tighten. This is not the final tightening torque. To prevent damage to timing pin, do not exceed this torque.**

(8) Disengage timing pin from the rear of camshaft gear by pulling it straight back.

(9) Remove access plug from injection pump (Fig. 91) and remove timing pin tool from pump.

(10) Do a final tightening of injection pump gear-to-injection pump shaft nut. Tighten to 195 N·m (144 ft. lbs.) torque. Use barring tool to prevent engine from rotating when tightening gear.

(11) After injection pump gear has received a final tightening, verify injection pump timing.

(a) Rotate engine counterclockwise with barring tool (clockwise as observed at crankshaft from front of vehicle). Continue rotating engine until timing pin aligns into hole at rear of camshaft gear (Fig. 86). The engine is now at TDC of number cylinder 1.

(b) With timing pin aligned into rear of camshaft gear, timing tooth should also be centered in access hole on side of injection pump (Fig. 93). Install timing pin tool (Fig. 92) to verify.

(c) If timing pin tool will not fit into timing tooth in pump, pump gear nut must be removed. Loosen pump gear from pump shaft with T-bar puller tool. With gear loosened, rotate injection pump shaft until it aligns to center of access hole on side of pump. Tighten injection gear nut and remove barring tool.

REMOVAL AND INSTALLATION (Continued)

(12) Remove timing pin tool from pump. Reverse position of this tool (Fig. 92). The slotted part of tool should be facing outward and will be stored in pump in this direction. Place tool back into pump. Install access plug and its sealing washer. Tighten plug to 15 N·m (11 ft. lbs.) torque.

(13) Install engine oil supply line to pump.

(14) Install fuel return line/overflow valve to pump. New or remanufactured fuel injection pumps should have a new overflow valve temporarily installed into side of pump. **Do not install a used overflow valve into a new or remanufactured pump.** Tighten valve to 30 N·m (24 ft. lbs.) torque.

(15) Install six high-pressure fuel lines to top of pump. Tighten lines to 30 N·m (22 ft. lbs.) torque.

(16) Install low-pressure fuel supply line to pump.

(17) Install AFC valve control line at rear of pump.

(18) **New or rebuilt P7100 series fuel injection pumps must be pre-lubricated before operation. Failure to do so may result in pre-mature governor wear.**

(a) Remove 10 mm hex plug (oil fill plug) on top of injection pump governor (Fig. 91).

(b) Add 750 ml (25 ounces) of clean engine oil through this opening.

(c) Install oil fill plug and tighten to 28 N·m (21 ft. lbs.) torque.

(19) Install throttle linkage assembly to pump. Tighten bolts to 24 N·m (18 ft. lbs.) torque.

(20) Connect electrical connector to fuel solenoid.

(21) Connect main engine wiring harness at top of injection pump.

(22) Install engine oil dipstick tube mounting clamp and bolt at opening to intake manifold.

(23) Install oil fill tube and tube adapter.

(24) Install oil fill tube bracket and mounting bolt.

(25) Install electrical connector to throttle position sensor (if equipped).

(26) Install air cleaner housing-to-turbocharger tube at air cleaner housing.

(27) Using a new gasket, install air heater assembly (five bolts).

(28) Install EGR tube (if equipped). Refer to Group 25, Emission Control System for procedures.

(29) Install intake manifold-to-intercooler tube.

(30) Check and adjust throttle linkage. Refer to Throttle Position Sensor in this group.

(31) Bleed air from fuel system. Refer to the Air Bleed Procedure in this section of the group.

(32) Adjust low idle speed if required. Refer to Idle Speed Adjustment.

(33) Inspect throttle linkage to be sure that control lever is opening to full open position.

(34) Some engine oil was lost when removing pump. Check and adjust engine oil level.

FUEL INJECTORS

REMOVAL

(1) Disconnect both negative battery cables from both batteries.

(2) Remove high-pressure fuel lines. Refer to High-Pressure Fuel Lines in this section. **Do not bend any high-pressure fuel line to gain access to fuel injector.**

(3) Remove fuel drain manifold. Refer to Fuel Drain Manifold in this section.

(4) Thoroughly clean the area around injector.

CAUTION: When rust has formed on the fuel injector nut, the injector (when being removed) can rotate in the cylinder head. This may cause damage to the cylinder head bore. Use a rust penetrating solvent (Fig. 95) before attempting to loosen a rusted holddown nut.

(5) Hold injector body with one wrench while removing injector mounting nut with another (Fig. 96). If nut cannot be rotated, pry out the square cut rubber seal from top of injector mounting nut (Fig. 95) and apply rust penetrating solvent to top of nut. Remove injector from cylinder head.

(6) Remove injector mounting nut (Fig. 97) from injector.

(7) Remove and discard square cut rubber seal (Fig. 97) from injector mounting nut.

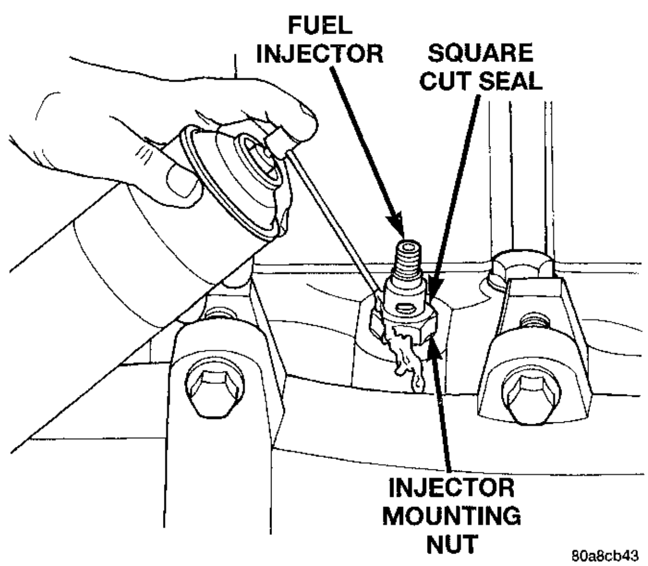

Fig. 95 Applying Rust Penetrating Solvent to Injector Mounting Nut

(8) If injector is tight in cylinder head, hit injector body with a brass drift to loosen it (Fig. 98).

(9) It may be necessary to tap the injector with an injector puller tool (Fig. 99). Use Cummins Fuel Injector Removal Tool number 3823276 or equivalent

REMOVAL AND INSTALLATION (Continued)

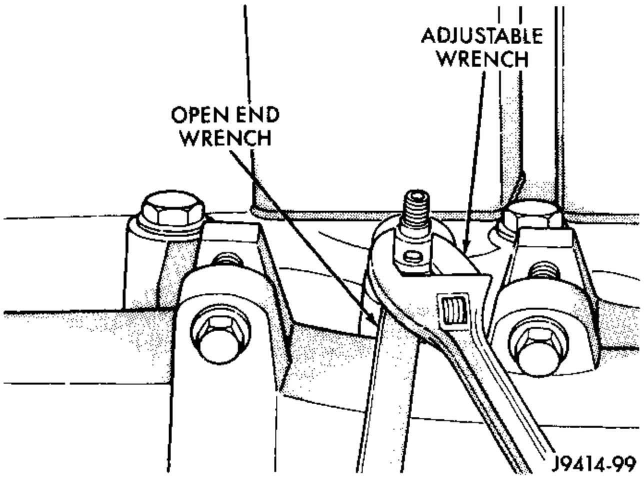

Fig. 96 Loosening Injector Mounting Nut

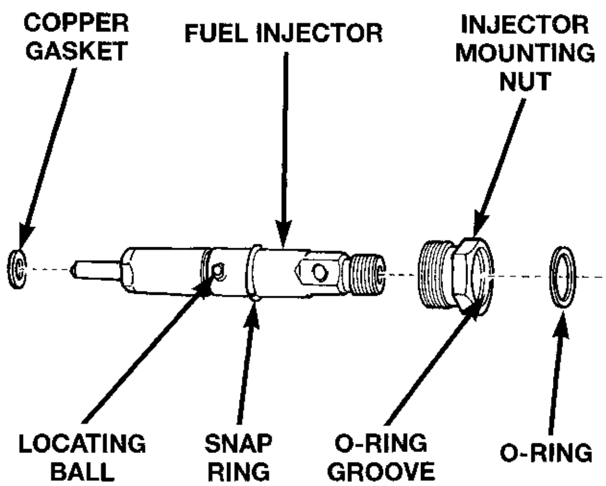

Fig. 97 Fuel Injector Assembly

injector removal tool. If the injector cannot be removed, carbon may have formed at the injector nozzle. In this case, use of carb cleaner is recommended. Spray the carb cleaner along the side of injector bore in the cylinder head. Continue to use the injector removal tool while spraying the injector.

(10) Remove and discard copper washer (gasket) (Fig. 97) from bottom of injector.

INSTALLATION

(1) Clean injector cylinder head bore with special Cummins wire brush tool or equivalent (Fig. 100).

(2) Install a new copper washer to bottom of injector (Fig. 97). Apply a light coating of clean engine oil to this washer. This will keep the washer in place during installation.

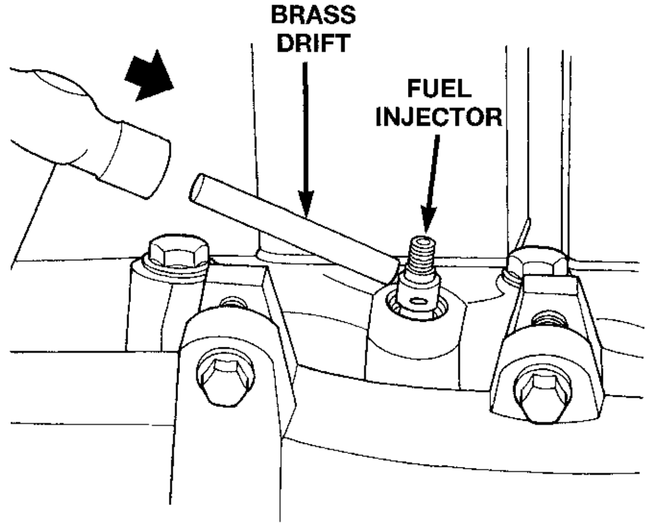

Fig. 98 Loosening Injector Body in Cylinder Head

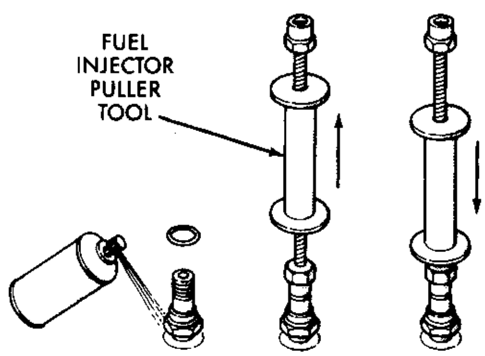

Fig. 99 Removing Injector with Puller Tool

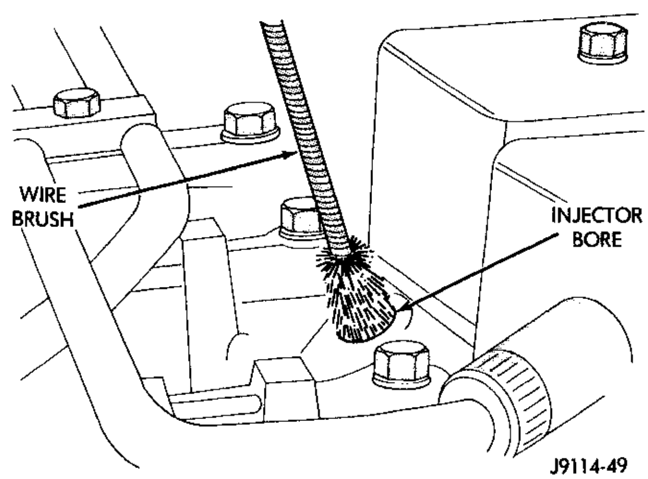

Fig. 100 Cleaning Cylinder Head Injector Bore

REMOVAL AND INSTALLATION (Continued)

(3) Apply a coating of anti-seize compound to the threads of the injector holddown nut and between top of nut and injector body (Fig. 101).

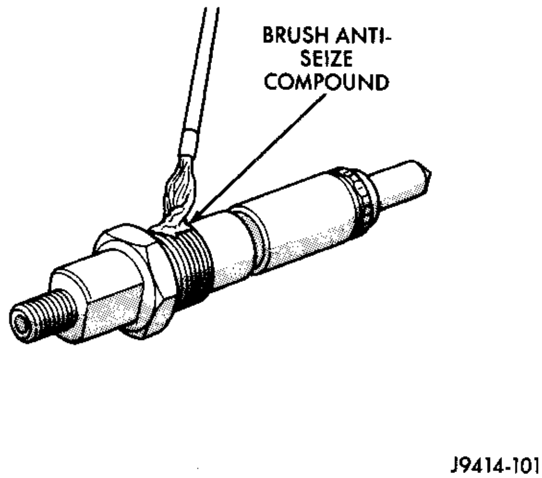

Fig. 101 Apply Anti-Seize Compound

(4) Install injector into cylinder head. **Align ball on side of injector into notch in cylinder head (Fig. 102).**

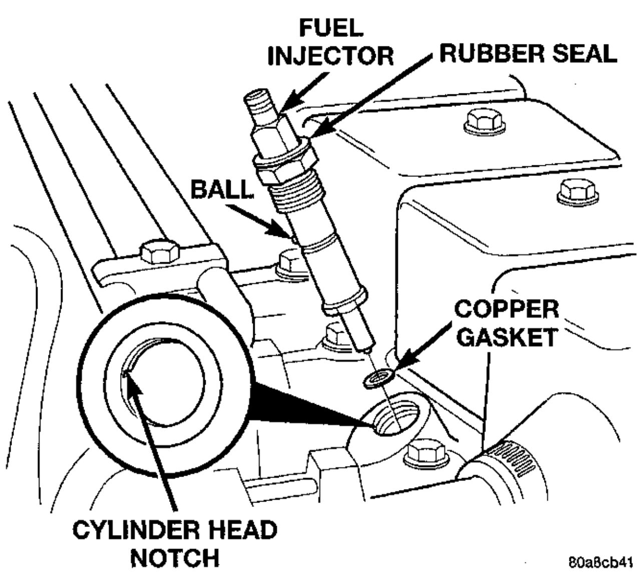

Fig. 102 Installing Injector

(5) Tighten injector holddown nut to 60 N·m (44 ft. lbs.) torque.

(6) After tightening injector holdown (mounting) nut, push the square cut rubber seal into groove on top of injector holdown nut (Fig. 103). This seal will prevent water from entering cylinder head bore.

(7) Connect fuel drain manifold to the injectors. Refer to Fuel Drain Manifold in this section.

(8) Connect high-pressure fuel lines. Refer to High-Pressure Fuel Lines in this section.

(9) Connect negative battery cables to both batteries.

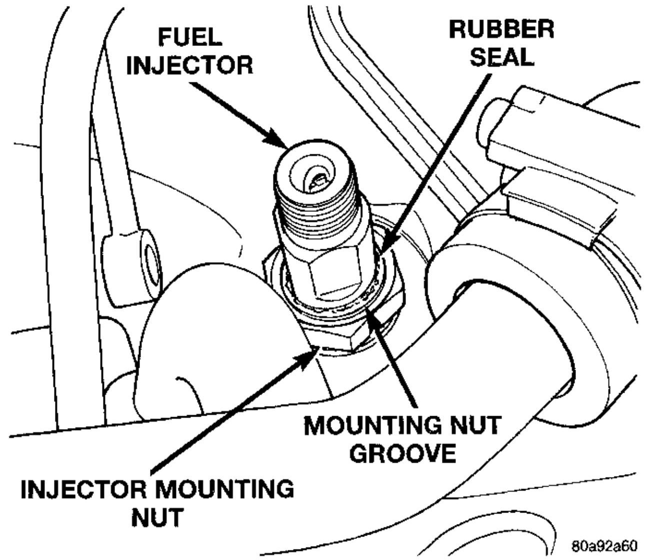

Fig. 103 Rubber Seal at Injector Mounting Nut

(10) Bleed the air from the high-pressure lines. Refer to High-Pressure Line Bleeding in the Air Bleed Procedure section of this group.

FUEL SHUTDOWN SOLENOID

REMOVAL

The fuel shutdown solenoid is mounted to a bracket located on the side of the fuel injection pump (Fig. 104).

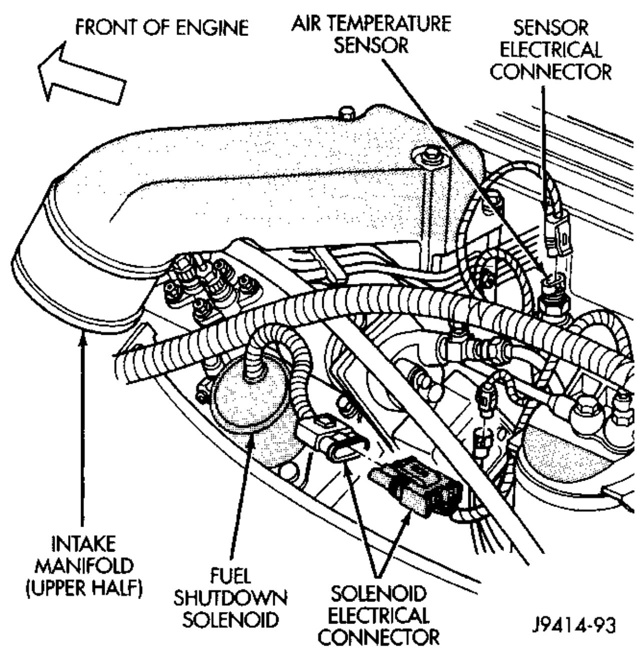

Fig. 104 Fuel Shutdown Solenoid Location

(1) Disconnect the solenoid electrical connector (Fig. 104).

AUTHENTIC RESTORATION PRODUCTS

REMOVAL AND INSTALLATION (Continued)

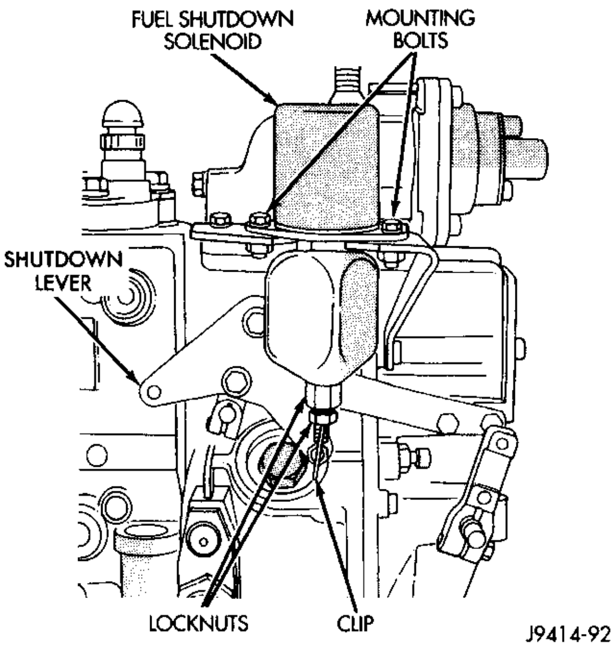

Fig. 105 Fuel Shutdown Solenoid Removal/ Installation

(2) Disconnect clip at injection pump shutdown lever (Fig. 105).
(3) Remove two solenoid mounting bolts.
(4) Remove solenoid from mounting bracket.

INSTALLATION

(1) Position solenoid to mounting bracket and injection pump lever.
(2) Install clip at injection pump lever.
(3) Install and tighten two mounting bolts.
(4) Check and adjust the shaft length of the solenoid. Refer to the following procedure:

SOLENOID SHAFT ADJUSTMENT

After replacing the fuel shutdown solenoid, the solenoid shaft length must be checked and if necessary, adjusted.
(1) Turn the ignition switch ON.
(2) Pull up (by hand) and hold on the solenoid lever (Fig. 106). **If the solenoid is operating correctly, it should remain in the UP position with the key in the ON position.**
(3) Take a measurement from the bottom of the solenoid mounting bracket to the top of the injection pump shutdown lever pin (Fig. 107).
(4) Dimension should be 66.9 mm (2.64 inches).
(5) If adjustment is necessary, loosen the shaft locknut and rotate the adjustment nut (Fig. 108) to attain dimension.

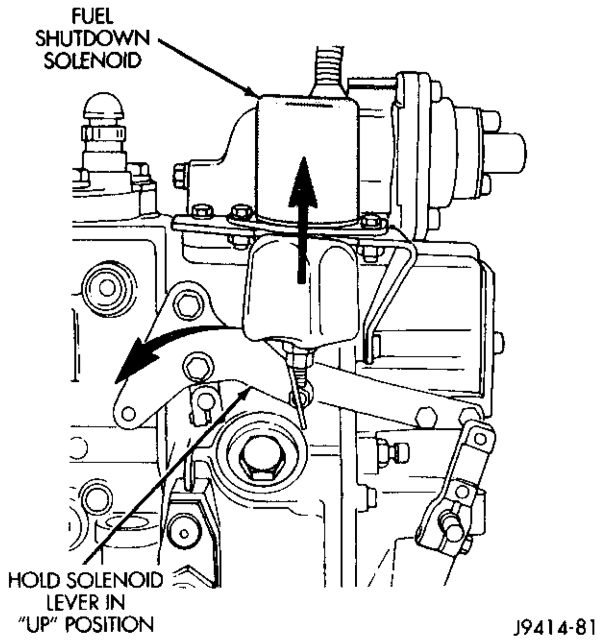

Fig. 106 Fuel Shutdown Solenoid Lever in Up Position

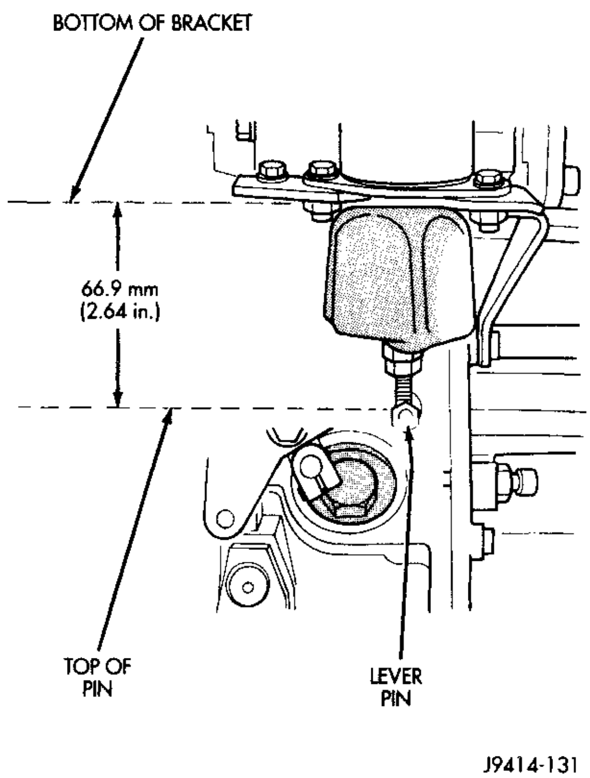

Fig. 107 Solenoid Measurement

REMOVAL AND INSTALLATION (Continued)

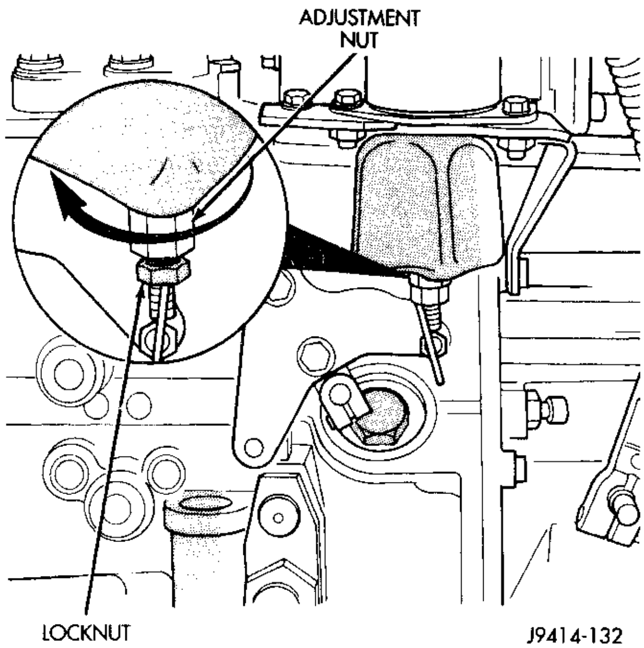

Fig. 108 Solenoid Adjustment

FUEL SHUTDOWN SOLENOID RELAY

The fuel shutdown solenoid relay is located in the engine compartment near the brake master cylinder (Fig. 109).

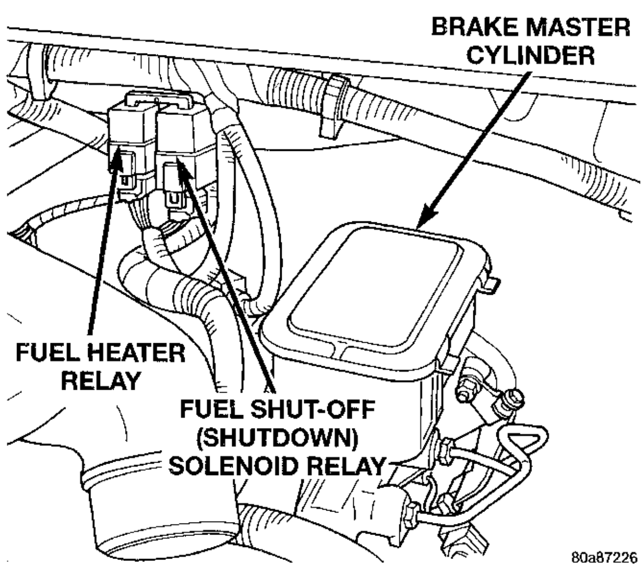

Fig. 109 Fuel Shutdown Solenoid Relay—Diesel

REMOVAL

(1) Disconnect both negative battery cables at both batteries.

(2) Disconnect the electrical connector at the relay.

(3) Remove the relay from the mounting bracket.

INSTALLATION

(1) Check the terminals within connector for damage or corrosion. Also check pin height of terminals within connector. Pin heights should be the same. Repair as necessary before connecting relay.

(2) Install the relay to the mounting bracket.

(3) Connect the electrical connector.

(4) Connect battery cables to both batteries.

FUEL TRANSFER PUMP

For operation of the fuel transfer pump primer button, refer to the Air Bleed Procedure in this group.

The fuel transfer pump (fuel lift pump) is located on the left side of the engine and above the starter motor (Fig. 110). The mounting bracket/spacer for the fuel heater assembly is located between the engine block and the fuel transfer pump (Fig. 111). The fuel heater housing and its bracket assembly must also be removed when removing fuel pump.

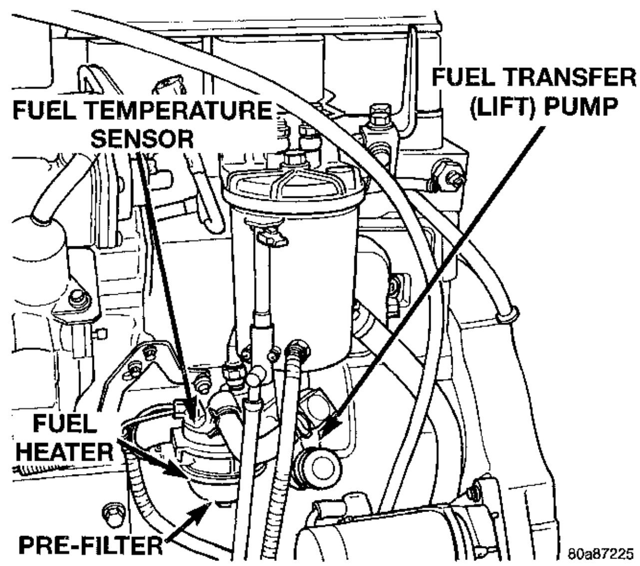

Fig. 110 Fuel Transfer Pump Location

REMOVAL

(1) Disconnect both negative battery cables at both batteries.

(2) Thoroughly clean the area around transfer pump and fuel lines of any contamination.

(3) Remove starter motor. Refer to Starter in Group 8B for procedures.

(4) Place a drain pan below the pump.

(5) Remove fuel line fittings at top of both the fuel pump and fuel heater housing (Fig. 111). Use back-up wrench to prevent damage to fittings.

(6) Remove fuel hose clamps and rubber fuel hose (fuel heater housing-to-fuel pump) (Fig. 111).

(7) The engine camshaft lobe must be at its low point in relation to end of pump piston (Fig. 112). Before removing or installing pump, rotate engine until camshaft is at low point. If cam lobe is at high

REMOVAL AND INSTALLATION (Continued)

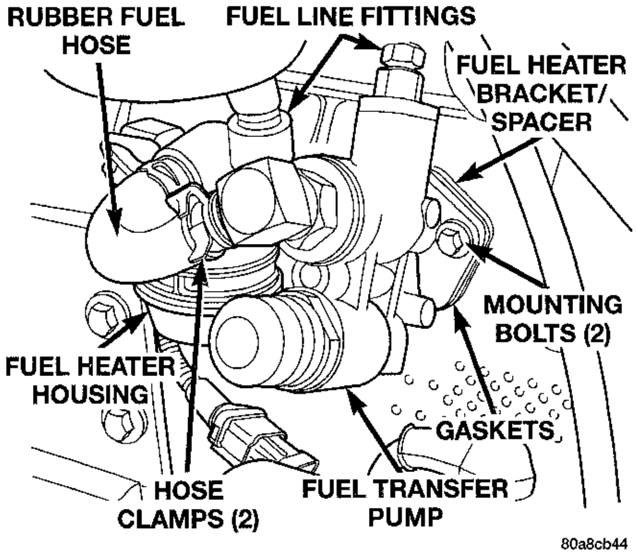

Fig. 111 Pump Removal/Installation

point, removal and installation of pump mounting bolts may be very difficult. Damage to pump may also occur.

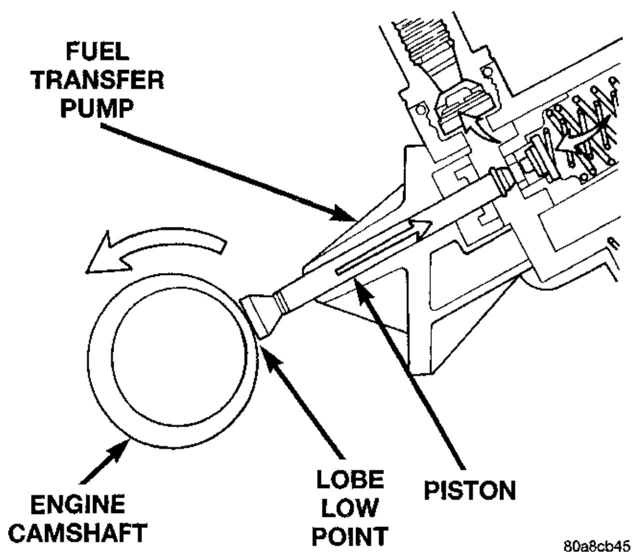

Fig. 112 Fuel Transfer Pump Piston at Engine Camshaft

NOTE: Locate top dead center (TDC) on cylinder #1.

(8) Remove the rubber access plug located in the rear flange of the engine on the exhaust manifold side. (Fig. 113).

NOTE: Removing the #1 cylinder valve cover and first barring (rotating) the engine clockwise until both intake and exhaust valves are closed will speed up locating engine TDC as described later in Step 10.

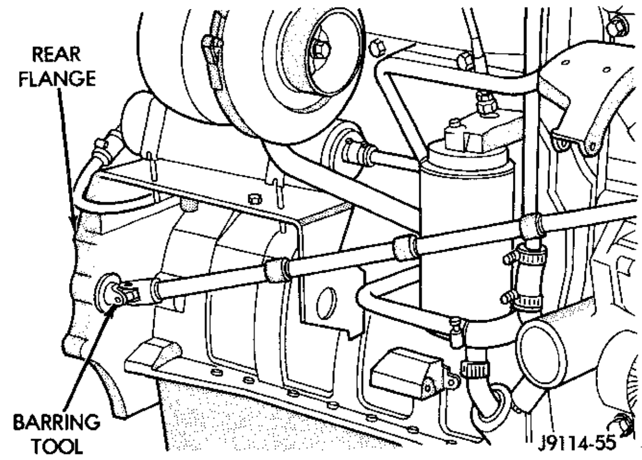

Fig. 113 Rotating Engine With Barring Tool

(9) Insert the barring tool number 7471B through the access hole and into the flywheel housing (Fig. 113).

(10) While holding tension on the timing pin (toward front of engine), slowly rotate the engine with the barring tool. Hold a slight rearward (pushing) pressure on the barring tool and continue to rotate the tool until the timing pin drops into the machined hole in the back of the camshaft gear. When the pin aligns to the gear (Fig. 114), and the intake and exhaust valves are closed at the #1 cylinder, the engine is at the TDC position (compression stroke) at cylinder number 1. **After TDC has been established, remove the pin. This will prevent pin damage when barring (rotating) the engine in later steps.**

NOTE: The pin is located above the power steering pump, below and to the inside of the fuel injection pump, on the rear of the cam gear housing (Fig. 115).

(11) After TDC has been established, rotate engine another 180–270 degrees. The camshaft lobe will now be at its lowest point.

(12) Remove two pump mounting bolts (Fig. 111).

(13) Remove the fuel pump and fuel heater assembly from the engine as one unit.

CAUTION: Do not allow pump plunger (piston) to catch on edge of hole in cylinder block during removal. Plunger may slide out and drop into engine.

INSTALLATION

(1) While fuel heater is off vehicle, disassemble it and clean pre-filter and screen. Install new seals to fuel heater. Refer to Fuel Heater Removal/Installation for procedures.

REMOVAL AND INSTALLATION (Continued)

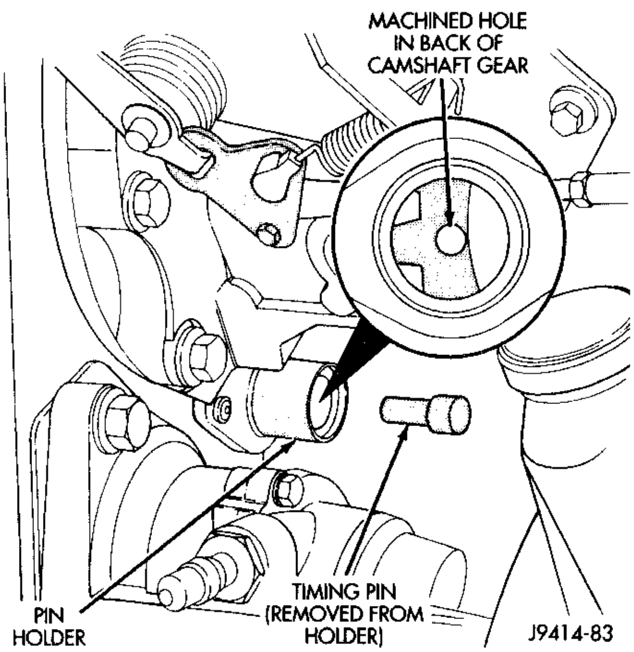

Fig. 114 Back of Camshaft Gear—Typical

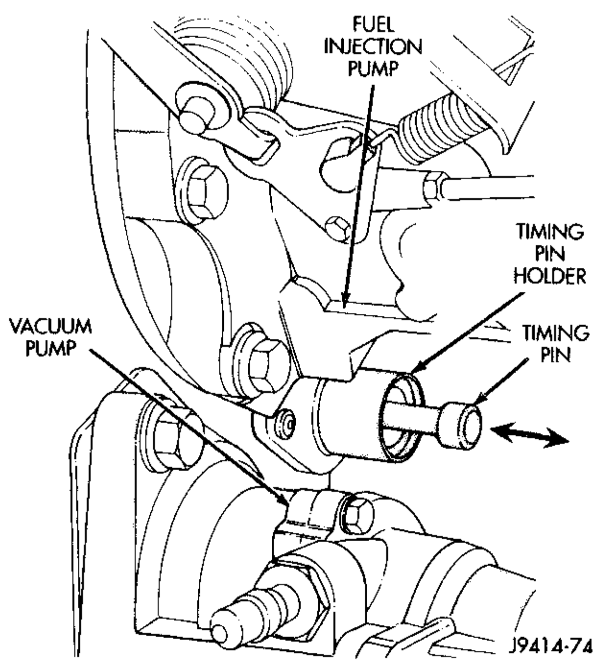

Fig. 115 Timing Pin and Location

(2) Clean the mating surfaces of the fuel heater mounting bracket, the fuel pump and the engine block of any gasket material.

(3) Position the new gaskets, the fuel heater housing mounting bracket and the fuel pump to the engine.

(4) Install the two mounting bolts into the engine. Tighten to 24 N·m (18 ft. lbs.) torque. **As these bolts are tightened, the plunger (piston) within the fuel pump is being compressed. Tighten these two bolts alternately to prevent damage to the fuel pump or camshaft.**

(5) Install fuel line fittings to pump and fuel heater. Tighten to 24 N·m (18 ft. lbs.) torque.

(6) Install a new fuel filter. Refer to Fuel Filter/Water Separator Removal/Installation for procedures.

(7) Install starter motor. Refer to Starter in Group 8B for procedures.

(8) Connect battery cables at both batteries.

(9) Bleed air from fuel system. Refer to the Air Bleed Procedure.

(10) Start engine and check for leaks.

OVERFLOW VALVE

Whenever the fuel injection pump is being replaced or removed for calibration, the overflow valve must stay with the pump. Make sure a new overflow valve is used with a new injection pump and the old (original) overflow valve is returned to the authorized repair facility with the old injection pump.

The overflow valve (pressure relief valve) is located at the inside/front of injection pump (Fig. 116). It connects the fuel return line (banjo fitting) to the pump. The valve has no internal serviceable parts and must be replaced as an assembly. Two sealing gaskets are used. One gasket is located between pump and banjo fitting. The other is located between the banjo fitting and end of valve.

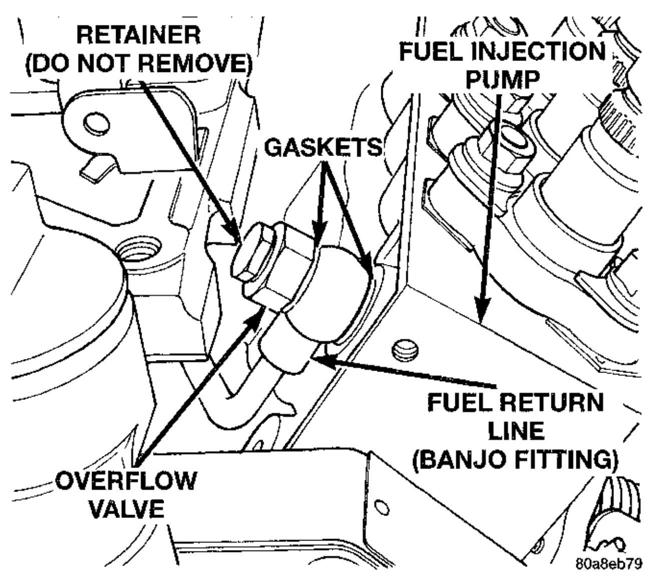

Fig. 116 Overflow Valve Location

REMOVAL

(1) Clean area around overflow valve and fuel return line at injection pump before removal.

(2) Remove valve assembly from pump and banjo fitting. **Do not remove retainer (Fig. 116) from valve. This retainer is spring-loaded.** If fuel

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

return line must be positioned for removal, very carefully bend line.

(3) Discard old sealing gaskets.

INSTALLATION

(1) Install new sealing gaskets to valve.

(2) Install valve through banjo fitting and into pump.

(3) Tighten to 30 N·m (24 ft. lbs.) torque.

HIGH-PRESSURE FUEL LINES

All high-pressure fuel lines are of the same length and inside diameter. Correct high-pressure fuel line usage and installation is critical to smooth engine operation.

Whenever the high-pressure lines are removed, they should be removed as a bundle (if possible). They should also be tagged for return to original position.

CAUTION: The high-pressure fuel lines must be clamped securely in place in the holders. The lines cannot contact each other or other components. Do not attempt to weld high-pressure fuel lines or to repair lines that are damaged. Only use the recommended lines when replacement of high-pressure fuel line is necessary.

REMOVAL

(1) Disconnect both negative battery cables from both batteries.

(2) Remove the nameplate/cover from the top of the six engine valve covers (two nuts) (Fig. 117).

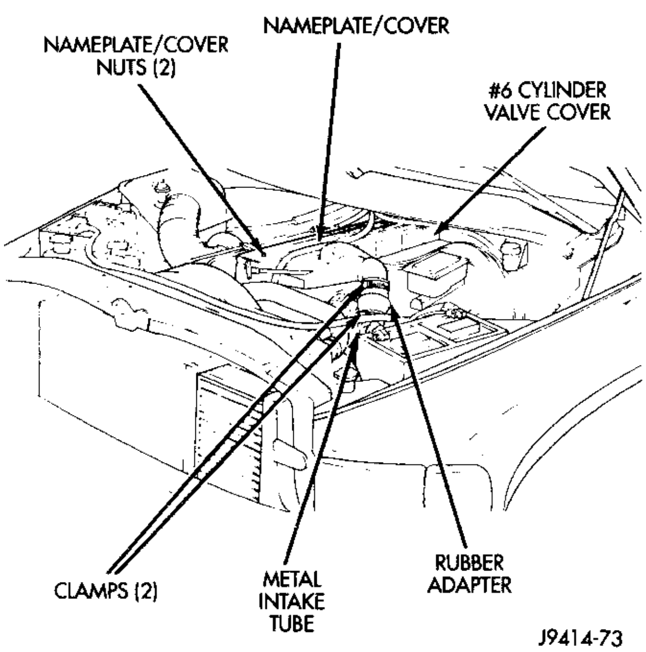

Fig. 117 Nameplate/Cover—Diesel

(3) Remove the necessary clamps holding the lines to the engine.

(4) Clean the area around each line. Disconnect each line at the top of each fuel injector (Fig. 118).

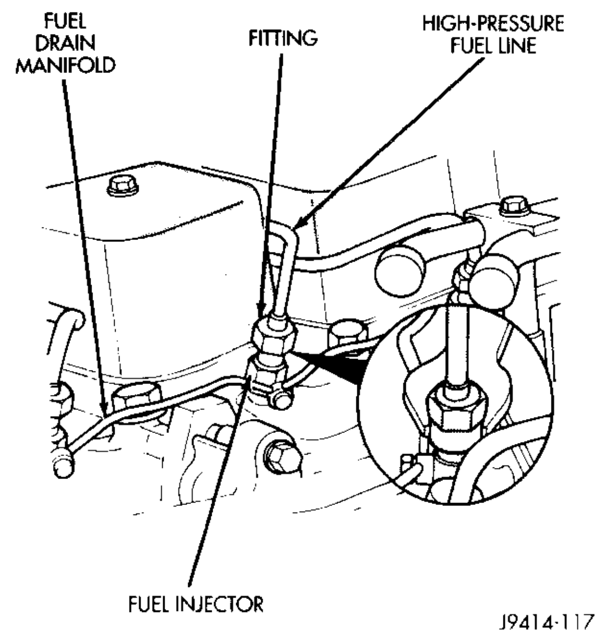

Fig. 118 Fuel Lines at Fuel Injectors

(5) Disconnect each high-pressure line fitting at each fuel injection pump delivery valve holder (Fig. 119).

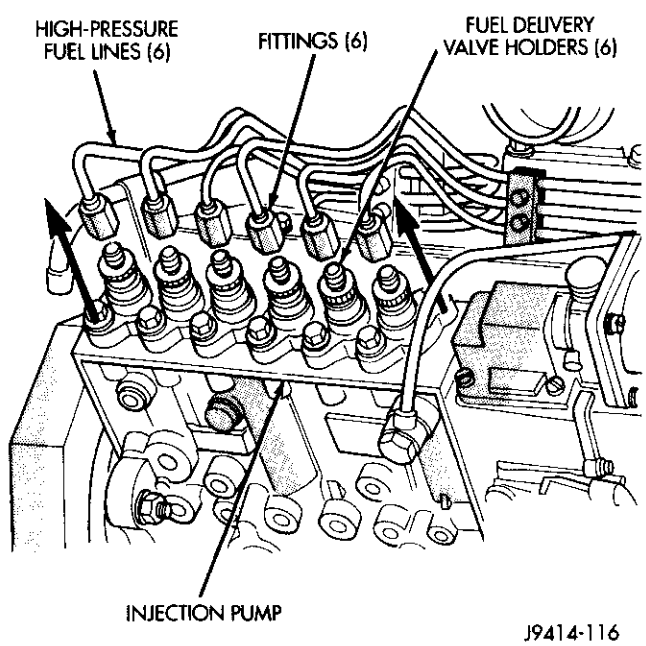

Fig. 119 Fuel Delivery Valve Holders and Pressure Lines

REMOVAL AND INSTALLATION (Continued)

(6) Very carefully remove each line from the engine. **Do not bend the line while removing.**

CAUTION: Be sure that the high-pressure fuel lines are installed in the same order that they were removed.

INSTALLATION

(1) Carefully position each high-pressure fuel line to the fuel injector and fuel injection pump delivery valve holder in the correct firing order. Also position each line in the correct line holder.

(2) Loosely install the line clamp isolator and bracket holder bolts.

(3) Tighten each line at the delivery valve holder to 24 N·m (18 ft. lbs.) torque.

(4) Tighten each line at the fuel injector to 24 N·m (18 ft. lbs.) torque.

CAUTION: Be sure the lines are not contacting each other or any other component. Noise will result.

(5) Tighten the clamp bracket bolts to 24 N·m (18 ft. lbs.) torque.

(6) Bleed air from the fuel system. Refer to High-Pressure Fuel Line Bleeding in the Air Bleed Procedure section of this group.

THROTTLE CABLE

CAUTION: Be careful not to damage or kink the cable core wire (within the cable sheathing) while servicing accelerator pedal or cables.

REMOVAL

(1) From inside the vehicle, hold up the accelerator pedal. Remove the plastic cable retainer and throttle cable core wire from upper end of pedal arm (Fig. 120). The plastic cable retainer snaps into pedal the arm.

(2) Remove the cable core wire at the pedal arm.

(3) From inside the vehicle, pinch both sides of the plastic cable housing retainer tabs at the dash panel (Fig. 120).

(4) Remove cable housing from dash panel and pull the cable into the engine compartment.

(5) Remove the throttle cable socket at fuel injection lever ball (Fig. 121).

(6) A rubber/plastic grommet is molded to the cable (Fig. 121). This grommet is pressed into the back of the cable mounting bracket. Apply lubricant to the rubber grommet (Fig. 121) on both sides of the cable mounting bracket. Work the rubber grommet (rearward) through the mounting bracket with two small screwdrivers. Remove throttle cable from vehicle.

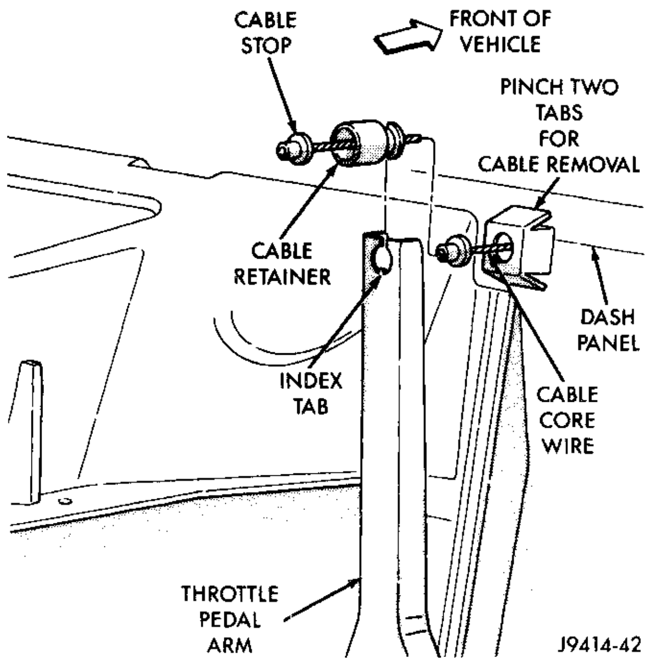

Fig. 120 Cable Removal/Installation

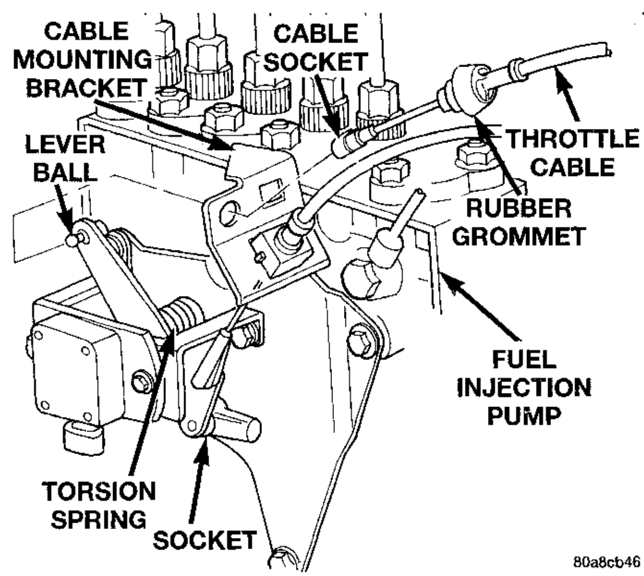

Fig. 121 Throttle Cable at Injection Pump—Diesel Engine

INSTALLATION

(1) Feed the cable through the rear of its mounting bracket (Fig. 121) until the rubber/plastic grommet locks into position on the bracket.

(2) Connect cable end socket to the fuel injection pump lever ball (snaps on).

(3) Install the remaining cable housing end into and through the dash panel opening (snaps into posi-

REMOVAL AND INSTALLATION (Continued)

tion). The two plastic pinch tabs (Fig. 120) should lock the cable to dash panel.

(4) From inside the vehicle, hold up the accelerator pedal. Install the throttle cable core wire and plastic cable retainer into and through the upper end of the pedal arm (the plastic retainer is snapped into the pedal arm). When installing the plastic retainer to the accelerator pedal arm, note the index tab on the pedal arm (Fig. 120). Align the index slot on the plastic cable retainer to this index tab.

SPECIFICATIONS

ENGINE DATA PLATE

If anything differs between the specifications found on the Engine Data Plate, and the specifications used in this manual, use specifications on data plate. The Engine Data Plate is located on the engine timing gear cover (Fig. 122).

FUEL INJECTION SYSTEM-DIESEL ENGINE

INDEX

GENERAL INFORMATION

INTRODUCTION

Various components, relays and switches are operated by the powertrain control module (PCM). **This section of the group will cover a description and operation of components controlled by the PCM for vehicles equipped with diesel powered engines.**

Diesel fuel injection system components, except for the intake manifold air heater elements, are **not** directly regulated by the PCM.

Refer to the Fuel Delivery System—Diesel Engine section of this group for fuel components **not** oper-

GENERAL INFORMATION (Continued)

ated or regulated by the PCM. These components are the:

- Fuel tank
- Fuel tank module
- Low and high-pressure fuel supply lines
- Low-pressure, mechanical, fuel transfer pump (fuel lift pump)
- High-pressure fuel injection pump
- Fuel filter/water separator
- Fuel heater
- Fuel heater relay
- Fuel shutdown solenoid
- Fuel shutdown solenoid relay
- High-pressure fuel injectors
- Fuel return line
- Fuel filter (strainer)
- Fuel drain manifold

DESCRIPTION AND OPERATION

POWERTRAIN CONTROL MODULE (PCM)—DIESEL

The powertrain control module (PCM) is located in the right-rear side of the engine compartment (Fig. 1). It is mounted to the dash panel cowl with three bolts. The PCM was formerly referred to as the SBEC or engine controller. Except for operation of the intake manifold air heater elements, the PCM does not regulate or control fuel system operation on the diesel engine.

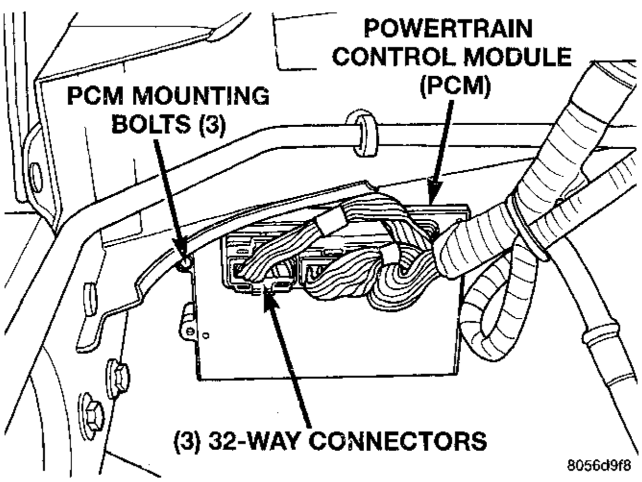

Fig. 1 PCM Location

The PCM is a pre-programmed, triple micro-processor digital computer. Although it does not regulate or control the fuel system on the diesel powered engine, it does operate or regulate the:

- Speed control system
- Charging system
- Certain warning lamps
- Transmission overdrive solenoid
- Torque convertor engagement
- Certain transmission shift features
- ASD relay
- Air conditioning operation
- Tachometer
- Intake manifold air heater

The PCM can adapt its programming to meet changing operating conditions.

The PCM receives input signals from various switches and sensors. Based on these inputs, the PCM regulates various engine and vehicle operations through different system components. These components are referred to as **PCM Outputs.** The sensors and switches that provide inputs to the PCM are considered **PCM Inputs.**

NOTE: PCM Inputs:

- A/C request (if equipped with factory A/C)
- A/C select (if equipped with factory A/C)
- Auto shutdown (ASD) sense
- Battery temperature
- Battery voltage
- Brake switch
- CCD bus (+) circuits
- CCD bus (-) circuits
- Data link connection for DRB scan tool
- Engine coolant temperature sensor (with EGR system)
- Engine speed sensor (rpm)
- Five volt sensor supply (primary)
- Five volt sensor supply (secondary)
- Generator (battery voltage) output
- Intake manifold air temperature sensor
- Oil pressure
- Output shaft speed sensor
- Overdrive/override switch
- Park/neutral switch (auto. trans. only)
- Power ground
- Sensor return
- Signal ground
- Speed control resume switch
- Speed control set switch
- Speed control on/off switch
- Throttle position sensor
- Transmission governor pressure sensor
- Transmission temperature sensor
- Water-in-fuel sensor
- Vehicle speed inputs from ABS or RWAL system

NOTE: PCM Outputs:

After inputs are received by the PCM, certain sensors, switches and components are controlled or regulated by the PCM. These are considered **PCM Outputs.** These outputs are for:

- A/C clutch relay
- Auto shutdown (ASD) relay

DESCRIPTION AND OPERATION (Continued)

- CCD bus (+) circuits (if equipped)
- CCD bus (-) circuits (if equipped)
- Data link connection for DRB scan tool
- EGR valve control solenoid (if equipped)
- Generator field driver (-)
- Generator field driver (+)
- Generator lamp (if equipped)
- Malfunction indicator lamp (Check engine lamp)
- Overdrive warning lamp (if equipped)
- Speed control vacuum solenoid
- Speed control vent solenoid
- Tachometer (if equipped)
- Transmission convertor clutch circuit
- Transmission 3–4 shift solenoid
- Transmission relay
- Transmission temperature lamp (if equipped)
- Transmission variable force solenoid (governor sol.)
- Wait-to-start lamp
- Water-in-fuel lamp
- Intake Manifold Air Heater Element #1
- Intake Manifold Air Heater Element #2

AIR CONDITIONING (A/C) CONTROLS—PCM INPUT

The A/C control system information applies to factory installed air conditioning units.

A/C SELECT SIGNAL: When the A/C switch is in the ON position, an input signal is sent to the powertrain control module (PCM). The signal informs the PCM that the A/C has been selected. The PCM adjusts idle speed to a pre-programmed rpm through the idle air control (IAC) motor to compensate for increased engine load.

A/C REQUEST SIGNAL: Once A/C has been selected, the powertrain control module (PCM) receives the A/C request signal from the clutch cycling pressure switch. The input indicates that the evaporator pressure is in the proper range for A/C application. The PCM uses this input to cycle the A/C compressor clutch (through the A/C relay). It will also determine the correct engine idle speed through the idle air control (IAC) motor position.

If the A/C low-pressure switch or high-pressure switch opens (indicating a low or high refrigerant pressure), the PCM will not receive an A/C request signal. The PCM will then remove the ground from the A/C relay. This will deactivate the A/C compressor clutch.

If the switch opens, (indicating that evaporator is not in proper pressure range), the PCM will not receive the A/C request signal. The PCM will then remove the ground from the A/C relay, deactivating the A/C compressor clutch.

AUTOMATIC SHUTDOWN (ASD) SENSE—PCM INPUT

A 12 volt signal at this input indicates to the PCM that the ASD has been activated. The ASD relay is located in the power distribution center (PDC). The PDC is located in the engine compartment. For the location of the relay within the PDC, refer to PDC cover.

This input is used only to sense that the ASD relay is energized. If the powertrain control module (PCM) does not see 12 volts + at this input when the ASD should be activated, it will set a diagnostic trouble code (DTC).

BATTERY VOLTAGE—PCM INPUT

The battery voltage input provides power to the powertrain control module (PCM). It also informs the PCM what voltage level is being supplied by the generator once the vehicle is running.

The battery input also provides the voltage that is needed to keep the PCM memory alive. The memory stores diagnostic trouble code (DTC) messages, minimum and maximum TPS value from the previous key-on and speed control adaptive memory.

BATTERY TEMPERATURE SENSOR—PCM INPUT

Provides a signal to the PCM corresponding to the battery temperature. Refer to Group 8C, Charging System for additional information.

BRAKE SWITCH—PCM INPUT

When the brake light switch is activated, the powertrain control module (PCM) receives an input indicating that the brakes are being applied. After receiving this input, the PCM is used to control the speed control system. It is also used for electrical operation of the transmission torque converter.

ENGINE SPEED SENSOR—PCM INPUT

The engine speed (rpm) sensor is mounted to the front of engine (Fig. 2). It generates an rpm signal to the PCM. The engine speed sensor input is used along with the vehicle speed sensor and throttle position sensor (TPS) inputs to determine when to shift the automatic transmission into and out of overdrive. The speed sensor signal is also used as an input for the ASD relay (for control of generator field), vehicle speed control, torque convertor electrical engagement and instrument panel mounted tachometer.

INTAKE MANIFOLD AIR TEMPERATURE SENSOR—PCM INPUT

The intake manifold air temperature sensor is a variable, thermistor type. It reacts to temperature changes. At cold air temperatures, its resistance is

DESCRIPTION AND OPERATION (Continued)

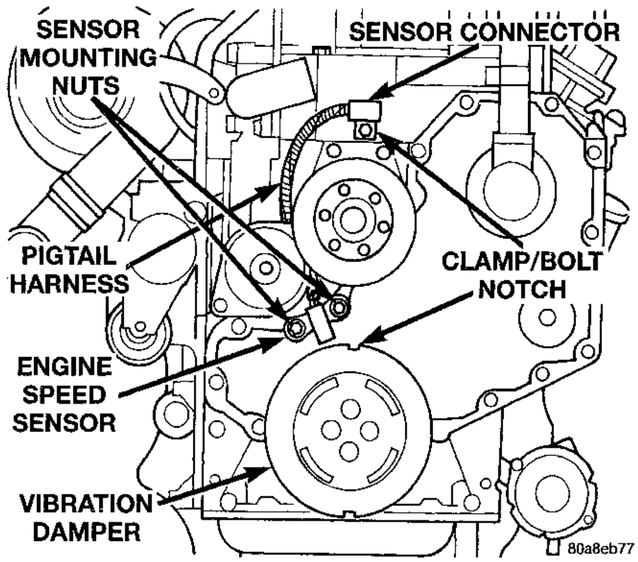

Fig. 2 Engine Speed Sensor Location—Diesel

high. As temperatures increase, its resistance will decrease.

The air temperature sensor element extends into the intake manifold air stream. It provides an input voltage to the PCM indicating intake manifold air temperature. The input from this sensor is used by the PCM to determine if and how long to activate the intake manifold air heater relays. When the relays are activated, current will flow through the relays to the intake manifold air heater element.

As the temperature of the air-fuel stream in the manifold varies, the sensor resistance will change. This will result in a different input voltage to the PCM.

The sensor is located on the top of the intake manifold and to the rear of the intake manifold air heater (Fig. 3).

Also refer to Intake Manifold Air Heater Relays for additional information.

INTAKE MANIFOLD AIR HEATER

The intake manifold air heater element assembly is located in the top of the intake manifold (Fig. 4).

The air heater is used to heat incoming air to the intake manifold to help engine starting and improve driveability with cool or cold outside temperatures.

Two heavy-duty cables (Fig. 5) connect the 2 air heater elements to the 2 air heater relays. Each of these cables will supply approximately 95 amps at 12 volts to an individual heating element within the heater block assembly.

Electrical supply for the 2 air heater elements (Fig. 5) is controlled by the powertrain control module (PCM) through the 2 air heater relays. Refer to Intake Manifold Air Heater Relays for more information.

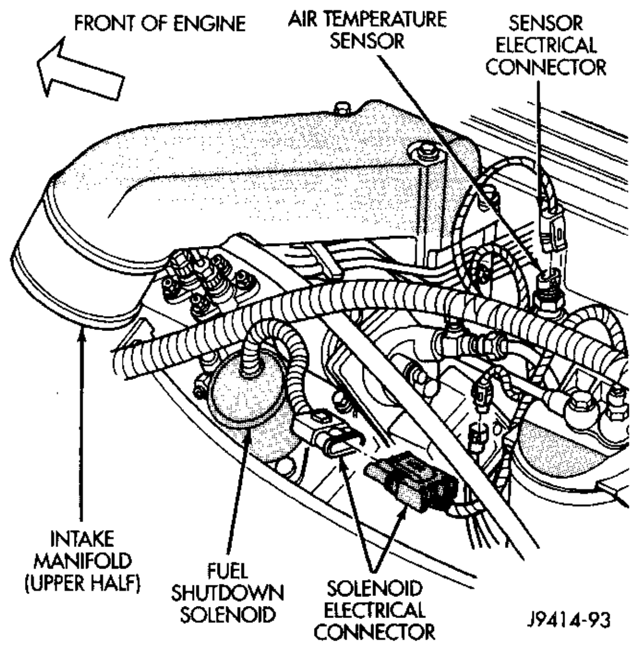

Fig. 3 Air Temperature Sensor Location—Diesel

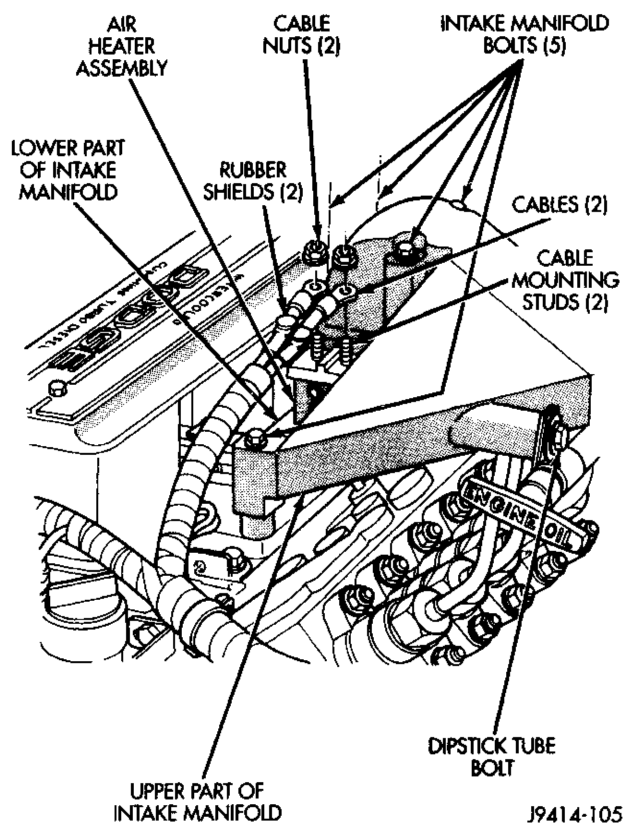

Fig. 4 Air Heater Location

AUTHENTIC RESTORATION PRODUCT

DESCRIPTION AND OPERATION (Continued)

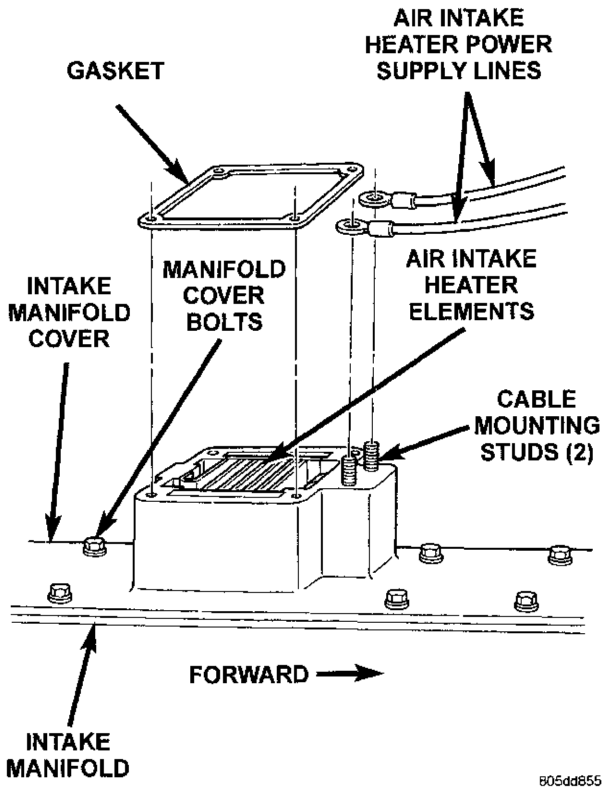

Fig. 5 Air Heater Elements

INTAKE MANIFOLD AIR HEATER RELAYS—PCM OUTPUT

The 2 relays are located in the engine compartment below the left battery (Fig. 6).

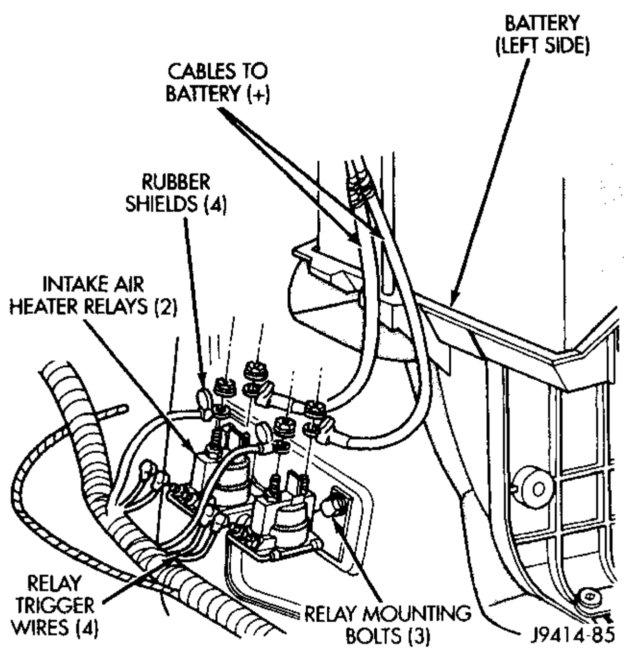

Fig. 6 Intake Manifold Air Heater Relays

The powertrain control module (PCM) operates the 2 heating elements within the air heater assembly through the 2 intake manifold air heater relays. The air heater elements are used to heat incoming air flowing into the intake manifold. This will help engine starting and improve driveability with cool or cold outside temperatures.

The relays may be energized by the PCM before and after cranking. This will depend on inputs the PCM receives from: the intake manifold air temperature sensor, the engine speed sensor and the vehicle speed sensor.

With a cool or cold engine, the air heater relays and the air heater elements may be activated for a maximum time of approximately 3 1/2 minutes. Refer to the following Air Heater Cycle Chart for a temperature/time comparison of relay engagement.

In this chart, Pre-Heat and Post-Heat times are mentioned. Pre-heat is the amount of time the relay circuits are activated when the ignition (key) switch is ON, but the engine has yet to be started. Post-heat is the amount of time the relay circuits are activated after the engine is operating.

The wait-to-start warning lamp is tied to this circuit. Lamp operation is also controlled by the PCM. The wait-to-start warning lamp **will not** be illuminated during the post-heat cycle.

The relays are not energized during engine cranking. When initially energized, they will make a clicking noise.

PREHEAT CYCLE

The PCM will supply a signal to the 2 relays when the ignition (key) switch is initially turned to the ON position. When this signal is supplied, electrical current is passed through the relays for operation of the 2 heating elements.

If the intake manifold air temperature is 15-19°C (59-66°F) or below, the air heater elements are energized and the wait-to-start warning lamp is illuminated. The heater is energized for a specific amount of time. Refer to the following Air Heater Cycle Chart for a temperature/time comparison of relay engagement.

Once the heater has cycled, the wait-to-start warning lamp goes out.

While the engine is cranked, the heater relays are not energized.

POST-HEAT CYCLE

After the pre-heat cycle is completed, the PCM must receive an engine crank signal (engine speed between 32 and 475 rpm) followed by an engine run signal (engine speed above 475 rpm). Intake manifold air temperature must also be below 15–19°C (59–66°F). All of these signals must be seen by the PCM before initiating the post-heat cycle.

DESCRIPTION AND OPERATION (Continued)

Depending upon intake manifold air temperature, engine rpm and predetermined PCM values, one or both of the relays and one or both of the heating elements may be activated. This may be observed as a large needle swing on the vehicle voltmeter and is due to the high-amperage draw of the heating elements. Each heating element will draw approximately 95 amps at 12 volts. **This voltmeter movement is a normal condition during the post-heat cycle.**

Refer to the following Air Heater Cycle Chart for a temperature/time comparison of relay engagement.

The PCM is also programmed with battery saving features. It will shut down the air heater relays if:

- the engine starter is operated during the pre-heat cycle.
- the engine stalls during the post-heat cycle.
- the engine starter is operated for more than 10 seconds during the post-heat cycle.
- the vehicle speed is above 18 mph during the post-heat cycle.

The post-heat cycle will continue for up to 3 1/2 minutes unless the PCM determines one or more of these preceding features interrupts the cycle strategy.

AIR HEATER CYCLE CHART

INTAKE MANIFOLD TEMPERATURE-KEY IN ON POSITION	PRE-HEAT CYCLE TIME-KEY ON, ENGINE NOT RUNNING	POST-HEAT CYCLE -IGNITION ON, ENGINE RUNNING
Above 15-19° C (59-66° F)	0 Seconds	No
-10° C to +19° C (15° F to 66° F)	10 Seconds	Yes
-18° C to -10° C (0° F to 15° F)	15 Seconds	Yes
Below -18° C (0° F)	30 Seconds	Yes

SPEED CONTROL SWITCHES—PCM INPUT

Six different speed control functions, using three momentary contact switches, are monitored through this **multiplexed** input. The resistance monitored at this input, in combination with the length of time the PCM measures the resistance, determines which switch feature has been selected. The three switches are: On/Off, Set/Coast, Cancel and Resume/Accelerate.

Refer to Group 8H, Vehicle Speed Control System for further speed control information.

PARK/NEUTRAL POSITION SWITCH—PCM INPUT

The park/neutral switch provides an input to the powertrain control module (PCM). This will indicate that the automatic transmission is in Park, Neutral or a Drive gear selection. This input is used to determine speed control strategy and electrical operation of both the overdrive and torque convertor solenoids. Refer to Group 21, Transmissions, for testing, replacement and adjustment information.

THROTTLE POSITION SENSOR—PCM INPUT

The throttle position sensor (TPS) is used only on diesel powered engines equipped with an automatic transmission and/or an EGR system.

The TPS is mounted on the side of the fuel injection pump (Fig. 7). The TPS provides an input to the PCM. It senses how far the throttle is open (past the idle position). The PCM uses the TPS input, along with vehicle speed sensor and engine speed sensor inputs to determine 3-4 upshift (overdrive) and 4-3 downshift. It is also used with the vehicle speed sensor and engine speed sensor inputs to engage and disengage the torque convertor solenoid. This solenoid is used for torque convertor engagement.

The TPS is a linear potentiometer. The PCM supplies 5 volts to the sensor. TPS output voltage to the PCM will vary. At idle speed, the voltage should be 1.0 volt (± .2 volts). At wide open throttle (WOT), the output voltage must be 2.2-to-2.9 volts higher than at idle speed.

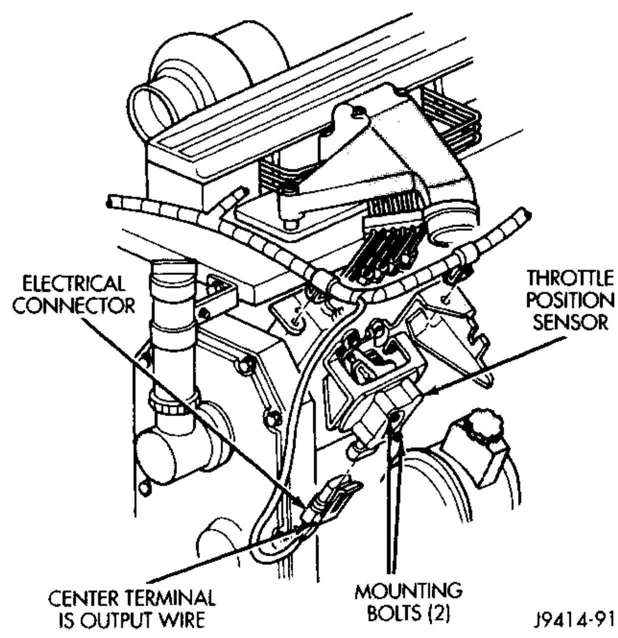

Fig. 7 Throttle Position Sensor Location—Diesel

TRANSMISSION TEMPERATURE SENSOR—PCM INPUT

DIESEL WITH AUTOMATIC TRANSMISSIONS ONLY

The transmission temperature sensor is a variable, thermistor type. It reacts to temperature changes. At

DESCRIPTION AND OPERATION (Continued)

cold transmission oil temperatures, its resistance is high. As temperatures increase, its resistance will decrease.

The transmission temperature sensor is used on models equipped with an automatic transmission. Its purpose is to help control transmission fluid overheating. If transmission overheating has been determined by this sensor (temp. above approximately 280 degrees F), an input is sent to the powertrain control module (PCM). The PCM will then force a 4-3 downshift. Once transmission temperature has cooled below specifications, a 3-4 upshift will be allowed. An instrument panel mounted transmission temperature warning lamp is also used.

This sensor is located in the transmission cooling line on the side of the transmission (Fig. 8).

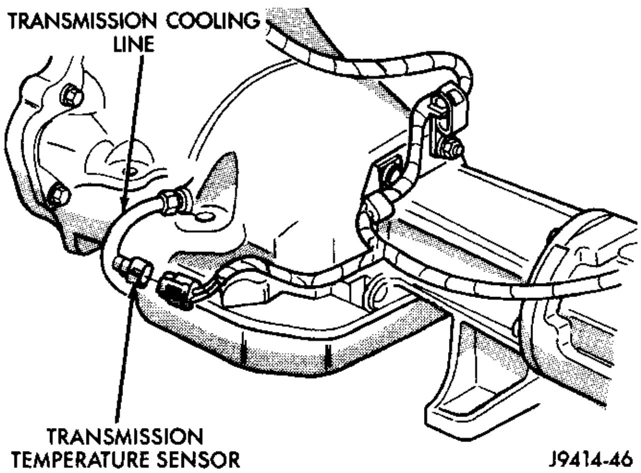

Fig. 8 Transmission Temperature Sensor Location—Typical

TRANSMISSION GOVERNOR PRESSURE SENSOR—PCM INPUT

Provides a signal proportional to the transmission governor pressure. It provides feedback for control of the governor pressure solenoid, which regulates transmission governor pressure. This input is used with 4–speed electronic transmissions only.

VEHICLE SPEED AND DISTANCE—PCM INPUT

The Vehicle Speed Sensor (VSS) is no longer used for any Dodge truck in the 1998 model year.

Vehicle speed and distance covered are measured by the Rear Wheel Speed Sensor. The sensor is mounted to the rear axle. A signal is sent from this sensor to the Controller Antilock Brake (CAB) computer. A signal is then sent from the CAB to the Powertrain Control Module (PCM) to determine vehicle speed and distance covered. The PCM will then determine strategies for fuel system and speed control system operation.

Refer to Odometer and Trip Odometer in Group 8E, Instrument Panel for additional information.

WATER-IN-FUEL SENSOR—PCM INPUT

The water-in-fuel (WIF) sensor is located at the bottom of the fuel filter/water separator canister (Fig. 9).

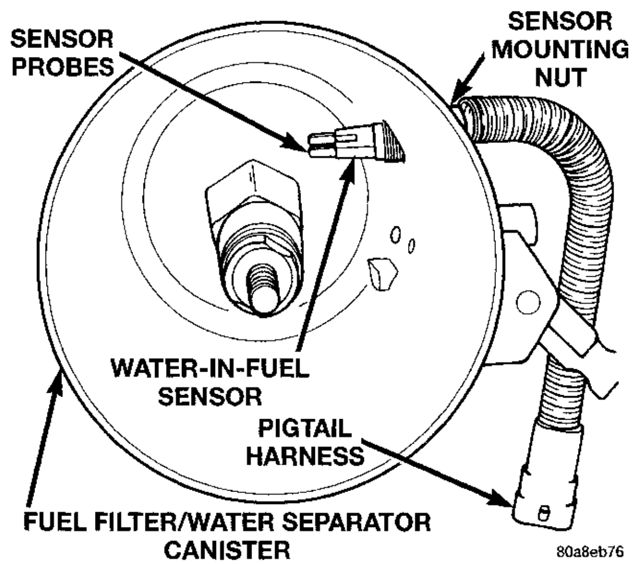

Fig. 9 Water-in-Fuel Sensor Location

The sensor sends an input to the powertrain control module (PCM) when it senses water in the fuel filter/water separator. As the water level in the filter/separator increases, the resistance across the WIF sensor decreases. This decrease in resistance is sent as a signal to the PCM and compared to a high water standard value. Once the value reaches 30 to 40 kilohms, the PCM will activate the instrument panel mounted, water-in-fuel warning lamp. This all takes place when the ignition key is initially put in the ON position. The PCM continues to monitor the input at the end of the intake manifold air heater post-heat cycle.

WATER-IN-FUEL WARNING LAMP—PCM INPUT

The PCM turns the water-in-fuel indicator lamp to the ON position if water is detected in the fuel. The water-in-fuel indicator lamp is located in the instrument panel. The lamp will illuminate for about two seconds each time the ignition key is initially turned to the ON position as a bulb check.

Also refer to Water-In-Fuel Sensor—PCM Input for additional information.

mopar AUTHENTIC RESTORATION

DESCRIPTION AND OPERATION (Continued)

AIR CONDITIONING CLUTCH RELAY—PCM OUTPUT

The A/C relay is located in the Power Distribution Center (PDC) (Fig. 10). Refer to label on PDC cover for relay location.

The powertrain control module (PCM) activates the A/C compressor through the A/C clutch relay. The PCM regulates A/C compressor operation by switching the ground circuit for the A/C clutch relay on and off.

The PCM will also de-energize the relay if coolant temperature exceeds 125°C (257°F).

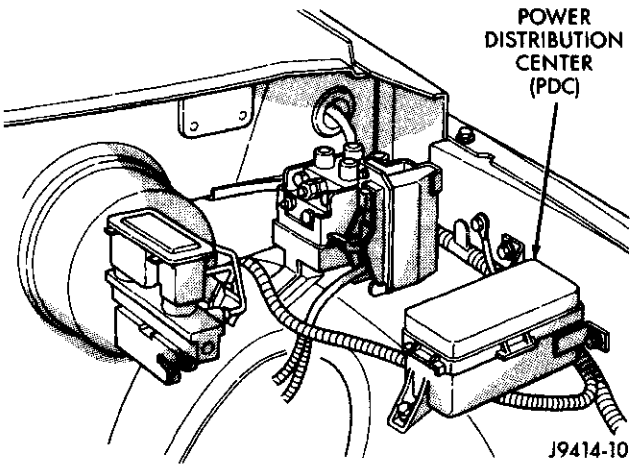

Fig. 10 Power Distribution Center (PDC) Location

AUTOMATIC SHUTDOWN (ASD) RELAY—PCM OUTPUT

This circuit controls operation of the ASD relay. It provides the necessary power to operate the generator field control for charging system operation.

The ASD relay is located in the power distribution center (PDC). The PDC is located in the engine compartment. For location of relay within the PDC, refer to PDC cover.

GENERATOR FIELD SOURCE (+)—PCM OUTPUT

This output from the Powertrain Control Module (PCM) regulates charging system voltage to the generator field source (+) circuit. The voltage range is 12.9 to 15.0 volts. Models of previous years had used the ASD relay (directly) to apply the 12 volt + power supply to the generator field source (+) circuit. Refer to Groups 8A and 8C for charging system information.

GENERATOR FIELD DRIVER (-)—PCM OUTPUT

This output from the Powertrain Control Module (PCM) regulates charging system ground control to the generator field driver (-) circuit. Refer to Groups 8A and 8C for charging system information.

GENERATOR LAMP—PCM OUTPUT

If the powertrain control module (PCM) senses a low charging condition in the charging system, it will illuminate the generator lamp (if equipped) on the instrument panel. For example, during low idle with all accessories turned on, the lamp may momentarily go on. Once the PCM corrects idle speed to a higher rpm, the lamp will go out. Refer to Groups 8A and 8C for charging system information.

DATA LINK CONNECTOR—PCM INPUT AND OUTPUT

The 16–way data link connector (diagnostic scan tool connector) links the Diagnostic Readout Box (DRB) scan tool or the Mopar Diagnostic System (MDS) with the powertrain control module (PCM). The data link connector (Fig. 11) is located at lower edge of instrument panel near steering column. For operation of the DRB scan tool, refer to the appropriate Powertrain Diagnostic Procedures service manual.

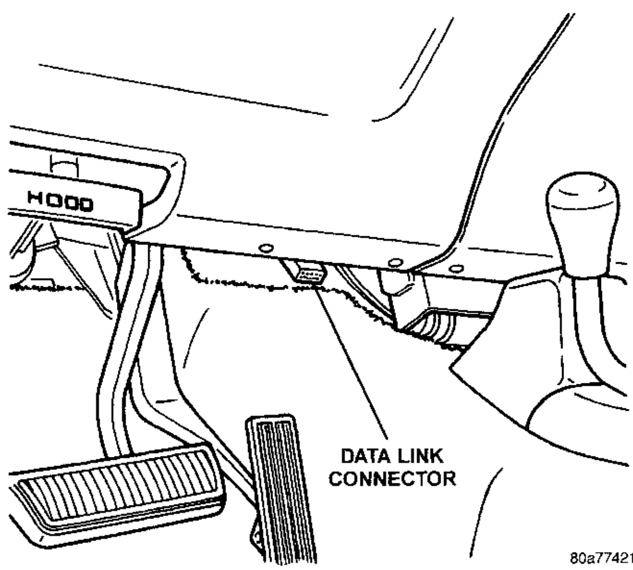

Fig. 11 16–Way Data Link Connector

MALFUNCTION INDICATOR LAMP—PCM OUTPUT

Refer to Group 25, Emission Control System for information.

OVERDRIVE LAMP—PCM OUTPUT

This circuit controls a signal for the operation of the instrument panel mounted push-button overdrive lamp switch. When the lamp is illuminated, the overdrive is disengaged.

OVERDRIVE/OVERRIDE SWITCH-PCM INPUT

On vehicles equipped with an automatic transmission and overdrive, the powertrain control module (PCM) regulates the 3-4 overdrive up-shift and down-

AUTHENTIC RESTORATION PRODUCT

DESCRIPTION AND OPERATION (Continued)

shift through the overdrive solenoid. This solenoid is located in the transmission. An overdrive/override push-button switch is located at the end of the shift lever.

The overdrive/override push-button switch is normally open (overdrive allowed) when the lamp is not illuminated. It momentarily closes (overdrive not allowed) when the operator presses the switch and the lamp is illuminated. Overdrive will revert to ON (lamp off) each time the ignition switch in turned on. The transmission downshifts if the operator presses the override switch while in overdrive.

Refer to Group 21 for more transmission information.

SPEED CONTROL SOLENOIDS—PCM OUTPUT

Speed control operation is regulated by the powertrain control module (PCM). The PCM controls the vacuum to the throttle actuator through the speed control vacuum and vent solenoids. Refer to Group 8H for Speed Control Information.

TACHOMETER—PCM OUTPUT

The powertrain control module (PCM) supplies engine rpm values to the instrument cluster tachometer. Refer to Group 8E for tachometer information.

TORQUE CONVERTOR CLUTCH (TCC) SOLENOID—PCM OUTPUT

This circuit controls operation of the transmission mounted torque convertor clutch (TCC) solenoid used for torque convertor engagement.

The powertrain control module (PCM) will determine when to engage and disengage the solenoid by monitoring vehicle miles per hour (mph) versus the output voltage of the throttle position sensor. Also needed are various inputs from:

- Transmission temperature sensor
- Output shaft speed sensor
- Module timer
- Engine rpm
- Throttle position sensor (if equipped)
- Brake switch

TRANSMISSION TEMPERATURE WARNING LAMP—PCM OUTPUT

AUTOMATIC TRANSMISSION ONLY

An instrument panel mounted lamp is used to warn of a possible transmission fluid overheating condition. When transmission fluid temperature has been determined to be above approximately 280 degrees F by the transmission temperature sensor, a signal is sent to the powertrain control module (PCM). The PCM will then control warning lamp operation. The lamp will illuminate for about two seconds each time the ignition key is initially turned to the ON position as a bulb check.

This feature is used with certain heavy-duty automatic transmissions only.

Also refer to Transmission Temperature Sensor—PCM Input for additional information.

WAIT-TO-START LAMP WARNING LAMP—PCM OUTPUT

The wait-to-start warning lamp is turned on and off by the PCM based on the intake manifold air temperature sensor input. The lamp is located on the instrument panel.

The lamp is turned on when the ignition is first activated. If the PCM reads intake manifold air temperature below 15–19°C (59–66°F), it will turn the wait-to-start warning lamp on for the air heater preheat cycle. The lamp stays on until the preheat cycle is over.

The wait-to-start lamp will flash on and off if the intake manifold air temperature sensor input to the PCM is below minimum value or above maximum value. The PCM stores a DTC when these conditions occur.

Refer to Intake Manifold Air Heater for additional information.

DIAGNOSIS AND TESTING

VISUAL INSPECTION

A visual inspection should be made before attempting to diagnose or service the diesel fuel injection system. A visual check will help find these conditions. It also saves unnecessary test and diagnostic time. A thorough visual inspection of the fuel injection system includes the following checks:

(1) Verify pigtail electrical connector from water-in-fuel (WIF) sensor is firmly attached to main engine wiring harness. The WIF sensor is located on side of Fuel Filter/Water Separator canister. Inspect connector for corrosion or damaged wires.

(2) Check for water in fuel filter/water separator. A water drain is supplied on the filter/separator. Refer to Fuel Filter/Water Separator Removal/Installation for water draining operation.

(3) Verify fuel filter has been serviced according to Maintenance Schedules in Group 0, Lubrication and Maintenance.

(4) Verify pre-filter (within fuel heater) has been cleaned when fuel filter was serviced.

(5) Inspect air cleaner element (filter) for restrictions by using the built-on Filter Minder™ (Fig. 12). Do not remove the top of air cleaner housing to inspect condition of air cleaner element. Refer to Air Cleaner Housing/Air Cleaner Element in the Removal/Installation section for Filter Minder information.

DIAGNOSIS AND TESTING (Continued)

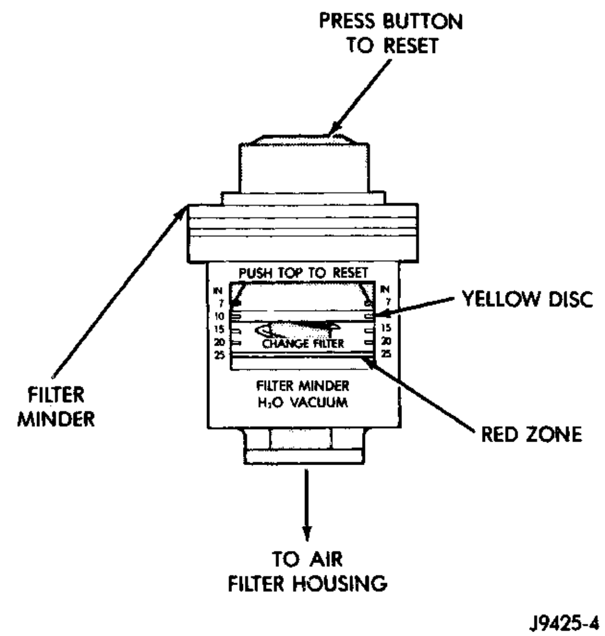

Fig. 12 Filter Minder™

(6) Check front of turbocharger intercooler for restrictions to airflow (insects, debris etc.). Clean if necessary.

(7) Be sure turbocharger output hose is firmly connected to charge air cooler (intercooler) inlet tube. Verify charge air cooler output hose is firmly connected to cooler and intake manifold.

(8) Verify turbocharger wastegate adjustment is correct. Refer to Group 11, Exhaust System and Intake Manifold for procedures.

(9) Verify throttle linkage is "breaking over". Refer to Wide-Open-Throttle Checks—Diesel Engine for procedures.

(10) Verify correct throttle linkage adjustment. Refer to Wide-Open-Throttle Checks—Diesel Engine for procedures.

(11) Verify correct Throttle Position Sensor (TPS) output voltage. Refer to Throttle Position Sensor—Diesel Engine, Removal/Installation/Testing/Adjustment.

(12) Be sure battery connections (on both batteries) are tight and not corroded.

(13) Be sure three 32–way connectors are fully engaged into the powertrain control module (PCM) (Fig. 13).

(14) Verify electrical connector is firmly connected to fuel shutdown solenoid on the injection pump (Fig. 14). Inspect connector for corrosion or damage.

(15) Verify electrical connector is firmly connected to intake manifold air temperature sensor. Inspect connector for corrosion or damaged wires. The sensor is located on top of intake manifold (Fig. 14).

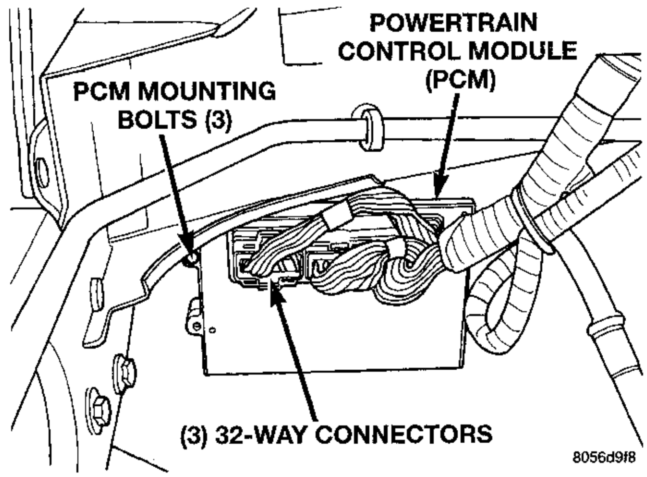

Fig. 13 PCM Location—Typical

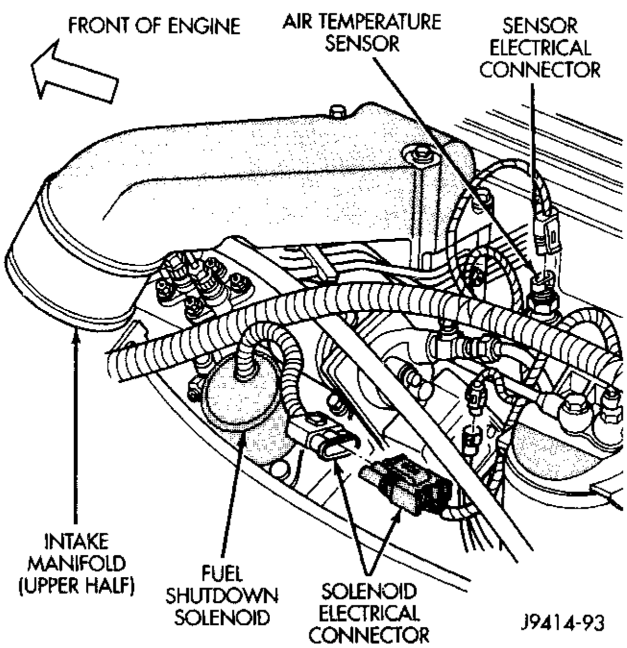

Fig. 14 Air Temperature Sensor and Fuel Shutdown Solenoid

(16) Be sure electrical connections at intake manifold air heater relays (Fig. 15) are tight and not corroded.

(17) Be sure intake manifold air heater electrical cable connections at intake manifold are tight and free of corrosion (Fig. 16).

(18) Inspect all fuel supply and return lines for signs of damage or kinking.

(19) Inspect all fuel supply and return lines for signs of leakage.

(20) Inspect throttle linkage and accelerator linkage for binding.

(21) Be sure throttle return spring is connected.

DIAGNOSIS AND TESTING (Continued)

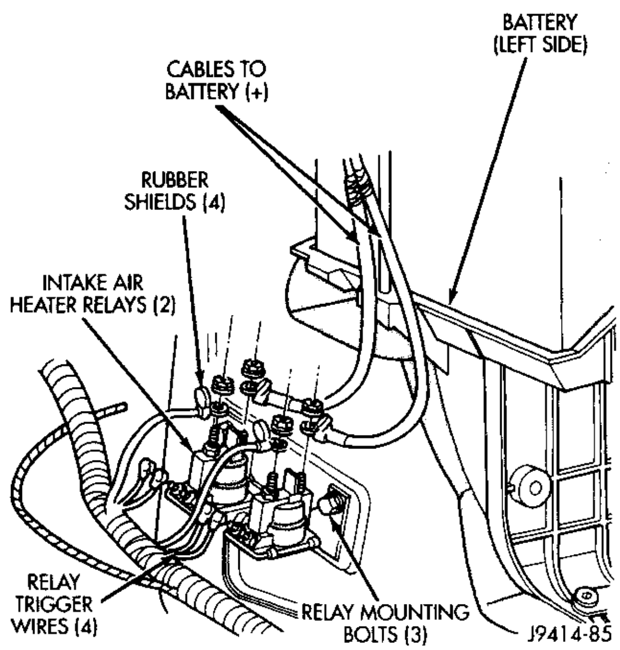

Fig. 15 Intake Manifold Air Heater Relays

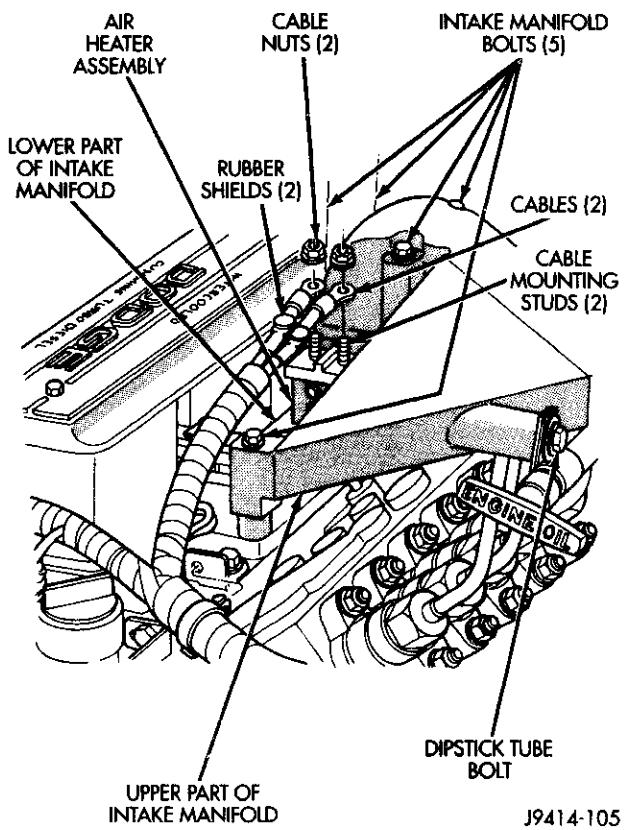

Fig. 16 Air Heater Cable Connections

(22) Be sure ground connections are tight and free of corrosion. Refer to Group 8, Wiring for locations of ground connections.

(23) Be sure accessory drive belt is not damaged or slipping.

(24) Automatic Transmission Only: Be sure electrical connectors are firmly connected to plugs on transmission case.

(25) Inspect starter motor and starter solenoid connections for tightness and corrosion.

AUTOMATIC SHUTDOWN (ASD) RELAY TEST

To perform a complete test of the ASD relay and its circuitry, refer to the DRB scan tool and appropriate Powertrain Diagnostics Procedures manual. To test the relay only, refer to Relays—Operation/Testing in this section of the group.

ENGINE SPEED SENSOR TEST

To perform a complete test of this sensor and its circuitry, refer to the appropriate Powertrain Diagnostic Procedures manual.

INTAKE MANIFOLD AIR TEMPERATURE SENSOR TEST

To perform a complete test of this sensor and its circuitry, refer to DRB scan tool and appropriate Powertrain Diagnostics Procedures manual. To test the sensor only, refer to following:

(1) Disconnect wire harness connector from intake manifold air temperature sensor. The sensor is located on top of intake manifold and to rear of air heater (Fig. 17).

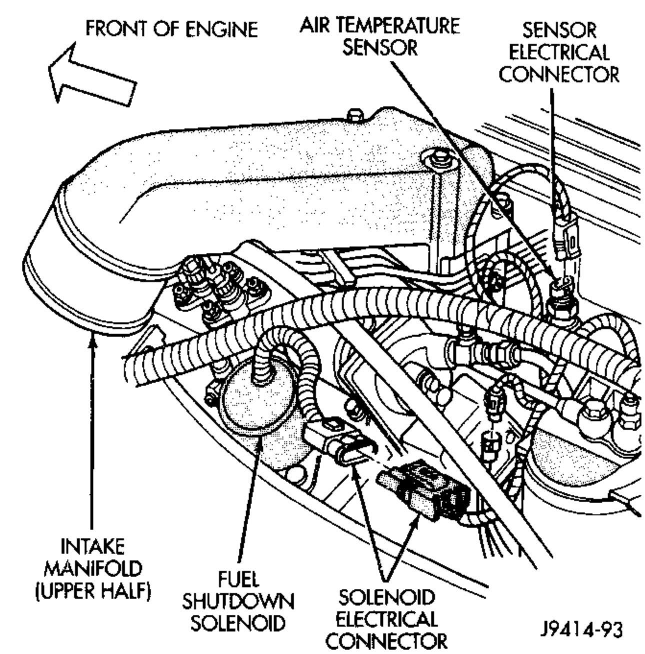

Fig. 17 Air Temperature Sensor Location—Diesel

(2) Test resistance of sensor with an input impedance (digital) volt-ohmmeter. The resistance (as measured across sensor terminals) should be as shown in

DIAGNOSIS AND TESTING (Continued)

the SENSOR RESISTANCE (OHMS)—INTAKE MANIFOLD AIR TEMPERATURE chart. Replace sensor if it is not within range of resistance specified in chart.

SENSOR RESISTANCE (OHMS)—INTAKE MANIFOLD AIR TEMPERATURE SENSOR

TEMPERATURE		RESISTANCE (OHMS)	
°CEL.	°FAHR.	MIN.	MAX.
-40	-40	291,490	381,710
-20	-4	85,850	108,390
-10	14	49,250	61,430
0	32	29,330	35,990
10	50	17,990	21,810
20	68	11,370	13,610
25	77	9,120	10,880
30	86	7,370	8,750

50	122	3,330	3,880
60	140	2,310	2,670
70	158	1,630	1,870
80	176	1,170	1,340
90	194	860	970
100	212	640	720
110	230	480	540
120	248	370	410

(3) Test resistance of wire harness. Do this between powertrain control module (PCM) wire harness connector terminal A–15 and sensor connector terminal. Also check between PCM terminal A–4 (sensor return) to sensor connector terminal. Repair wire harness as necessary if resistance is greater than 1 ohm.

INTAKE MANIFOLD AIR HEATER TEST

The intake manifold air heater (Fig. 18) is controlled by the powertrain control module (PCM) through the intake manifold air heater relays (Fig. 19). This is done after a specified signal is sent to the PCM from the intake manifold air temperature sensor.

Two heating elements are located within the air heater assembly. A separate heavy-duty cable is connected to a separate terminal to supply power for each element.

PREHEAT/POST-HEAT CYCLE

Refer to the Intake Manifold Air Heater Relays—PCM Output for preheat/post heat cycle information.

The PCM provides a ground path for the intake manifold air heater relays. The ground path is provided if intake manifold air temperature is below 15-19°C (59-66°F) when the ignition key is initially placed in the ON position. When the ground is provided, the air heater is energized to start the preheat cycle.

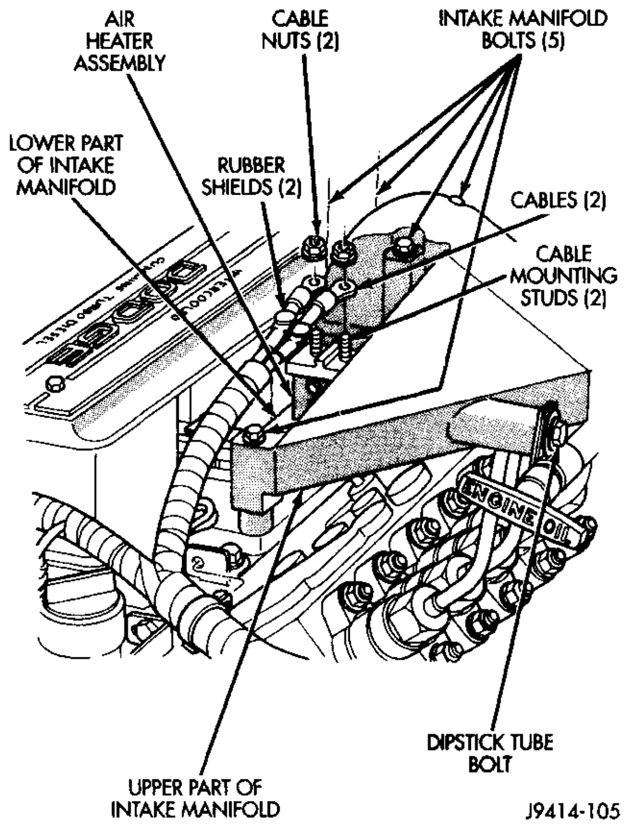

Fig. 18 Intake Manifold Air Heater

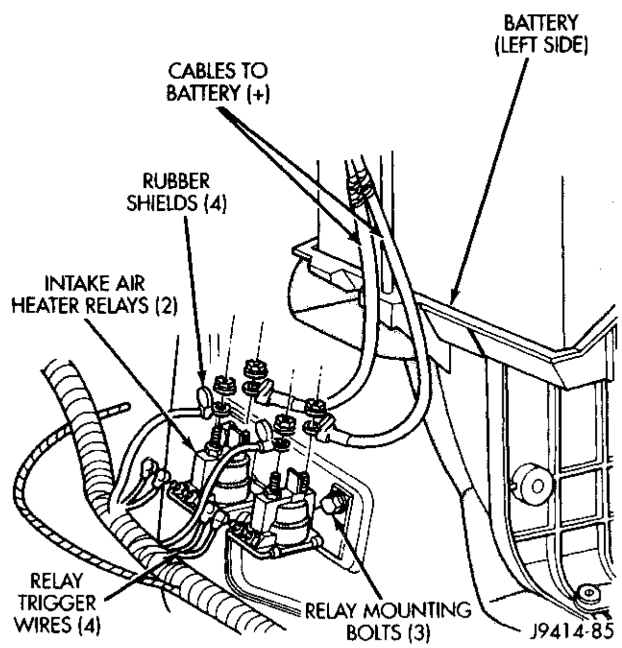

Fig. 19 Intake Manifold Air Heater Relays

DIAGNOSIS AND TESTING (Continued)

The preheat-cycle can be tested with a voltmeter or test light. If the intake manifold air temperature is above 15°C (59°F), the wait-to-start warning lamp will not illuminate and the air heater will not be energized.

(1) With the engine not running, and intake manifold air temperature below 15-19°C (59-66°F), turn the ignition key to the ON position.

(2) The wait-to-start warning lamp will come on and the air heater relays should click ON signaling the start of the preheat cycle. **If the engine starter is engaged before the preheat cycle of the heaters is complete, the PCM will stop the remaining preheat cycle.**

(3) Check for battery voltage at both air heater terminals (Fig. 18). **The heater will only be energized for 10 to 30 seconds.** Refer to the following Air Heater Cycle Chart for a time/temperature comparison.

AIR HEATER CYCLE CHART

INTAKE MANIFOLD TEMPERATURE-KEY IN ON POSITION	PRE-HEAT CYCLE TIME-KEY ON, ENGINE NOT RUNNING	POST-HEAT CYCLE-IGNITION ON, ENGINE RUNNING
Above 15-19° C (59-66° F)	0 Seconds	No
-10° C to +19° C (15° F to 66° F)	10 Seconds	Yes
-18° C to -10° C (0° F to 15° F)	15 Seconds	Yes
Below -18° C (0° F)	30 Seconds	Yes

HEATER TEST

(1) Disconnect both negative battery cables at both batteries.

(2) Lift the rubber shields from each of the cable connectors at the intake manifold air heater (Fig. 18) to expose the cable terminals. Do not disconnect cable nuts.

(3) Use an ohmmeter to test the resistance between the cable terminal (not the mounting stud) and a ground. The resistance should be zero (0). If not, inspect for corroded or dirty cable connections. Clean or repair the connections and retest before replacing heater. If resistance is now anything other than zero (0), proceed to next step.

(4) Disconnect both cables from the intake manifold heater (two nuts) (Fig. 18).

(5) Measure the resistance from each of the air heater terminal threaded studs to a ground. The resistance should be zero (0). If the ohmmeter is still reading anything other than zero (0), replace the intake manifold air heater elements. The heater elements are part of the intake manifold and will require manifold replacement.

(6) After testing and repairing, connect battery cables to both batteries.

INTAKE MANIFOLD AIR HEATER RELAY TEST

To test the intake manifold air heater, refer to the previous Intake Manifold Air Heater Test.

To test the intake manifold air heater relays, refer to the following:

(1) Disconnect both negative battery cables at both batteries.

(2) Disconnect the four small relay trigger wires at both relays (Fig. 19). Note position of wires before removal.

(3) Disconnect the four large cables at each of the relay terminals (four nuts) (Fig. 19). Note position of cables before removal.

(4) Attach an ohmmeter across two of the large studs on one of the relays.

(5) Attach a jumper wire (+ and -) to each of the small terminals on one of the relays. Polarity is not important.

(6) Momentarily touch the jumper wires to the vehicle battery (+ and -). The relay should click and the ohmmeter should show a closed circuit across the large terminals. If not, replace relay and bracket assembly.

(7) Repeat the same test on the opposite relay.

(8) After testing and repairing, connect battery cables to both batteries.

THROTTLE POSITION SENSOR TEST

The throttle position sensor (TPS) is used on diesel engines only when equipped with an automatic transmission and/or an Exhaust Gas Recirculation (EGR) system.

To perform a complete test of this sensor and its circuitry, refer to the appropriate Powertrain Diagnostic Procedures service manual. To test the sensor only, refer to Throttle Position Sensor in the Removal/Installation section of this group. This will give adjustment, testing and removal/installation procedures.

TRANSMISSION TEMPERATURE SENSOR TEST

AUTOMATIC TRANSMISSION ONLY

To perform a complete test of this sensor and its circuitry, refer to DRB scan tool and appropriate Powertrain Diagnostics Procedures manual. To test the sensor only, refer to following:

(1) Disconnect wire harness connector from temperature sensor. The sensor is located on side of transmission in transmission cooling line (Fig. 20).

(2) Test resistance of sensor with an input impedance (digital) volt-ohmmeter. The resistance (as measured across the sensor terminals) should be as shown in SENSOR RESISTANCE (OHMS)—TRANS-

DIAGNOSIS AND TESTING (Continued)

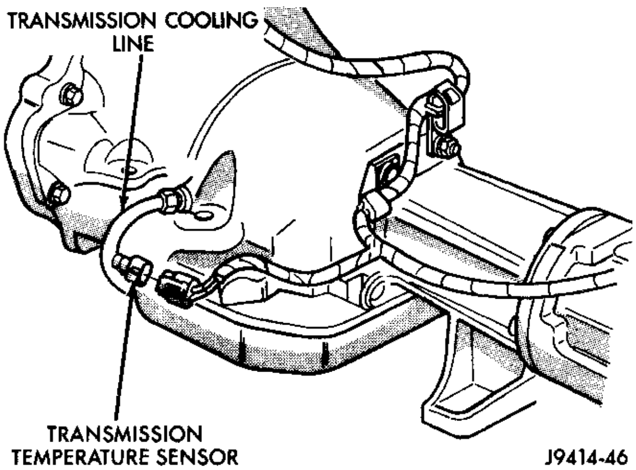

Fig. 20 Transmission Temperature Sensor Location—Typical

MISSION TEMPERATURE SENSOR resistance chart. Replace sensor if it is not within range of resistance specified in chart.

SENSOR RESISTANCE (OHMS)— TRANSMISSION TEMPERATURE SENSOR

TEMPERATURE		RESISTANCE (OHMS)	
°CEL.	°FAHR.	MIN.	MAX.
-40	-40	291,490	381,710
-20	-4	85,850	108,390
-10	14	49,250	61,430
0	32	29,330	35,990
10	50	17,990	21,810
20	68	11,370	13,610
25	77	9,120	10,880
30	86	7,370	8,750
40	104	4,900	5,750
50	122	3,330	3,880
60	140	2,310	2,670
70	158	1,630	1,870
80	176	1,170	1,340
90	194	860	970
100	212	640	720
110	230	480	540
120	248	370	410

(3) Test resistance of the wire harness. Do this between powertrain control module (PCM) wire harness connector terminal B–1 and sensor connector terminal. Also check between PCM terminal A–4 to sensor connector terminal. Repair wire harness as necessary if resistance is greater than 1 ohm.

REMOVAL AND INSTALLATION

ENGINE SPEED SENSOR

The engine speed (rpm) sensor is located on the front of engine (Fig. 21). Spacers located behind the sensor are used to position sensor over the vibration damper.

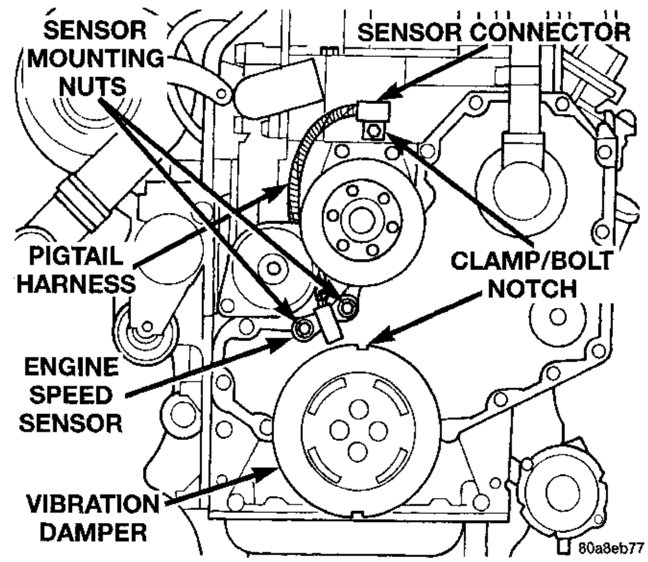

Fig. 21 Engine Speed Sensor Location—Diesel

REMOVAL

Before removing sensor and its pigtail wiring harness, note position and routing of harness. This routing must be maintained to prevent wiring from contacting belt or pulleys.

(1) Disconnect speed sensor pigtail harness from main engine wiring harness near front/top of engine (Fig. 21).

(2) Remove clip bolts from sensor pigtail wiring harness.

(3) Remove two speed sensor mounting nuts (Fig. 21) or (Fig. 22).

(4) Remove speed sensor and its mounting spacers from engine.

INSTALLATION/ADJUSTMENT

The engine speed sensor has 2 slotted holes (Fig. 22) to adjust its depth. A brass (non-magnetic) feeler gauge must be used to adjust sensor.

Sensor-to-vibration damper air gap: **1.25 MM (.049 in.) minimum to 1.30 MM (.051 in.) maximum.**

(1) Position speed sensor, its mounting spacers and two mounting nuts to engine. Install mounting nuts finger tight.

(2) Route sensor wiring harness behind engine pulleys. Install and tighten wiring harness clip bolts.

(3) Place feeler gauge between bottom of sensor and top of vibration dampener.

REMOVAL AND INSTALLATION (Continued)

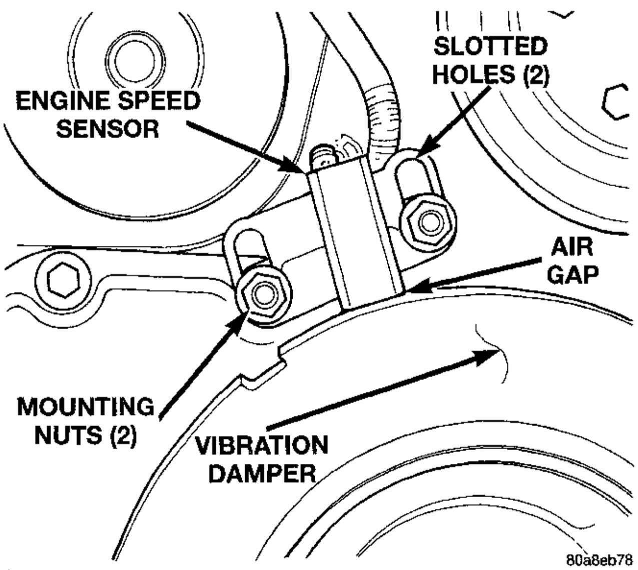

Fig. 22 Engine Speed Sensor—Removal/Installation/ Adjustment

(4) Gently seat (push down) sensor until it contacts feeler gauge. Sensor should be flat to feeler gauge. Slide sensor through slotted holes until flat to feeler gauge. **Be sure sensor is not near either of notches (Fig. 21) on vibration damper. If sensor is adjusted at or near these notches, it will be damaged when engine is started.**

(5) Tighten sensor mounting nuts to 24 N·m (18 ft. lbs.) torque.

(6) Remove feeler gauge.

(7) Connect sensor electrical pigtail connector to main engine wiring harness.

THROTTLE POSITION SENSOR—DIESEL ENGINE

This section will include the removal/installation/adjustment of the Throttle Position Sensor (TPS) plus TPS voltage tests. It also includes throttle linkage adjustment.

The TPS is used on diesel powered engines only when equipped with an automatic transmission and/or an Exhaust Gas Recirculation (EGR) system. If the TPS is to be replaced on a diesel engine, it must be tested and, if necessary, have throttle linkage adjusted after replacement.

REMOVAL

(1) Disconnect electrical connector on bottom of TPS (Fig. 23).

(2) Remove two TPS mounting bolts.

(3) Remove sensor from bracket.

INSTALLATION

(1) Position TPS to mounting bracket. The electrical connector should be facing downward.

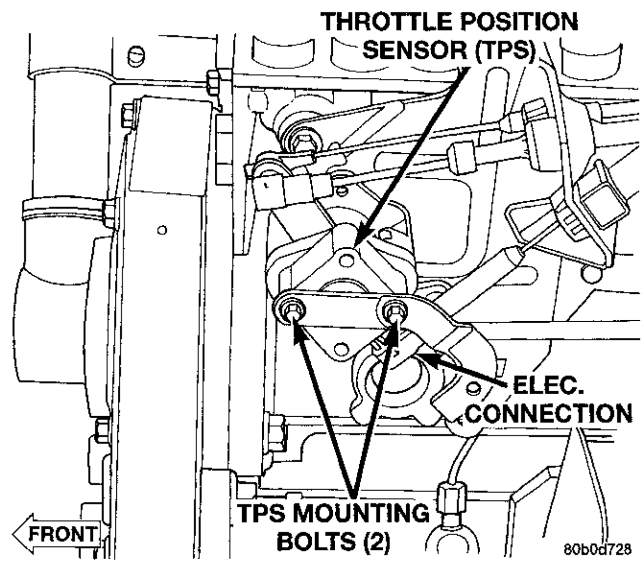

Fig. 23 Throttle Position Sensor Location—Diesel Engine

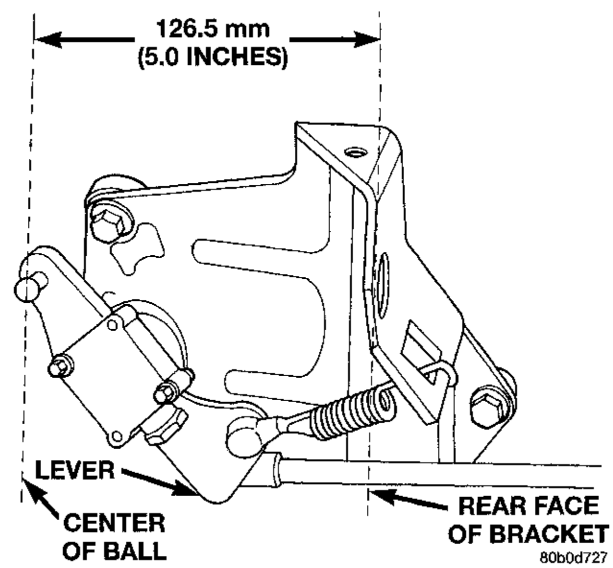

Fig. 24 TPS Linkage Measurement—Diesel

NOTE: The TPS is spring loaded. After positioning the TPS to its mounting bracket, rotate TPS on bracket in a counterclockwise direction until two bolt holes align.

(2) Install and tighten two bolts.

(3) Connect electrical connector on bottom of TPS.

(4) Operate throttle by hand to check for binding.

(5) Be sure of wide open throttle (WOT) when accelerator pedal is pressed to the floor. This is checked by observing throttle lever "breakover" position. Refer to Wide-Open-Throttle Checks—Diesel Engine for procedures. Linkage adjustments for "breakover" must be made **before** attempting to test or adjust TPS.

REMOVAL AND INSTALLATION (Continued)

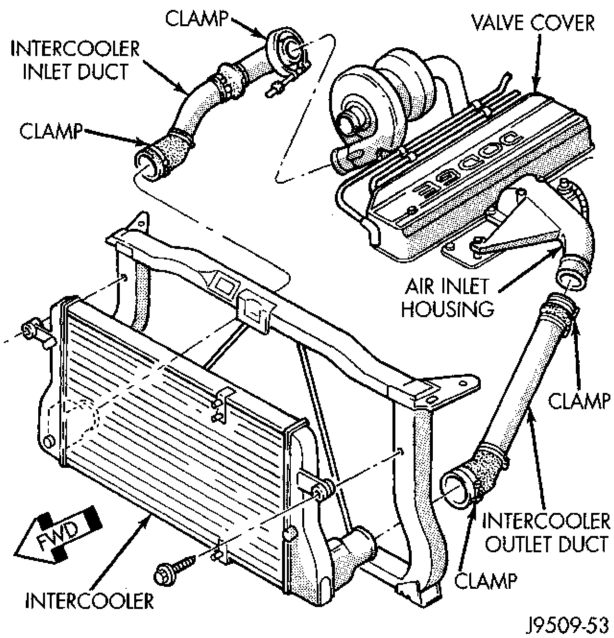

Fig. 25 Intercooler Outlet Duct

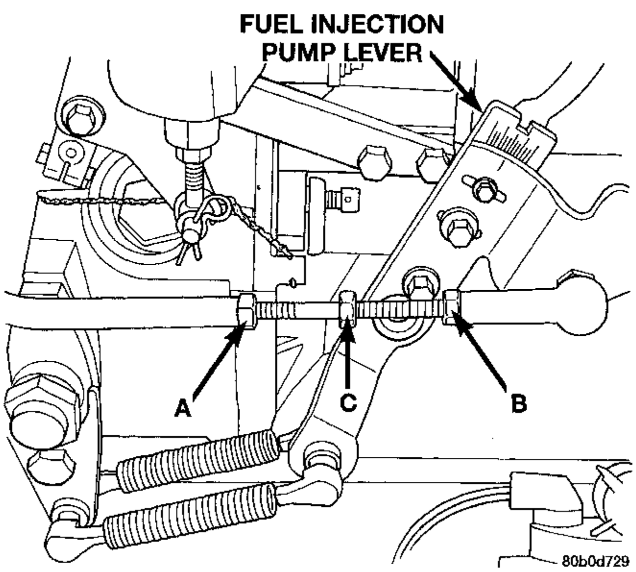

Fig. 26 Throttle Lever Linkage Rod Adjustment—Diesel

(6) After proper "breakover" is observed, test TPS voltage and (if necessary) adjust throttle linkage rod. Refer to the following:

THROTTLE POSITION SENSOR TESTING AND ADJUSTMENT / THROTTLE LINKAGE ADJUSTMENT

CAUTION: Before attempting to test TPS, verify linkage adjustment dimension (Fig. 24). This dimension MUST be 126.5 mm (5.0 inches) BEFORE testing.

(1) Attach DRB scan tool to data link connector.

(2) Warm engine to operating temperature and confirm correct engine idle speed and adjust if necessary. **This step must be done before testing TPS. Refer to Idle Speed Adjustment for specifications.**

(3) Shut engine off.

(4) Access the SENSOR display screen on DRB tool.

(5) Turn ignition switch to ON position. Do not start engine.

(6) TPS voltage should be 1.0 volt (± .2 volt) with linkage at idle position. At wide open throttle (WOT), output voltage must be 2.2-to-2.9 volts higher than at idle speed. If voltage is not correct, proceed to adjusting linkage.

(7) The throttle rod (Fig. 26) connecting throttle lever to fuel injection pump lever is adjustable.

(8) At side of fuel injection pump, remove intercooler outlet duct from air inlet housing (Fig. 25).

(9) Loosen rod nuts A (right-hand-thread) and B (left-hand-thread) while holding studnut C with another wrench (Fig. 26).

(10) Rotate studnut C (Fig. 26) on linkage rod (lengthen or shorten) to achieve 1.0 volt (± .2 volts) on voltmeter with linkage in idle position. At wide open throttle (WOT), output voltage must be 2.2-to-2.9 volts higher than at idle speed. **DO NOT lengthen or shorten linkage rod more than 1 mm from dimension shown in (Fig. 24). If voltage requirements cannot be met by linkage adjustment (125.6 to 127.6 mm), replace TPS.**

(11) Tighten rod nuts A and B (Fig. 26) after adjustment. **After tightening nuts, be sure the rod assembly will rotate (slightly) without binding at each ball end.** If binding occurs, loosen one of the nuts and back off until binding is eliminated. Retighten nut.

(12) With engine OFF, operate throttle from accelerator pedal and check for throttle lever action and binding. Be sure throttle lever stop is against low idle speed screw after throttle is released.

(13) Again, check and verify low idle speed. Adjust if necessary.

(14) Install intercooler outlet duct to air inlet housing.

AIR CLEANER HOUSING/AIR CLEANER ELEMENT

TESTING AIR CLEANER ELEMENT

Do not attempt to unnecessarily remove the top of the air cleaner housing for air cleaner element inspection on diesel engines.

The air cleaner (filter) housing is equipped with an air Filter Minder™ gauge (Fig. 27). This air flow restriction gauge will determine when the air cleaner element is restricted and should be replaced.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

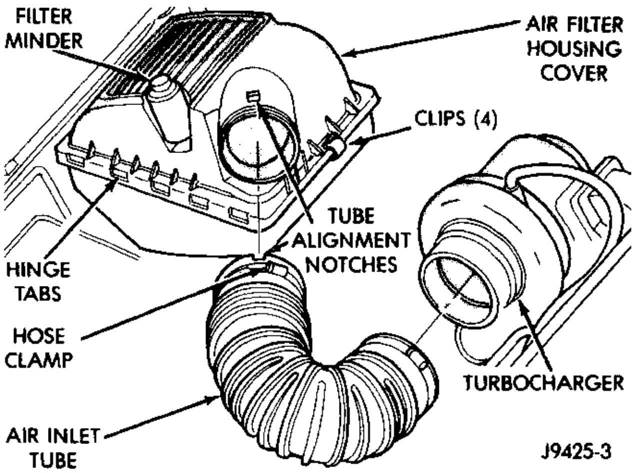

Fig. 27 Filter Minder—Location—Diesel Engine

The Filter Minder® consists of a diaphragm and calibrated spring sealed inside of a plastic housing (Fig. 28). A yellow colored disc attached to the diaphragm moves along a graduated scale on the side of the Filter Minder. After the engine has been shut off, a ratcheting device located within the Filter Minder will hold the yellow disc at the highest restriction that the air cleaner element has experienced. A drop in air pressure due to an air cleaner element restriction moves the diaphragm and the yellow disc will indicate the size of the air drop.

CAUTION: Certain engine degreasers or cleaners may discolor or damage the plastic housing of the Filter Minder. Cover and tape the Filter Minder if any engine degreasers or cleaners are to be used.

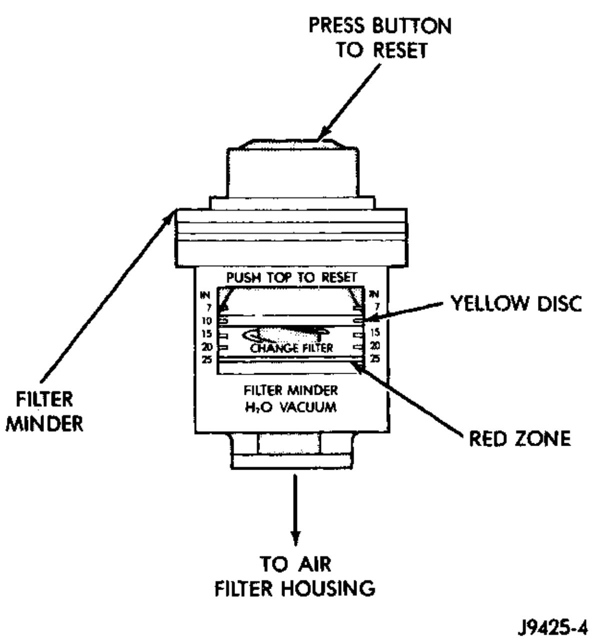

Fig. 28 Filter Minder®—Diesel Engine

To test, turn the engine off. If the yellow disc (Fig. 28) has reached the red colored zone on the graduated scale, the air cleaner element should be replaced. Refer to the proceeding removal/installation paragraphs.

Resetting the Filter Minder: After the air cleaner (filter) element has been replaced, press the rubber button on the top of the Filter Minder (Fig. 28). This will allow the yellow colored disc to reset. After the button has been pressed, the yellow disc should spring back to the UP position.

If the Filter Minder gauge has reached the red colored zone, and after an examination of the air cleaner (filter) element, the element appears to be clean, the high reading may be due to a temporary condition such as snow build-up at the air intake. Temporary high restrictions may also occur if the air cleaner (filter) element has gotten wet such as during a heavy rain or snow. If this occurs, allow the element to dry out during normal engine operation. Reset the rubber button on the top of the Filter Minder and retest after the element has dried.

REMOVAL/INSTALLATION

(1) Loosen the air inlet tube clamp at air cleaner housing inlet (Fig. 27). Remove this tube at air cleaner housing cover.

(2) The housing cover is equipped with four (4) spring clips (Fig. 27) and is hinged at the front with plastic tabs. Unlatch the clips from the top of air cleaner housing and tilt the housing cover up and forward for cover removal.

(3) Remove the air cleaner element from air cleaner housing.

(4) Before installing a new air cleaner element, clean inside of air cleaner housing.

(5) Position air cleaner cover to tabs on front of air cleaner housing. Latch the four spring clips to seal cover to housing.

(6) Install the air inlet tube at air cleaner housing inlet. Note the hose alignment notches at both the inlet hose and air cleaner cover (Fig. 27).

(7) Position the tube clamp to the inlet tube and tighten to 3 N·m (25 in. lbs.) torque.

INTAKE MANIFOLD AIR TEMPERATURE SENSOR

The intake manifold air temperature sensor is located on the top of intake manifold and to the rear of the intake manifold heater (Fig. 29).

REMOVAL

(1) Disconnect the electrical connector at the sensor.

(2) Remove the sensor (Fig. 29) the from intake manifold.

REMOVAL AND INSTALLATION (Continued)

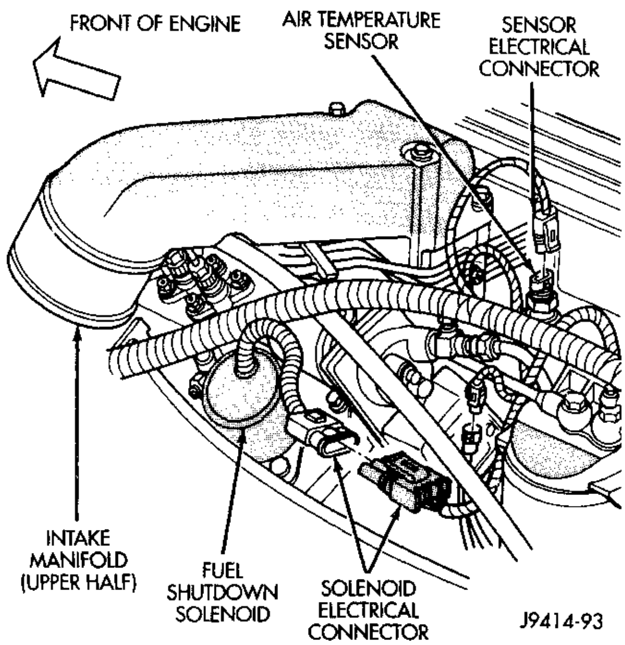

Fig. 29 Air Temperature Sensor Location—Diesel

INSTALLATION

(1) Install sensor to intake manifold. Tighten to 28 N·m (20 ft. lbs.) torque.

(2) Install electrical connector.

INTAKE MANIFOLD AIR HEATER ELEMENTS

The intake manifold air heater elements are located within the top cover of the intake manifold (Fig. 30). If replacement of the elements is necessary, the intake manifold cover must be removed. Refer to Intake Manifold Removal/Installation in Group 11.

INTAKE MANIFOLD AIR HEATER RELAYS

The relays are located in the engine compartment, bolted to the left inner fender below the left battery (Fig. 31).

REMOVAL

The mounting bracket and both relays are replaced as an assembly.

(1) Disconnect both negative battery cables at both batteries.

(2) Disconnect the four relay trigger wires at both relays (Fig. 31). Note the position of wiring before removing.

(3) Lift the four rubber shields from the four cables (Fig. 31).

(4) Remove the four nuts at the cable connectors (Fig. 31). Note the position of wiring before removing.

(5) Remove the three relay mounting bracket bolts (Fig. 31) and remove relay assembly.

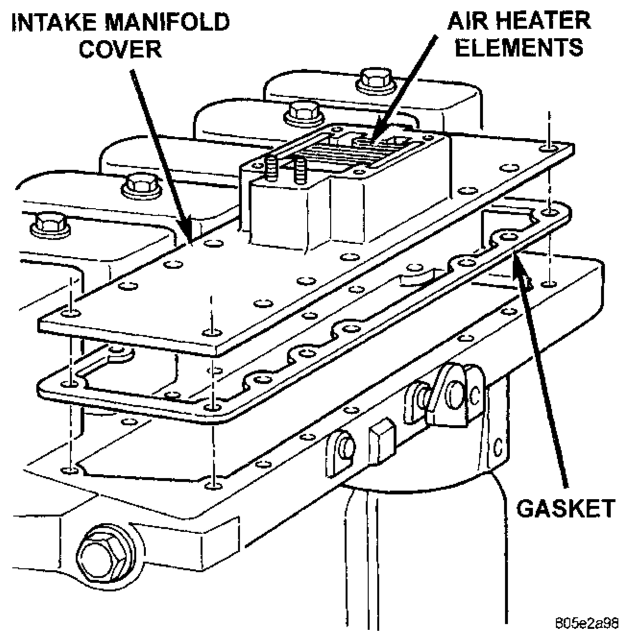

Fig. 30 Intake Manifold Air Heater Elements

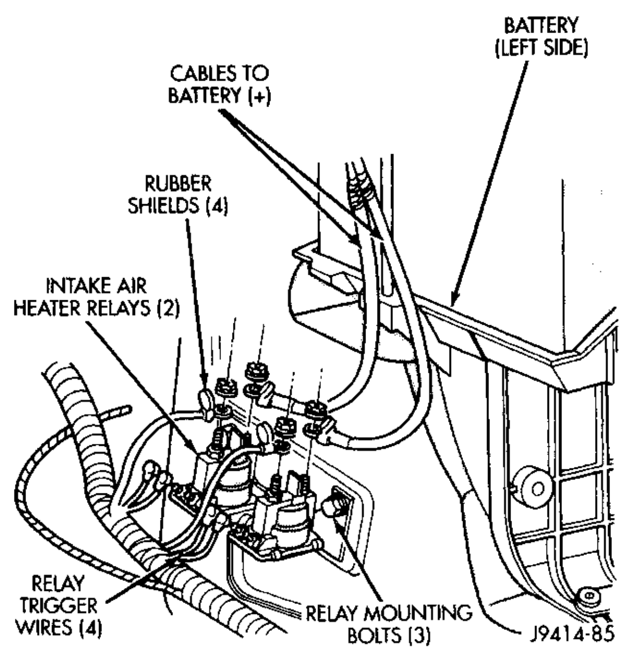

Fig. 31 Intake Manifold Air Heater Relays

INSTALLATION

(1) Install the relay assembly to the inner fender. Tighten mounting bolts to 4.5 N·m (40 in. lbs.) torque.

(2) Connect the eight electrical connectors to the relays.

(3) Connect battery cables to both batteries.

Mopar AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

WATER-IN-FUEL SENSOR

The Water-In-Fuel (WIF) sensor is located at the side of fuel filter/water separator canister. Refer to Fuel Filter/Water Separator Removal/Installation for WIF sensor removal/installation procedures.

STEERING

CONTENTS

POWER STEERING

INDEX

GENERAL INFORMATION

STEERING SYSTEM

The power steering system uses a recirculating-ball type gear. The gear is mounted to the frame rail. The hydraulic pressure for the power steering gear is provided by a P-Series pump. The pump is mounted to the engine and driven by a belt on gasoline engines. On vehicles equipped with a diesel engine the pump is mounted to the back of the vacuum pump. A oil cooler is used on vehicles with the trailer tow option.

AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING

POWER STEERING SYSTEM

STEERING NOISE

There is some noise in all power steering systems. One of the most common is a hissing sound evident at a standstill parking. Or when the steering wheel is at the end of it's travel. Hiss is a high frequency noise similar to that of a water tap being closed slowly. The noise is present in all valves that have a high velocity fluid passing through an orifice. There is no relationship between this noise and steering performance.

CONDITION	POSSIBLE CAUSES	CORRECTION
OBJECTIONAL HISS OR WHISTLE	1. Steering intermediate shaft to dash panel seal. 2. Noisy valve in power steering gear.	1. Check and repair seal at dash panel. 2. Replace steering gear.
RATTLE OR CLUNK	1. Gear mounting bolts loose. 2. Loose or damaged suspension components. 3. Loose or damaged steering linkage. 4. Internal gear noise. 5. Pressure hose in contact with other components.	1. Tighten bolts to specification. 2. Inspect and repair suspension. 3. Inspect and repair steering linkage. 4. Replace gear. 5. Reposition hose.
CHIRP OR SQUEAL	1. Loose belt.	1. Adjust or replace.
WHINE OR GROWL	1. Low fluid level. 2. Pressure hose in contact with other components. 3. Internal pump noise.	1. Fill to proper level. 2. Reposition hose. 3. Replace pump.
SUCKING AIR SOUND	1. Loose return line clamp. 2. O-ring missing or damaged on hose fitting. 3. Low fluid level. 4. Air leak between pump and reservoir.	1. Replace clamp. 2. Replace o-ring. 3. Fill to proper level. 4. Repair as necessary.
SCRUBBING OR KNOCKING	1. Wrong tire size. 2. Wrong gear.	1. Verify tire size. 2. Verify gear.

BINDING AND STICKING

CONDITION	POSSIBLE CAUSE	CORRECTION
DIFFICULT TO TURN WHEEL STICKS OR BINDS	1. Low fluid level. 2. Tire pressure. 3. Steering components (ball joints/tie rod ends). 4. Loose belt. 5. Low pump pressure. 6. Column shaft coupler binding. 7. Steering gear worn or out of adjustment.	1. Fill to proper level. 2. Adjust tire pressure. 3. Lube, inspect and repair as necessary. 4. Adjust or replace. 5. Pressure test and replace if necessary. 6. Replace coupler. 7. Repair or replace gear.

Mopar AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING (Continued)

INSUFFICIENT ASST. OR POOR RETURN TO CENTER

CONDITION	POSSIBLE CAUSE	CORRECTION
HARD TURNING OR MOMENTARY INCREASE IN TURNING EFFORT	1. Tire pressure. 2. Low fluid level. 3. Loose belt. 4. Lack of lubrication. 5. Low pump pressure. 6. Internal gear leak.	1. Adjust tire pressure. 2. Fill to proper level. 3. Adjust or replace. 4. Inspect and lubricate steering and suspension compnents. 5. Pressure test and repair as necessary. 6. Pressure and flow test, and repair as necessary.
STEERING WHEEL DOES NOT WANT TO RETURN TO CENTER POSITION	1. Tire pressure. 2. Wheel alignment. 3. Lack of lubrication. 4. High friction in steering gear.	1. Adjust tire pressure. 2. Align front end. 3. Inspect and lubricate steering and suspension compnents. 4. Test and adjust as necessary.

LOOSE STEERING AND VEHICLE LEAD

CONDITION	POSSIBLE CAUSE	CORRECTION
EXCESSIVE PLAY IN STEERING WHEEL	1. Worn or loose suspension or steering components. 2. Worn or loose wheel bearings. 3. Steering gear mounting. 4. Gear out of adjustment. 5. Worn or loose steering coupler.	1. Inspect and repair as necessary. 2. Inspect and repair or adjust bearings. 3. Tighten gear mounting bolts to specification. 4. Adjust gear to specification. 5. Inspect and replace as necessary.
VEHICLE PULLS OR LEADS TO ONE SIDE.	1. Tire Pressure. 2. Radial tire lead. 3. Brakes dragging. 4. Wheel alignment.	1. Adjust tire pressure. 2. Rotate tires. 3. Repair as necessary. 4. Align front end.

POWER STEERING PUMP

INDEX

DESCRIPTION AND OPERATION

POWER STEERING PUMP

The P-Series pump is used on these vehicles (Fig. 1).

Hydraulic pressure is provided for the power steering gear by the belt driven power steering pump. The power steering pump is a constant flow rate and displacement, vane-type pump.

The pump is connected to the steering gear via the pressure hose and the return hose. The pump shaft has a pressed-on pulley that is belt driven by the crankshaft pulley.

Trailer tow option vehicles are equipped with a power steering pump oil cooler. The oil cooler is mounted to the radiator support.

NOTE: Power steering pumps are not interchangeable with pumps installed on other vehicles.

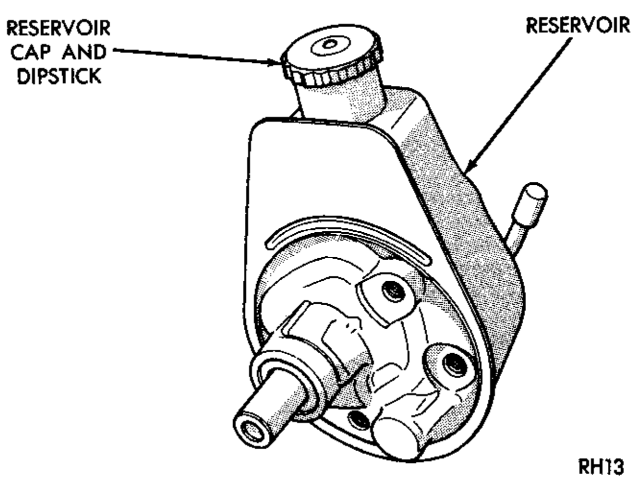

Fig. 1 P-Series—Pump

DIAGNOSIS AND TESTING

PUMP FLOW RATE AND PRESSURE

The following procedure is used to test the operation of the power steering system on the vehicle. This test will provide the flow rate of the power steering pump along with the maximum relief pressure. Perform test any time a power steering system problem is present. This test will determine if the power steering pump or power steering gear is not functioning properly. The following pressure and flow test is performed using Power Steering Analyzer Tool kit 6815 (Fig. 2) and Adapter Kit 6893.

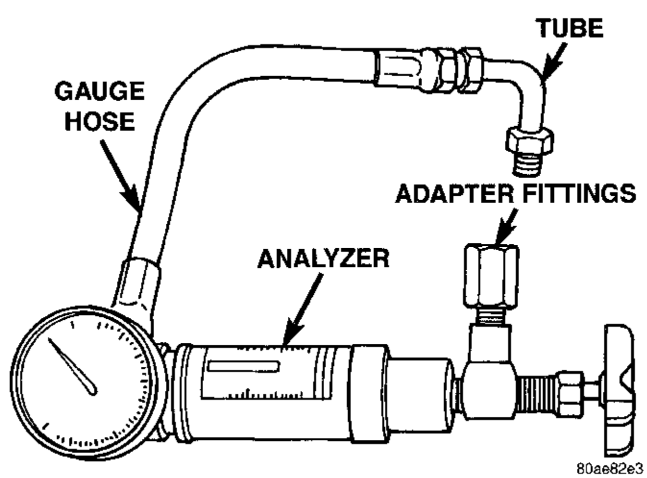

Fig. 2 Pressure Test Gauge

POWER STEERING ANALYZER INSTALLATION

WITHOUT HYDRAULIC BOOSTER

(1) Remove the high pressure hose from the power steering pump.

(2) Connect Tube 6844 into the pump hose fitting.

AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING (Continued)

(3) Connect pressure gauge hose from the Power Steering Analyzer to Tube 6844.

(4) Connect Adapter 6826 to Power Steering Analyzer test valve end.

(5) Connect the power steering hose from the steering gear to Adapter 6826.

WITH HYDRAULIC BOOSTER

(1) Remove high pressure hose which goes to the steering gear from the tube coming out of the booster.

(2) Connect Adapter 6826 to the Power Steering Analyzer pressure gauge hose.

(3) Connect pressure gauge hose to the tube coming out of the booster.

(4) Connect Tube 6844 to the steering gear hose and Power Steering Analyzer test valve end.

FLOW AND PRESSURE TEST

(1) Check belt condition and tension.

(2) Open the test valve completely.

(3) Start engine and let idle long enough to circulate power steering fluid through flow/pressure test gauge and to get air out of the fluid. Then shut off engine.

(4) Check fluid level, add fluid as necessary. Start engine again and let idle.

(5) Gauge should read below 1034 kPa (150 psi), if above, inspect the hoses for restrictions and repair as necessary. The initial pressure reading should be in the range of 345-552 kPa (50-80 psi).

(6) Increase the engine speed to 1500 RPM and read the flow meter. If the flow rate (GPM) is below specification (Refer to pump specification chart for GPM) the pump should be replaced.

CAUTION: The following test procedure involves testing maximum pump pressure output and flow control valve operation. Do not leave valve closed for more than three seconds as the pump could be damaged.

(7) Close valve fully three times and record highest pressure indicated each time. **All three readings must be above specifications and within 345 kPa (50 psi) of each other.**

- Pressures above specifications but not within 345 kPa (50 psi) of each other, replace pump.
- Pressures within 345 kPa (50 psi) of each other but below specifications, replace pump.

(8) Open the test valve and turn the steering wheel to the extreme left and right positions three times against the stops. Record the highest pressure reading at each position. Compare the readings to the pump specifications chart. If pressures readings are not within 50 psi of each other, the gear is leaking internally and must be repaired.

CAUTION: Do not force the pump to operate against the stops for more than 2 to 3 seconds at a time because, pump damage will result.

PUMP SPECIFICATION

ENGINE	RELIEF PRESSURE (P.S.I.)	FLOW (G.P.M.) at 1500 RPM
3.9L	1400 to 1500	2.7 to 3.1
5.2L	1400 to 1500	2.7 to 3.1
5.9L	1400 to 1500	2.7 to 3.1
8.0L	1400 to 1500	2.7 to 3.1
5.9L Diesel	1450 to 1550	3.1 to 3.5
All With Hydraulic Booster	1450 to 1550	3.1 to 3.5

NOTE: After preforming test and removing Power Steering Analyzer, check power steering fluid level.

PUMP LEAKAGE DIAGNOSIS

SERVICE PROCEDURES

POWER STEERING PUMP - INITIAL OPERATION

WARNING: THE FLUID LEVEL SHOULD BE CHECKED WITH ENGINE OFF TO PREVENT INJURY FROM MOVING COMPONENTS.

CAUTION: Use MOPAR Power Steering Fluid or equivalent. Do not use automatic transmission fluid and do not overfill.

Wipe filler cap clean, then check the fluid level. The dipstick should indicate **COLD** when the fluid is at normal temperature.

(1) Fill the pump fluid reservoir to the proper level and let the fluid settle for at least two (2) minutes.

(2) Start the engine and let run for a few seconds then turn engine off.

(3) Add fluid if necessary. Repeat the above procedure until the fluid level remains constant after running the engine.

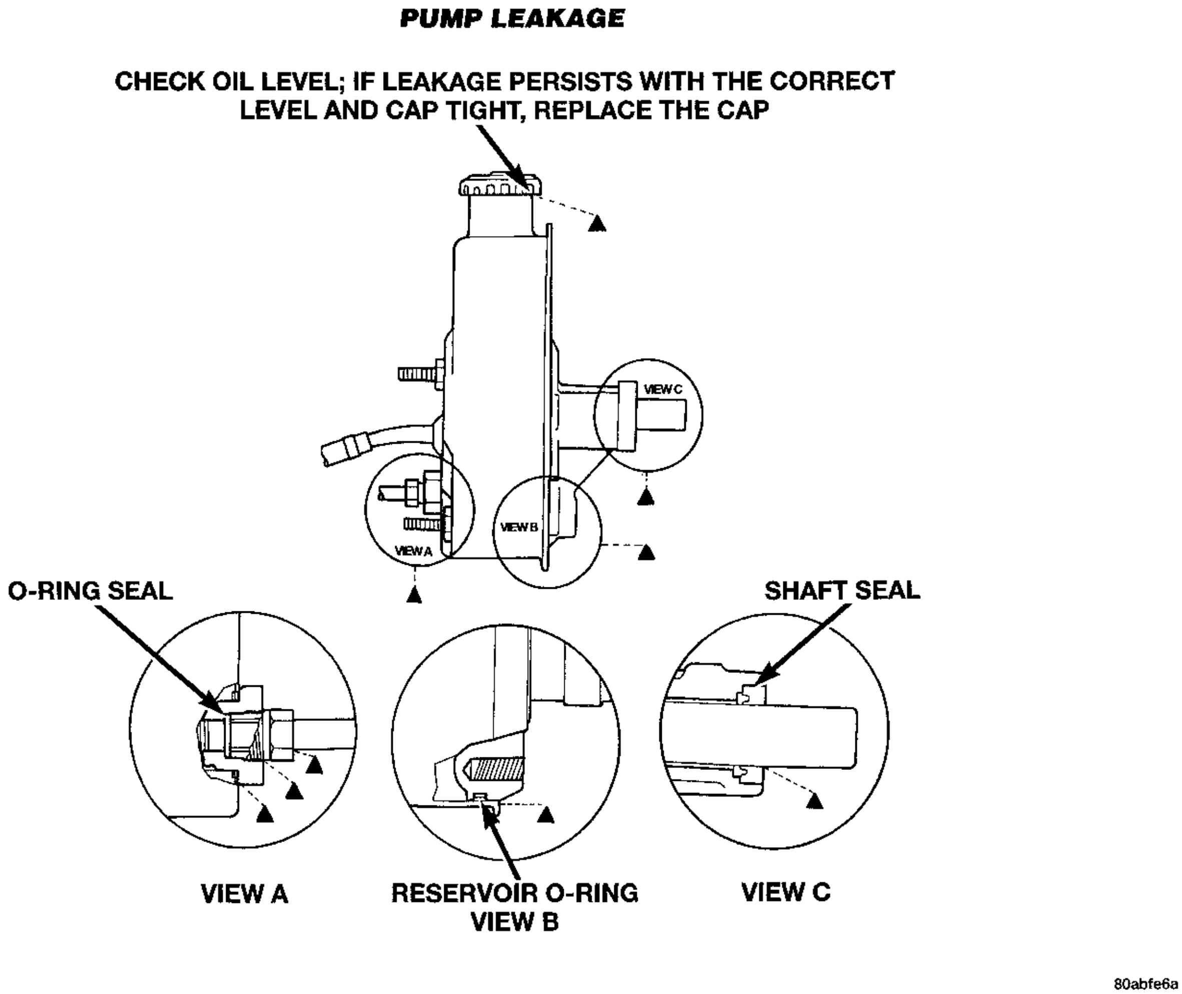
(4) Raise the front wheels off the ground.

(5) Slowly turn the steering wheel right and left, lightly contacting the wheel stops at least 20 times.

(6) Check the fluid level add if necessary.

(7) Lower the vehicle, start the engine and turn the steering wheel slowly from lock to lock.

SERVICE PROCEDURES (Continued)



(8) Stop the engine and check the fluid level and refill as required.

(9) If the fluid is extremely foamy or milky looking, allow the vehicle to stand a few minutes and repeat the procedure.

CAUTION: Do not run a vehicle with foamy fluid for an extended period. This may cause pump damage.

FLUSHING POWER STEERING SYSTEM

Flushing is required when the power steering/hydraulic booster system fluid has become contaminated. Contaminated fluid in the steering/booster system can cause seal deterioration and affect steering gear/booster spool valve operation.

(1) Raise the front end of the vehicle off the ground until the wheels are free to turn.

(2) Remove the return line from the pump.

NOTE: If vehicle is equipped with a hydraulic booster remove both return lines from the pump.

(3) Plug the return line port/ports at the pump.

(4) Position the return line/lines into a large container to catch the fluid.

(5) While an assistant is filling the pump reservoir start the engine.

(6) With the engine running at idle turn the wheel back and forth.

NOTE: Do not contact or hold the wheel against the steering stops.

(7) Run a quart of fluid through the system then stop the engine and install the return line/lines.

(8) Fill the system with fluid and perform Steering Pump Initial Operation.

(9) Start the engine and run it for fifteen minutes then stop the engine.

(10) Remove the return line/lines from the pump and plug the pump port/ports.

(11) Pour fresh fluid into the reservoir and check the draining fluid for contamination. If the fluid is still contaminated, disassemble and clean the steering gear and flush the system again.

(12) Install the return line/lines and perform Steering Pump Initial Operation.

Mopar AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION

POWER STEERING PUMP - GASOLINE ENGINE

WARNING: DO NOT REMOVE THE WATER PUMP COOLANT TUBE UNLESS THE COOLANT SYSTEM HAS BEEN DEPRESSURIZED AND DRAINED.

REMOVAL

(1) Remove the serpentine drive belt, refer to Group 7 Cooling.
(2) Remove the hoses from the power steering pump and cap the fittings.
(3) Remove battery ground cable and unthread stud from cylinder head, do not remove from bracket.
(4) Loosen upper bracket bolt and remove the lower bracket to engine block bolts.
(5) Pivot the pump assembly past the coolant tube.
(6) Remove the upper stud and remove upper bolt from cylinder head.
(7) Remove steering pump and mounting bracket from engine as an assembly.
(8) Remove the pump pulley, to access pump attaching bolts.
(9) Remove the front pump bracket (Fig. 3). On 8.0L engine remove rear pump bracket (Fig. 4).

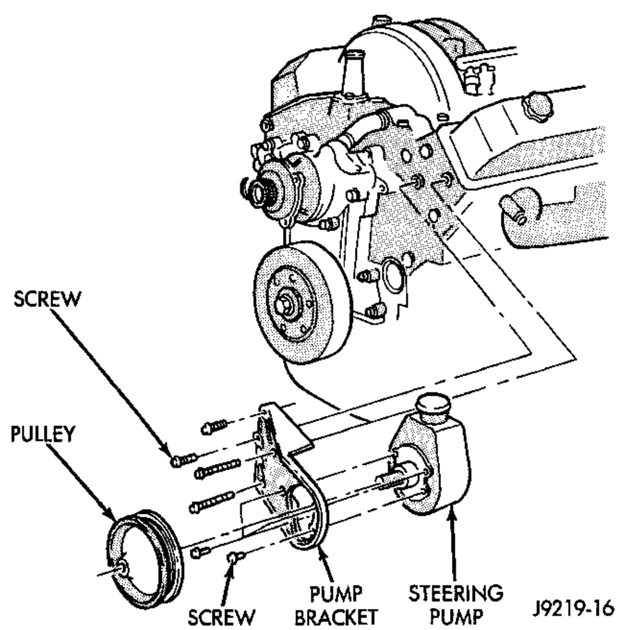


Fig. 3 Pump Mounting 3.9L, 5.2L and 5.9L

INSTALLATION

(1) Install the front pump bracket and tighten bolts to 47 N·m (35 ft. lbs.). On 8.0L engine install rear pump bracket and tighten nut to 47 N·m (35 ft. lbs.), tighten bolts to 24 N·m (18 ft. lbs.).
(2) Install the pump pulley.

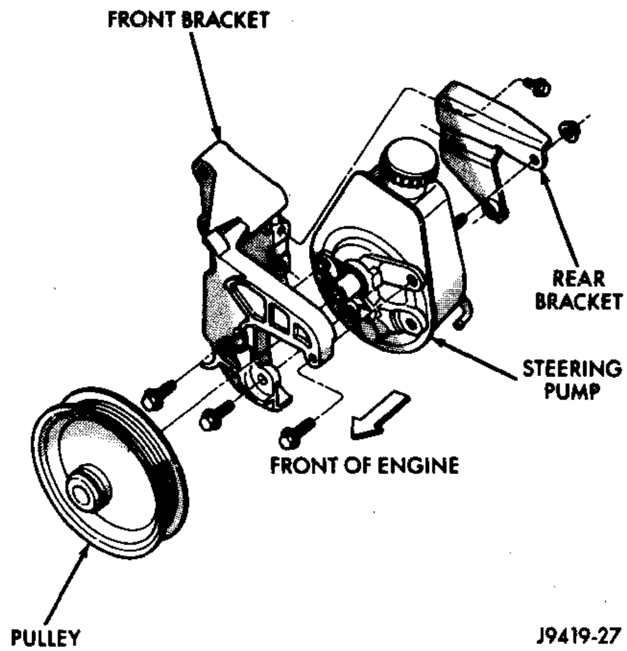

Fig. 4 Pump Mounting 8.0L

(3) Install steering pump assembly on the engine block. Install the upper stud and bolt in bracket.
(4) Pivot the pump down past the coolant tube and install the lower bolts in bracket.
(5) Tighten the bolts and nut to 41 N·m (30 ft. lbs.).
(6) Connect the hoses to the pump.
(7) Install the serpentine drive belt refer to Group 7, Cooling for belt routing.
(8) Fill the reservoir with power steering fluid, refer to Pump Initial Operation.

POWER STEERING PUMP—DIESEL ENGINE

REMOVAL

(1) Remove and cap steering pump hoses and vacuum pump vacuum line.
(2) Remove the sender unit from engine block and plug hole in block (Fig. 5).
(3) Remove and cap the oil feed line from the bottom of the vacuum pump (Fig. 6).
(4) Remove the lower bolt that attaches the vacuum/steering pump assembly to the engine block. Remove the nut from the steering pump attaching bracket (Fig. 6).
(5) Remove upper bolt from the pump assembly (Fig. 7) and remove the assembly.
(6) Remove the mounting gasket.
(7) Remove the steering pump to vacuum pump bracket attaching nuts (Fig. 8).
(8) Slide the steering pump from the bracket. Use care not to damage the internal oil seal in the vacuum pump (Fig. 9).

REMOVAL AND INSTALLATION (Continued)

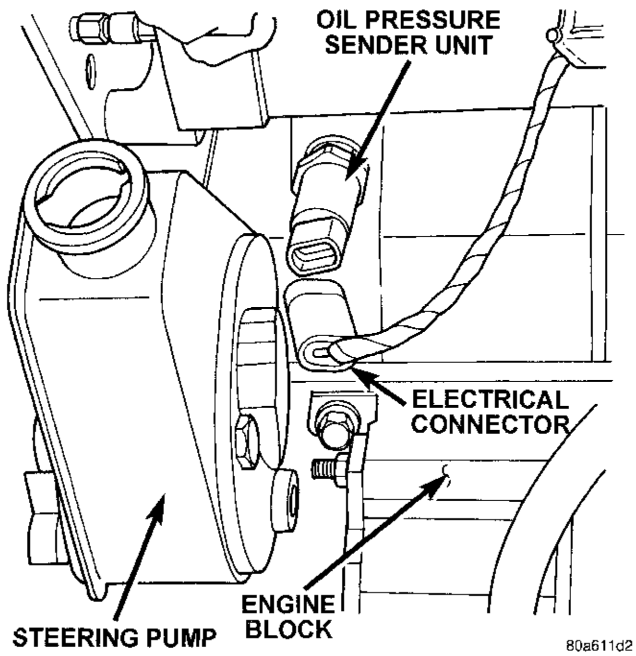

Fig. 5 Oil Pressure Sending Unit

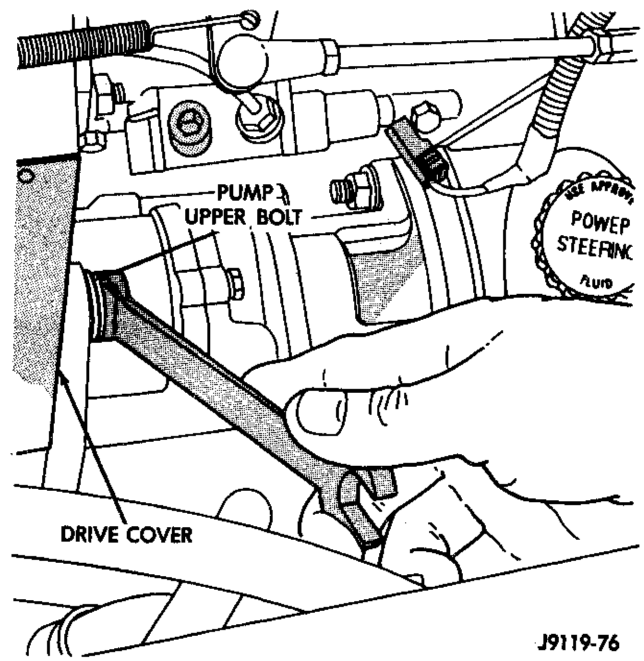

Fig. 7 Pump Assembly Upper Bolt

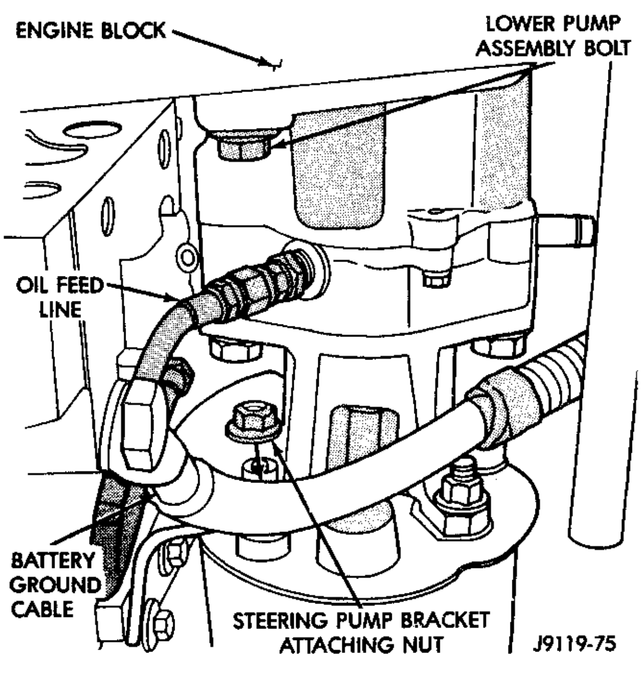

Fig. 6 Oil Feed Line

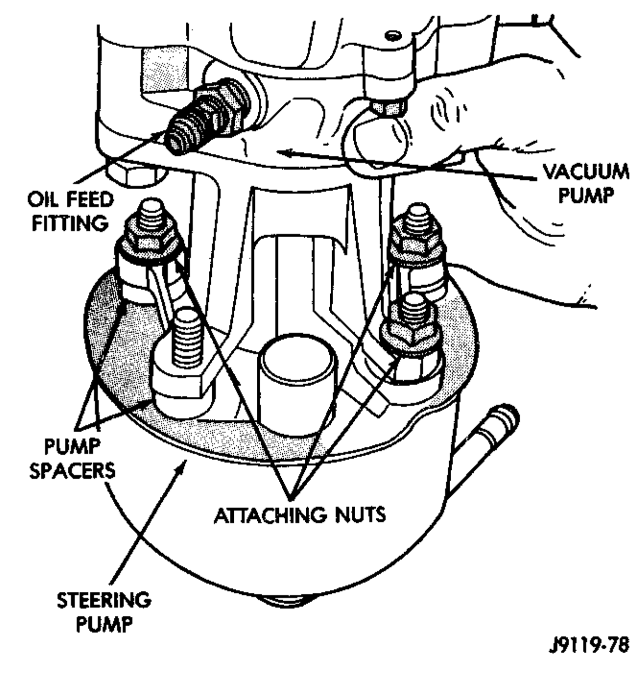

Fig. 8 Bracket Mounting Nuts

(9) Remove the two pump body spacers.

INSTALLATION

(1) Install the two pump body spacers.

(2) Rotate the drive gear until the steering pump and vacuum pump drive dogs align. Install the steering pump onto the vacuum pump bracket. Use care to avoid damaging the oil seal in the vacuum pump during installation. **The steering pump housing and spacers must mate completely with the vacuum pump bracket.**

(3) Install the vacuum pump bracket to steering pump nuts and tighten to 24 N·m (18 ft. lbs.).

(4) Position new gasket on vacuum pump assembly. Use sealer if necessary to retain the gasket.

(5) Align and install the pump assembly on the engine. Ensure the steering pump stud is inserted

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

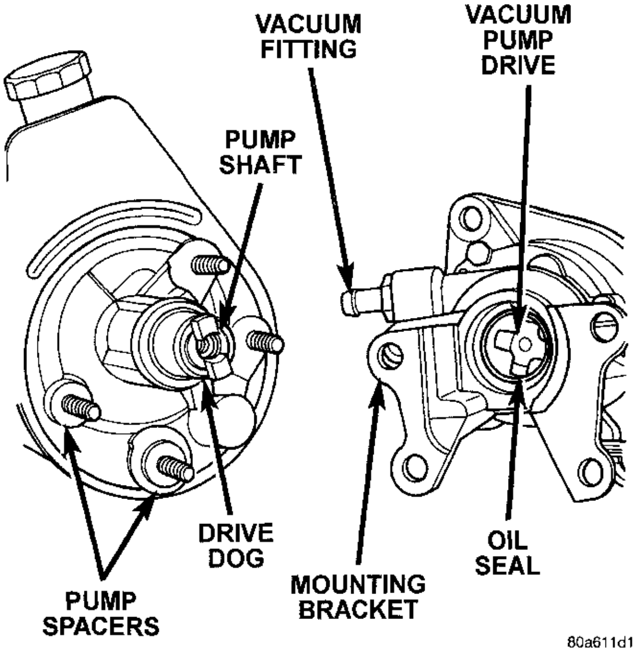

Fig. 9 Steering Pump & Vacuum Pump

into the block bracket. Tighten the pump- to-engine block attaching bolts to 77 N·m (57 ft. lbs.).

(6) Install the steering pump to attaching bracket nut and tighten to 24 N·m (18 ft. lbs.).

(7) Remove plug and install the oil pressure sending unit and electrical connector.

(8) Install the oil feed line to the vacuum pump. Tighten the oil line connection to 7 N·m (60 in. lbs./ 5 ft. lbs.).

(9) Install the fluid hoses to the power steering pump. Tighten the pressure fitting at the pump to 31 N·m (23 ft. lbs.).

(10) Install and clamp the hose on the vacuum pump.

(11) Fill the reservoir with power steering fluid, refer to Pump Initial Operation.

(12) Start the engine and check the operation of the brakes.

DISASSEMBLY AND ASSEMBLY

PUMP PULLEY

DISASSEMBLY

(1) Remove pump assembly.

(2) Remove pulley from pump with Puller C-4333 (Fig. 10).

ASSEMBLY

(1) Replace pulley if bent, cracked, or loose.

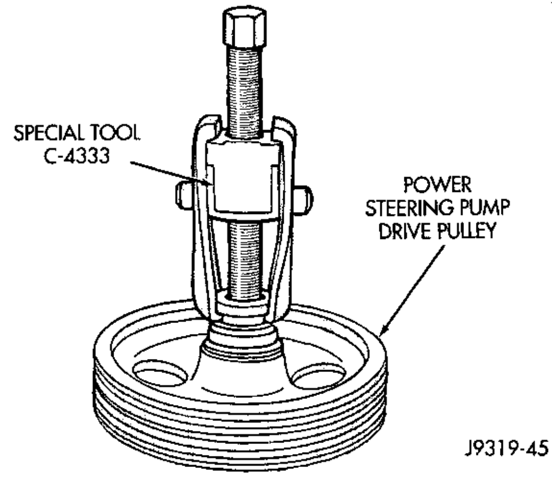

Fig. 10 Pulley Removal

(2) Install pulley on pump with Installer C-4063-B (Fig. 11) flush with the end of the shaft. Ensure the tool and pulley remain aligned with the pump shaft.

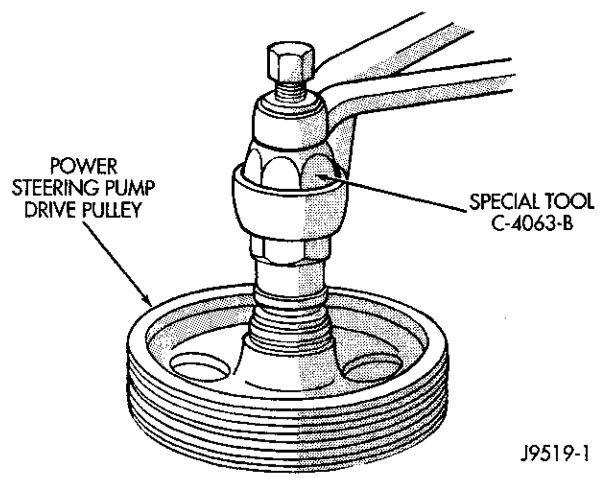

Fig. 11 Pulley Installation

(3) Install pump assembly.

(4) With Serpentine Belts; Run engine until warm (5 min.) and note any belt chirp. If chirp exists, move pulley outward approximately 0.5 mm (0.020 in.). If noise increases, press on 1.0 mm (0.040 in.). **Be careful that pulley does not contact mounting bolts.**

POWER STEERING GEAR

INDEX

DESCRIPTION AND OPERATION

POWER STEERING GEAR

The power steering gear is a recirculating ball type gear (Fig. 1). The gear acts as a rolling thread between the worm shaft and rack piston. The worm shaft is supported by a thrust bearing at the lower end and a bearing assembly at the upper end. When the worm shaft is turned the rack piston moves. The rack piston teeth mesh with the pitman shaft. Turning the worm shaft turns the pitman shaft, which turns the steering linkage.

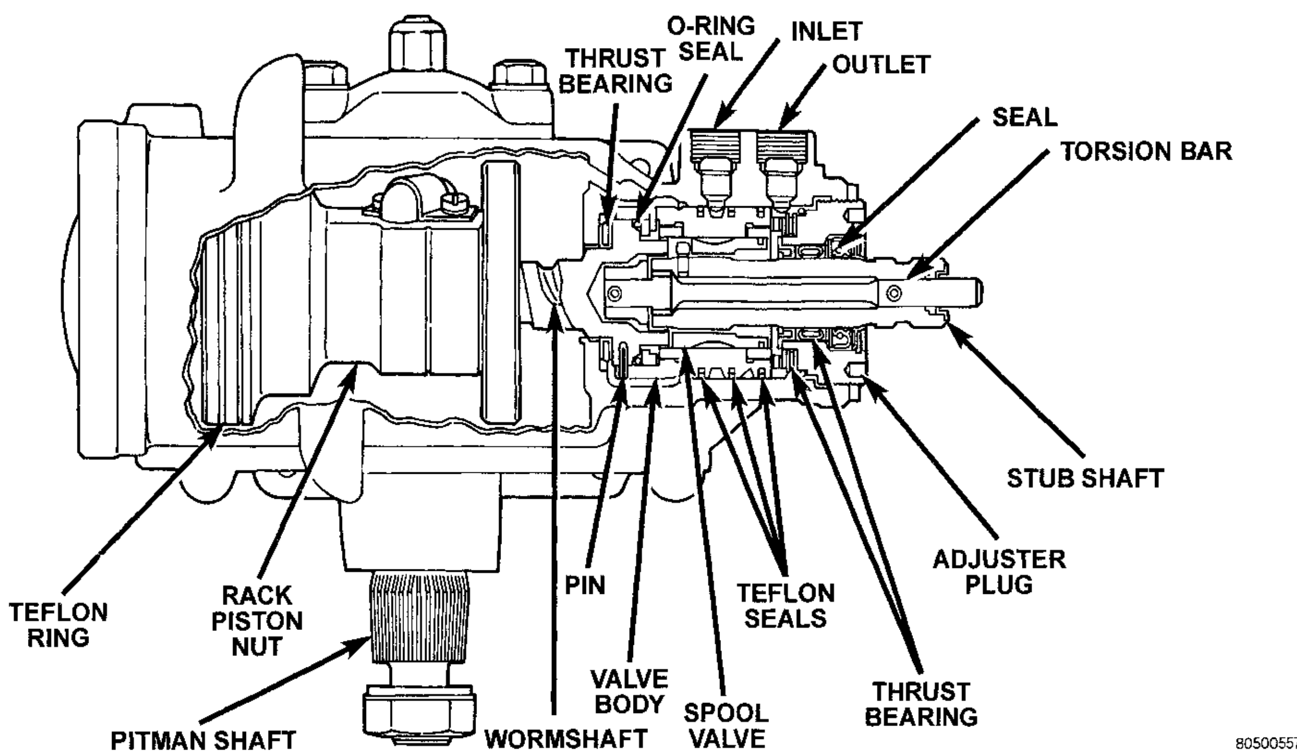

Fig. 1 Power Steering Gear

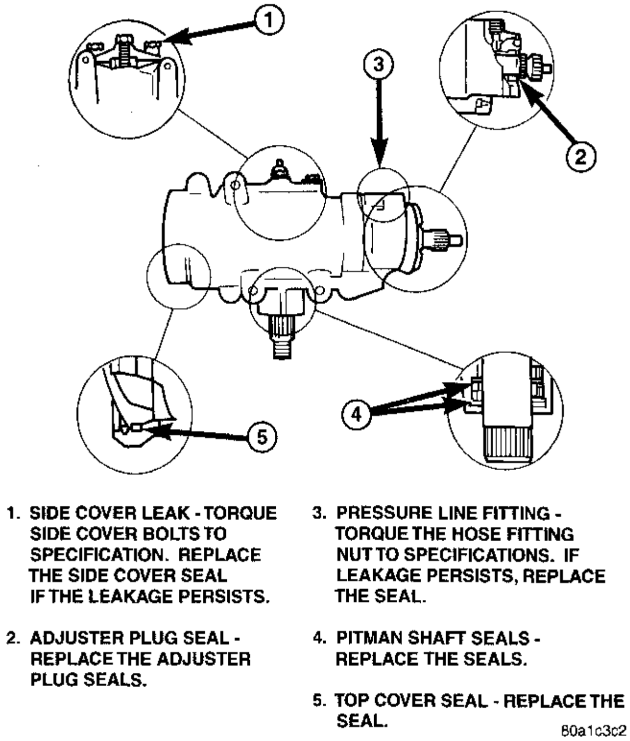
DIAGNOSIS AND TESTING

POWER STEERING GEAR LEAKAGE DIAGNOSIS



REMOVAL AND INSTALLATION

POWER STEERING GEAR

REMOVAL

(1) Place the front wheels in a straight-ahead position.

(2) Disconnect and cap the fluid hoses from steering gear.

(3) Remove coupler pinch bolt at the steering gear and slide shaft off gear (Fig. 2).

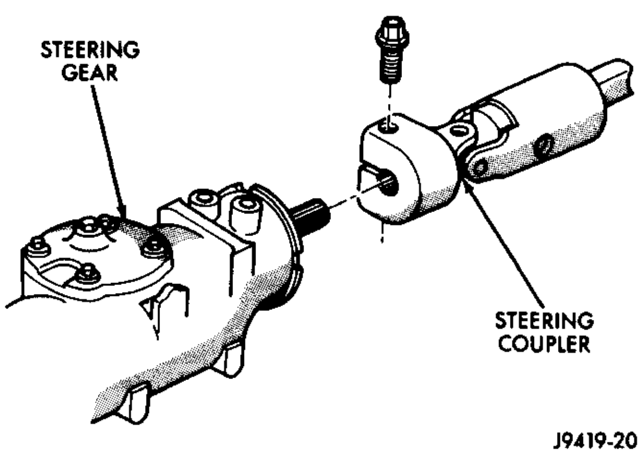


Fig. 2 Column Shaft

(4) Mark the pitman shaft and pitman arm for installation reference. Remove the pitman arm from the shaft with Puller C-4150A (Fig. 3).

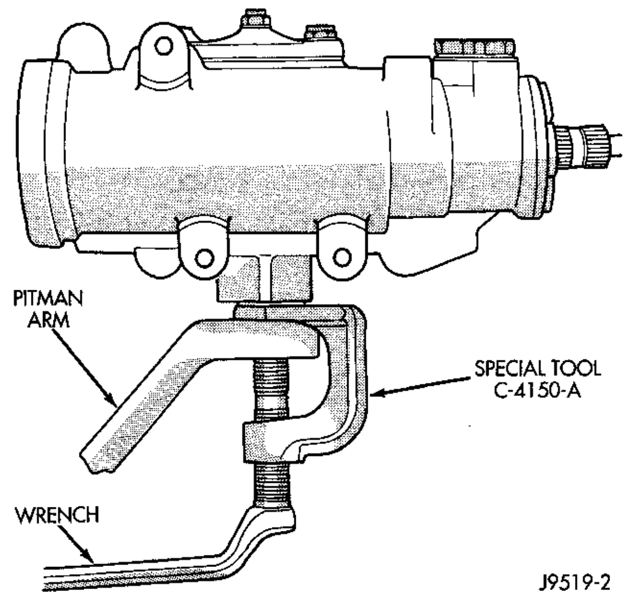

Fig. 3 Pitman Arm

(5) Remove steering gear retaining bolts and nuts. Remove the steering gear from the vehicle.

INSTALLATION

(1) Position the steering gear on the frame rail and install the bolts. Tighten mounting bolts to specifications.

(2) Align steering coupler on gear shaft. Install pinch bolt and tighten to 49 N·m (36 ft. lbs.) torque.

(3) Align and install the pitman arm.

(4) Install the washer and retaining nut on the pitman shaft. Tighten the nut to 251 N·m (185 ft. lbs.).

(5) Connect fluid hoses to steering gear, tighten to 31 N·m (23 ft. lbs.). Add fluid, refer to Power Steering Pump Initial Operation.

DISASSEMBLY AND ASSEMBLY

HOUSING END PLUG

DISASSEMBLY

(1) Unseat and remove retaining ring from groove with a punch through the hole in the end of the housing (Fig. 4).

(2) Slowly rotate stub shaft with 12 point socket COUNTER-CLOCKWISE to force the end plug out from housing.

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

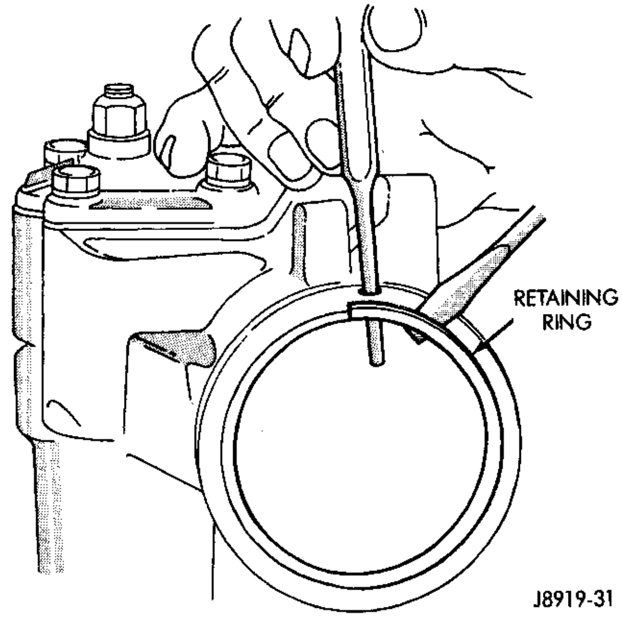

Fig. 4 End Plug Retaining Ring

CAUTION: Do not turn stub shaft any further than necessary. The rack piston balls will drop out of the rack piston circuit if the stub shaft is turned too far.

(3) Remove O-ring from the housing (Fig. 5).

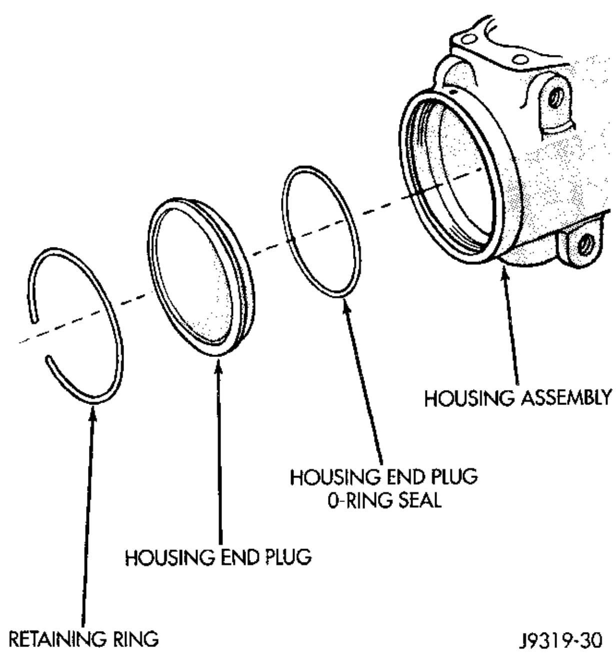

Fig. 5 End Plug Components

ASSEMBLY

(1) Lubricate O-ring with power steering fluid and install into the housing.

(2) Install end plug by tapping the plug lightly with a plastic mallet into the housing.

(3) Install retaining ring so one end of the ring covers the housing access hole (Fig. 6).

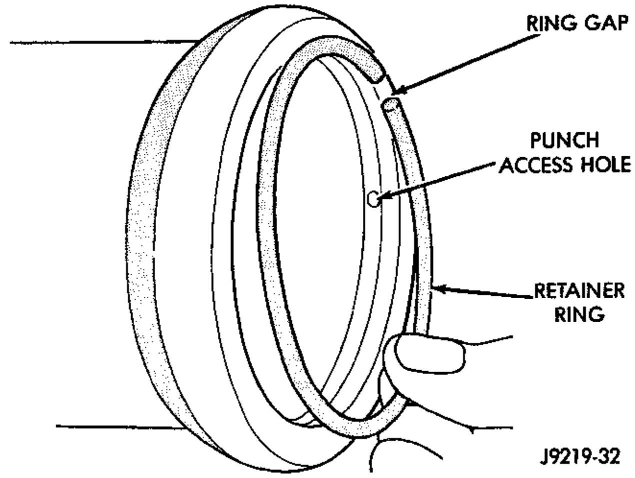

Fig. 6 Installing The Retaining Ring

PITMAN SHAFT/SEALS/BEARING

DISASSEMBLY

(1) Clean exposed end of pitman shaft and housing with a wire brush.

(2) Remove preload adjuster nut (Fig. 7).

(3) Rotate the stub shaft with a 12 point socket from stop to stop and count the number of turns.

(4) Center the stub shaft by rotating it from the stop 1/2 of the total amount of turns.

(5) Remove side cover bolts and remove side cover, gasket and pitman shaft as an assembly (Fig. 7).

NOTE: The pitman shaft will not clear the housing if it is not centered.

(6) Remove pitman shaft from the side cover.

(7) Remove dust seal from the housing with a seal pick (Fig. 8).

CAUTION: Use care not to score the housing bore when prying out seals and washer.

(8) Remove retaining ring with snap ring pliers.

(9) Remove washer from the housing.

(10) Remove oil seal from the housing with a seal pick.

(11) Remove pitman shaft bearing from housing with a bearing driver and handle (Fig. 9).

ASSEMBLY

(1) Install pitman shaft bearing into housing with a bearing driver and handle.

(2) Coat the oil seals and washer with grease.

(3) Install the oil seal with a driver and handle.

(4) Install backup washer.

(5) Install the retainer ring with snap ring pliers.

AUTHENTIC RESTORATION

DISASSEMBLY AND ASSEMBLY (Continued)

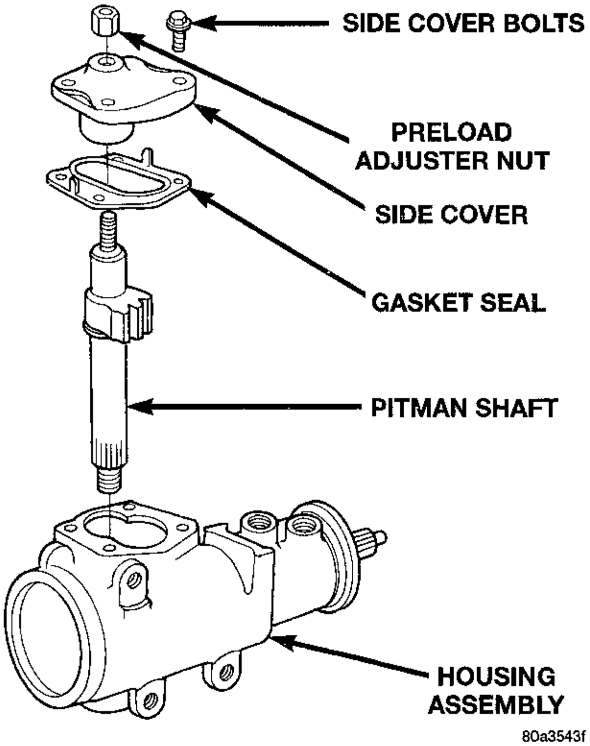

Fig. 7 Side Cover and Pitman Shaft

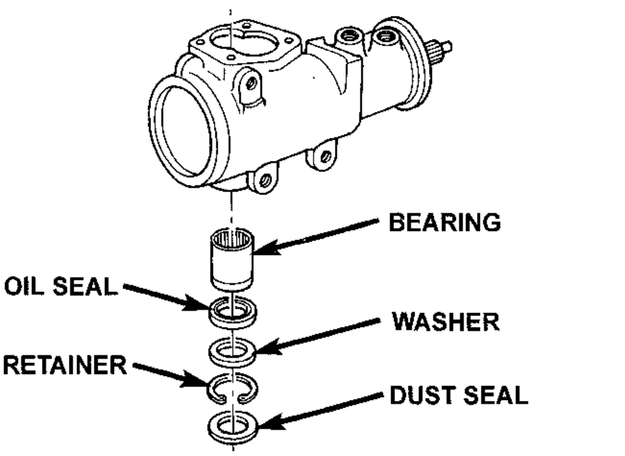

Fig. 8 Pitman Shaft Seals & Bearing

(6) Install dust seal with a driver and handle.

(7) Install pitman shaft to side cover by screwing shaft in until it fully seats to side cover.

(8) Install preload adjuster nut. **Do not tighten nut until after Over-Center Rotation Torque adjustment has been made.**

(9) Install gasket to side cover and bend tabs around edges of side cover (Fig. 7).

(10) Install pitman shaft assembly and side cover to housing.

(11) Install side cover bolts and tighten to 60 N·m (44 ft. lbs.).

(12) Adjust Over-Center Rotation Torque.

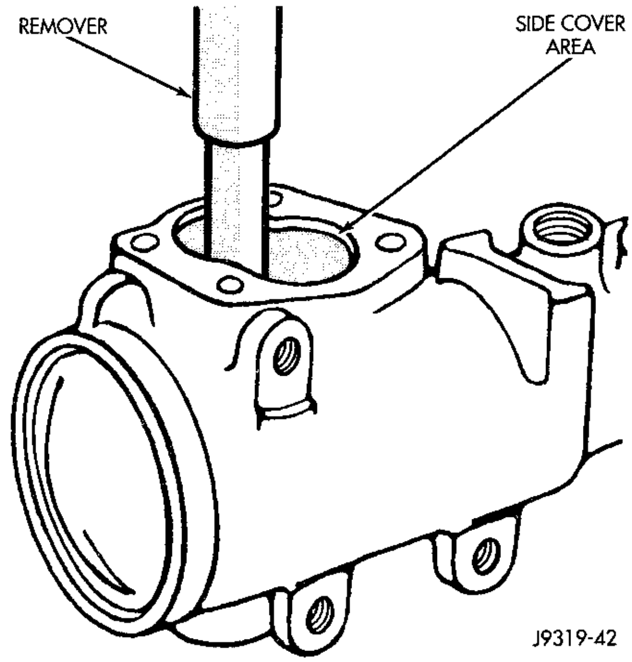

Fig. 9 Needle Bearing Removal

SPOOL VALVE

DISASSEMBLY

(1) Remove lock nut (Fig. 10).

(2) Remove adjuster nut with Spanner Wrench C-4381.

(3) Remove thrust support assembly out of the housing (Fig. 11).

(4) Pull stub shaft and valve assembly from the housing (Fig. 12).

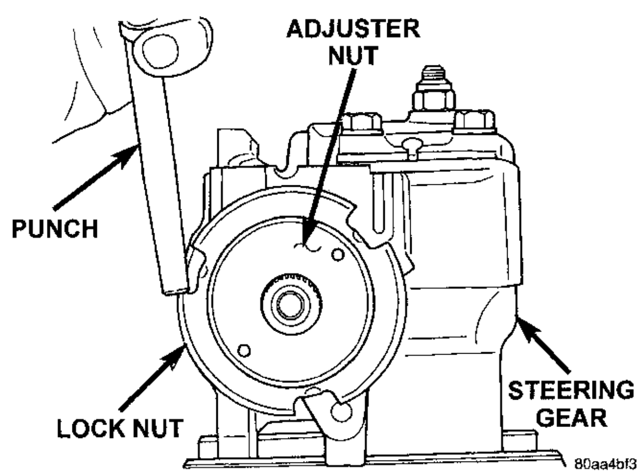

Fig. 10 Lock Nut and Adjuster Nut

(5) Remove stub shaft from valve assembly by lightly tapping shaft on a block of wood to loosen shaft. Then disengage stub shaft pin from hole in spool valve and separate the valve assembly from stub shaft (Fig. 13).

DISASSEMBLY AND ASSEMBLY (Continued)

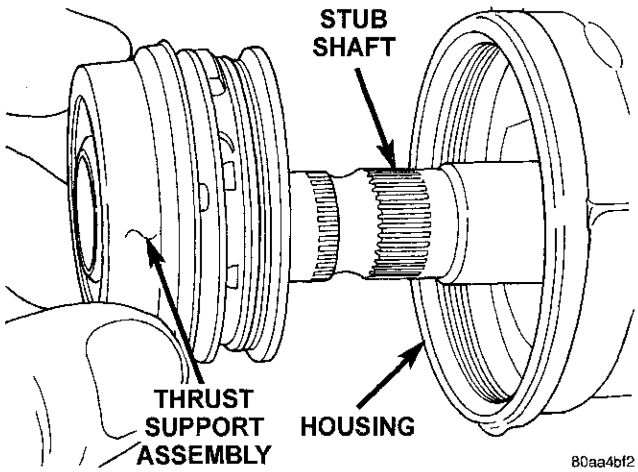

Fig. 11 Thrust Support Assembly

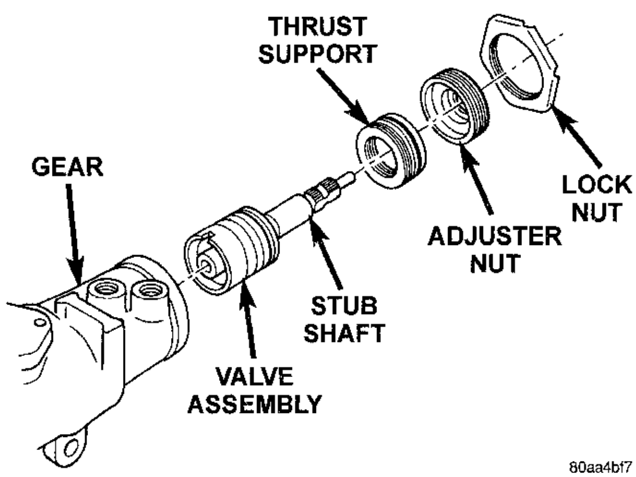

Fig. 12 Valve Assembly With Stub Shaft

(6) Remove spool valve from valve body by pulling and rotating the spool valve from the valve body (Fig. 14).

(7) Remove spool valve O-ring and valve body teflon rings and O-rings underneath the teflon rings (Fig. 15).

(8) Remove the O-ring between the worm shaft and the stub shaft.

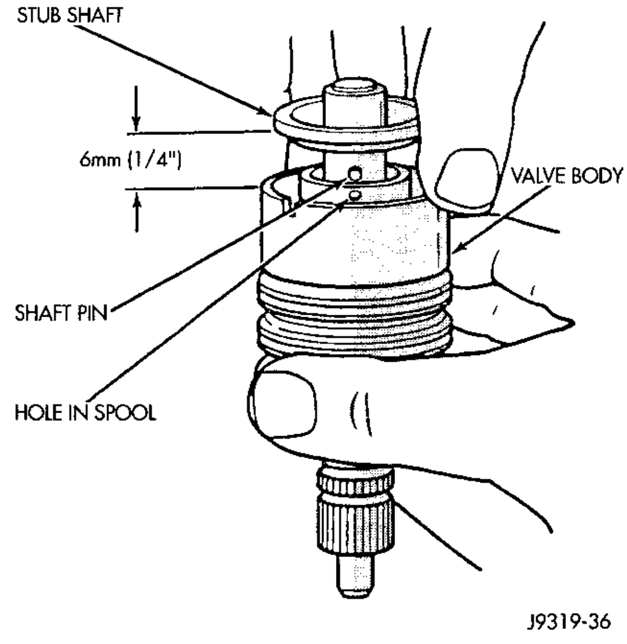

Fig. 13 Stub Shaft

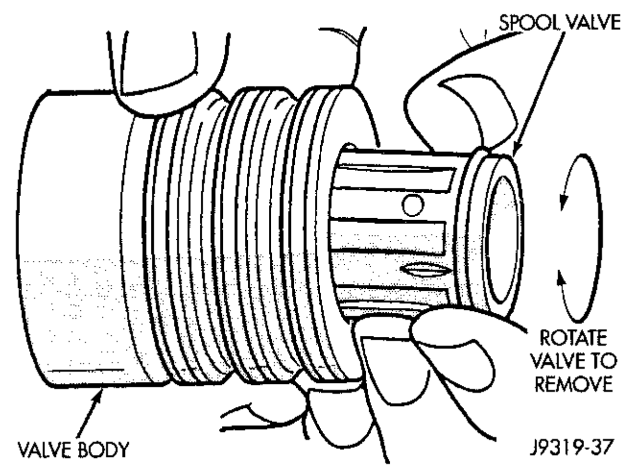

Fig. 14 Spool Valve

NOTE: Notch in stub shaft cap must fully engage valve body pin and seat against valve body shoulder.

ASSEMBLY

NOTE: Clean and dry all components, then lubricate with power steering fluid.

(1) Install spool valve spool O-ring.

(2) Install spool valve in valve body by pushing and rotating. Hole in spool valve for stub shaft pin must be accessible from opposite end of valve body.

(3) Install stub shaft in valve spool and engage locating pin on stub shaft into spool valve hole (Fig. 16).

(4) Install O-rings and teflon rings over the O-rings on valve body.

(5) Install O-ring into the back of the stub shaft cap (Fig. 17).

(6) Install stub shaft and valve assembly in the housing. Line up worm shaft to slots in the valve assembly.

(7) Install thrust support assembly.

NOTE: The thrust support is serviced as an assembly. If any component of the thrust support is damaged the assembly must be replaced.

DISASSEMBLY AND ASSEMBLY (Continued)

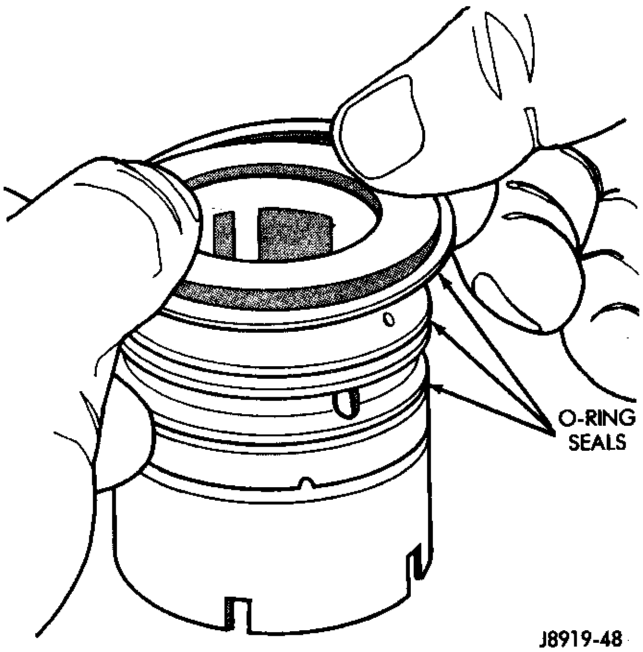

Fig. 15 Valve Seals

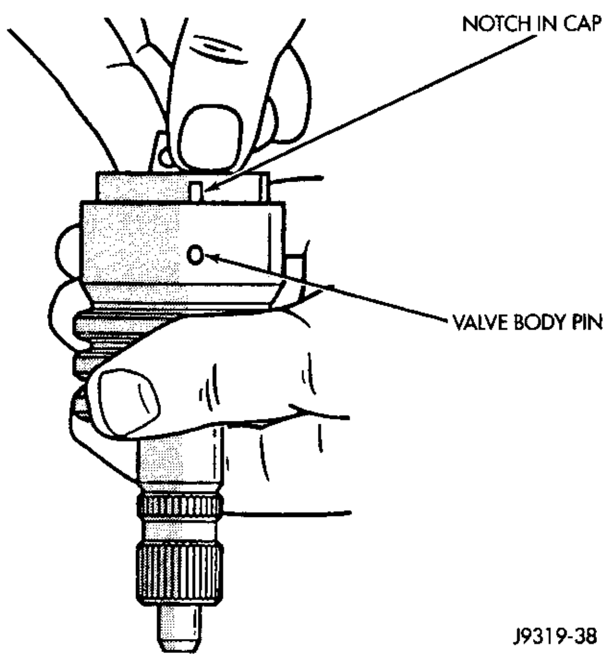

Fig. 16 Stub Shaft Installation

(8) Install adjuster nut and lock nut.

(9) Adjust Thrust Bearing Preload and Over-Center Rotating Torque.

RACK PISTON AND WORM SHAFT

DISASSEMBLY

(1) Remove housing end plug.

(2) Remove rack piston plug (Fig. 18).

(3) Remove side cover and pitman shaft.

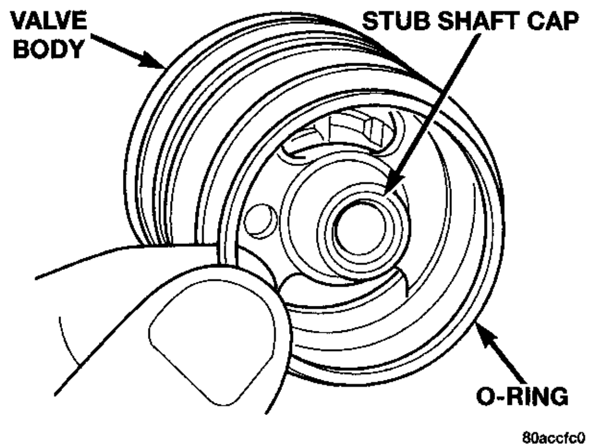

Fig. 17 Stub Shaft Cap O-Ring

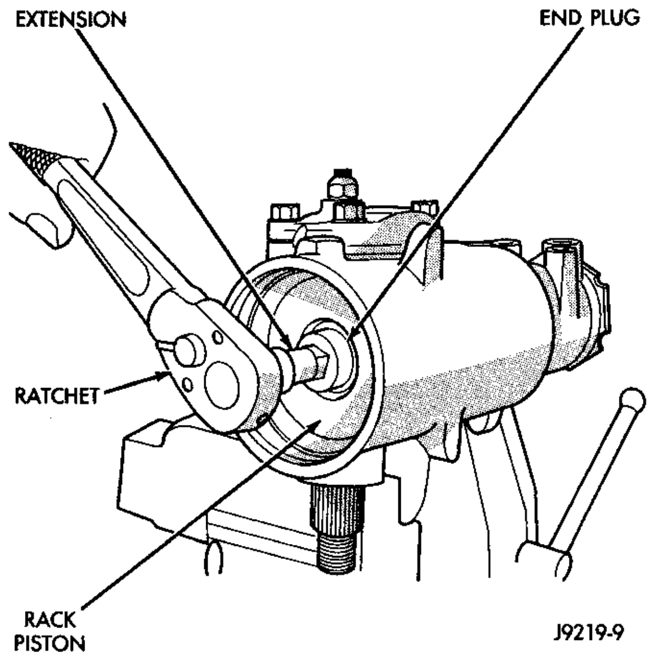

Fig. 18 Rack Piston End Plug

(4) Turn stub shaft COUNTERCLOCKWISE until the rack piston begins to come out of the housing.

(5) Insert Arbor C-4175 into bore of rack piston (Fig. 19) and hold tool tightly against worm shaft.

(6) Turn the stub shaft with a 12 point socket COUNTERCLOCKWISE, this will force the rack piston onto the tool and hold the rack piston balls in place.

(7) Remove the rack piston and tool together from housing.

(8) Remove tool from rack piston.

(9) Remove rack piston balls.

(10) Remove clamp bolts, clamp and ball guide (Fig. 20).

(11) Remove teflon ring and O-ring from the rack piston (Fig. 21).

DISASSEMBLY AND ASSEMBLY (Continued)

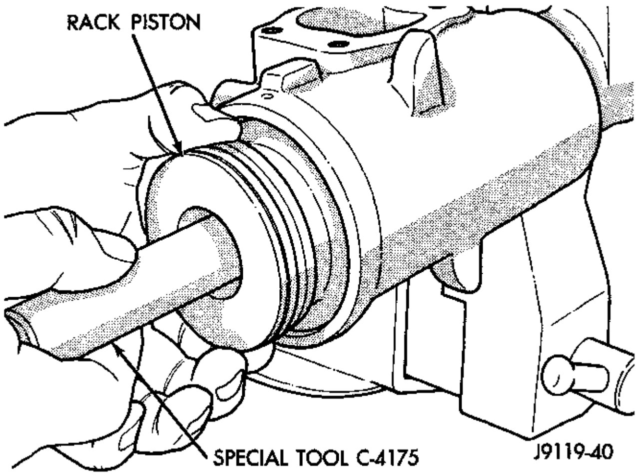

Fig. 19 Rack Piston with Arbor

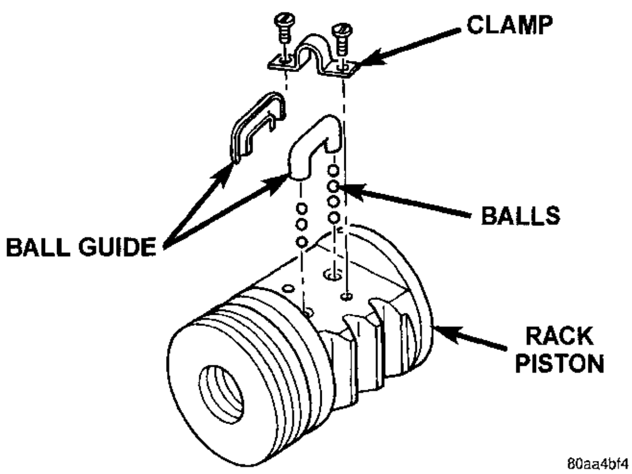

Fig. 20 Rack Piston

(12) Remove the adjuster lock nut and adjuster nut from the stub shaft.

(13) Pull the stub shaft with the spool valve and thrust support assembly out of the housing.

(14) Remove the worm shaft from the housing (Fig. 22).

ASSEMBLY

NOTE: Clean and dry all components and lubricate with power steering fluid.

(1) Check for scores, nicks or burrs on the rack piston finished surface. Slight wear is normal on the worm gear surfaces.

(2) Install O-ring and teflon ring on the rack piston.

(3) Install worm shaft in the rack piston and align worm shaft spiral groove with rack piston ball guide hole (Fig. 23).

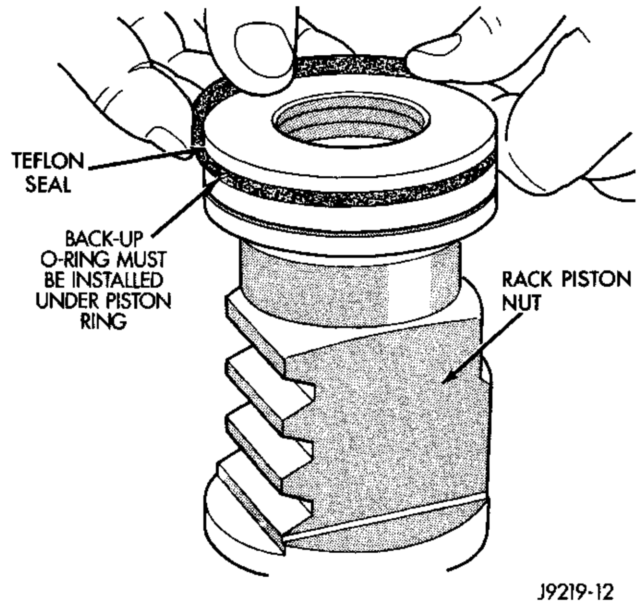

Fig. 21 Rack Piston Teflon Ring and O-Ring

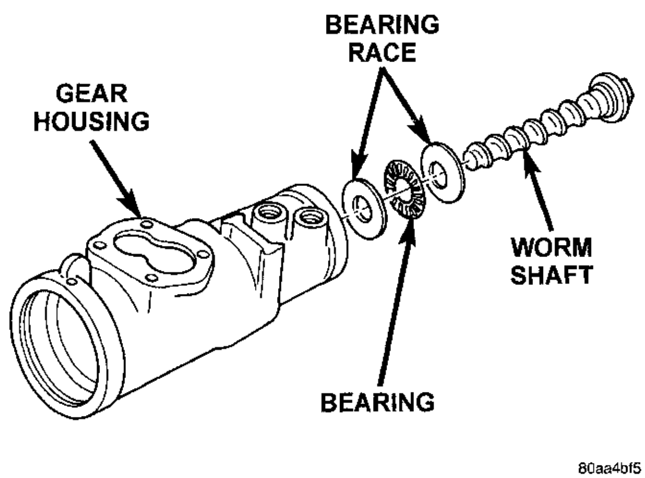

Fig. 22 Worm Shaft

CAUTION: The rack piston balls must be installed alternately into the rack piston and ball guide. This maintains worm shaft preload. There are 12 black balls and 12 silver (Chrome) balls. The black balls are smaller than the silver balls.

(4) Lubricate and install rack piston balls through return guide hole while turning worm shaft COUNTERCLOCKWISE (Fig. 23).

(5) Install remaining balls in guide using grease to hold the balls in place (Fig. 24).

(6) Install the guide onto rack piston and install clamp and clamp bolts. Tighten bolts to 58 N·m (43 ft. lbs.).

(7) Insert Arbor C-4175 into bore of rack piston and hold tool tightly against worm shaft.

DISASSEMBLY AND ASSEMBLY (Continued)

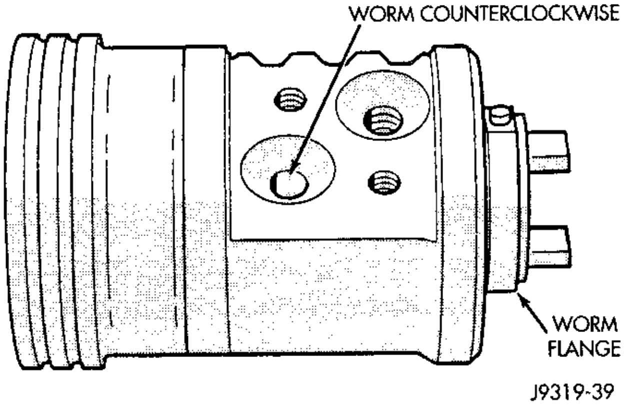

Fig. 23 Installing Balls in Rack Piston

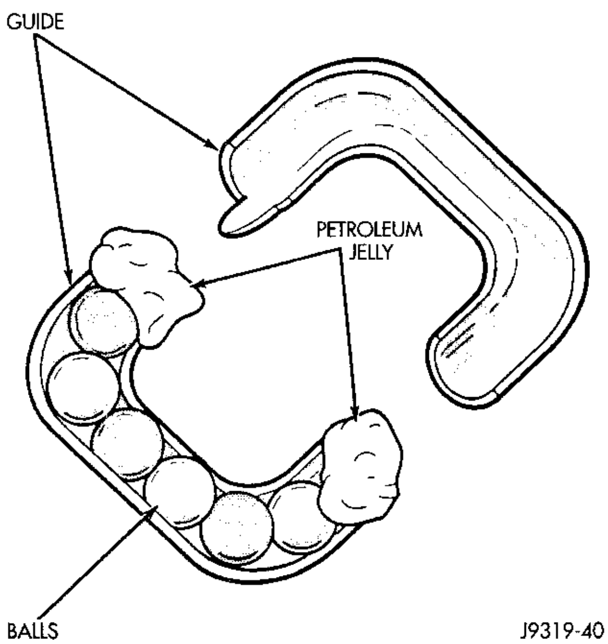

Fig. 24 Balls in the Return Guide

(8) Turn the worm shaft COUNTERCLOCKWISE while pushing on the arbor. This will force the rack piston onto the arbor and hold the rack piston balls in place.

(9) Install the races and thrust bearing on the worm shaft and install shaft in the housing (Fig. 22).

(10) Install the stub shaft with spool valve, thrust support assembly and adjuster nut in the housing.

(11) Install the rack piston and arbor tool into the housing.

(12) Hold arbor tightly against worm shaft and turn stub shaft CLOCKWISE until rack piston is seated on worm shaft.

(13) Install pitman shaft and side cover in the housing.

(14) Install rack piston plug and tighten to 150 N·m (111 ft. lbs.).

(15) Install housing end plug.

(16) Adjust worm shaft thrust bearing preload and over-center rotating torque.

ADJUSTMENTS

STEERING GEAR

CAUTION: Steering gear must be adjusted in the proper order. If adjustments are not performed in order, gear damage and improper steering response may result.

NOTE: Adjusting the steering gear in the vehicle is not recommended. Remove gear from the vehicle and drain the fluid. Then mount gear in a vise to perform adjustments.

WORM THRUST BEARING PRELOAD

(1) Mount the gear carefully into a vise.

CAUTION: Do not overtighten the vise on the gear case. This may affect the adjustment

(2) Remove adjuster plug locknut (Fig. 25).

(3) Rotate the stub shaft back and forth with a 12 point socket to drain the remaining fluid.

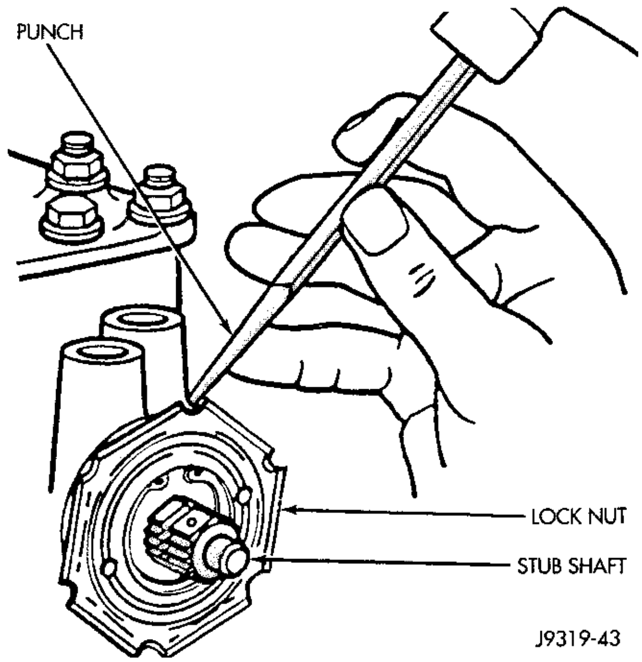

Fig. 25 Loosening the Adjuster Plug

(4) Turn the adjuster in with Spanner Wrench C-4381. Tighten the plug and thrust bearing in the

ADJUSTMENTS (Continued)

housing until firmly bottomed in the housing about 34 N·m (25 ft. lbs.).

(5) Place an index mark on the housing even with one of the holes in adjuster plug (Fig. 26).

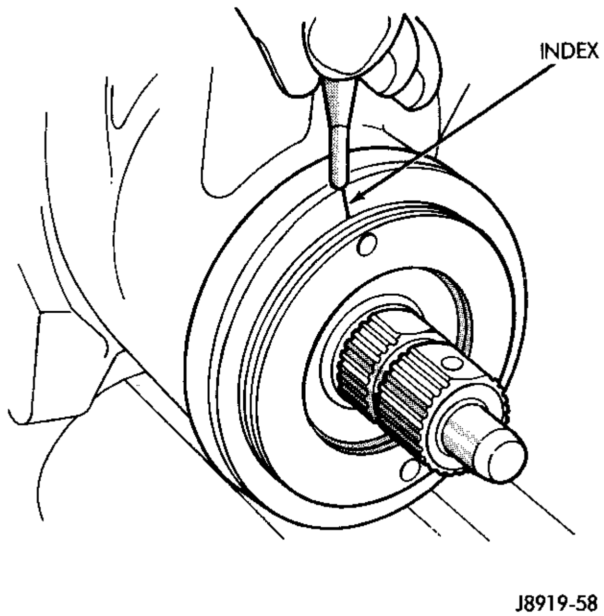

Fig. 26 Alignment Marking On Housing

(6) Measure back (counterclockwise) 10 mm (0.40 in) and mark housing (Fig. 27).

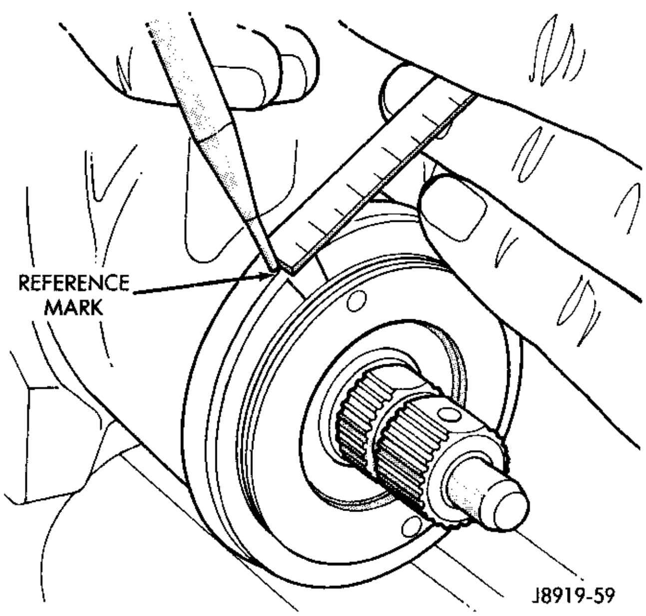

Fig. 27 Second Marking On Housing

(7) Rotate adjustment cap back (counterclockwise) with spanner wrench until hole is aligned with the second mark (Fig. 28).

(8) Install and tighten locknut to 108 N·m (80 ft. lbs.). Be sure adjustment cap does not turn while tightening the locknut.

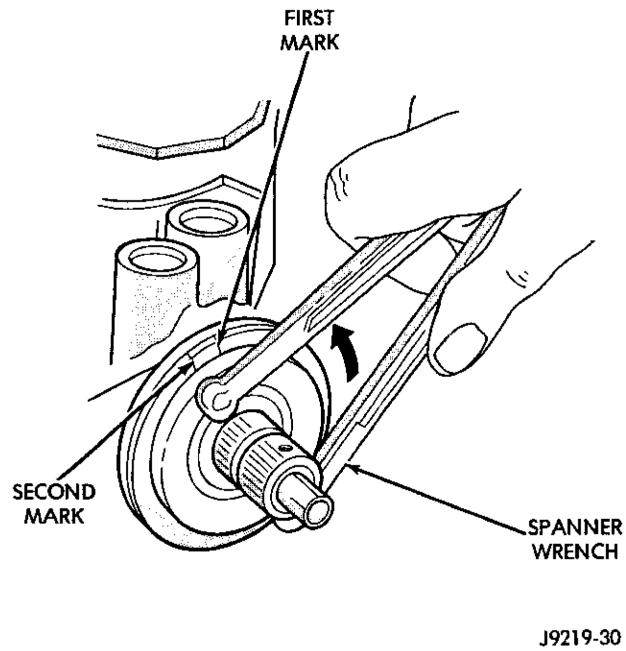

Fig. 28 Aligning To The Second Mark

OVER-CENTER

NOTE: Before performing this procedure, the worm bearing preload adjustment must be performed.

(1) Rotate the stub shaft with a 12 point socket from stop to stop and count the number of turns.

(2) Starting at either stop, turn the stub shaft back 1/2 the total number of turns. This is the center of the gear travel (Fig. 29).

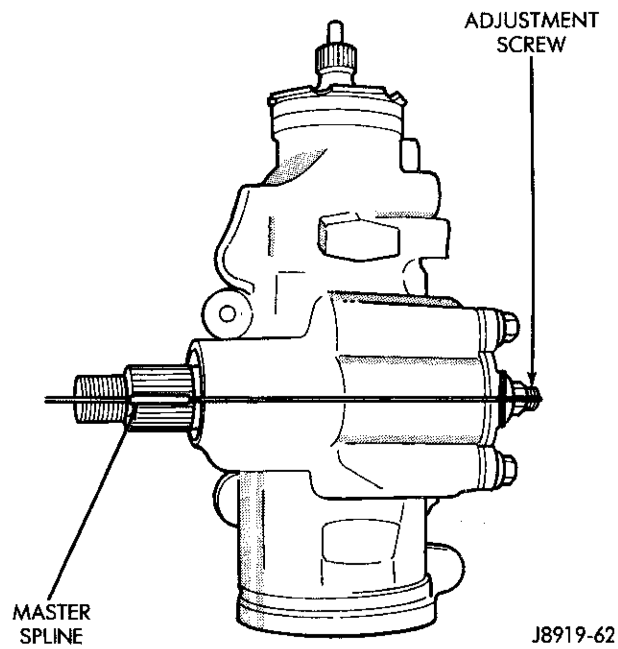

Fig. 29 Steering Gear Centered

ADJUSTMENTS (Continued)

(3) Place the torque wrench in the vertical position on the stub shaft. Rotate the wrench 45 degrees each side of the center and record the highest rotational torque in this range (Fig. 30). This is the Over-Center Rotating Torque.

NOTE: The stub shaft must rotate smoothly without sticking or binding.

(4) Rotate the stud shaft between 90° and 180° to the left of center and record the left off-center preload. Repeat this to the right of center and record the right off-center preload. The average of these two recorded readings is the Preload Rotating Torque.

(5) The Over-Center Rotating Torque should be 0.45-0.9 N·m (4-8 in. lbs.) **higher** than the Preload Rotating Torque.

(6) If an adjustment to the Over-Center Rotating Torque is necessary, first loosen the adjuster lock nut. Then turn the pitman shaft adjuster screw back (COUNTERCLOCKWISE) until fully extended, then turn back in (CLOCKWISE) one full turn.

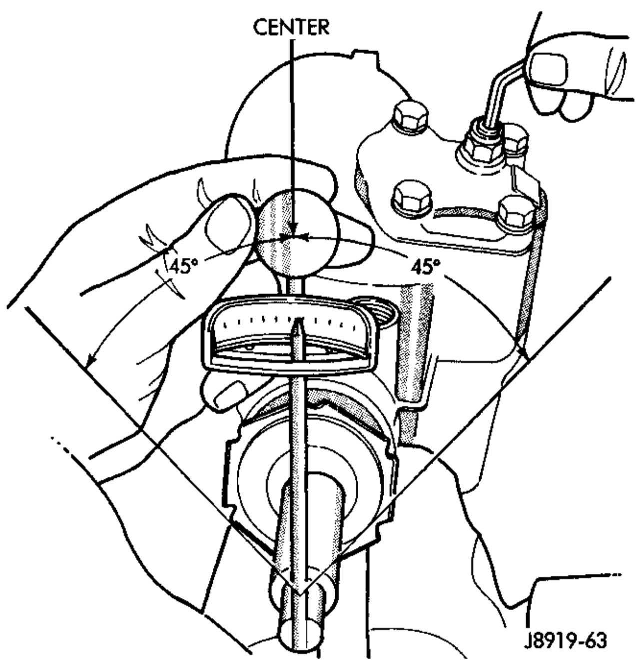

Fig. 30 Checking Over-center Rotation Torque

(7) Remeasure Over-Center Rotating Torque. If necessary turn the adjuster screw and repeat measurement until correct Over-Center Rotating Torque is reached.

NOTE: To increase the Over-Center Rotating Torque turn the screw CLOCKWISE.

(8) Prevent the adjuster screw from turning while tightening adjuster lock nut. Tighten the adjuster lock nut to 49 N·m (36 ft. lbs.).

STEERING COLUMN

INDEX

GENERAL INFORMATION

STEERING COLUMN

The tilt and standard column (Fig. 1) has been designed to be serviced as an assembly; less wiring, switches, shrouds, steering wheel, etc. Most steering column components can be serviced without removing the steering column from the vehicle.

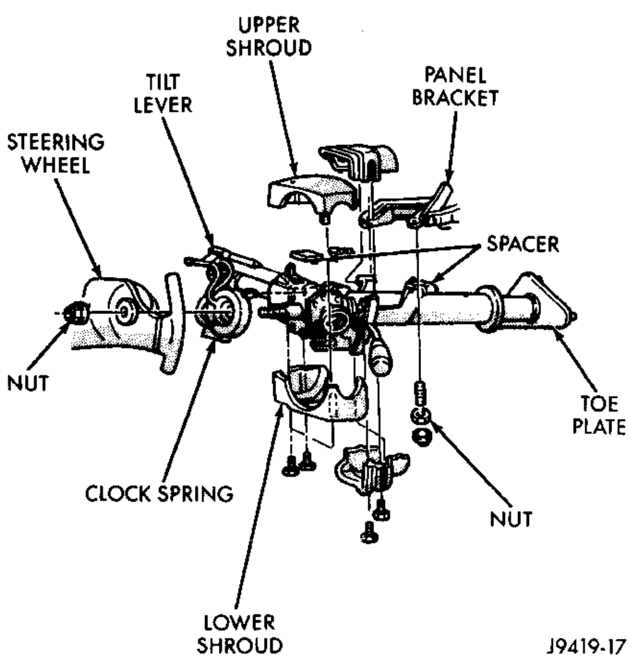

Fig. 1 Steering Column

SERVICE PRECAUTIONS

Safety goggles should be worn at all times when working on steering columns.

To service the steering wheel, switches or the airbag, refer to the appropriate section of Group 8. Follow all WARNINGS.

WARNING: THE AIRBAG SYSTEM IS A SENSITIVE, COMPLEX ELECTRO-MECHANICAL UNIT. BEFORE ATTEMPTING TO DIAGNOSE, REMOVE OR INSTALL THE AIRBAG SYSTEM COMPONENTS YOU MUST FIRST DISCONNECT AND ISOLATE THE BATTERY NEGATIVE (GROUND) CABLE. THEN WAIT TWO MINUTES FOR THE SYSTEM CAPACITOR TO DISCHARGE. FAILURE TO DO SO COULD RESULT IN ACCIDENTAL DEPLOYMENT OF THE AIRBAG AND POSSIBLE PERSONAL INJURY. THE FASTENERS, SCREWS, AND BOLTS, ORIGINALLY USED FOR THE AIRBAG COMPONENTS, HAVE SPECIAL COATINGS AND ARE SPECIFICALLY DESIGNED FOR THE AIRBAG SYSTEM. THEY MUST NEVER BE REPLACED WITH ANY SUBSTITUTES. ANYTIME A NEW FASTENER IS NEEDED, REPLACE WITH THE CORRECT FASTENERS PROVIDED IN THE SERVICE PACKAGE OR FASTENERS LISTED IN THE PARTS BOOKS.

WARNING: THE AIRBAG SYSTEM IS A SENSITIVE, COMPLEX ELECTRO-MECHANICAL UNIT.

CAUTION: Do not hammer on steering column shaft or shift tube. This may cause the shaft or shift tube to collapse.

CAUTION: Do not attempt to remove the pivot pins to disassemble the tilting mechanism. Do not remove ignition locking link, shaft lock plate or plate retainer. This will damage the column (Fig. 2) and (Fig. 3).

DIAGNOSIS AND TESTING

IGNITION SWITCH

TEST AND REPAIR

If the ignition switch effort is excessive, remove the ignition switch from the steering column. Refer to Group 8D Ignition System. Using a key cylinder,

DIAGNOSIS AND TESTING (Continued)

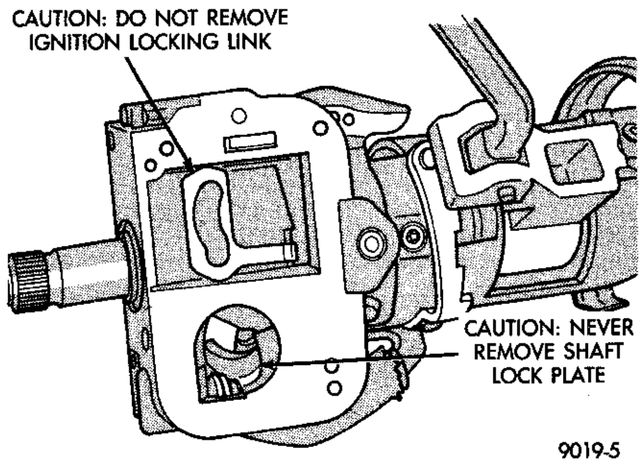

Fig. 2 Observe Cautions

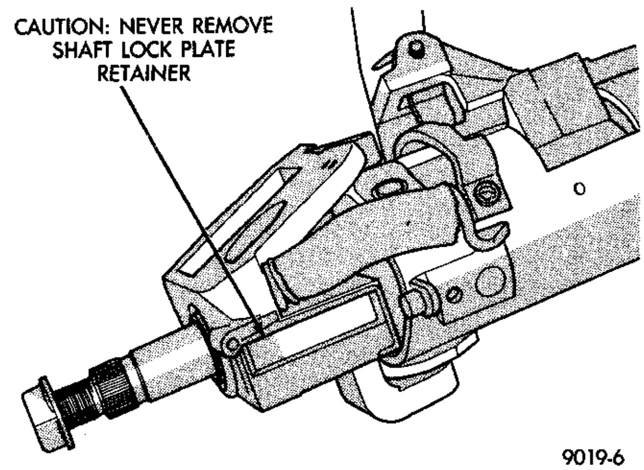

Fig. 3 Observe Cautions

check the turning effort of the switch. If the ignition switch binds look for the following conditions.

(1) Look for rough areas or flash in the casting and if found remove with a file (Fig. 4).

(2) Remove the link and slider and check the link to see if it is bent. If so replace with a new part.

(3) Put the slider in its slot in the sleeve and verify a loose fit over the length of the slot. If the slider binds in the slot at any point lightly file the slider until clearance is achieved.

(4) If no binding is found, lightly file the ramp on the ignition switch, (The ramp fits into the casting) until binding no longer occurs.

REMOVAL AND INSTALLATION

STEERING COLUMN

WARNING: BEFORE SERVICING THE STEERING COLUMN THE AIRBAG SYSTEM MUST BE DISARMED, REFER TO GROUP 8M RESTRAINT SYSTEMS FOR SERVICE PROCEDURES. FAILURE TO DO SO MAY RESULT IN ACCIDENTAL DEPLOYMENT OF THE AIRBAG AND POSSIBLE PERSONAL INJURY.

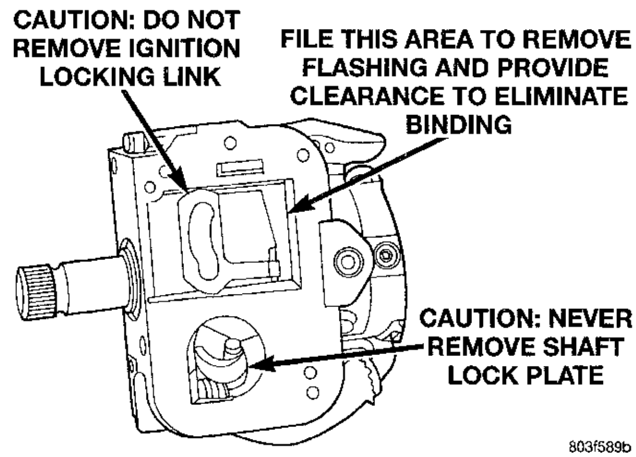

Fig. 4 Steering Column Flash Removal And Non-Serviceable Components

CAUTION: All fasteners must be torque to specification to ensure proper operation of the steering column.

REMOVAL

(1) Position front wheels straight ahead.

(2) Remove the negative (ground) cable from the battery.

(3) Remove airbag, refer to Group 8M Restraint Systems for procedures.

(4) Remove the steering wheel with an appropriate puller.

CAUTION: Ensure the puller bolts are fully engaged into the steering wheel and not into the clockspring, before attempting to remove the wheel. Failure to do so may damage the steering wheel.

(5) Remove the shift link rod in engine compartment (if equipped). Pry rod out from grommet in the shift lever.

(6) Scribe or paint reference mark on the column shaft-to-coupler. This will aid in column shaft installation alignment. Remove the steering column shaft-to-coupler bolt (Fig. 5).

(7) Remove the steering column opening cover/ knee blocker, refer to Group 8E Instrument Panel Systems.

(8) Remove PRNDL cable on column shift vehicles. Put shift lever in **Park** position. Pull cable and twist to remove from position arm. Push tab up on bottom

REMOVAL AND INSTALLATION (Continued)

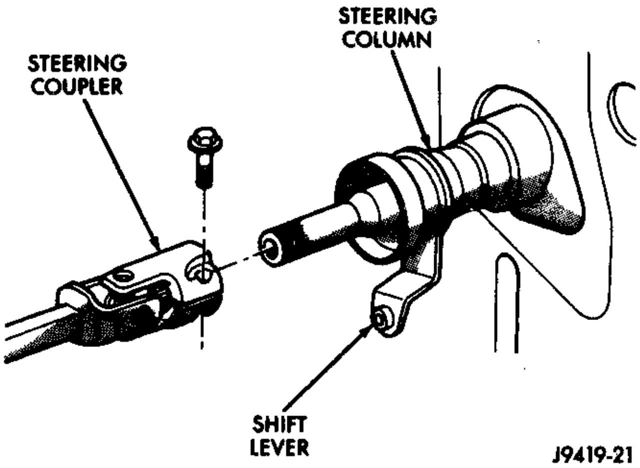

Fig. 5 Steering Coupler

of cable retainer, then squeeze sides to remove retainer from column (Fig. 6).

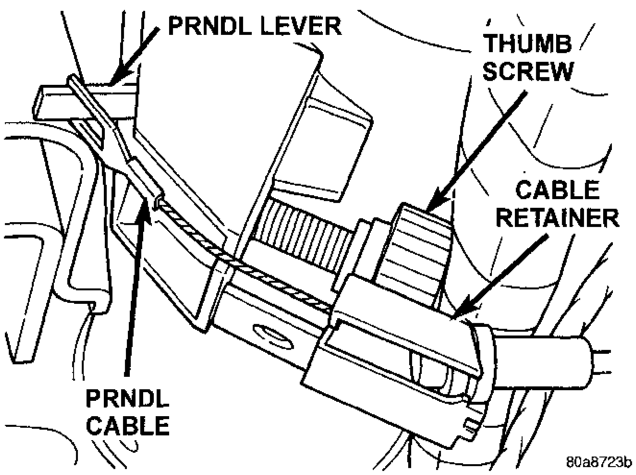

Fig. 6 PRNDL Drive Cable

(9) Remove tilt lever (if equipped) from column.

(10) Remove the upper and lower lock housing shroud and remove the lower fixed shroud.

(11) Remove the turn signal multi-function switch with a 7mm socket (Fig. 7).

(12) Loosen the upper Support Bracket nuts to allow some slack. This will aid in removal of the upper fixed shroud.

(13) Remove electrical connections from Key-in light, Ignition Switch, Horn and Clock Spring (Speed Control) (Fig. 8).

(14) Remove the wiring harness from the column by prying out the plastic retainer buttons.

(15) Remove toe plate fasteners.

(16) Remove column from vehicle.

(17) Remove clock spring and switches, refer to Group 8 Electrical for procedures.

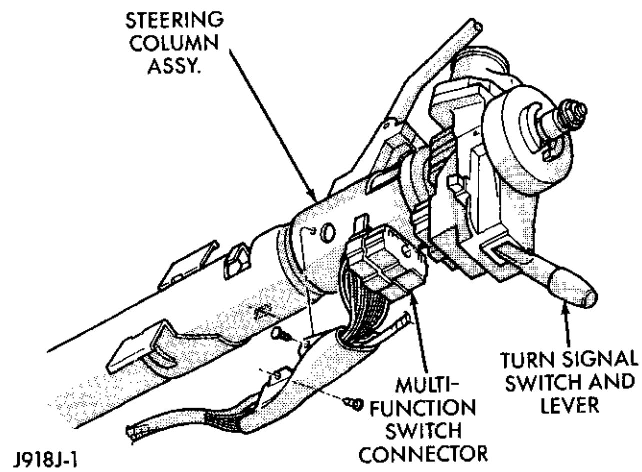

Fig. 7 Multi-function Switch

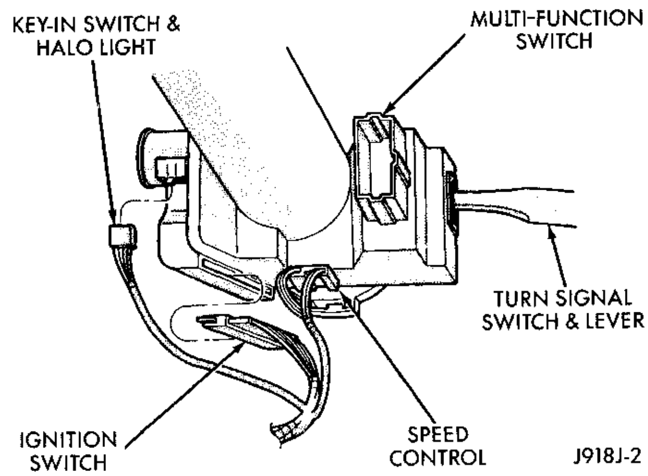

Fig. 8 Steering Column Wiring

INSTALLATION

(1) Install clock spring and switches, refer to Group 8 Electrical for procedures.

(2) Column shift vehicles, install a new grommet. Use multi-purpose lubricant, or equivalent, to aid installation of the grommet.

NOTE: A new grommet should be used when ever the rod is disconnected from the lever.

(3) Remove the shipping lock pin if necessary.

(4) Install the ground clip on the left spacer slot.

(5) Install column through floor pan.

(6) Position the column bracket breakaway capsules on the mounting studs. Install, but **loose assemble** the two upper bracket nuts.

(7) With the front wheels in the straight-ahead position. Align steering column shaft to the coupler. Install a **new** pinch bolt and tighten to 49 N·m (36 ft. lbs.).

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

(8) Clip the wiring harness on the steering column. Connect the multi- function switch wiring and tighten with 7mm socket.

(9) Install the upper fixed shroud.

(10) Be sure both breakaway capsules are fully seated in the slots in the column support bracket. Tighten upper bracket nuts to 12 N·m (105 in. lbs.).

(11) Tighten the toe plate to floor pan attaching nuts to 22.5 N·m (200 in. lbs.).

(12) Install the wiring connections to the column. Install the lower fixed shroud.

(13) Column shift vehicles, install the PRNDL driver cable. Place shifter in Park position. If indicator needs adjusting, turn thumb screw on cable retainer to adjust cable.

(14) Install the lock housing shrouds. Install the tilt lever (if equipped).

(15) Install the knee blocker and steering column opening cover, refer to Group 8E Instrument Panel Systems.

(16) Install steering wheel and tighten nut to 61 N·m (45 ft. lbs.).

(17) Install airbag, refer to Group 8M Restraint Systems.

(18) Column shift vehicles, connect the shift link rod to the transmission shift lever. Use multi-purpose lubricant, or an equivalent product, to aid the installation.

(19) Install the battery ground (negative) cable.

(20) Verify operation of the automatic transmission shift linkage and adjust as necessary. Refer to Group 21, Transmission for adjustment procedure.

GEAR SHIFT LEVER

REMOVAL

(1) Support the steering column assembly as shown in (Fig. 9) using a suitable size socket.

(2) Using a drift of the appropriate size drive the roll pin out of the steering column and gear shift lever. Remove the gear shift lever from the steering column assembly.

INSTALLATION

(1) Support the steering column using a suitable size socket.

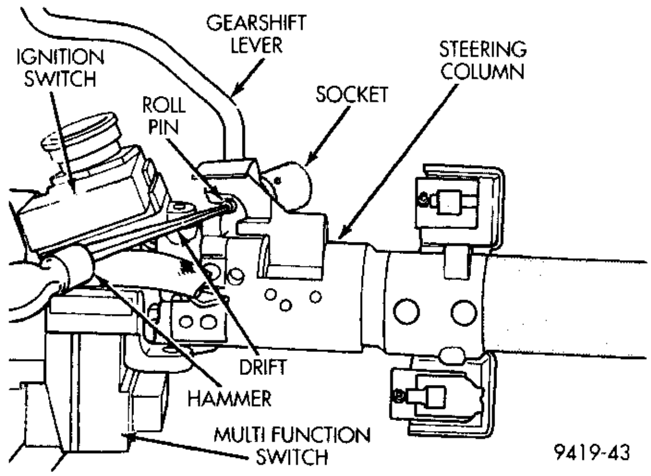

Fig. 9 Gear Shift Lever

(2) Install the gear shift lever into the steering column assembly. Align the roll pin holes in the gear shift lever and the steering column assembly.

(3) Carefully Install the roll pin into the steering column assembly and through the shift lever. If the roll pin binds check the alignment on the holes. Be sure roll pin is fully installed into the steering column assembly.

STEERING LINKAGE—IFS SUSPENSION

INDEX

GENERAL INFORMATION

IFS-STEERING LINKAGE

Light duty (LD) and heavy duty (HD) steering linkage is used with IFS suspensions (Fig. 1). Heavy duty linkage is used on 8800 and 10500 lb. GVW vehicles. Vehicles with 10500 lb. GVW rating have a steering damper mounted from a frame bracket to the centerlink.

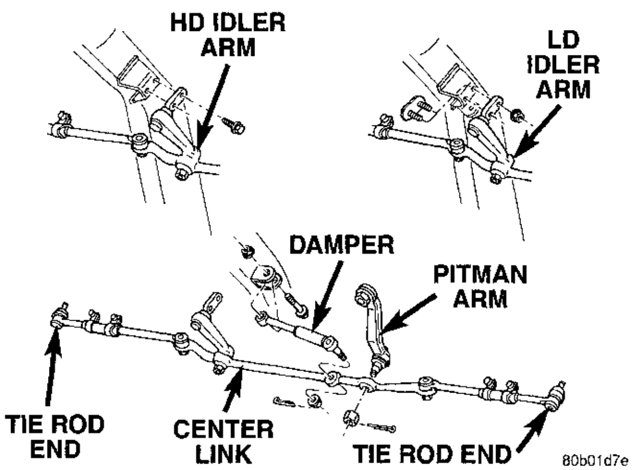

Fig. 1 Steering Linkage

CAUTION: If any steering components are replaced or serviced an alignment must be performed.

CAUTION: Components attached with a nut and cotter pin must be torqued to specification. Then if the slot in the nut does not line up with the cotter pin hole, tighten nut until it is aligned. Never loosen the nut to align the cotter pin hole.

NOTE: Periodic lubrication of the steering system components is required. Refer to Group 0, Lubrication And Maintenance for the recommended maintenance schedule.

NOTE: When servicing the steering linkage, use care to avoid damaging ball stud seals. Use Puller C-3894–A or an appropriate puller to remove tie rod ends (Fig. 2).

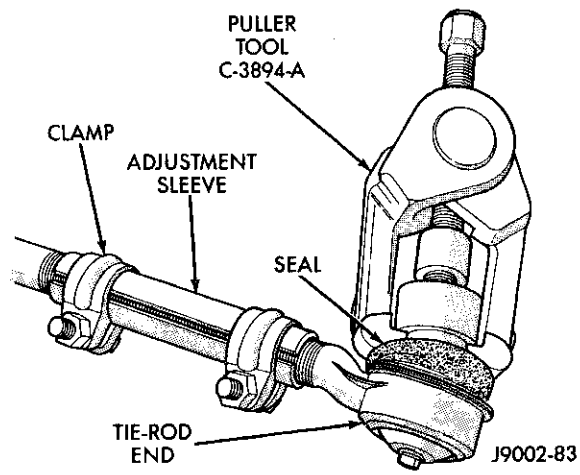

Fig. 2 Tie Rod End

REMOVAL AND INSTALLATION

STEERING LINKAGE

REMOVAL

(1) Remove the cotter pin and nut from the tie-rod.
(2) Remove the tie-rod end ball studs from the steering knuckles with an appropriate puller.
(3) Remove inner tie-rod ends from center link.
(4) If equipped remove steering damper from center link and frame bracket.
(5) Remove idler arm ball stud from center link with an appropriate puller. Remove idler arm mounting nuts (LD) or mounting bolts (HD) from frame bracket.
(6) Remove pitman arm ball stud from center link.
(7) Mark the pitman arm and shaft positions for installation reference. Remove pitman arm with Puller C-4150A (Fig. 3).

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

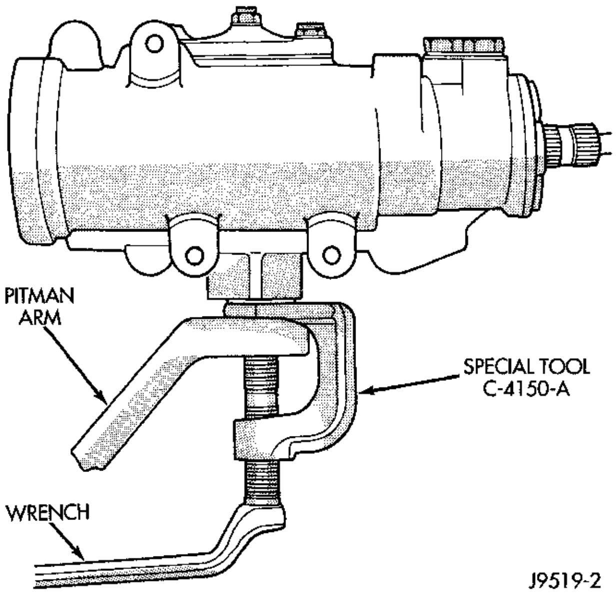

Fig. 3 Pitman Arm

INSTALLATION

(1) Position idler arm on the frame bracket and tighten the mounting nuts (LD) or bolts (HD) to specification.

(2) Center steering gear to alignment marks and install pitman arm.

(3) Install the lock washer and retaining nut on the pitman shaft. Tighten the nut to 251 N·m (185 ft. lbs.).

(4) Install center link to ball studs and tighten retaining nuts to 88 N·m (65 ft. lbs.). Install new cotter pins.

(5) Install tie-rod ends into center link and tighten the nuts to 88 N·m (65 ft. lbs.). Install new cotter pins.

(6) Install steering damper to frame bracket and center link (if equipped). Tighten frame mounting nut to 108 N·m (80 ft. lbs.). Tighten center link mounting nut to 68 N·m (50 ft. lbs.) and install a new cotter pin.

(7) Install tie-rod ends into steering knuckles and tighten nuts to 88 N·m (65 ft. lbs.). Install new cotter pins.

(8) Remove the supports and lower the vehicle to the surface. Center steering wheel and adjust toe (refer to the Alignment Specifications chart within Group 2, Front Suspension).

NOTE: Position the clamp on the sleeve so retaining bolt is located on the bottom side of the sleeve.

(9) After adjustment, tighten the tie-rod adjustment sleeve clamp bolt to 54 N·m (40 ft. lbs.).

STEERING LINKAGE—LINK/COIL SUSPENSION

INDEX

GENERAL INFORMATION

LINK/COIL-STEERING LINKAGE

A light duty (LD) steering linkage (Fig. 1) is used on 6400, 6600 and 7500 lb. GVW vehicles. A heavy duty (HD) steering linkage (Fig. 2) is used on 8800 and 11000 lb. GVW vehicles. The steering linkage is comprised of a tie rod end, tie rod, drag link, steering damper and pitman arm .

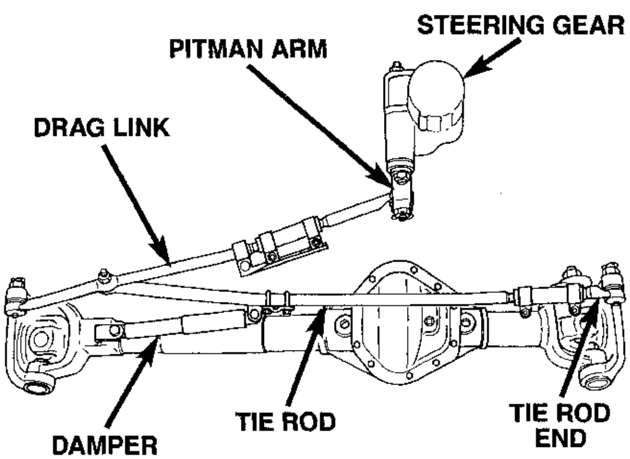

Fig. 1 Light Duty Steering Linkage

CAUTION: If any steering components are replaced or serviced an alignment must be performed.

CAUTION: Components attached with a nut and cotter pin must be torqued to specification. Then if the slot in the nut does not line up with the cotter pin hole, tighten nut until it is aligned. Never loosen the nut to align the cotter pin hole.

NOTE: Periodic lubrication of the steering system components is required. Refer to Group 0, Lubrication And Maintenance for the recommended maintenance schedule.

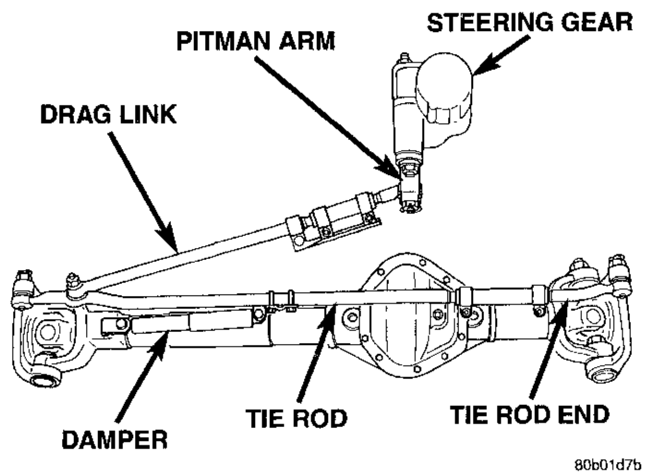

Fig. 2 Heavy Duty Steering Linkage

NOTE: To avoid damaging ball stud seals, use Puller C-3894–A or an appropriate puller to remove tie rod ends (Fig. 3).

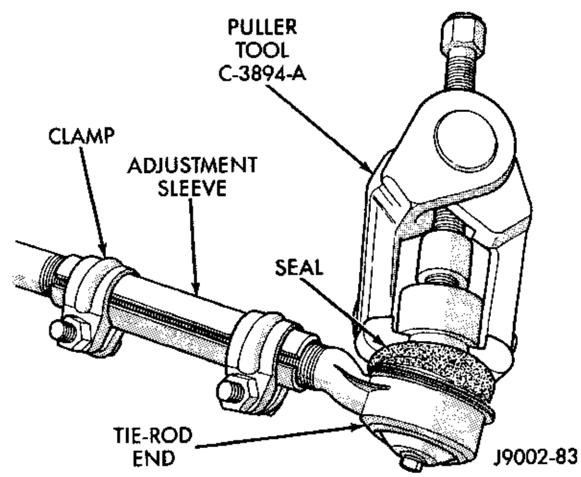

Fig. 3 Tie Rod End

Mopar AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION

STEERING LINKAGE

NOTE: Do not loosen/move alignment bar or alignment bar clamp (Fig. 4). The bar is used as a locator for the adjuster clamps.

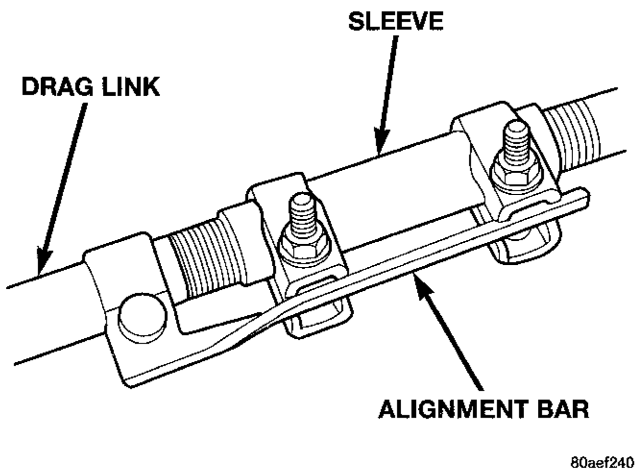

Fig. 4 Alignment Bar

REMOVAL

(1) Remove tie rod from drag link.
(2) Remove steering damper from drag link with Puller C-4150A.
(3) Remove drag link tie rod end from steering knuckle and pitman arm.
(4) Mark the pitman arm and shaft positions for installation reference. Remove the nut and washer from the pitman arm. Remove the pitman arm with Puller C-4150A.
(5) Remove tie rod from steering knuckle.

INSTALLATION

NOTE: When installing linkage tighten nuts to proper torque, then align cotter pin slot by tightening nut if necessary.

(1) Align reference marks and install pitman arm.
(2) Install the lock washer and retaining nut on the pitman shaft and tighten nut to 251 N·m (185 ft. lbs.).
(3) Install drag link ball studs to steering knuckle and pitman arm. Install the retaining nuts and tighten to 88 N·m (65 ft. lbs.). Install new cotter pins.
(4) Install tie rod on steering knuckle and drag link. Tighten the nuts to 88 N·m (65 ft. lbs.). Install new cotter pins.
(5) Install steering damper on drag link and tighten nut to 68 N·m (50 ft. lbs.). Install new cotter pin.
(6) Remove the supports and lower the vehicle to the surface. Center steering wheel and adjust toe, refer to Group 2 Suspension.
(7) After adjustment tighten tie rod adjustment sleeve clamp bolts to 54 N·m (40 ft. lbs.).

NOTE: Position the clamp on the sleeve so retaining bolt is located on the bottom side of the sleeve.

TRANSMISSION AND TRANSFER CASE

CONTENTS

NV3500 MANUAL TRANSMISSION

INDEX

GENERAL INFORMATION

NV3500 MANUAL TRANSMISSION

The NV3500 is a medium-duty, 5-speed, constant mesh, fully synchronized manual transmission. Fifth gear is an overdrive range with a ratio of 0.729:1. The NV3500 is available in two and four–wheel drive configurations.

The transmission gear case consists of two aluminum housings (Fig. 1). The clutch housing is not a removable component. It is an integral part of the transmission front housing.

A combination of roller and ball bearings are used to support the transmission shafts in the two housings. The transmission gears all rotate on caged type needle bearings. A roller bearing is used between the input and output shaft.

The NV3500 has a single shaft shift mechanism with three shift forks all mounted on the shaft. The shaft is supported in the front and rear housings by bushings and one linear ball bearing. Internal shift components consist of the forks, shaft, shift lever socket, and detent components (Fig. 2).

TRANSMISSION LUBRICANT

Required lubricant for the NV3500 is Mopar® Manual Transmission Lubricant, P/N 4761526. This is the **only** lubricant to be used in NV3500 transmissions. No other lubricants are acceptable, or recommended.

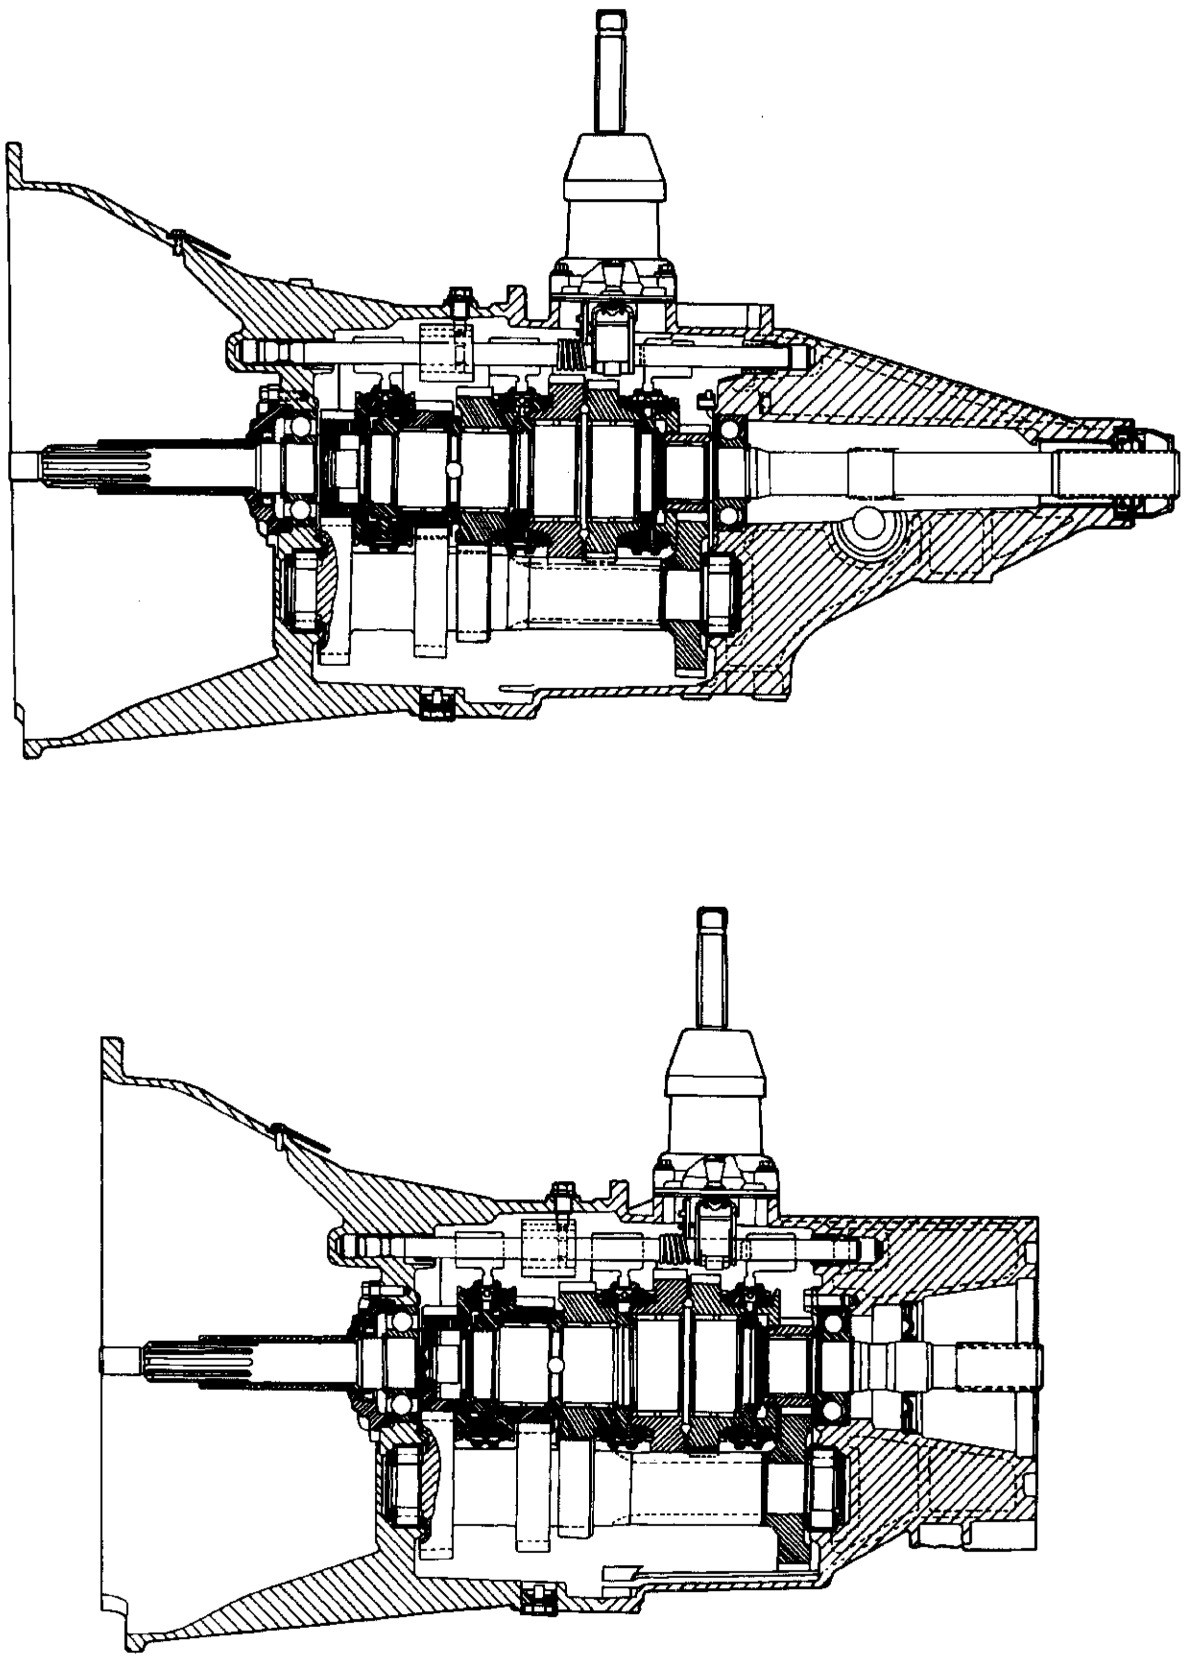
TRANSMISSION LUBRICANT LEVEL AND CAPACITY

The correct transmission lubricant level is to the bottom edge of the fill plug hole (Fig. 3).

The transmission must be level to obtain an accurate lubricant level check. A drive–on type of hoist is recommended for this purpose.

Lubricant capacity of the NV3500 is approximately 2.28 liters (4.8 pints). This represents the approximate quantity needed to refill the transmission after a lubricant change or overhaul.

GENERAL INFORMATION (Continued)



J9421-1

Fig. 1 NV3500 Manual Transmission

Mopar AUTHENTIC RESTORATION PRODUCT

GENERAL INFORMATION (Continued)

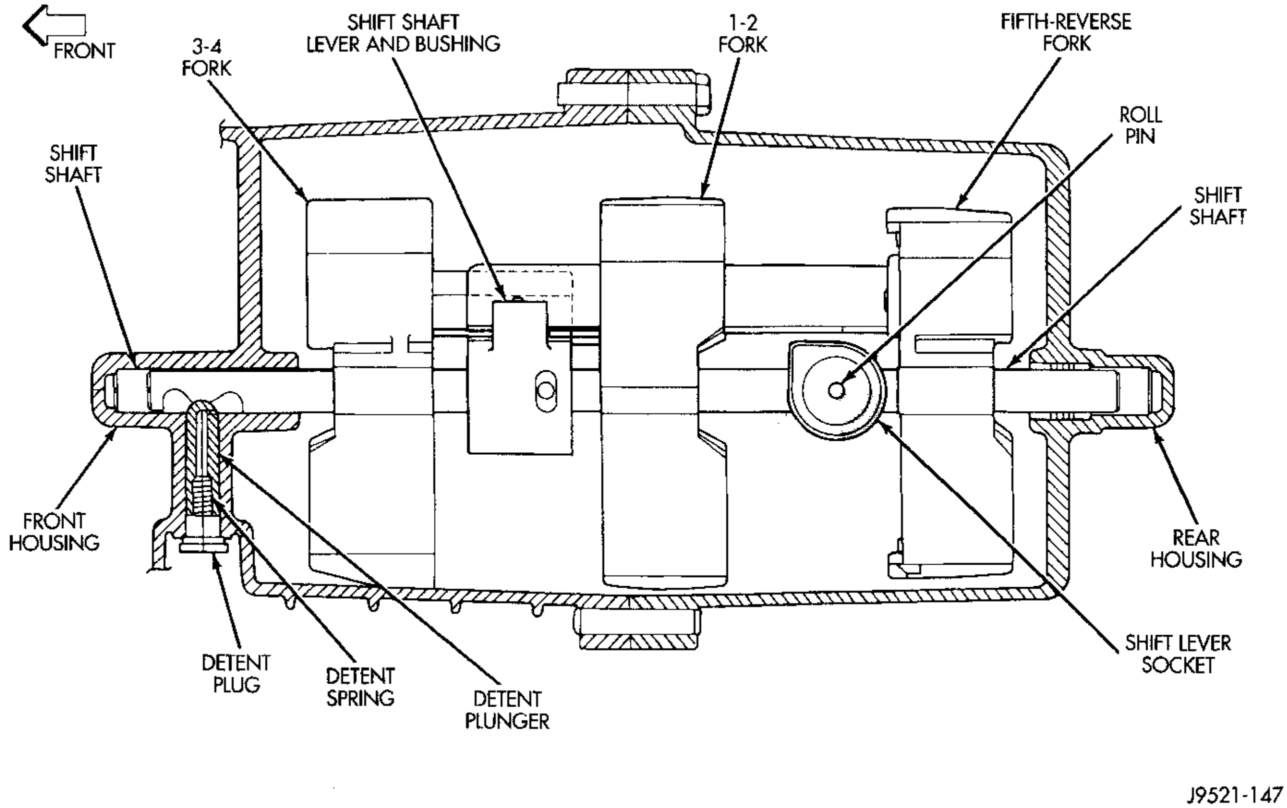


Fig. 2 NV3500 Shift Mechanism

DRAIN AND FILL PLUG LOCATIONS

The NV3500 fill and drain plugs are both located in the front housing. The fill plug is at the passenger side of the housing. The drain plug is at the bottom of the housing (Fig. 3).

TRANSMISSION GEAR RATIOS

Two versions of the NV3500 are available. The wide ratio version has a 4.01 first gear and 2.32 second gear. The close ratio NV3500 has a 3.49 first gear and 2.16 second gear.

DIAGNOSIS AND TESTING

LOW LUBRICANT LEVEL

A low transmission lubricant level is generally the result of a leak, inadequate lubricant fill, or an incorrect lubricant level check.

Leaks can occur at the mating surfaces of the housings, or from the front/rear seals. A suspected leak could also be the result of an overfill condition.

Leaks at component mating surfaces will probably be the result of inadequate sealer, gaps in the sealer, incorrect bolt tightening, or use of a non-recommended sealer.

A leak at the front of the transmission will be from either a loose or damaged, front bearing retainer or

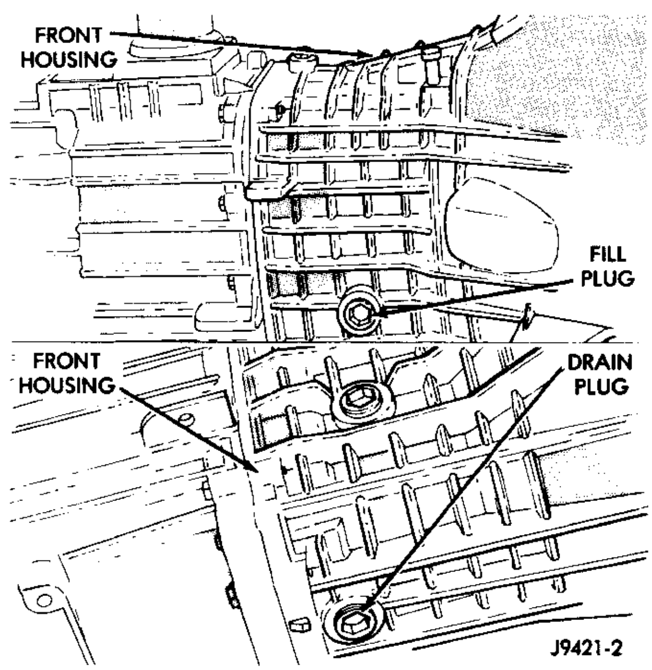

Fig. 3 Drain and Fill Plug Locations

retainer seal. Lubricant may also drip from the transmission clutch housing after extended operation. If the leak is severe, it will contaminate the clutch disc causing slip, grab and chatter.

DIAGNOSIS AND TESTING (Continued)

WIDE RATIO VERSION

RANGE	RATIO
FIRST	4.01:1
SECOND	2.32:1
THIRD =	1.40:1
FOURTH =	1:1
FIFTH =	0.73:1
REVERSE =	3.55:1

CLOSE RATIO VERSION

RANGE	RATIO
FIRST	3.48:1
SECOND	2.16:1
THIRD =	1.40:1
FOURTH =	1:1
FIFTH =	0.73:1
REVERSE =	3.55:1

Transmissions filled from air or electrically powered lubricant containers can be under filled. Always check the lubricant level after filling to avoid an under fill condition.

A correct lubricant level check can only be made when the vehicle is level; use a drive–on hoist to ensure this. Also allow the lubricant to settle for a minute or so before checking. These recommendations will ensure an accurate check and avoid an under-or-overfill condition.

HARD SHIFTING

Hard shifting is usually caused by a low lubricant level, improper or contaminated lubricants, transmission component damage, clutch linkage malfunction, or by a damaged clutch pressure plate or disc.

Substantial lubricant leaks can result in gear, shift component, synchro and bearing damage. If a leak goes undetected for an extended period, the first indications of a problem are usually hard shifting and noise.

Incorrect or contaminated lubricants can also contribute to hard shifting. The consequence of using non–recommended lubricants is noise, excessive wear, internal bind and hard shifting.

Improper clutch release is a frequent cause of hard shifting. Incorrect adjustment or a worn, damaged pressure plate or disc can cause incorrect release. If the clutch problem is advanced, gear clash during shifts can result.

Worn or damaged synchro rings can cause gear clash when shifting into any forward gear. In some new or rebuilt transmissions, new synchro rings may tend to stick slightly causing stiff and/or noisy shifts. In most cases, this condition will decline as the rings wear in.

TRANSMISSION NOISE

Most manual transmissions make some noise during normal operation. Rotating gears can generate a mild whine that may only be audible at extreme speeds.

Severe, obviously audible transmission noise is generally the result of a lubricant problem. Insufficient, improper, or contaminated lubricant can promote rapid wear of gears, synchros, shift rails, forks and bearings. The overheating caused by a lubricant problem, can also lead to gear breakage.

REMOVAL AND INSTALLATION

TRANSMISSION—2WD

REMOVAL

(1) Disconnect battery negative cable.
(2) Shift transmission into Neutral.
(3) Remove shift boot bezel screws and slide boot upward on shift lever extension.
(4) Remove bolts attaching shift tower and lever assembly to rear case. Then remove shift tower and shift lever assembly.
(5) Raise vehicle on hoist.
(6) Remove crankshaft position sensor. Retain sensor attaching bolts.
(7) Remove skid plate, if equipped.
(8) Drain transmission lubricant if transmission will be disassembled for service.
(9) Mark propeller shaft and U-joint for installation reference. Then disconnect and remove propeller shaft.
(10) Disengage harness from clips on transmission housing.
(11) Support engine with adjustable jack stand.
(12) Remove nuts attaching rear mount to crossmember (Fig. 4). Then remove insulator from extension housing if necessary.
(13) Remove bolts and nuts attaching crossmember to frame rails. Rotate crossmember diagonally and remove crossmember.
(14) Disconnect exhaust as necessary.
(15) Remove slave cylinder attaching nuts and remove cylinder from clutch housing.
(16) Remove starter motor.
(17) Support transmission with transmission jack. Secure transmission to jack with safety chains.
(18) Remove nuts/bolts attaching transmission front housing to engine.
(19) Remove transmission dust shield.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

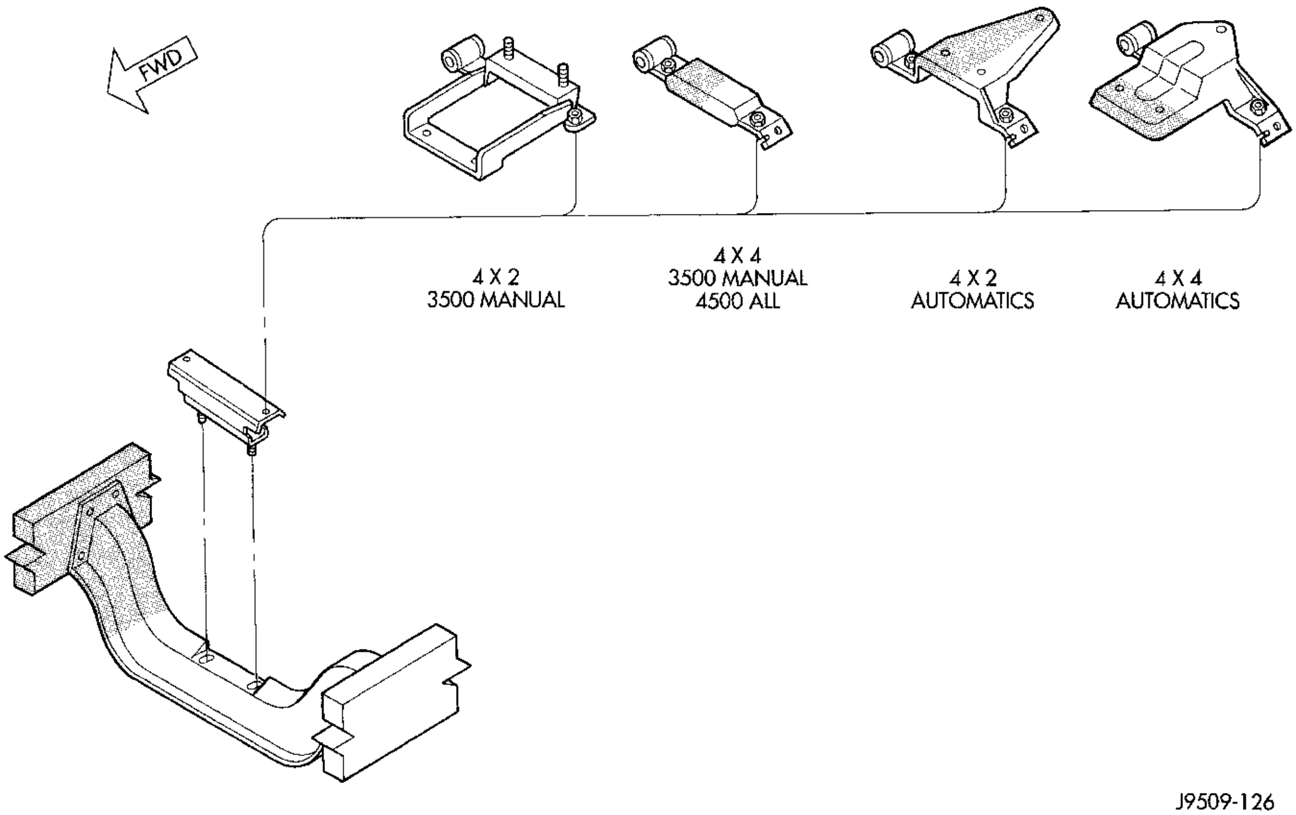

Fig. 4 Transmission Rear Support Brackets

(20) Move transmission rearward until input shaft is clear of clutch disc and cover. Then lower jack and remove transmission from under vehicle.

INSTALLATION

(1) Make sure transmission front housing mounting surface is clean before installation.

(2) Apply light coat of Mopar® high temperature bearing grease to contact surfaces of following components:

- input shaft splines and pilot bearing hub.
- release bearing slide surface of front retainer.
- pilot bearing.
- release bearing bore.
- release fork.
- release ball stud.
- propeller shaft slip yoke.

(3) Mount transmission on jack. Secure transmission to jack with safety chains.

(4) Align transmission input shaft with clutch disc. Then slide transmission into place on engine block.

(5) Install and tighten transmission attaching bolts to 54-61 N·m (40-45 ft. lbs.) torque. Be sure front housing is fully seated before tightening bolts. Install front dust cover after all bolts are tightened.

(6) Fill transmission with Mopar® lubricant P/N 4761526. Correct fill level is to bottom edge of fill plug hole.

(7) Connect backup lamp switch wires.

(8) Connect transmission harnesses to clips on case.

(9) Install crossmember. Tighten crossmember–to–frame bolts to 68 N·m (50 ft. lbs.) torque.

(10) Tighten crossmember-to-transmission insulator nuts to 68 N·m (50 ft. lbs.) torque.

(11) Install slave cylinder. Tighten cylinder nuts to 23 N·m (200 in. lbs.) torque.

(12) Remove jack used to support transmission.

(13) Install strut bolts/nuts, if removed. Also install oil filter if removal was necessary.

(14) Install and connect exhaust system. Align exhaust components before tightening clamp and bracket bolts and nuts. Be sure exhaust components are clear of all chassis and driveline components.

(15) Align and install propeller shaft. Tighten U-joint clamp bolts to 19 N·m (170 in. lbs.) torque.

(16) Verify that all linkage components, hoses and electrical wires have been connected.

(17) Remove any remaining support stands and lower vehicle.

(18) Install crankshaft position sensor.

(19) Connect battery negative cable.

(20) Install shift tower and lever assembly. Tighten shift tower bolts to 7-10 N·m (5-7 ft. lbs.) torque.

(21) Install shift boot and bezel.

REMOVAL AND INSTALLATION (Continued)

TRANSMISSION—4WD

REMOVAL

(1) Disconnect battery negative cable.

(2) Shift transmission into Neutral.

(3) Remove screws attaching shift boot bezel and slide boot upward on shift lever extension.

(4) Remove bolts attaching shift tower and lever assembly to rear case. Then remove shift tower and lever as an assembly.

(5) Remove crankshaft position sensor. Retain sensor attaching bolts.

(6) Raise vehicle on hoist.

(7) Remove skid plate, if equipped.

(8) Drain transmission lubricant if transmission will be disassembled for service.

(9) Mark propeller shafts and U-joints for installation reference. Then disconnect and remove propeller shafts.

(10) Disconnect transfer case shift linkage at transfer case range lever.

(11) Remove bolts attaching shift linkage bracket to transfer case and move linkage and bracket aside.

(12) Support transfer case with transmission jack.

(13) Remove nuts attaching transfer case to transmission adapter housing.

(14) Remove transfer case with aid of helper.

(15) Support engine with adjustable jack stand.

(16) Remove nuts and bolts attaching support bracket and cushions to fixed crossmember.

(17) Remove nuts and bolts attaching removable crossmember to frame rails.

(18) Remove crossmember.

(19) Disconnect exhaust as necessary.

(20) Remove slave cylinder attaching nuts and remove cylinder from clutch housing. Move cylinder aside for working clearance.

(21) Remove clutch housing dust cover.

(22) On some models, it may be necessary to remove front axle struts and oil filter for access and removal clearance. Remove these components if necessary.

(23) Support transmission with transmission jack. Secure transmission to jack with safety chains.

(24) Remove bolts attaching transmission clutch housing to engine block.

(25) Move transmission rearward until transmission input shaft is clear of clutch disc and cover. Then lower jack and remove transmission from under vehicle.

INSTALLATION

(1) Make sure transmission front housing and engine block contact surfaces are clean.

(2) Apply light coat of Mopar® high temperature bearing grease to contact surfaces of following components:

- input shaft splines and pilot bearing hub.
- release bearing slide surface of front retainer.
- pilot bearing.
- release bearing bore.
- release fork.
- release ball stud.
- propeller shaft slip yoke.

(3) Mount transmission on jack. Secure transmission to jack with safety chains.

(4) Align transmission input shaft with clutch disc. Then slide clutch housing into place on engine block.

(5) Install and tighten transmission attaching bolts to 54-61 N·m (40-45 ft. lbs.) torque. Be sure housing is fully seated before tightening bolts. If equipped, install dust cover after tightening housing bolts.

(6) Fill transmission with Mopar® lubricant, P/N 4761526. Correct fill level is to bottom edge of fill plug hole.

(7) Connect backup lamp switch wires.

(8) Connect transmission harnesses and vent line to retainer clips on housing.

(9) Install center crossmember. Tighten crossmember-to-frame bolts to 67 N·m (50 ft. lbs.) torque.

(10) Tighten crossmember-to-support bracket nuts to 54-61 N·m (40-45 ft. lbs.) torque.

(11) Install slave cylinder in transmission clutch housing. Tighten cylinder attaching nuts to 23 N·m (200 in. lbs.) torque.

(12) Remove jack used to support transmission.

(13) Install strut bolts/nuts, if removed.

(14) Install transfer case. Align and position transfer case with transmission jack or aid of helper.

(15) Install and tighten transfer case attaching nuts to 47 N·m (35 ft. lbs.) torque.

(16) Install and connect transfer case shift linkage.

(17) Align and connect exhaust system components. Be sure exhaust components are clear of all chassis and driveline components.

(18) Align and install front and rear propeller shafts. Tighten U-joint clamp bolts to 19 N·m (170 in. lbs.) torque.

(19) Verify that all linkage components, hoses and electrical wires have been connected.

(20) Check transfer case fluid level. Add Mopar® Dexron II, or ATF Plus if necessary. Correct level is to edge of fill plug hole. Be sure transfer case is level before checking or adding fluid.

(21) Check and adjust transfer case shift linkage if necessary.

(22) Install transfer case skid plate, if equipped.

(23) Install crankshaft position sensor.

(24) Remove any remaining support stands and lower vehicle.

(25) Connect battery negative cable.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

(26) Install shift tower and lever assembly. Tighten shift tower bolts to 7-10 N·m (5-7 ft. lbs.) torque.

(27) Install shift boot and bezel.

YOKE SEAL REPLACEMENT

REMOVAL

(1) Raise vehicle.

(2) Mark propeller shaft and axle yoke for alignment reference.

(3) Disconnect and remove propeller shaft.

(4) Remove old seal with Seal Remover C-3985-B (Fig. 5) from extension housing.

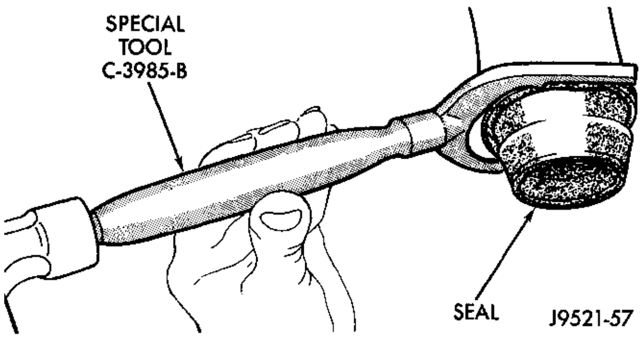

Fig. 5 Removing Extension Housing Yoke Seal

INSTALLATION

(1) Place seal in position on extension housing.

(2) Drive seal into extension housing with Seal Installer C-3972-A (Fig. 6).

(3) Carefully guide propeller shaft slip yoke into housing and onto output shaft splines. Align marks made at removal and connect propeller shaft to rear axle pinion yoke.

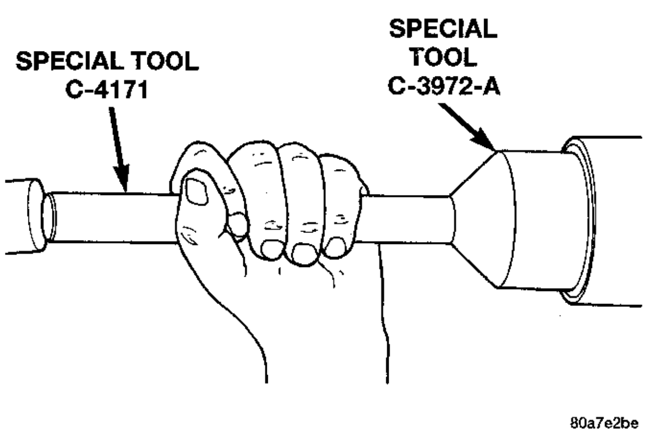

Fig. 6 Installing Extension Housing Yoke Seal

REAR HOUSING YOKE BUSHING

REMOVAL

(1) Remove housing yoke seal.

(2) Insert Remover 6957 into rear housing. Tighten tool to bushing and remove bushing (Fig. 7).

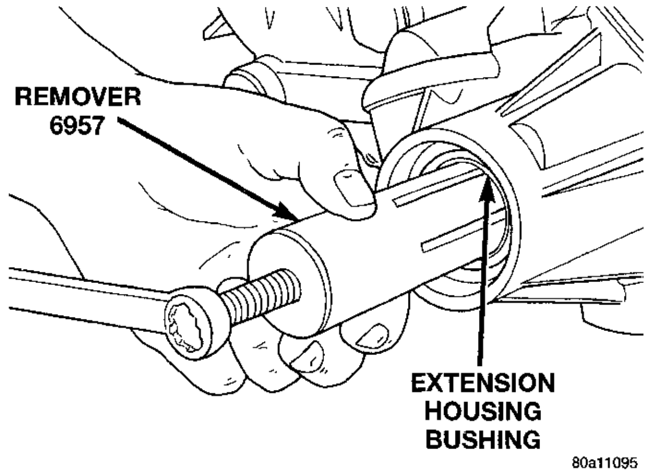

Fig. 7 Bushing Removal—Typical

INSTALLATION

(1) Align bushing oil hole with oil slot in rear housing.

(2) Tap bushing into place with Installer 6951 and Handle C-4171.

(3) Install new oil seal in housing using Seal Installer C-3972–A (Fig. 8).

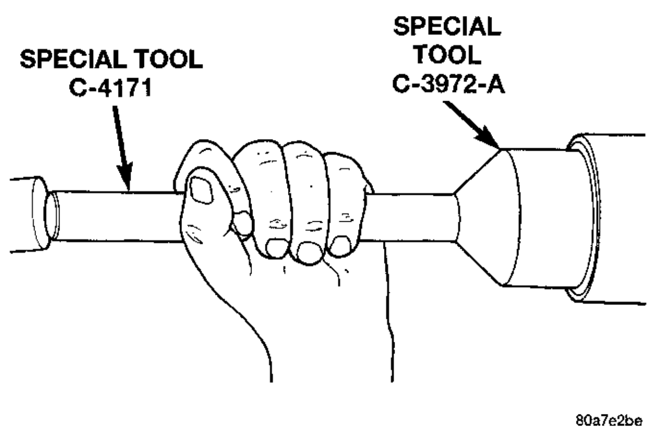

Fig. 8 Rear Housing Seal Installation

DISASSEMBLY AND ASSEMBLY

TRANSMISSION

FRONT HOUSING REMOVAL

(1) If necessary, temporarily reinstall shift lever assembly. Shift transmission into Neutral.

(2) If lubricant was not drained out of transmission during removal, remove drain plug and drain lubricant into container at this time.

(3) Inspect drain plug magnet for debris.

DISASSEMBLY AND ASSEMBLY (Continued)

(4) Remove backup light switch. Switch is located on driver side of rear housing (Fig. 9).

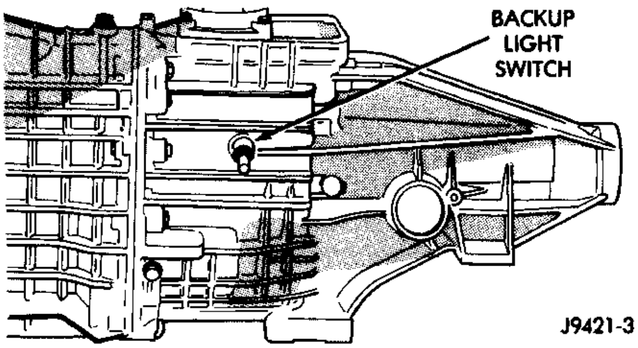

Fig. 9 Backup Light Switch Location

(5) If necessary, remove shift tower bolts and remove tower and lever assembly.

(6) Remove shift shaft lock bolt (Fig. 10). Bolt is located at top of front housing just forward of shift tower. Bolt is a shoulder bolt that secures the shift shaft bushing and lever.

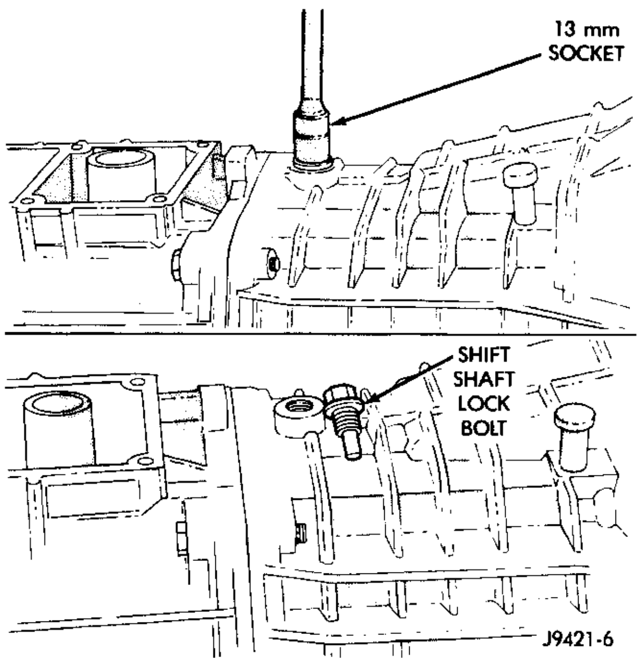

Fig. 10 Shift Shaft Lock Bolt Removal

(7) Remove bolts attaching input shaft bearing retainer in front housing (Fig. 11). Note location of oil feed formation on retainer for installation reference.

(8) Remove input shaft bearing retainer. Use pry tool to carefully lift retainer and break sealer bead (Fig. 12).

(9) Remove bearing retainer from input shaft (Fig. 13).

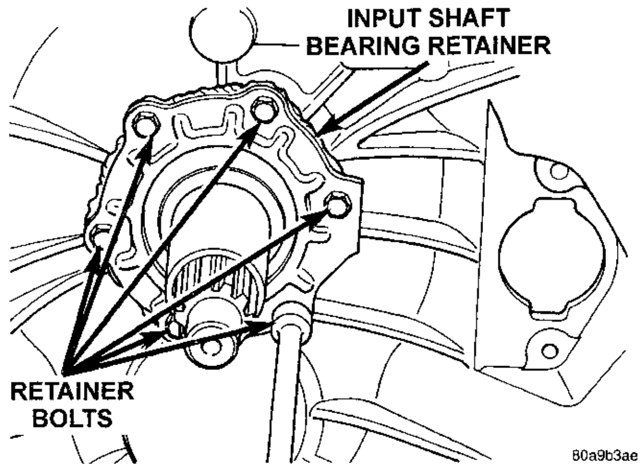

Fig. 11 Input Shaft Bearing Retainer Bolt Removal

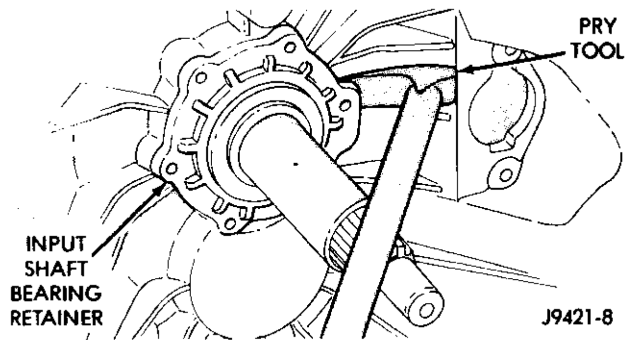

Fig. 12 Loosening Bearing Retainer Sealer Bead

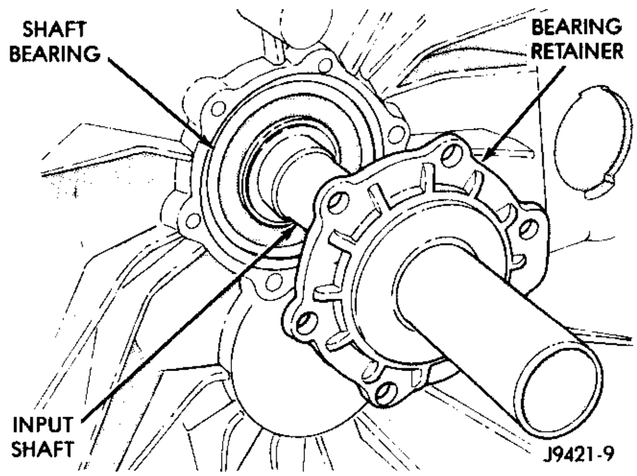

Fig. 13 Input Shaft Bearing Retainer Removal

DISASSEMBLY AND ASSEMBLY (Continued)

(10) Remove snap ring that secures input shaft in front bearing (Fig. 14).

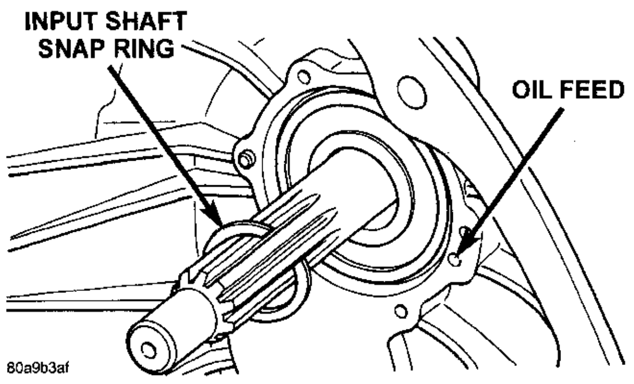

Fig. 14 Input Shaft Snap Ring Removal

(11) Use Remover 8117 and suitable slide hammer to remove shift shaft detent plug.

(12) Remove shift shaft detent plunger and spring (Fig. 15). Use pencil magnet to remove spring then plunger, if necessary.

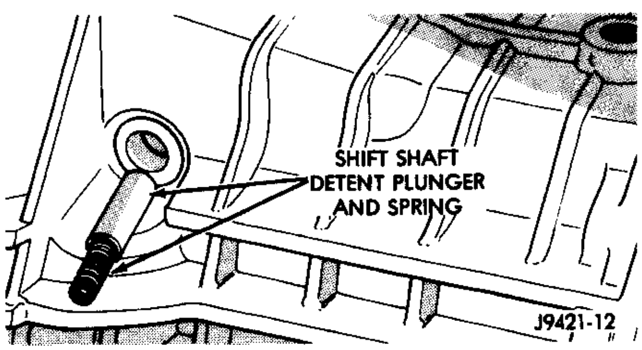

Fig. 15 Detent Plunger And Spring Removal

(13) Remove bolts that attach front housing to rear housing (Fig. 16). Three bolts at extreme rear of housing are actually for the output shaft bearing retainer. It is not necessary to remove all three bolts at this time. Leave at least one bolt in place until rear case is ready to be removed.

(14) Separate front housing from rear housing (Fig. 17). Use plastic mallet to tap front housing off alignment dowels.

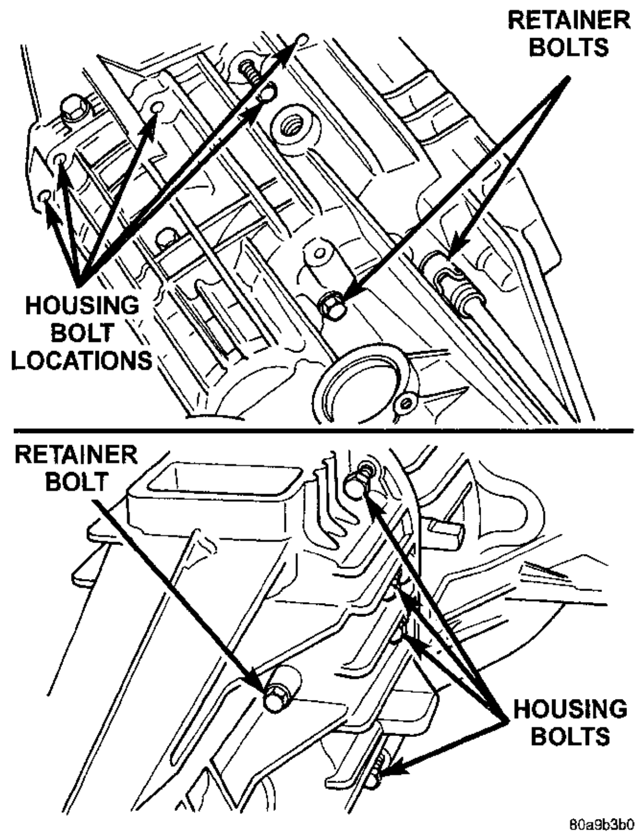

Fig. 16 Housing And Bearing Retainer Bolt Locations

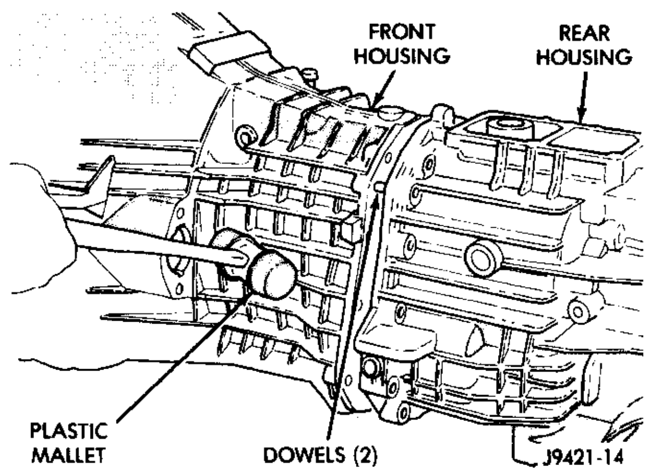

Fig. 17 Front Housing Removal

DISASSEMBLY AND ASSEMBLY (Continued)

(15) Remove input shaft bearing and countershaft front bearing from front case (Fig. 18). Countershaft bearing can be removed by hand.

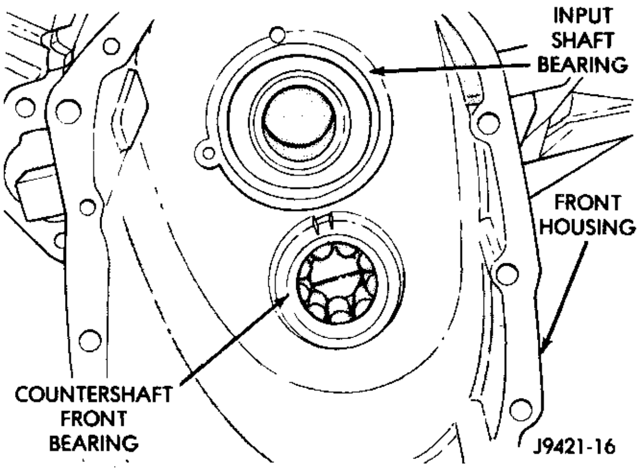

Fig. 18 Input Shaft And Countershaft Front Bearing Location

(16) Note position of input shaft, shift shaft and forks, and geartrain components in housing (Fig. 19).

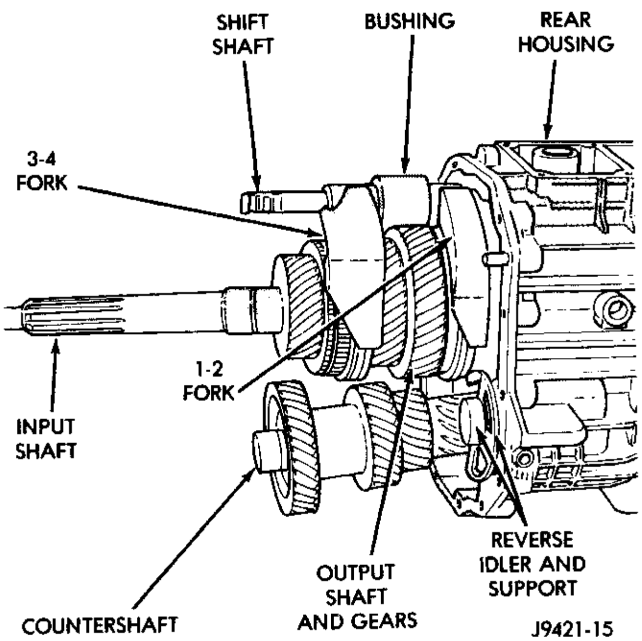

Fig. 19 Geartrain And Shift Component Identification

SHIFT SHAFT, SHIFT FORKS AND REVERSE IDLER SEGMENT REMOVAL

(1) Place shop towel over shaft lever and bushing to contain lever detent ball and spring.

(2) Rotate lever and bushing upward out of shift forks and catch ball and spring as they exit shaft lever (Fig. 20).

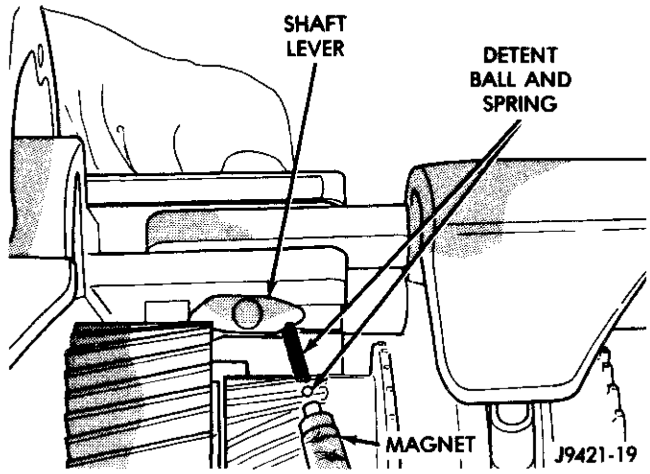

Fig. 20 Removing Shift Shaft Lever Detent Ball And Spring

(3) Unseat roll pin that secures shift socket to shift shaft with Special Tool 6858 as follows:

(a) Position Tool 6858 on shift socket. Then center tool over roll pin. Be sure tool legs are firmly seated on shift socket (Fig. 21).

(b) Tilt socket toward side of case. This places roll pin at slight angle to avoid trapping pin between gear teeth.

(c) Tighten tool punch to press roll pin downward and out of shift socket (Fig. 21). Roll pin does not have to come completely out of shift shaft; it only has to clear shift socket. Be careful not to drive roll pin out of shaft far enough to jam into the geartrain.

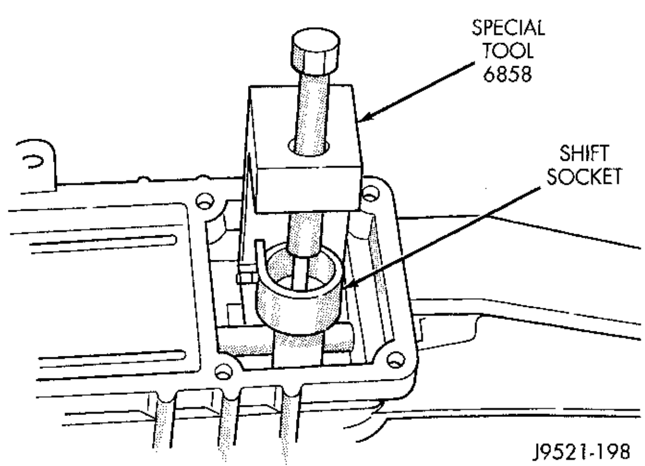

Fig. 21 Unseating Shift Socket Roll Pin With Tool 6858

DISASSEMBLY AND ASSEMBLY (Continued)

(4) Drive out roll pin that secures shift bushing and lever to shift shaft (Fig. 22).

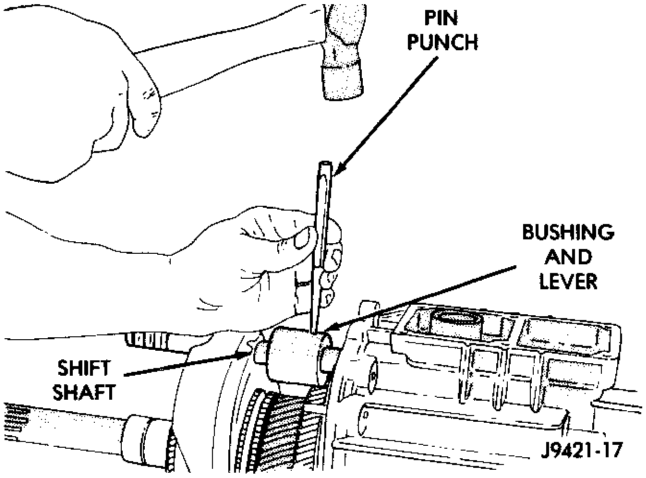

Fig. 22 Removing Shift Shaft Lever And Bushing Roll Pin

(5) Pull shift shaft straight out of rear housing, shift socket, fifth-reverse fork, and 1-2 fork (Fig. 23).

(6) Remove shift socket from rear housing (Fig. 24).

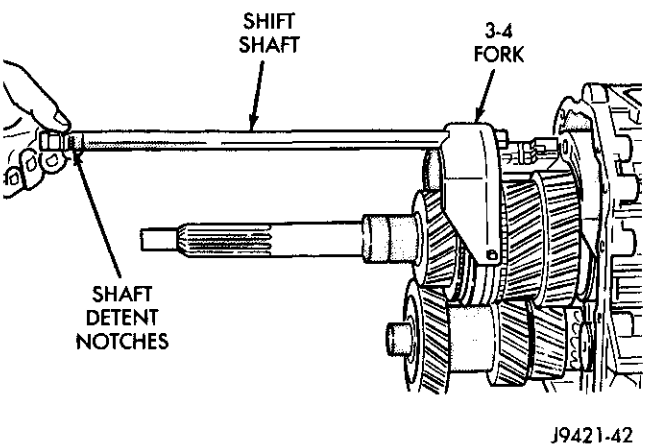

Fig. 23 Shift Shaft Removal

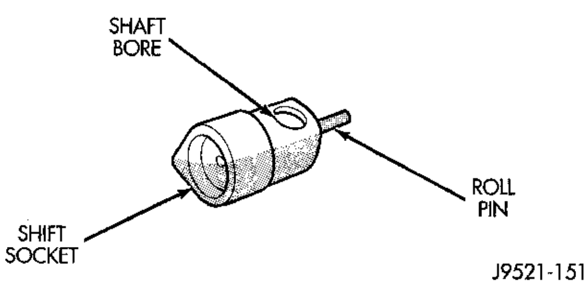

Fig. 24 Shift Socket And Roll Pin

(7) Remove lever and bushing (Fig. 25).

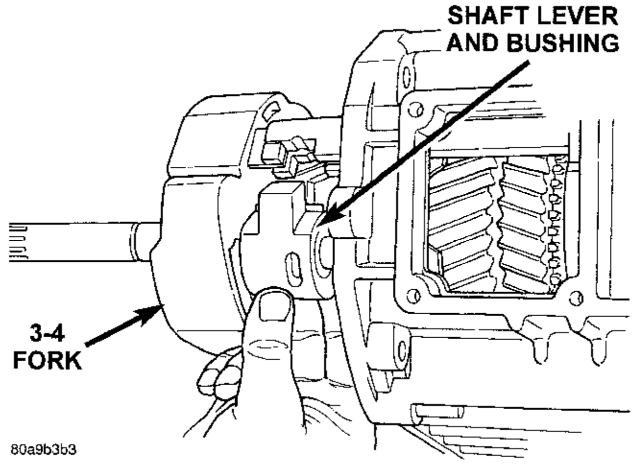

Fig. 25 Removing Shift Shaft Lever And Bushing

(8) Remove 3-4 fork. Rotate 3-4 fork around synchro sleeve until fork clears shift arms on 1-2 and fifth-reverse forks. Then remove 3-4 fork (Fig. 26).

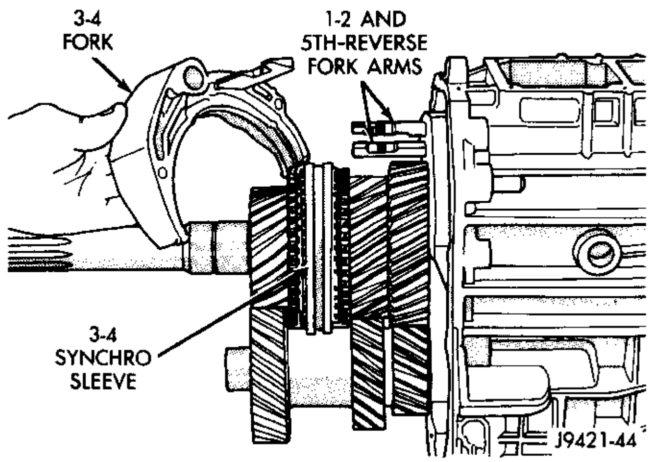

Fig. 26 Removing 3-4 Shift Fork

DISASSEMBLY AND ASSEMBLY (Continued)

(9) Remove the front reverse idler shaft bolt.
(10) Loosen rear reverse idler shaft bolt.
(11) Remove reverse idler shaft support segment by sliding it straight out of housing.
(12) Support geartrain and rear housing on Assembly Fixture Tool 6747 as follows:
(a) Adjust height of reverse idler pedestal rod until the reverse idle shaft bottoms in Cup 8115.
(b) Position Adapters 6747-1A and 6747-2A on Assembly Fixture 6747.
(c) Slide fixture tool onto input shaft, countershaft and idler gear (Fig. 27).
(d) Stand geartrain and rear housing upright on fixture (Fig. 28). Have helper hold fixture tool in place while housing and geartrain is being rotated into upright position.

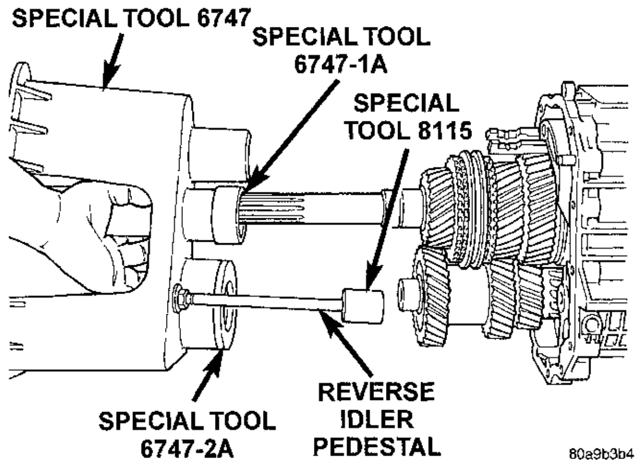

Fig. 27 Installing Assembly Fixture On Geartrain

(13) Remove rear bolt holding reverse idler shaft in housing.

REAR HOUSING REMOVAL—2WD

(1) On 2-wheel drive transmission, remove three bolts that attach output shaft bearing retainer to rear case (Fig. 29). Bolts are rear of shift tower opening.
(2) Unseat output shaft bearing from bearing bore in rear housing. Use plastic or rawhide mallet to tap rear housing upward and off output shaft bearing as shown (Fig. 30).
(3) Lift rear housing up and off geartrain (Fig. 31).
(4) Remove countershaft rear bearing from countershaft (Fig. 32).
(5) Examine condition of bearing bore and idler shaft notch in rear housing. Replace housing if any of these components are damaged.

REAR ADAPTER HOUSING REMOVAL—4WD

(1) Locate dimples in face of rear seal (Fig. 33). Use a suitable slide hammer mounted screw to remove seal by inserting screw into seal at dimple locations (Fig. 34).

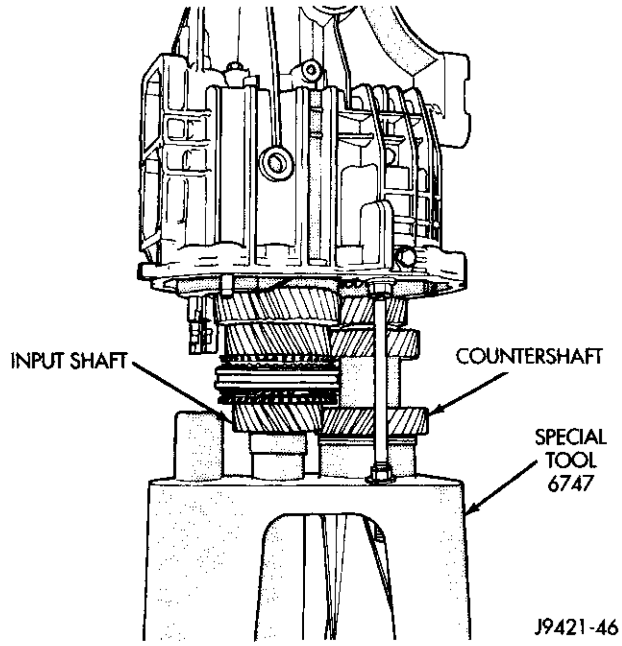

Fig. 28 Geartrain And Housing Mounted On Fixture Tool

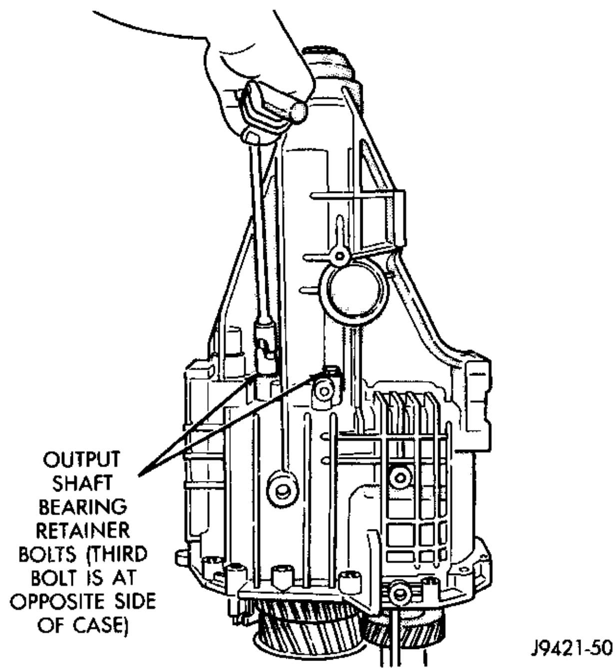

Fig. 29 Removing/Installing Output Shaft Bearing Retainer Bolts—2WD

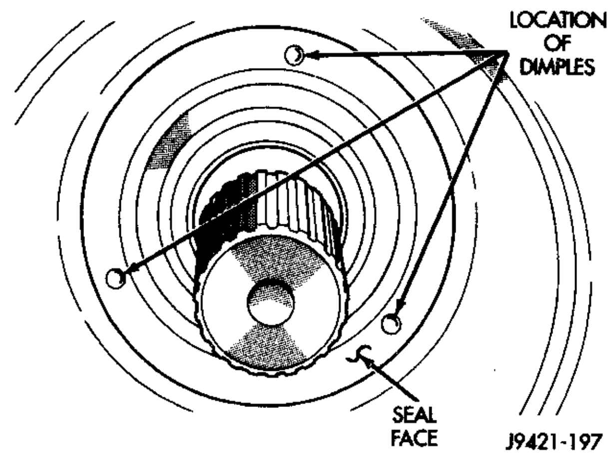

Fig. 33 Location Of Dimples In Seal Face—4WD

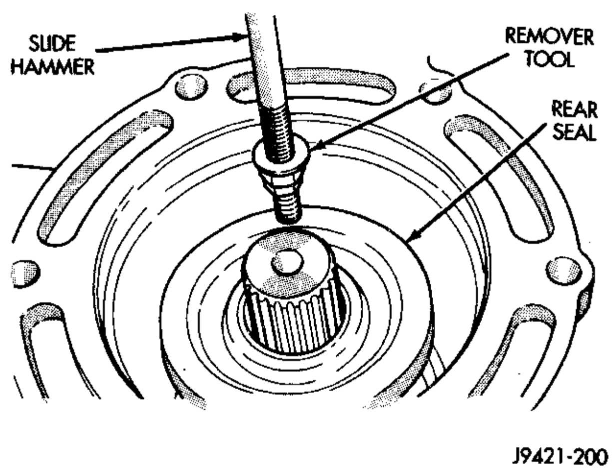

Fig. 34 Rear Seal Removal—4WD

DISASSEMBLY AND ASSEMBLY (Continued)

(2) Remove rear bearing snap ring from output shaft with heavy duty snap ring pliers (Fig. 35).

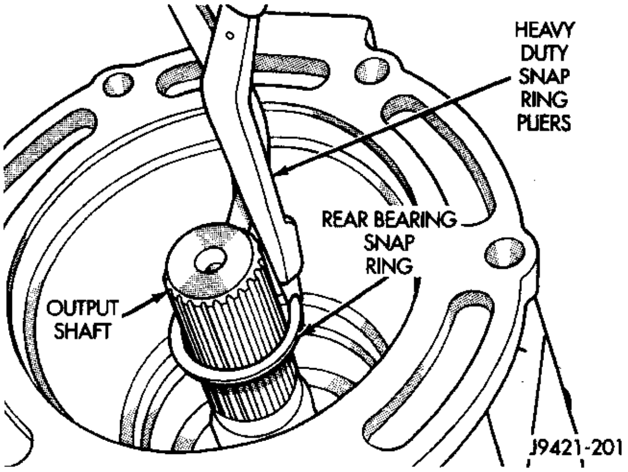

Fig. 35 Rear Bearing Snap Ring Removal—4WD

(3) Lift rear adapter housing upward and off geartrain (Fig. 36).

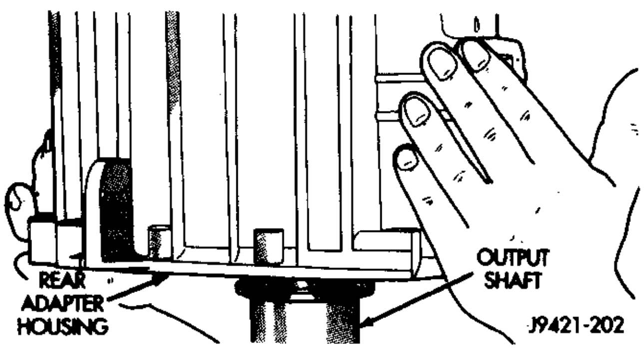

Fig. 36 Rear Adapter Housing Removal

(4) Remove bearing retainer bolts and remove rear bearing retainer and rear bearing (Fig. 37). Use hammer handle to push or tap bearing out of housing if needed.

(5) Examine condition of bearing bore, countershaft rear bearing race and idler shaft notch in rear housing. Replace housing if race, bore or notch are worn or damaged.

GEARTRAIN DISASSEMBLY FROM FIXTURE

(1) Remove reverse idler gear assembly from assembly fixture cup.

(2) Remove 1-2 and fifth-reverse forks from synchro sleeves.

(3) Slide countershaft out of fixture tool.

(4) Remove output shaft bearing retainer from rear surface of fifth gear (retainer will drop onto gear after bolts are removed).

(5) Lift and remove output shaft and gears off input shaft.

(6) Lift and remove input shaft, pilot bearing and fourth gear synchro ring from assembly fixture tool.

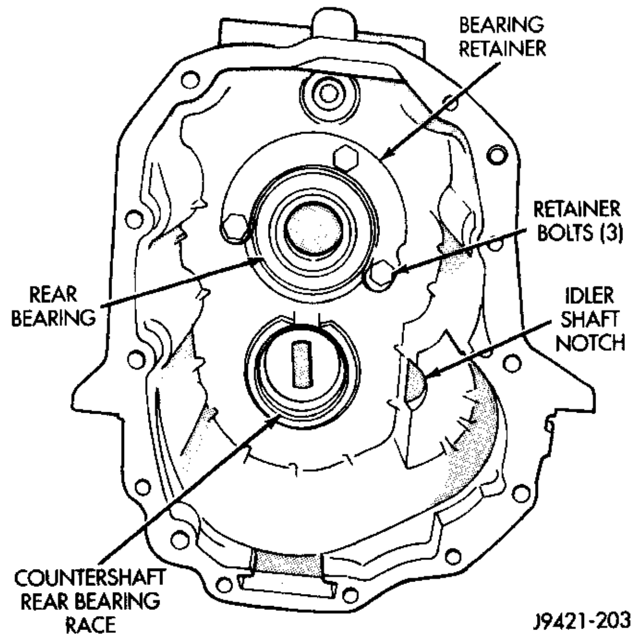

Fig. 37 Rear Adapter Housing Components

OUTPUT SHAFT DISASSEMBLY

NOTE: The synchronizer hubs and sleeves are different and must not be intermixed. It is recommended that each synchronizer unit be removed as an assembly to avoid intermixing parts. It is also recommended that each synchro hub and sleeve be marked with a scriber or paint for correct assembly reference.

(1) Remove snap ring that secures 3-4 synchro hub on output shaft.

(2) Remove 3-4 synchro assembly, third gear synchro ring, and third gear with shop press and Remover Tool 1130. Position Tool 1130 between second and third gears.

(3) Remove third gear needle bearing (Fig. 38).

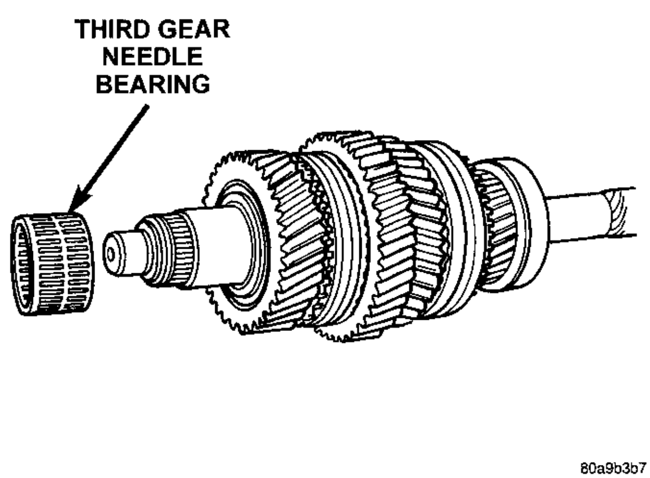

Fig. 38 Third Gear Needle Bearing Removal

DISASSEMBLY AND ASSEMBLY (Continued)

(4) Remove retaining ring that secures two-piece thrust washer on shaft (Fig. 39). Use small pry tool to remove retaining ring.

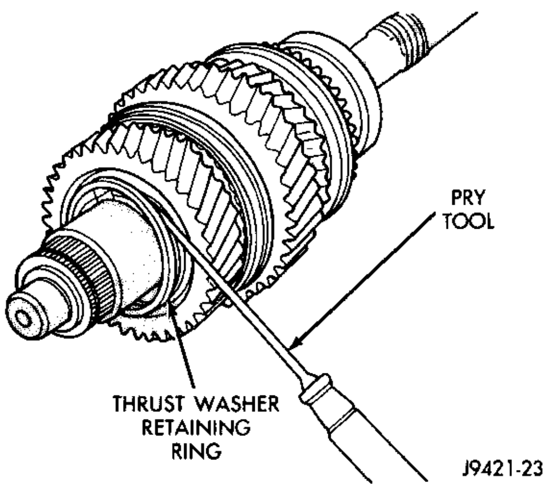

Fig. 39 Thrust Washer Retaining Ring Removal

(5) Remove two-piece thrust washer (Fig. 40). Note position of washer locating lugs in shaft notches for installation reference.

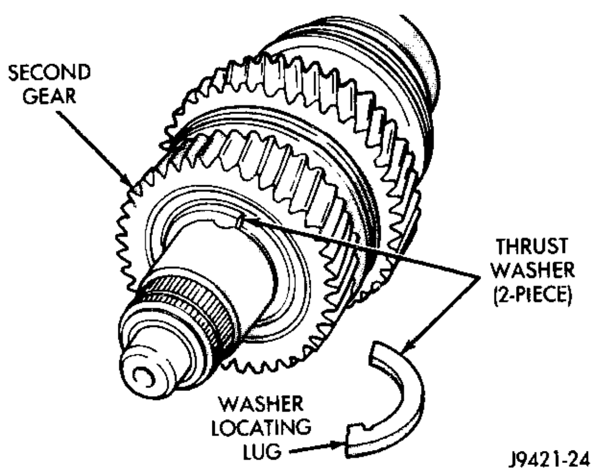

Fig. 40 Two-Piece Thrust Washer Removal

(6) Remove second gear and needle bearing (Fig. 41).

(7) Remove second gear synchro ring (Fig. 42). Then remove the 1–2 synchro hub snap ring.

(8) Remove 1-2 synchro hub and sleeve and first gear from output shaft with shop press and Remover Tool 1130 (Fig. 43). Position Tool 1130 between first and reverse gears.

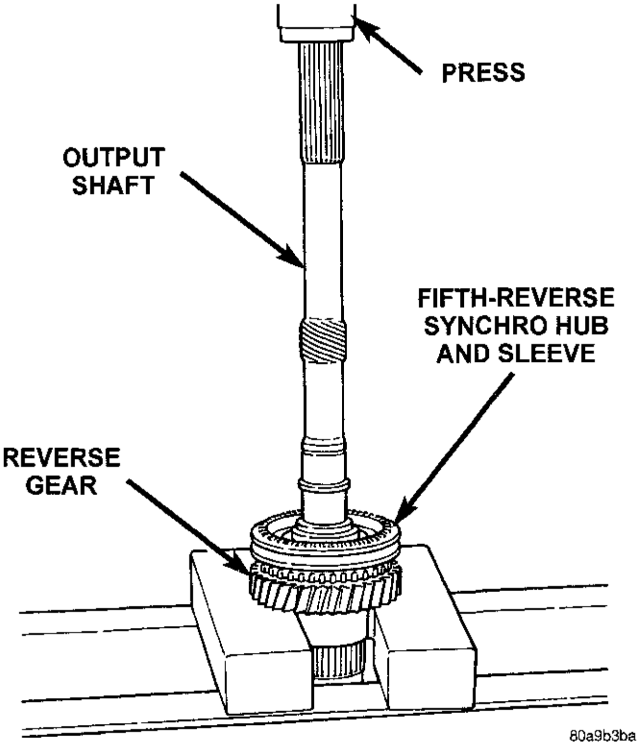

Fig. 49 Fifth-Reverse Synchro Hub And Sleeve Removal

(16) Remove reverse gear and needle bearing (Fig. 50).

REVERSE IDLER DISASSEMBLY

(1) Remove idler gear snap rings (Fig. 51).
(2) Remove thrust washer, wave washer, thrust plate and idler gear from shaft.
(3) Remove idler gear needle bearing from shaft.

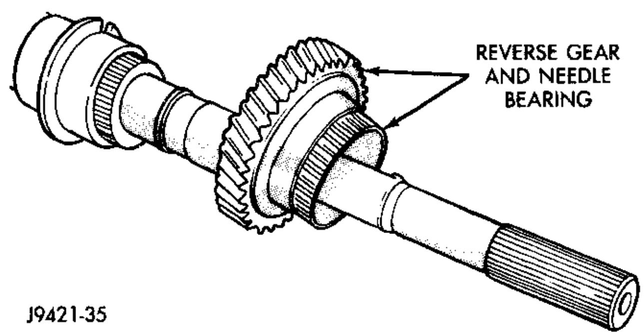

Fig. 50 Reverse Gear And Needle Bearing Removal

ASSEMBLY

Gaskets are not used in the NV3500 transmission. Sealers are used at all case joints. Recommended sealers are Mopar® Gasket Maker for all case joints and Mopar® silicone sealer, or equivalent, for the input shaft bearing retainer. Apply these products as indicated in the assembly procedures.

NOTE: It is very important that the transmission shift components be in Neutral position during assembly. This is necessary to prevent damaging synchro and shift components when the housings are installed.

The 3-4, 1-2 and fifth-reverse synchro hub snap rings can be fitted selectively. New snap rings are available in 0.05 mm (0.0019 in.) thickness increments. Use the thickest snap ring that will fit in each snap ring groove.

SYNCHRO COMPONENT ASSEMBLY

The easiest method of assembling each synchro is to install the springs, struts and detent balls one at a time as follows:

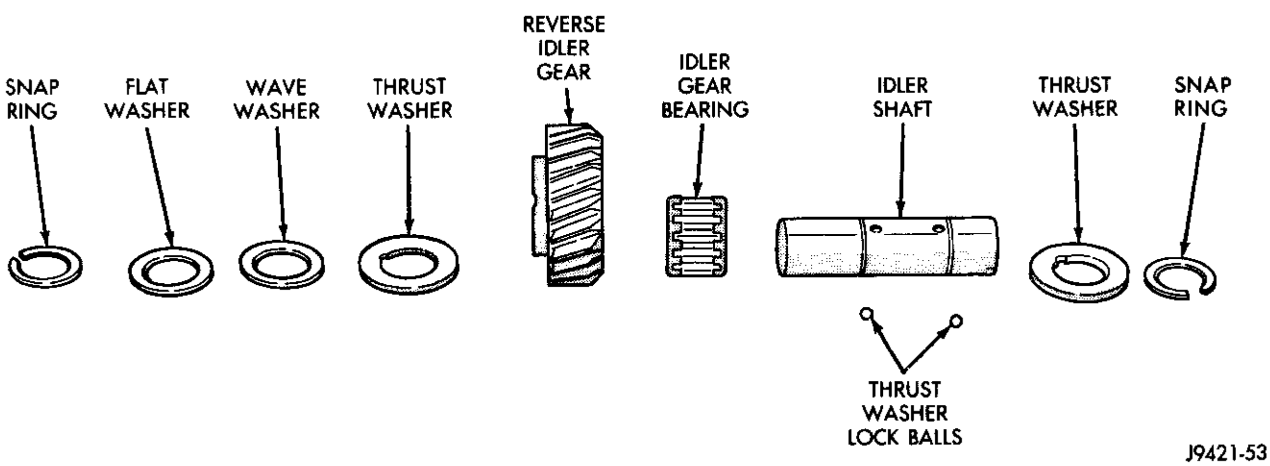

Fig. 51 Reverse Idler Components

DISASSEMBLY AND ASSEMBLY (Continued)

(1) Slide the sleeve part way onto the hub. Leave enough room to install the spring in the hub and the strut in the hub groove.

(2) Install the first spring in the hub. Then install a strut over the spring. Be sure the spring is seated in the spring bore in the strut.

(3) Slide the sleeve onto the hub just far enough to hold the first strut and spring in place.

(4) Place the detent ball in the top of the strut. Then carefully work the sleeve over the ball to hold it in place. A small flat blade screwdriver can be used to press the ball into place while moving the sleeve over it.

(5) Repeat the procedure for the remaining springs, struts and balls. Tape, or a rubber band can be used to temporarily secure each strut and ball as they are installed.

(6) Verify synchro assembly. Be sure the three springs, struts and detent balls are all in place (Fig. 52).

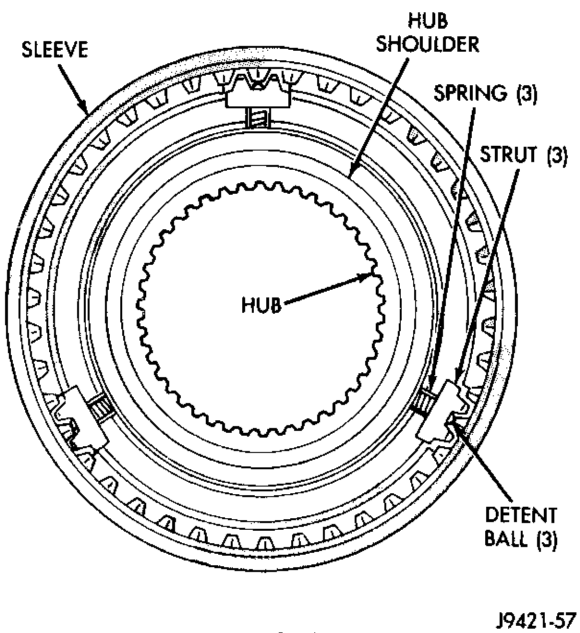

Fig. 52 Assembled View Of Synchro Components

OUTPUT SHAFT ASSEMBLY

(1) Lubricate shaft, gears and bearings with recommended lubricant during assembly. Petroleum jelly can be used to hold parts in place.

(2) Check bearing surfaces of output shaft for nicks or scratches. Smooth surfaces with 320/400 grit emery cloth if necessary. Apply oil to emery cloth and shaft surface before polishing.

(3) Inspect and replace any synchro ring that exhibits wear or damage. Completely immerse each synchro ring in lubricant before installation.

(4) Lubricate and install reverse gear needle bearing on shaft (Fig. 53). Slide bearing up against shoulder on output shaft.

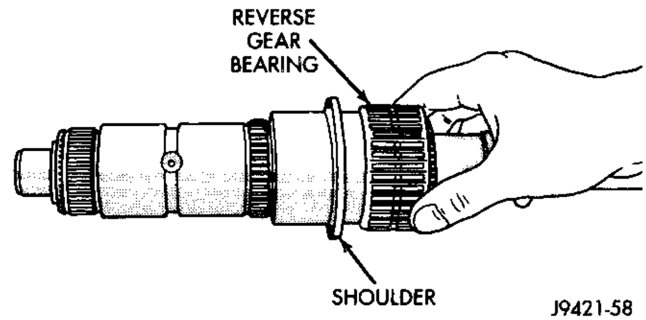

Fig. 53 Reverse Gear Bearing Installation

(5) Install reverse gear over needle bearing (Fig. 54).

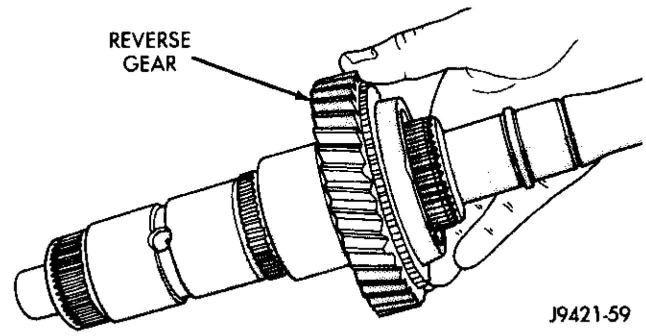

Fig. 54 Reverse Gear Installation

(6) Install solid brass synchro ring on reverse gear (Fig. 55).

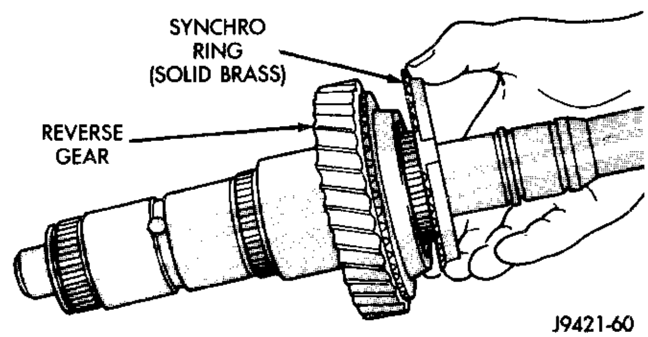

Fig. 55 Reverse Gear Synchro Ring Installation

(7) Assemble fifth-reverse synchro hub, sleeve, struts, springs and detent balls, if not previously done.

CAUTION: The fifth-reverse synchro hub and sleeve can be installed backwards if care is not exercised. One side of the hub has shoulders around the hub bore. Make sure this side of the hub is facing the rear of the shaft. In addition, one side of the sleeve is tapered. Be sure the sleeve is installed so the tapered side will be facing the front of the shaft.

DISASSEMBLY AND ASSEMBLY (Continued)

(8) Start fifth-reverse synchro assembly on output shaft splines by hand. Then seat synchro onto shaft with shop press and Remover 6310-1 (Fig. 56).

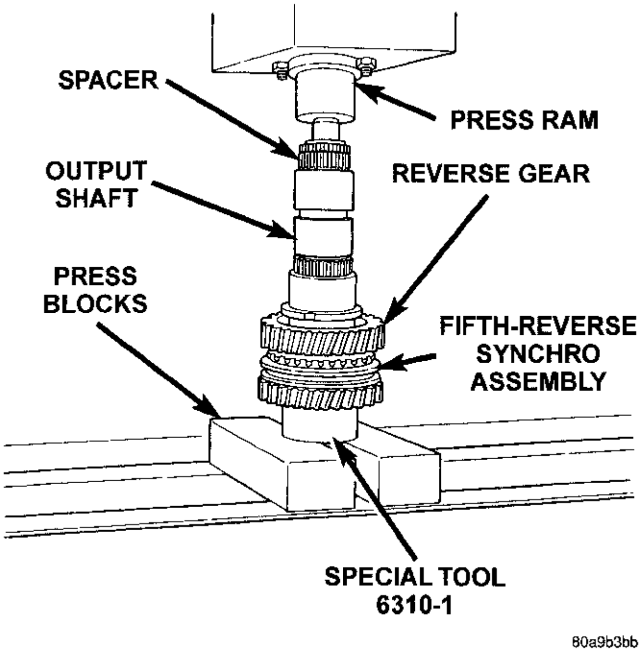

Fig. 56 Fifth-Reverse Synchro Assembly Installation

(9) Install new fifth-reverse hub snap ring (Fig. 57) as follows:

(a) Snap rings are available in thicknesses from 2.00 mm to 2.20 mm (0.078 to 0.086 in.).

(b) Install thickest snap ring that will fit in shaft groove.

(c) Verify that snap ring is completely seated in groove before proceeding.

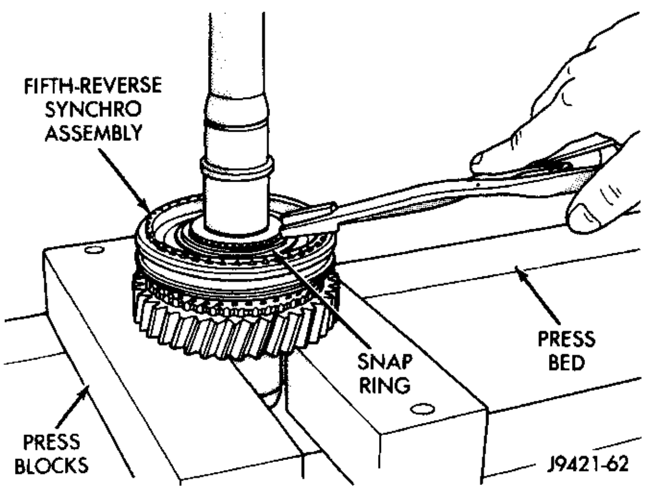

Fig. 57 Installing Fifth-Reverse Synchro Hub Snap Ring

(10) Install fifth gear synchro ring in synchro hub and sleeve (Fig. 58).

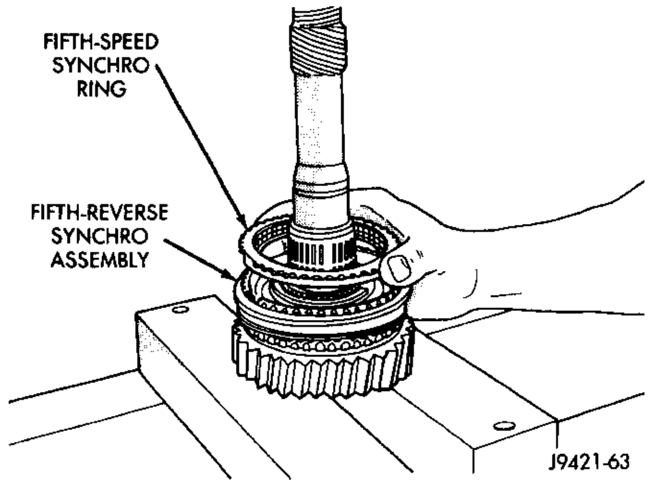

Fig. 58 Installing Fifth Gear Synchro Ring

(11) Install fifth gear bearing. Spread bearing only enough to clear shoulder on output shaft (Fig. 59). Be sure bearing is properly seated after installation.

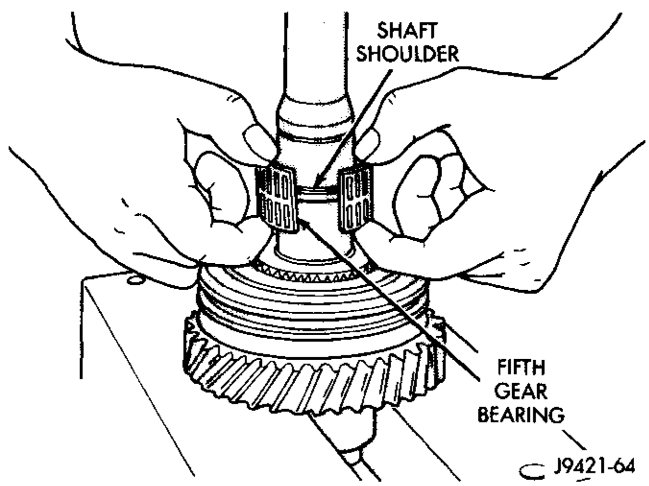

Fig. 59 Installing Fifth Gear Bearing

DISASSEMBLY AND ASSEMBLY (Continued)

(12) Install fifth gear on shaft and onto bearing (Fig. 60).

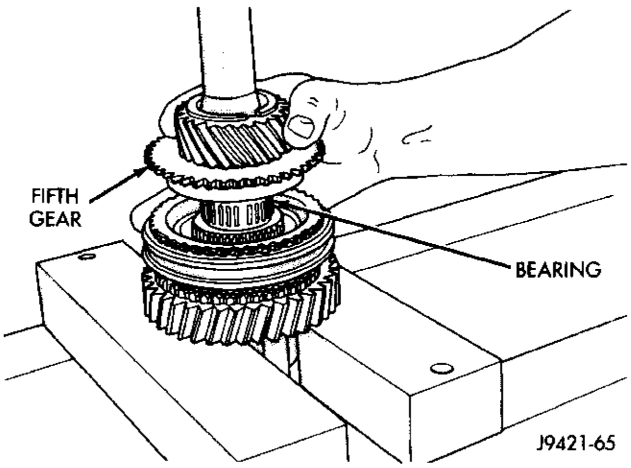

Fig. 60 Fifth Gear Installation

(13) Invert output shaft and set the shaft in Remover 6310-1 so that fifth gear is seated on the tool (Fig. 61).

(14) Install first gear bearing on output shaft (Fig. 61). Be sure bearing is seated on shaft shoulder and is properly joined.

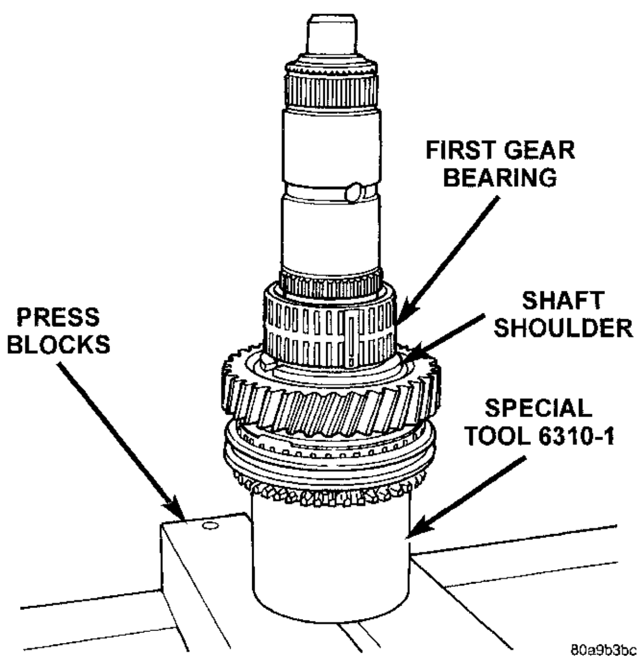

Fig. 61 First Gear Bearing Installation

(15) Install first gear on shaft and over bearing (Fig. 62). Make sure bearing synchro cone is facing up as shown.

(16) Install first gear synchro ring (Fig. 63).

(17) Assemble 1-2 synchro hub sleeve, springs, struts and detent balls.

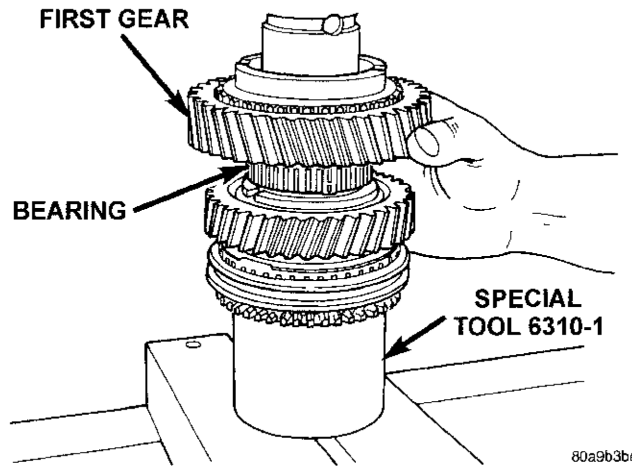

Fig. 62 First Gear Installation

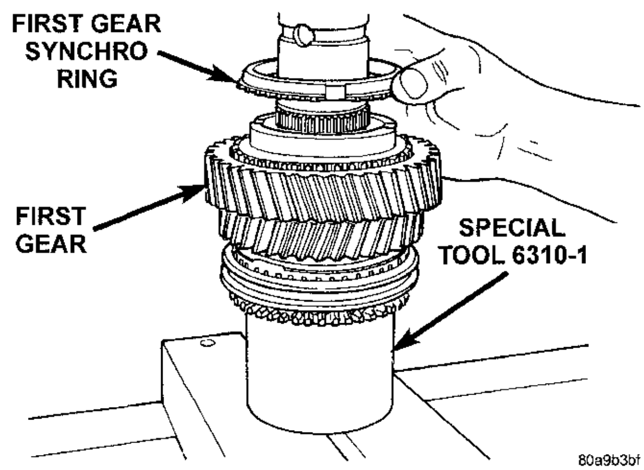

Fig. 63 First Gear Synchro Ring Installation

CAUTION: The 1-2 synchro hub and sleeve can be installed backwards if care is not exercised. One side of the hub has a small diameter shoulder around the hub bore. Make sure this side of the hub faces the forward end of the output shaft. In addition, one side of the synchro sleeve is marked First Gear Side. Be sure this side of the sleeve will face first gear after installation.

(18) Start 1-2 synchro assembly on shaft by hand (Fig. 64). Be sure synchro sleeve is properly positioned. Side marked first side must be facing first gear.

(19) Press 1-2 synchro onto output shaft using suitable size pipe tool and shop press (Fig. 65).

CAUTION: Take time to align the synchro ring and sleeve as hub the is being pressed onto the shaft. The synchro ring can be cracked if it becomes misaligned.

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

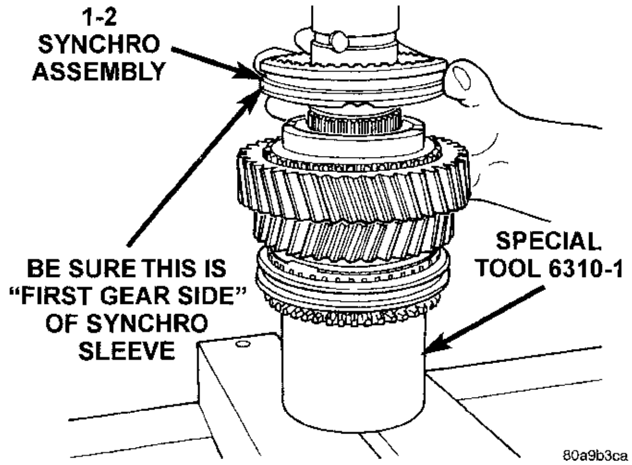

Fig. 64 Starting 1-2 Synchro On Shaft

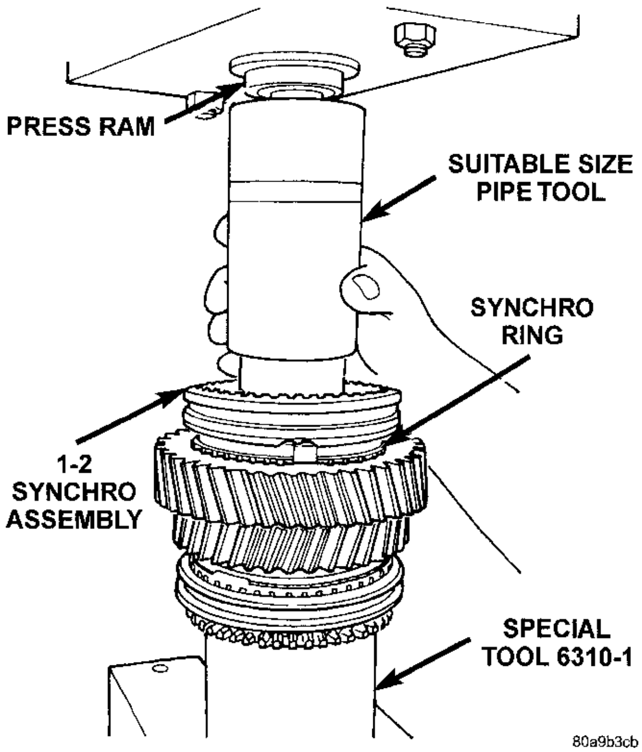

Fig. 65 Pressing 1-2 Synchro Assembly Onto Output Shaft

(20) Install new 1-2 synchro hub snap ring (Fig. 66) as follows:

(a) Snap rings are available in thicknesses from 1.80 mm to 2.00 mm (0.070 to 0.078 in.).

(b) Install thickest snap ring that will fit in shaft groove.

(c) Verify that snap ring is completely seated in groove before proceeding.

(21) Install second gear synchro ring in 1-2 synchro hub and sleeve (Fig. 67). Be sure synchro ring is properly seated in sleeve.

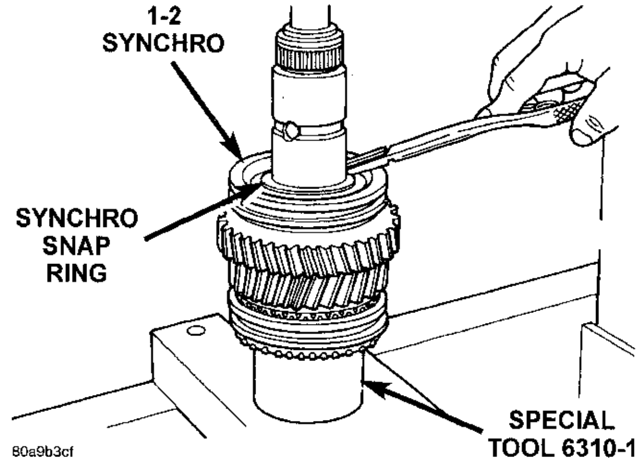

Fig. 66 Installing 1-2 Synchro Hub Snap Ring

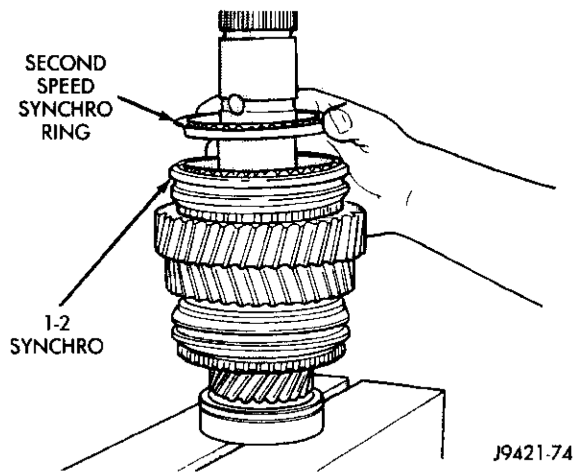

Fig. 67 Second Gear Synchro Ring Installation

(22) Install second gear needle bearing on shaft (Fig. 68).

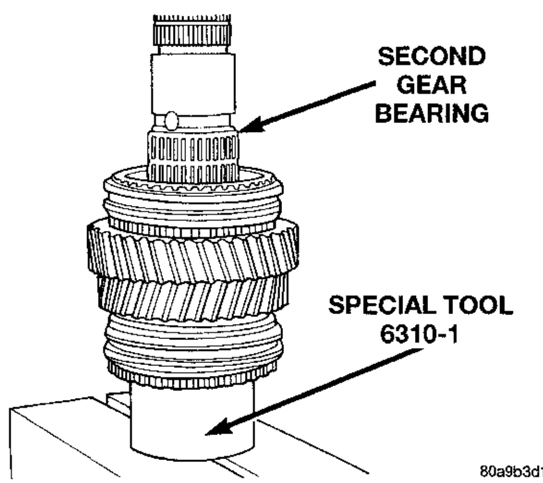

Fig. 68 Second Gear Bearing Installation

DISASSEMBLY AND ASSEMBLY (Continued)

(23) Install second gear onto shaft and bearing (Fig. 69). Make sure that second gear is fully seated on synchro components.

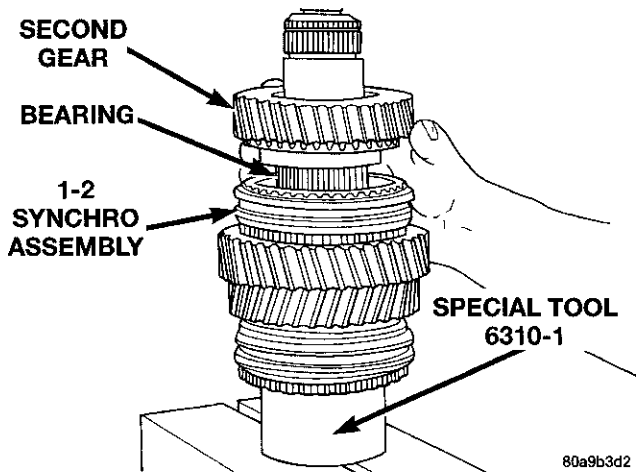

Fig. 69 Second Gear Installation

(24) Install two-piece thrust washer (Fig. 70). Be sure washer halves are seated in shaft groove and that washer lugs are seated in shaft lug bores. Also, ensure that the i.d. grooves and markings noted during removal are facing the correct direction.

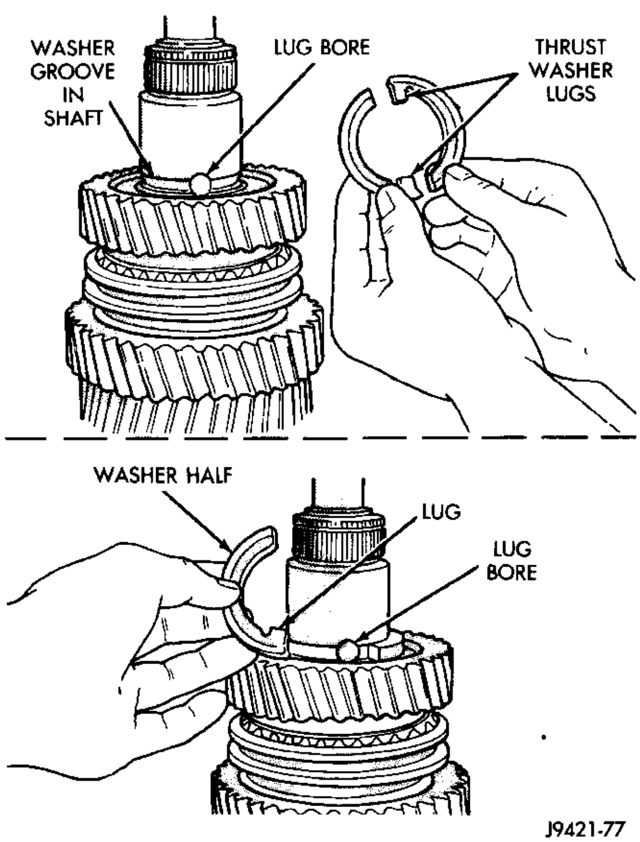

Fig. 70 Installing Two-Piece Thrust Washer

(25) Start retaining ring around two-piece thrust washer (Fig. 71). Make sure that the locating dimple is between the thrust washer halves.

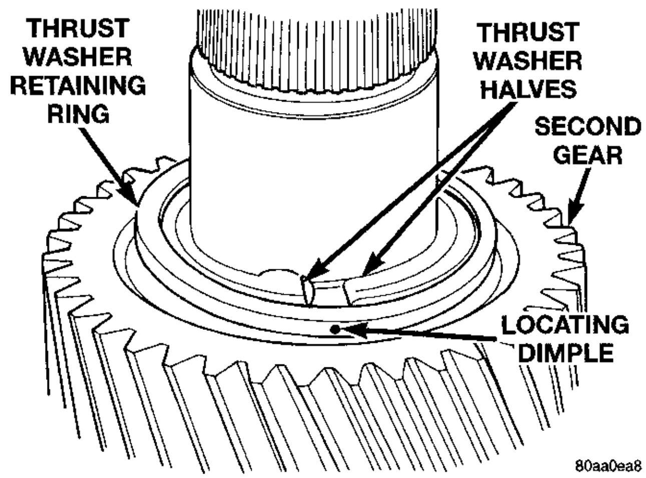

Fig. 71 Starting Retaining Ring Over Two-Piece Thrust Washer

(26) Seat thrust washer retaining ring with plastic mallet (Fig. 72).

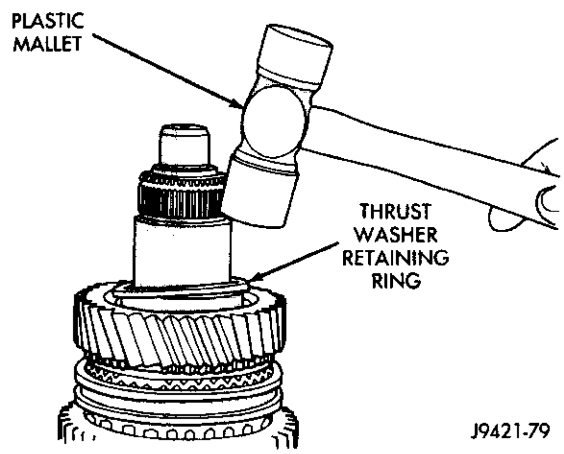

Fig. 72 Seating Thrust Washer Retaining Ring

DISASSEMBLY AND ASSEMBLY (Continued)

(27) Install third gear needle bearing on shaft (Fig. 73).

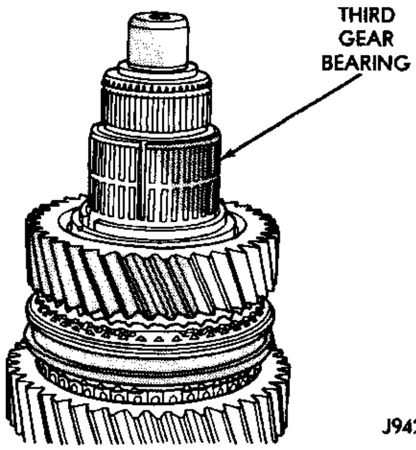

Fig. 73 Third Gear Bearing Installation

(28) Install third gear on shaft and bearing (Fig. 74).

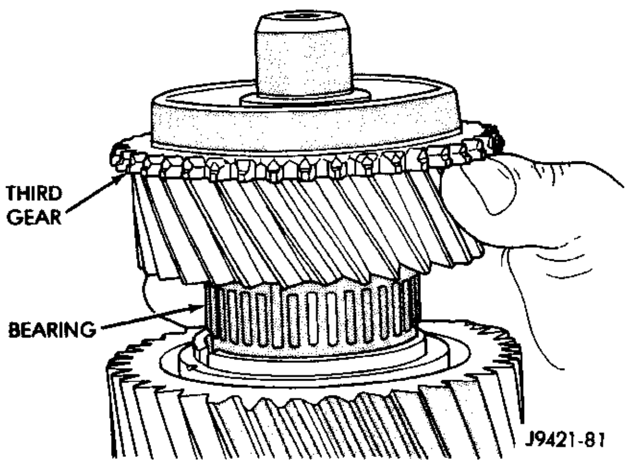

Fig. 74 Installing Third Gear

(29) Install third gear synchro ring on third gear (Fig. 75).

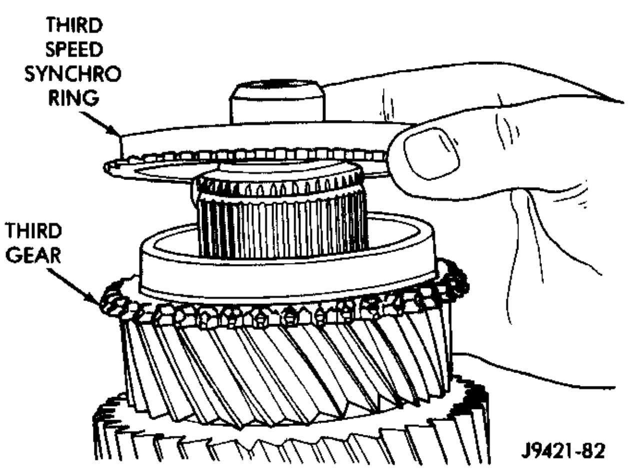

Fig. 75 Third Gear Synchro Ring Installation

(30) Assemble 3-4 synchro hub, sleeve, springs, struts and detent balls.

CAUTION: The 3-4 synchro hub and sleeve can be installed backwards if care is not exercised. One side of the hub has shoulders around the hub bore. Make sure this side of the hub is facing the front of the shaft. In addition, one side of the sleeve has grooves in it. Be sure this side of sleeve is also facing the front of the shaft.

(31) Start 3-4 synchro hub on output shaft splines by hand (Fig. 76).

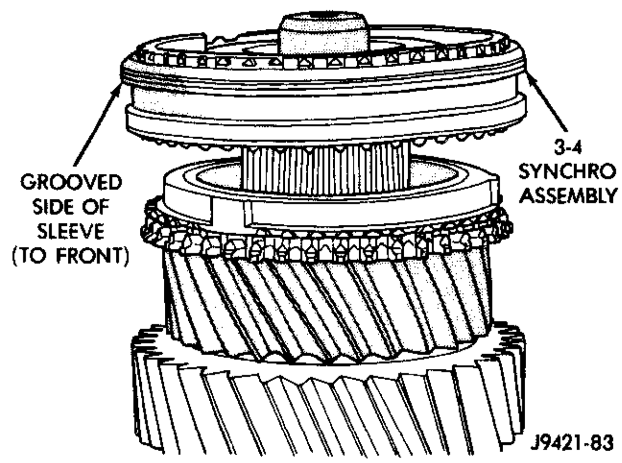

Fig. 76 Starting 3-4 Synchro Hub On Output Shaft

(32) Press 3-4 synchro assembly onto output shaft with shop press and suitable size pipe tool (Fig. 77). Make sure that the tool presses on hub as close to output shaft as possible but does not contact the shaft splines.

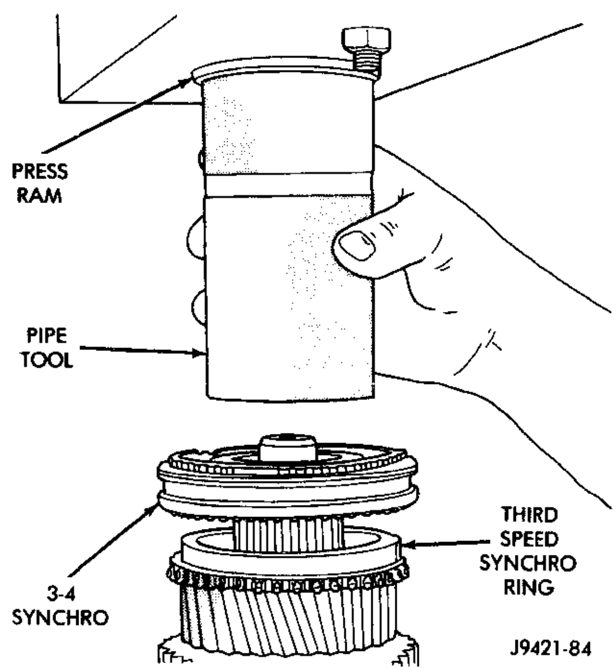

Fig. 77 Pressing 3-4 Synchro Assembly On Output Shaft

DISASSEMBLY AND ASSEMBLY (Continued)

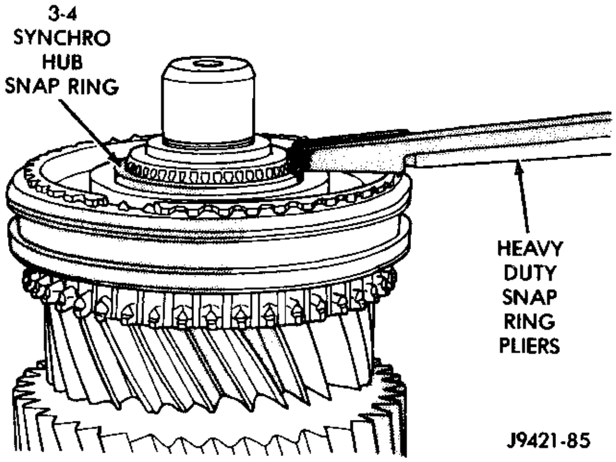

Fig. 78 Installing 3-4 Synchro Hub Snap Ring

(33) Install 3-4 synchro hub snap ring (Fig. 78) as follows:

(a) Snap rings are available in thicknesses from 2.00 mm to 2.30 mm (0.078 to 0.090 in.).

(b) Install thickest snap ring that will fit in shaft groove. Use heavy duty snap ring pliers to install new ring.

(c) Verify that snap ring is completely seated in groove before proceeding.

(34) Install output shaft bearing.

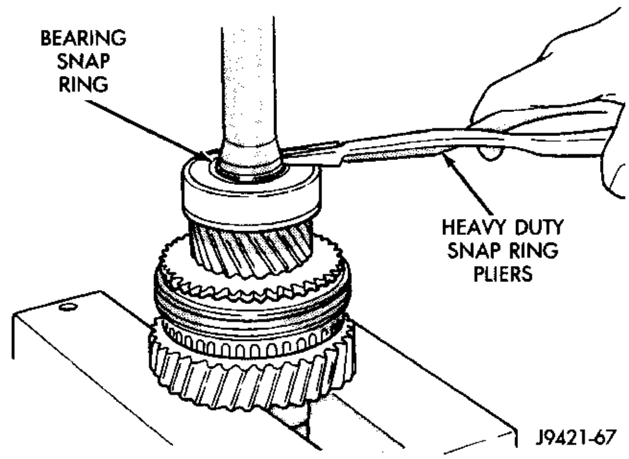

Fig. 79 Installing Output Shaft Bearing Snap Ring

(35) Install output shaft bearing snap ring (Fig. 79). Use heavy duty snap ring pliers and spread snap ring only enough to install it. Be sure snap ring is completely seated in shaft groove before proceeding.

(36) Verify correct position of synchro sleeves before proceeding with assembly operations (Fig. 80). Grooved side of 3-4 sleeve should be facing forward. First gear side of 1-2 sleeve should be facing first gear. Tapered side of fifth-reverse sleeve should be facing forward.

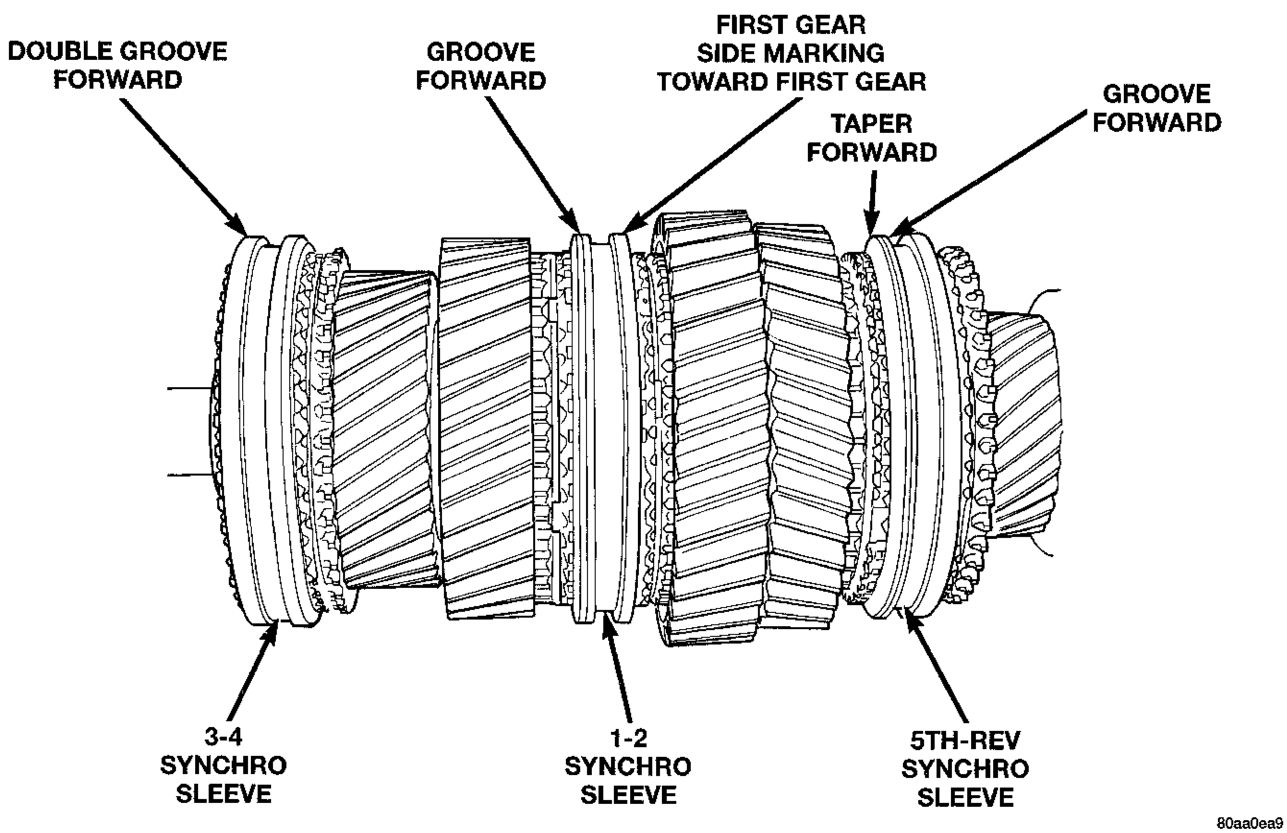

Fig. 80 Correct Synchro Sleeve Position

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

REVERSE IDLER ASSEMBLY

(1) Lubricate idler components with gear lube.

(2) Slide idler gear bearing on shaft (Fig. 81). Bearing fits either way on shaft.

(3) Slide gear onto shaft. Side of gear with recess goes to rear (Fig. 81).

(4) Place first lock ball in dimple at rear end of idler shaft (Fig. 81). Petroleum jelly can be used to hold ball in place if desired.

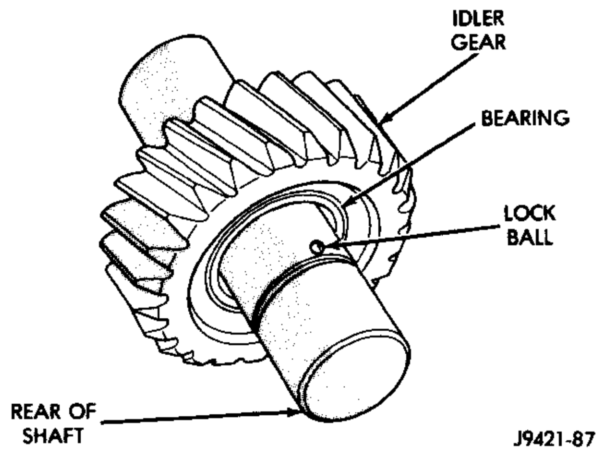

Fig. 81 Idler Gear And Bearing Installation

(5) Slide thrust rear thrust washer onto shaft and over lock ball (Fig. 82).

(6) Install snap ring in groove at rear of shaft (Fig. 82).

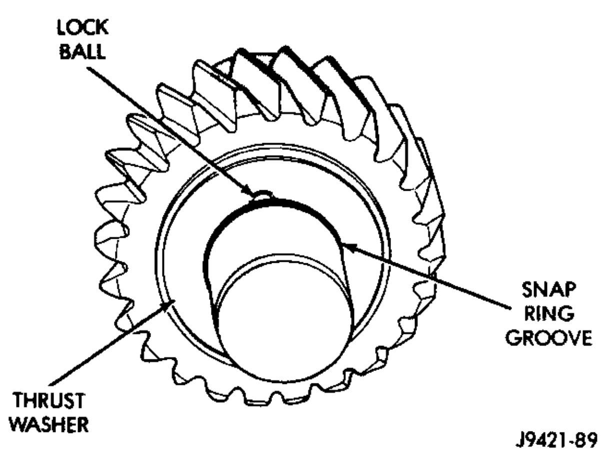

Fig. 82 Idler Gear Rear Thrust Washer Installation

(7) Install lock ball in dimple at front of shaft. Hold ball in place with petroleum jelly if desired.

(8) Install front thrust washer on shaft and slide washer up against gear and over lock ball (Fig. 83).

(9) Install wave washer, flat washer and remaining snap ring on idler shaft (Fig. 83). Be sure snap ring is fully seated.

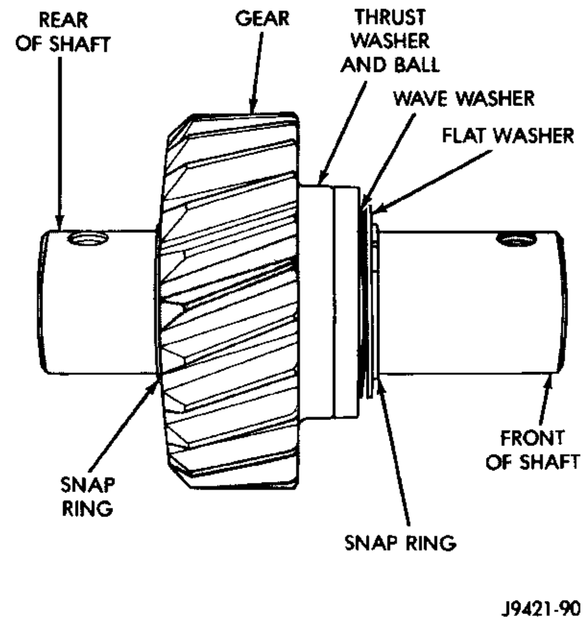

Fig. 83 Idler Gear And Shaft Assembly

SHIFT SHAFT AND DETENT PLUNGER BUSHINGS/BEARINGS

(1) Inspect shift shaft bushing and bearing for damage.

(2) If necessary, the shift shaft bushing can be replaced as follows:

(a) Locate a bolt that will thread into the bushing without great effort.

(b) Thread the bolt into the bushing, allowing the bolt to make its own threads in the bushing.

(c) Attach a slide hammer or suitable puller to the bolt and remove bushing.

(d) Use the short end of Installer 8119 to install the new bushing.

(e) The bushing is correctly installed if the bushing is flush with the transmission case.

(3) If necessary, the shift shaft bearing can be replaced as follows:

(a) Locate a bolt that will thread into the bearing without great effort.

(b) Thread the bolt into the bearing as much as possible.

(c) Attach a slide hammer or suitable puller to the bolt and remove the bearing.

(d) Use the short end of Installer 8119 to install the new bearing.

(e) The bearing is correctly installed if the bearing is flush with the transmission case.

(4) Inspect detent plunger bushings for damage.

DISASSEMBLY AND ASSEMBLY (Continued)

NOTE: The detent plunger bushings are installed to a specific depth. The space between the two bushings when correctly installed contain an oil feed hole. Do not attempt to install the bushings with anything other than the specified tool or this oil hole may become restricted.

(5) If necessary, the detent plunger bushings can be replaced as follows:

(a) Using the long end of Installer 8119, drive the detent bushings through the outer case and into the shift shaft bore.

(b) Remove the bushings from the shift shaft bore.

(c) Install a new detent plunger bushing on the long end of Installer 8118.

(d) Start the bushing in the detent plunger bore in the case.

(e) Drive the bushing into the bore until the tool contacts the transmission case.

(f) Install a new detent plunger bushing on the short end of Installer 8118.

(g) Start the bushing in the detent plunger bore in the case.

(h) Drive the bushing into the bore until the tool contacts the transmission case.

GEARTRAIN ASSEMBLY IN FIXTURE

(1) Install Adapter 6747-1A on input shaft hub of fixture tool (Fig. 84). Then install Adapter 6747-2A on front bearing hub of countershaft. Adapter 6747-2A has a raised shoulder on one side. Be sure the shoulder is seated against the countershaft.

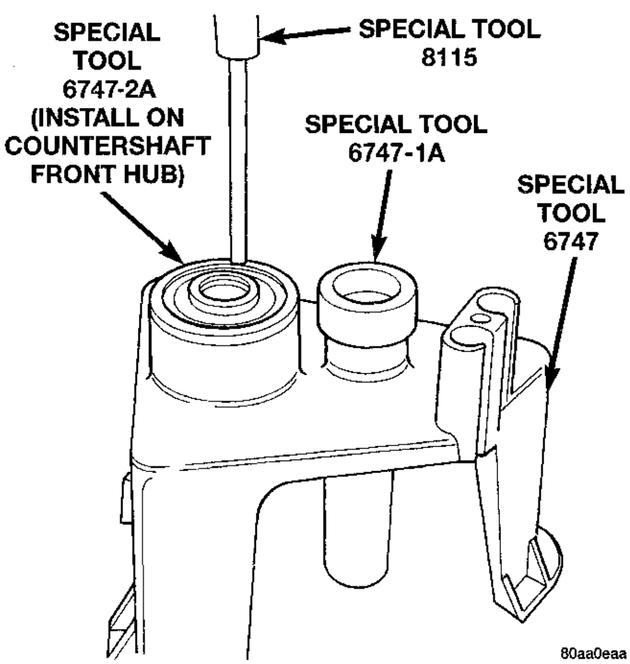

Fig. 84 Preparing Assembly Fixture For Geartrain Build-up

(2) Install input shaft in fixture tool. Make sure Adapter Tool 6747-1A is positioned under shaft as shown (Fig. 85).

(3) Install pilot bearing in input shaft (Fig. 85).

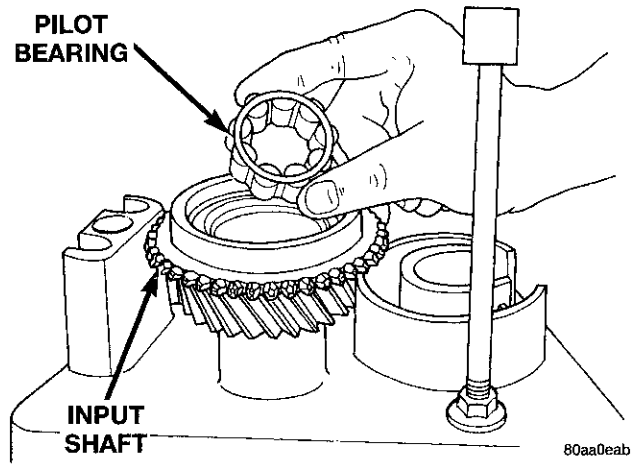

Fig. 85 Installing Pilot Bearing In Input Shaft

(4) Install fourth gear synchro ring on input shaft (Fig. 86).

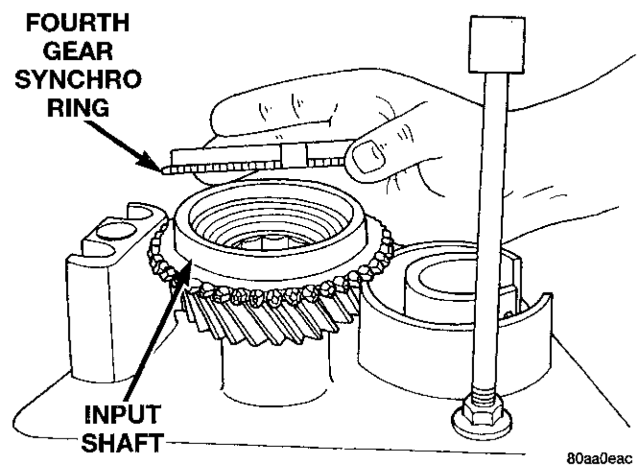

Fig. 86 Installing Fourth Gear Synchro Ring On Input Shaft

DISASSEMBLY AND ASSEMBLY (Continued)

(5) Adjust height of idler gear pedestal on assembly fixture (Fig. 87). Start with a basic height of 18.4 cm (7-1/4 in.). Final adjustment can be made after gear is positioned on pedestal.

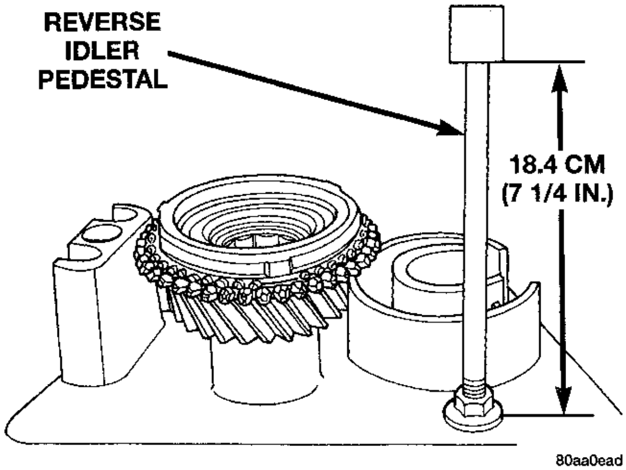

Fig. 87 Idler Pedestal Basic Height Adjustment

(6) Install assembled output shaft and geartrain in input shaft (Fig. 88). Carefully rotate output shaft until the 3–4 synchro ring seats in synchro hub and sleeve.

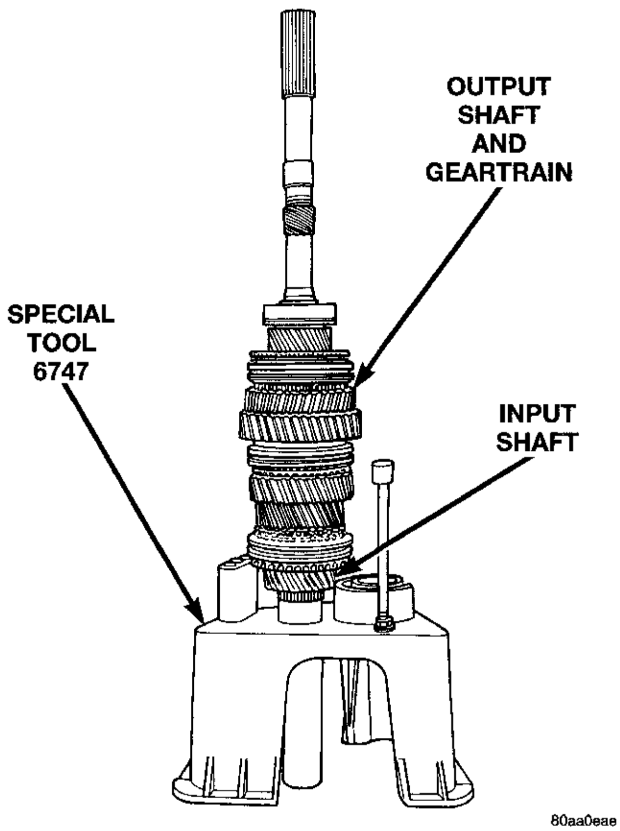

Fig. 88 Output Shaft And Geartrain Installed In Input Shaft

(7) Install Adapter 6747-2A on front bearing hub of countershaft, if not previously done. The adapter has a shoulder on one side. The shoulder goes toward the countershaft.

(8) Slide countershaft (and adapter) into fixture slot. Verify that countershaft and output shaft gears are fully meshed with the mainshaft gears before proceeding (Fig. 89).

(9) Check alignment of countershaft and output shaft gear teeth. Note that gears may not align perfectly. A difference in height of 1.57 to 3.18 mm (1/16 to 1/8 in.) will probably exist. This difference will not interfere with assembly. However, if the difference is greater than this, the countershaft adapter tool is probably upside down. Remove countershaft, reverse adapter tool, reinstall countershaft and check alignment again.

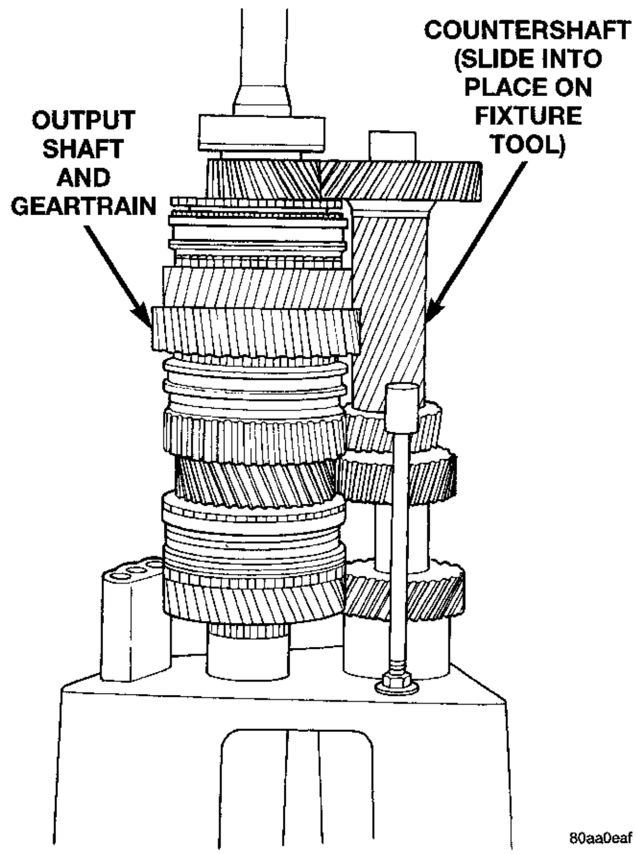

Fig. 89 Countershaft Installed On Fixture Tool

DISASSEMBLY AND ASSEMBLY (Continued)

(10) Position reverse idler in support cup of assembly fixture (Fig. 90). Be sure idler gear is properly meshed and aligned with shaft gear teeth and that bolt holes are facing out and not toward geartrain. Adjust pedestal up or down if necessary. Also be sure that short end of idler shaft is facing up as shown.

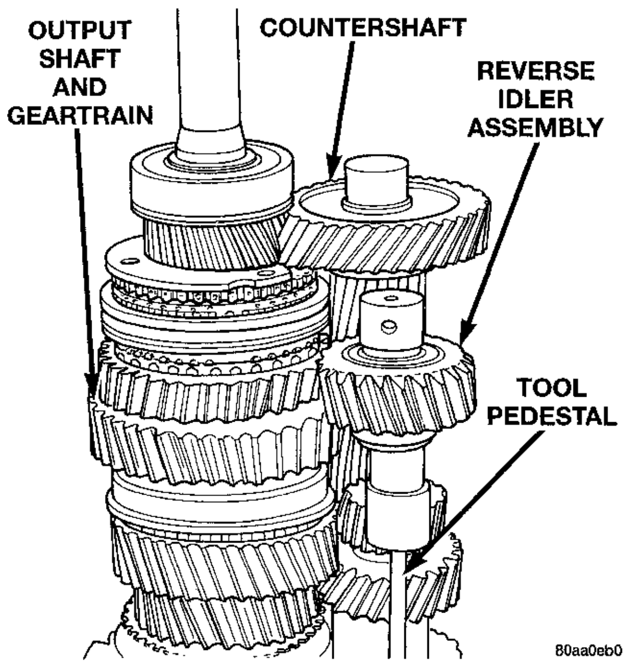

Fig. 90 Reverse Idler Assembly Positioned On Assembly Fixture Pedestal

(11) On 2-wheel drive transmission, thread one Pilot Stud 8120 in center or passenger side hole of output shaft bearing retainer. Then position retainer on fifth gear as shown (Fig. 91).

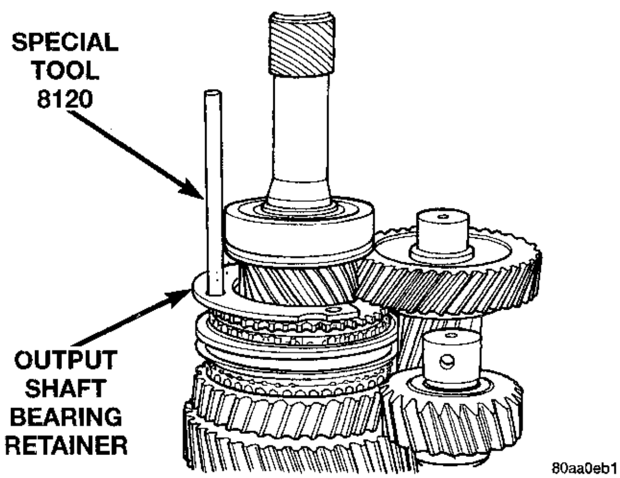

Fig. 91 Positioning Output Shaft Bearing Retainer For Rear Housing Installation

(12) Assemble 1-2 and fifth reverse-shift forks (Fig. 92). Arm of fifth-reverse fork goes through slot in 1-2 fork.

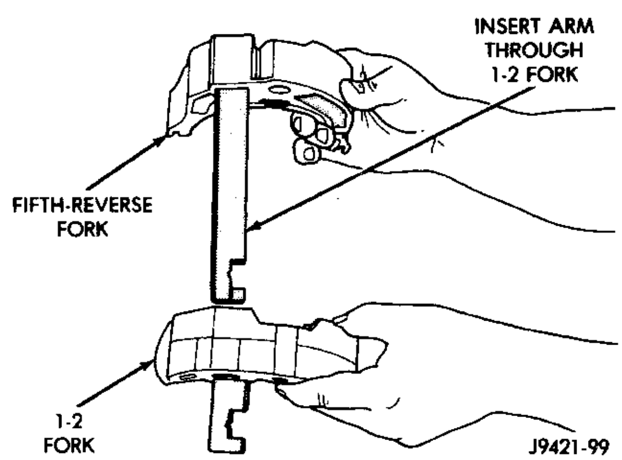

Fig. 92 Assembling 1-2 And Fifth-Reverse Shift Forks

(13) Install assembled shift forks in synchro sleeves (Fig. 93). Be sure forks are properly seated in sleeves.

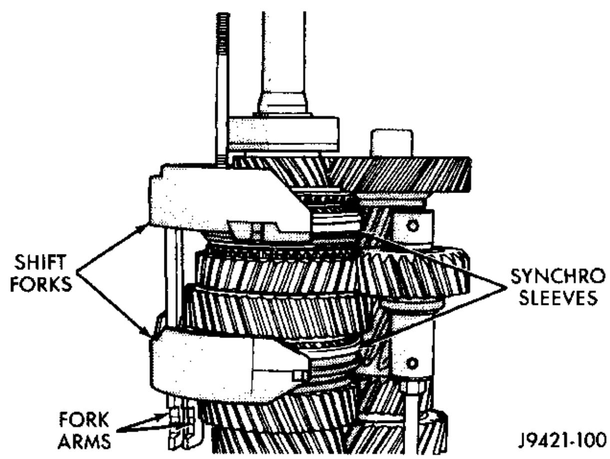

Fig. 93 Shift Forks Installed In Synchro Sleeves

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

REAR HOUSING INSTALLATION—2WD

(1) Drive adapter housing alignment dowels back into housing until dowels are flush with mounting surface (Fig. 94).

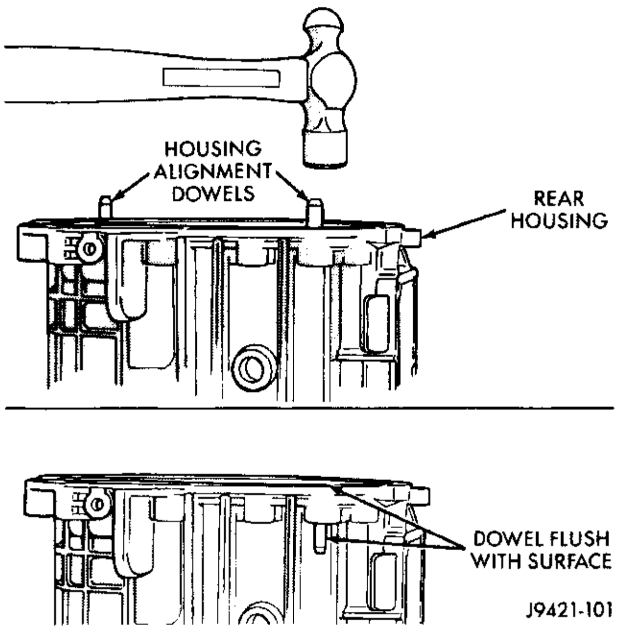

Fig. 94 Preparing Rear Housing Dowels For Installation

(2) Apply liberal quantity of petroleum jelly to countershaft rear bearing and bearing race.

(3) Install countershaft rear bearing in bearing race (Fig. 95).

CAUTION: The countershaft bearings can be installed backwards if care is not exercised. Be sure the large diameter side of the roller retainer faces the countershaft and the small diameter side faces the race and housing (Fig. 96).

(4) Apply extra petroleum jelly to hold countershaft rear bearing in place when housing is installed.

(5) Apply light coat of petroleum jelly to shift shaft bushing/bearing in rear housing (Fig. 96).

(6) Reach into countershaft rear bearing with finger, and push each bearing roller outward against race. Then apply extra petroleum jelly to hold rollers in place. This avoids having rollers becoming displaced during housing installation. This will result in misalignment between bearing and countershaft bearing hub.

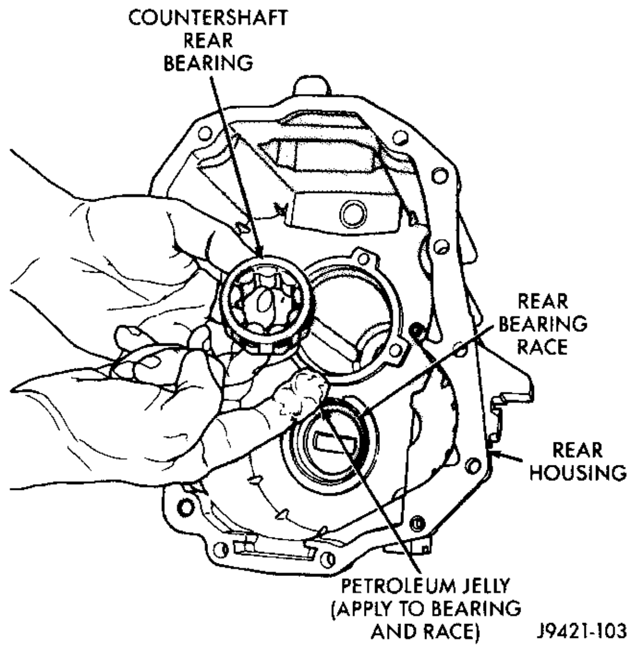

Fig. 95 Lubricating Countershaft Rear Bearing

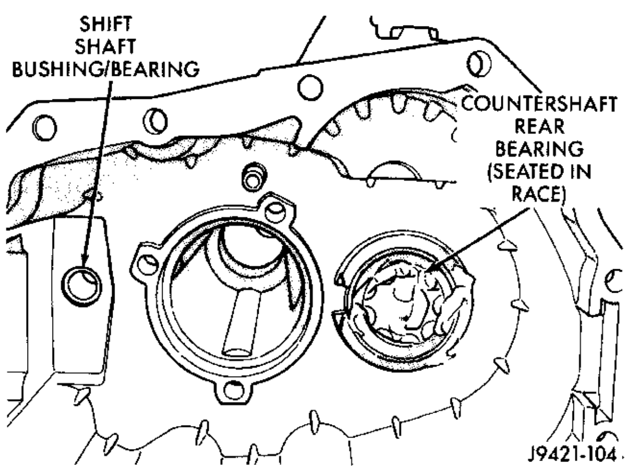

Fig. 96 Countershaft Rear Bearing Seated In Seated in Race

DISASSEMBLY AND ASSEMBLY (Continued)

(7) Install rear housing onto geartrain (Fig. 97). Be sure bearing retainer pilot stud is in correct bolt hole in housing. Also be sure countershaft and output shaft bearings are aligned in housing and on countershaft. It may be necessary to lift upward on countershaft slightly to ensure that the countershaft rear bearing engages to the countershaft before the rear output shaft bearing engages the housing.

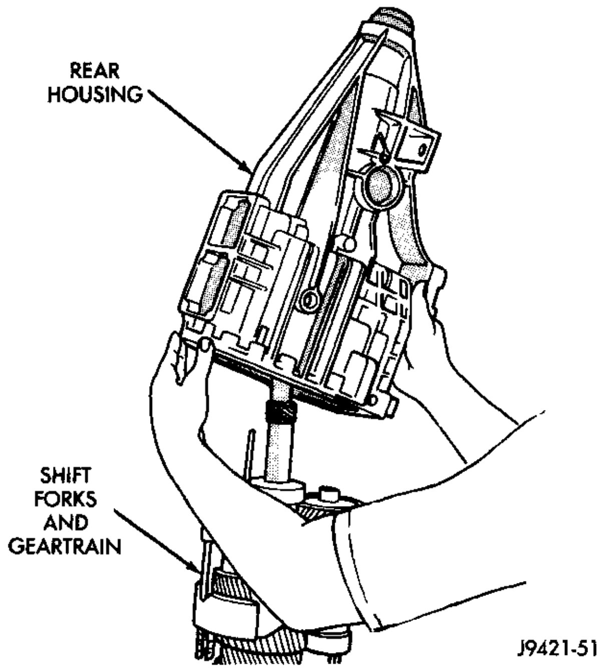

Fig. 97 Rear Housing Installation—2WD

(8) Seat rear housing on output shaft rear bearing and countershaft. Use plastic or rawhide mallet to tap housing into place.

(9) Install the three bolts that secure rear bearing retainer to rear housing as follows:

(a) Apply Mopar® Gasket Maker, or equivalent, to bolt threads, bolt shanks and under bolt heads (Fig. 98).

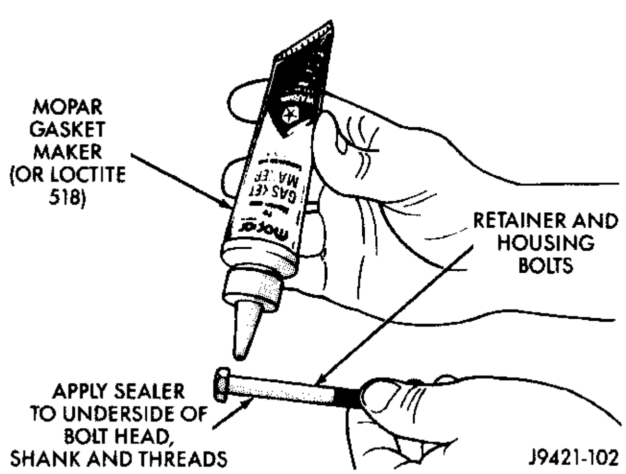

Fig. 98 Applying Sealer To Retainer And Housing Bolts

(b) Start first two bolts in retainer (Fig. 99). It may be necessary to move retainer rearward (with pilot stud) in order to start bolts in retainer.

(c) Remove Pilot Stud 8120 and install last retainer bolt (Fig. 99).

(d) Tighten all three retainer bolts to 30-35 N·m (22-26 ft. lbs.) torque.

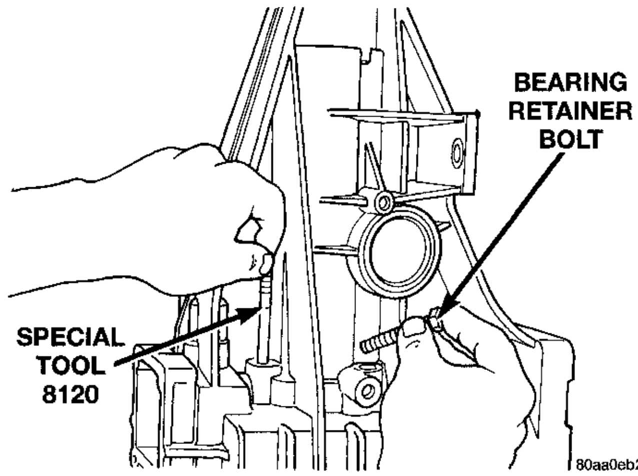

Fig. 99 Removing Pilot Stud Tool And Installing Retainer Bolts—2WD

ADAPTER HOUSING INSTALLATION—4WD

(1) Install rear bearing in adapter housing. Use wood hammer handle or wood dowel to tap bearing into place.

(2) Position rear bearing retainer in adapter housing (Fig. 100).

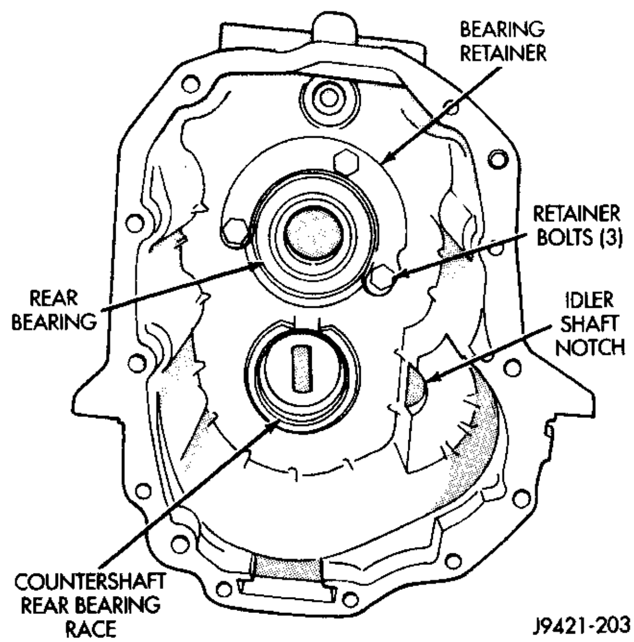

Fig. 100 Preparing Adapter Housing For Installation—4WD

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(3) Apply Mopar® Gasket Maker, or equivalent, to threads, bolt shanks and under hex heads of bearing retainer bolts (Fig. 101).

(4) Apply liberal quantity of petroleum jelly to countershaft rear bearing and bearing race.

(5) Install countershaft rear bearing in bearing race (Fig. 96).

CAUTION: The countershaft bearings can be installed backwards if care is not exercised. Be sure the large diameter side of the roller retainer faces the countershaft and the small diameter side faces the race and housing (Fig. 96).

(6) Apply extra petroleum jelly to hold countershaft rear bearing in place when housing is installed.

(7) Apply light coat of petroleum jelly to shift shaft bushing/bearing in adapter housing (Fig. 96).

(8) Install adapter housing on geartrain.

(9) Install rear bearing snap ring on output shaft (Fig. 101).

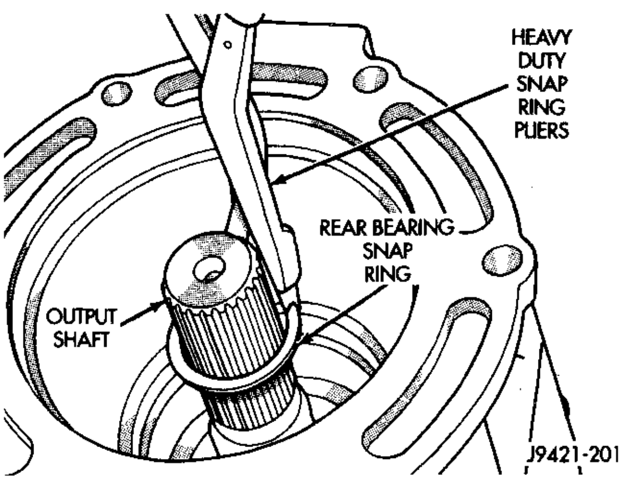

Fig. 101 Installing Rear Bearing Snap Ring—4WD

(10) Lubricate lip of new rear seal (Fig. 102) with Mopar® Door Ease, or transmission fluid.

(11) Install new rear seal in adapter housing bore with Installer C-3860-A. Be sure seal is fully seated in housing bore (Fig. 102).

REVERSE IDLER SEGMENT INSTALLATION

(1) Remove geartrain and housing assembly from fixture with aid of helper.

(2) Apply Mopar® Gasket Maker, or equivalent, sealer to underside of idler shaft bolt heads, bolt shanks and bolt threads (Fig. 98).

(3) Align idler shaft and rear housing bolt holes with drift, pin punch, or Phillips screwdriver.

(4) Work segment upward into housing and onto idler shaft.

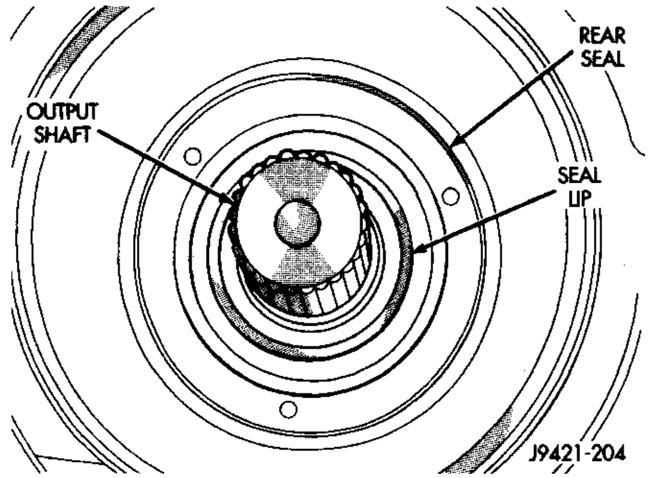

Fig. 102 Rear Seal Installation—4WD

(5) Verify that idler shaft is seated in housing notch before proceeding. Segment and housing can be damaged if idler shaft is misaligned.

(6) Insert idler shaft retaining bolts through housing and segment and into shaft. Long bolt goes through segment and short bolt goes through housing and directly into rear of shaft.

(7) Tighten idler shaft bolts to 19-25 N·m (14-18 ft. lbs.) torque.

CAUTION: Make sure the idler shaft and support segment are properly seated and held firmly in place while tightening the shaft bolts. The segment, housing or shaft threads can be damaged if the idler shaft is allowed to shift out of position in the housing.

SHIFT SHAFT, SHAFT LEVER AND BUSHING AND SHIFT SOCKET INSTALLATION

(1) Before proceeding, verify that all synchro sleeves are in Neutral position (centered on hub). Move sleeves into neutral if necessary.

CAUTION: The transmission synchros must all be in Neutral position for proper reassembly. Otherwise, the housings, shift forks and gears can be damaged during installation of the two housings.

(2) Install 3-4 shift fork in synchro sleeve (Fig. 103). Verify that groove in fork arm is aligned with grooves in 1-2 and fifth-reverse fork arms as shown.

(3) Slide shift shaft through 3-4 shift fork (Fig. 104). Be sure shaft detent notches are to front.

(4) Assemble shift shaft shift lever and bushing (Fig. 105). Be sure slot in bushing is facing up and roll pin hole for lever is aligned with hole in shaft.

(5) Install assembled lever and bushing on shift shaft (Fig. 106).

DISASSEMBLY AND ASSEMBLY (Continued)

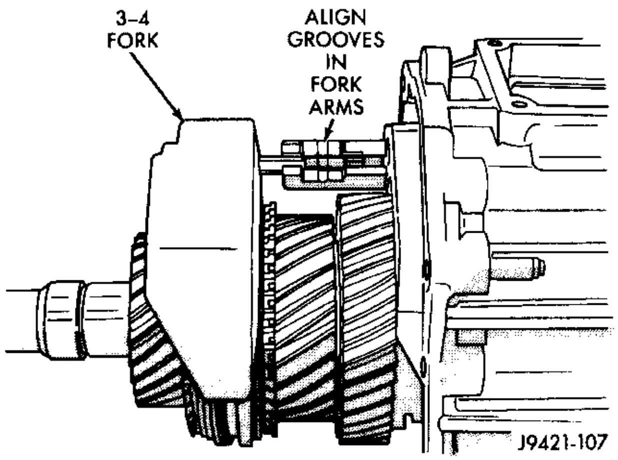

Fig. 103 Installing 3-4 Shift Fork

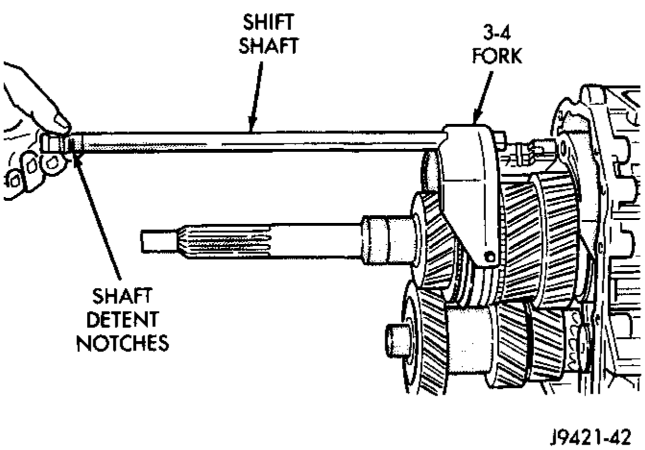

Fig. 104 Shift Shaft Installation

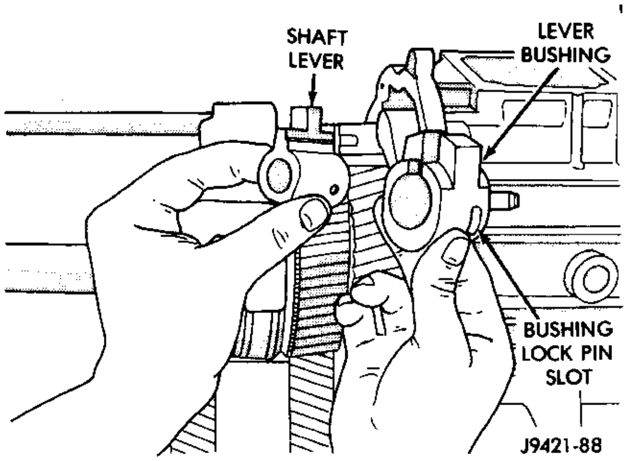

Fig. 105 Assembling Shift Shaft Lever And Bushing

(6) Slide shift shaft through 1-2 and fifth-reverse fork and into shift lever opening in rear housing (Fig. 107).

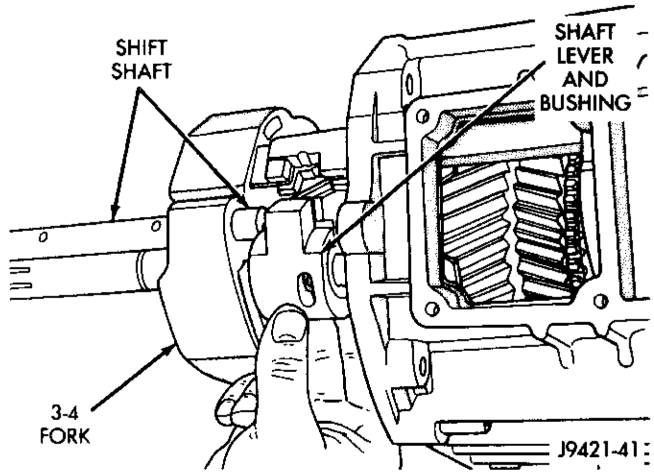

Fig. 106 Installing Shift Shaft Lever And Bushing

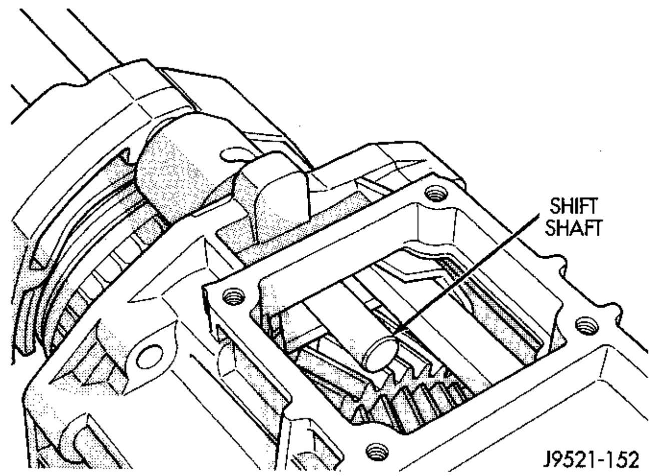

Fig. 107 Inserting Shaft Into Lever Opening In Housing

(7) Align shift socket with shaft and slide shaft through socket and into shift shaft bearing in rear housing (Fig. 108).

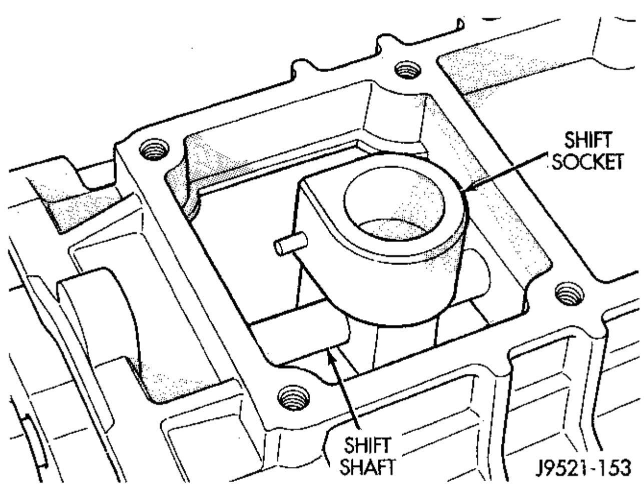

Fig. 108 Shift Socket Installation

DISASSEMBLY AND ASSEMBLY (Continued)

(8) Rotate shift shaft so detent notches in shaft are facing driver side of housing.

CAUTION: Correct positioning of the shift shaft detent notch is important. Both of the shaft roll pins can be installed even when the shaft is 180° off. If this occurs, the transmission will have to be disassembled again to correct shaft alignment.

(9) Select correct new roll pin for shift shaft lever (Fig. 109). Shaft lever roll pin is approximately 22 mm (7/8 in.) long. Shift socket roll pin is approximately 33 mm (1-1/4 in.) long.

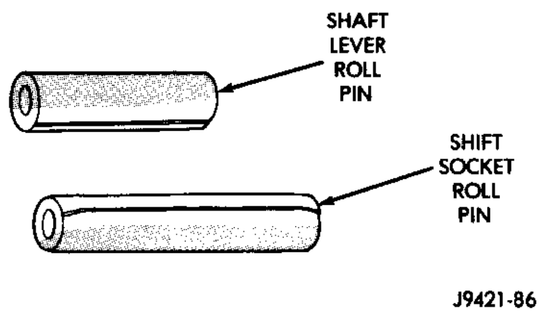

Fig. 109 Roll Pin Identification—Shaft Lever And Shift Socket

(10) Align roll pin holes in shift shaft, lever and bushing. Then start roll pin into shaft lever by hand (Fig. 110).

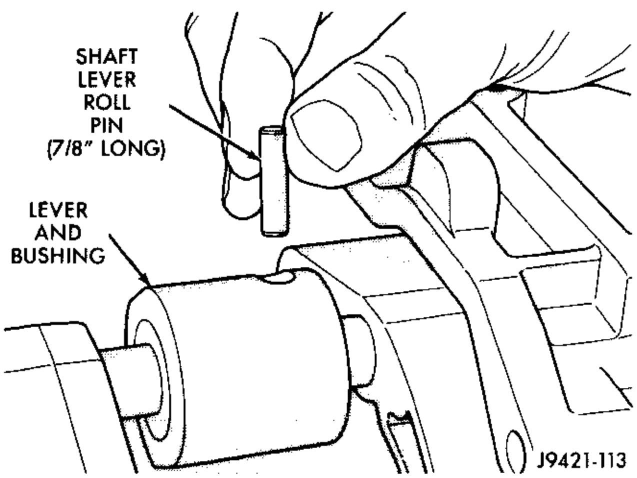

Fig. 110 Starting Roll Pin In Shift Shaft Lever

(11) Seat shaft lever roll pin with pin punch (Fig. 111).

CAUTION: The shaft lever roll pin must be flush with the surface of the lever. The lever bushing will bind on the roll pin if the pin is not seated flush.

(12) Before proceeding, verify that lock pin slot in lever bushing is positioned as shown (Fig. 111).

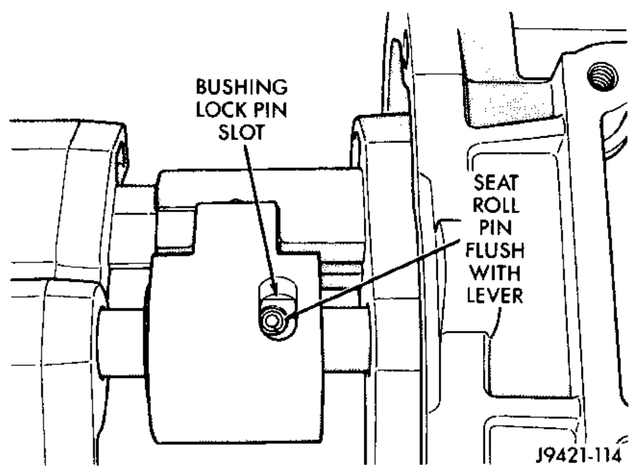

Fig. 111 Correct Seating Of Shift Shaft Lever Roll Pin

(13) Align roll pin holes in shift socket and shift shaft. Then start roll pin into shift shaft by hand (Fig. 112).

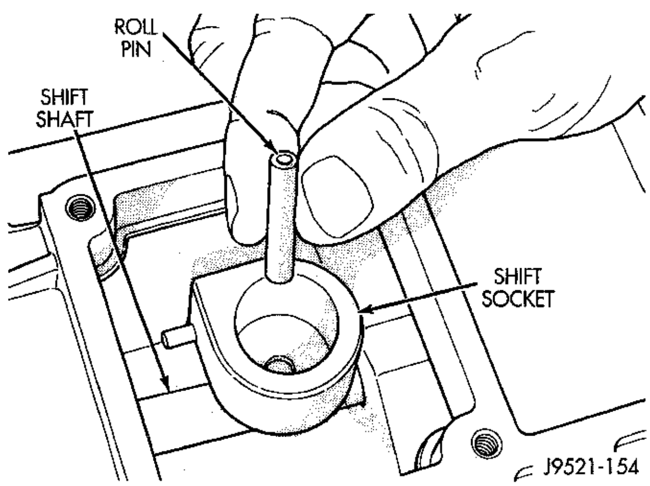

Fig. 112 Starting Roll Pin In Shift Socket

DISASSEMBLY AND ASSEMBLY (Continued)

(14) Seat roll pin in shift socket with pin punch. Roll pin must be flush with socket after installation (Fig. 113).

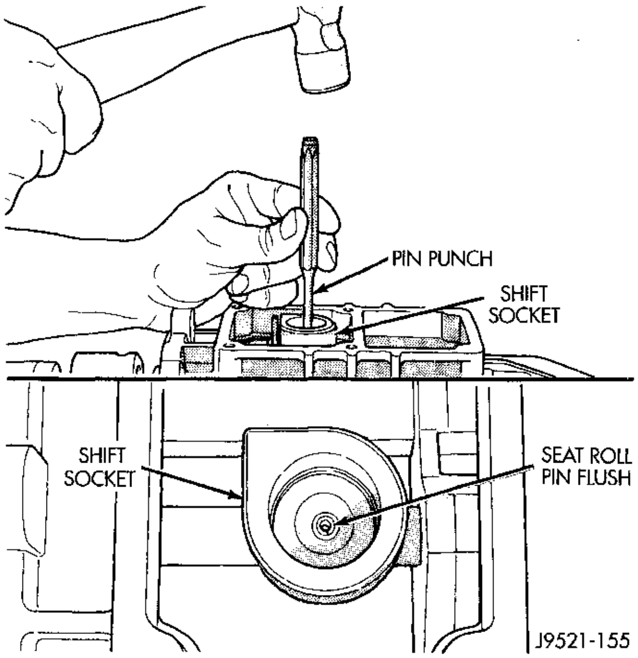

Fig. 113 Seating Shift Socket Roll Pin

(15) Verify that notches in shift fork arms are aligned (Fig. 114). Realign arms if necessary.

(16) Rotate shaft lever and bushing downward (out of fork arms), to expose detent bore in lever (Fig. 114).

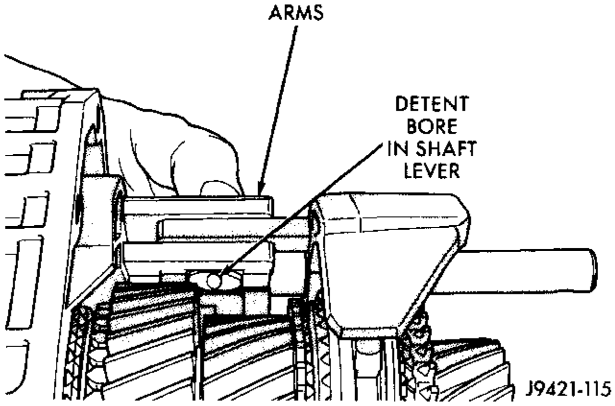

Fig. 114 Shaft Lever Positioned For Detent Ball and Spring Installation

(17) Insert detent spring in lever bore (Fig. 115).

(18) Install detent ball on top of spring in lever bore (Fig. 116).

(19) Press and hold detent ball in lever. Then carefully rotate lever upward into fork arm notches. Be

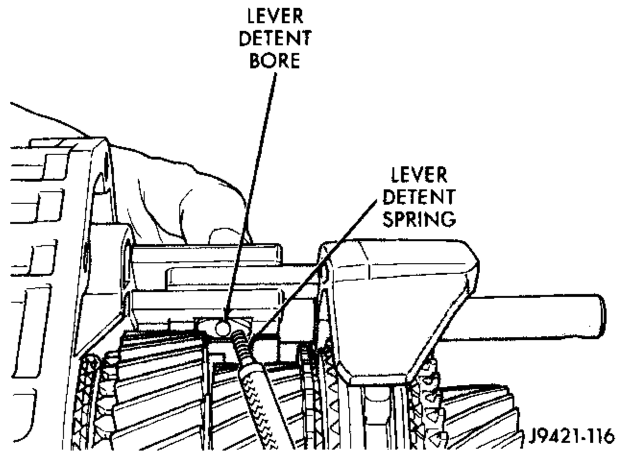

Fig. 115 Installing Detent Spring In Shaft Lever

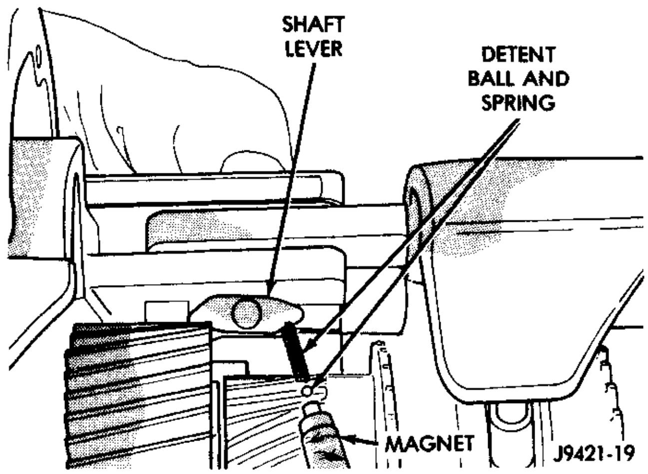

Fig. 116 Installing Detent Ball In Shaft Lever

sure ball is seated in fork arms before proceeding (Fig. 117).

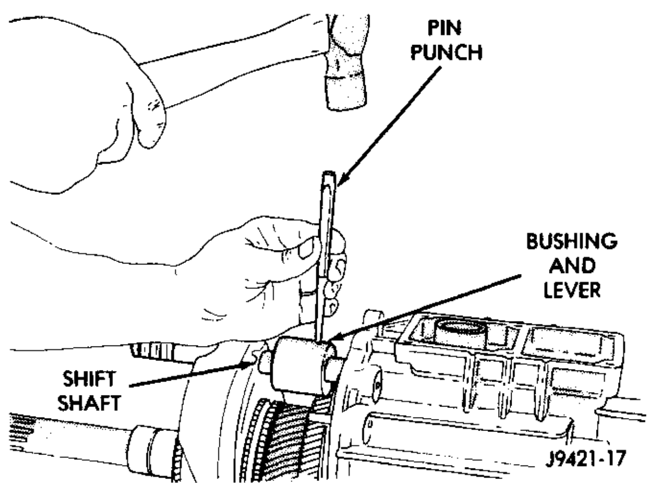

Fig. 117 Correct Seating Of Lever Detent Ball In Shift Fork Arms

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

FRONT HOUSING AND INPUT SHAFT BEARING RETAINER INSTALLATION

(1) Install input shaft bearing in front housing bore (Fig. 118). Use plastic mallet to seat bearing. Bearing goes in from front side of housing only.

(2) Apply liberal quantity of petroleum jelly to countershaft front bearing. Then insert bearing in front housing race (Fig. 119). Large diameter side of bearing cage goes toward countershaft (Fig. 118). Small diameter side goes toward bearing race in housing.

(3) Reach into countershaft front bearing with finger, and push each bearing roller outward against race. Then apply extra petroleum jelly to hold rollers in place. This avoids having rollers becoming displaced during housing installation. This will result in misalignment between bearing and countershaft bearing hub.

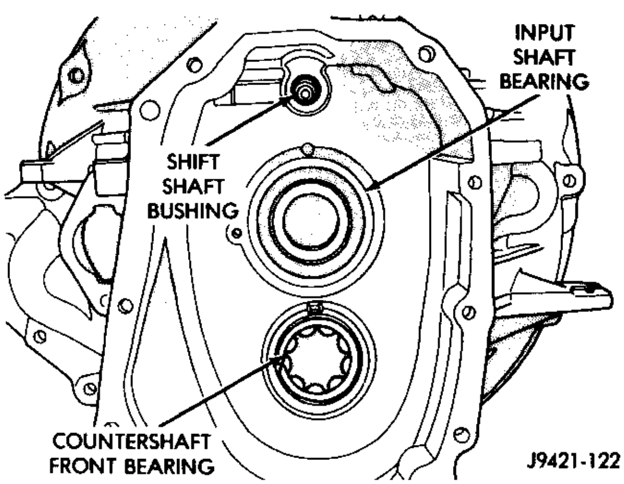

Fig. 118 Input Shaft Bearing And Countershaft Front Bearing Installation

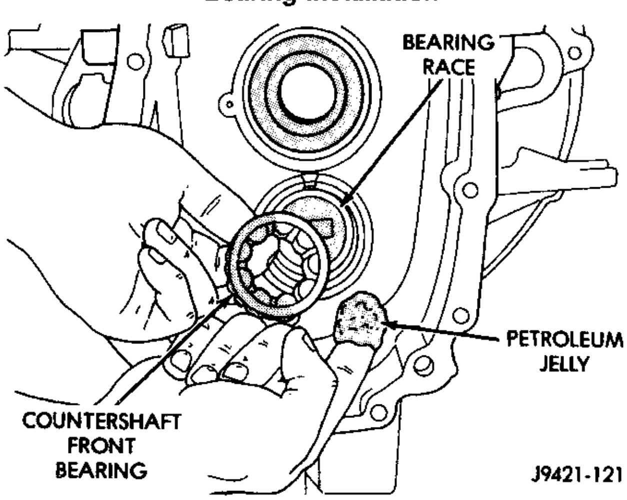

Fig. 119 Lubricating/Positioning Countershaft Front Bearing

(4) Apply small amount of petroleum jelly to shift shaft bushing in front housing (Fig. 120).

(5) Apply 1/8 in. wide bead of Mopar® Gasket Maker, or equivalent, to mating surfaces of front and rear housings (Fig. 120).

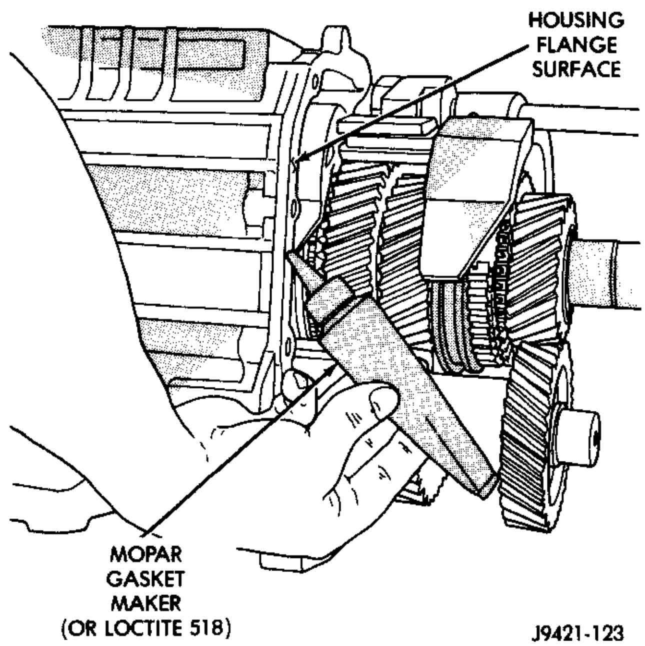

Fig. 120 Applying Sealer To Front/Rear Housings

(6) Have helper hold rear housing and geartrain in upright position. Then install front housing on rear housing and geartrain (Fig. 121).

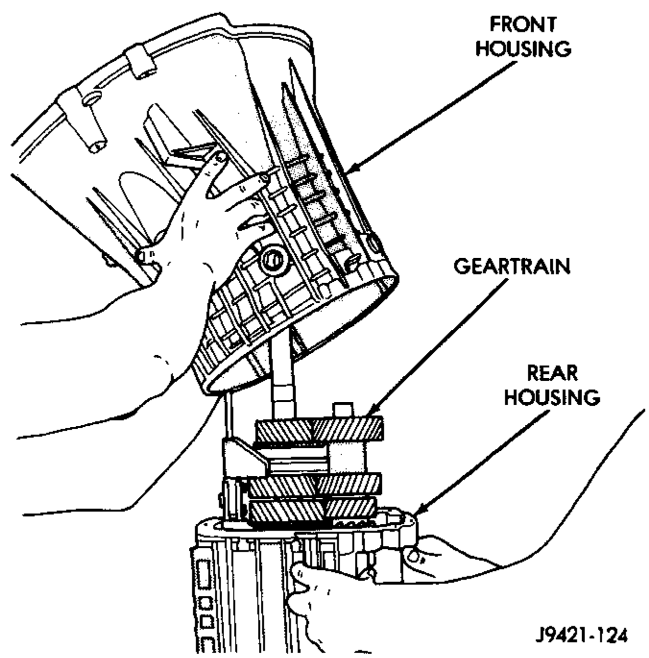

Fig. 121 Front Housing Installation

DISASSEMBLY AND ASSEMBLY (Continued)

(7) Work front housing downward onto geartrain until seated on rear housing.

CAUTION: If the front housing will not seat on the rear housing, either the shift components are not in Neutral, or one or more components are misaligned. Do not force the front housing into place. This will only result in damaged components.

(8) Tap rear housing alignment dowels back into place with hammer and pin punch (Fig. 122). Both dowels should be flush fit in each housing. Have helper hold transmission upright while dowels are tapped back into place.

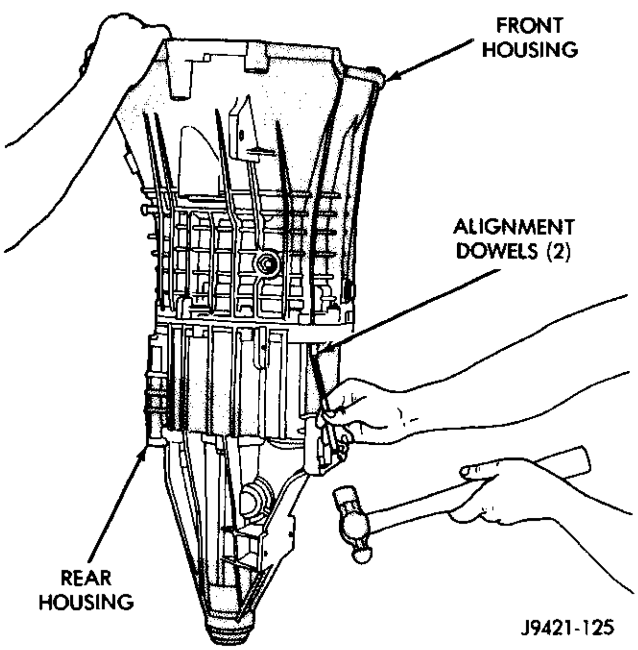

Fig. 122 Reseating Housing Alignment Dowels

(9) Place transmission in horizontal position.

(10) Apply Mopar® Gasket Maker, or equivalent, to housing attaching bolts. Apply sealer material sealer to underside of bolt heads and to bolt shanks and threads (Fig. 123).

(11) Install and start housing attaching bolts by hand (Fig. 123). Then tighten bolts to 30-35 N·m (22-26 ft. lbs.) torque.

(12) Install shift shaft bushing lock bolt (Fig. 124). Apply Mopar® Gasket Maker, or equivalent, to bolt threads, shank and underside of bolt head before installation.

CAUTION: If the lock bolt cannot be fully installed, do not try to force it into place. Either the shift shaft is not in Neutral, or the shaft bushing (or lever) is misaligned (Fig. 125).

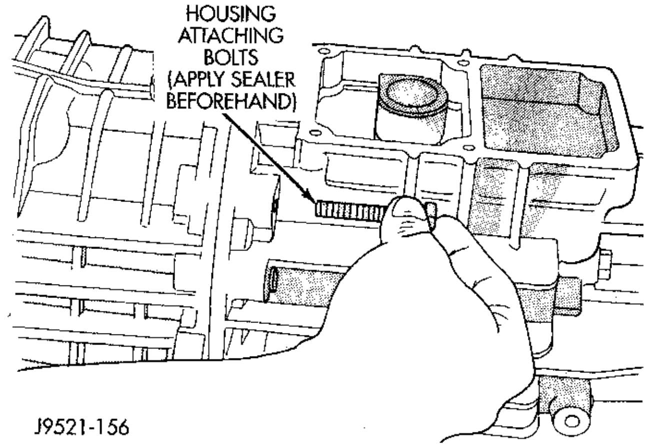

Fig. 123 Installing Housing Attaching Bolts

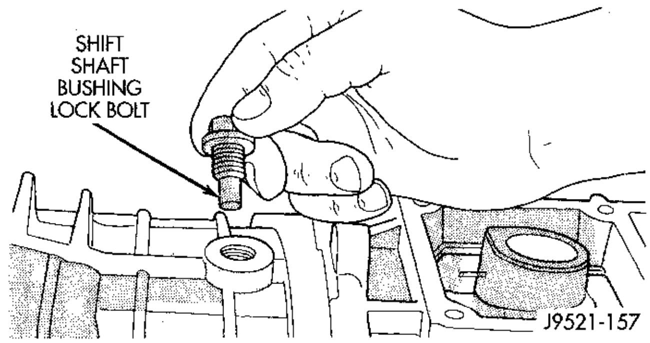

Fig. 124 Installing Shift Shaft Bushing Lock Bolt

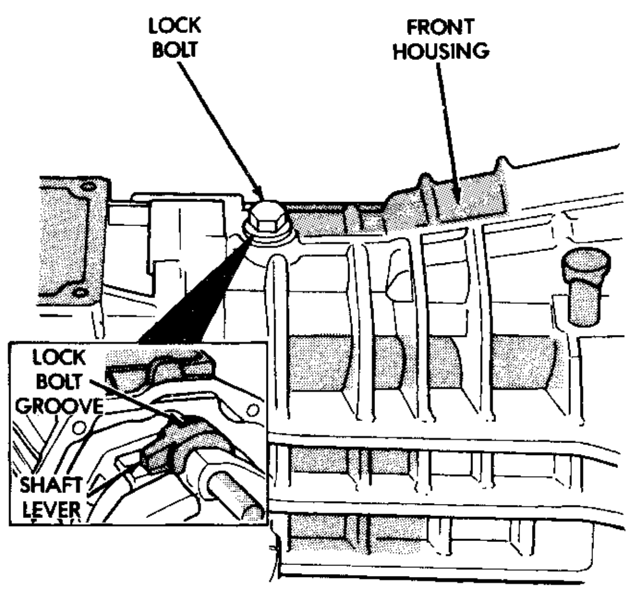

Fig. 125 Correct Alignment Of Lock Bolt And Shaft Bushing

Mopar AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(13) Lubricate then install shift shaft detent plunger in housing bore (Fig. 126). Lubricate plunger with petroleum jelly or gear lubricant. **Be sure plunger is fully seated in detent notch in shift shaft.**

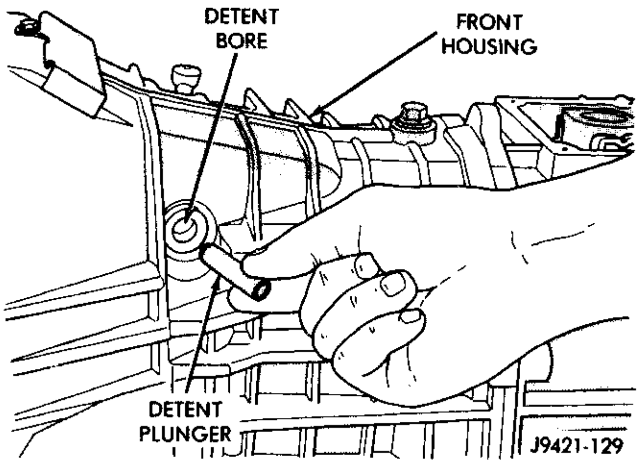

Fig. 126 Installing Shift Shaft Detent Plunger

(14) Install detent spring inside plunger (Fig. 127).

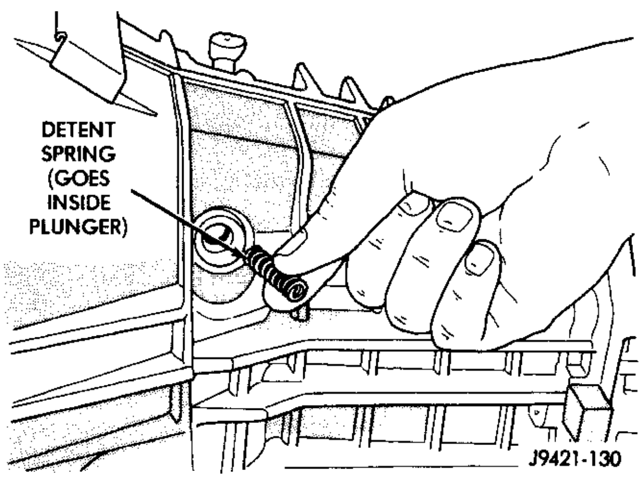

Fig. 127 Installing Detent Plunger Spring

(15) Install detent plug as follows:

(a) Install detent plug in end of Installer 8123.

(b) Position plug on detent spring and compress spring until detent plug pilots in detent plunger bore.

(c) Drive detent plug into transmission case until plug seats.

(16) Install backup light switch (Fig. 128).

(17) Install input shaft snap ring (Fig. 129).

(18) Install new oil seal in front bearing retainer with Installer Tool 6448 (Fig. 130).

(19) Apply bead of Mopar® silicone sealer, or equivalent, to flange surface of front bearing retainer (Fig. 131).

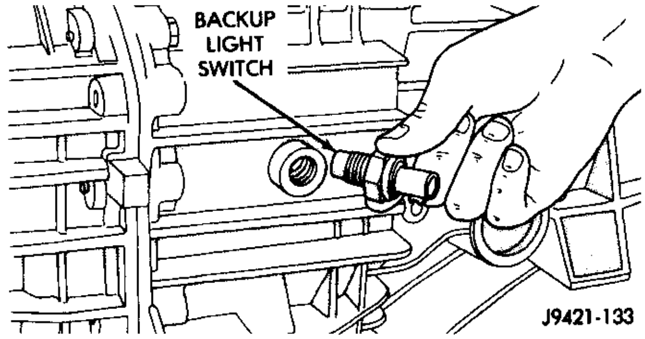

Fig. 128 Installing Backup Light Switch

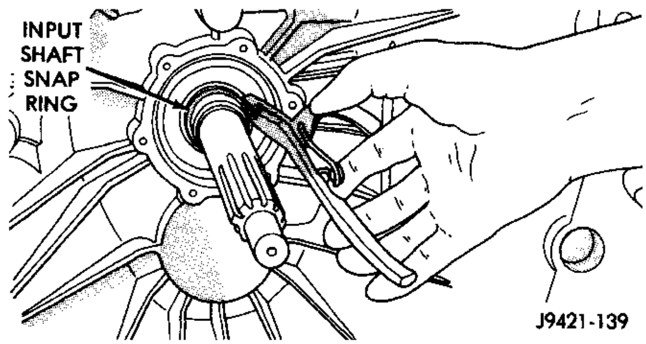

Fig. 129 Installing Input Shaft Snap Ring

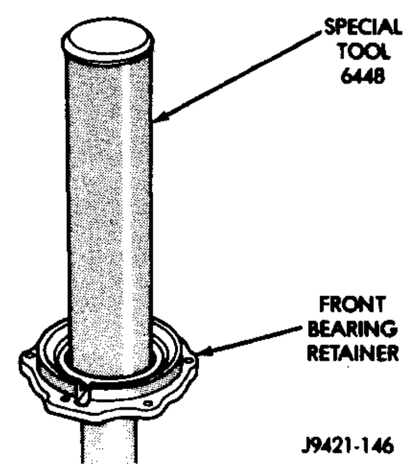

Fig. 130 Installing Oil Seal In Front Bearing Retainer

(20) Align and install front bearing retainer over input shaft and onto housing mounting surface (Fig. 132). Although retainer is one-way fit on housing, be sure bolt holes are aligned before seating retainer. Be sure that no sealer gets into the oil feed hole in the transmission case or bearing retainer.

(21) Install and tighten bearing retainer bolts to 7-10 N·m (5-7 ft. lbs.) torque (Fig. 133).

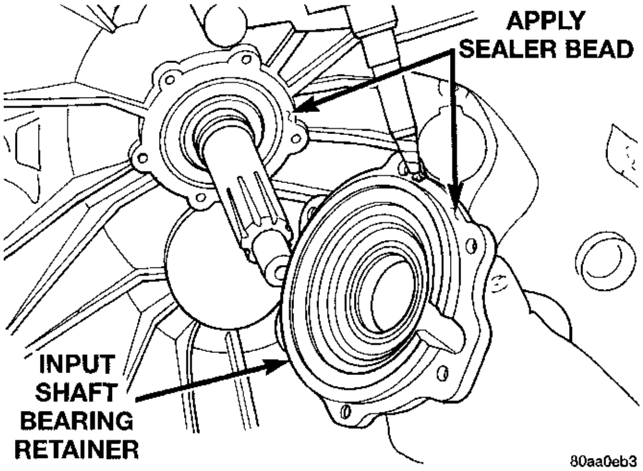

Fig. 131 Applying Sealer To Bearing Retainer And Housing

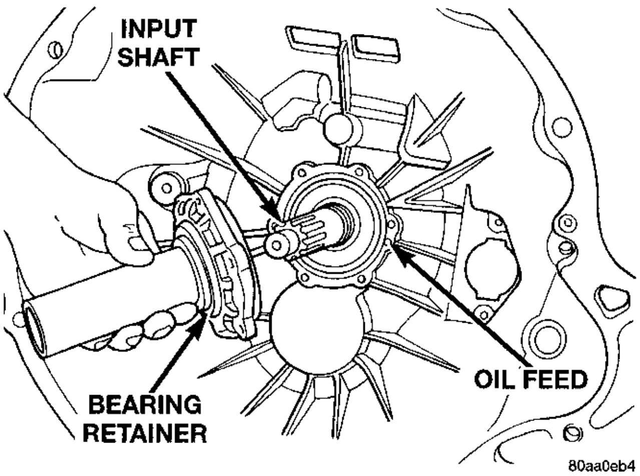

Fig. 132 Installing Input Shaft Bearing Retainer

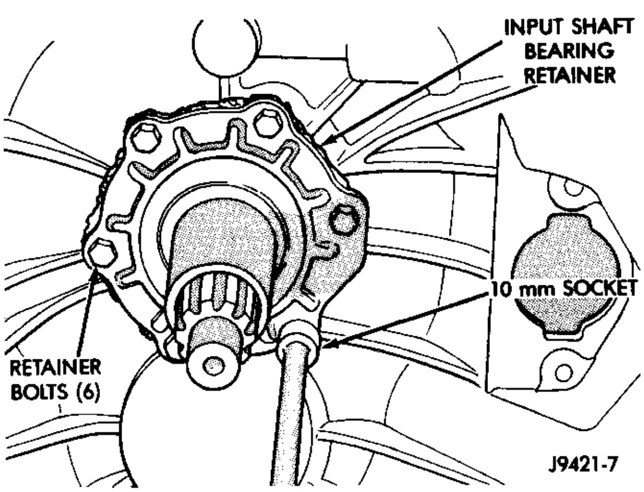

Fig. 133 Installing Input Shaft Bearing Retainer Bolts

SHIFT TOWER AND LEVER ASSEMBLY INSTALLATION

(1) Apply petroleum jelly to ball end of shift lever and interior of shift socket.

(2) Align and install shift tower and lever assembly. Be sure shift ball is seated in socket and the offset in the tower is toward the passenger side of the vehicle before installing tower bolts.

(3) Install shift tower bolts (Fig. 134). Tighten bolts to 7-10 N·m (5-7 ft. lbs.) torque.

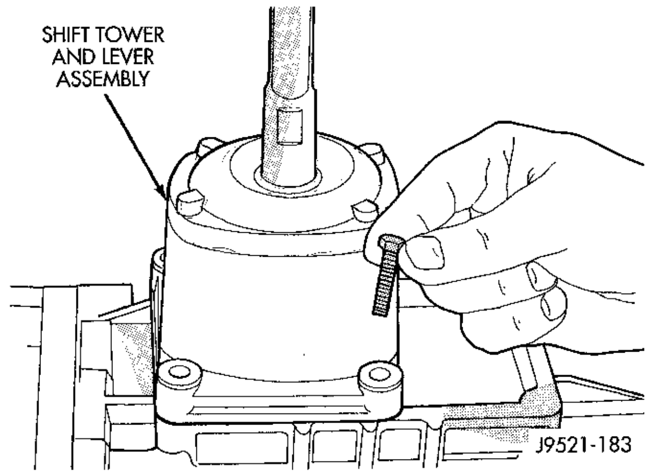

Fig. 134 Shift Tower Bolt Installation

(4) Fill transmission to bottom edge of fill plug hole with Mopar® Transmission Lubricant, P/N 4761526.

(5) Install and tighten fill plug to 19-27 N·m (14-20 ft. lbs.) torque.

(6) Check transmission vent (Fig. 135). Be sure vent is open and not restricted.

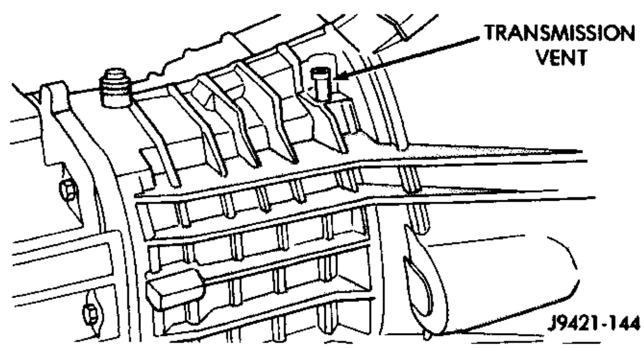

Fig. 135 Vent Location

CLEANING AND INSPECTION

TRANSMISSION COMPONENTS

Clean the gears, shafts, shift components and transmission housings with a standard parts cleaning solvent. Do not use acid or corrosive base solvents. Dry all parts except bearings with compressed air.

AUTHENTIC RESTORATION PRODUCT

CLEANING AND INSPECTION (Continued)

Clean the shaft bearings with a mild solvent such as Mopar® degreasing solvent, Gunk, or similar solvents. Do not dry the bearings with compressed air. Allow the bearings to either air dry, or wipe them dry with clean shop towels.

SHIFT LEVER ASSEMBLY

The shift lever assembly is not serviceable. Replace the lever and shift tower as an assembly if the tower, lever, lever ball, or internal components are worn, or damaged.

SHIFT SHAFT AND FORKS

Inspect the shift fork interlock arms and synchro sleeve contact surfaces (Fig. 136). Replace any fork exhibiting wear or damage in these areas. Do not attempt to salvage shift forks.

Check condition of the shift shaft detent plunger and spring. The plunger should be smooth and free of nicks, or scores. The plunger spring should be straight and not collapsed, or distorted. Minor scratches, or nicks on the plunger can be smoothed with 320/400 grit emery soaked in oil. Replace the plunger and spring if in doubt about condition. Check condition of detent plunger bushings. Replace if damaged.

Inspect the shift shaft, shift shaft bushing and bearing, the shaft lever, and the lever bushing that fits over the lever. Replace the shaft if bent, cracked, or severely scored. Minor burrs, nicks, or scratches can be smoothed off with 320/400 grit emery cloth followed by polishing with crocus cloth. Replace the shift shaft bushing or bearing if damaged.

Replace the shaft lever and bushing if either part is deformed, or worn. Do not attempt to salvage these parts as shift fork binding will occur. Replace the small detent ball and spring that goes in the lever if the ball is worn, or if the spring is bent or collapsed. Replace the roll pin that secures the lever to the shaft.

FRONT/REAR HOUSINGS AND BEARING RETAINERS

Inspect the housings carefully. Look for cracks, stripped threads, scored mating surfaces, damaged bearing bores, or worn dowel pin holes. Minor nicks on mating surfaces can be dressed off with a fine file, or emery cloth. Damaged threads can be renewed by either re-tapping or installing Helicoil inserts.

NOTE: The front housing contains the countershaft front bearing race. The rear housing contains the countershaft rear bearing race. Be advised that these components are NOT serviceable items. The front housing will have to be replaced if the countershaft bearing race is loose, worn, or damaged. The rear housing will have to be replaced if the countershaft rear bearing race is loose, worn, or damaged.

Inspect the input shaft bearing retainer. Be sure the release bearing slide surface of the retainer is in good condition. Minor nicks on the surface can be smoothed off with 320/420 grit emery cloth and final polished with oil coated crocus cloth. Replace the retainer seal if necessary.

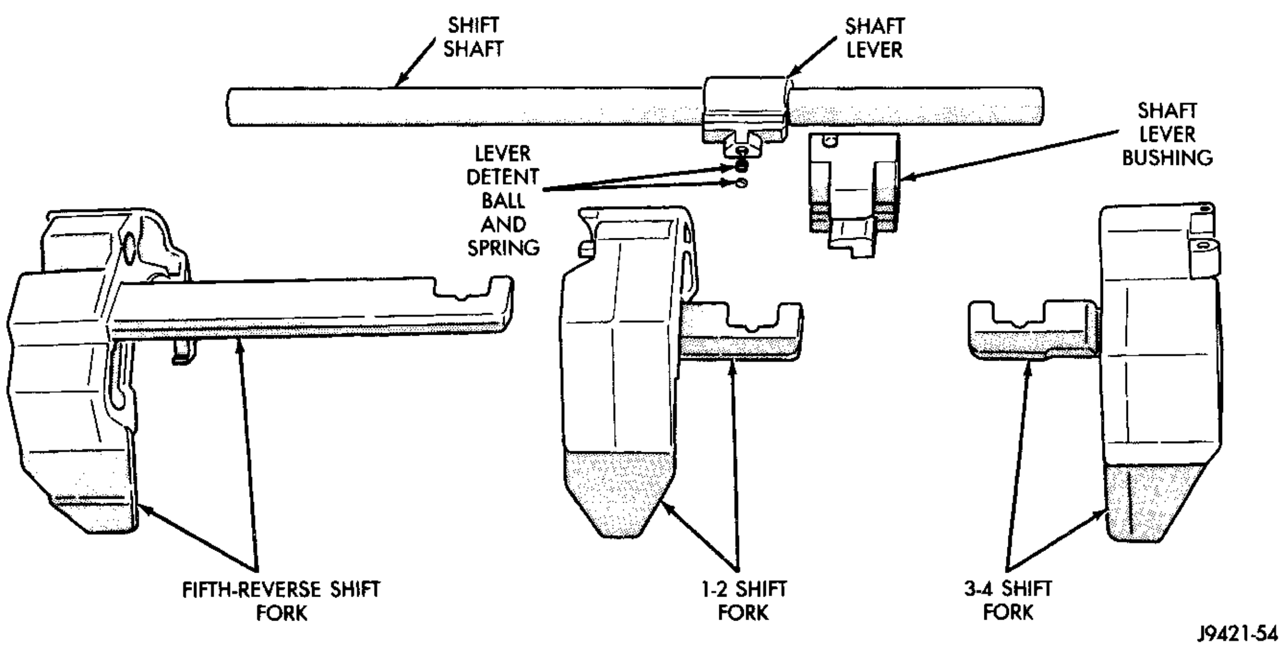

Fig. 136 Shift Forks And Shaft

CLEANING AND INSPECTION (Continued)

Inspect the output shaft bearing retainer. Be sure the U-shaped retainer is flat and free of distortion. Replace the retainer if the threads are damaged, or if the retainer is bent, or cracked.

COUNTERSHAFT BEARINGS AND RACES

The countershaft bearings and races are machine lapped during manufacture to form matched sets. The bearings and races should not be interchanged.

NOTE: The bearing races are a permanent press fit in the housings and are NOT serviceable. If a bearing race becomes damaged, it will be necessary to replace the front or rear housing as necessary. A new countershaft bearing will be supplied with each new housing for service use.

The countershaft bearings can be installed backwards if care is not exercised. The bearing roller cage is a different diameter on each side. Be sure the bearing is installed so the large diameter side of the cage is facing the countershaft gear (Fig. 137). The small diameter side goes in the bearing race.

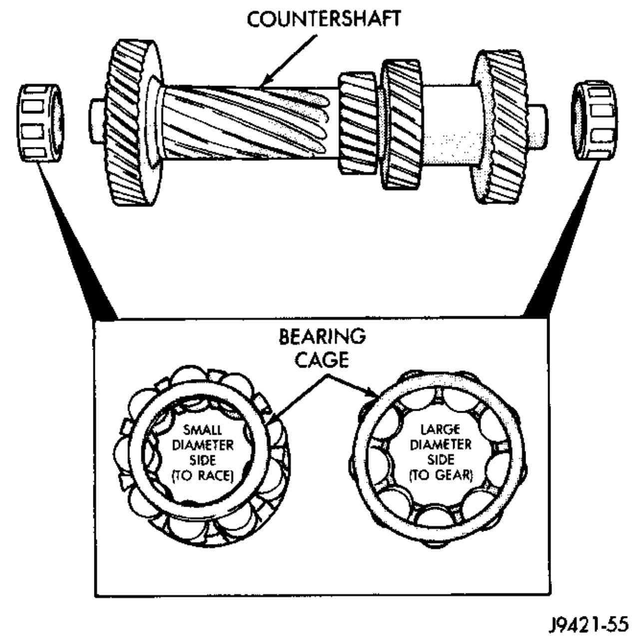

Fig. 137 Correct Countershaft Bearing Installation

REVERSE IDLER COMPONENTS

Inspect the idler gear, bearing, shaft, thrust washer, wave washer and thrust plate. Replace the bearing if any of the needle bearing rollers are worn, chipped, cracked, flat-spotted, or brinnelled. Also replace the bearing if the plastic bearing cage is damaged or distorted.

Replace the thrust washer, wave washer, or thrust plate if cracked, chipped, or worn. Replace the idler gear if the teeth are chipped, cracked or worn thin. Replace the shaft if worn, scored, or the bolt threads are damaged beyond repair. Replace the support segment if cracked, or chipped and replace the idler attaching bolts if the threads are damaged.

Shift Socket

Inspect the shift socket for wear or damage. replace the socket if the roll pin, or shift shaft bores are damaged. Minor nicks in the shift lever ball seat in the socket can be smoothed down with 400 grit emery or wet/dry paper. Replace the socket if the ball seat is worn, or cracked. Do not reuse the original shift socket roll pin. Install a new pin during reassembly. The socket roll pin is approximately is approximately 33 mm (1-1/4 in.) long.

Output Shaft And Geartrain

Inspect all of the gears for worn, cracked, chipped, or broken teeth. Also check condition of the bearing bore in each gear. The bores should be smooth and free of surface damage. Discoloration of the gear bores is a normal occurrence and is not a reason for replacement. Replace gears only when tooth damage has occurred, or if the bores are brinnelled or severely scored.

Inspect the shaft splines and bearings surfaces. Minor nicks on the bearing surfaces can be smoothed with 320/420 grit emery and final polished with crocus cloth. Replace the shaft if the splines are damaged or bearing surfaces are deeply scored, worn, or brinnelled.

NV4500 MANUAL TRANSMISSION

INDEX

GENERAL INFORMATION

NV4500 INTRODUCTION

The NV4500 is a five–speed, constant mesh manual transmission (Fig. 1). All gear ranges including reverse are synchronized. Fifth gear is an overdrive range with a ratio of 0.75:1. The transmission has a cast iron gear case and aluminum shift cover.

Two versions of the NV4500 are used. A standard duty version is used for 5.2L and 5.9L applications and a heavy duty version for V10 and Cummins diesel applications. Main differences are the larger diameter input shaft, output shaft, and mainshaft fifth gear in the heavy duty model.

The NV4500 is a top loader style transmission. The shift lever is located in a shifter tower which is bolted to the shift cover and operates the shift forks and rails directly. The shift forks and rails are all located within the aluminum cover which is bolted to the top of the gear case.

Tapered roller bearings support the drive gear, mainshaft and countershaft in the gear case. Pilot roller bearings in the drive gear support the forward end of the mainshaft. The mainshaft gears are all supported on caged type roller bearings. Drive gear thrust reaction is controlled by a needle type thrust bearing. The bearing is located at the forward end of the mainshaft.

GENERAL INFORMATION (Continued)

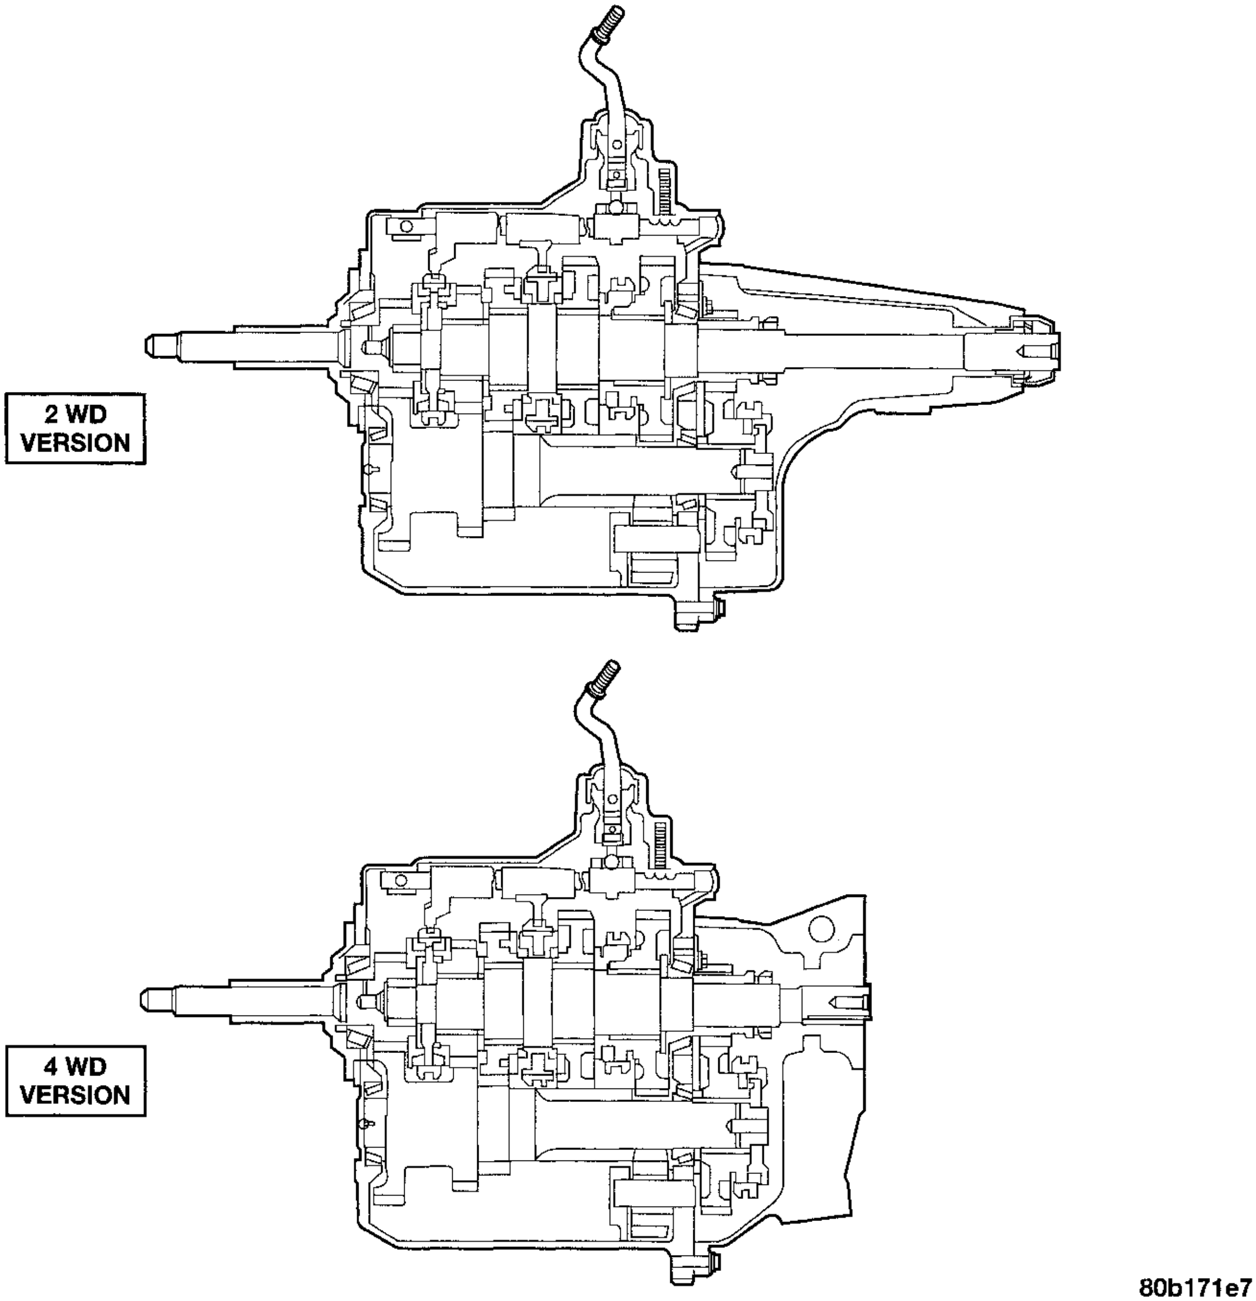

Fig. 1 NV4500 Manual Transmission

GENERAL INFORMATION (Continued)

TRANSMISSION IDENTIFICATION

The NV4500 transmission identification tag is attached to the driver side PTO cover (Fig. 2).

The tag provides the transmission model number, build date and part number. Be sure to reinstall the I.D. tag if removed during service. The information on the tag is essential to correct parts ordering.

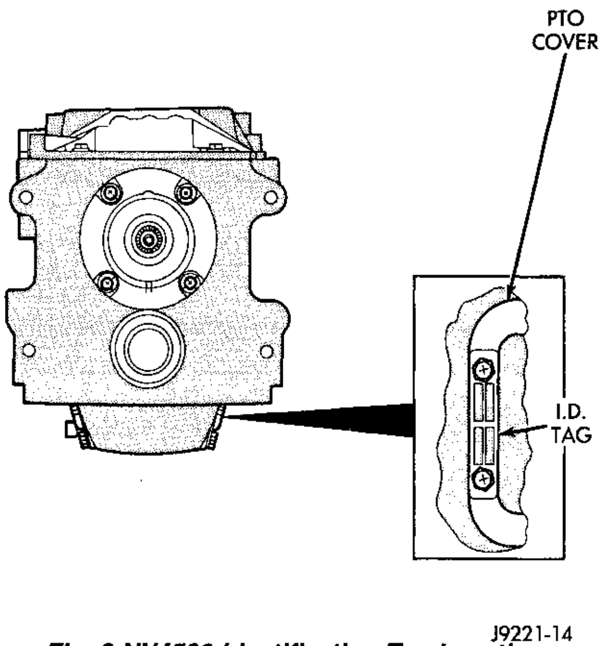

Fig. 2 NV4500 Identification Tag Location

LUBRICANT LEVEL AND CAPACITY

Required lubricant for the NV4500 is Mopar Manual Transmission Lubricant, P/N 4637579. This is the only lubricant recommended for use.

Dry fill lubricant capacity is approximately 3.78 liters (8 pints).

Correct lubricant fill level is to the bottom edge of the fill plug hole (Fig. 3). Check fill level only when the transmission is level.

The transmission lubricant is drained through the PTO cover bottom bolt hole (Fig. 3). It will be necessary to apply sealer to the bolt threads before installing it during a lubricant change.

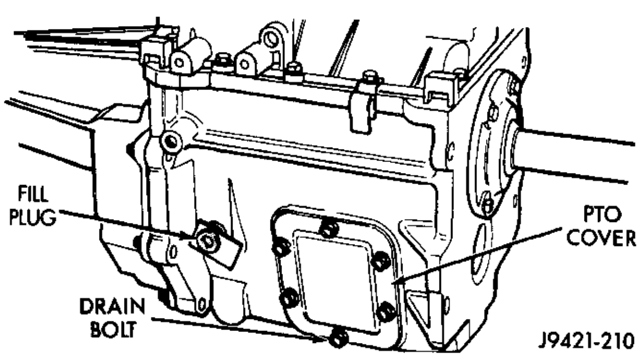

Fig. 3 NV4500 Fill Plug And Drain Bolt

GEAR RATIOS

RANGE	RATIO
First gear	5.61:1
Second Gear	3.04:1
Third Gear	1.67:1
Fourth Gear	1.00:1
Fifth Gear	0.75:1
Reverse gear	5.04:1

SHIFT PATTERN

The NV4500 shift pattern is in a modified H pattern (Fig. 4). Overdrive fifth and reverse gears are in line and outboard of the first through fourth gear positions.

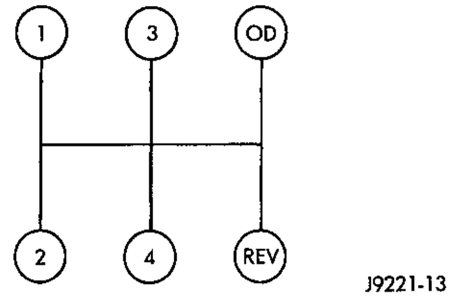

Fig. 4 NV4500 Shift Pattern

DIAGNOSIS AND TESTING

COMMON PROBLEM CAUSES

The majority of transmission malfunctions are a result of:

- insufficient lubricant.
- incorrect lubricant.
- misassembled or damaged internal components.
- improper operation.

HARD SHIFTING

A low lubricant level, loose or worn shift lever, or loose, damaged shift housing components are common causes of hard shifting. If hard shifting is also accompanied by gear clash, synchronizer clutch and stop rings, or mainshaft gear teeth may be worn or damaged.

Hard shifting may also be caused by a loose, or misaligned shift cover, or alignment dowels. Worn, or damaged shift cover components will also cause hard shifting. Any of the foregoing faults will cause component bind and high shift efforts.

Misassembled synchro components will also cause shift problems. Incorrectly installed synchro sleeves, struts, or springs will all cause shift problems.

DIAGNOSIS AND TESTING (Continued)

NOISY OPERATION

Transmission noise is most often a result of worn or damaged components. Chipped, broken gear or synchronizer teeth and brinnelled, spalled bearings all cause noise.

Abnormal wear and damage to internal components is frequently the end result of insufficient lubricant, non–recommended lubricants, or improper operation.

SLIPS OUT OF GEAR

Transmission disengagement may be caused by misaligned or damaged shift components, or worn teeth on the mainshaft gears or synchro components. Incorrect assembly will also contribute to gear disengagement.

LOW LUBRICANT LEVEL

Insufficient transmission lubricant is usually the result of leaks, or inaccurate fluid level check or refill method.

Leaks will be evident by the presence of gear oil around the leak point. If leakage is not evident, the condition is probably the result of an under fill condition.

If air powered lubrication equipment is used to fill a transmission, be sure the equipment is properly calibrated. Equipment out of calibration can lead to an underfill condition.

CLUTCH PROBLEMS

Worn, damaged, or misaligned clutch components can cause difficult shifting, gear clash and noise.

A damaged pilot bearing will cause noise. If bearing damage is severe, drive gear misalignment and hard shifting can also occur.

A worn or damaged clutch disc, pressure plate, or release bearing can cause hard shifting and gear clash.

Damaged or worn clutch hydraulic components, or leaks in the fluid lines or cylinders will cause hard shifting and gear clash. Failure of one of the clutch hydraulic cylinders can result in incomplete clutch release or engagement.

Verify that clutch components are all in good condition before removing the transmission for repair.

SERVICE PROCEDURES

FIFTH–REVERSE SHIFT FORK PADS

The plastic shift fork pads are held in place by a combination of tension and a small locating tang. Three pads are used on the fork (Fig. 5).

The pads can be removed either by hand or with a narrow blade screwdriver. To remove the pads by hand, grasp each pad and tilt it out and off the fork. If the pads prove difficult to remove by hand, insert a screwdriver blade between the pad and fork and pry the pad off.

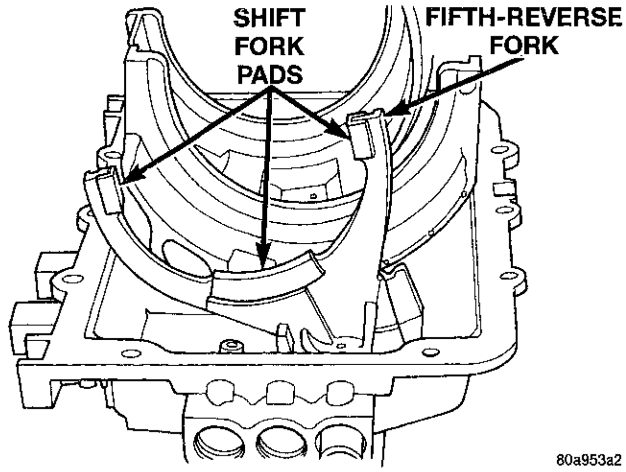

Fig. 5 Shift Fork Pad Locations

SHIFT COVER VENT

The shift cover vent assembly consists of the vent tube, connecting hose, hose clamps, and vent valve (Fig. 6).

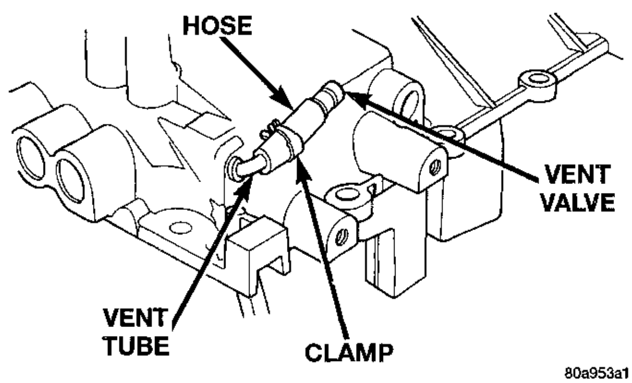

Fig. 6 Shift Cover Vent Components

If the vent tube is removed for replacement or service access, apply Mopar® silicone adhesive/sealer, or equivalent, to the tube to help secure it in the cover. Ensure that the vent is positioned 15–35° from horizontal in order to prevent leaks.

BACKUP LAMP SWITCH REPLACEMENT

The backup light switch is located at the left (driver) side of the cover (Fig. 7). The switch plunger is operated by the fifth–reverse shift rail.

The switch can be replaced with the transmission in, or out of the vehicle. A gasket must used with the switch.

Apply sealer to the switch threads before installation. Tightening torque for the switch is 22–34 N·m (192–300 in. lbs.).

SERVICE PROCEDURES (Continued)

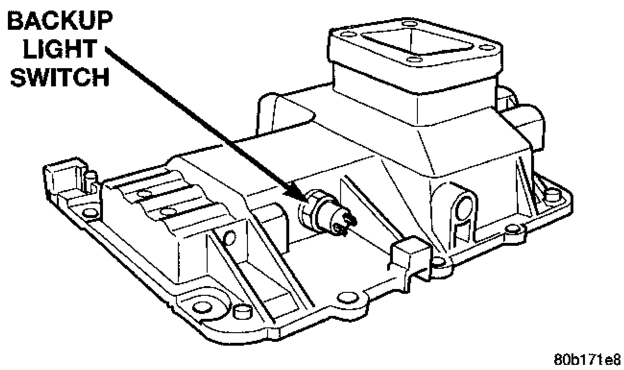

Fig. 7 Backup Light Switch Location

EXPANSION PLUG REPLACEMENT

The expansion plugs at the rear of the shift rail bores (Fig. 8) can be replaced if loose and/or leaking. Replacement procedure is as follows:

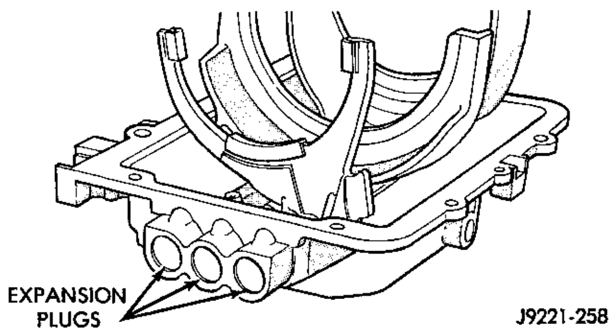

Fig. 8 Expansion Plug Location

(1) Drill 6 mm (1/4 in.) diameter hole in center of each plug to be removed.
(2) Pry plug out of cover with tapered punch.
(3) Clean all chips from shift cover and plug bores. Then clean plug bores with solvent and dry with clean shop towel.
(4) Apply small bead of sealer to outer edge of each new plug. Use Mopar® silicone adhesive/sealer, or equivalent.
(5) Position each new plug in bore and tap into place with hammer and suitable size punch or socket.

REMOVAL AND INSTALLATION

TRANSMISSION—2WD

REMOVAL

(1) Disconnect battery negative cable.
(2) Shift transmission into Neutral.
(3) Remove screws attaching shift boot to floorpan. Then slide boot upward on the shift lever.
(4) Remove the bolts holding the shift tower to the isolator plate and transmission shift cover.
(5) Remove the shift tower and isolator plate from the transmission shift cover.
(6) Raise and support vehicle.
(7) Mark propeller shaft and axle yokes for alignment reference. Use paint, scriber, or chalk to mark yokes.
(8) Remove universal joint strap screws and remove straps.
(9) Remove propeller shaft.
(10) Disconnect and remove exhaust system Y-pipe.
(11) Disconnect wires at speed sensor and backup light switch.
(12) Support engine with adjustable safety stand and wood block.
(13) If transmission is to be disassembled for repair, remove drain bolt at bottom of PTO cover and drain lubricant from transmission (Fig. 9).

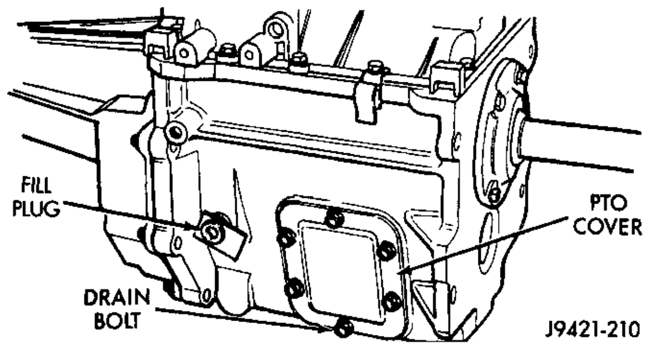

Fig. 9 NV4500 Drain Bolt

(14) Remove bolts/nuts attaching transmission to rear mount.
(15) Support transmission with a transmission jack. Secure transmission to jack with safety chains.
(16) Remove rear crossmember.
(17) Remove bolts attaching clutch slave cylinder to clutch housing. Then move cylinder aside for working clearance.
(18) Remove transmission harness wires from clips on transmission shift cover.
(19) Remove bolts attaching transmission to clutch housing.
(20) Slide transmission and jack rearward until input shaft clears clutch housing.
(21) Lower transmission jack and remove transmission from under vehicle.

INSTALLATION

(1) Apply light coat of Mopar® high temperature bearing grease to contact surfaces of following components:
- input shaft splines and pilot bearing hub.
- release bearing slide surface of front retainer.
- pilot bearing.
- release bearing bore.
- release fork.

REMOVAL AND INSTALLATION (Continued)

- release fork ball stud.
- propeller shaft slip yoke.

(2) Apply sealer to threads of bottom PTO cover bolt and install bolt in case.

(3) Mount transmission on jack and position transmission under vehicle.

(4) Raise transmission until input shaft is centered in release bearing and clutch disc hub.

(5) Move transmission forward and start input shaft in release bearing, clutch disc and pilot bushing.

(6) Work transmission forward until seated against clutch housing. Do not allow transmission to remain unsupported after input shaft has entered clutch disc.

(7) Install and tighten transmission-to-clutch housing bolts to 108 N·m (80 ft. lbs.) torque.

(8) Install clutch slave cylinder.

(9) Connect speed sensor and backup light switch wires.

(10) Fill transmission with recommended lubricant. Correct fill level is bottom edge of fill plug hole.

(11) Position transmission harness wires in clips on shift cover.

(12) Install transmission mount on transmission or rear crossmember.

(13) Install rear crossmember.

(14) Remove transmission jack and engine support fixture.

(15) Align and install propeller shaft.

(16) Lower vehicle.

(17) Clean the mating surfaces of shift tower, isolator plate, and shift cover with suitable wax and grease remover.

(18) Apply Mopar® Gasket Maker, or equivalent, to the sealing surface of the shift cover. Do not over apply sealant.

(19) Install the isolator plate onto the shift cover, metal side down.

(20) Install the shift tower onto the isolator plate. No sealant is necessary between the shift tower and the isolator plate.

(21) Verify that the shift tower, isolator plate, and the shift tower bushings are properly aligned.

(22) Install the bolts to hold the shift tower to the isolator plate and the shift cover. Tighten the shift tower bolts to 10.2–11.25 N·m (7.5–8.3 ft. lbs.).

(23) Install shift boot and bezel.

(24) Connect battery negative cable.

TRANSMISSION—4WD

REMOVAL

(1) Disconnect battery negative cable.

(2) Shift transmission into Neutral.

(3) Remove screws attaching shift boot to floorpan. Then slide boot upward on the shift lever.

(4) Remove the bolts holding the shift tower to the isolator plate and transmission shift cover.

(5) Remove the shift tower and isolator plate from the transmission shift cover.

(6) Raise and support vehicle.

(7) Remove skid plate, if equipped.

(8) If transmission will be disassembled for repair, remove drain bolt at bottom of PTO cover and drain lubricant from transmission (Fig. 10).

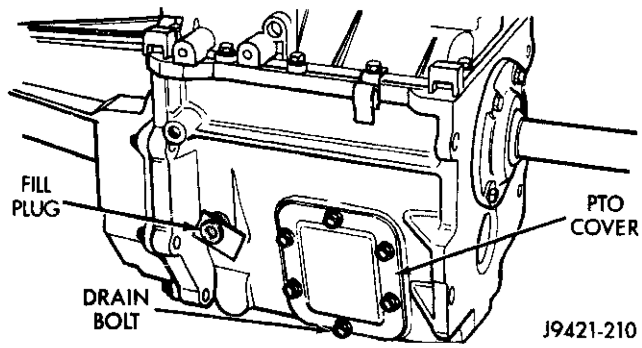

Fig. 10 NV4500 Drain Bolt

(9) Mark propeller shafts and yokes for assembly reference.

(10) Disconnect propeller shafts and remove propeller shafts.

(11) Disconnect and remove exhaust system Y-pipe. Then disconnect and lower remaining exhaust pipes for clearance as necessary.

(12) Support engine with adjustable safety stand.

(13) Disconnect speed sensor wires.

(14) Disconnect backup lamp switch wires.

(15) Disconnect transfer case shift linkage at transfer case range lever. Then remove transfer case shift mechanism from transmission (Fig. 11).

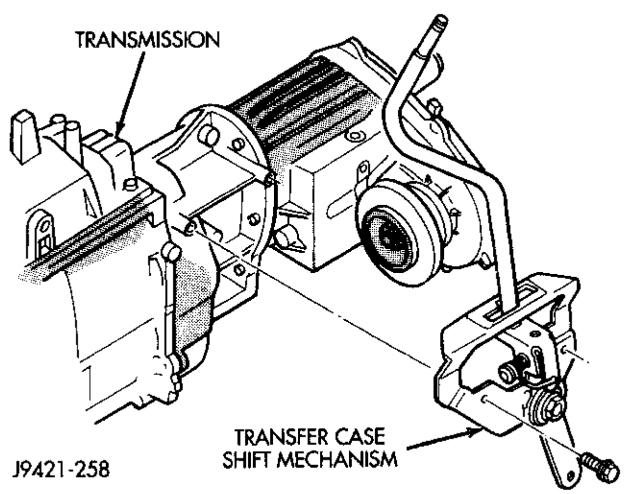

Fig. 11 Transfer Case Shift Mechanism—Typical

(16) Support transfer case with transmission jack. Secure transfer case to jack with safety chains.

REMOVAL AND INSTALLATION (Continued)

(17) Remove transfer case attaching nuts.

(18) Move transfer case rearward until input gear clears transmission mainshaft.

(19) Lower transfer case assembly and move it from under vehicle.

(20) Support transmission with transmission jack. Secure transmission to jack with safety chains.

(21) Remove transmission harness from retaining clips on transmission shift cover.

(22) Remove bolts/nuts attaching transmission mount to rear crossmember.

(23) Remove rear crossmember.

(24) Remove clutch slave cylinder splash shield, if equipped.

(25) Loosen clutch slave cylinder attaching nuts until cylinder piston rod is clear of release lever. This reduces pressure on lever and release bearing making transmission removal/installation easier. Cylinder does not have to be removed completely.

(26) Remove bolts attaching transmission to clutch housing.

(27) Move transmission rearward until input shaft clears clutch disc and release bearing.

(28) Lower transmission and remove it from under vehicle.

INSTALLATION

(1) Apply light coat of Mopar® high temperature bearing grease to contact surfaces of following components:

- input shaft splines and pilot bearing hub.
- release bearing slide surface of front retainer.
- pilot bearing.
- release bearing bore.
- release fork.
- release fork ball stud.
- propeller shaft slip yoke.

(2) Apply sealer to threads of PTO cover bottom drain bolt then install bolt in case.

(3) Mount transmission on jack and position transmission under vehicle. Secure transmission to jack with safety chains.

(4) Raise transmission until input shaft is centered in release bearing and clutch disc hub.

(5) Move transmission forward and start input shaft in release bearing, clutch disc, and pilot bearing.

(6) Work transmission forward until seated against clutch housing. Do not allow transmission to remain unsupported after input shaft has entered clutch disc.

(7) Install and tighten transmission-to-clutch housing bolts to 108 N·m (80 ft. lbs.) torque.

(8) Install transmission mount on transmission or rear crossmember.

(9) Install rear crossmember.

(10) Remove transmission jack and engine support fixture.

(11) Position transmission harness wires in clips on shift cover.

(12) Tighten slave cylinder attaching nuts and install slave cylinder shield, if equipped.

(13) Install transfer case shift mechanism on transmission (Fig. 11).

(14) Install transfer case on transmission jack. Secure transfer case to jack with safety chains.

(15) Raise jack and align transfer case input gear with transmission mainshaft.

(16) Move transfer case forward and seat it on adapter.

(17) Install and tighten transfer case attaching nuts. Tighten nuts to 41-47 N·m (30-35 ft. lbs.) if case has 3/8 studs, or 30-41 N·m (22-30 ft. lbs.) if case has 5/16 studs.

(18) Connect speed sensor and backup lamp switch wires.

(19) Install transfer case shift mechanism to side of transfer case.

(20) Connect transfer case shift lever to range lever on transfer case.

(21) Align and connect propeller shafts. Tighten universal joint clamp strap bolts to 19 N·m (170 in. lbs.) torque.

(22) Fill transmission with required lubricant. Check lubricant level in transfer case and add lubricant if necessary.

(23) Install transfer case skid plate, if equipped, and crossmember. Tighten attaching bolts/nuts to 41 N·m (30 ft. lbs.) torque.

(24) Install exhaust system components.

(25) Lower vehicle.

(26) Clean the mating surfaces of shift tower, isolator plate, and shift cover with suitable wax and grease remover.

(27) Apply Mopar® Gasket Maker, or equivalent, to the sealing surface of the shift cover. Do not over apply sealant.

(28) Install the isolator plate onto the shift cover, metal side down.

(29) Install the shift tower onto the isolator plate. No sealant is necessary between the shift tower and the isolator plate.

(30) Verify that the shift tower, isolator plate, and the shift tower bushings are properly aligned.

(31) Install the bolts to hold the shift tower to the isolator plate and the shift cover. Tighten the shift tower bolts to 10.2–11.25 N·m (7.5–8.3 ft. lbs.).

(32) Install shift lever boot and bezel.

(33) Connect battery negative cable.

REMOVAL AND INSTALLATION (Continued)

SHIFT TOWER

REMOVAL

(1) Shift transmission into Neutral.

(2) Unscrew and remove the shift lever extension from the shift

(3) Remove screws attaching shift boot to floorpan. Then slide boot upward on the shift lever.

(4) Remove the bolts holding the shift tower to the isolator plate and transmission shift cover.

(5) Remove the shift tower and isolator plate from the transmission shift cover.

INSTALLATION

(1) Clean the mating surfaces of shift tower, isolator plate, and shift cover with suitable wax and grease remover.

(2) Apply Mopar® Gasket Maker, or equivalent, to the sealing surface of the shift cover. Do not over apply sealant.

(3) Install the isolator plate onto the shift cover, metal side down.

(4) Install the shift tower onto the isolator plate. No sealant is necessary between the shift tower and the isolator plate.

(5) Verify that the shift tower, isolator plate, and the shift tower bushings are properly aligned.

(6) Install the bolts to hold the shift tower to the isolator plate and the shift cover. Tighten the shift tower bolts to 10.2–11.25 N·m (7.5–8.3 ft. lbs.).

(7) Install the shift lever extension, shift boot, and bezel.

SHIFT COVER

REMOVAL

(1) Remove transmission from vehicle.

(2) Remove shift cover bolts (Fig. 12).

(3) Loosen shift cover with pry tool. To avoid damaging cover seal surface, insert pry tool only in slots provided in cover (Fig. 13).

(4) Raise cover enough to disengage it from alignment dowels in gear case (Fig. 14).

(5) Raise front of shift cover and lift cover up and off gear case (Fig. 14).

INSTALLATION

(1) Clean mating surfaces of shift cover and gear case with wax and grease remover.

(2) Apply Mopar® Gasket Maker, or equivalent, to sealing surface of shift cover or gear case. Do not over–apply sealer material. Excess can be squeezed into gear case and could block lubricant feed holes in time.

(3) Lubricate synchro sleeves with Castrol Syntorq gear lubricant. Then apply light coat of petroleum jelly to shift fork contact surfaces.

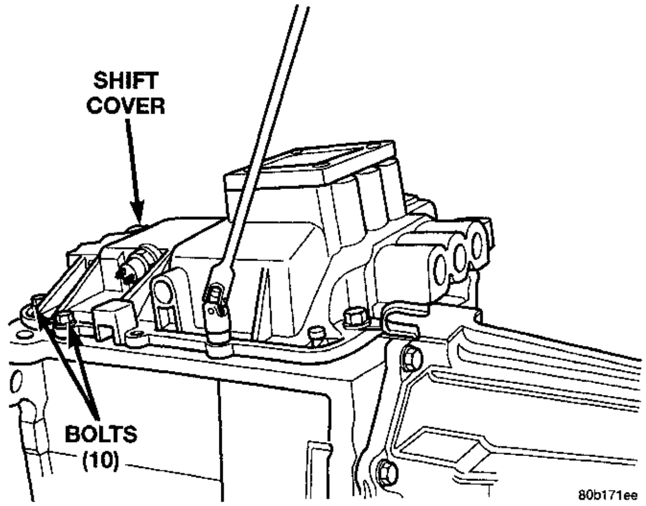

Fig. 12 Shift Cover Bolts

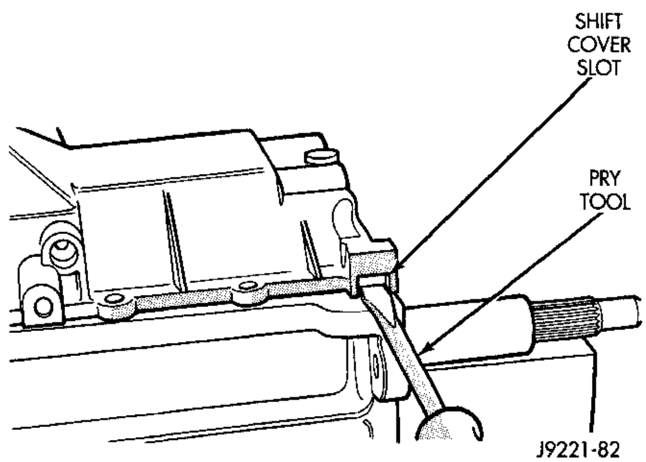

Fig. 13 Loosening Shift Cover

(4) Verify that the shift fork pads (Fig. 15) are properly and securely positioned on the fifth-reverse fork

(5) Verify that 1–2 and 3–4 synchro sleeves are in neutral position. Also verify that forks in shift cover are in neutral position.

(6) Align and install shift cover (Fig. 14). If cover will not seat, it is either not aligned on gear case dowels, or shift forks are not aligned with sleeves and shift lug.

(7) Apply Mopar® Lock N' Seal, or equivalent, to threads of shift cover bolts.

(8) Install and tighten shift cover bolts to 27–31 N·m (216–276 in. lbs.) torque.

(9) Install backup lamp switch and gasket in cover. Apply sealer to switch threads before installation and tighten switch to 22–34 N·m (193–265 in. lbs.).

(10) Install vent assembly, if removed. Apply an adhesive/sealer to vent tube to help secure it in cover.

REMOVAL AND INSTALLATION (Continued)

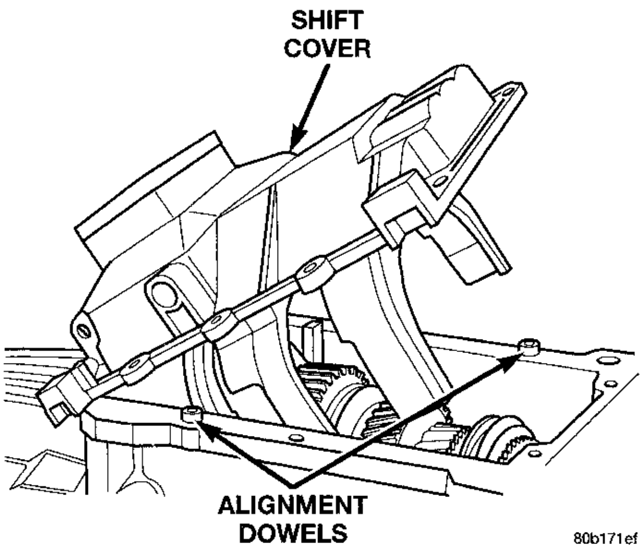

Fig. 14 Shift Cover

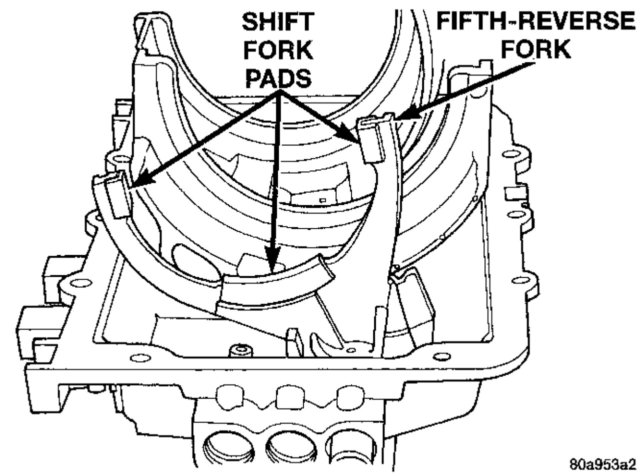

Fig. 15 Fifth-Reverse Shift Fork Pads

(11) Install transmission.

EXTENSION/ADAPTER HOUSING

REMOVAL

(1) Raise and support vehicle.
(2) Remove rear propeller shaft.
(3) Support transmission with suitable transmission jack.
(4) Remove engine rear support. Refer to Group 9, Engine, for proper procedures.
(5) Remove transfer case, if equipped.
(6) Remove bolts attaching extension/adapter housing to gear case (Fig. 16).
(7) Remove extension/adapter housing (Fig. 17). There is one alignment dowel in the gear case and one in the extension/adapter housing.
(8) Remove rubber spline seal from end of mainshaft (Fig. 18). The seal can be reused or discarded as desired. The seal is not an essential part and can be reused or discarded as desired. The seal is mainly used to prevent lubricant loss during shipping and does not have to be replaced if damaged.

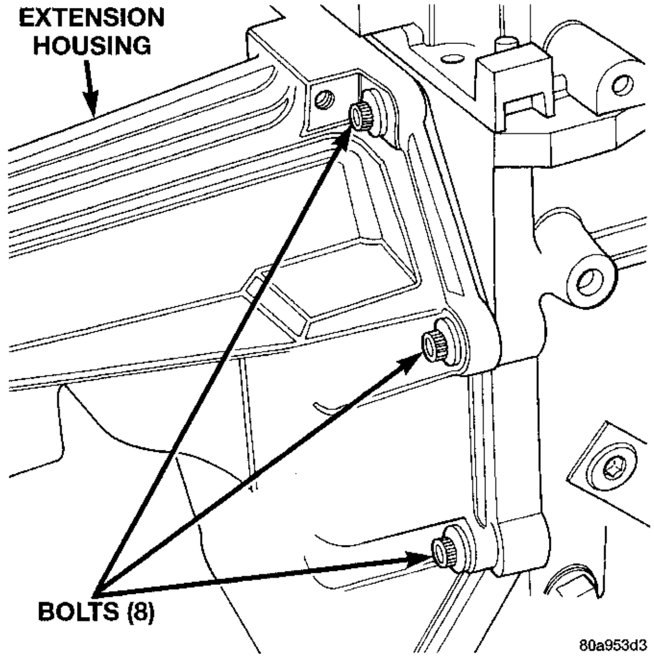

Fig. 16 Extension/Adapter Housing Bolts

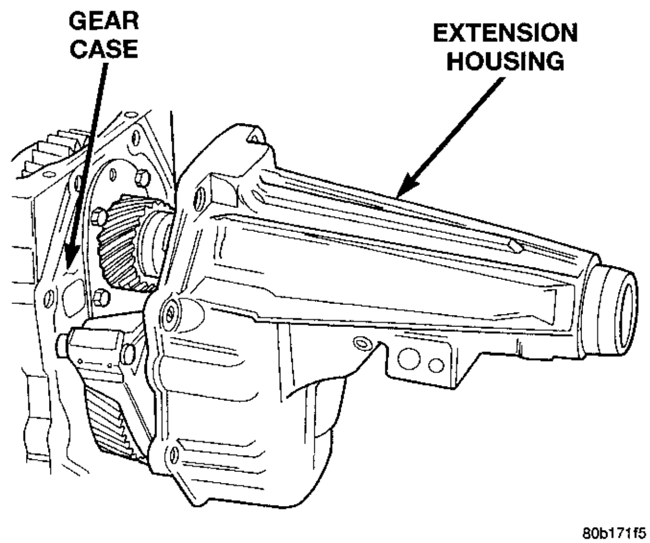

Fig. 17 Extension/Adapter Housing

INSTALLATION

(1) Clean mating surfaces of extension/adapter housing and gear case with a wax and grease remover.
(2) Check alignment dowels in gear case and housing or adapter. Be sure dowels are in position and seated.

Mopar AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

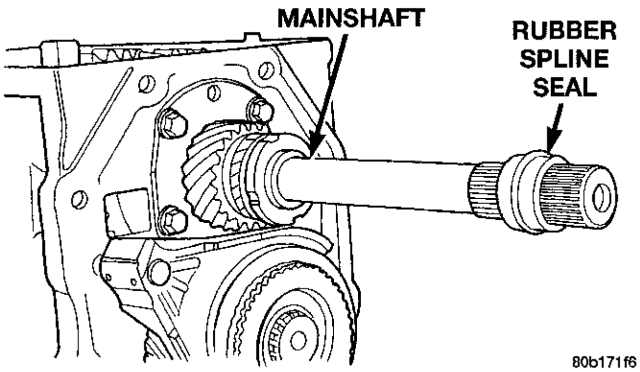

Fig. 18 Mainshaft Spline Seal

(3) Apply Mopar® Gasket Maker to gear case and housing mating surfaces.

(4) Align and install extension/adapter housing on gear case (Fig. 19).

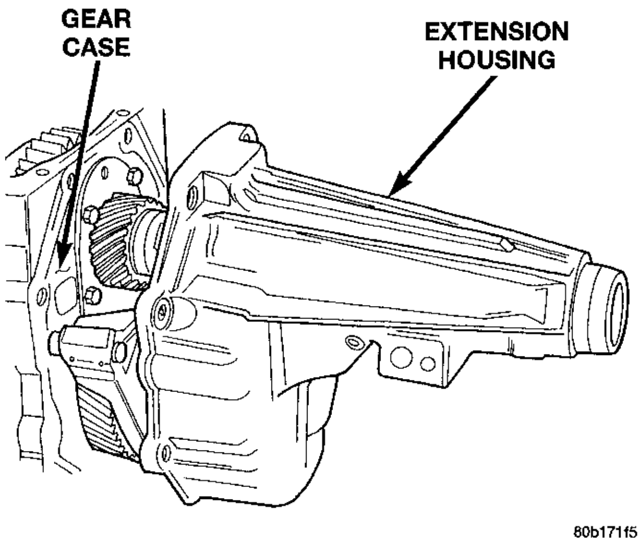

Fig. 19 Installing Extension/Adapter Housing

(5) Apply Mopar® Lock N' Seal, or equivalent, to threads of extension/adapter housing bolts.

(6) Install and tighten housing bolts to 54 N·m (40 ft. lbs.) torque.

(7) Install transfer case, if equipped.

(8) Install engine rear support. Refer to Group 9, Engine, for proper procedures.

(9) Install propeller shaft(s).

(10) Remove transmission support stand and lower vehicle.

EXTENSION/ADAPTER HOUSING SEAL AND BUSHING

REMOVAL

(1) On 4X2 vehicles, remove the propeller shaft.

(2) On 4X4 vehicles, remove the transfer case.

(3) On light duty 4X2 vehicles, remove extension housing seal (Fig. 20) using Remover C-3985-B.

(4) On heavy duty 4X2 vehicles, remove extension housing seal with a suitable pry tool or a slide hammer mounted screw.

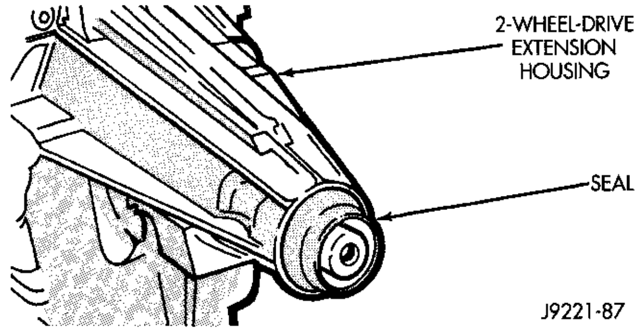

Fig. 20 Extension Housing And Seal (2-Wheel Drive Models)

(5) On 4X4 vehicles, use a suitable pry tool, or a slide hammer mounted screw, to remove the adapter housing seal (Fig. 21).

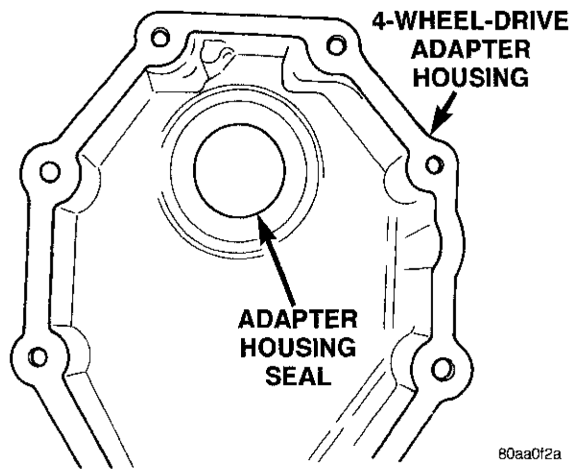

Fig. 21 Adapter Housing (4-Wheel Drive Models)

(6) On light duty transmissions, remove the extension housing bushing with Remover 6957.

(7) On heavy duty transmissions, remove the extension housing bushing with Remover 8155.

INSTALLATION

(1) On light duty transmissions, install the extension housing bushing with Installer 6951 and Handle C-4171 (Fig. 22).

(2) On heavy duty transmissions, install the extension housing bushing with Installer 8156 and Handle C-4171.

(3) On light duty 4X2 transmissions, install the extension housing seal with Installer C-3972-A and Handle C-4171 (Fig. 23).

REMOVAL AND INSTALLATION (Continued)

(4) On heavy duty 4X2 transmissions, install the extension housing seal with Installer 8154 and Handle C-4171.

(5) On 4X4 transmissions, install the adapter housing seal with Installer C-3860-A and Handle C-4171.

(6) Install transfer case, if necessary, and propeller shaft(s).

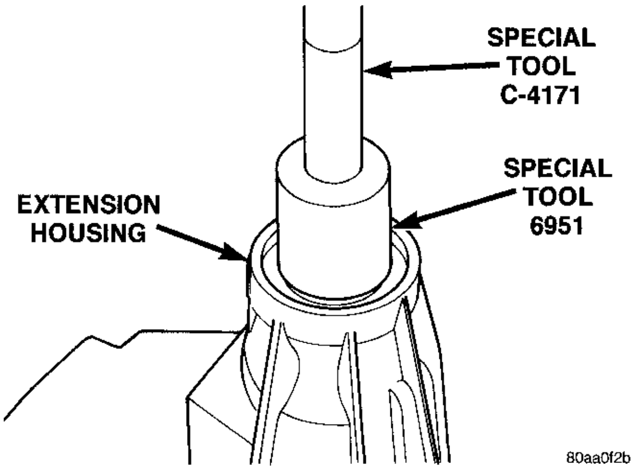

Fig. 22 Install Extension Housing Bushing

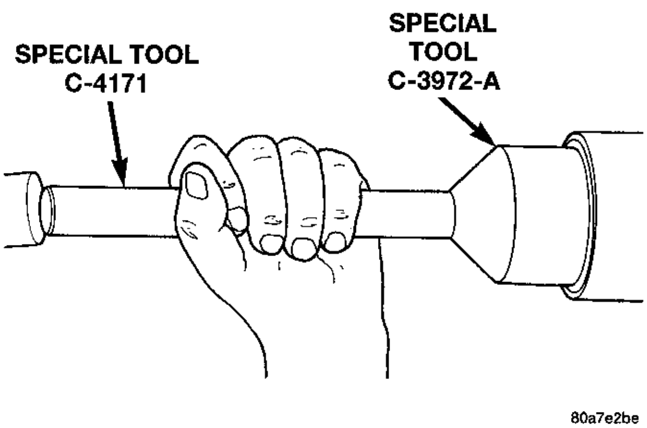

Fig. 23 Install Extension Housing Seal

DISASSEMBLY AND ASSEMBLY

TRANSMISSION

DISASSEMBLY

FIFTH GEAR REMOVAL

(1) Remove mainshaft fifth gear nut as follows:

(a) Install nut wrench on fifth gear nut (Fig. 24). Use Nut Wrench 6443 on standard duty models and Wrench 6743 on heavy duty models.

(b) Note that wrench only fits one way on nut. Be sure wrench is fully engaged in nut slots and is not cocked.

(c) There are four splined sockets available to retain the mainshaft while removing the fifth gear nut.

- Socket 6441 fits light duty 4X2 mainshafts.
- Socket 6442 fits light duty 4X4 mainshafts.
- Socket 6993 fits heavy duty 4X2 mainshafts.
- Socket 6984 fits heavy duty 4X4 mainshafts.

(d) Install breaker bar in appropriate socket wrench (Fig. 25).

(e) Wedge breaker bar handle against workbench. Purpose of socket wrench and breaker bar is to prevent mainshaft from turning while nut is loosened.

(f) Position small end of Nut Wrench 6443 at approximately 10 o'clock position (Fig. 24).

(g) Strike small end of nut wrench with heavy copper hammer to break nut loose. Nut is secured by interference fit thread plus Loctite adhesive and will require several firm blows to loosen it (nut torque is in 300 ft. lb. range).

(h) Once nut is loose, it can be removed by holding nut wrench with breaker bar and rotating output shaft with socket wrench and ratchet.

(i) Remove and discard fifth gear nut (Fig. 26).

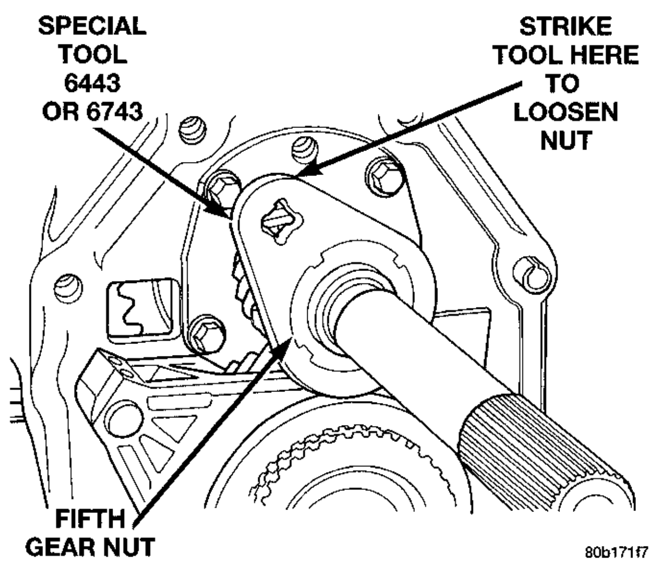

Fig. 24 Installing Nut Wrench On Mainshaft Fifth Gear

Mopar AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

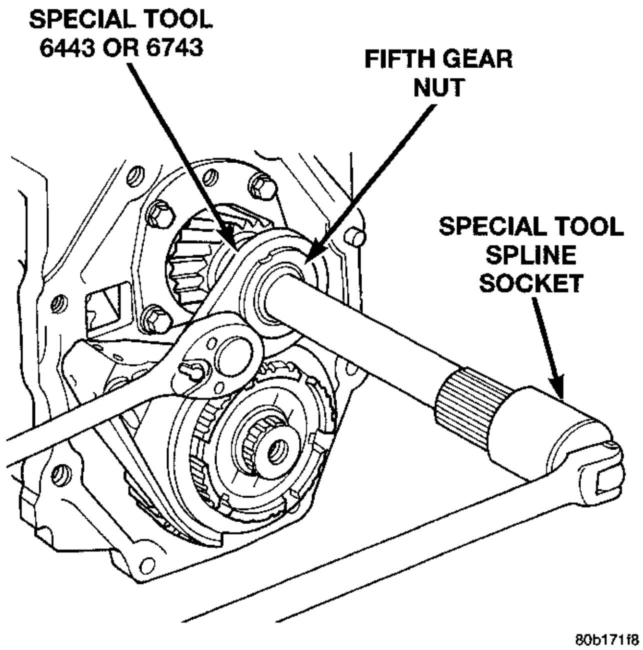

Fig. 25 RemoveMainshaft Fifth Gear Nut

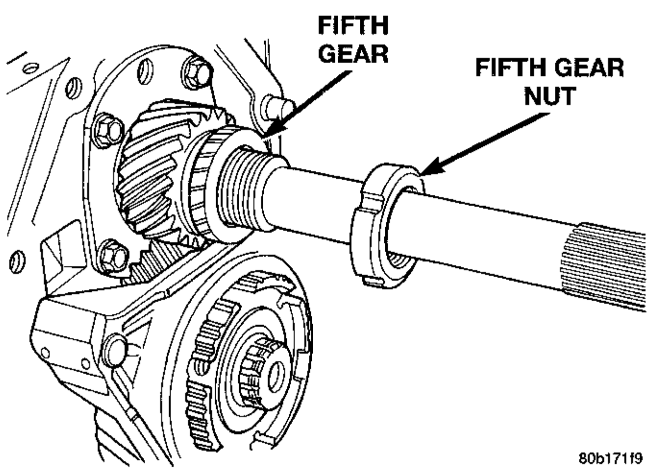

Fig. 26 Mainshaft Fifth Gear Nut Removal

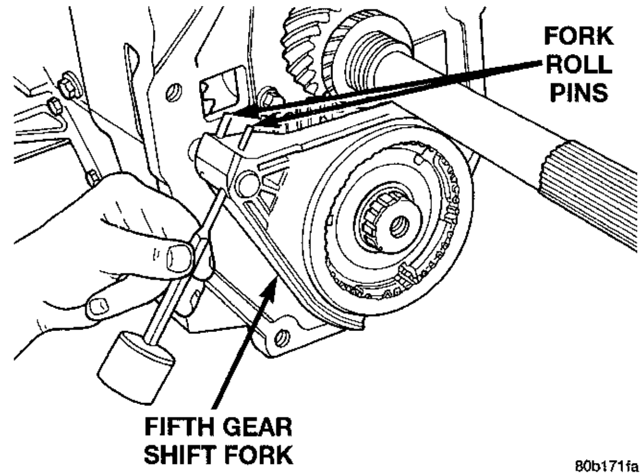

Fig. 27 Removing Fifth Gear Shift Fork Roll Pins

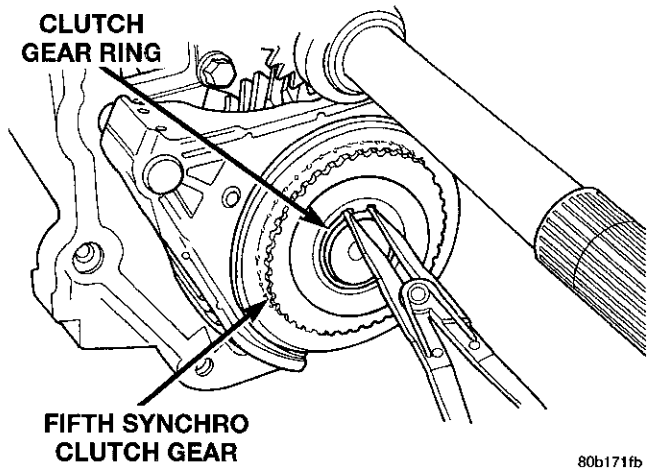

Fig. 28 Removing Countershaft Fifth Gear Clutch Gear Snap Ring

(2) Remove roll pins that secure countershaft fifth gear shift fork to shift rail with pin punch (Fig. 27). Roll pins are driven out from bottom of fork and not from top.

(3) Remove snap ring that secures fifth gear clutch hub and gear on countershaft (Fig. 28).

(4) Remove fifth gear shift fork and gear assembly. Remove assembly by tapping fork off rail with plastic mallet.

(5) Remove countershaft fifth gear clutch gear and stop ring.

(6) Remove fifth gear shift fork from sleeve.

(7) Remove sleeve, struts, and strut springs from countershaft fifth gear hub, if necessary.

(8) Remove countershaft fifth gear needle bearing assembly (Fig. 29).

(9) Remove cone shaped rear bearing thrust washer from end of countershaft (Fig. 30). Note position of washer for assembly reference. Also note that washer bore has notch for locating pin.

(10) Remove and retain thrust washer locating pin from countershaft.

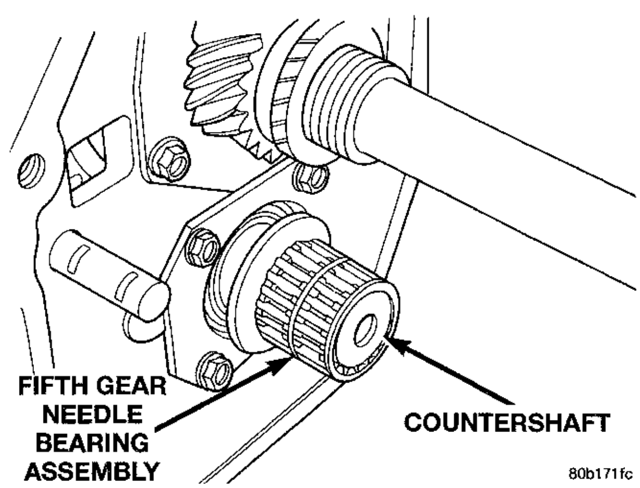

Fig. 29 Countershaft Fifth Gear Needle Bearing Removal

DISASSEMBLY AND ASSEMBLY (Continued)

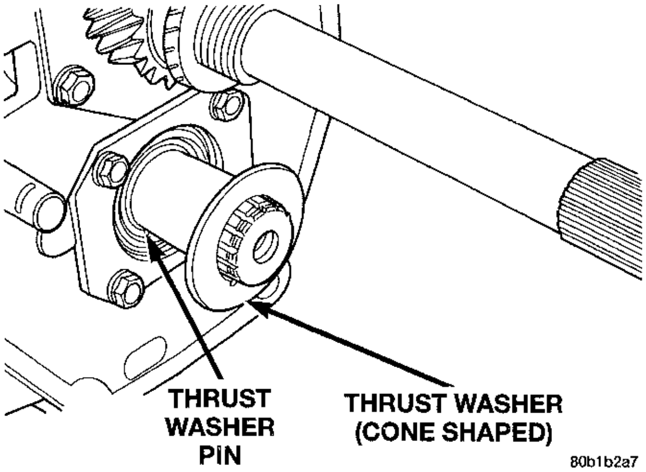

Fig. 30 Countershaft Rear Bearing Thrust Washer Removal

(11) Remove mainshaft overdrive fifth gear with Puller Tool Set 6444. Note that puller set can be used on both standard and heavy duty transmissions.

(12) Gear removal procedure is as follows:

(a) Position first puller jaw on gear (Fig. 31). Use Puller Jaws 6459 on standard duty models and Puller Jaws 6820 on heavy duty models.

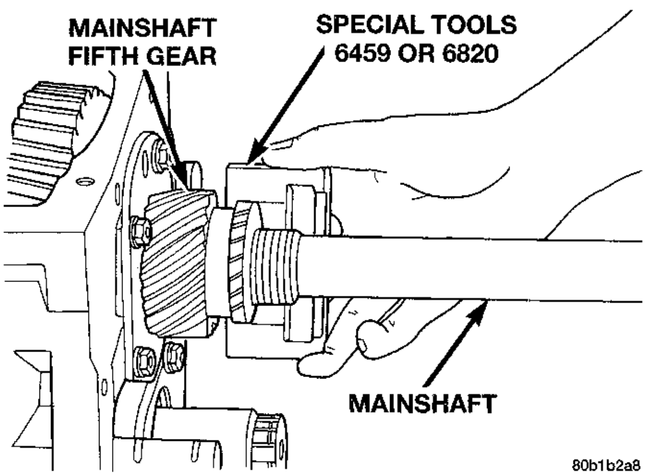

Fig. 31 Installing First Puller Jaw On Mainshaft Fifth (Overdrive) Gear

(b) Assemble Puller Flange 6444-1 and Puller Rods 6444-3 for 4X2 vehicles, or 6444–4 for 4X4 vehicles, (Fig. 32).

(c) Slide assembled puller flange and rods onto output shaft. Then seat flange in notch of puller jaw (Fig. 32).

(d) Position second puller jaw (6459 or 6820) on gear and in notch of puller flange (Fig. 33).

(e) Slide Retaining Collar 6444-8 over puller jaws to hold them in place (Fig. 33).

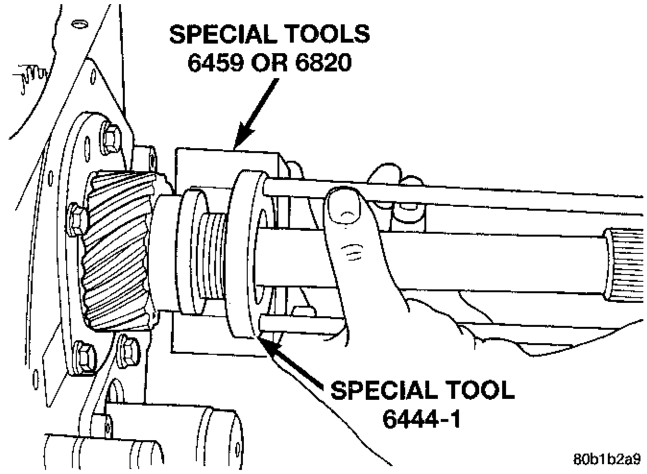

Fig. 32 Seating Puller Flange In First Puller Jaw

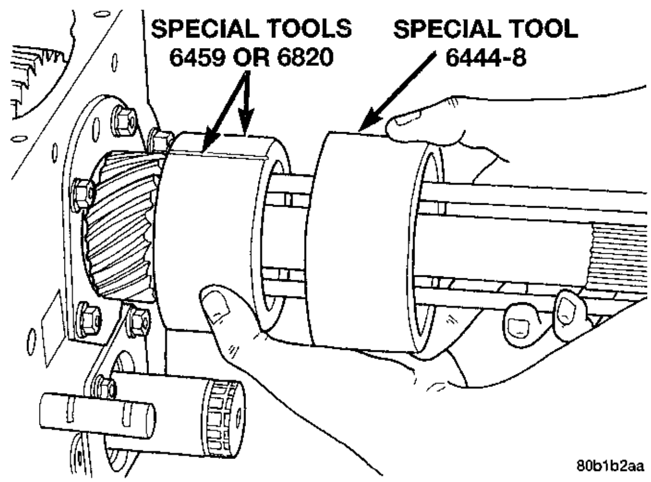

Fig. 33 Installing Retaining Collar Over Puller Jaws

(f) Install Puller and Bolt 6444 on puller rods. Then secure puller to rods with retaining nuts (Fig. 34).

(g) Tighten puller bolt to remove gear from shaft splines (Fig. 34).

(13) Remove bolts attaching mainshaft rear bearing plate to gear case and remove fifth gear plate end play shims and bearing cup (Fig. 35).

FRONT RETAINER REMOVAL

(1) Remove front retainer bolts (Fig. 36). Discard retainer bolts. They should not be reused.

(2) Remove front retainer by lightly tapping it back and forth with plastic mallet to loosen it. Then rock retainer back and forth by hand to work it out of gear case. Note that retainer flange extends into the transmission case and is a snug fit into case bore.

(3) Remove seal from front retainer (Fig. 37). Use small chisel to collapse one side of seal then pry it out with suitable tool.

(4) Remove bearing cup from front retainer as follows:

mopar AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

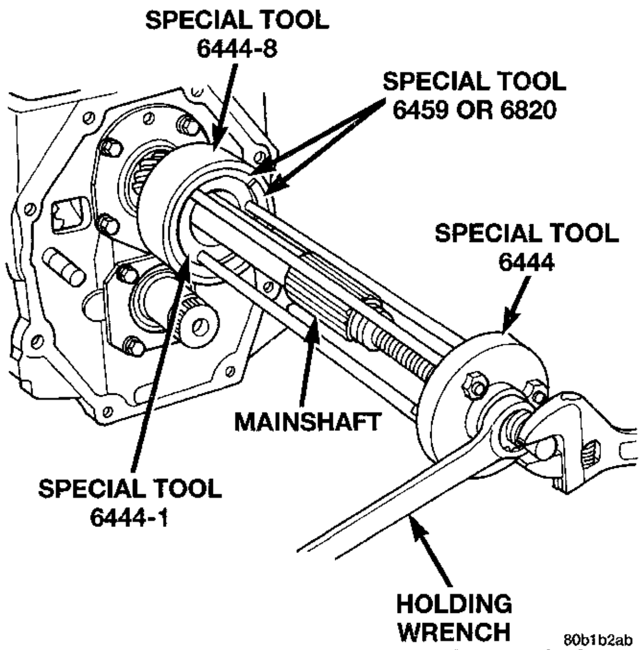

Fig. 34 Removing Fifth Gear From Mainshaft Splines

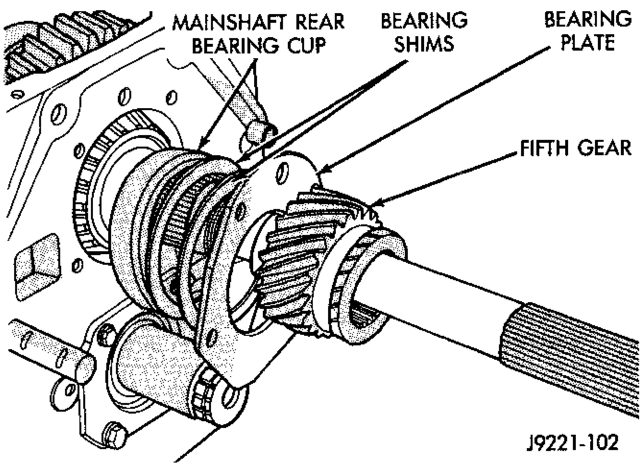

Fig. 35 Removing Mainshaft Fifth Gear Bearing Plate, Bearing Shims, And Rear Bearing Cup

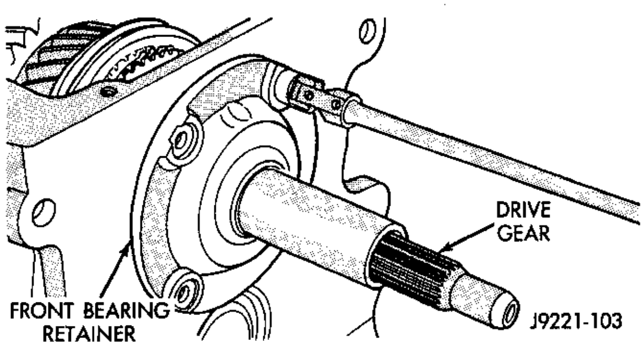

Fig. 36 Removing Front Bearing Retainer Bolts

(a) Assemble Puller Flange 6444-1 and Puller Rods 6444-4 (Fig. 38).

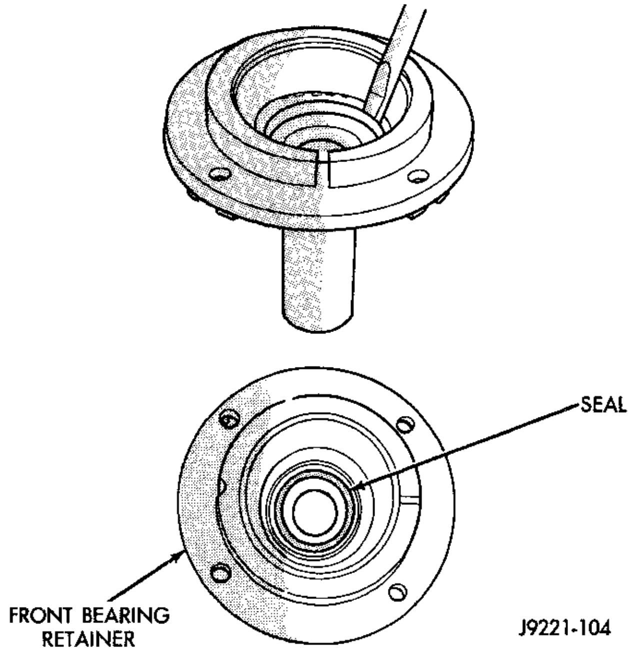

Fig. 37 Removing Bearing Retainer Seal

(b) Insert Puller Jaws 6453-1 in puller flange (Fig. 38). Narrow lip of puller jaws will go under bearing cup.

(c) Install Disc C-4487-1 into bearing retainer on heavy duty transmissions for Insert 6453-2 to rest upon.

(d) Install assembled tools in front retainer (Fig. 39). Be sure puller jaws are seated under bearing cup.

(e) Place Insert Tool 6453-2 in center of puller jaws (Fig. 39). Insert tool is used to hold puller jaws in place.

(f) Install Puller 6444 on puller rods (Fig. 40). Then install retaining nuts on puller rods.

(g) Tighten puller bolt to draw bearing cup out of retainer (Fig. 40).

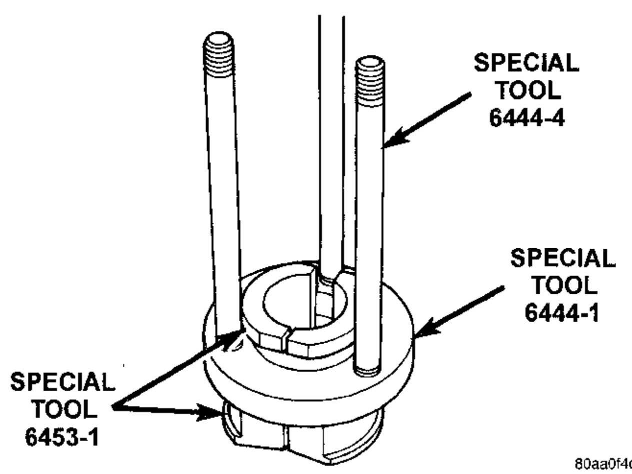

Fig. 38 Assembling Puller Rods, Flange And Jaws

DISASSEMBLY AND ASSEMBLY (Continued)

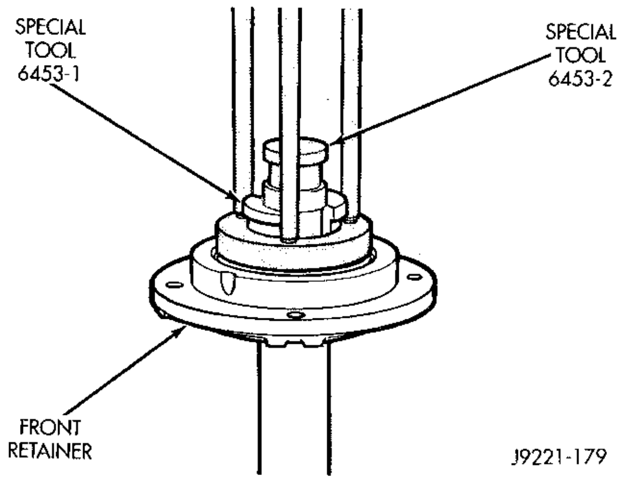

Fig. 39 Installing Puller Tools In Front Retainer

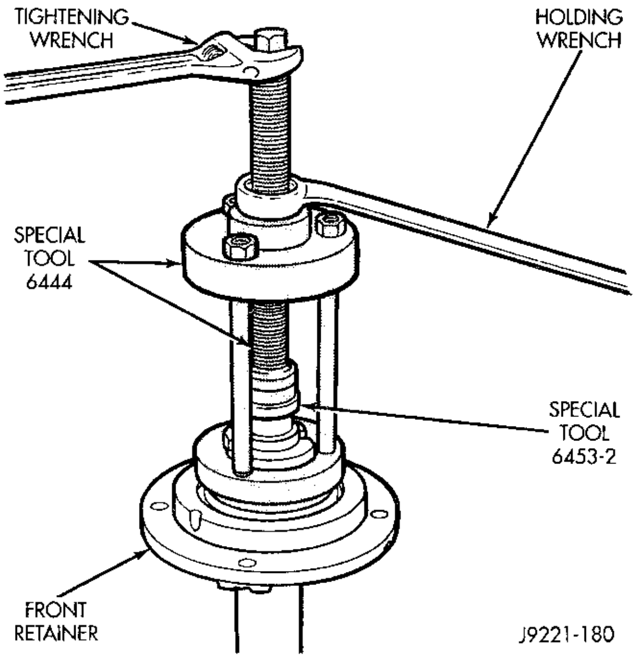

Fig. 40 Removing Bearing Cup From Front Retainer

DRIVE GEAR REMOVAL

(1) Remove drive gear (Fig. 41).

(2) Remove pilot bearing from drive gear (Fig. 42).

(3) Remove tapered bearing from drive gear as follows:

(a) Assemble Puller Flange 6444-1 and Puller Rods 6444-6. Then position first Puller Jaw 6447 on bearing (Fig. 43).

(b) Slide assembled puller flange and rod tools onto input shaft. Then seat flange in notch of puller jaw (Fig. 43).

(c) Position second Puller Jaw 6447 on gear and in notch of puller flange (Fig. 43).

(d) Slide Retaining Collar 6444-8 over puller jaws to hold them in place (Fig. 43).

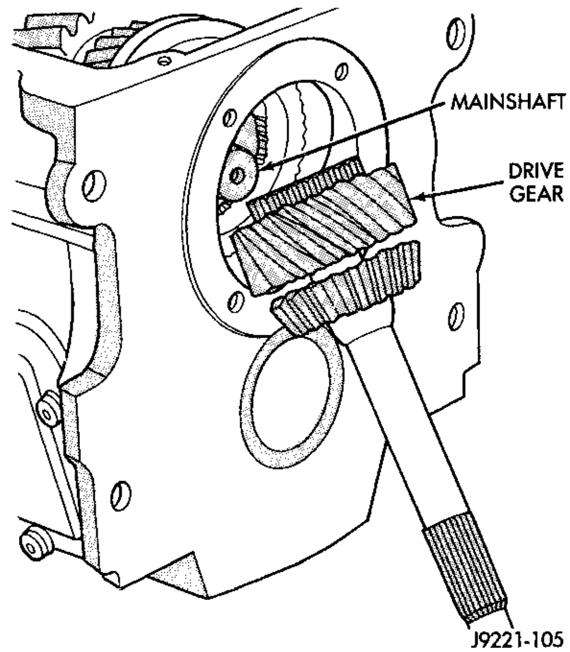

Fig. 41 Drive Gear Removal

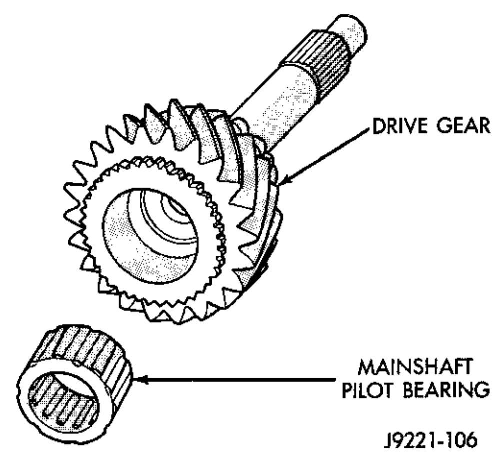

Fig. 42 Pilot Bearing Removal/Installation

(e) Install Puller 6444 on puller rods. Then secure puller to rods with retaining nuts (Fig. 43).

(f) Tighten puller bolt to remove bearing cone from drive gear (Fig. 43).

MAINSHAFT AND GEARTRAIN REMOVAL

(1) Move 1-2 and 3-4 synchro sleeves into Neutral, if necessary.

(2) Remove drive gear thrust bearing from forward end of mainshaft (Fig. 44).

(3) Remove fourth gear clutch gear and synchro stop ring from mainshaft (Fig. 45).

(4) Roll gear case onto left side (Fig. 46).

(5) Remove rear mainshaft rear bearing.

(6) Remove mainshaft assembly as follows (Fig. 46):

mopar AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

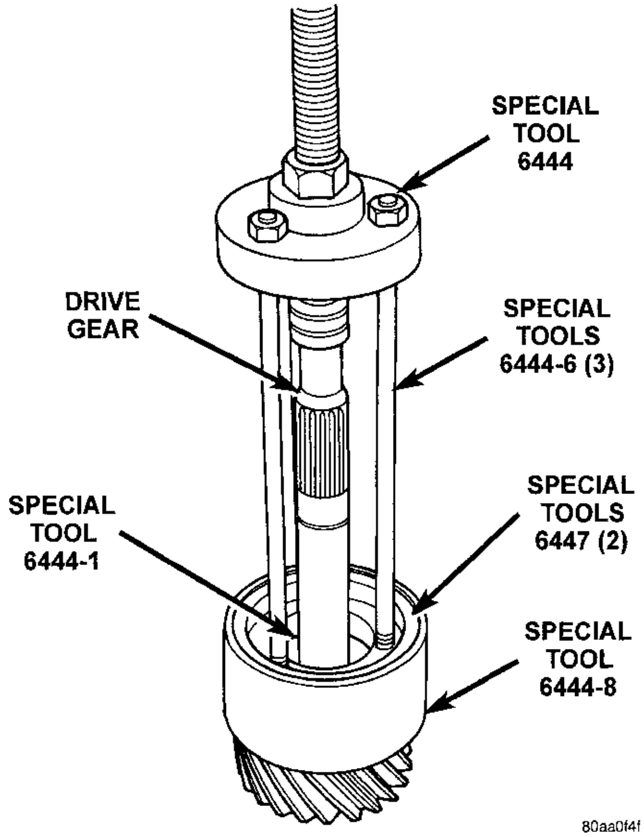

Fig. 43 Removing Front Bearing From Drive Gear

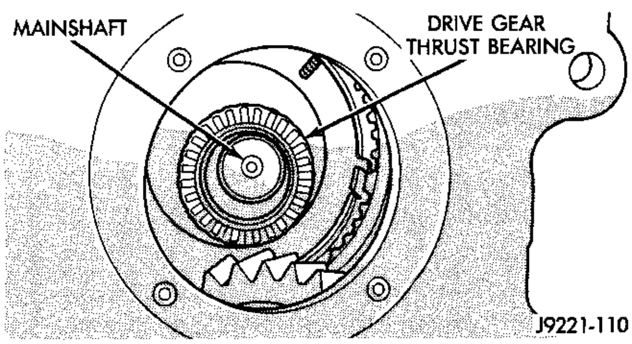

Fig. 44 Drive Gear Thrust Bearing Removal

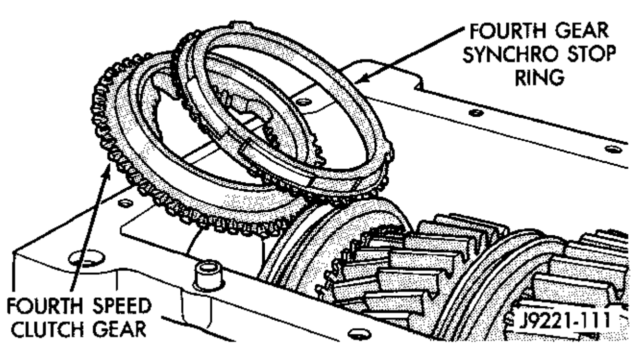

Fig. 45 Fourth Gear Clutch Gear Stop Ring Removal

(a) Lift front end of mainshaft slightly. Use care when handling the mainshaft because the gears will be lose on the mainshaft.

(b) Grasp mainshaft rear splines. Then turn spline end of mainshaft in counterclockwise direction to rotate shaft and geartrain out of case.

(c) Once mainshaft gears roll clear of countershaft gears, shaft and gear assembly can be tilted outward and removed from gear case (Fig. 46).

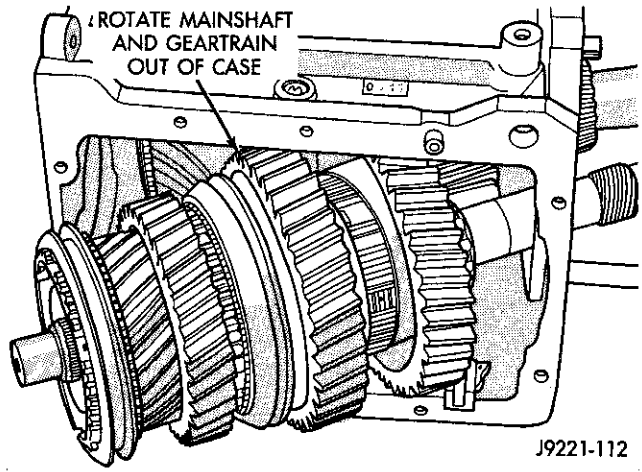

Fig. 46 Mainshaft And Geartrain Removal

REVERSE IDLER AND COUNTERSHAFT REMOVAL

(1) Remove countershaft rear bearing plate (Fig. 47).

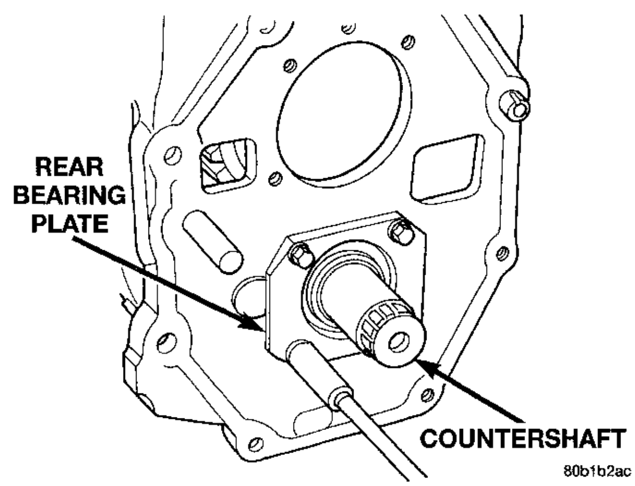

Fig. 47 Removing Countershaft Rear Bearing Plate

DISASSEMBLY AND ASSEMBLY (Continued)

(2) Remove countershaft end play shim and rear bearing cup (Fig. 48).

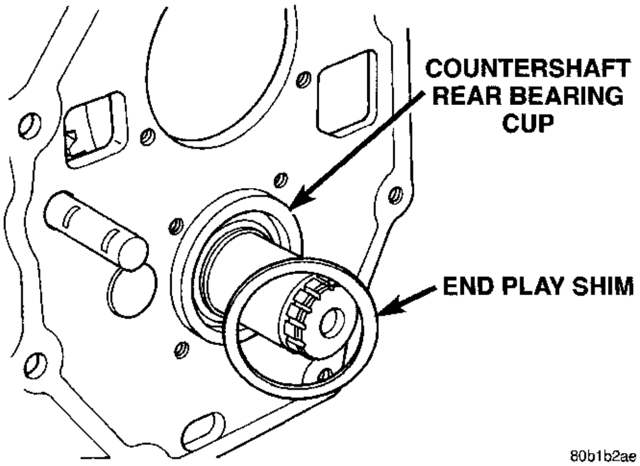

Fig. 48 Countershaft End Play Shim And Rear Bearing Cup Removal

(3) Remove reverse idler shaft (Fig. 49).

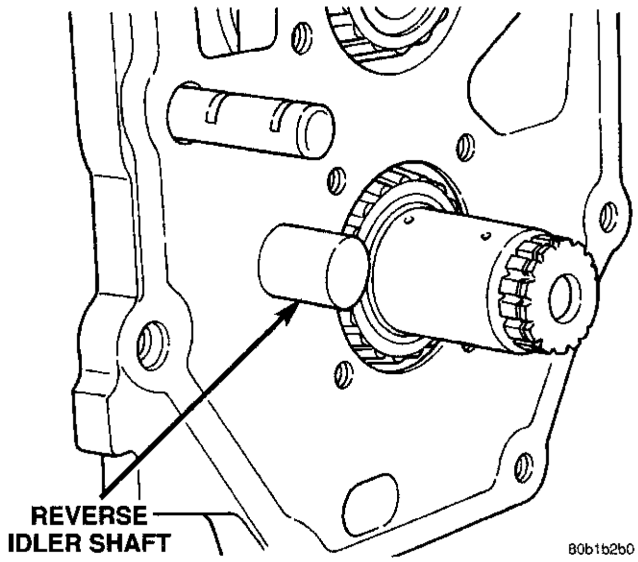

Fig. 49 Removing Reverse Idler Shaft

(4) Rotate countershaft outward and push reverse idler gear away from countershaft and toward front of case (Fig. 50).

(5) Remove idler gear (Fig. 51).

(6) Keep reverse idler gear bearings and spacer together for cleaning and inspection (Fig. 52). Insert idler shaft through gear and bearings to keep them in place.

(7) Remove idler gear thrust washers from gear case. Install washers on idler shaft to keep them together for cleaning and inspection.

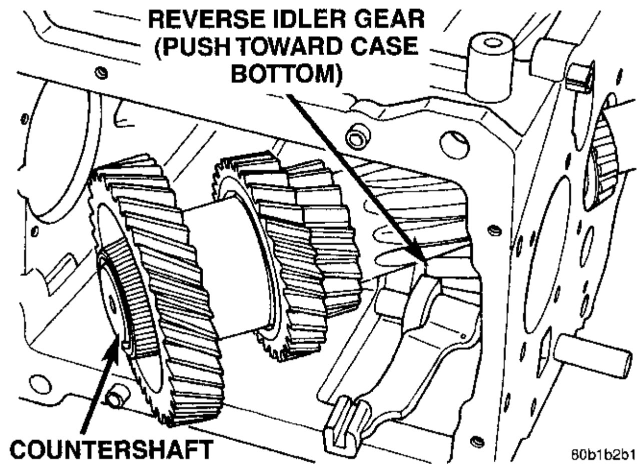

Fig. 50 Idler Gear Moved Away From Countershaft

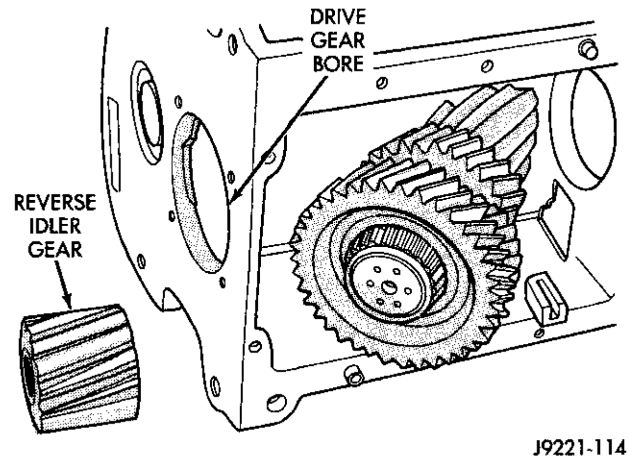

Fig. 51 Reverse Idler Gear Removal

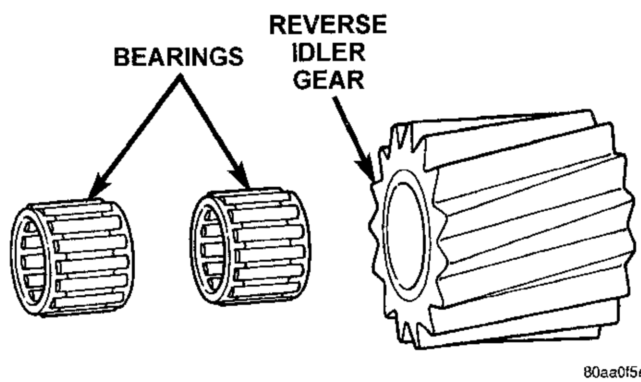

Fig. 52 Reverse Idler Gear Components

Mopar AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(8) Remove countershaft rear bearing. Shaft cannot be removed from case until rear bearing has been removed. Bearing removal procedure is as follows:

(a) Assemble Puller Flange 6444-1 and Puller Rods 6444-4 (Fig. 53).

(b) Position first Puller Jaw 6449 on bearing cone (Fig. 53).

(c) Seat puller flange in notch of puller jaw just installed on bearing cone (Fig. 53).

(d) Install second Puller Jaw 6449 on bearing and in notch of puller flange (Fig. 53).

(e) Slide Retaining Collar 6444-8 over puller jaws to hold them in place (Fig. 53). Note that retaining collar has small lip on one end and only fits one way over jaws.

(f) Install Puller 6444 on puller rods. Then secure puller to rods with retaining nuts (Fig. 53).

(g) Tighten puller bolt to remove bearing from shaft (Fig. 53). If bearing is exceptionally tight, tap end of puller bolt with copper mallet to help loosen bearing.

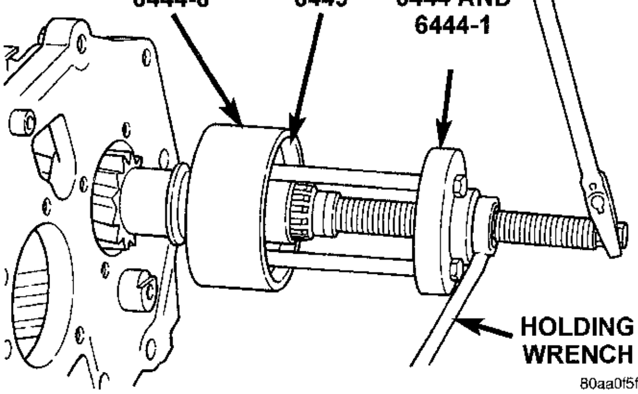

Fig. 53 Removing Countershaft Rear Bearing

(9) Remove bearing puller tools.

(10) Rotate countershaft out of gear case (Fig. 54).

(11) Remove countershaft front bearing as follows:

(a) Assemble Puller Flange 6444-1 and Puller Bolts 6444-4 (Fig. 55).

(b) Position first Puller Jaw 6451 on bearing.

(c) Seat puller flange in notch of puller jaw.

(d) Install second Puller Jaw 6451 on bearing and in notch of puller flange.

(e) Slide Retaining Collar 6444-8 over puller jaws to hold them in place (Fig. 55). Note that retaining collar has small lip on one end and only fits one way over jaws.

(f) Install Puller Bridge And Bolt Assembly 6444 on puller bolts. Then secure bridge to bolts with retaining nuts (Fig. 55).

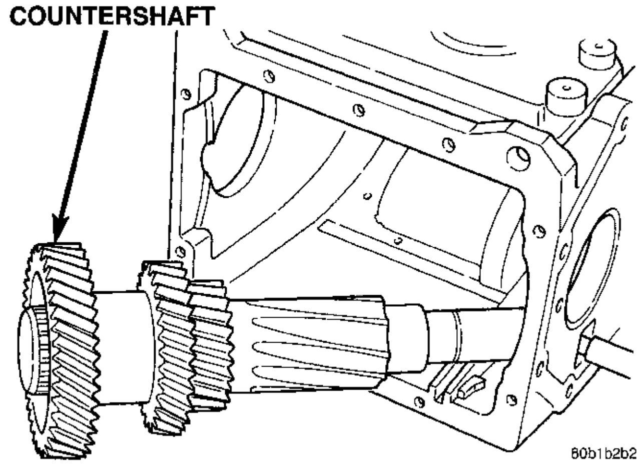

Fig. 54 Removing Countershaft From Gear Case

(g) Tighten puller bolt to remove bearing from shaft (Fig. 55). If bearing is exceptionally tight, tap end of puller bolt with mallet to help loosen bearing.

(12) Remove bearing puller tools.

(13) Set countershaft and idler gear aside for cleaning and inspection.

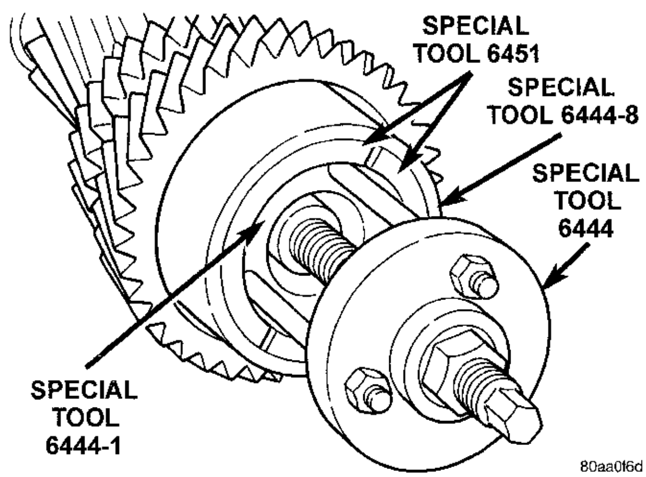

Fig. 55 Removing Countershaft Front Bearing

GEAR CASE DISASSEMBLY

(1) Remove countershaft front bearing cap. Use mallet or hammer to remove cap from inside case (Fig. 56).

(2) Remove countershaft front bearing cup with Remover Tool 6454 and Tool Handle C-4171 (Fig. 57).

(3) Remove roll pin that secures shift lug on shift rail in case (Fig. 58). A small pin punch can be modified by putting a slight bend in it to drive pin completely out of shift rail (Fig. 58).

(4) Remove shift lug rail.

DISASSEMBLY AND ASSEMBLY (Continued)

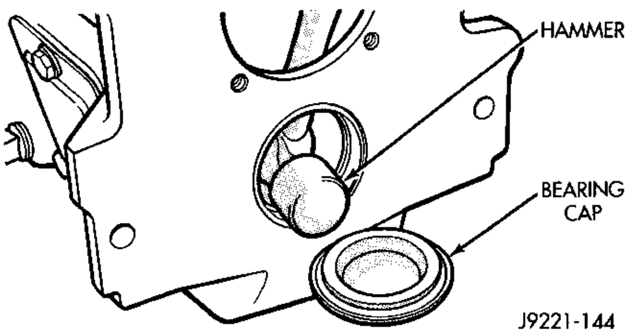

Fig. 56 Countershaft Front Bearing Cap Removal

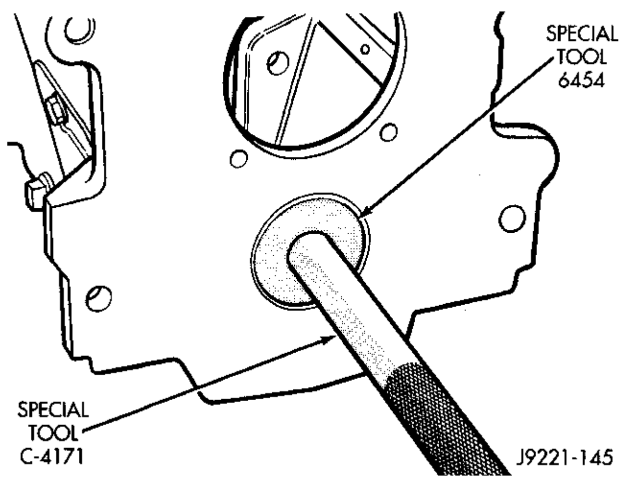

Fig. 57 Countershaft Front Bearing Cup Removal

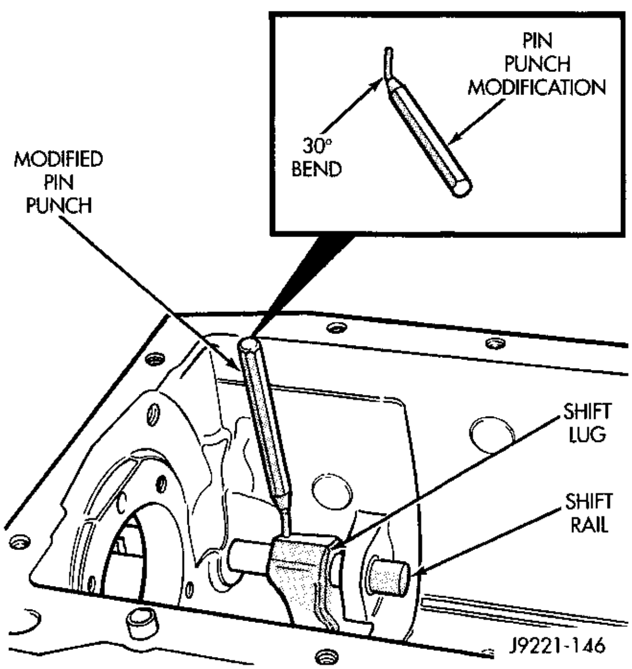

Fig. 58 Removing Shift Lug Roll Pin

MAINSHAFT DISASSEMBLY

NOTE: Not all of the mainshaft gear and synchro components are a one-way fit. Some gear and synchro components can be installed backwards. To avoid reassembly problems, mark the gear gears, clutch gears, synchro hubs, and sleeves for reference during teardown. Use paint or a scriber for marking purposes. Then stack the geartrain parts in order of removal. This practice will help avoid incorrect assembly and lost time.

(1) Remove drive gear thrust bearing from end of mainshaft, if not previously removed.

(2) Remove 3-4 synchro hub, third gear stop ring and third gear as an assembly (Fig. 59). It is not necessary to diassemble the synchronizer components unless worn or damaged.

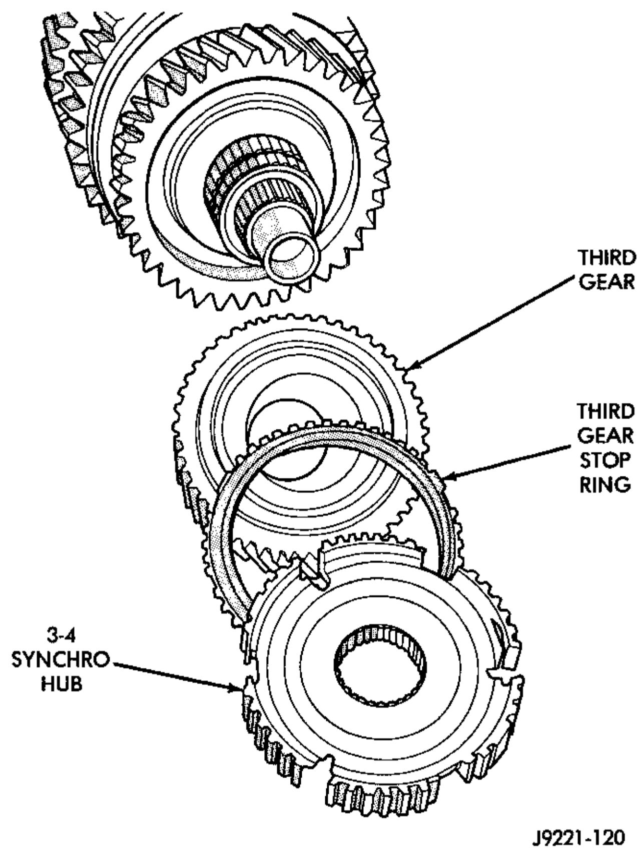

Fig. 59 Third Gear, Stop Ring, And 3-4 Hub Removal

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(3) Remove third gear bearing from mainshaft (Fig. 60).

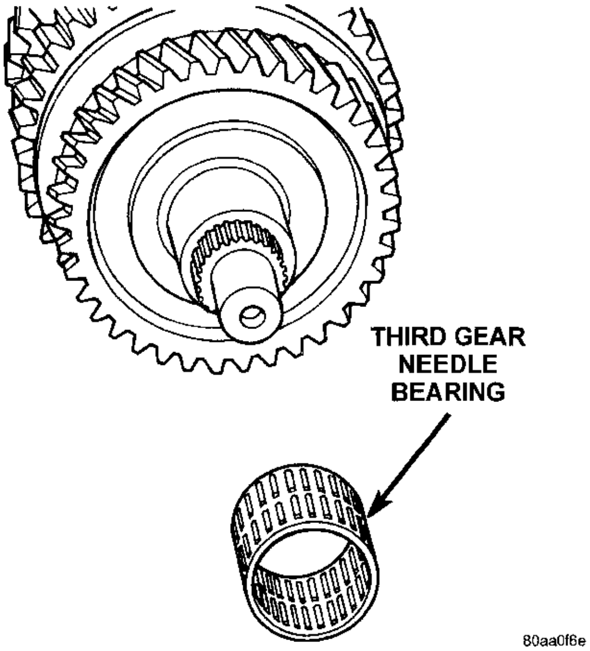

Fig. 60 Third Gear Needle Bearing Removal

(4) Remove third gear bearing spacer (Fig. 61).

(5) Remove snap ring that retains second gear thrust washer on mainshaft (Fig. 61).

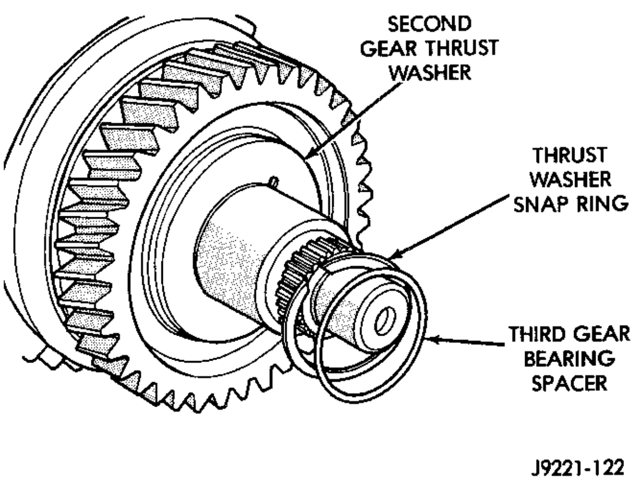

Fig. 61 Bearing Spacer And Snap Ring Location

(6) Remove second gear thrust washer (Fig. 62). Note that washer is notched for locating pin.

(7) Remove thrust washer locating pin (Fig. 63). Use needle nose pliers to grip and remove pin.

(8) Remove second gear (Fig. 64).

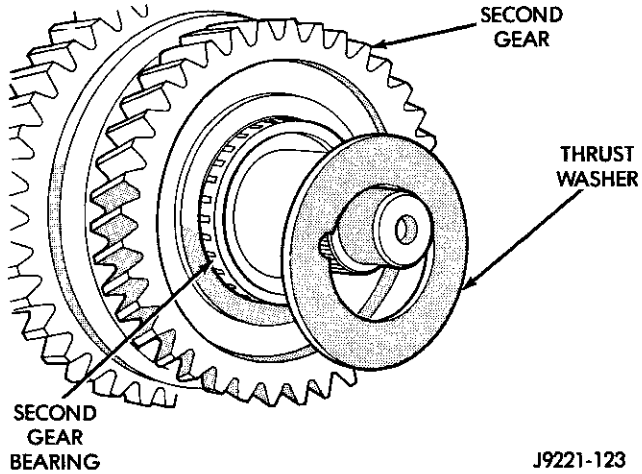

Fig. 62 Second Gear Thrust Washer Removal

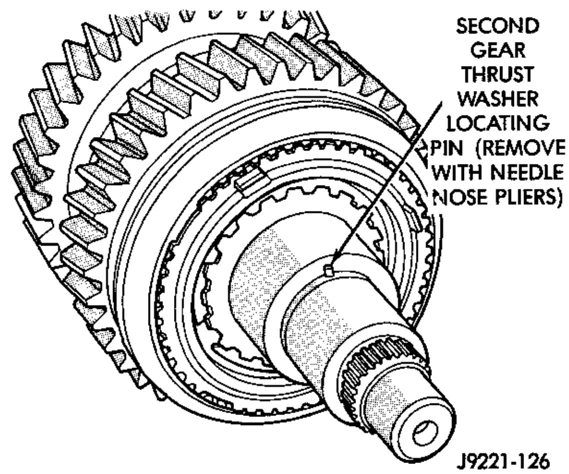

Fig. 63 Thrust Washer Locating Pin Removal

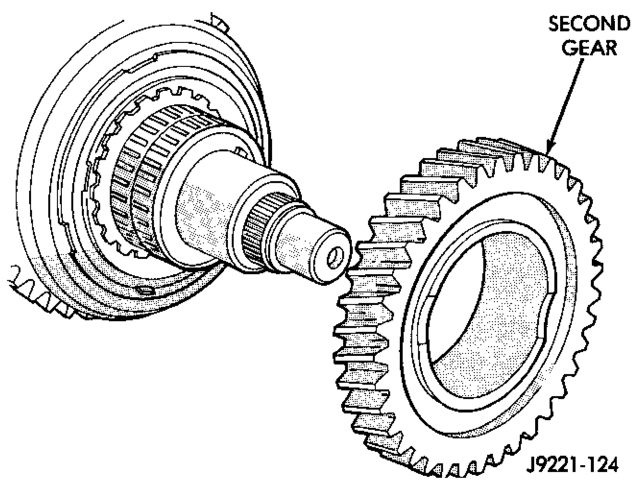

Fig. 64 Second Gear Removal

DISASSEMBLY AND ASSEMBLY (Continued)

(9) Remove second gear bearing (Fig. 65).

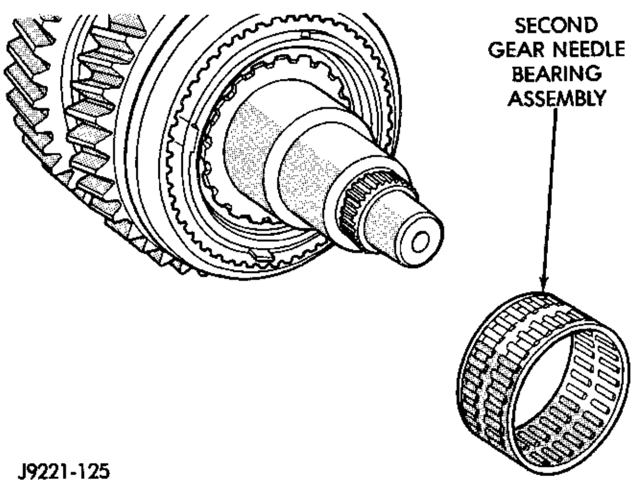

Fig. 65 Second Gear Bearing Removal

(10) Remove snap ring that retains second gear clutch cone (Fig. 66). Snap ring is seated in mainshaft synchro hub groove.

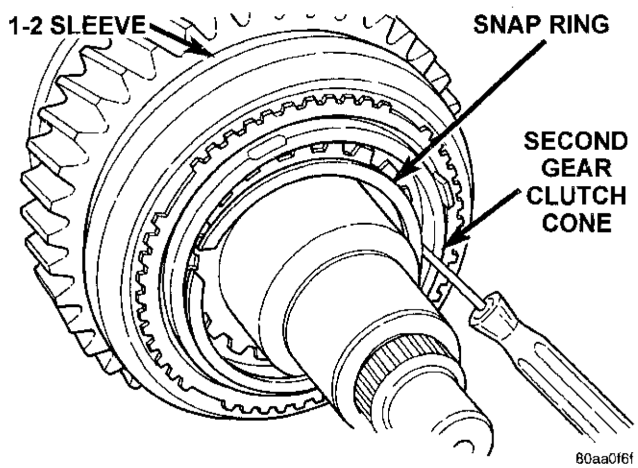

Fig. 66 Removing Second Gear Clutch Cone Snap Ring

(11) Remove second gear clutch cone, synchro clutch ring and synchro stop ring (Fig. 67).

(12) Remove 1-2 synchro hub snap ring (Fig. 68).

(13) Remove 1-2 synchro sleeve, hub, struts and springs as an assembly (Fig. 69). Note that tapered side of sleeve also goes toward front. It is not necessary to disassemble synchro components unless worn, or damaged.

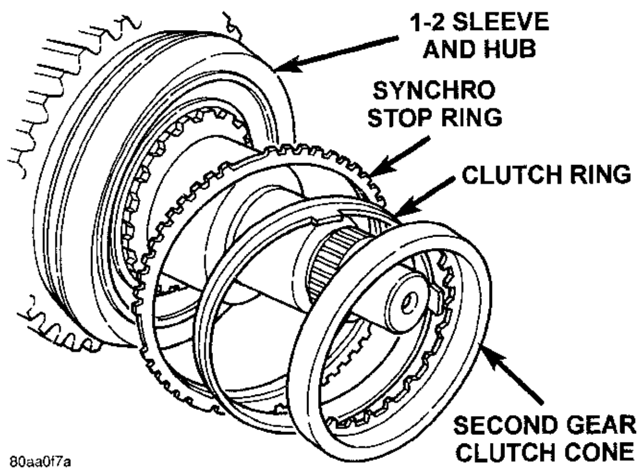

Fig. 67 Second Gear Clutch Cone, Clutch Ring, And Stop Ring Removal

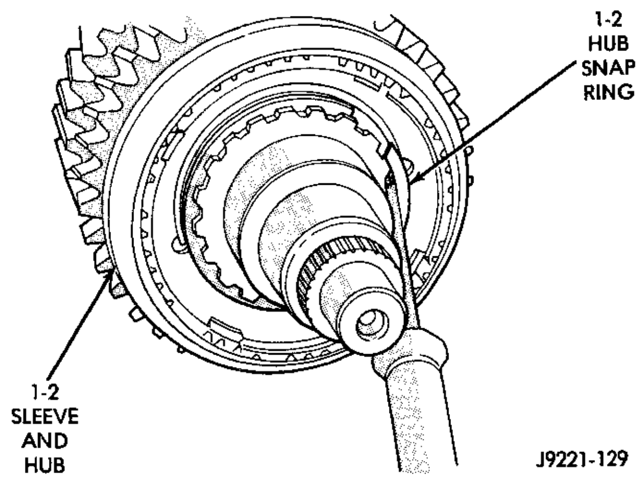

Fig. 68 Removing 1-2 Sleeve And Hub Snap Ring

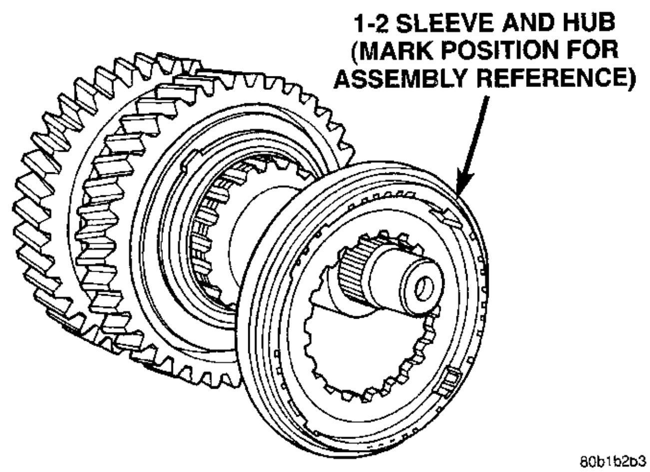

Fig. 69 Removing 1-2 Synchro Sleeve And Hub

Mopar AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(14) Remove first gear synchro stop ring and clutch ring (Fig. 70).

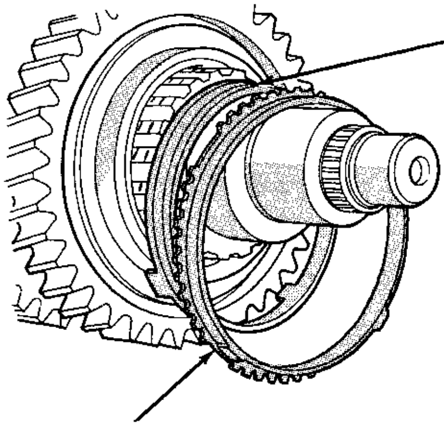

Fig. 70 First Gear Stop And Clutch Ring Removal

(15) Remove first gear clutch cone front snap ring from mainshaft hub (Fig. 71).

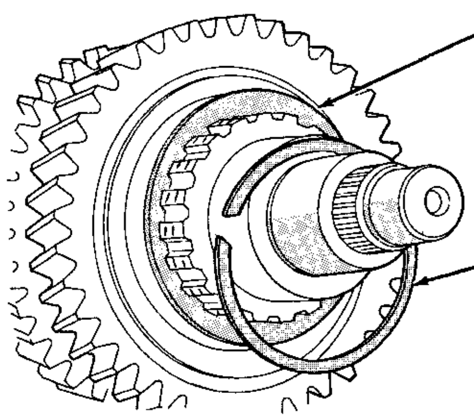

Fig. 71 First Gear Clutch Gear Front Snap Ring Removal

(16) Remove first gear clutch cone (Fig. 72).

(17) Remove first gear clutch gear rear snap ring from mainshaft hub (Fig. 72). It is not really necessary to remove this snap ring unless it, or the mainshaft is to be replaced.

(18) Remove reverse gear thrust washer (Fig. 73).

(19) Remove reverse gear and synchro components as assembly (Fig. 74). It is not necessary to remove or disassemble synchro components unless they are damaged and need to be replaced. If synchro sleeve or struts require service, mark position of sleeve on hub before removal. Correct sleeve position is important as sleeve can be installed backwards causing shift problems.

(20) Remove reverse gear bearing assembly from mainshaft (Fig. 74).

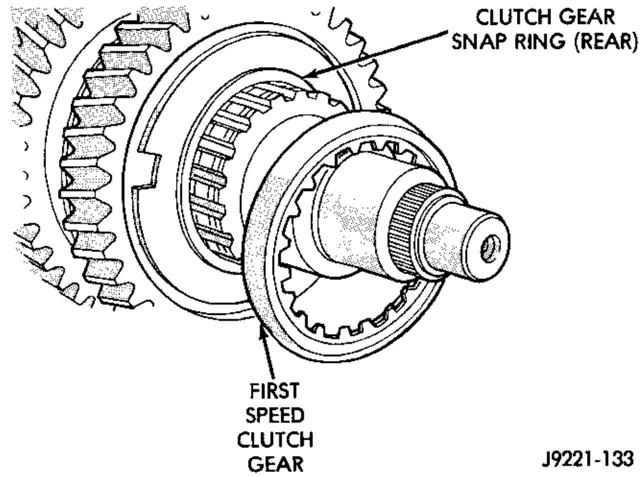

Fig. 72 First Gear Clutch Gear Removal

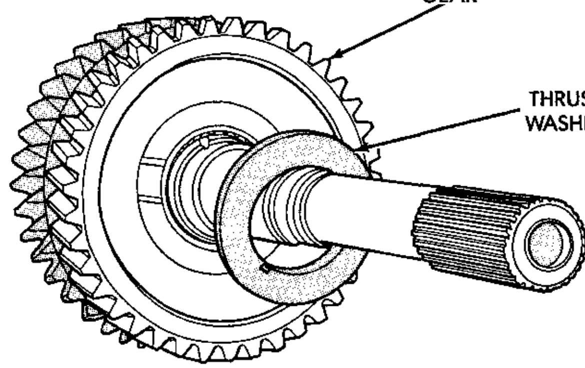

Fig. 73 Reverse Gear Thrust Washer Removal

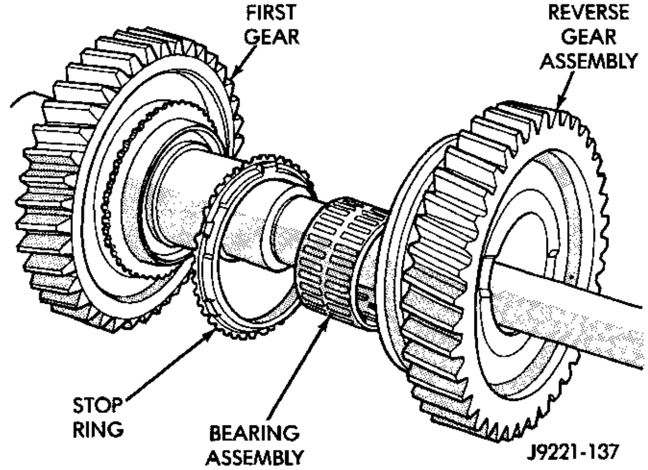

Fig. 74 Reverse Gear, Bearing, And Stop Ring Removal

AUTHENTIC RESTORATION PRODUCTS

DISASSEMBLY AND ASSEMBLY (Continued)

(21) Remove reverse gear bearing spacer from mainshaft (Fig. 75).

(22) Remove reverse clutch gear snap ring (Fig. 75). Tension of this snap ring is considerable. Heavy duty snap ring pliers will be required to spread the ring far enough to remove it.

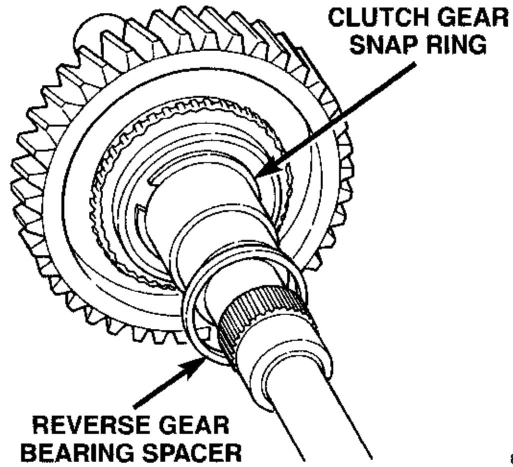

Fig. 75 Reverse Gear Bearing Spacer And First Gear Snap Ring Removal

(23) Remove reverse clutch gear (Fig. 76).

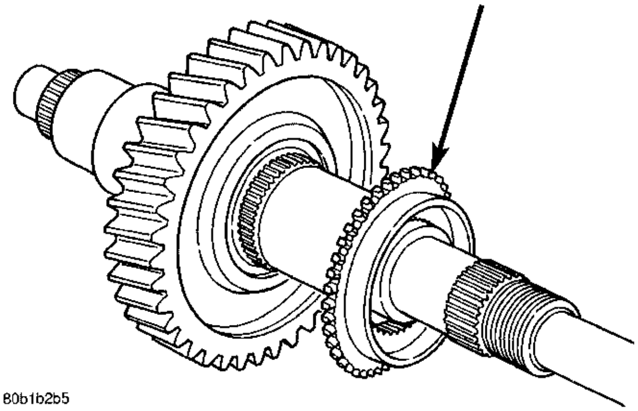

Fig. 76 Removing Reverse Clutch Gear

(24) Remove first gear from bearing and mainshaft (Fig. 77).

(25) Remove first gear bearing from mainshaft (Fig. 78).

ASSEMBLY

NOTE: Gaskets are not used in the NV4500 transmission. Use Mopar® Gasket Maker, or equivalent, on all gear case and extension housing sealing surfaces.

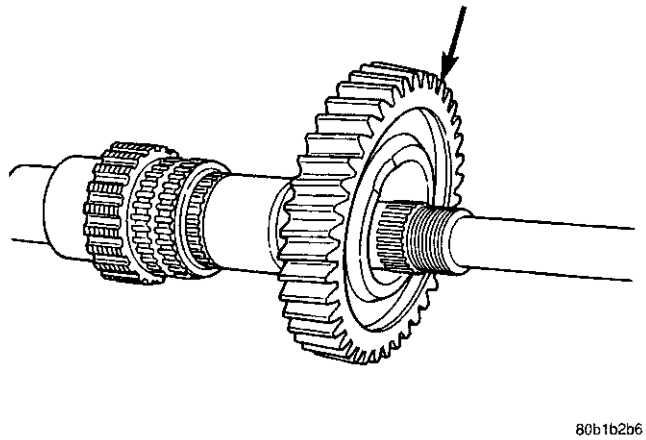

Fig. 77 Removing First Gear

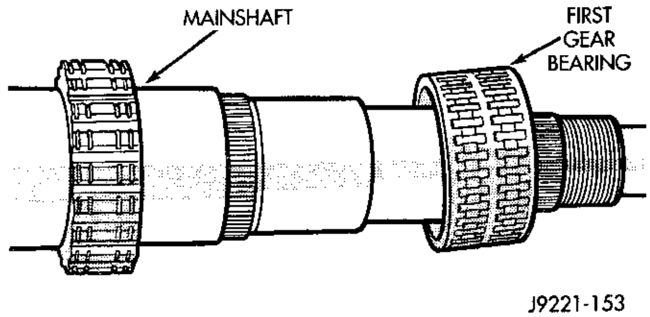

Fig. 78 Removing First Gear Bearing

GEAR CASE ASSEMBLY

(1) Install countershaft front bearing cup in case with Tool Handle C-4171 and Installer Tool 6061-1.

COUNTERSHAFT AND REVERSE IDLER GEAR INSTALLATION

(1) Install front bearing on countershaft with Installer Tool C-4340 (Fig. 79).

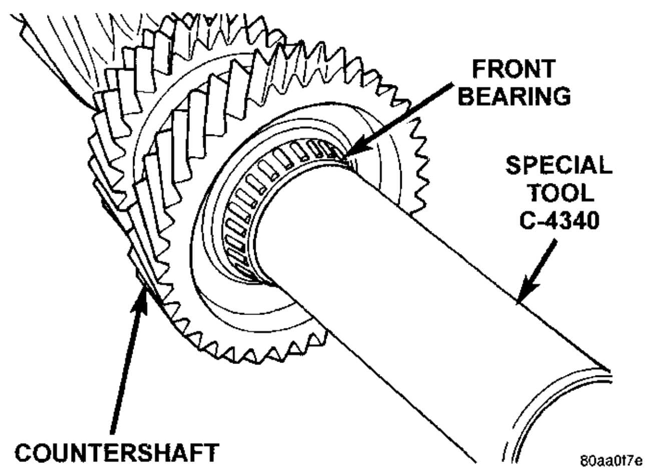

Fig. 79 Countershaft Front Bearing Installation

mopar AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(2) Lubricate countershaft front bearing cup and cone with petroleum jelly.

(3) Position gear case on end with rear of case facing up (Fig. 80).

(4) Install countershaft in gear case (Fig. 80). Do not install rear countershaft bearing on countershaft at this time.

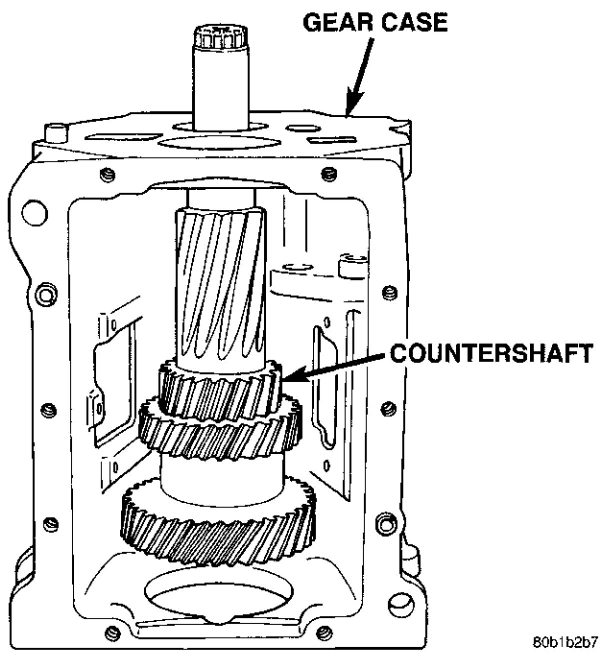

Fig. 80 Positioning Countershaft In Gear Case

(5) Lubricate reverse idler gear bearings with petroleum jelly and install first bearing and second bearing (Fig. 81).

(6) Install idler gear front thrust washer on boss in gear case (Fig. 81). Coat thrust washer with liberal quantity of petroleum jelly to hold it in place.

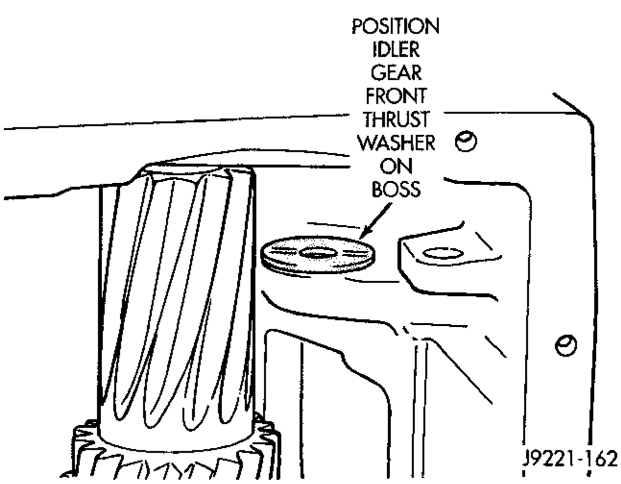

Fig. 81 Positioning Idler Gear Front Thrust Washer In Case

(7) Install reverse idler gear in case (Fig. 82).

(8) Install idler gear rear thrust washer between idler gear and case boss (Fig. 82).

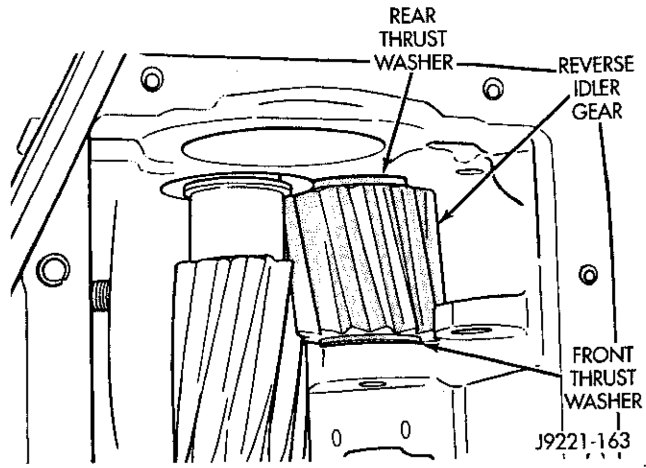

Fig. 82 Idler Gear And Thrust Washer Installation

(9) Align idler gear bearings and thrust washers with drift.

(10) Install reverse idler shaft (Fig. 83). Be sure notched end of shaft is facing countershaft as shown.

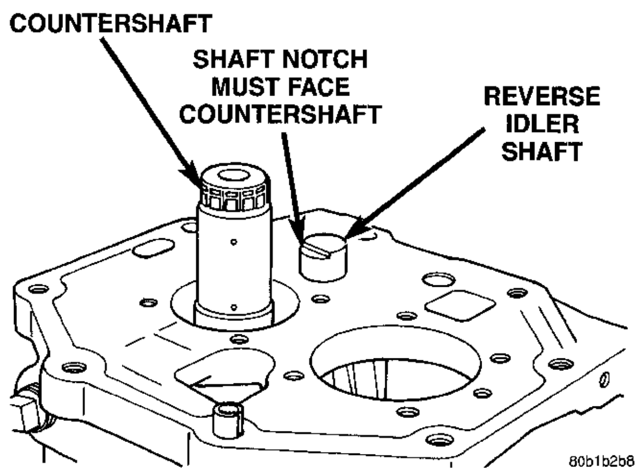

Fig. 83 Reverse Idler Shaft Installation

DISASSEMBLY AND ASSEMBLY (Continued)

(11) Lift countershaft upward and position wood block between front of shaft and case (Fig. 84).

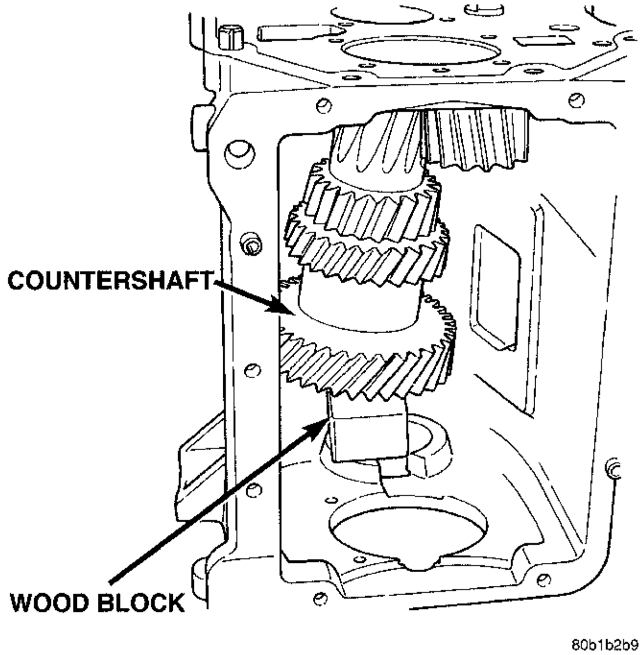

Fig. 84 Supporting Countershaft With Wood Block

(12) Install rear bearing cone on countershaft with Installer Tool C-4040 (Fig. 85).

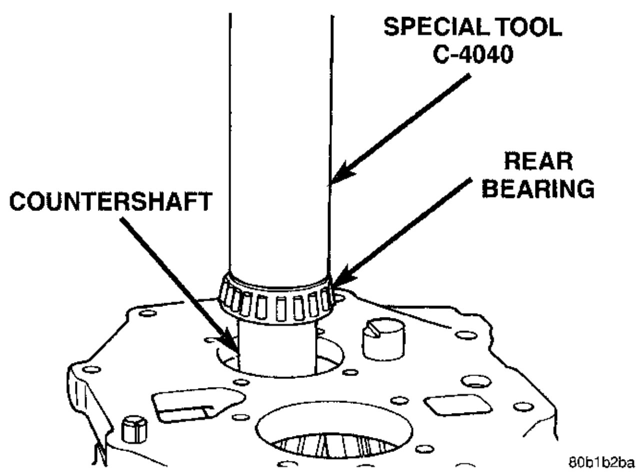

Fig. 85 Installing Countershaft Rear Bearing

(13) Remove wood block from under countershaft and lower countershaft front bearing into front bearing cup.

(14) Lubricate countershaft rear bearing cup and cone with petroleum jelly.

(15) Install countershaft rear bearing cup in gear case and over rear bearing (Fig. 86). Tap cup into place with plastic mallet if necessary.

(16) Install countershaft rear bearing plate (Fig. 88). Be sure plate is seated in notch in reverse idler shaft before tightening bearing plate bolts.

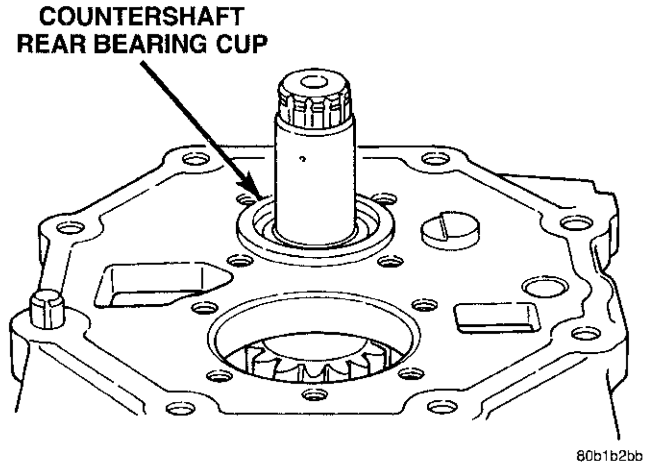

Fig. 86 Countershaft Rear Bearing Cup Installation

(17) Apply Mopar® silicone adhesive/sealer to flange and lip of new cap. Install new front bearing cap in gear case (Fig. 87) with Handle C-4171 and Installer C-3972-A.

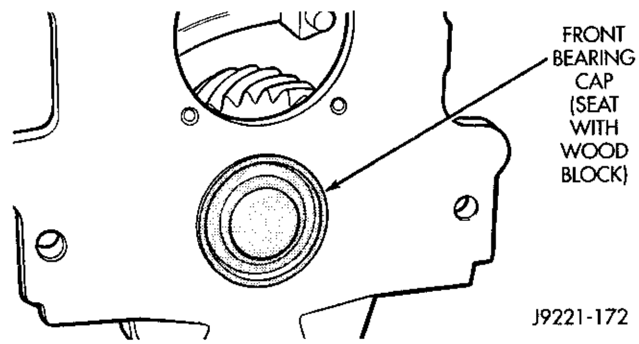

Fig. 87 Countershaft Front Bearing Cap Installation

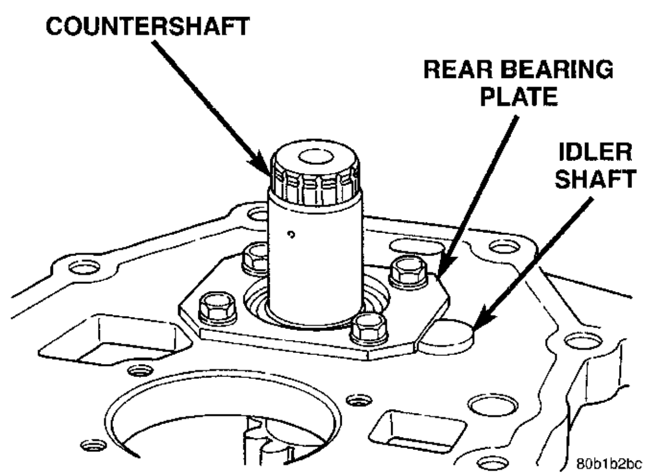

Fig. 88 Countershaft Rear Bearing Plate Installation

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

ADJUSTING COUNTERSHAFT END PLAY

(1) Rotate countershaft 4-5 times to seat bearings.

(2) Mount dial indicator on case. Then position indicator plunger on end of countershaft and zero indicator dial needle (Fig. 89).

(3) Raise countershaft with screwdriver and note end play reading on dial indicator. End play should be 0.051 - 0.15 mm (0.002 - 0.006 in.).

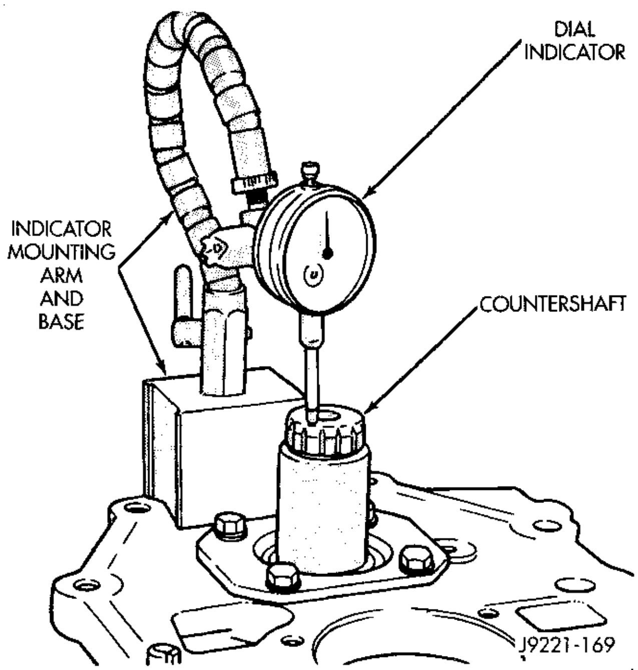

Fig. 89 Measuring Countershaft End Play

(4) Remove countershaft rear bearing plate.

(5) Select and install end play shim that will provide minimum countershaft end play. Position shim on rear bearing cup (Fig. 90).

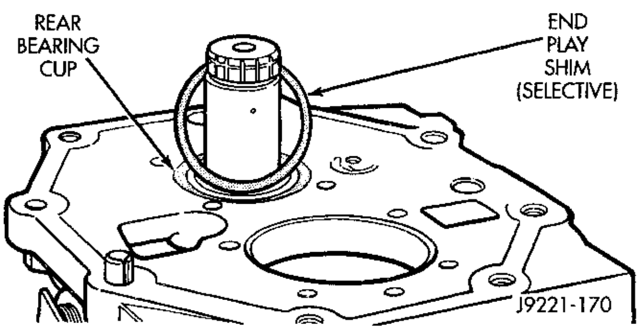

Fig. 90 Installing Countershaft End Play Shim

(6) Reinstall countershaft rear bearing plate (Fig. 88). Be sure plate is seated in reverse idler shaft notch before installing bolts. Also be sure end play shims are still in position before tightening bearing plate bolts.

(7) Apply 1-2 drops Mopar® Loc N' Seal, or equivalent, to threads of rear bearing plate bolts. Then install and tighten bearing plate bolts to 23 N·m (200 in. lbs.) torque.

SHIFT LUG AND RAIL INSTALLATION

(1) Lubricate shift lug and rail with Castrol Syntorq.

(2) Insert shift lug rail part way into case.

(3) Install shift lug on rail.

(4) Position shift rail so roll pin notches are toward outside of case (Fig. 91).

(5) Install roll pin that secures lug to rail (Fig. 91).

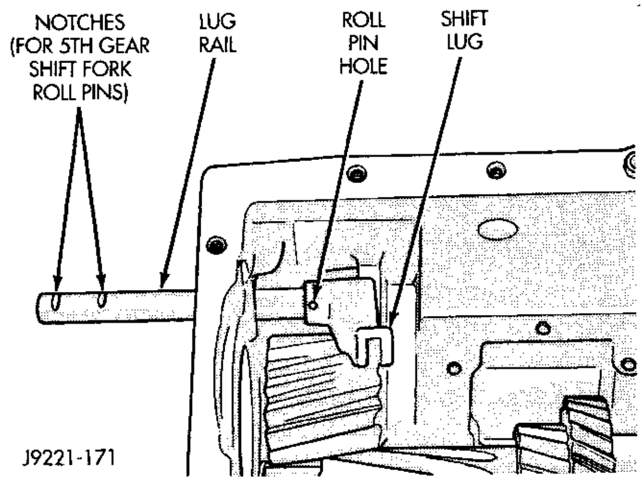

Fig. 91 Shift Lug And Rail Installation

MAINSHAFT AND GEARTRAIN ASSEMBLY

CAUTION: The reverse, 1-2 and 3-4 synchro components can be assembled and installed incorrectly if care is not exercised. Some components can be installed backwards resulting in shift problems. Refer to the assembly procedures for component identification and location.

Lubricate mainshaft bearing surfaces and all bearing assemblies with Castrol Syntorq or with petroleum jelly.

(1) Install first snap ring in rearmost groove of mainshaft hub (Fig. 92). This snap ring locates first gear clutch gear on shaft. A total of four of these snap rings are used to secure various components on the mainshaft 1-2 synchro hub. The snap rings are all the same size and are interchangeable.

(2) Install first gear clutch cone on mainshaft 1-2 synchro hub (Fig. 93). Recessed side of cone faces front. Be sure cone is seated against snap ring previously installed on hub.

(3) Install snap ring on mainshaft 1-2 synchro hub to secure clutch cone (Fig. 94). Be sure snap ring is fully seated in hub groove and against clutch cone. Note that this is second of four snap rings used to secure synchro components on shaft hub.

DISASSEMBLY AND ASSEMBLY (Continued)

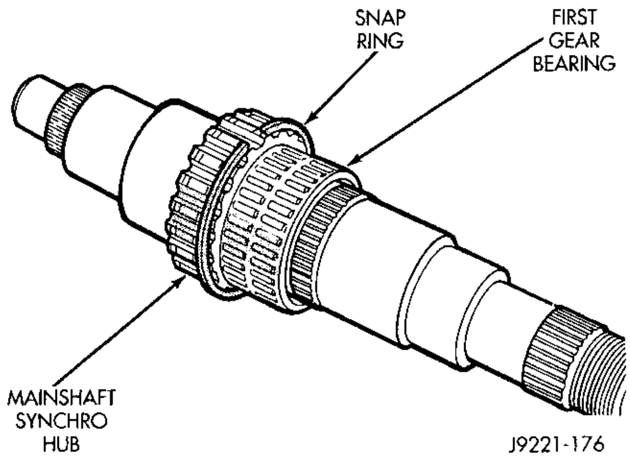

Fig. 92 First Gear Bearing and Snap Ring Installation

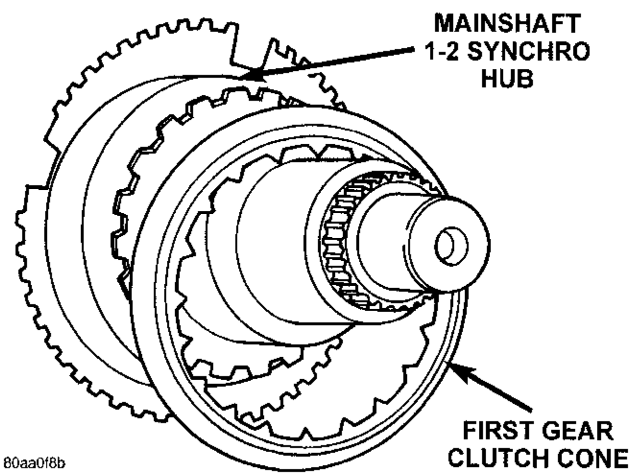

Fig. 93 Installing First Gear Clutch Cone

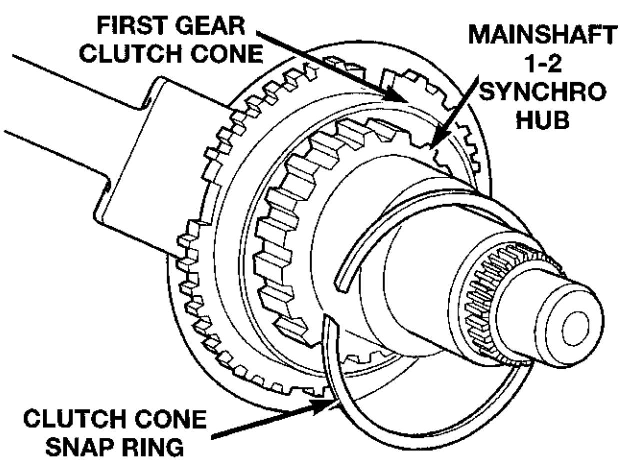

Fig. 94 Installing First Gear Clutch Cone Snap Ring

(4) Support mainshaft in upright position. Remaining gears, snap rings and synchro components are easier to install with shaft in upright position. Shaft can be supported in gear case, or hole can be cut in workbench to support shaft.

(5) If 1-2 synchro hub and sleeve were disassembled for service, reassemble hub, sleeve, struts and springs as follows:

(a) Align and install sleeve on hub. Rotate sleeve until it slides onto hub. Sleeve only fits one way and will easily slide onto hub when long slot in sleeve, aligns with long shoulder on hub (Fig. 95).

(b) Place wood blocks under hub that will raise hub about 3.5 cm (1.375 in.) above surface of workbench. Then allow sleeve to drop down on hub (Fig. 96).

(c) Install springs and struts in hub (Fig. 96). Use lots of petroleum jelly to hold them in place. Then compress struts with your fingers and move sleeve upward until struts are started in sleeve. Verify that struts are engaged in sleeve before proceeding.

(d) Turn synchro assembly upright. Then move sleeve into neutral position on hub and work struts into sleeve at same time. Be sure struts are seated and springs are not displaced during assembly.

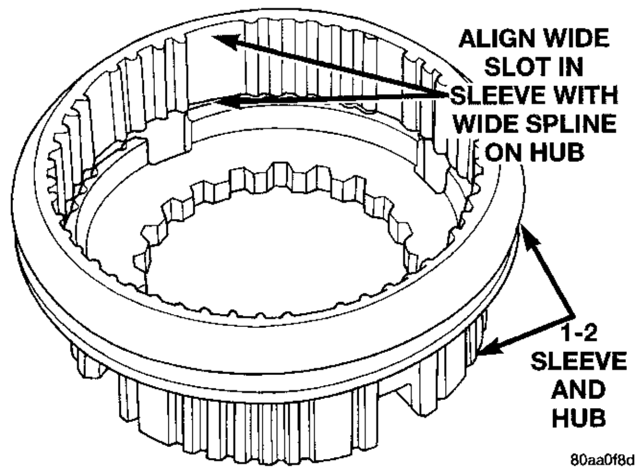

Fig. 95 Installing 1-2 Synchro Sleeve On Hub

(6) Install first gear stop ring in 1-2 synchro hub and sleeve (Fig. 97). Be sure stop ring is fully seated and engaged in hub and sleeve.

(7) Install 1-2 synchro assembly and stop ring on mainshaft. Ensure that the taper on the sleeve is facing forward. Then seat assembly on shaft (Fig. 98).

(8) Install snap ring that secures 1-2 synchro on mainshaft hub (Fig. 99). Be sure snap ring is fully seated in ring groove in mainshaft hub.

(9) Assemble second gear clutch cone, clutch ring and stop ring (Fig. 100).

(10) Install assembled second gear clutch cone and rings on mainshaft and in 1-2 synchro hub (Fig. 101).

Mopar AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

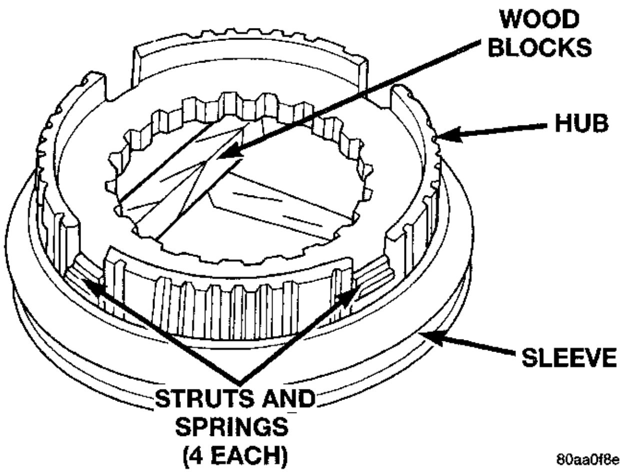

Fig. 96 Installing 1-2 Synchro Struts And Springs

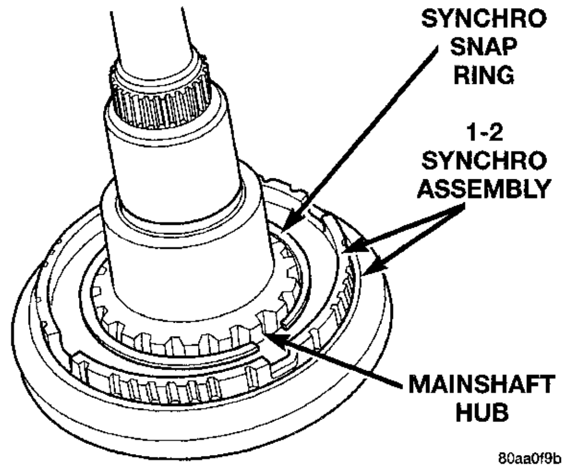

Fig. 99 Installing 1-2 Synchro Snap Ring

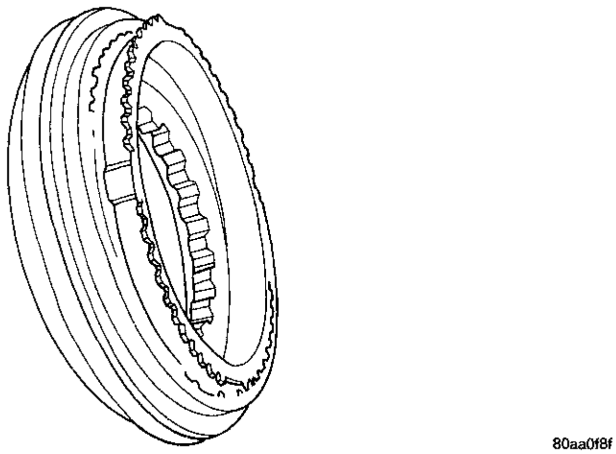

Fig. 97 Installing First Gear Stop Ring In Synchro Hub

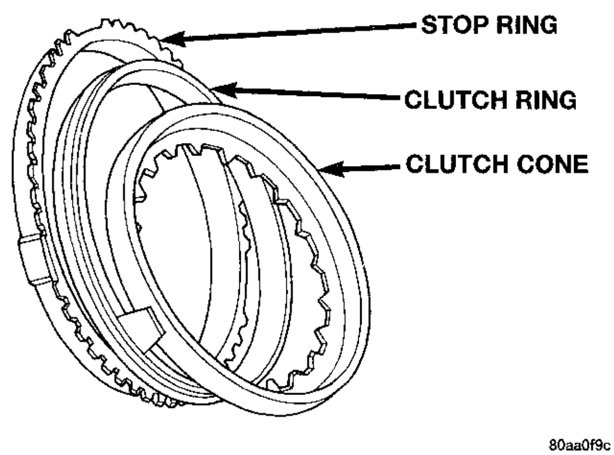

Fig. 100 Assembling Second Gear Clutch Cone, Clutch Ring, And Stop Ring

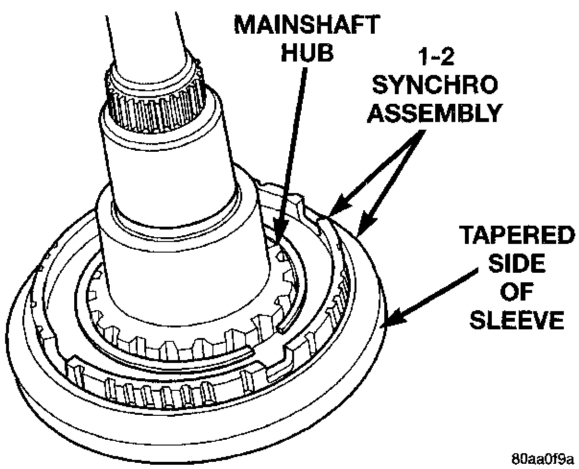

Fig. 98 1-2 Synchro Installation

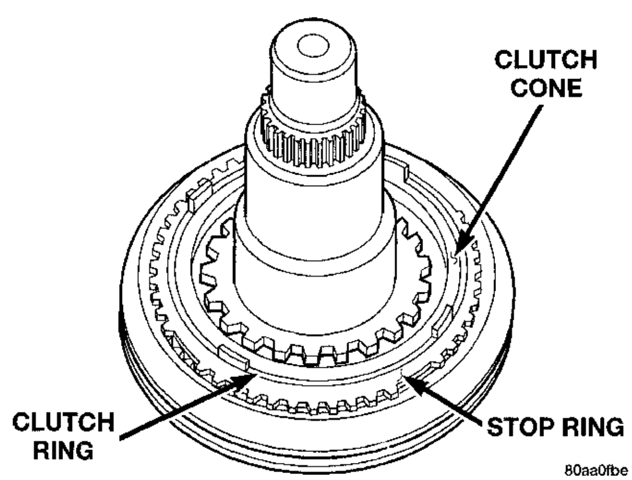

Fig. 101 Second Gear Clutch Cone, Clutch Ring, And Stop Ring Installation

DISASSEMBLY AND ASSEMBLY (Continued)

(11) Install snap ring that secures second gear clutch cone on mainshaft (Fig. 102). Use narrow blade screwdriver to work snap ring into hub groove as shown. **Be sure snap ring is fully engaged in mainshaft groove before proceeding. If snap ring will not fit in groove, clutch cone is slightly misaligned.**

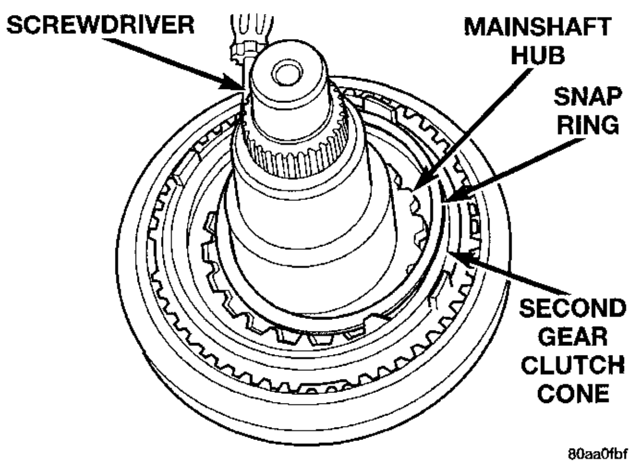

Fig. 102 Installing Second Gear Clutch Cone Snap Ring

(12) Install second gear bearing on mainshaft (Fig. 103).

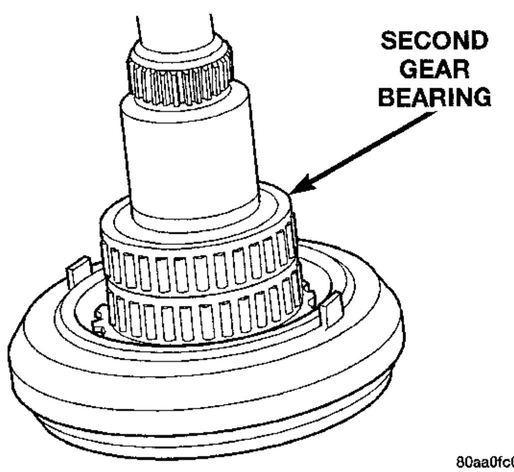

Fig. 103 Second Gear Bearing Installation

(13) Install second gear on mainshaft and bearing. Rotate gear until tabs of second gear clutch ring are fully seated in tab slots in gear (Fig. 104).

(14) Install thrust washer pin in shaft (Fig. 105).

(15) Install second gear thrust washer. Be sure washer is seated on gear and pin (Fig. 106).

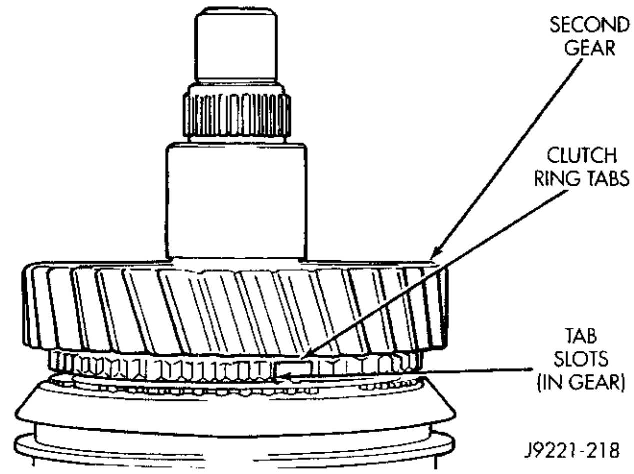

Fig. 104 Second Gear Installation

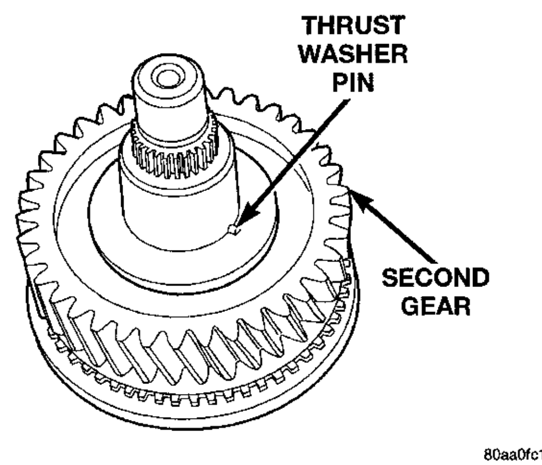

Fig. 105 Thrust Washer Pin Installation

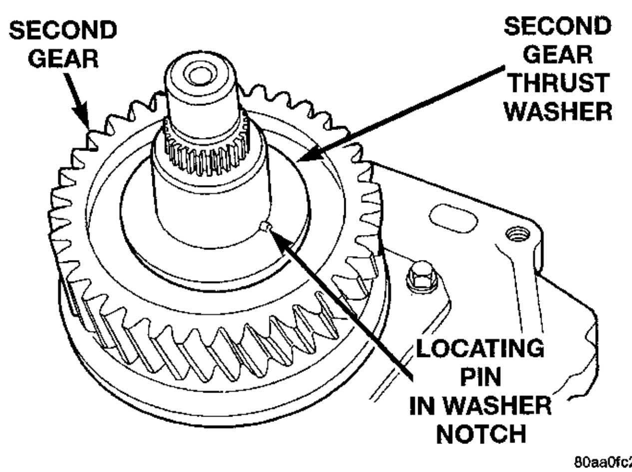

Fig. 106 Second Gear Thrust Washer Installation

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(16) Install second gear thrust washer snap ring (Fig. 107). Be sure snap ring is fully seated in mainshaft groove.

(17) Install third gear bearing spacer on shaft and seat it against thrust washer snap ring (Fig. 107).

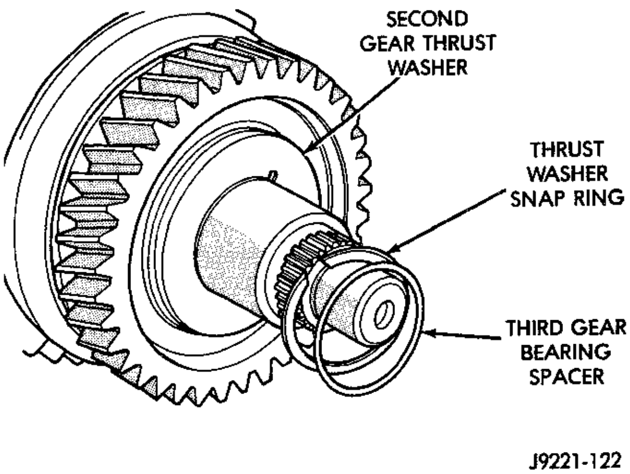

Fig. 107 Installing Snap Ring And Third Gear Bearing Spacer

(18) Install third gear bearing on mainshaft (Fig. 108). Bearing should be flush with mainshaft hub. If bearing is not flush with hub, either bearing spacer or snap ring was not installed. Check and correct if necessary.

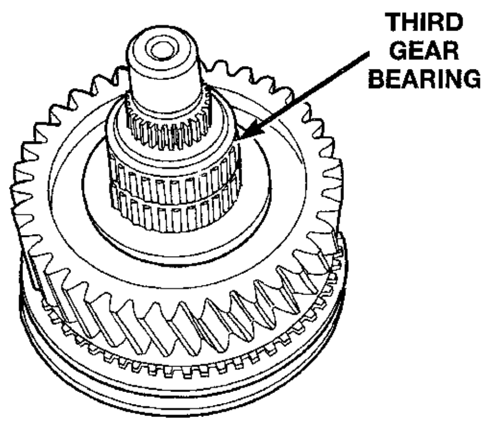

Fig. 108 Third Gear Bearing Installation

(19) Install third gear over bearing and onto mainshaft (Fig. 109).

(20) Install synchro stop ring on third gear (Fig. 110). Be sure stop ring is fully seated on cone taper.

(21) If 3-4 synchro was disassembled for service, reassemble synchro components as follows:

(a) Align and install synchro sleeve on hub (Fig. 111). **Front side of hub has a narrow groove machined in it.**

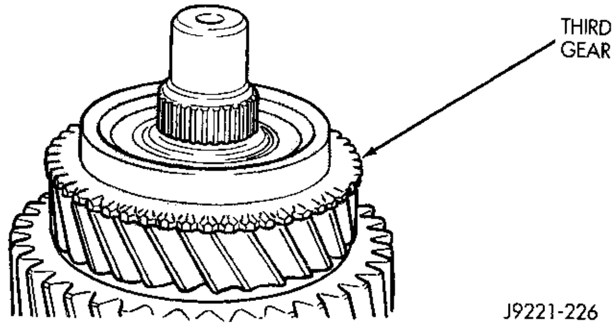

Fig. 109 Third Gear Installation

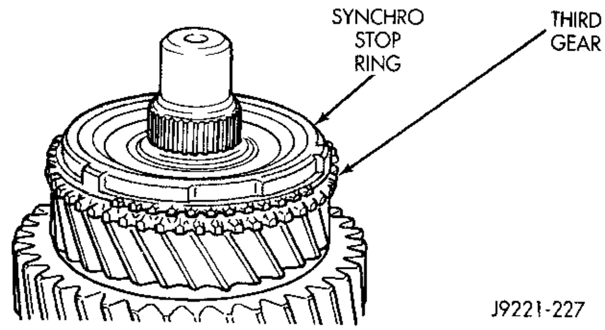

Fig. 110 Third Gear Stop Ring Installation

(b) Insert all three synchro struts in slots machined in sleeve and hub (Fig. 111).

(c) Install and seat synchro springs (Fig. 111). Use flat blade or Phillips screwdriver to compress springs and seat them in struts and hub as shown.

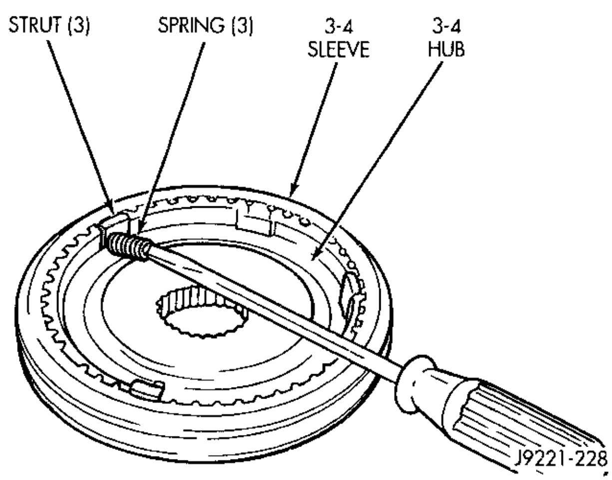

Fig. 111 Synchro Assembly (3-4)

DISASSEMBLY AND ASSEMBLY (Continued)

(22) Start 3-4 synchro assembly on mainshaft. Ensure that the hub groove and the sleeve groove both face forward. Tap assembly onto shaft splines until hub is about 3 mm (0.125 in.) away from third gear stop ring. Then align stop ring with synchro sleeve and hub and seat synchro assembly with Tool C-4040 (Fig. 112).

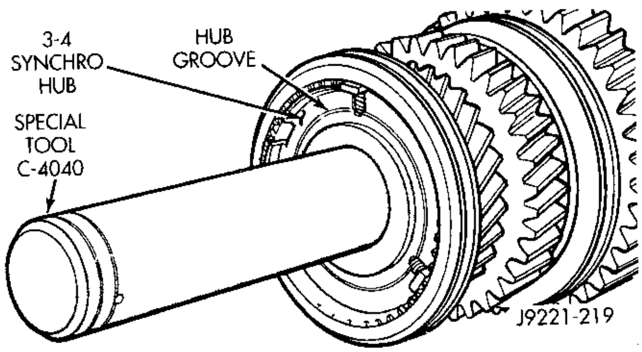

Fig. 112 Seating 3-4 Synchro Assembly On Mainshaft

(23) Verify that 3-4 synchro hub is fully seated on shaft. Approximately 3 mm (0.125 in.) of shaft spline should be visible. If hub is not seated, stop ring lugs are misaligned. Rotate ring until lugs are fully engaged in 3-4 hub slots.

(24) Verify that second and third gear rotate freely at this point. If not, determine the cause and correct.

(25) Invert mainshaft in case or bench. Reverse gear components are easier to install with shaft upright.

(26) Install first gear bearing on mainshaft.

(27) Install first gear on shaft (Fig. 113). Clutch hub side of gear faces front of shaft. Be sure tabs on clutch ring are aligned and seated in first gear hub. 1-2 synchro hub will not seat properly if clutch ring tabs are misaligned.

(28) Install reverse clutch gear on first gear (Fig. 113). Be sure clutch gear is seated on shaft splines.

(29) Install reverse clutch gear snap ring (Fig. 113). Use heavy duty snap ring pliers to install this snap ring as ring tension is considerable. Do not overspread snap ring and make sure it is fully seated in groove. Reverse gear will not fit properly if snap ring is not fully seated.

(30) Install stop ring on clutch cone (Fig. 114). Be sure stop ring is fully seated on cone taper.

(31) Install reverse gear bearing spacer on mainshaft (Fig. 115). Bearing spacer seats against reverse clutch gear snap ring.

(32) Install reverse gear bearing on mainshaft (Fig. 115).

CAUTION: The reverse sleeve will fit either way on the hub. This means the sleeve can be installed backwards if care is not exercised. Be sure the tapered side of the sleeve faces rearward after installation.

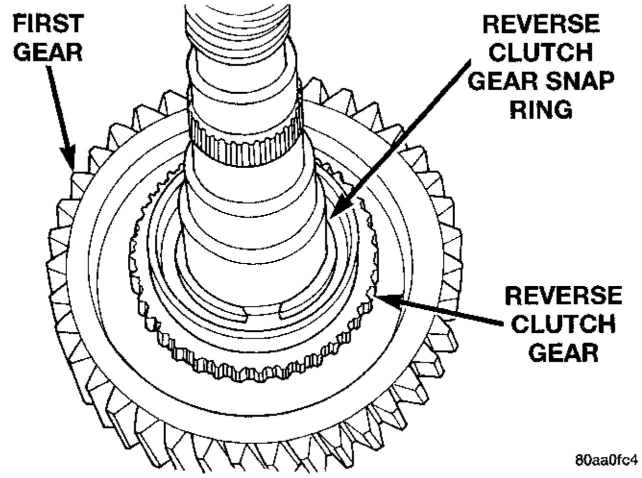

Fig. 113 First Gear, Clutch Gear, And Snap Ring Installation

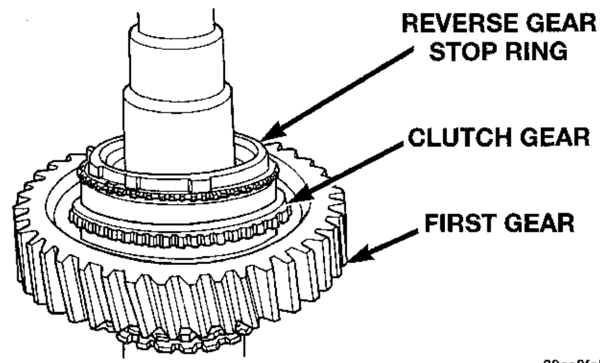

Fig. 114 Clutch Gear Stop Ring Installation

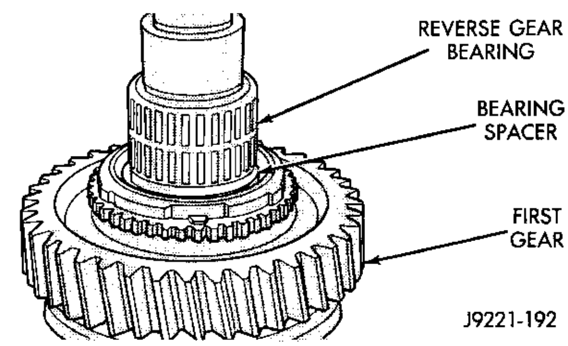

Fig. 115 Reverse Gear Bearing And Spacer Installation

(33) If reverse gear sleeve and struts were disassembled for service, reassemble sleeve, struts and springs as follows:

(a) Position sleeve on hub so tapered side of sleeve faces rearward. Sleeve will fit either way

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

but will cause shift problems if installed backwards (Fig. 116).

(b) Rotate sleeve to align teeth on sleeve and hub. Sleeve will slide easily into place on hub when properly aligned.

(c) Install springs in gear hub (Fig. 116). Use petroleum jelly to hold springs in place if desired.

(d) Compress first spring with flat blade screwdriver and slide strut into position in hub slot. Then work spring into seat in strut with small hooked tool, or screwdriver.

(e) Install second and third struts in same manner as described in step (d).

(f) Work sleeve upward on hub until struts are centered and seated in sleeve. Sleeve should be in neutral position after seating struts.

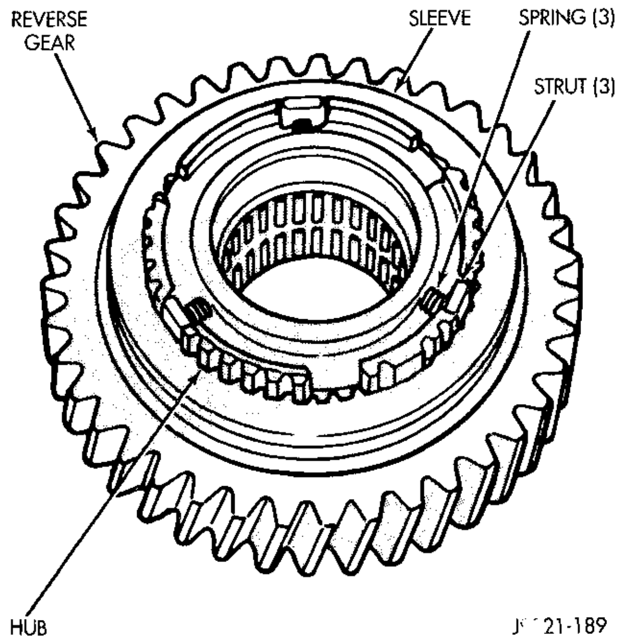

Fig. 116 Reverse Gear Synchro Assembly

(34) Install reverse gear and synchro assembly on mainshaft (Fig. 117). Rotate assembly until stop ring lugs engage in hub slots and gear drops into fully seated position.

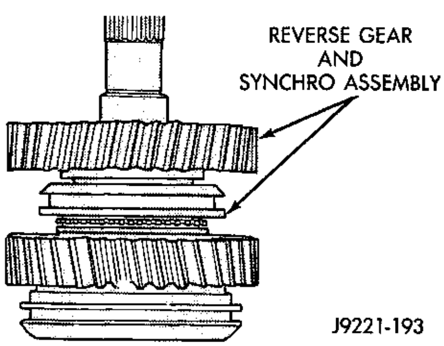

Fig. 117 Reverse Gear Installation

(35) Install reverse gear thrust washer (Fig. 118).

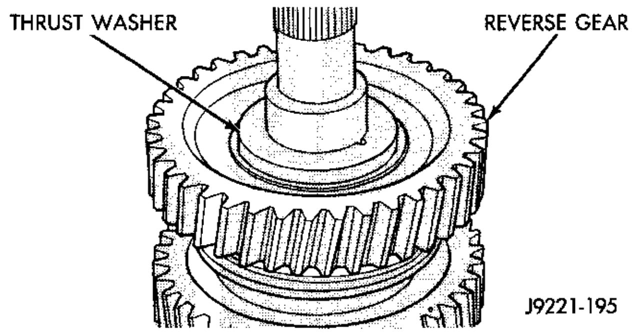

Fig. 118 Reverse Gear Thrust Washer Installation

(36) Install rear bearing on mainshaft.

(37) Install fourth gear stop ring in 3-4 synchro sleeve (Fig. 119).

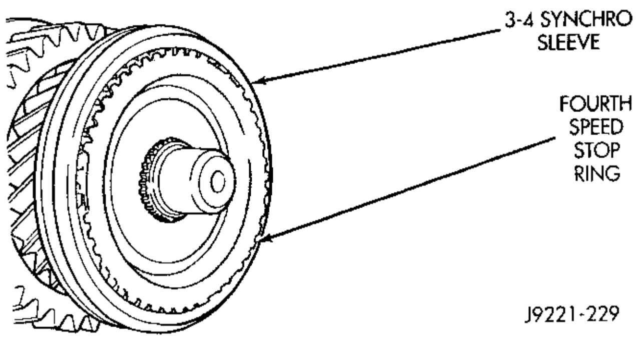

Fig. 119 Fourth gear Stop Ring Installation

(38) Install fourth gear clutch gear in stop ring (Fig. 120).

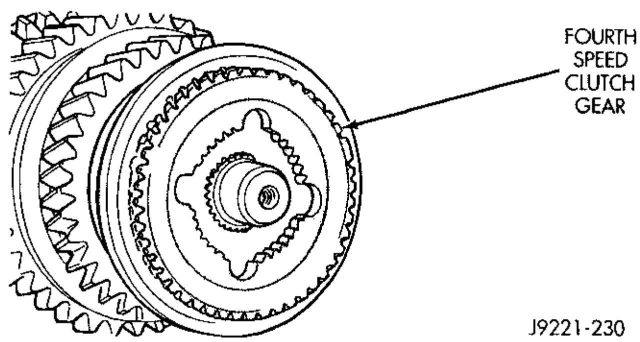

Fig. 120 Fourth gear Clutch Gear Installation

MAINSHAFT AND GEARTRAIN INSTALLATION

(1) Roll gear case onto its left side.

(2) Grip mainshaft at pilot bearing hub and just behind reverse gear. Then lift assembly and guide rear of shaft through bearing bore at rear of case.

(3) Continue holding front of shaft but switch grip at rear to shaft output splines. Lift mainshaft assembly slightly, align gears and seat assembly in case.

(4) Set transmission case upright (Fig. 121).

DISASSEMBLY AND ASSEMBLY (Continued)

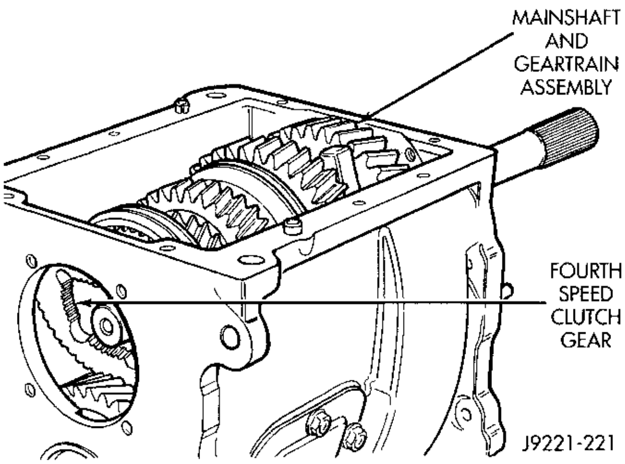

Fig. 121 Mainshaft And Geartrain Installed In Case

(5) Install drive gear thrust bearing on mainshaft (Fig. 122). Use plenty of petroleum jelly to hold bearing in place.

(6) Check alignment and mesh of mainshaft gears. If gears are not aligned, roll case on side and realign shaft and gears in case.

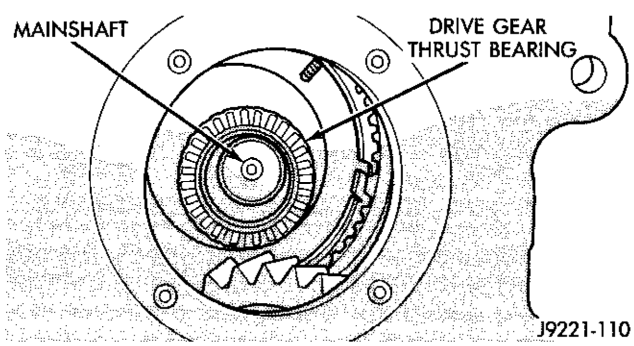

Fig. 122 Drive Gear Thrust Bearing Installation

DRIVE GEAR AND RETAINER INSTALLATION

(1) Install bearing on drive gear with Installer Tool 6448 (Fig. 123).

(2) Lubricate pilot bearing with petroleum jelly and install it in drive gear bore.

(3) Install drive gear on mainshaft. Work gear rearward until mainshaft hub is fully seated in pilot bearing.

(4) Install bearing cup in front retainer with Driver Handle C-4171 and Installer C-4308 (Fig. 124).

(5) Install new oil seal in front bearing retainer with Tool 6052 (Fig. 125). Use one or two wood blocks to support retainer as shown. Lubricate seal lip with petroleum jelly after installation.

(6) Clean contact surfaces of gear case and front bearing retainer with a wax and grease remover.

(7) Apply Mopar® Gasket Maker to flange surface of front bearing retainer (Fig. 126).

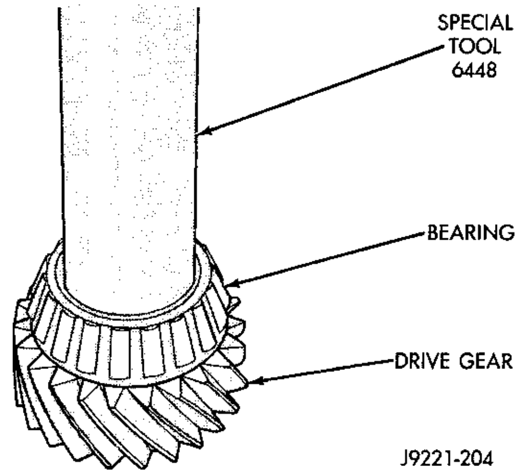

Fig. 123 Installing Front Bearing On Drive Gear

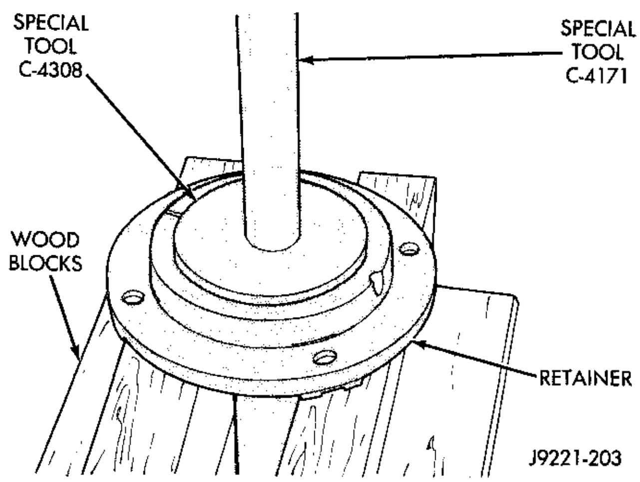

Fig. 124 Installing Front Bearing Cup In Retainer

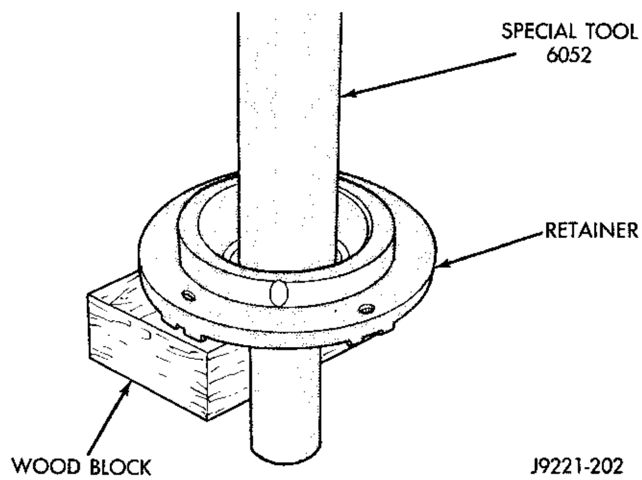

Fig. 125 Installing Bearing Retainer Oil Seal

(8) Install front bearing retainer over drive gear and start it into case.

DISASSEMBLY AND ASSEMBLY (Continued)

(9) Start front bearing retainer in gear case. Verify that retainer lube channel is at top-center (12 O'clock) position (Fig. 126). Adjust retainer position before proceeding, if necessary.

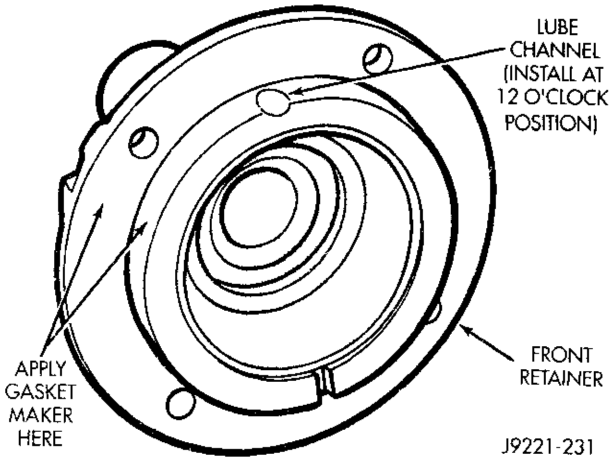

Fig. 126 Location Of Front Retainer Lube Channel

(10) Align front bearing retainer bolt holes and tap retainer into place with plastic mallet. Install and tighten retainer bolts to 30 N·m (265 in. lbs.) torque (Fig. 127). **Use new retainer bolts. Do not reuse the old ones.**

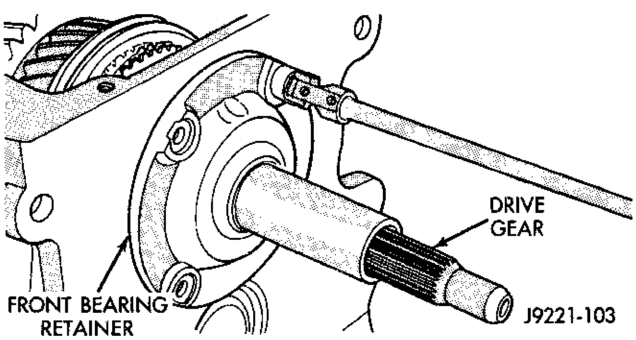

Fig. 127 Installing Front Bearing Retainer

MAINSHAFT END PLAY ADJUSTMENT

(1) Install mainshaft rear bearing.

(2) Install mainshaft rear bearing cup in case and over bearing. Tap bearing cup into place with plastic mallet.

(3) Install rear bearing plate to hold mainshaft and rear bearing in position (Fig. 128). Do not install any end play shims at this time.

(4) Tighten rear bearing plate bolts securely.

(5) Place gear case in upright position on bench. Either cut hole in bench to accept drive gear and front retainer, or use C-clamps to secure transmission on bench. Do not leave transmission unsupported.

(6) Install Extension Rod 8161 into a suitable threaded hole in rear of case.

(7) Mount dial indicator on extension rod and position indicator plunger against end of mainshaft.

(8) Move mainshaft forward to remove all play. Then zero dial indicator.

(9) Move mainshaft upward and observe dial indicator reading. Move mainshaft with pry tool positioned between drive gear and case.

(10) End play should be 0.051-0.15 mm (0.002-0.006 in.). Select fit shims are available to adjust end play, if necessary.

(11) If end play adjustment is required, remove bearing plate and install necessary shim.

(12) Reinstall rear bearing plate (Fig. 128).

(13) Apply Mopar® Lock N' Seal, or equivalent, bearing plate bolt threads. Then install and tighten bolts to 23 N·m (200 in. lbs.) torque. Be sure oil hole in bearing plate is at top as shown.

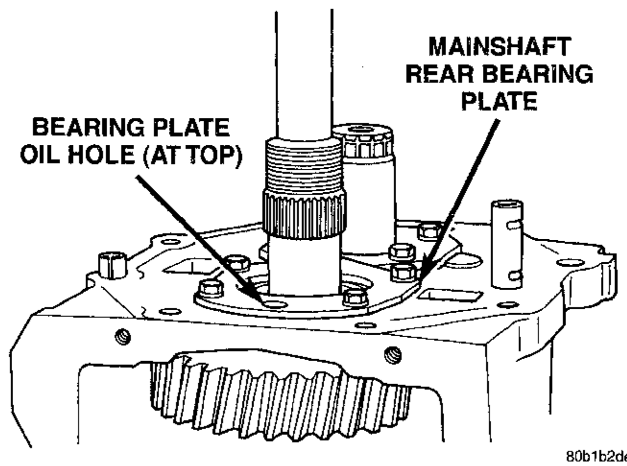

Fig. 128 Rear Bearing Plate Installation

COUNTERSHAFT FIFTH GEAR SYNCHRO INSTALLATION

(1) Install thrust washer pin in countershaft (Fig. 129).

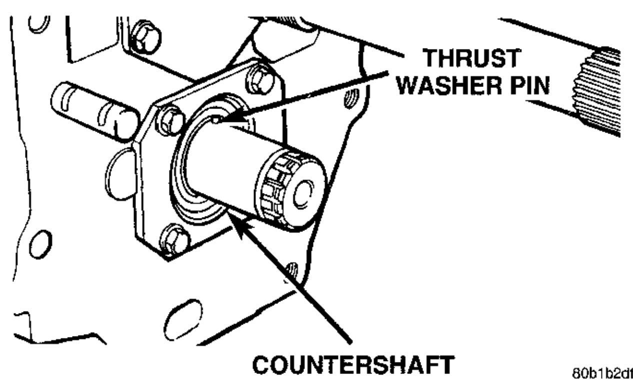

Fig. 129 Installing Fifth Gear Thrust Washer Pin

DISASSEMBLY AND ASSEMBLY (Continued)

(2) Install thrust washer on countershaft. Turn washer until pin engages in washer notch (Fig. 130). Flat side of washer faces rear and cone side to front as shown.

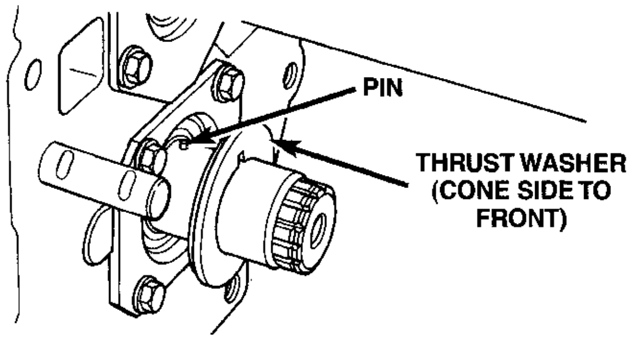

Fig. 130 Installing Fifth Gear Thrust Washer

(3) Lubricate and install fifth gear bearing on countershaft (Fig. 131).

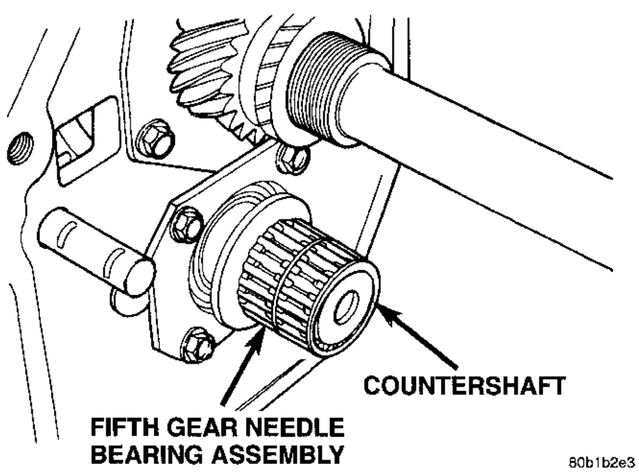

Fig. 131 Countershaft Fifth Gear Bearing Installation

(4) Install synchro sleeve on hub of countershaft fifth gear. Tapered side of sleeve faces front and flat side faces rear (Fig. 132).

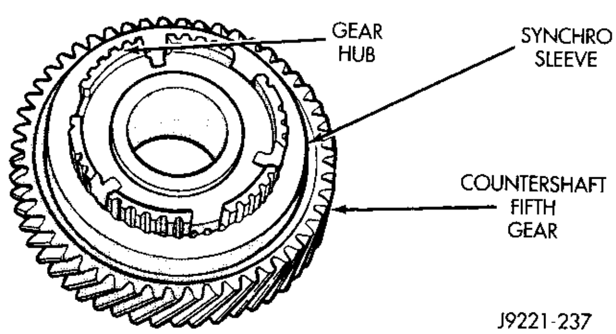

Fig. 132 Installing Synchro Sleeve On Countershaft Fifth Gear Hub

(5) Install shift fork in synchro sleeve (Fig. 133).

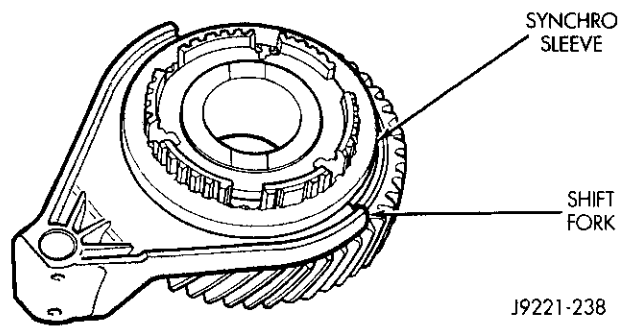

Fig. 133 Installing Fifth Gear Shift Fork In Synchro Sleeve

(6) Install assembled fifth gear, synchro sleeve and shift fork (Fig. 134). Align fork with shift lug rail and align gear with bearings and countershaft. Start components onto shaft and rail. Then tap gear and fork into place with plastic or rawhide mallet.

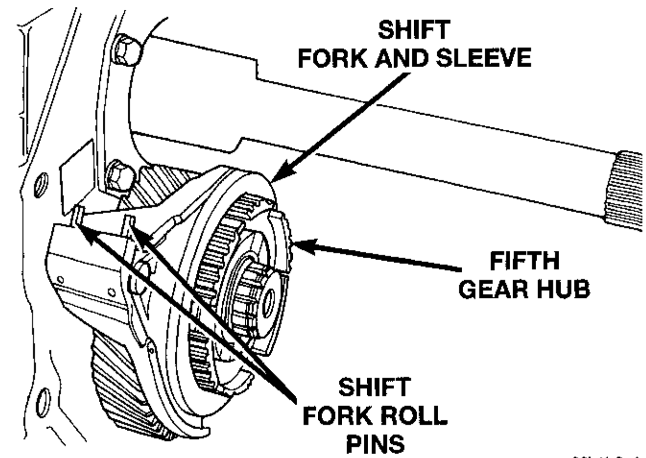

Fig. 134 Installing Assembled Countershaft Fifth Gear, Shift Fork And Synchro Sleeve

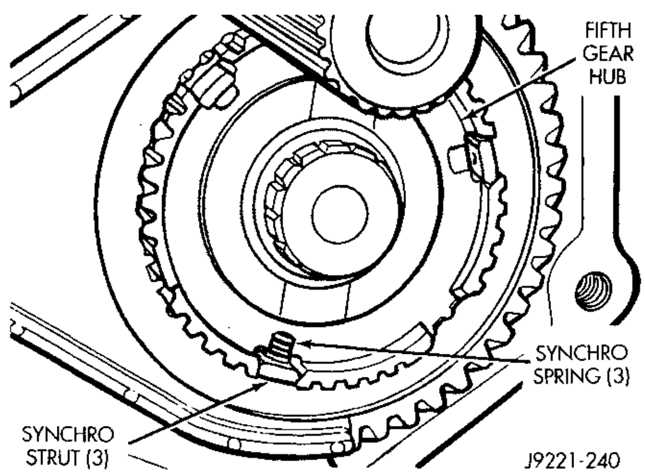

Fig. 135 Installing Fifth Gear Synchro Struts And Springs

DISASSEMBLY AND ASSEMBLY (Continued)

(7) Assemble and install fifth synchro clutch gear and stop ring in fifth gear hub (Fig. 136). Make sure both parts are seated in fifth gear hub.

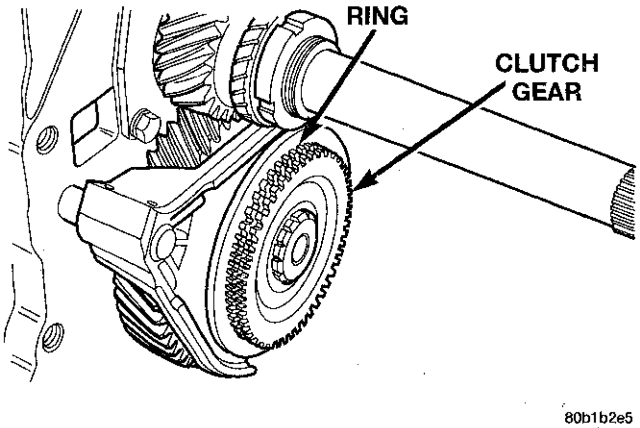

Fig. 136 Fifth Synchro Clutch Gear And Stop Ring Installation

(8) Install clutch gear snap ring (Fig. 137).

(9) Align roll pin holes in shift fork with notches in shift lug rail. Then install roll pins from top side of fork (Fig. 134). Note that roll pins are one way fit due to small shoulder at one end of each pin.

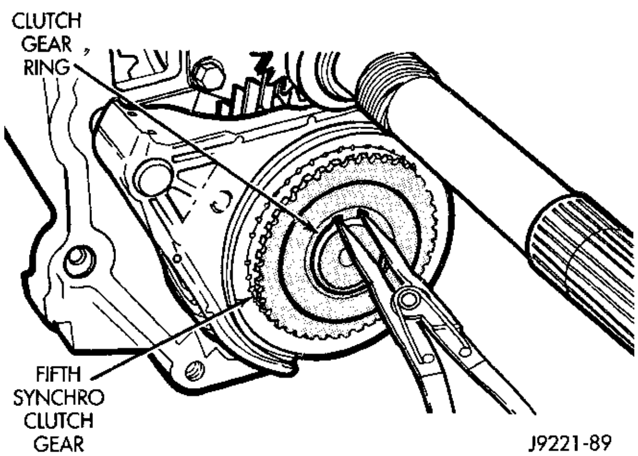

Fig. 137 Installing Fifth Synchro Clutch Snap Ring

MAINSHAFT FIFTH GEAR INSTALLATION

(1) Install mainshaft fifth gear. Use Installer Tool 6446 to seat gear on shaft (Fig. 138). Gear is seated when it contacts rear bearing.

(2) Install new fifth gear nut on mainshaft (Fig. 139).

(3) There are four splined sockets available to retain the mainshaft while installing the fifth gear nut.

- Socket 6441 fits light duty 4X2 mainshafts.
- Socket 6442 fits light duty 4X4 mainshafts.
- Socket 6993 fits heavy duty 4X2 mainshafts.

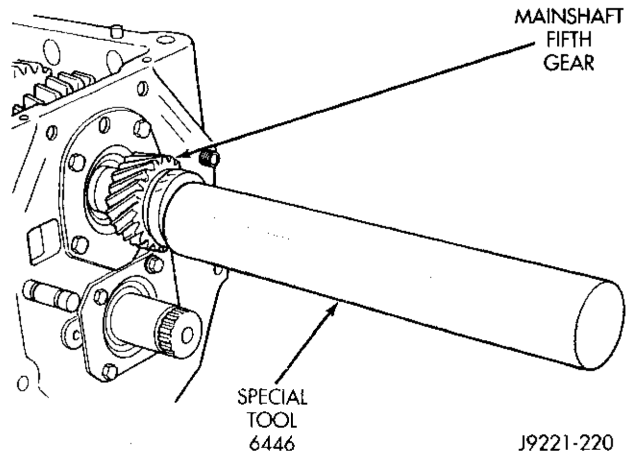

Fig. 138 Installing Mainshaft Fifth Gear

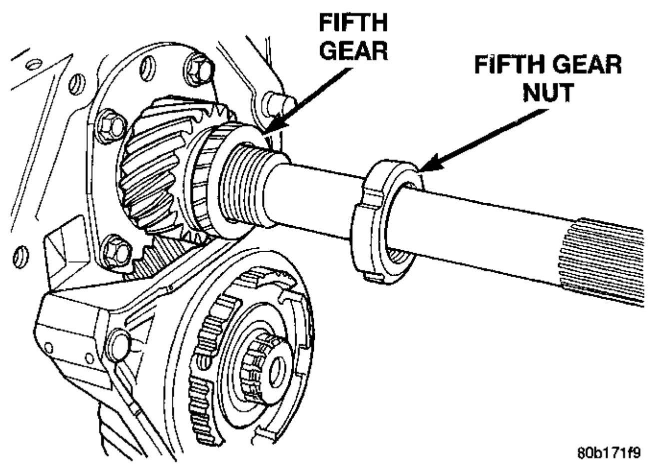

Fig. 139 Installing Fifth Gear Nut

- Socket 6984 fits heavy duty 4X4 mainshafts.

(4) Tighten fifth gear nut as much as possible with Nut Wrench 6443 or 6743, long handle ratchet, breaker bar and applicable socket wrench (Fig. 140).

(5) Lock mainshaft gears by shifting all synchro sleeves into engaged position.

(6) Tighten fifth gear nut with Nut Wrench 6443 or 6743 and high capacity torque wrench. Required torque on nut is 339-475 N·m (250-350 ft. lbs.). Have helper hold transmission steady if necessary.

(7) Use Staking Tool 8213 to stake the fifth gear nut to the mainshaft. The tool is designed to function on both the light duty and heavy duty versions of the NV4500. Ensure that the tool is configured properly for the transmission being serviced.

NOTE: It may be necessary to remove the fifth gear fork and countershaft fifth gear components in order to install the Staking Tool 8213 onto the fifth gear nut.

DISASSEMBLY AND ASSEMBLY (Continued)

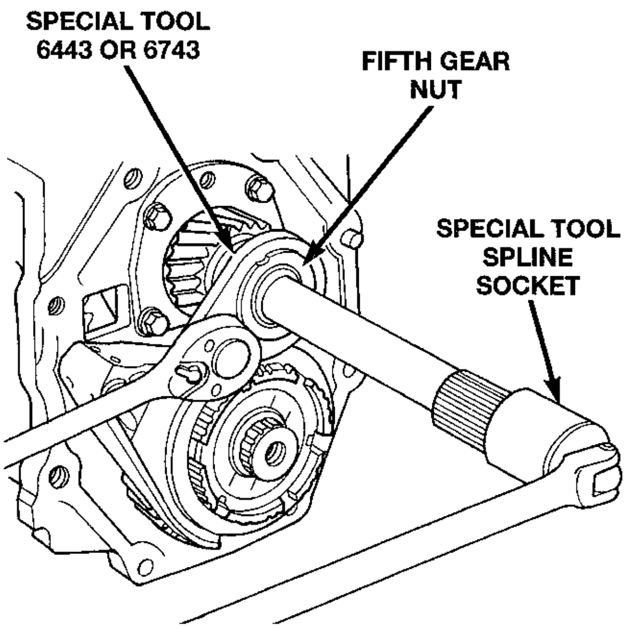

Fig. 140 Fifth Gear Nut Installation

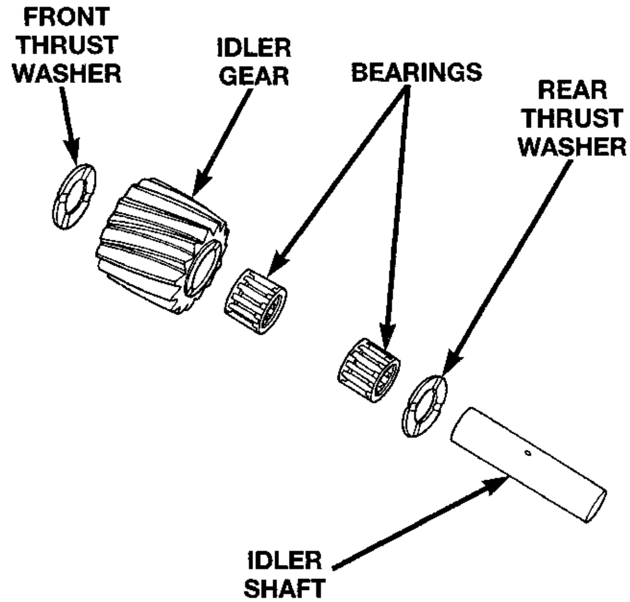

Fig. 141 Reverse Idler Components

CLEANING AND INSPECTION

SHIFT COVER INSPECTION

Inspect the cover and shift components whenever the cover is removed from the gear case or whenever diagnosis indicates inspection is necessary.

Check the forks for wear, distortion, cracks, or being loose on the shift rails. Also check fit of the shift rails in the cover. Replace the cover assembly if the rails are loose in the cover bores.

Inspect and replace the pads on the fifth–reverse shift fork if worn. The expansion plugs at the rear of the cover can be replaced if loose or leaking.

A gasket is not used between the shift cover and gear case. Use Mopar® Gasket Maker, or equivalent, to seal the cover.

TRANSMISSION

Clean the gears, bearings shafts, extension/adapter housing and gear case with solvent. Dry all parts except the bearings with compressed air. Allow the bearings to either air dry or wipe them dry with clean shop towels.

Inspect the reverse idler gear, bearings, shaft and thrust washers (Fig. 141). Replace the bearings if the rollers are worn, chipped, cracked, flat-spotted, or brinnelled. Or if the bearing cage is damaged or distorted. Replace the thrust washers if cracked, chipped, or worn. Replace the gear if the teeth are chipped, cracked or worn thin.

Inspect the drive gear and bearings (Fig. 142). Minor scratches and burrs on the gear surfaces can be reduced with an oil stone and 400 grit paper wetted with oil. Replace either bearing if worn, or damaged. Replace the gear if any teeth, splines, or bearing surfaces are also worn or damaged.

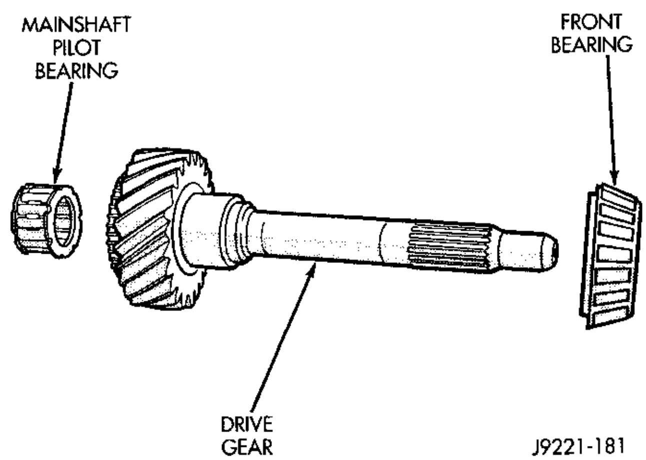

Fig. 142 Drive Gear Components

Inspect the front bearing retainer and bearing cup (Fig. 143). Replace the bearing cup if scored, cracked, brinnelled, or rough. Check the release bearing slide surface of the retainer carefully. Minor corrosion, nicks, or pitting can be smoothed with 400 grit emery and polished out with crocus cloth. Wet the abrasive paper and crocus cloth with oil when smoothing/polishing. Replace the retainer if worn or damaged in any way. Do not reuse the original retainer bolts. Install new bolts during assembly.

Inspect the countershaft and bearings (Fig. 144). Replace the bearings if worn, rough, flat spotted, or

CLEANING AND INSPECTION (Continued)

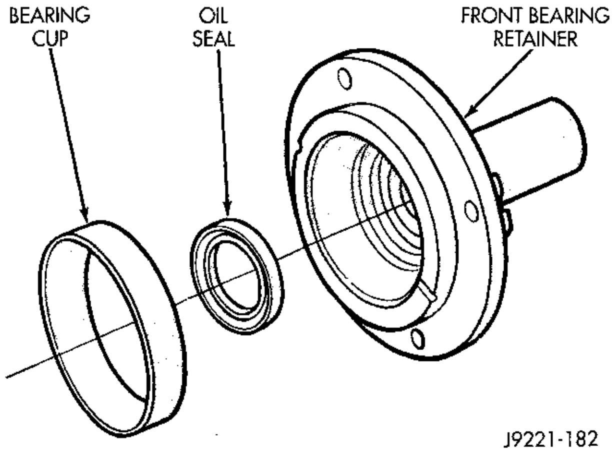

Fig. 143 Front Bearing Retainer Components

heat checked. Check the countershaft gear teeth carefully. Small nicks, scratches, or burrs can be removed with an oil stone and 400 grit paper wetted with oil. Replace the shaft if any of the teeth are worn, cracked, broken, or severely chipped.

Be sure to check condition of the countershaft bearing cups. Replace either bearings cup if worn, or damaged.

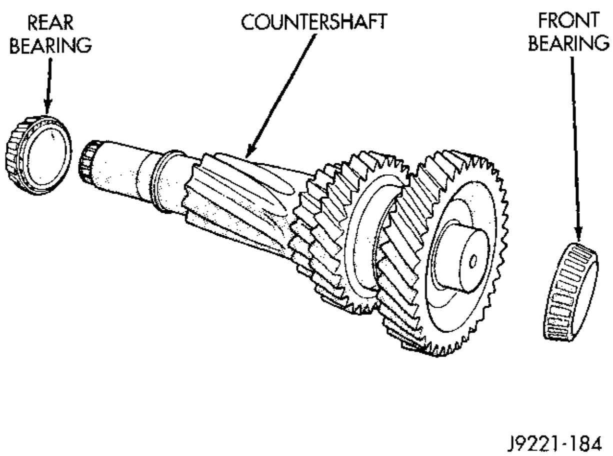

Fig. 144 Countershaft And Bearings

Check condition of the mainshaft. Inspect all the bearing surfaces, splines and threads. Also check condition of the snap ring grooves in the hub area and the speedometer drive gear teeth (Fig. 145). Minor scratches or burrs can be removed with an oil stone and polished with crocus cloth. However, replace the shaft if any surfaces exhibit considerable wear or damage.

Check condition of the gear case and extension or adapter housing. Be sure the alignment dowels in the case top surface and in the housing/adapter are tight and in good condition.

Run a tap through the gear case bolt holes if the threads need minor cleanup. Helicoil inserts can be

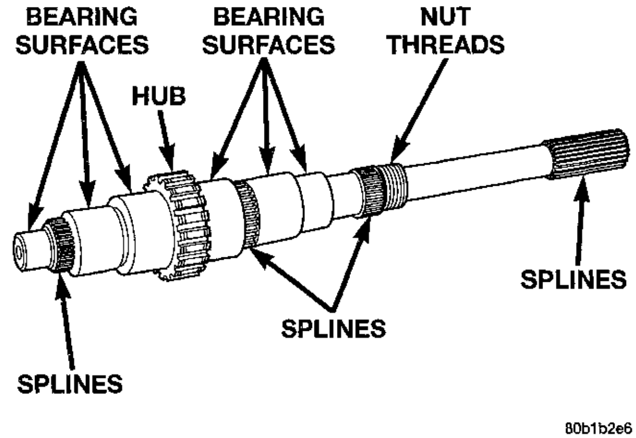

Fig. 145 Mainshaft Bearing And Spline Surfaces

used to repair seriously damaged threaded holes if necessary.

Be sure all case and housing/adapter sealing and mating surfaces are free of burrs and nicks. This is especially important as gaskets are not used in the NV4500. Minor nicks and scratches on the sealing surfaces can be dressed off with a fine tooth file or oil stone.

Replace the gear case or housing/adapter if cracked or broken. Do not attempt to repair this type of damage by welding or brazing.

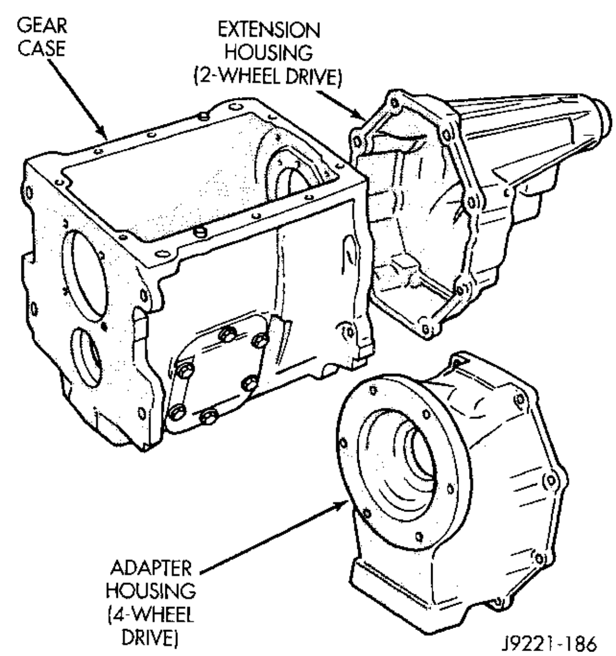

Fig. 146 Gear Case And Extension/Adapter Housings

Check condition of the countershaft fifth gear components (Fig. 147). This includes the shift lug and rail located in the gear case and the rail bushings.

CLEANING AND INSPECTION (Continued)

Inspect the gear and hub assembly. Minor burrs can be cleaned up with an oil stone. However, the gear and hub assembly should be replaced if the teeth or splines are excessively worn, or damaged. The synchro sleeve should also be replaced if worn or damaged in any way. Do not reuse synchro struts that are worn, or springs that are collapsed or severely distorted. Replace worn distorted synchro parts to avoid shift problems after assembly and installation.

The shift fork should be inspected for evidence of wear and distortion. Check fit of the sleeve in the fork to be sure the two parts fit and work smoothly. Replace the fork if the roll pin holes are worn oversize or damaged. Do not attempt to salvage a worn fork. It will cause shift problems later on. Replace the shift fork roll pins if necessary, or if doubt exists about their condition.

The bearings should be examined carefully for wear, roughness, flat spots, pitting, or other damage. Replace the bearings if necessary.

Inspect the stop ring and clutch gear. replace either part if worn or damaged in any way. Also be sure replacement parts fit properly before proceeding with assembly.

Examine the 1–2 synchro hub and sleeve for wear or damage. Replace the sleeve and hub if the splines are worn, chipped or damaged.

Replace the synchro struts if worn, or chipped. Also replace the springs if collapsed, distorted, or broken.

Inspect the mainshaft geartrain components. Check the teeth on all gears, hubs, clutch gears, stop rings and clutch rings. The teeth must be in good condition and not worn, cracked, or chipped. Replace any component that exhibits wear or damage.

Examine the synchro stop rings, clutch rings and clutch gears. Replace any part that exhibits wear, distortion, or damage. Replace the clutch rings if the friction material is burned, flaking off, or worn.

Inspect all of the thrust washers and locating pins. Replace the pins if bent, or worn. Replace the washers if worn, or the locating pin notches are distorted.

Check condition of the synchro struts and springs. Replace these parts if worn, cracked, or distorted.

AUTOMATIC TRANSMISSION—42RE

INDEX

Mopar AUTHENTIC RESTORATION PRODUCT

GENERAL INFORMATION

42RE TRANSMISSION

The 42RE is a four speed fully automatic transmission (Fig. 1) with an electronic governor. First through third gear ranges are provided by the clutches, bands, overrunning clutch, and planetary gear sets in the transmission. Fourth gear range is provided by the overdrive unit that contains an overdrive clutch, direct clutch, planetary gear set, and overrunning clutch. The overdrive clutch is applied in fourth gear only. The direct clutch is applied in all ranges except fourth gear. The 42RE is equipped with a lock-up clutch in the torque converter. The torque converter clutch is controlled by the Powertrain Control Module (PCM). The torque converter clutch is hydraulically applied and is released when fluid is vented from the hydraulic circuit by the torque converter control (TCC) solenoid on the valve body. The torque converter clutch engages in fourth gear, and in third gear when the O/D switch is OFF. Engagement occurs when the vehicle is cruising on a level plane after the vehicle has warmed up. The torque converter clutch disengages when the accelerator is applied. The torque converter clutch feature increases fuel economy and reduces the transmission fluid temperature. The 42RE transmission is cooled by an integral fluid cooler inside the radiator.

Mopar AUTHENTIC RESTORATION PRODUCT

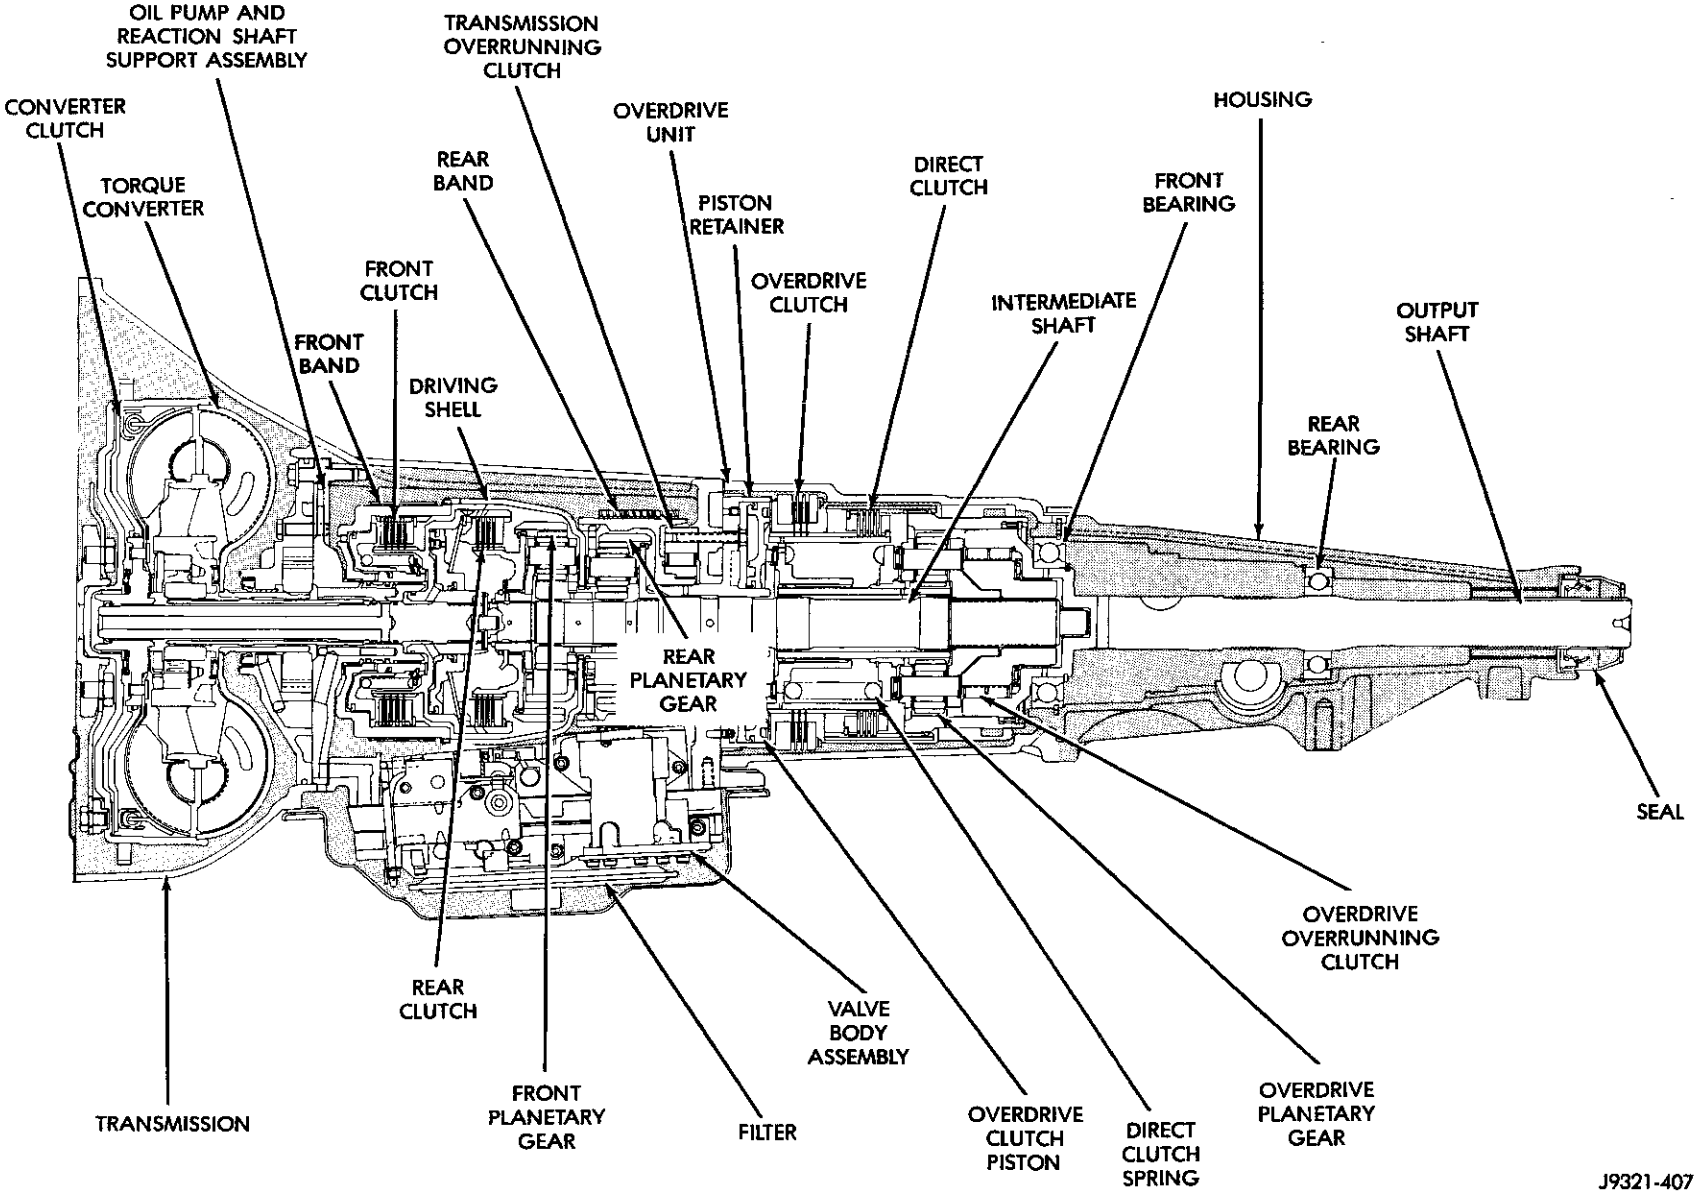

Fig. 1 42RE Transmission

GENERAL INFORMATION (Continued)

TRANSMISSION IDENTIFICATION

Transmission identification numbers are stamped on the left side of the case just above the oil pan gasket surface (Fig. 2). Refer to this information when ordering replacement parts.

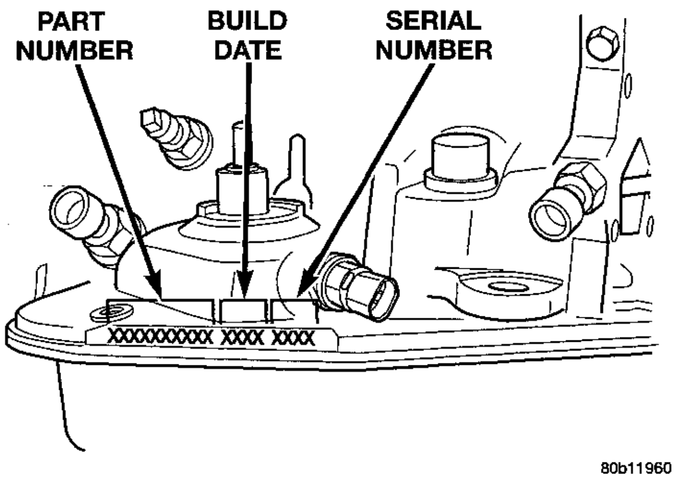

Fig. 2 Transmission Part And Serial Number Location

RECOMMENDED FLUID

Mopar® ATF Plus 3, Type 7176 automatic transmission fluid is the recommended fluid for Chrysler automatic transmissions.

Dexron II fluid IS NOT recommended. Clutch chatter can result from the use of improper fluid.

EFFECTS OF INCORRECT FLUID LEVEL

A low fluid level allows the pump to take in air along with the fluid. Air in the fluid will cause fluid pressures to be low and develop slower than normal. If the transmission is overfilled, the gears churn the fluid into foam. This aerates the fluid and causing the same conditions occurring with a low level. In either case, air bubbles cause fluid overheating, oxidation and varnish buildup which interferes with valve, clutch and servo operation. Foaming also causes fluid expansion which can result in fluid overflow from the transmission vent or fill tube. Fluid overflow can easily be mistaken for a leak if inspection is not careful.

CAUSES OF BURNT FLUID

Burnt, discolored fluid is a result of overheating which has two primary causes.

(1) A result of restricted fluid flow through the main and/or auxiliary cooler. This condition is usually the result of a faulty or improperly installed drainback valve, a damaged main cooler, or severe restrictions in the coolers and lines caused by debris or kinked lines.

(2) Heavy duty operation with a vehicle not properly equipped for this type of operation. Trailer towing or similar high load operation will overheat the transmission fluid if the vehicle is improperly equipped. Such vehicles should have an auxiliary transmission fluid cooler, a heavy duty cooling system, and the engine/axle ratio combination needed to handle heavy loads.

FLUID CONTAMINATION

Transmission fluid contamination is generally a result of:

- adding incorrect fluid
- failure to clean dipstick and fill tube when checking level
- engine coolant entering the fluid
- internal failure that generates debris
- overheat that generates sludge (fluid breakdown)
- failure to reverse flush cooler and lines after repair
- failure to replace contaminated converter after repair

The use of non recommended fluids can result in transmission failure. The usual results are erratic shifts, slippage, abnormal wear and eventual failure due to fluid breakdown and sludge formation. Avoid this condition by using recommended fluids only.

The dipstick cap and fill tube should be wiped clean before checking fluid level. Dirt, grease and other foreign material on the cap and tube could fall into the tube if not removed beforehand. Take the time to wipe the cap and tube clean before withdrawing the dipstick.

Engine coolant in the transmission fluid is generally caused by a cooler malfunction. The only remedy is to replace the radiator as the cooler in the radiator is not a serviceable part. If coolant has circulated through the transmission for some time, an overhaul may also be necessary; especially if shift problems had developed.

The transmission cooler and lines should be reverse flushed whenever a malfunction generates sludge and/or debris. The torque converter should also be replaced at the same time.

Failure to flush the cooler and lines will result in recontamination. Flushing applies to auxiliary coolers as well. The torque converter should also be replaced whenever a failure generates sludge and debris. This is necessary because normal converter flushing procedures will not remove all contaminants.

ELECTRONIC LOCK-UP TORQUE CONVERTER

The torque converter is a hydraulic device that couples the engine crankshaft to the transmission.

GENERAL INFORMATION (Continued)

The torque converter consists of an outer shell with an internal turbine, a stator, an overrunning clutch, an impeller, and an electronically applied converter clutch. Torque multiplication is created when the stator directs the hydraulic flow from the turbine to rotate the impeller in the direction the engine crankshaft is turning. The turbine transfers power to the planetary gear sets in the transmission. The transfer of power into the impeller assists torque multiplication. At low vehicle-speed, the overrunning clutch holds the stator stationary (during torque multiplication) and allows the stator to freewheel at high vehicle speed. The converter clutch engagement reduces engine speed. Clutch engagement also provides reduced transmission fluid temperatures. The torque converter hub drives the transmission oil (fluid) pump.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

CAUTION: The torque converter must be replaced if a transmission failure results in large amounts of metal or fiber contamination in the fluid.

TRANSMISSION GEAR RATIOS

Gear ratios are:

- **1st** 2.74:1
- **2nd** 1.54:1
- **3rd** 1.00:1
- **4th** 0.69:1
- **Rev.** 2.21

GEARSHIFT MECHANISM

The gear shift mechanism provides six shift positions which are:

- park (P)
- reverse (R)
- neutral (N)
- drive (D)
- manual second (2)
- manual low (1)

Manual low (1) range provides first gear only. Overrun braking is also provided in this range. Manual second (2) range provides first and second gear only.

Drive range provides first, second third and overdrive fourth gear ranges. The shift into overdrive fourth gear range occurs only after the transmission has completed the shift into D third gear range. No further movement of the shift mechanism is required to complete the 3-4 shift.

The fourth gear upshift occurs automatically when the overdrive selector switch is in the ON position.

DESCRIPTION AND OPERATION

ELECTRONIC GOVERNOR

Governor pressure is controlled electronically. Components used for governor pressure control include:

- Governor body
- Valve body transfer plate
- Governor pressure solenoid valve
- Governor pressure sensor
- Fluid temperature thermistor
- Throttle position sensor (TPS)
- Transmission speed sensor
- Powertrain control module (PCM)

GOVERNOR PRESSURE SOLENOID VALVE

The solenoid valve is a duty-cycle solenoid which regulates the governor pressure needed for upshifts and downshifts. It is an electro-hydraulic device located in the governor body on the valve body transfer plate (Fig. 3).

The inlet side of the solenoid valve is exposed to normal transmission line pressure. The outlet side of the valve leads to the valve body governor circuit.

The solenoid valve regulates line pressure to produce governor pressure. The average current supplied to the solenoid controls governor pressure. One amp current produces zero kPa/psi governor pressure. Zero amps sets the maximum governor pressure.

The powertrain control module (PCM) turns on the trans control relay which supplies electrical power to the solenoid valve. Operating voltage is 12 volts (DC). The PCM controls the ground side of the solenoid using the governor pressure solenoid control circuit.

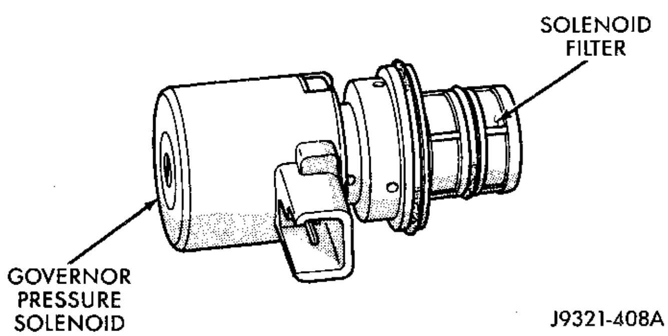

Fig. 3 Governor Pressure Solenoid Valve

GOVERNOR PRESSURE SENSOR

The governor pressure sensor measures output pressure of the governor pressure solenoid valve (Fig. 4).

The sensor output signal provides the necessary feedback to the PCM. This feedback is needed to adequately control governor pressure.

DESCRIPTION AND OPERATION (Continued)

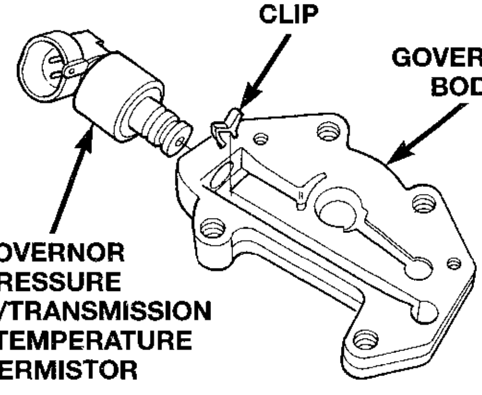

Fig. 4 Governor Pressure Sensor

GOVERNOR BODY AND TRANSFER PLATE

The transfer plate is designed to supply transmission line pressure to the governor pressure solenoid valve and to return governor pressure.

The governor pressure solenoid valve is mounted in the governor body. The body is bolted to the lower side of the transfer plate (Fig. 4). The transfer plate channels line pressure to the solenoid valve through the governor body. It also channels governor pressure from the solenoid valve to the governor circuit. It is the solenoid valve that develops the necessary governor pressure.

TRANSMISSION FLUID TEMPERATURE THERMISTOR

Transmission fluid temperature readings are supplied to the transmission control module by the thermistor. The temperature readings are used to control engagement of the fourth gear overdrive clutch, the converter clutch, and governor pressure. Normal resistance value for the thermistor at room temperature is approximately 1000 ohms.

The PCM prevents engagement of the converter clutch and overdrive clutch, when fluid temperature is below approximately 10°C (50°F).

If fluid temperature exceeds 126°C (260°F), the PCM causes a 4-3 downshift and engage the converter clutch. Engagement is according to the third gear converter clutch engagement schedule.

The overdrive OFF lamp in the instrument panel illuminates when the shift back to third occurs. The transmission will not allow fourth gear operation until fluid temperature decreases to approximately 110°C (230°F).

The thermistor is part of the governor pressure sensor assembly and is immersed in transmission fluid at all times.

TRANSMISSION SPEED SENSOR

The speed sensor (Fig. 5) is located in the overdrive gear case. The sensor is positioned over the park gear and monitors transmission output shaft rotating speed. Speed sensor signals are triggered by the park gear lugs as they rotate past the sensor pickup face. Input signals from the sensor are sent to the transmission control module for processing. The vehicle speed sensor also serves as a backup for the transmission speed sensor. Signals from this sensor are shared with the powertrain control module.

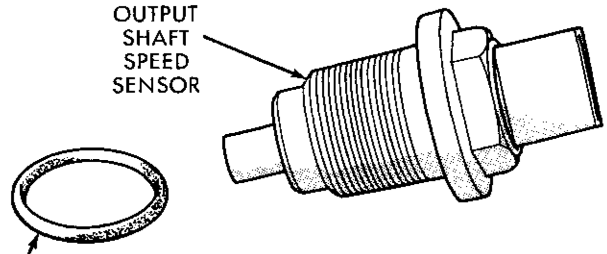

Fig. 5 Transmission Output Speed Sensor

THROTTLE POSITION SENSOR (TPS)

The TPS provides throttle position input signals to the PCM. This input signal is used to determine overdrive and converter clutch shift schedule and to select the proper governor curve.

POWERTRAIN CONTROL MODULE (PCM)

The PCM controls operation of the converter clutch, overdrive clutch, and governor pressure solenoid.

The control module determines transmission shift points based on input signals from the transmission thermistor, transmission output shaft speed sensor, crankshaft position sensor, vehicle speed sensor, throttle position sensor, and battery temperature sensor.

GOVERNOR PRESSURE CURVES

There are four governor pressure curves programmed into the transmission control module. The different curves allow the control module to adjust governor pressure for varying conditions. One curve is used for operation when fluid temperature is at, or below, 1°C (30°F). A second curve is used when fluid temperature is at, or above, 10°C (50°F) during normal city or highway driving. A third curve is used during wide-open throttle operation. The fourth curve is used when driving with the transfer case in low range.

DESCRIPTION AND OPERATION (Continued)

SHIFT VALVE OPERATION

The shift valves are moved by a combination of throttle and governor pressure. The governor pressure is generated by electrical components.

The conditions under which a shift to fourth will not occur are:

- Overdrive switch is Off
- Transmission fluid temperature is below 10° C (50° F) or above 121° C (250° F)
- Shift to third not yet completed
- Vehicle speed too low for 3-4 shift to occur
- Battery temperature below –5° F.

HYDRAULIC CONTROL SYSTEM

The hydraulic control system provides fully automatic operation. The system performs five basic functions which are: pressure supply, pressure regulation, flow control, clutch/band application, and lubrication.

PRESSURE REGULATION

The pressure regulator valve maintains line pressure. The amount of pressure developed is controlled by throttle pressure which is dependent on the degree of throttle opening. The regulator valve is located in the valve body.

The throttle valve determines line pressure and shift speed. Governor pressure increases in proportion to vehicle speed. The throttle valve controls upshift and downshift speeds by regulating pressure according to throttle position.

Shift Valve Flow Control

The manual valve is operated by the gearshift linkage and provides the operating range selected by the driver.

The 1-2 shift valve provides 1-2 or 2-1 shifts and the 2-3 shift valve provides 2-3 or 3-2 shifts.

The kickdown valve provides forced 3-2 or 3-1 downshifts depending on vehicle speed. Downshifts occur when the throttle is opened beyond downshift detent position. Detent is reached just before wide open throttle position.

The 2-3 valve throttle pressure plug provides 3-2 downshifts at varying throttle openings depending on vehicle speed.

The 1-2 shift control valve transmits 1-2 shift pressure to the accumulator piston. This controls kickdown band capacity on 1-2 upshifts and 3-2 downshifts.

The 3-4 shift, quick fill, and timing valves plus the 3-4 accumulator, are only actuated when the overdrive solenoid is energized. The solenoid contains a check ball that controls a vent port to the 3-4 valves. The check ball either diverts line pressure away from or directly to the 3-4 valves.

The limit valve determines maximum speed at which a 3-2 part throttle kickdown can be made. On transmissions without a limit valve, maximum speed for a 3-2 kickdown is at detent position.

The 2-3 shuttle valve has two functions. The first is fast front band release and smooth engagement during lift-foot 2-3 upshifts. The second is to regulate front clutch and band application during 3-2 downshifts.

The 3-4 timing valve is moved by line pressure coming through the 3-4 shift valve. The timing valve holds the 2-3 shift valve in an upshift position. The purpose is to prevent the 2-3 valve from up or downshifting before the 3-4 valve.

The 3-4 accumulator is mounted on the overdrive housing and performs the same function as the 2-3 accumulator; it is used to smooth engagement during a 3-4 shift.

The switch valve directs fluid apply pressure to the converter clutch in one position and releases it in the opposite position. It also directs oil to the cooling and lube circuits. The switch valve regulates oil pressure to the torque converter by limiting maximum oil pressure to 130 psi.

OVERDRIVE OFF SWITCH

The overdrive OFF (control) switch is located in the shift lever arm. The switch is a momentary contact device that signals the PCM to toggle current status of the overdrive function. At key-on, overdrive operation is allowed. Pressing the switch once causes the overdrive OFF mode to be entered and the overdrive OFF switch lamp to be illuminated. Pressing the switch a second time causes normal overdrive operation to be restored and the overdrive lamp to be turned off. The overdrive OFF mode defaults to ON after the ignition switch is cycled OFF and ON. The normal position for the control switch is the ON position. The switch must be in this position to energize the solenoid and allow a 3-4 upshift. The control switch indicator light illuminates only when the overdrive switch is turned to the OFF position, or when illuminated by the transmission control module.

3-4 SHIFT SEQUENCE

The overdrive clutch is applied in fourth gear only. The direct clutch is applied in all ranges except fourth gear. Fourth gear overdrive range is electronically controlled and hydraulically activated. Various sensor inputs are supplied to the powertrain control module to operate the overdrive solenoid on the valve body. The solenoid contains a check ball that opens and closes a vent port in the 3-4 shift valve feed passage. The overdrive solenoid (and check ball) are not energized in first, second, third, or reverse gear. The vent port remains open, diverting line pressure from the 2-3 shift valve away from the 3-4 shift valve. The overdrive control switch must be in the ON position

Mopar AUTHENTIC RESTORATION PRODUCT

DESCRIPTION AND OPERATION (Continued)

to transmit overdrive status to the PCM. A 3-4 upshift occurs only when the overdrive solenoid is energized by the PCM. The PCM energizes the overdrive solenoid during the 3-4 upshift. This causes the solenoid check ball to close the vent port allowing line pressure from the 2-3 shift valve to act directly on the 3-4 upshift valve. Line pressure on the 3-4 shift valve overcomes valve spring pressure moving the valve to the upshift position. This action exposes the feed passages to the 3-4 timing valve, 3-4 quick fill valve, 3-4 accumulator, and ultimately to the overdrive piston. Line pressure through the timing valve moves the overdrive piston into contact with the overdrive clutch. The direct clutch is disengaged before the overdrive clutch is engaged. The boost valve provides increased fluid apply pressure to the overdrive clutch during 3-4 upshifts, and when accelerating in fourth gear. The 3-4 accumulator cushions overdrive clutch engagement to smooth 3-4 upshifts. The accumulator is charged at the same time as apply pressure acts against the overdrive piston.

CONVERTER CLUTCH ENGAGEMENT

Converter clutch engagement in third or fourth gear range is controlled by sensor inputs to the powertrain control module. Inputs that determine clutch engagement are: coolant temperature, engine rpm, vehicle speed, throttle position, and manifold vacuum. The torque converter clutch is engaged by the clutch solenoid on the valve body. The clutch can be engaged in third and fourth gear ranges depending on overdrive control switch position. If the overdrive control switch is in the normal ON position, the clutch will engage after the shift to fourth gear, and above approximately 72 km/h (45 mph). If the control switch is in the OFF position, the clutch will engage after the shift to third gear, at approximately 56 km/h (35 mph) at light throttle.

QUICK FILL VALVE

The 3-4 quick fill valve provides faster engagement of the overdrive clutch during 3-4 upshifts. The valve temporarily bypasses the clutch piston feed orifice at the start of a 3-4 upshift. This exposes a larger passage into the piston retainer resulting in a much faster clutch fill and apply sequence. The quick fill valve does not bypass the regular clutch feed orifice throughout the 3-4 upshift. Instead, once a predetermined pressure develops within the clutch, the valve closes the bypass. Clutch fill is then completed through the regular feed orifice.

CONVERTER DRAINBACK VALVE

The drainback valve is located in the transmission cooler outlet (pressure) line. The valve prevents fluid from draining from the converter into the cooler and lines when the vehicle is shut down for lengthy periods. Production valves have a hose nipple at one end, while the opposite end is threaded for a flare fitting. All valves have an arrow (or similar mark) to indicate direction of flow through the valve.

DIAGNOSIS AND TESTING

AUTOMATIC TRANSMISSION DIAGNOSIS

Automatic transmission problems can be a result of poor engine performance, incorrect fluid level, incorrect linkage or cable adjustment, band or hydraulic control pressure adjustments, hydraulic system malfunctions or electrical/mechanical component malfunctions. Begin diagnosis by checking the easily accessible items such as: fluid level and condition, linkage adjustments and electrical connections. A road test will determine if further diagnosis is necessary.

PRELIMINARY DIAGNOSIS

Two basic procedures are required. One procedure for vehicles that are drivable and an alternate procedure for disabled vehicles (will not back up or move forward).

VEHICLE IS DRIVEABLE

(1) Check for transmission fault codes using DRB scan tool.

(2) Check fluid level and condition.

(3) Adjust throttle and gearshift linkage if complaint was based on delayed, erratic, or harsh shifts.

(4) Road test and note how transmission upshifts, downshifts, and engages.

(5) Perform stall test if complaint is based on sluggish acceleration. Or, if abnormal throttle opening is needed to maintain normal speeds with a properly tuned engine.

(6) Perform hydraulic pressure test if shift problems were noted during road test.

(7) Perform air-pressure test to check clutch-band operation.

VEHICLE IS DISABLED

(1) Check fluid level and condition.

(2) Check for broken or disconnected gearshift or throttle linkage.

(3) Check for cracked, leaking cooler lines, or loose or missing pressure-port plugs.

(4) Raise and support vehicle on safety stands, start engine, shift transmission into gear, and note following:

(a) If propeller shaft turns but wheels do not, problem is with differential or axle shafts.

(b) If propeller shaft does not turn and transmission is noisy, stop engine. Remove oil pan, and

DIAGNOSIS AND TESTING (Continued)

check for debris. If pan is clear, remove transmission and check for damaged drive plate, converter, oil pump, or input shaft.

(c) If propeller shaft does not turn and transmission is not noisy, perform hydraulic-pressure test to determine if problem is hydraulic or mechanical.

PARK/NEUTRAL POSITION SWITCH

The center terminal of the park/neutral position switch is the starter-circuit terminal. It provides the ground for the starter solenoid circuit through the selector lever in PARK and NEUTRAL positions only. The outer terminals on the switch are for the backup lamp circuit.

SWITCH TEST

To test the switch, remove the wiring connector. Test for continuity between the center terminal and the transmission case. Continuity should exist only when the transmission is in PARK or NEUTRAL.

Shift the transmission into REVERSE and test continuity at the switch outer terminals. Continuity should exist only when the transmission is in REVERSE. Continuity should not exist between the outer terminals and the case.

Check gearshift linkage adjustment before replacing a switch that tests faulty.

OVERDRIVE ELECTRICAL CONTROLS

The overdrive off switch, valve body solenoid, case connectors and related wiring can all be tested with a 12 volt test lamp or a volt/ohmmeter. Check continuity of each component when diagnosis indicates this is necessary. Refer to Group 8W, Wiring Diagrams, for component locations and circuit information.

Switch and solenoid continuity should be checked whenever the transmission fails to shift into fourth gear range.

GEARSHIFT LINKAGE AND THROTTLE CABLE

GEARSHIFT LINKAGE

Gearshift linkage adjustment is important because it positions the valve body manual valve. Incorrect adjustment will cause creeping in Neutral, premature clutch wear, delayed engagement in any gear, or a no-start in Park or Neutral position.

Proper operation of the park/neutral position switch will provide a quick check of linkage adjustment.

THROTTLE VALVE CABLE ADJUSTMENT

Throttle valve cable adjustment is important to proper operation. This adjustment positions the throttle valve which controls shift speed, quality and part throttle downshift sensitivity.

If cable setting is too short, early shifts and slippage between shifts may occur. If the setting is too long, shifts may be delayed and part throttle downshifts may be very sensitive.

ROAD TESTING

Before road testing, be sure the fluid level and control cable adjustments have been checked and adjusted if necessary. Verify that diagnostic trouble codes have been resolved.

Observe engine performance during the road test. A poorly tuned engine will not allow accurate analysis of transmission operation.

Operate the transmission in all gear ranges. Check for shift variations and engine flare which indicates slippage. Note if shifts are harsh, spongy, delayed, early, or if part throttle downshifts are sensitive.

Slippage indicated by engine flare, usually means clutch, band or overrunning clutch problems. If the condition is advanced, an overhaul will be necessary to restore normal operation.

A slipping clutch or band can often be determined by comparing which internal units are applied in the various gear ranges. The Clutch and Band Application chart provides a basis for analyzing road test results.

ANALYZING ROAD TEST

Refer to the Clutch and Band Application chart and note which elements are in use in the various gear ranges.

Note that the rear clutch is applied in all forward ranges (D, 2, 1). The transmission overrunning clutch is applied in first gear (D, 2 and 1 ranges) only. The rear band is applied in 1 and R range only.

Note that the overdrive clutch is applied only in fourth gear and the overdrive direct clutch and overrunning clutch are applied in all ranges except fourth gear.

For example: If slippage occurs in first gear in D and 2 range but not in 1 range, the transmission overrunning clutch is faulty. Similarly, if slippage occurs in any two forward gears, the rear clutch is slipping.

Applying the same method of analysis, note that the front and rear clutches are applied simultaneously only in D range third and fourth gear. If the transmission slips in third gear, either the front clutch or the rear clutch is slipping.

If the transmission slips in fourth gear but not in third gear, the overdrive clutch is slipping. By selecting another gear which does not use these clutches, the slipping unit can be determined. For example, if the transmission also slips in Reverse, the front clutch is slipping. If the transmission does not slip in Reverse, the rear clutch is slipping.

J9421-218

Clutch And Band Application Chart

If slippage occurs during the 3-4 shift or only in fourth gear, the overdrive clutch is slipping. Similarly, if the direct clutch were to fail, the transmission would lose both reverse gear and overrun braking in 2 position (manual second gear).

If the transmission will not shift to fourth gear, the control switch, overdrive solenoid or related wiring may also be the problem cause.

This process of elimination can be used to identify a slipping unit and check operation. Proper use of the Clutch and Band Application Chart is the key.

Although road test analysis will help determine the slipping unit, the actual cause of a malfunction usually cannot be determined until hydraulic and air pressure tests are performed. Practically any condition can be caused by leaking hydraulic circuits or sticking valves.

Unless a malfunction is obvious, such as no drive in D range first gear, do not disassemble the transmission. Perform the hydraulic and air pressure tests to help determine the probable cause.

HYDRAULIC PRESSURE TEST

Hydraulic test pressures range from a low of one psi (6.895 kPa) governor pressure, to 300 psi (2068 kPa) at the rear servo pressure port in reverse.

An accurate tachometer and pressure test gauges are required. Test Gauge C-3292 has a 100 psi range and is used at the accumulator, governor, and front servo ports. Test Gauge C-3293-SP has a 300 psi range and is used at the rear servo and overdrive ports where pressures exceed 100 psi.

Pressure Test Port Locations

Test ports are located at both sides of the transmission case (Fig. 6).

Line pressure is checked at the accumulator port on the right side of the case. The front servo pressure port is at the right side of the case just behind the filler tube opening.

The rear servo and governor pressure ports are at the right rear of the transmission case. The overdrive clutch pressure port is at the left rear of the case.

Test One - Transmission In Manual Low

NOTE: This test checks pump output, pressure regulation, and condition of the rear clutch and servo circuit. Both test gauges are required for this test.

(1) Connect tachometer to engine. Position tachometer so it can be observed from driver seat if helper will be operating engine. Raise vehicle on hoist that will allow rear wheels to rotate freely.

(2) Connect 100 psi Gauge C-3292 to accumulator port. Then connect 300 psi Gauge C-3293-SP to rear servo port.

(3) Disconnect throttle and gearshift cables from levers on transmission valve body manual shaft.

(4) Have helper start and run engine at 1000 rpm.

(5) Move transmission shift lever fully forward into 1 range.

(6) Gradually move transmission throttle lever from full forward to full rearward position and note pressures on both gauges:

DIAGNOSIS AND TESTING (Continued)

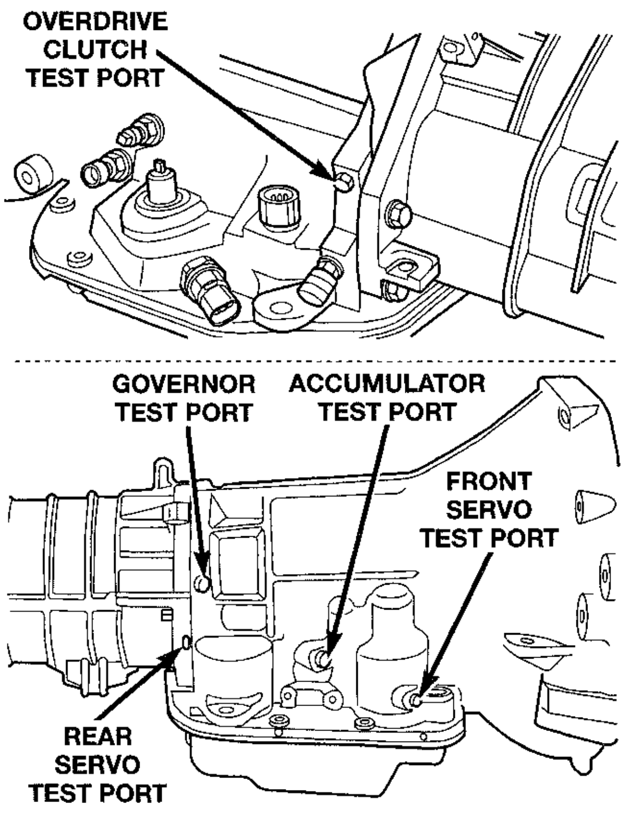

Fig. 6 Pressure Test Port Locations

- Line pressure at accumulator port should be 54-60 psi (372-414 kPa) with throttle lever forward and gradually increase to 90-96 psi (621-662 kPa) as throttle lever is moved rearward.
- Rear servo pressure should be same as line pressure within 3 psi (20.68 kPa).

Test Two—Transmission In 2 Range

NOTE: This test checks pump output, line pressure and pressure regulation. Use 100 psi Test Gauge C-3292 for this test.

(1) Leave vehicle in place on hoist and leave Test Gauge C-3292 connected to accumulator port.
(2) Have helper start and run engine at 1000 rpm.
(3) Move transmission shift lever one detent rearward from full forward position. This is 2 range.
(4) Move transmission throttle lever from full forward to full rearward position and read pressure on gauge.
(5) Line pressure should be 54-60 psi (372-414 kPa) with throttle lever forward and gradually increase to 90-96 psi (621-662 kPa) as lever is moved rearward.

Test Three—Transmission In D Range Third Gear

NOTE: This test checks pressure regulation and condition of the clutch circuits. Both test gauges are required for this test.

(1) Turn OD switch off.
(2) Leave vehicle on hoist and leave Gauge C-3292 in place at accumulator port.
(3) Move Gauge C-3293-SP over to front servo port for this test.
(4) Have helper start and run engine at 1600 rpm for this test.
(5) Move transmission shift lever two detents rearward from full forward position. This is D range.
(6) Read pressures on both gauges as transmission throttle lever is gradually moved from full forward to full rearward position:

- Line pressure at accumulator in D range third gear, should be 54-60 psi (372-414 kPa) with throttle lever forward and increase as lever is moved rearward.
- Front servo pressure in D range third gear, should be within 3 psi (21 kPa) of line pressure up to kickdown point.

Test Four—Transmission In Reverse

NOTE: This test checks pump output, pressure regulation and the front clutch and rear servo circuits. Use 300 psi Test Gauge C-3293-SP for this test.

(1) Leave vehicle on hoist and leave gauge C3292 in place at accumulator port.
(2) Move 300 psi Gauge C-3293-SP back to rear servo port.
(3) Have helper start and run engine at 1600 rpm for test.
(4) Move transmission shift lever four detents rearward from full forward position. This is Reverse range.
(5) Move transmission throttle lever fully forward then fully rearward and note reading at Gauge C-3293-SP.
(6) Pressure should be 145 - 175 psi (1000-1207 kPa) with throttle lever forward and increase to 230 - 280 psi (1586-1931 kPa) as lever is gradually moved rearward.

Mopar AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING (Continued)

Test Five—Governor Pressure

NOTE: This test checks governor operation by measuring governor pressure response to changes in vehicle speed. It is usually not necessary to check governor operation unless shift speeds are incorrect or if the transmission will not downshift. The test should be performed on the road or on a hoist that will allow the rear wheels to rotate freely.

(1) Move 100 psi Test Gauge C-3292 to governor pressure port.

(2) Move transmission shift lever two detents rearward from full forward position. This is D range.

(3) Have helper start and run engine at curb idle speed. Then firmly apply service brakes so wheels will not rotate.

(4) Note governor pressure:

• Governor pressure should be no more than 20.6 kPa (3 psi) at curb idle speed and wheels not rotating.

• If pressure exceeds 20.6 kPa (3 psi), a fault exists in governor pressure control system.

(5) Release brakes, slowly increase engine speed, and observe speedometer and pressure test gauge (do not exceed 30 mph on speedometer). Governor pressure should increase in proportion to vehicle speed. Or approximately 6.89 kPa (1 psi) for every 1 mph.

(6) Governor pressure rise should be smooth and drop back to no more than 20.6 kPa (3 psi), after engine returns to curb idle and brakes are applied to prevent wheels from rotating.

(7) Compare results of pressure test with analysis chart.

Test Six—Transmission In Overdrive Fourth Gear

NOTE: This test checks line pressure at the overdrive clutch in fourth gear range. Use 300 psi Test Gauge C-3292 for this test. The test should be performed on the road or on a chassis dyno.

(1) Remove tachometer; it is not needed for this test.

(2) Move 300 psi Gauge to overdrive clutch pressure test port. Then remove other gauge and reinstall test port plug.

(3) Lower vehicle.

(4) Turn OD switch on.

(5) Secure test gauge so it can be viewed from drivers seat.

(6) Start engine and shift into D range.

(7) Increase vehicle speed gradually until 3-4 shift occurs and note gauge pressure.

(8) Pressure should be 469-496 kPa (68-72 psi) with closed throttle and increase to 620-827 kPa (90-120 psi) at 1/2 to 3/4 throttle. Note that pressure can increase to around 896 kPa (130 psi) at full throttle.

(9) Return to shop or move vehicle off chassis dyno.

PRESSURE TEST ANALYSIS CHART

TEST CONDITION	INDICATION
Line pressure OK during any one test	Pump and regulator valve OK
Line pressure OK in R but low in D, 2, 1	Leakage in rear clutch area (seal rings, clutch seals)
Pressure low in D Fourth Gear Range	Overdrive clutch piston seal, or check ball problem
Pressure OK in 1, 2 but low in D3 and R	Leakage in front clutch area
Pressure OK in 2 but low in R and 1	Leakage in rear servo
Front servo pressure low in 2	Leakage in servo; broken servo ring or cracked servo piston
Pressure low in all positions	Clogged filter, stuck regulator valve, worn or faulty pump, low oil level
Governor pressure too high at idle speed	Governor pressure solenoid valve system fault. Refer to diagnostic book.
Governor pressure low at all mph figures	Faulty governor pressure solenoid, transmission control module, or governor pressure sensor
Lubrication pressure low at all throttle positions	Clogged fluid cooler or lines, seal rings leaking, worn pump bushings, pump, clutch retainer, or clogged filter.
Line pressure high	Output shaft plugged, sticky regulator valve
Line pressure low	Sticky regulator valve, clogged filter, worn pump

CONVERTER STALL TEST

Stall testing involves determining maximum engine speed obtainable at full throttle with the rear wheels locked and the transmission in D range. This test checks the holding ability of the converter overrunning and transmission clutches.

WARNING: NEVER ALLOW ANYONE TO STAND DIRECTLY IN LINE WITH THE VEHICLE FRONT OR REAR DURING A STALL TEST. ALWAYS BLOCK THE WHEELS AND FULLY APPLY THE SERVICE AND PARKING BRAKES DURING THE TEST.

DIAGNOSIS AND TESTING (Continued)

STALL TEST PROCEDURE

(1) Connect tachometer to engine. Position tachometer so it can be viewed from driver's seat.

(2) Drive vehicle to bring transmission fluid up to normal operating temperature. Vehicle can be driven on road or on chassis dynamometer, if available.

(3) Check transmission fluid level. Add fluid if necessary.

(4) Block front wheels.

(5) Fully apply service and parking brakes.

(6) Open throttle completely and record maximum engine speed registered on tachometer. It takes 4-10 seconds to reach max rpm. **Once max rpm has been achieved, do not hold wide open throttle for more than 4-5 seconds.**

CAUTION: Stalling the converter causes a rapid increase in fluid temperature. To avoid fluid overheating, hold the engine at maximum rpm for no more than 5 seconds. If engine exceeds 2500 rpm during the test, release the accelerator pedal immediately; transmission clutch slippage is occurring.

(7) If a second stall test is required, cool down fluid before proceeding. Shift into NEUTRAL and run engine at 1000 rpm for 20-30 seconds to cool fluid.

STALL TEST ANALYSIS

Stall Speed Too High

If the stall speed exceeds 2500 rpm, transmission clutch slippage is indicated.

Stall Speed Low

Low stall speed with a properly tuned engine indicate a torque converter overrunning clutch problem. The condition should be confirmed by road testing. A stall speed 250-350 rpm below normal indicates the converter overrunning clutch is slipping. The vehicle also exhibits poor acceleration but operates normally once highway cruise speeds are reached. Torque converter replacement will be necessary.

Stall Speed Normal But Acceleration Poor

If stall speeds are normal (1800-2300 rpm) but abnormal throttle opening is required for acceleration, or to maintain cruise speed, the converter overrunning clutch is seized. The torque converter will have to be replaced.

Converter Noise During Test

A whining noise caused by fluid flow is normal during a stall test. However, loud metallic noises indicate a damaged converter. To confirm that the noise is originating from the converter, operate the vehicle at light throttle in DRIVE and NEUTRAL on a hoist and listen for noise coming from the converter housing.

AIR TESTING TRANSMISSION CLUTCH AND BAND OPERATION

Air-pressure testing can be used to check transmission front/rear clutch and band operation. The test can be conducted with the transmission either in the vehicle or on the work bench, as a final check, after overhaul.

Air-pressure testing requires that the oil pan and valve body be removed from the transmission. The servo and clutch apply passages are shown (Fig. 7).

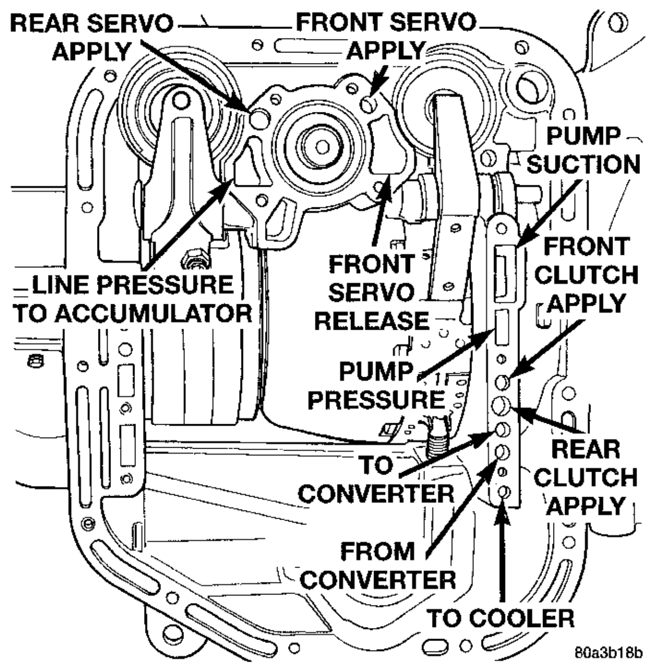

Fig. 7 Air Pressure Test Passages

Front Clutch Air Test

Place one or two fingers on the clutch housing and apply air pressure through front clutch apply passage. Piston movement can be felt and a soft thump heard as the clutch applies.

Rear Clutch Air Test

Place one or two fingers on the clutch housing and apply air pressure through rear clutch apply passage. Piston movement can be felt and a soft thump heard as the clutch applies.

Front Servo Apply Air Test

Apply air pressure to the front servo apply passage. The servo rod should extend and cause the band to tighten around the drum. Spring pressure should release the servo when air pressure is removed.

AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING (Continued)

Rear Servo Air Test

Apply air pressure to the rear servo apply passage. The servo rod should extend and cause the band to tighten around the drum. Spring pressure should release the servo when air pressure is removed.

CONVERTER HOUSING FLUID LEAK DIAGNOSIS

When diagnosing converter housing fluid leaks, two items must be established before repair.

(1) Verify that a leak condition actually exists.

(2) Determined the true source of the leak.

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill or fill after repair. Converter housing leaks have several potential sources. Through careful observation, a leak source can be identified before removing the transmission for repair. Pump seal leaks tend to move along the drive hub and onto the rear of the converter. Pump O-ring or pump body leaks follow the same path as a seal leak (Fig. 8). Pump vent or pump attaching bolt leaks are generally deposited on the inside of the converter housing and not on the converter itself (Fig. 8). Pump seal or gasket leaks usually travel down the inside of the converter housing. Front band lever pin plug leaks are generally deposited on the housing and not on the converter.

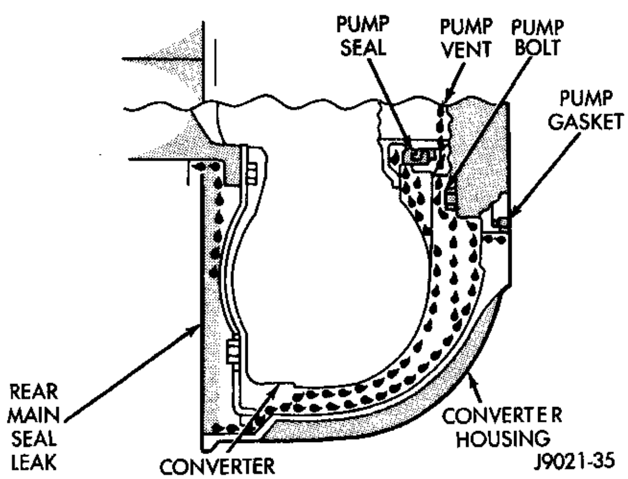

Fig. 8 Converter Housing Leak Paths

TORQUE CONVERTER LEAK POINTS

Possible sources of converter leaks are:

(1) Leaks at the weld joint around the outside diameter weld (Fig. 9).

(2) Leaks at the converter hub weld (Fig. 9).

CONVERTER HOUSING AREA LEAK CORRECTION

(1) Remove converter.

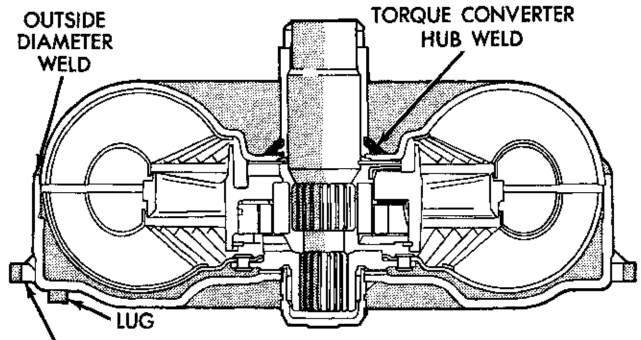

Fig. 9 Converter Leak Points—Typical

(2) Tighten front band adjusting screw until band is tight around front clutch retainer. This prevents front/rear clutches from coming out when oil pump is removed.

(3) Remove oil pump and remove pump seal. Inspect pump housing drainback and vent holes for obstructions. Clear holes with solvent and wire.

(4) Inspect pump bushing and converter hub. If bushing is scored, replace it. If converter hub is scored, either polish it with crocus cloth or replace converter.

(5) Install new pump seal, O-ring, and gasket. Replace oil pump if cracked, porous or damaged in any way. Be sure to loosen the front band before installing the oil pump, damage to the oil pump seal may occur if the band is still tightened to the front clutch retainer.

(6) Loosen kickdown lever pin access plug three turns. Apply Loctite 592, or Permatex No. 2 to plug threads and tighten plug to 17 N·m (150 in. lbs.) torque.

(7) Adjust front band.

(8) Lubricate pump seal and converter hub with transmission fluid or petroleum jelly and install converter.

(9) Install transmission and converter housing dust shield.

(10) Lower vehicle.

DIAGNOSIS TABLES AND CHARTS—RE TRANSMISSION

The diagnosis charts provide additional reference when diagnosing a transmission fault. The charts provide general information on a variety of transmission, overdrive unit and converter clutch fault conditions.

The hydraulic flow charts in the Schematics and Diagrams section of this group, outline fluid flow and hydraulic circuitry. Circuit operation is provided for neutral, third, fourth and reverse gear ranges. Normal working pressures are also supplied for each of the gear ranges.

DIAGNOSIS AND TESTING (Continued)

DIAGNOSIS CHARTS

CONDITION	POSSIBLE CAUSES	CORRECTION
HARSH ENGAGEMENT (FROM NEUTRAL TO DRIVE OR REVERSE)	1. Fluid Level Low	1. Add Fluid
	2. Throttle Linkage Misadjusted	2. Adjust linkage - setting may be too long.
	3. Mount and Driveline Bolts Loose	3. Check engine mount, transmission mount, propeller shaft, rear spring to body bolts, rear control arms, crossmember and axle bolt torque. Tighten loose bolts and replace missing bolts.
	4. U-Joint Worn/Broken	4. Remove propeller shaft and replace U-Joint.
	5. Axle Backlash Incorrect	5. Check per Service Manual. Correct as needed.
	6. Hydraulic Pressure Incorrect	6. Check pressure. Remove, overhaul or adjust valve body as needed.
	7. Band Misadjusted.	7. Adjust rear band.
	8. Valve Body Check Balls Missing.	8. Inspect valve body for proper check ball installation.
	9. Axle Pinion Flange Loose.	9. Replace nut and check pinion threads before installing new nut. Replace pinion gear if threads are damaged.
	10. Clutch, band or planetary component damaged.	10. Remove, disassemble and repair transmission as necessary.
	11. Converter Clutch Faulty.	11. Replace converter and flush cooler and line before installing new converter.

Mopar AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
DELAYED ENGAGEMENT (FROM NEUTRAL TO DRIVE OR REVERSE)	1. Fluid Level Low.	1. Correct level and check for leaks.
	2. Filter Clogged.	2. Change filter.
	3. Gearshift Linkage Misadjusted.	3. Adjust linkage and repair linkage if worn or damaged.
	4. Torque Converter Drain Back (Oil drains from torque converter into transmission sump)	4. If vehicle moves normally after 5 seconds after shifting into gear, no repair is necessary. If longer, inspect pump bushing for wear. Replace pump house.
	5. Rear Band Misadjusted.	5. Adjust band.
	6. Valve Body Filter Plugged.	6. Replace fluid and filter. If oil pan and old fluid were full of clutch disc material and/or metal particles, overhaul will be necessary.
	7. Oil Pump Gears Worn/Damaged.	7. Remove transmission and replace oil pump.
	8. Governor Circuit and Solenoid Valve Electrical Fault.	8. Test with DRB scan tool and repair as required.
	9. Hydraulic Pressure Incorrect.	9. Perform pressure test, remove transmission and repair as needed.
	10. Reaction Shaft Seal Rings Worn/Broken.	10. Remove transmission, remove oil pump and replace seal rings.
	11. Rear Clutch/Input Shaft, Rear Clutch Seal Rings Damaged.	11. Remove and disassemble transmission and repair as necessary.
	12. Regulator Valve Stuck.	12. Clean.
	13. Cooler Plugged.	13. Transfer case failure can plug cooler.
NO DRIVE RANGE (REVERSE OK)	1. Fluid Level Low.	1. Add fluid and check for leaks if drive is restored.
	2. Gearshift Linkage/Cable Loose/Misadjusted.	2. Repair or replace linkage components.
	3. Rear Clutch Burnt.	3. Remove and disassemble transmission and rear clutch and seals. Repair/replace worn or damaged parts as needed.
	4. Valve Body Malfunction.	4. Remove and disassemble valve body. Replace assembly if any valves or bores are damaged.
	5. Transmission Overrunning Clutch Broken.	5. Remove and disassemble transmission. Replace overrunning clutch.
	6. Input Shaft Seal Rings Worn/Damaged.	6. Remove and disassemble transmission. Replace seal rings and any other worn or damaged parts.
	7. Front Planetary Failed Broken.	7. Remove and repair.

mopar AUTHENTIC RESTORATION

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO DRIVE OR REVERSE (VEHICLE WILL NOT MOVE)	1. Fluid Level Low.	1. Add fluid and check for leaks if drive is restored.
	2. Gearshift Linkage/Cable Loose/Misadjusted.	2. Inspect, adjust and reassemble linkage as needed. Replace worn/damaged parts.
	3. U-Joint/Axle/Transfer Case Broken.	3. Perform preliminary inspection procedure for vehicle that will not move. Refer to procedure in diagnosis section.
	4. Filter Plugged.	4. Remove and disassemble transmission. Repair or replace failed components as needed. Replace filter. If filter and fluid contained clutch material or metal particles, an overhaul may be necessary. Perform lube flow test. Flush oil. Replace cooler as necessary.
	5. Oil Pump Damaged.	5. Perform pressure test to confirm low pressure. Replace pump body assembly if necessary.
	6. Valve Body Malfunctioned.	6. Check and inspect valve body. Replace valve body (as assembly) if any valve or bore is damaged. Clean and reassemble correctly if all parts are in good condition.
	7. Transmission Internal Component Damaged.	7. Remove and disassemble transmission. Repair or replace failed components as needed.
	8. Park Sprag not Releasing - Check Stall Speed, Worn/Damaged/ Stuck.	8. Remove, disassemble, repair.
	9. Torque Converter Damage.	9. Inspect and replace as required.

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
SHIFTS DELAYED OR ERRATIC (SHIFTS ALSO HARSH AT TIMES)	1. Fluid Level Low/High.	1. Correct fluid level and check for leaks if low.
	2. Fluid Filter Clogged.	2. Replace filter. If filter and fluid contained clutch material or metal particles, an overhaul may be necessary. Perform lube flow test.
	3. Throttle Linkage Misadjusted.	3. Adjust linkage as described in service section.
	4. Throttle Linkage Binding.	4. Check cable for binding. Check for return to closed throttle at transmission.
	5. Gearshift Linkage/Cable Misadjusted.	5. Adjust linkage/cable as described in service section.
	6. Clutch or Servo Failure.	6. Remove valve body and air test clutch, and band servo operation. Disassemble and repair transmission as needed.
	7. Governor Circuit Electrical Fault.	7. Test using DRB scan tool and repair as required.
	8. Front Band Misadjusted.	8. Adjust band.
	9. Pump Suction Passage Leak.	9. Check for excessive foam on dipstick after normal driving. Check for loose pump bolts, defective gasket. Replace pump assembly if needed.
NO REVERSE (D RANGES OK)	1. Gearshift Linkage/Cable Misadjusted/Damaged.	1. Repair or replace linkage parts as needed.
	2. Park Sprag Sticking.	2. Replace overdrive annulus gear.
	3. Rear Band Misadjusted/Worn.	3. Adjust band; replace.
	4. Valve Body Malfunction.	4. Remove and service valve body. Replace valve body if any valves or valve bores are worn or damaged.
	5. Rear Servo Malfunction.	5. Remove and disassemble transmission. Replace worn/ damaged servo parts as necessary.
	6. Direct Clutch in Overdrive Worn	6. Disassemble overdrive. Replace worn or damaged parts.
	7. Front Clutch Burnt.	7. Remove and disassemble transmission. Replace worn, damaged clutch parts as required.
HAS FIRST/REVERSE ONLY (NO 1-2 OR 2-3 UPSHIFT)	1. Governor Circuit Electrical Fault.	1. Test using DRB scan tool and repair as required.
	2. Valve Body Malfunction.	2. Repair stuck 1-2 shift valve or governor plug.
	3. Front Servo/Kickdown Band Damaged/Burned.	3. Repair/replace.

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
MOVES IN 2ND OR 3RD GEAR, ABRUPTLY DOWNSHIFTS TO LOW	1. Valve Body Malfunction.	1. Remove, clean and inspect. Look for stuck 1-2 valve or governor plug.
	2. Governor Valve Sticking.	2. Remove, clean and inspect. Replace faulty parts.
NO LOW GEAR (MOVES IN 2ND OR 3RD GEAR ONLY)	1. Governor Valve Sticking.	1. Remove governor, clean, inspect and repair as required.
	2. Governor Circuit Electrical Fault.	2. Test with DRB scan tool and repair as required.
	3. Valve Body Malfunction.	3. Remove, clean and inspect. Look for sticking 1-2 shift valve, 2-3 shift valve, governor plug or broken springs.
	4. Front Servo Piston Cocked in Bore.	4. Inspect servo and repair as required.
	5. Front Band Linkage Malfunction	5. Inspect linkage and look for bind in linkage.
NO KICKDOWN OR NORMAL DOWNSHIFT	1. Throttle Linkage Misadjusted.	1. Adjust linkage.
	2. Accelerator Pedal Travel Restricted.	2. Verify floor mat is not under pedal, repair worn accelerator cable or bent brackets.
	3. Valve Body Hydraulic Pressures Too High or Too Low Due to Valve Body Malfunction or Incorrect Hydraulic Control Pressure Adjustments.	3. Perform hydraulic pressure tests to determine cause and repair as required. Correct valve body pressure adjustments as required.
	4. Governor Circuit Electrical Fault.	4. Test with DRB scan tool and repair as required.
	5. Valve Body Malfunction.	5. Perform hydraulic pressure tests to determine cause and repair as required. Correct valve body pressure adjustments as required.
	6. TPS Malfunction.	6. Replace sensor, check with DRB scan tool.
	7. PCM Malfunction.	7. Check with DRB scan tool and replace if required.
	8. Valve Body Malfunction.	8. Repair sticking 1-2, 2-3 shift valves, governor plugs, 3-4 solenoid, 3-4 shift valve, 3-4 timing valve.

CONDITION	POSSIBLE CAUSES	CORRECTION
NO 3-4 UPSHIFT	1. Dash O/D Switch In OFF Position.	1. Turn control switch to ON position.
	2. Overdrive Circuit Fuse Blown.	2. Replace fuse. Determine why fuse failed and repair as necessary (i.e., shorts or grounds in circuit).
	3. O/D Switch Wire Shorted/Open Cut.	3. Check wires/connections with 12V test lamp and voltmeter. Repair damaged or loose wire/connection as necessary.
	4. Distance or Coolant Sensor Malfunction.	4. Check with DRB scan tool and repair or replace as necessary.
	5. TPS Malfunction.	5. Check with DRB scan tool and replace if necessary.
	6. Neutral Switch to PCM Wire Shorted/Cut.	6. Test switch as described in service section and replace if necessary. Engine no start.
	7. PCM Malfunction.	7. Check with DRB scan tool and replace if necessary.
	8. Overdrive Solenoid Shorted/ Open.	8. Replace solenoid if shorted or open and repair loose or damaged wires (DRB scan tool).
	9. Solenoid Feed Orifice in Valve Body Blocked.	9. Remove, disassemble, and clean valve body thoroughly. Check feed orifice.
	10. Overdrive Clutch Failed.	10. Disassemble overdrive and repair as needed.
	11. Hydraulic Pressure Low.	11. Pressure test transmission to determine cause.
	12. Valve Body Valve Stuck.	12. Repair stuck 3-4 shift valve, 3-4 timing valve.
	13. O/D Piston Incorrect Spacer.	13. Remove unit, check end play and install correct spacer.
	14. Overdrive Piston Seal Failure.	14. Replace both seals.
	15. O/D Check Valve/Orifice Failed.	15. Check for free movement and secure assembly (in piston retainer). Check ball bleed orifice.

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
SLIPS IN OVERDRIVE FOURTH GEAR	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Overdrive Clutch Pack Worn.	2. Remove overdrive unit and rebuild clutch pack.
	3. Overdrive Piston Retainer Bleed Orifice Blown Out.	3. Disassemble transmission, remove retainer and replace orifice.
	4. Overdrive Piston or Seal Malfunction.	4. Remove overdrive unit. Replace seals if worn. Replace piston if damaged. If piston retainer is damaged, remove and disassemble the transmission.
	5. 3-4 Shift Valve, Timing Valve or Accumulator Malfunction.	5. Remove and overhaul valve body. Replace accumulator seals. Make sure all valves operate freely in bores and do not bind or stick. Make sure valve body screws are correctly tightened and separator plates are properly positioned.
	6. Overdrive Unit Thrust Bearing Failure.	6. Disassemble overdrive unit and replace thrust bearing (NO. 1 thrust bearing is between overdrive piston and clutch hub; NO. 2 thrust bearing is between the planetary gear and the direct clutch spring plate; NO. 3 thrust bearing is between overrunning clutch hub and output shaft).
	7. O/D Check Valve/Bleed Orifice Failure.	7. Check for function/secure orifice insert in O/D piston retainer.
DELAYED 3-4 UPSHIFT (SLOW TO ENGAGE)	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Throttle Valve Cable Misadjusted.	2. Adjust throttle valve cable.
	3. Overdrive Clutch Pack Worn/ Burnt.	3. Remove unit and rebuild clutch pack.
	4. TPS Faulty.	4. Test with DRB scan tool and replace as necessary
	5. Overdrive Clutch Bleed Orifice Plugged.	5. Disassemble transmission and replace orifice.
	6. Overdrive Solenoid or Wiring Shorted/Open.	6. Test solenoid and check wiring for loose/corroded connections or shorts/grounds. Replace solenoid if faulty and repair wiring if necessary.
	7. Overdrive Excess Clearance	7. Remove unit. Measure end play and select proper spacer.
	8. O/D Check Valve Missing or Stuck.	8. Check for presence of check valve. Repair or replace as required.

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
TORQUE CONVERTER LOCKS UP IN SECOND AND/OR THIRD GEAR	Lockup Solenoid, Relay or Wiring Shorted/Open.	Test solenoid, relay and wiring for continuity, shorts or grounds. Replace solenoid and relay if faulty. Repair wiring and connectors as necessary.
HARSH 1-2, 2-3, 3-4 OR 3-2 SHIFTS	Lockup Solenoid Malfunction.	Remove valve body and replace solenoid assembly.
NO START IN PARK OR NEUTRAL	1. Gearshift Linkage/Cable Misadjusted.	1. Adjust linkage/cable.
	2. Neutral Switch Wire Open/Cut.	2. Check continuity with test lamp. Repair as required.
	3. Neutral Switch Faulty.	3. Refer to service section for test and replacement procedure.
	4. Neutral Switch Connect Faulty.	4. Connectors spread open. Repair.
	5. Valve Body Manual Lever Assembly Bent/Worn/Broken.	5. Inspect lever assembly and replace if damaged.
NO REVERSE (OR SLIPS IN REVERSE)	1. Direct Clutch Pack (front clutch) Worn.	1. Disassemble unit and rebuild clutch pack.
	2. Rear Band Misadjusted.	2. Adjust band.
	3. Front Clutch Malfunctioned/ Burned.	3. Air-pressure test clutch operation. Remove and rebuild if necessary.
	4. Overdrive Thrust Bearing Failure.	4. Disassemble geartrain and replace bearings.
	5. Direct Clutch Spring Collapsed/ Broken.	5. Remove and disassemble unit. Check clutch position and replace spring.

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL LEAKS.	1. Fluid Lines and Fittings Loose/Leaks/Damaged.	1. Tighten fittings. If leaks persist, replace fittings and lines if necessary.
	2. Fill Tube (where tube enters case) Leaks/Damaged.	2. Replace tube seal. Inspect tube for cracks in fill tube.
	3. Pressure Port Plug Loose Loose/Damaged.	3. Tighten to correct torque. Replace plug or reseal if leak persists.
	4. Pan Gasket Leaks.	4. Tighten pan screws (150 in. lbs.). If leaks persist, replace gasket.
	5. Valve Body Manual Lever Shaft Seal Leaks/Worn.	5. Replace shaft seal.
	6. Rear Bearing Access Plate Leaks.	6. Replace gasket. Tighten screws.
	7. Gasket Damaged or Bolts are Loose.	7. Replace bolts or gasket or tighten both.
	8. Adapter/Extension Gasket Damaged Leaks/Damaged.	8. Replace gasket.
	9. Neutral Switch Leaks/Damaged.	9. Replace switch and gasket.
	10. Converter Housing Area Leaks.	10. Check for leaks at seal caused by worn seal or burr on converter hub (cutting seal), worn bushing, missing oil return, oil in front pump housing or hole plugged. Check for leaks past O-ring seal on pump or past pump-to-case bolts; pump housing porous, oil coming out vent due to overfill or leak past front band shaft access plug.
	11. Pump Seal Leaks/Worn/ Damaged.	11. Replace seal.
	12. Torque Converter Weld Leak/Cracked Hub.	12. Replace converter.
	13. Case Porosity Leaks.	13. Replace case.
NOISY OPERATION IN FOURTH GEAR ONLY	1. Overdrive Clutch Discs, Plates or Snap Rings Damaged.	1. Remove unit and rebuild clutch pack.
	2. Overdrive Piston or Planetary Thrust Bearing Damaged.	2. Remove and disassemble unit. Replace either thrust bearing if damaged.
	3. Output Shaft Bearings Scored/ Damaged.	3. Remove and disassemble unit. Replace either bearing if damaged.
	4. Planetary Gears Worn/Chipped.	4. Remove and overhaul overdrive unit.
	5. Overdrive Unit Overrunning Clutch Rollers Worn/Scored.	5. Remove and overhaul overdrive unit.

SERVICE PROCEDURES

FLUID LEVEL CHECK

Transmission fluid level should be checked monthly under normal operation. If the vehicle is used for trailer towing or similar heavy load hauling, check fluid level and condition weekly. Fluid level is checked with the engine running at curb idle speed, the transmission in NEUTRAL and the transmission fluid at normal operating temperature.

FLUID LEVEL CHECK PROCEDURE

(1) Transmission fluid must be at normal operating temperature for accurate fluid level check. Drive vehicle if necessary to bring fluid temperature up to normal hot operating temperature of 82°C (180°F).

(2) Position vehicle on level surface.

(3) Start and run engine at curb idle speed.

(4) Apply parking brakes.

(5) Shift transmission momentarily into all gear ranges. Then shift transmission back to Neutral.

(6) Clean top of filler tube and dipstick to keep dirt from entering tube.

(7) Remove dipstick (Fig. 10) and check fluid level as follows:

(a) Correct acceptable level is in crosshatch area.

(b) Correct maximum level is to MAX arrow mark.

(c) Incorrect level is at or below MIN line.

(d) If fluid is low, add only enough Mopar® ATF Plus 3 to restore correct level. Do not overfill.

CAUTION: Do not overfill the transmission. Overfilling may cause leakage out the pump vent which can be mistaken for a pump seal leak. Overfilling will also cause fluid aeration and foaming as the excess fluid is picked up and churned by the gear train. This will significantly reduce fluid life.

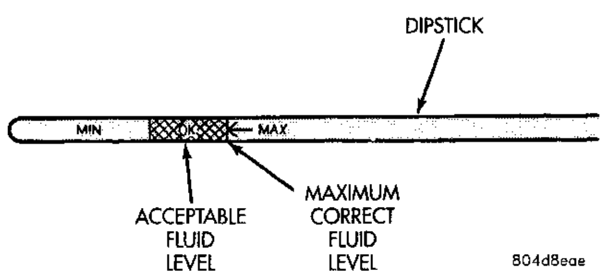

Fig. 10 Dipstick Fluid Level Marks—Typical

FLUID AND FILTER REPLACEMENT

Refer to the Maintenance Schedules in Group 0, Lubrication and Maintenance, for proper service intervals. The service fluid fill after a filter change is approximately 3.8 liters (4.0 quarts).

REMOVAL

(1) Hoist and support vehicle on safety stands.

(2) Place a large diameter shallow drain pan beneath the transmission pan.

(3) Remove bolts holding front and sides of pan to transmission (Fig. 11).

(4) Loosen bolts holding rear of pan to transmission.

(5) Slowly separate front of pan away from transmission allowing the fluid to drain into drain pan.

(6) Hold up pan and remove remaining bolt holding pan to transmission.

(7) While holding pan level, lower pan away from transmission.

(8) Pour remaining fluid in pan into drain pan.

(9) Remove screws holding filter to valve body (Fig. 12).

(10) Separate filter from valve body and pour fluid in filter into drain pan.

(11) Dispose of used trans fluid and filter properly.

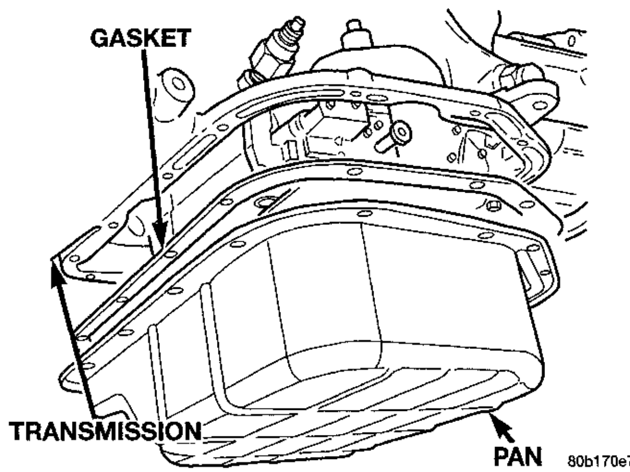

Fig. 11 Transmission Pan—Typical

INSPECTION

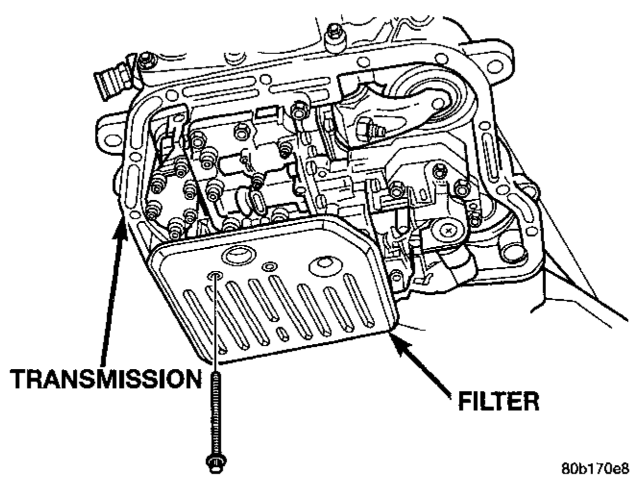

Fig. 12 Transmission Filter—Typical

Inspect bottom of pan and magnet for excessive amounts of metal. A light coating of clutch or band

SERVICE PROCEDURES (Continued)

material on the bottom of the pan does not indicate a problem unless accompanied by slipping condition or shift lag. If fluid and pan are contaminated with excessive amounts or debris, refer to the diagnosis section of this group.

Check the adjustment of the front and rear bands, adjust if necessary.

CLEANING

(1) Using a suitable solvent, clean pan and magnet.

(2) Using a suitable gasket scraper, clean gasket material from gasket surface of transmission case and the gasket flange around the pan.

INSTALLATION

(1) Place replacement filter in position on valve body.

(2) Install screws to hold filter to valve body (Fig. 12). Tighten screws to 4 N·m (35 in. lbs.) torque.

(3) Place new gasket in position on pan and install pan on transmission.

(4) Place pan in position on transmission.

(5) Install screws to hold pan to transmission (Fig. 11). Tighten bolts to 17 N·m (150 in. lbs.) torque.

(6) Lower vehicle and fill transmission with Mopar® ATF Plus 3, type 7176 fluid.

TRANSMISSION FILL PROCEDURE

To avoid overfilling transmission after a fluid change or overhaul, perform the following procedure:

(1) Remove dipstick and insert clean funnel in transmission fill tube.

(2) Add following initial quantity of Mopar® ATF Plus 3 to transmission:

(a) If only fluid and filter were changed, add **3 pints (1-1/2 quarts)** of ATF Plus 3 to transmission.

(b) If transmission was completely overhauled, torque converter was replaced or drained, and cooler was flushed, add **12 pints (6 quarts)** of ATF Plus 3 to transmission.

(3) Apply parking brakes.

(4) Start and run engine at normal curb idle speed.

(5) Apply service brakes, shift transmission through all gear ranges then back to NEUTRAL, set parking brake, and leave engine running at curb idle speed.

(6) Remove funnel, insert dipstick and check fluid level. If level is low, **add fluid to bring level to MIN mark on dipstick.** Check to see if the oil level is equal on both sides of the dipstick. If one side is noticably higher than the other, the dipstick has picked up some oil from the dipstick tube. Allow the oil to drain down the dipstick tube and re-check.

(7) Drive vehicle until transmission fluid is at normal operating temperature.

(8) With the engine running at curb idle speed, the gear selector in NEUTRAL, and the parking brake applied, check the transmission fluid level.

CAUTION: Do not overfill transmission, fluid foaming and shifting problems can result.

(9) Add fluid to bring level up to MAX arrow mark.

When fluid level is correct, shut engine off, release park brake, remove funnel, and install dipstick in fill tube.

CONVERTER DRAINBACK CHECK VALVE SERVICE

The converter drainback check valve is located in the cooler outlet (pressure) line near the radiator lower tank. The valve prevents fluid drainback when the vehicle is parked for lengthy periods. The valve check ball is spring loaded and has an opening pressure of approximately 2 psi.

The valve is serviced as an assembly; it is not repairable. Do not clean the valve if restricted, or contaminated by sludge, or debris. If the valve fails, or if a transmission malfunction occurs that generates sludge and/or clutch particles and metal shavings, the valve must be replaced.

The valve must be removed whenever the cooler and lines are reverse flushed. The valve can be flow tested when necessary. The procedure is exactly the same as for flow testing a cooler.

If the valve is restricted, installed backwards, or in the wrong line, it will cause an overheating condition and possible transmission failure.

CAUTION: The drainback valve is a one-way flow device. It must be properly oriented in terms of flow direction for the cooler to function properly. The valve must be installed in the pressure line. Otherwise flow will be blocked and would cause an overheating condition and eventual transmission failure.

OIL PUMP VOLUME CHECK

After the new or repaired transmission has been installed, fill to the proper level with Mopar® ATF PLUS 3 (Type 7176) automatic transmission fluid. The volume should be checked using the following procedure:

(1) Disconnect the **From cooler** line at the transmission and place a collecting container under the disconnected line.

CAUTION: With the fluid set at the proper level, fluid collection should not exceed (1) quart or internal damage to the transmission may occur.

Mopar AUTHENTIC RESTORATION PRODUCT

SERVICE PROCEDURES (Continued)

(2) Run the engine **at curb idle speed**, with the shift selector in neutral.

(3) If fluid flow is intermittent or it takes more than 20 seconds to collect one quart of ATF PLUS 3, disconnect the **To Cooler** line at the transaxle.

(4) Refill the transaxle to proper level and recheck pump volume.

(5) If flow is found to be within acceptable limits, replace the cooler. Then fill transmission to the proper level, using Mopar® ATF PLUS 3 (Type 7176) automatic transmission fluid.

(6) If fluid flow is still found to be inadequate, check the line pressure using the Transaxle Hydraulic Pressure Test procedure.

FLUSHING COOLERS AND TUBES

When a transmission failure has contaminated the fluid, the oil cooler(s) must be flushed. The cooler bypass valve in the transmission must be replaced also. The torque converter must also be replaced. This will insure that metal particles or sludged oil are not later transferred back into the reconditioned (or replaced) transmission.

The only recommended procedure for flushing coolers and lines is to use Tool 6906 Cooler Flusher.

WARNING: WEAR PROTECTIVE EYEWEAR THAT MEETS THE REQUIREMENTS OF OSHA AND ANSI Z87.1–1968. WEAR STANDARD INDUSTRIAL RUBBER GLOVES.

KEEP LIGHTED CIGARETTES, SPARKS, FLAMES, AND OTHER IGNITION SOURCES AWAY FROM THE AREA TO PREVENT THE IGNITION OF COMBUSTIBLE LIQUIDS AND GASES. KEEP A CLASS (B) FIRE EXTINGUISHER IN THE AREA WHERE THE FLUSHER WILL BE USED.

KEEP THE AREA WELL VENTILATED.

DO NOT LET FLUSHING SOLVENT COME IN CONTACT WITH YOUR EYES OR SKIN: IF EYE CONTAMINATION OCCURS, FLUSH EYES WITH WATER FOR 15 TO 20 SECONDS. REMOVE CONTAMINATED CLOTHING AND WASH AFFECTED SKIN WITH SOAP AND WATER. SEEK MEDICAL ATTENTION.

COOLER FLUSH USING TOOL 6906

(1) Remove cover plate filler plug on Tool 6906. Fill reservoir 1/2 to 3/4 full of fresh flushing solution. Flushing solvents are petroleum based solutions generally used to clean automatic transmission components. **DO NOT** use solvents containing acids, water, gasoline, or any other corrosive liquids.

(2) Reinstall filler plug on Tool 6906.

(3) Verify pump power switch is turned OFF. Connect red alligator clip to positive (+) battery post. Connect black (-) alligator clip to a good ground.

(4) Disconnect the cooler lines at the transmission.

NOTE: When flushing transmission cooler and lines, ALWAYS reverse flush.

(5) Connect the BLUE pressure line to the OUTLET (From) cooler line.

(6) Connect the CLEAR return line to the INLET (To) cooler line

(7) Turn pump ON for two to three minutes to flush cooler(s) and lines. Monitor pressure readings and clear return lines. Pressure readings should stabilize below 20 psi. for vehicles equipped with a single cooler and 30 psi. for vehicles equipped with dual coolers. If flow is intermittent or exceeds these pressures, replace cooler.

(8) Turn pump OFF.

(9) Disconnect CLEAR suction line from reservoir at cover plate. Disconnect CLEAR return line at cover plate, and place it in a drain pan.

(10) Turn pump ON for 30 seconds to purge flushing solution from cooler and lines. Turn pump OFF.

(11) Place CLEAR suction line into a one quart container of Mopar® ATF Plus 3, type 7176 automatic transmission fluid.

(12) Turn pump ON until all transmission fluid is removed from the one quart container and lines. This purges any residual cleaning solvent from the transmission cooler and lines. Turn pump OFF.

(13) Disconnect alligator clips from battery. Reconnect flusher lines to cover plate, and remove flushing adapters from cooler lines.

ALUMINUM THREAD REPAIR

Damaged or worn threads in the aluminum transaxle case and valve body can be repaired by the use of Heli-Coils, or equivalent. This repair consists of drilling out the worn-out damaged threads. Then tap the hole with a special Heli-Coil tap, or equivalent, and installing a Heli-Coil insert, or equivalent, into the hole. This brings the hole back to its original thread size.

Heli-Coil, or equivalent, tools and inserts are readily available from most automotive parts suppliers.

REMOVAL AND INSTALLATION

TRANSMISSION

The overdrive unit can be removed and serviced separately. It is not necessary to remove the entire transmission assembly to perform overdrive unit repairs.

If only the overdrive unit requires service, refer to the overdrive unit removal and installation procedures.

REMOVAL AND INSTALLATION (Continued)

CAUTION: The transmission and torque converter must be removed as an assembly to avoid component damage. The converter drive plate, pump bushing, or oil seal can be damaged if the converter is left attached to the driveplate during removal. Be sure to remove the transmission and converter as an assembly.

REMOVAL

(1) Disconnect battery negative cable.

(2) Disconnect and lower or remove necessary exhaust components.

(3) Remove engine-to-transmission struts, if equipped (Fig. 13).

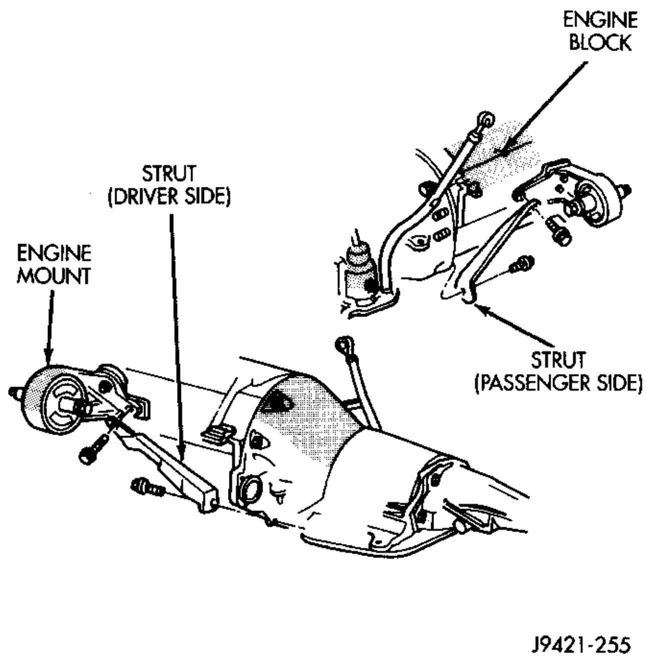

Fig. 13 Transmission-To-Engine Strut Attachment

(4) Disconnect fluid cooler lines at transmission.

(5) Remove starter motor.

(6) Disconnect and remove the crankshaft position sensor. Retain the sensor attaching bolts.

(7) Remove torque converter access cover.

(8) If transmission is being removed for overhaul, remove transmission oil pan, drain fluid and reinstall pan.

(9) Remove fill tube bracket bolts and pull tube out of transmission. Retain fill tube seal (Fig. 13). On 4 x 4 models, it will also be necessary to remove bolt attaching transfer case vent tube to converter housing (Fig. 14).

(10) Mark torque converter and drive plate for assembly alignment. Note that bolt holes in crankshaft flange, drive plate and torque converter all have one offset hole.

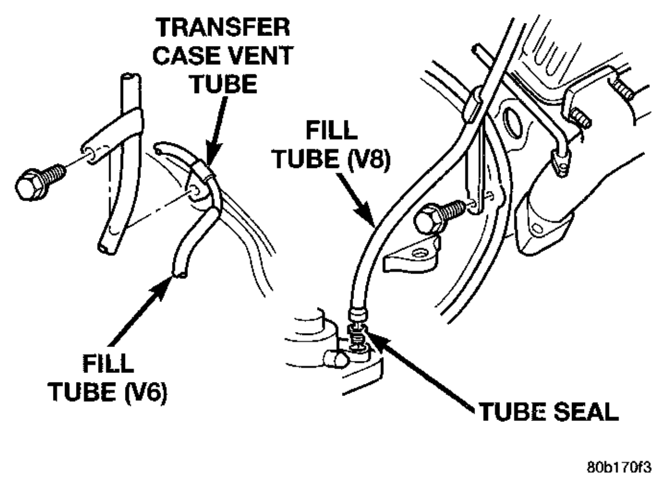

Fig. 14 Fill Tube Attachment

(11) Rotate crankshaft in clockwise direction until converter bolts are accessible. Then remove bolts one at a time. Rotate crankshaft with socket wrench on dampener bolt.

(12) Mark propeller shaft and axle yokes for assembly alignment. Then disconnect and remove propeller shaft. On 4 x 4 models, remove both propeller shafts.

(13) Disconnect wires from park/neutral position switch and transmission solenoid.

(14) Disconnect gearshift rod and torque shaft assembly from transmission.

(15) Disconnect throttle valve cable from transmission bracket and throttle valve lever.

(16) On 4 x 4 models, disconnect shift rod from transfer case shift lever.

(17) Support rear of engine with safety stand or jack.

(18) Raise transmission slightly with service jack to relieve load on crossmember and supports.

(19) Remove bolts securing rear support and cushion to transmission and crossmember. Raise transmission slightly, slide exhaust hanger arm from bracket (Fig. 15) and remove rear support.

(20) Remove bolts attaching crossmember to frame and remove crossmember.

(21) On 4 x 4 models, remove transfer case with transmission jack or aid of helper.

(22) Remove all converter housing bolts.

(23) Carefully work transmission and torque converter assembly rearward off engine block dowels.

(24) Lower transmission and remove assembly from under the vehicle.

(25) To remove torque converter, remove C-clamp from edge of bell housing and carefully slide torque converter out of the transmission.

REMOVAL AND INSTALLATION (Continued)

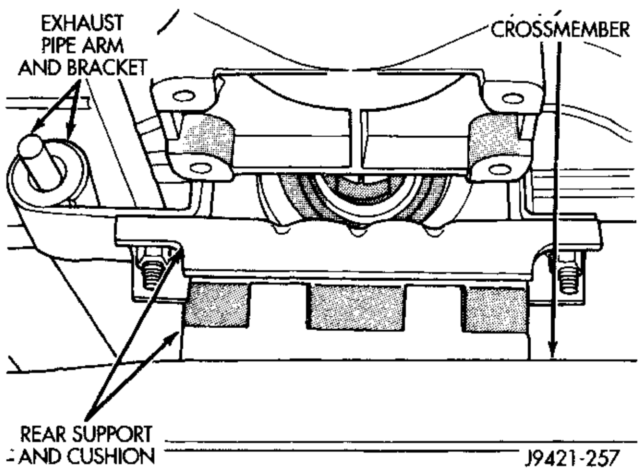

Fig. 15 Rear Support Cushion

INSTALLATION

(1) Check torque converter hub and hub drive notches for sharp edges burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper and crocus cloth if necessary. The hub must be smooth to avoid damaging pump seal at installation.

(2) Lubricate converter drive hub and oil pump seal lip with transmission fluid.

(3) Lubricate converter pilot hub with transmission fluid.

(4) Align and install converter in oil pump.

(5) Carefully insert converter in oil pump. Then rotate converter back and forth until fully seated in pump gears.

(6) Check converter seating with steel scale and straightedge (Fig. 16). Surface of converter lugs should be 1/2 in. to rear of straightedge when converter is fully seated.

(7) Temporarily secure converter with C-clamp.

(8) Position transmission on jack and secure it with chains.

(9) Check condition of converter driveplate. Replace the plate if cracked, distorted or damaged. **Also be sure transmission dowel pins are seated in engine block and protrude far enough to hold transmission in alignment.**

(10) Raise transmission and align converter with drive plate and converter housing with engine block.

(11) Move transmission forward. Then raise, lower or tilt transmission to align converter housing with engine block dowels.

(12) Rotate converter so alignment marks scribed on converter are aligned with mark on driveplate.

(13) Carefully work transmission forward and over engine block dowels until converter hub is seated in crankshaft.

(14) Install bolts attaching converter housing to engine.

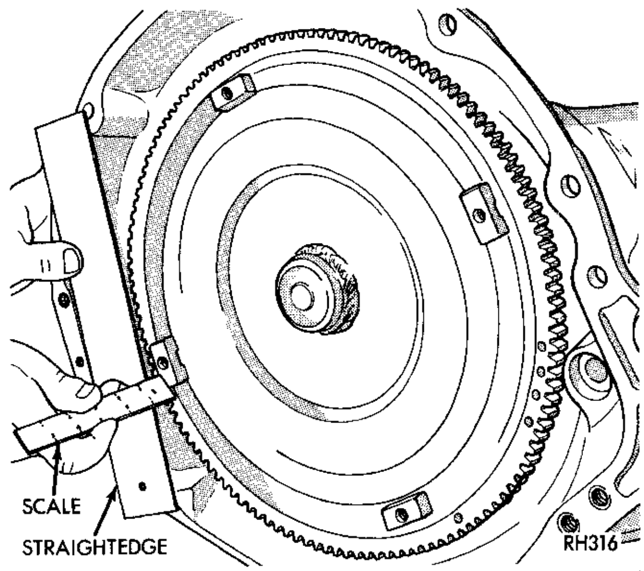

Fig. 16 Typical Method Of Checking Converter Seating

(15) Install rear support. Then lower transmission onto crossmember and install bolts attaching transmission mount to crossmember.

(16) Remove engine support fixture.

(17) Install crankshaft position sensor.

(18) Install new plastic retainer grommet on any shift linkage rod or lever that was disconnected. Grommets should not be reused. Use pry tool to remove rod from grommet and cut away old grommet. Use pliers to snap new grommet into lever and to snap rod into grommet at assembly.

(19) Connect gearshift and throttle cable to transmission.

(20) Connect wires to park/neutral position switch, transmission solenoid(s) and oxygen sensor. Be sure transmission harnesses are properly routed.

CAUTION: It is essential that correct length bolts be used to attach the converter to the driveplate. Bolts that are too long will damage the clutch surface inside the converter.

(21) Install torque converter-to-driveplate bolts. On models with 10.75 in. converter, tighten bolts to 31 N·m (270 in. lbs.). On models with 12.2 in. converter, tighten bolts to 47 N·m (35 ft. lbs.).

(22) Install converter housing access cover.

(23) Install starter motor and cooler line bracket.

(24) Connect cooler lines to transmission.

(25) Install transmission fill tube. Install new seal on tube before installation.

(26) Install exhaust components.

(27) Align and connect propeller shaft.

(28) Adjust gearshift linkage and throttle valve cable if necessary.

REMOVAL AND INSTALLATION (Continued)

(29) Lower vehicle.

(30) Fill transmission with Mopar® ATF Plus 3, Type 7176 fluid.

TORQUE CONVERTER

REMOVAL

(1) Remove transmission and torque converter from vehicle.

(2) Place a suitable drain pan under the converter housing end of the transmission.

CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition.

The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.

(3) Pull the torque converter forward until the center hub clears the oil pump seal.

(4) Separate the torque converter from the transmission.

INSTALLATION

Check converter hub and drive notches for sharp edges, burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper or crocus cloth if necessary. The hub must be smooth to avoid damaging the pump seal at installation.

(1) Lubricate converter hub and oil pump seal lip with transmission fluid.

(2) Place torque converter in position on transmission.

CAUTION: Do not damage oil pump seal or bushing while inserting torque converter into the front of the transmission.

(3) Align torque converter to oil pump seal opening.

(4) Insert torque converter hub into oil pump.

(5) While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.

(6) Check converter seating with a scale and straightedge (Fig. 17). Surface of converter lugs should be 1/2 in. to rear of straightedge when converter is fully seated.

(7) If necessary, temporarily secure converter with C-clamp attached to the converter housing.

(8) Install the transmission in the vehicle.

(9) Fill the transmission with the recommended fluid.

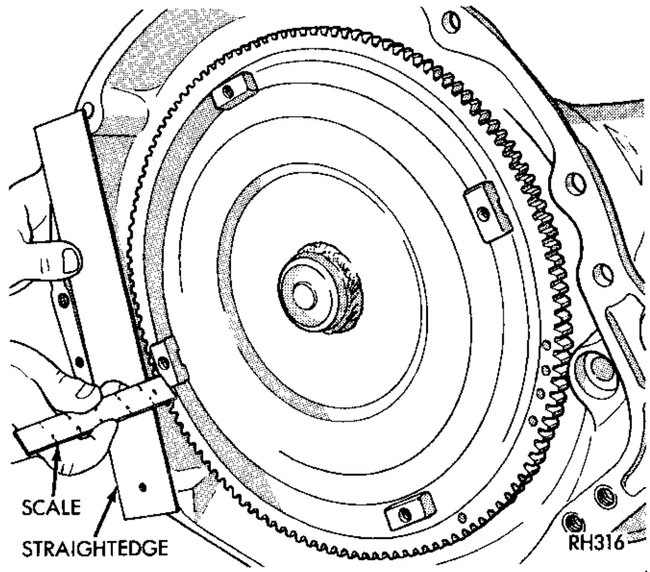

Fig. 17 Checking Torque Converter Seating

YOKE SEAL REPLACEMENT

REMOVAL

(1) Raise vehicle.

(2) Mark propeller shaft and axle yoke for alignment reference.

(3) Disconnect and remove propeller shaft.

(4) Remove old seal with Seal Remover C-3985-B (Fig. 18) from overdrive housing.

INSTALLATION

(1) Place seal in position on overdrive housing.

(2) Drive seal into overdrive housing with Seal Installer C-3995-A (Fig. 19).

(3) Carefully guide propeller shaft slip yoke into housing and onto output shaft splines. Align marks made at removal and connect propeller shaft to rear axle pinion yoke.

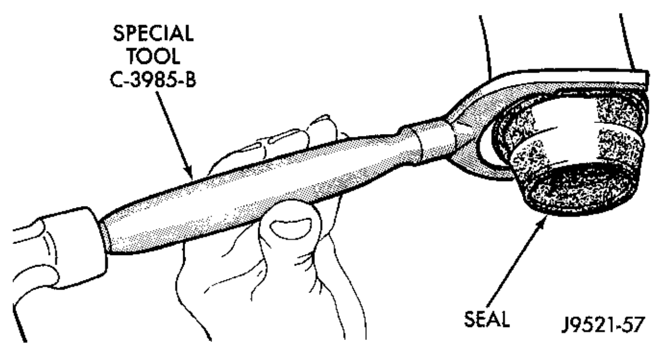

Fig. 18 Removing Overdrive Housing Yoke Seal

PARK/NEUTRAL POSITION SWITCH

REMOVAL

(1) Raise vehicle and position drain pan under switch.

AUTHENTIC RESTORATION PRODUCT Mopar

REMOVAL AND INSTALLATION (Continued)

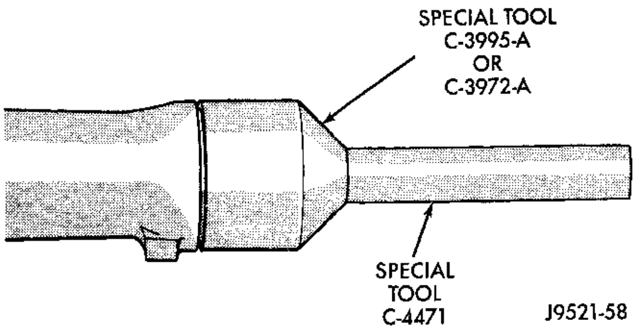

Fig. 19 Installing Overdrive Housing Yoke Seal

(2) Disconnect switch wires.

(3) Remove switch from case.

INSTALLATION

(1) Move shift lever to Park and Neutral positions. Verify that switch operating lever fingers are centered in switch opening in case (Fig. 20).

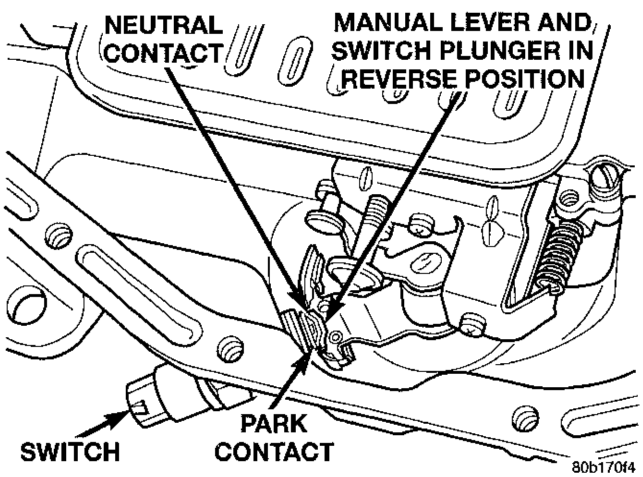

Fig. 20 Park/Neutral Position Switch

(2) Install new seal on switch and install switch in case. Tighten switch to 34 N·m (25 ft. lbs.) torque.

(3) Test continuity of new switch with 12V test lamp.

(4) Connect switch wires and lower vehicle.

(5) Top off transmission fluid level.

GOVERNOR SOLENOID AND PRESSURE SENSOR

REMOVAL

(1) Hoist and support vehicle on safety stands.

(2) Remove transmission fluid pan and filter.

(3) Disengage wire connectors from pressure sensor and solenoid (Fig. 21).

(4) Remove screws holding pressure solenoid retainer to governor body.

(5) Separate solenoid retainer from governor (Fig. 22).

(6) Pull solenoid from governor body (Fig. 23).

(7) Remove bolts holding governor body to valve body.

(8) Separate governor body from valve body (Fig. 24).

(9) Remove governor body gasket.

(10) Remove retainer holding pressure sensor to governor body.

(11) Pull pressure sensor from governor body (Fig. 25).

INSTALLATION

Before installing the pressure sensor and solenoid in the governor body, replace O-ring seals, clean the gasket surfaces and replace gasket.

(1) Lubricate O-ring on pressure sensor with transmission fluid.

(2) Align pressure sensor to bore in governor body (Fig. 25).

(3) Push pressure sensor into governor body.

(4) Install retainer to hold pressure sensor to governor body.

(5) Place gasket in position on back of governor body (Fig. 24).

(6) Place governor body in position on valve body.

(7) Install bolts to hold governor body to valve body.

(8) Lubricate O-ring, on pressure solenoid, with transmission fluid.

(9) Align pressure solenoid to bore in governor body (Fig. 23).

(10) Push solenoid into governor body.

(11) Place solenoid retainer in position on governor (Fig. 22).

(12) Install screws to hold pressure solenoid retainer to governor body.

(13) Engage wire connectors into pressure sensor and solenoid (Fig. 21).

(14) Install transmission fluid pan and (new) filter.

(15) Lower vehicle and road test to verify repair.

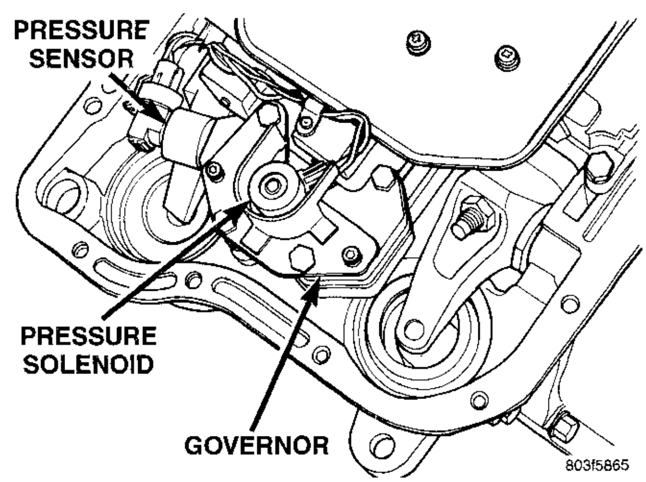

Fig. 21 Governor Solenoid And Pressure Sensor

REMOVAL AND INSTALLATION (Continued)

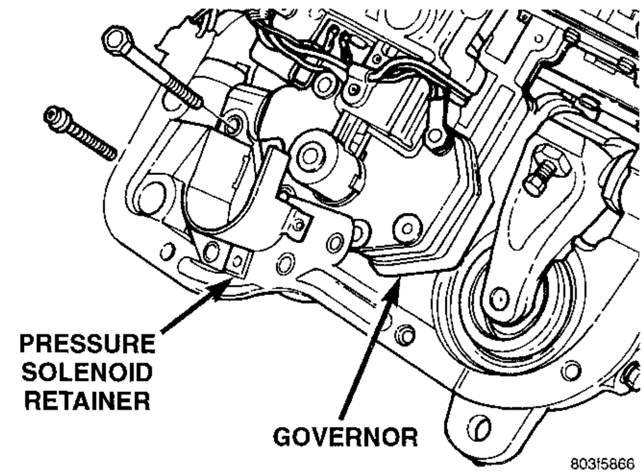

Fig. 22 Pressure Solenoid Retainer

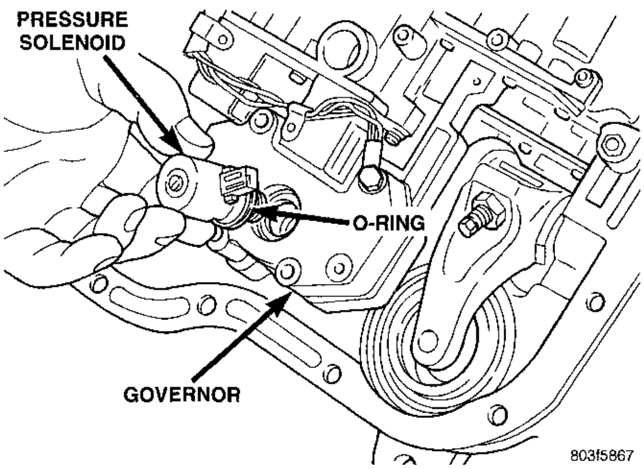

Fig. 23 Pressure Solenoid and O-ring

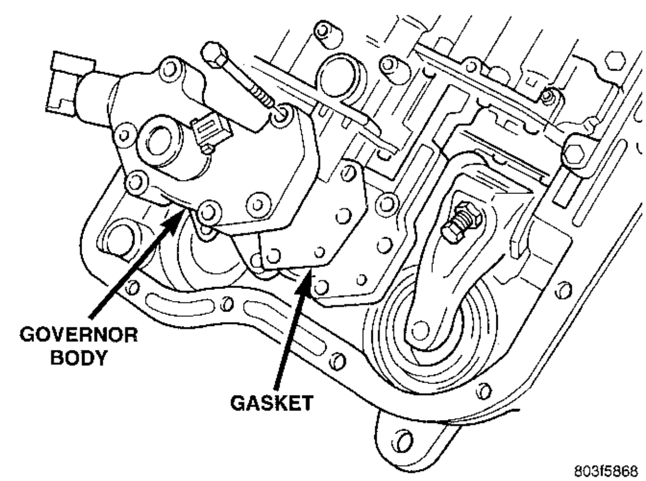

Fig. 24 Governor Body and Gasket

VALVE BODY

The valve body can be removed for service without having to remove the transmission assembly.

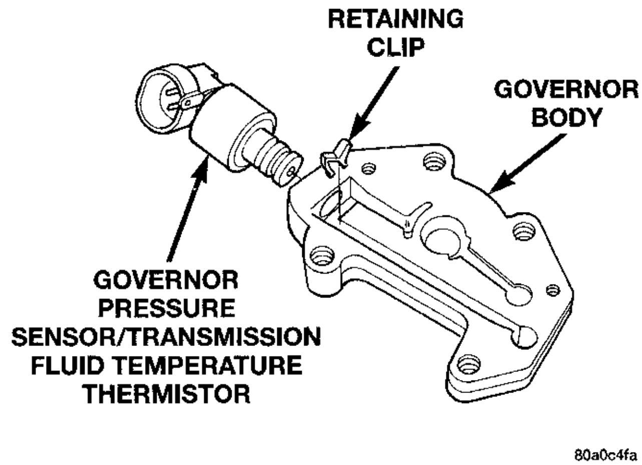

Fig. 25 Pressure Sensor and Retainer

The valve body can be disassembled for cleaning and inspection of the individual components. Refer to Disassembly and Assembly section for proper procedures.

The only replaceable valve body components are:

- Manual lever.
- Manual lever washer, seal, E-clip, and shaft seal.
- Manual lever detent ball.
- Throttle lever.
- Fluid filter.
- Pressure adjusting screw bracket.
- Governor pressure solenoid.
- Governor pressure sensor.
- Converter clutch/overdrive solenoid assembly and harness (includes sump temperature thermistor).
- Governor housing gasket.
- Solenoid case connector O-rings.

The remaining valve body components are serviced only as part of a complete valve body assembly.

REMOVAL

(1) Shift transmission into NEUTRAL.

(2) Raise vehicle.

(3) Remove gearshift and throttle levers from shaft of valve body manual lever.

(4) Disconnect wires at solenoid case connector (Fig. 26).

(5) Position drain pan under transmission oil pan.

(6) Remove transmission oil pan and gasket.

(7) Remove fluid filter from valve body.

(8) Remove bolts attaching valve body to transmission case.

(9) Lower valve body enough to remove accumulator piston and springs.

(10) Work manual lever shaft and electrical connector out of transmission case.

REMOVAL AND INSTALLATION (Continued)

(11) Lower valve body, rotate valve body away from case, pull park rod out of sprag, and remove valve body (Fig. 27).

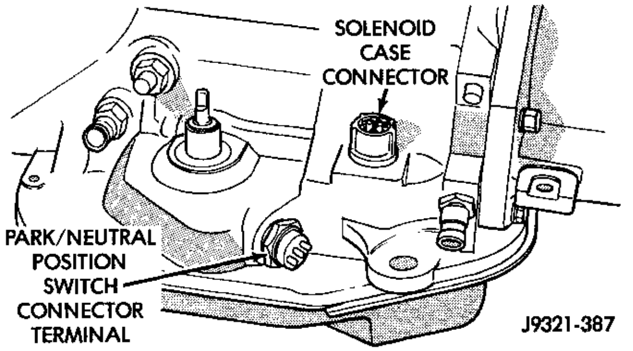

Fig. 26 Transmission Case Connector

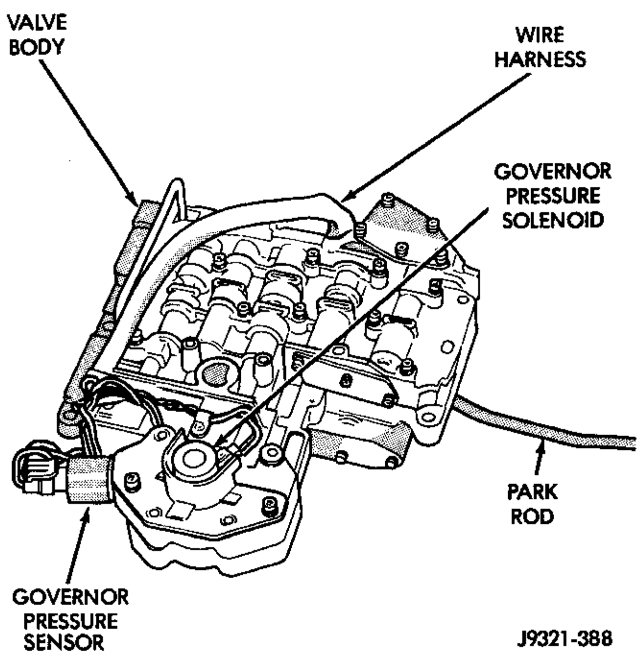

Fig. 27 Valve Body

INSTALLATION

(1) Check condition of O-ring seals on valve body harness connector (Fig. 28). Replace seals on connector body if cut or worn.

(2) Check condition of manual lever shaft seal in transmission case. Replace seal if lip is cut or worn. Install new seal with 15/16 deep well socket (Fig. 29).

(3) Check condition of seals on accumulator piston (Fig. 30). Install new piston seals, if necessary.

(4) Place valve body manual lever in low (1 position) so ball on park lock rod will be easier to install in sprag.

(5) Lubricate shaft of manual lever with petroleum jelly. This will ease inserting shaft through seal in case.

(6) Lubricate seal rings on valve body harness connector with petroleum jelly.

(7) Position valve body in case and work end of park lock rod into and through pawl sprag. Turn propeller shaft to align sprag and park lock teeth if necessary. The rod will click as it enters pawl. Move rod to check engagement.

CAUTION: It is possible for the park rod to displace into a cavity just above the pawl sprag during installation. Make sure the rod is actually engaged in the pawl and has not displaced into this cavity.

(8) Install accumulator springs and piston into case. Then swing valve body over piston and outer spring to hold it in place.

(9) Align accumulator piston and outer spring, manual lever shaft and electrical connector in case.

(10) Then seat valve body in case and install one or two bolts to hold valve body in place.

(11) Tighten valve body bolts alternately and evenly to 11 N·m (100 in. lbs.) torque.

(12) Install new fluid filter on valve body. Tighten filter screws to 4 N·m (35 in. lbs.) torque.

(13) Install throttle and gearshift levers on valve body manual lever shaft.

(14) Check and adjust front and rear bands if necessary.

(15) Connect solenoid case connector wires.

(16) Install oil pan and new gasket. Tighten pan bolts to 17 N·m (13 ft. lbs.) torque.

(17) Lower vehicle and fill transmission with Mopar® ATF Plus 3, type 7176 fluid.

(18) Check and adjust gearshift and throttle valve cables, if necessary.

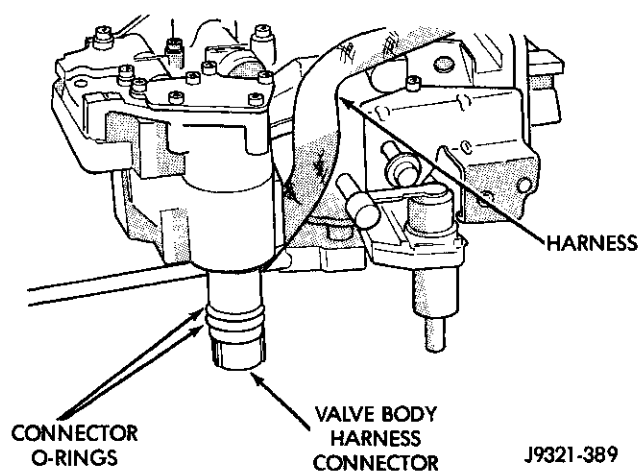

Fig. 28 Valve Body Harness Connector O-Ring Seal

REMOVAL AND INSTALLATION (Continued)

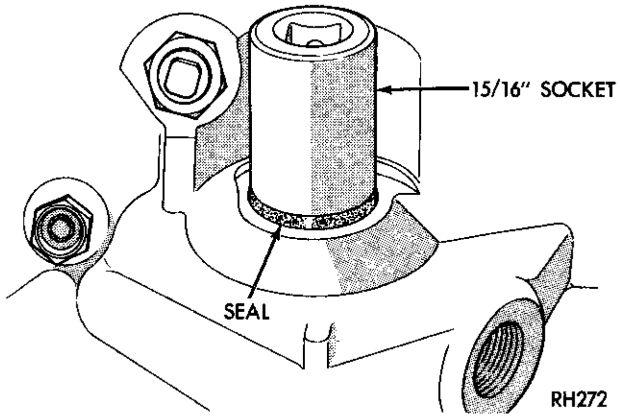

Fig. 29 Manual Lever Shaft Seal

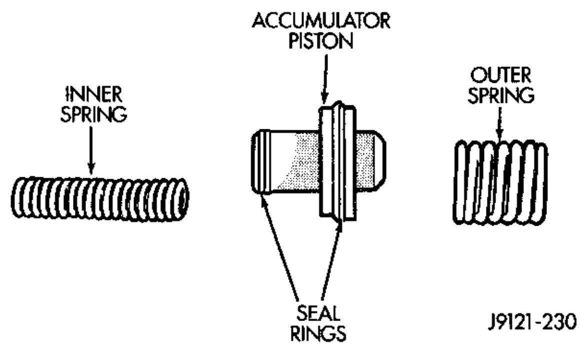

Fig. 30 Accumulator Piston Components

OVERDRIVE UNIT

REMOVAL

(1) Shift transmission into Park.

(2) Raise vehicle.

(3) Mark propeller shaft universal joint(s) and axle pinion yoke for alignment reference at installation.

(4) Disconnect and remove propeller shaft(s).

(5) Remove transmission oil pan, remove gasket, drain oil and reinstall pan.

(6) If overdrive unit had malfunctioned, or if fluid is contaminated, remove entire transmission. If diagnosis indicated overdrive problems only, remove just the overdrive unit.

(7) Support transmission with transmission jack.

(8) Remove bolts attaching overdrive unit to transmission (Fig. 31).

CAUTION: Support the overdrive unit with a jack before moving it rearward. This is necessary to prevent damaging the intermediate shaft. Do not allow the shaft to support the entire weight of the overdrive unit.

(9) Carefully work overdrive unit off intermediate shaft. Do not tilt unit during removal. Keep it as level as possible.

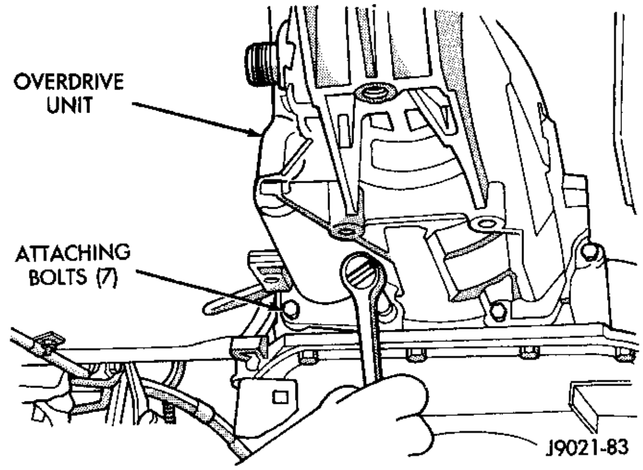

Fig. 31 Overdrive Unit Bolts

(10) If overdrive unit does not require service, immediately insert Alignment Tool 6227-2 in splines of planetary gear and overrunning clutch to prevent splines from rotating out of alignment. If misalignment occurs, overdrive unit will have to be disassembled in order to realign splines.

(11) Remove and retain overdrive piston thrust bearing. Bearing may remain on piston or in clutch hub during removal.

(12) Position drain pan on workbench.

(13) Place overdrive unit over drain pan. Tilt unit to drain residual fluid from case.

(14) Examine fluid for clutch material or metal fragments. If fluid contains these items, overhaul will be necessary.

(15) If overdrive unit does not require any service, leave alignment tool in position. Tool will prevent accidental misalignment of planetary gear and overrunning clutch splines.

INSTALLATION

(1) Be sure overdrive unit Alignment Tool 6227-2 is fully seated before moving unit. If tool is not seated and gear splines rotate out of alignment, overdrive unit will have to be disassembled in order to realign splines.

(2) If overdrive piston retainer was not removed during service and original case gasket is no longer reusable, prepare new gasket by trimming it.

(3) Cut out old case gasket around piston retainer with razor knife (Fig. 32).

(4) Use old gasket as template and trim new gasket to fit.

(5) Position new gasket over piston retainer and on transmission case. Use petroleum jelly to hold gasket in place if necessary. Do not use any type of sealer to secure gasket. Use petroleum jelly only.

REMOVAL AND INSTALLATION (Continued)

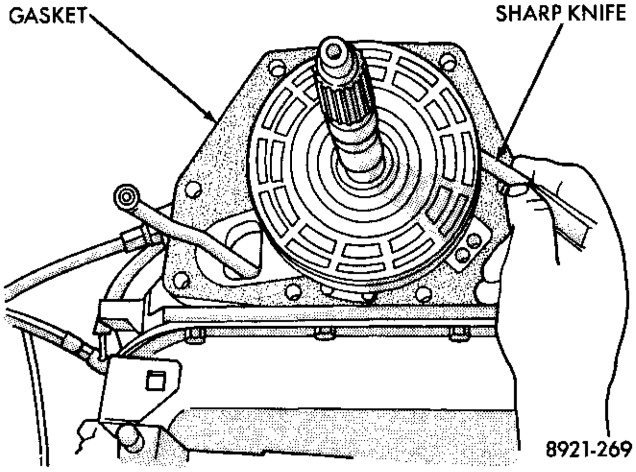

Fig. 32 Trimming Overdrive Case Gasket

(6) Install selective spacer on intermediate shaft, if removed. Spacer goes in groove just rearward of shaft rear splines (Fig. 33).

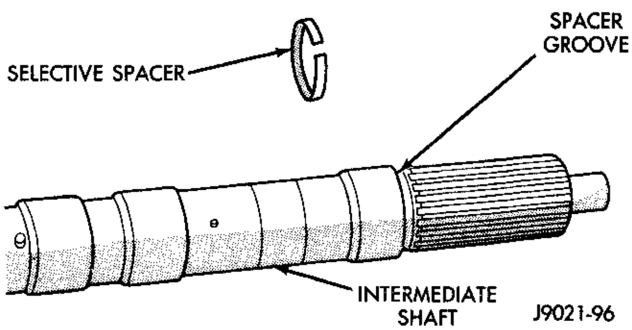

Fig. 33 Intermediate Shaft Selective Spacer Location

(7) Install thrust bearing in overdrive unit sliding hub. Use petroleum jelly to hold bearing in position.

CAUTION: Be sure the shoulder on the inside diameter of the bearing is facing forward.

(8) Verify that splines in overdrive planetary gear and overrunning clutch hub are aligned with Alignment Tool 6227-2. Overdrive unit cannot be installed if splines are not aligned. If splines have rotated out of alignment, unit will have to be disassembled to realign splines.

(9) Carefully slide Alignment Tool 6227-2 out of overdrive planetary gear and overrunning clutch splines.

(10) Raise overdrive unit and carefully slide it straight onto intermediate shaft. Insert park rod into park lock reaction plug at same time. Avoid tilting overdrive during installation as this could cause planetary gear and overrunning clutch splines to rotate out of alignment. If this occurs, it will be necessary to remove and disassemble overdrive unit to realign splines.

(11) Work overdrive unit forward on intermediate shaft until seated against transmission case.

(12) Install bolts attaching overdrive unit to transmission unit. Tighten bolts in diagonal pattern to 34 N·m (25 ft-lbs).

(13) Align and install propeller shaft(s).

OVERDRIVE HOUSING BUSHING

REMOVAL

(1) Remove overdrive housing yoke seal.

(2) Insert Remover 6957 into overdrive housing. Tighten tool to bushing and remove bushing (Fig. 34).

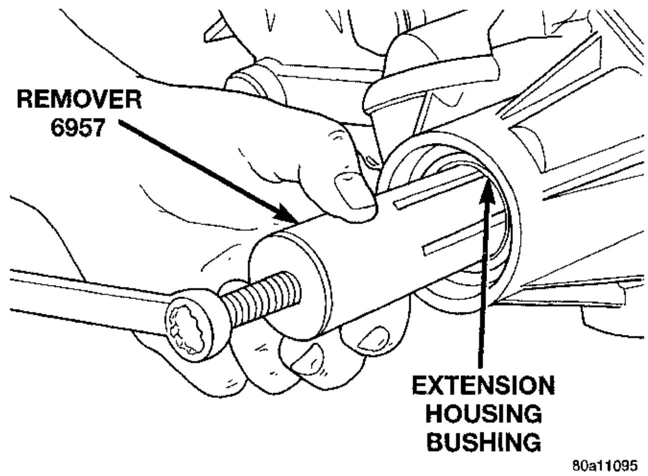

Fig. 34 Bushing Removal—Typical

INSTALLATION

(1) Align bushing oil hole with oil slot in overdrive housing.

(2) Tap bushing into place with Installer 6951 and Handle C-4171.

(3) Install new oil seal in housing using Seal Installer C-3995-A (Fig. 35).

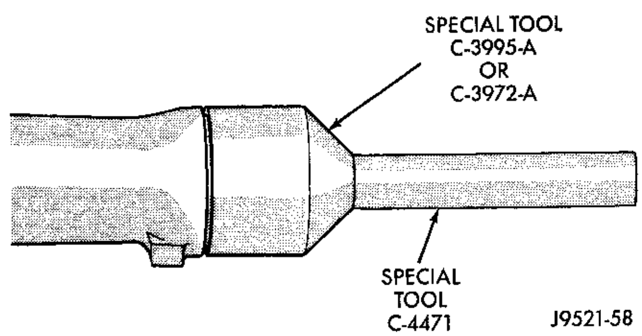

Fig. 35 Overdrive Housing Seal Installation

OUTPUT SHAFT REAR BEARING

REMOVAL

(1) Remove overdrive unit from the vehicle.

(2) Remove overdrive geartrain from housing.

REMOVAL AND INSTALLATION (Continued)

(3) Remove snap ring holding output shaft rear bearing into overdrive housing (Fig. 36).

(4) Using a suitable driver inserted through the rear end of housing, drive bearing from housing.

INSTALLATION

(1) Place replacement bearing in position in housing.

(2) Using a suitable driver, drive bearing into housing until the snap ring groove is visible.

(3) Install snap ring to hold bearing into housing (Fig. 36).

(4) Install overdrive geartrain into housing.

(5) Install overdrive unit in vehicle.

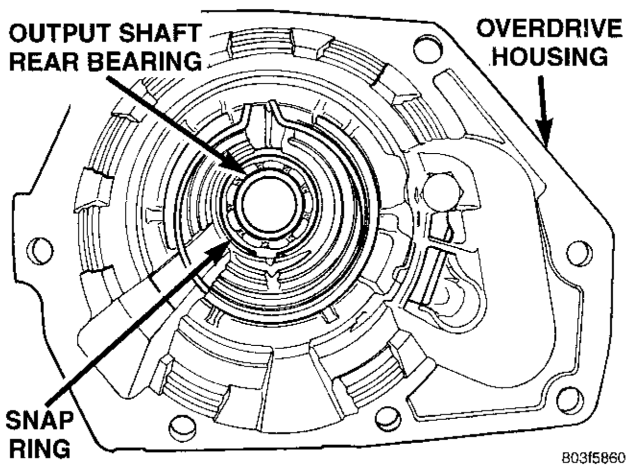

Fig. 36 Output Shaft Rear Bearing

OUTPUT SHAFT FRONT BEARING

REMOVAL

(1) Remove overdrive unit from the vehicle.

(2) Remove overdrive geartrain from housing.

(3) Remove snap ring holding output shaft front bearing to overdrive geartrain. (Fig. 37).

(4) Pull bearing from output shaft.

INSTALLATION

(1) Place replacement bearing in position on geartrain with locating retainer groove toward the rear.

(2) Push bearing onto shaft until the snap ring groove is visible.

(3) Install snap ring to hold bearing onto output shaft (Fig. 37).

(4) Install overdrive geartrain into housing.

(5) Install overdrive unit in vehicle.

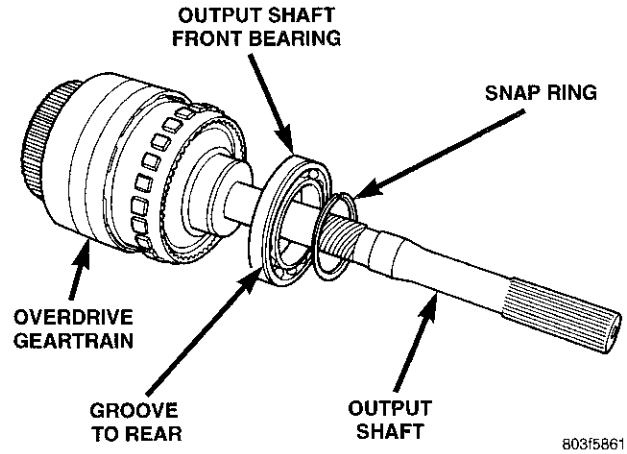

Fig. 37 Output Shaft Front Bearing

DISASSEMBLY AND ASSEMBLY

VALVE BODY

Remove the valve body from the transmission, refer to Removal and Installation procedures section in this group.

DISASSEMBLY

CAUTION: Do not clamp any valve body component in a vise. This practice can damage the component resulting in unsatisfactory operation after assembly and installation. Do not use pliers to remove any of the valves, plugs or springs and do not force any of the components out or into place. The valves and valve body housings will be damaged if force is used. Tag or mark the valve body springs for reference as they are removed. Do not allow them to become intermixed.

(1) Remove fluid filter.

(2) Disconnect wires from governor pressure sensor and solenoid.

(3) Remove screws attaching governor body and retainer plate to transfer plate.

(4) Remove retainer plate, governor body and gasket from transfer plate.

(5) Disconnect wires from governor pressure sensor, if not done previously.

(6) Remove governor pressure sensor from governor body. Sensor is retained in body with M-shaped spring clip. Remove clip with small pointed tool and slide sensor out of body.

(7) Remove governor pressure solenoid by pulling it straight out of bore in governor body. Remove and discard solenoid O-rings if worn, cut, or torn.

(8) Remove small shoulder bolt that secures solenoid harness case connector to 3-4 accumulator housing (Fig. 38). **Retain shoulder bolt. Either tape it**

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

to harness or thread it back into accumulator housing after connector removal.

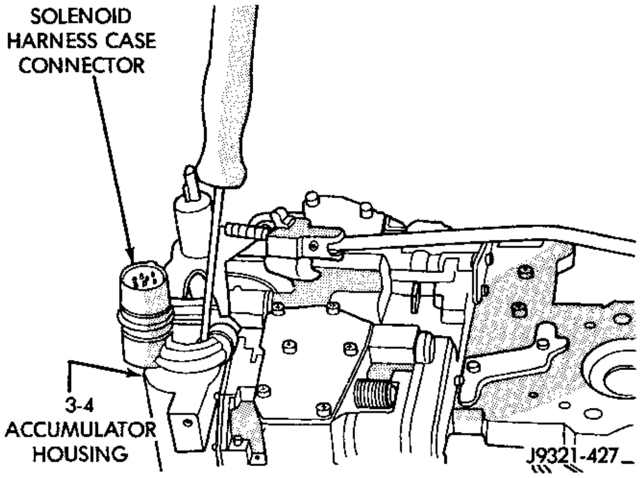

Fig. 38 Solenoid Harness Case Connector Shoulder Bolt

(9) Unhook overdrive/converter solenoid harness from 3-4 accumulator cover plate (Fig. 39).

(10) Turn valve body over and remove screws that attach overdrive/converter solenoid assembly to valve body (Fig. 40).

(11) Remove solenoid and harness assembly from valve body (Fig. 41).

(12) Remove boost valve cover (Fig. 42).

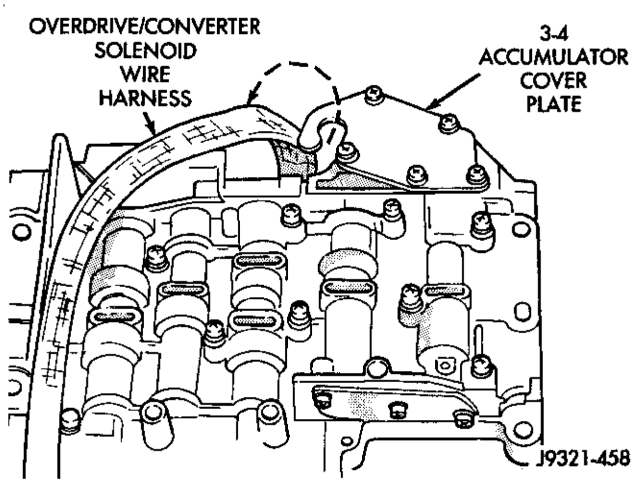

Fig. 39 Unhooking Solenoid Harness From Accumulator Cover Plate

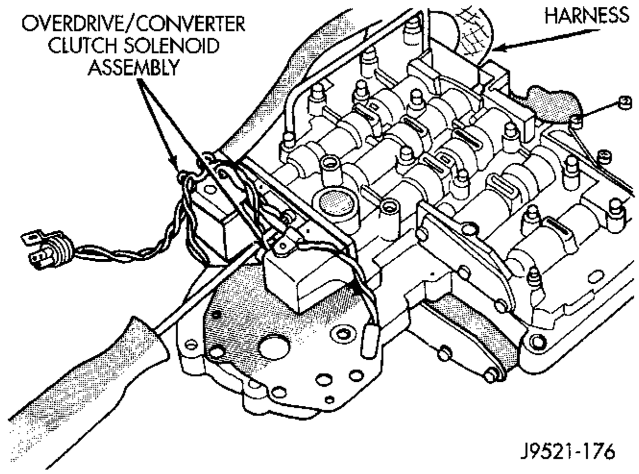

Fig. 40 Solenoid Assembly Screws

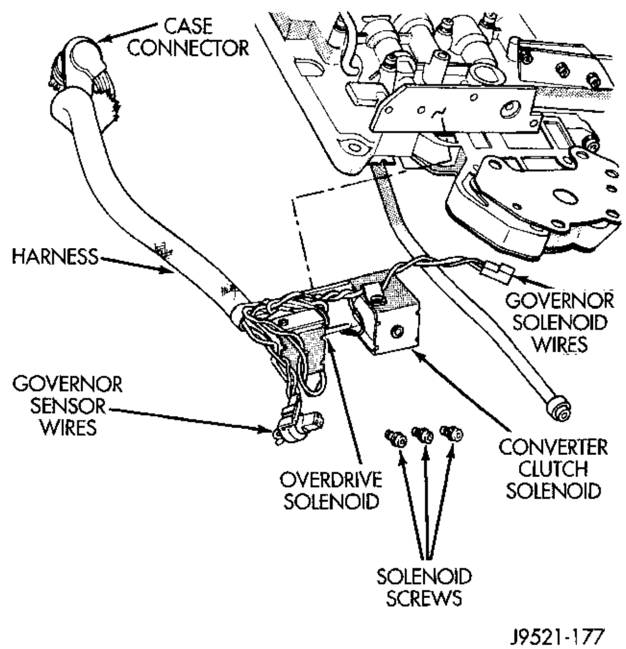

Fig. 41 Solenoid Assembly

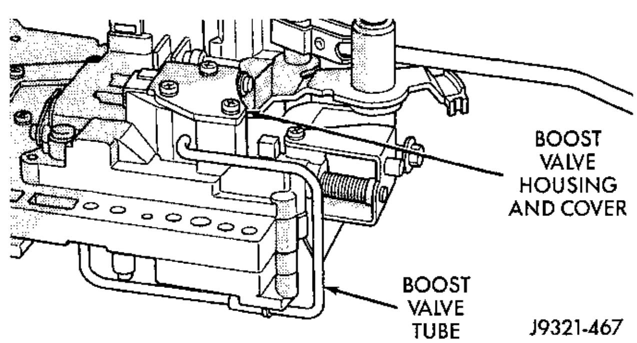

Fig. 42 Boost Valve Cover Location

DISASSEMBLY AND ASSEMBLY (Continued)

(13) Remove boost valve retainer, valve spring and boost valve (Fig. 43).

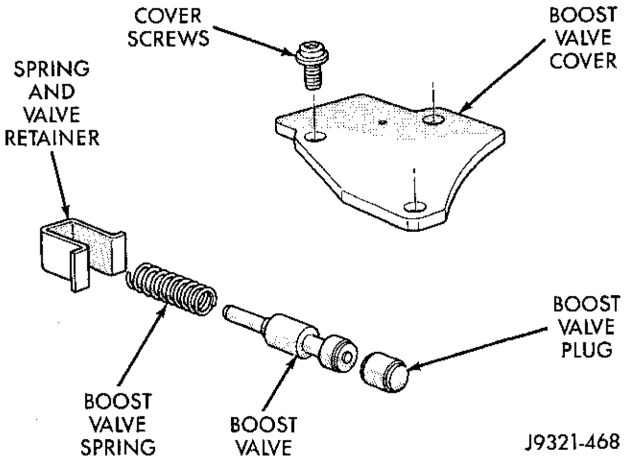

Fig. 43 Boost Valve Components

(14) Secure detent ball and spring with Retainer Tool 6583 (Fig. 44).

(15) Remove park rod E-clip and separate rod from manual lever (Fig. 45).

(16) Remove E-clip and washer that retains throttle lever shaft in manual lever (Fig. 46).

(17) Remove manual lever and throttle lever (Fig. 47). Rotate and lift manual lever off valve body and throttle lever shaft. Then slide throttle lever out of valve body.

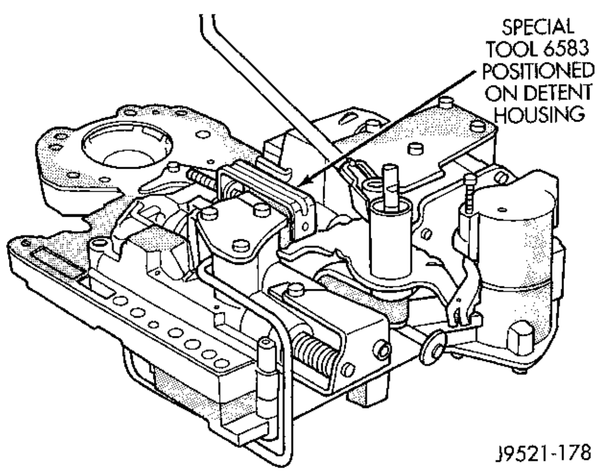

Fig. 44 Detent Ball And Spring

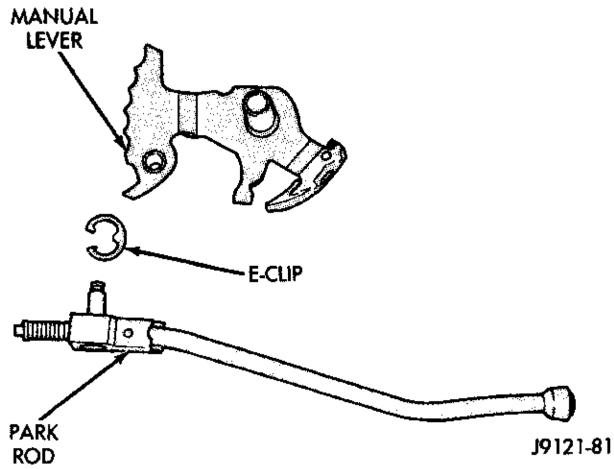

Fig. 45 Park Rod

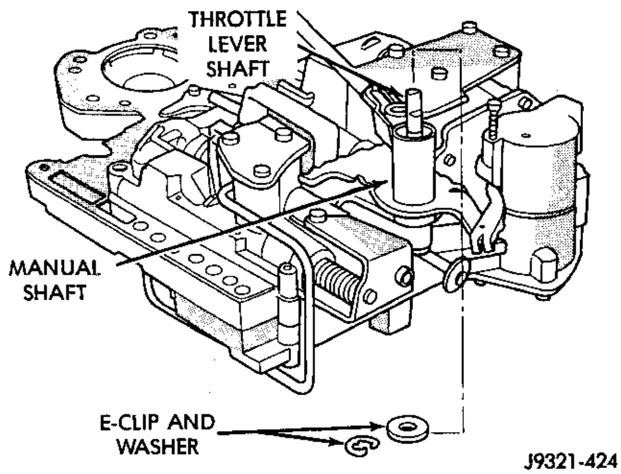

Fig. 46 Throttle Lever E-Clip And Washer

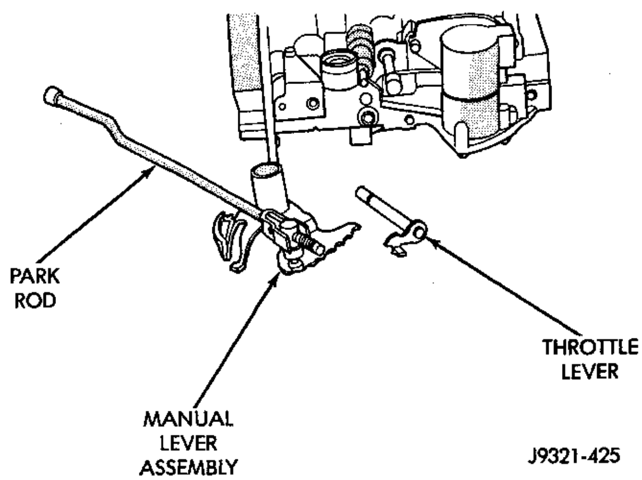

Fig. 47 Manual And Throttle Lever

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(18) Position pencil magnet next to detent housing to catch detent ball and spring. Then carefully remove Retainer Tool 6583 and remove detent ball and spring (Fig. 48).

(19) Remove screws attaching pressure adjusting screw bracket to valve body and transfer plate (Fig. 49). Hold bracket firmly against spring tension while removing last screw.

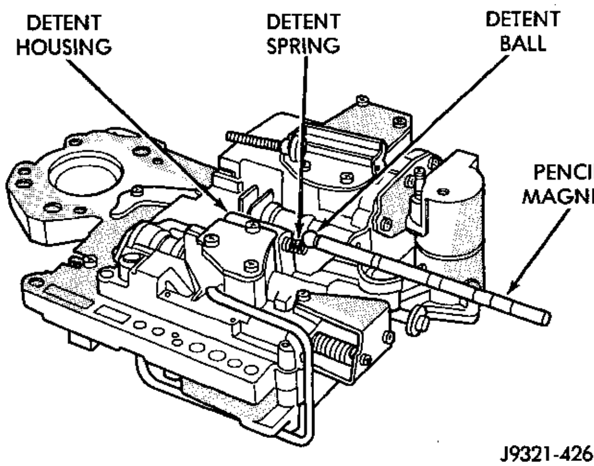

Fig. 48 Detent Ball And Spring

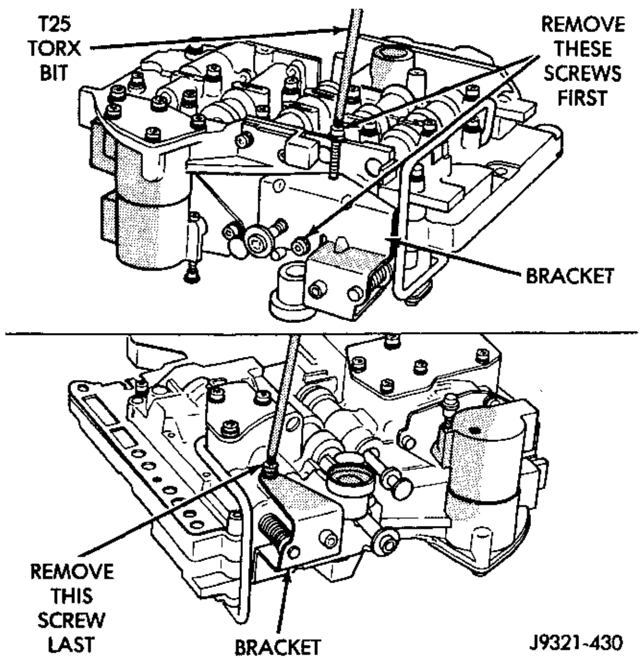

Fig. 49 Adjusting Screw Bracket Fastener

(20) Remove adjusting screw bracket, line pressure adjusting screw, pressure regulator valve spring and switch valve spring (Fig. 50). **Do not remove throttle pressure adjusting screw from bracket and do not disturb setting of either adjusting screw during removal.**

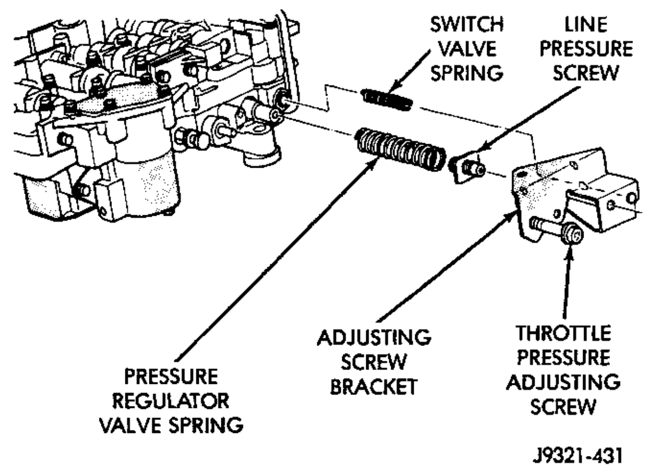

Fig. 50 Adjusting Screw Bracket And Spring

(21) Turn upper housing over and remove switch valve, regulator valve and spring, and manual valve (Fig. 51).

(22) Remove kickdown detent, kickdown valve, and throttle valve and spring (Fig. 51).

(23) Loosen left-side 3-4 accumulator housing attaching screw about 2-3 threads. Then remove center and right-side housing attaching screws (Fig. 52).

(24) Carefully rotate 3-4 accumulator housing upward and remove 3-4 shift valve spring and converter clutch valve plug and spring (Fig. 53).

(25) Remove left-side screw and remove 3-4 accumulator housing from valve body (Fig. 54).

DISASSEMBLY AND ASSEMBLY (Continued)

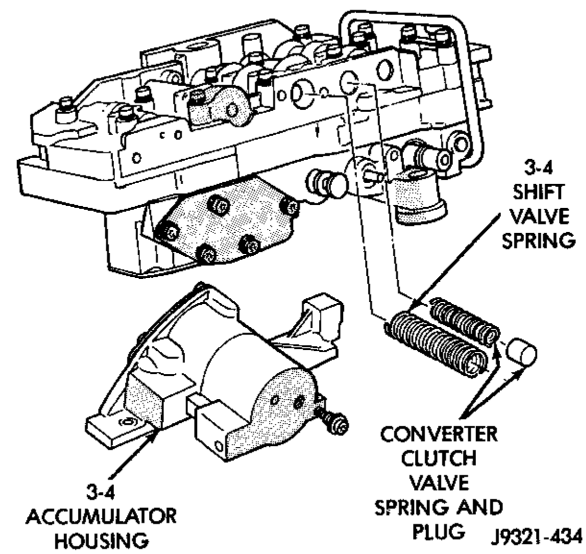

Fig. 54 Accumulator Housing, Valve Springs And Plug

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(26) Bend back tabs on boost valve tube brace (Fig. 55).

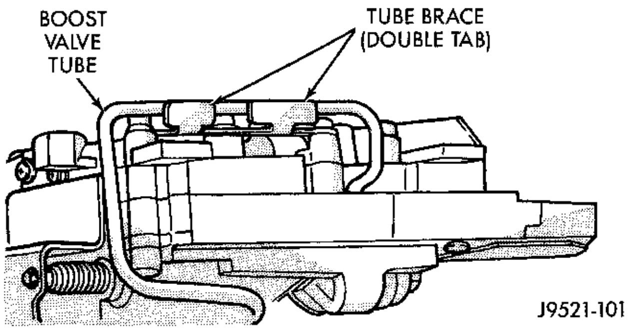

Fig. 55 Boost Valve Tube Brace

(27) Remove boost valve connecting tube (Fig. 56). Disengage tube from upper housing port first. Then rock opposite end of tube back and forth to work it out of lower housing.

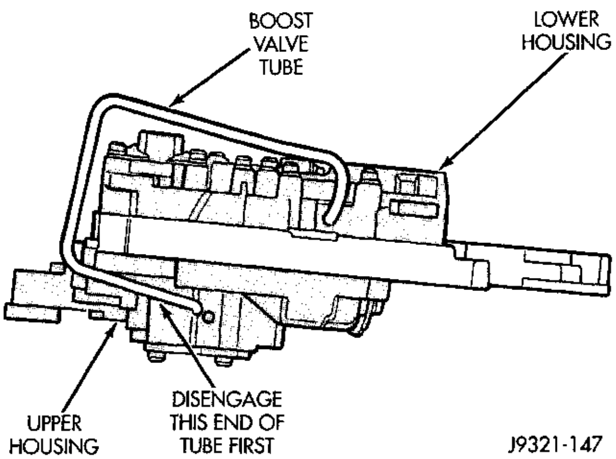

Fig. 56 Boost Valve Tube

CAUTION: Do not use tools to loosen or pry the connecting tube out of the valve body housings. Loosen and remove the tube by hand only.

(28) Turn valve body over so lower housing is facing upward (Fig. 57). In this position, the two check balls in upper housing will remain in place and not fall out when lower housing and separator plate are removed.

(29) Remove screws attaching valve body lower housing to upper housing and transfer plate (Fig. 57). **Note position of boost valve tube brace for assembly reference.**

(30) Remove lower housing and overdrive separator plate from transfer plate (Fig. 57).

(31) Remove the ECE check ball from the transfer plate (Fig. 58). The ECE check ball is approximately 4.8 mm (3/16 in.) in diameter.

(32) Remove transfer plate from upper housing (Fig. 59).

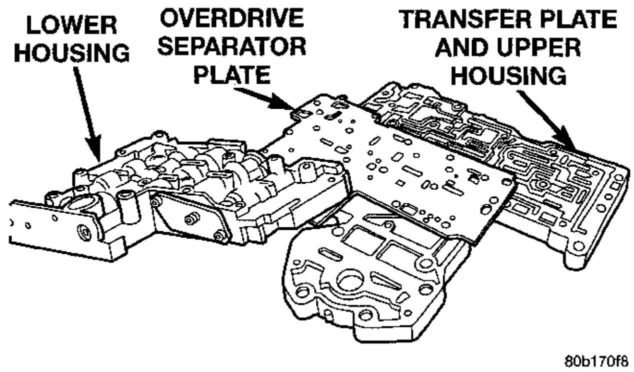

Fig. 57 Lower Housing

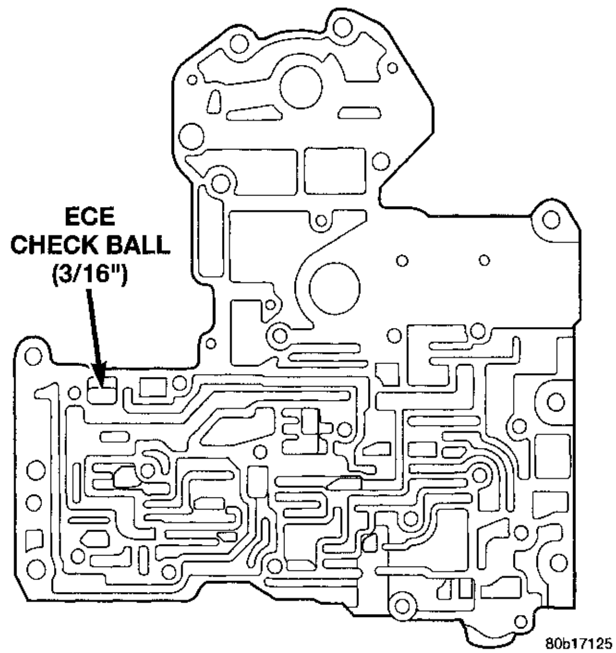

Fig. 58 ECE Check Ball

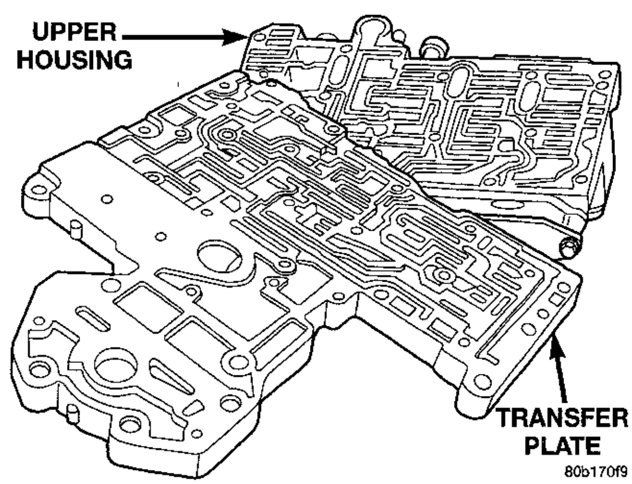

Fig. 59 Transfer Plate

DISASSEMBLY AND ASSEMBLY (Continued)

(33) Turn transfer plate over so upper housing separator plate is facing upward.

(34) Remove upper housing separator plate from transfer plate (Fig. 60). Note position of filter in separator plate for assembly reference.

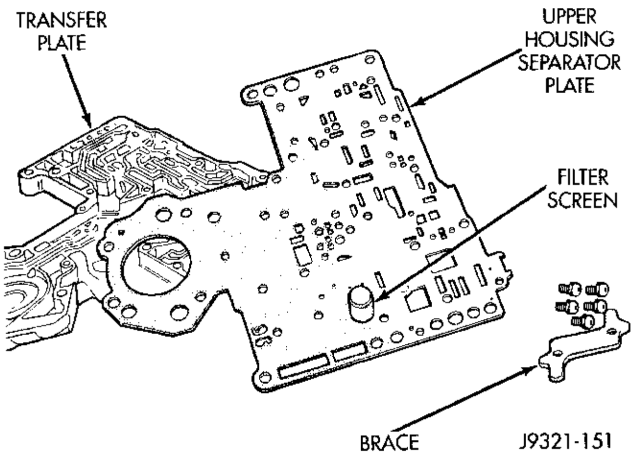

Fig. 60 Upper Housing Separator Plate

(35) Remove rear clutch and rear servo check balls from transfer plate. Note check ball location for assembly reference (Fig. 61).

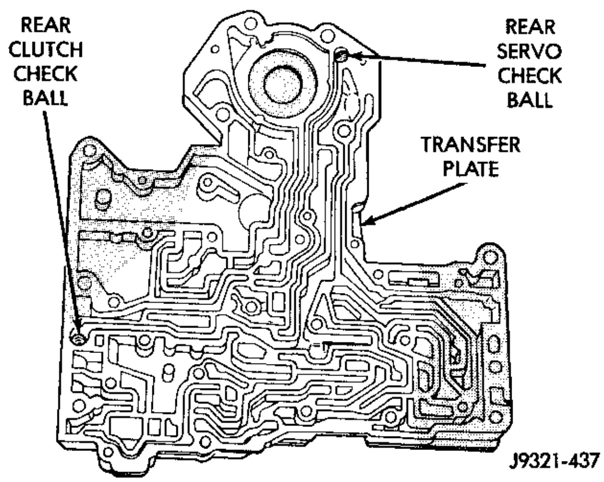

Fig. 61 Rear Clutch And Rear Servo Check Ball Locations

VALVE BODY UPPER HOUSING

(1) Note location of check balls in valve body upper housing (Fig. 62). Then remove the one large diameter and the six smaller diameter check balls.

(2) Remove governor plug and shuttle valve covers (Fig. 64).

(3) Remove E-clip that secures shuttle valve secondary spring on valve stem (Fig. 63).

(4) Remove throttle plug, primary spring, shuttle valve, secondary spring, and spring guides (Fig. 64).

(5) Remove boost valve retainer, spring and valve if not previously removed.

(6) Remove throttle plug and 1-2 and 2-3 governor plugs (Fig. 51).

(7) Turn upper housing around and remove limit valve and shift valve covers (Fig. 65).

(8) Remove limit valve housing. Then remove retainer, spring, limit valve, and 2-3 throttle plug from limit valve housing (Fig. 65).

(9) Remove 1-2 shift control valve and spring (Fig. 65).

(10) Remove 1-2 shift valve and spring (Fig. 65).

(11) Remove 2-3 shift valve and spring from valve body (Fig. 65).

(12) Remove pressure plug cover (Fig. 65).

(13) Remove line pressure plug, sleeve, throttle pressure plug and spring (Fig. 65).

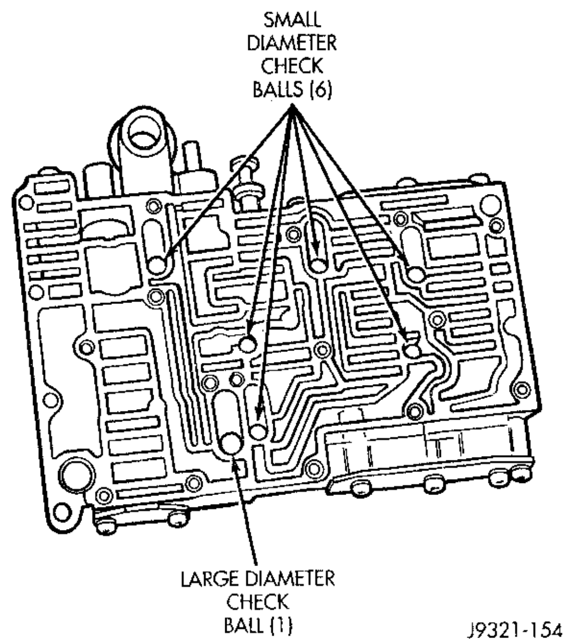

Fig. 62 Check Ball Locations In Upper Housing

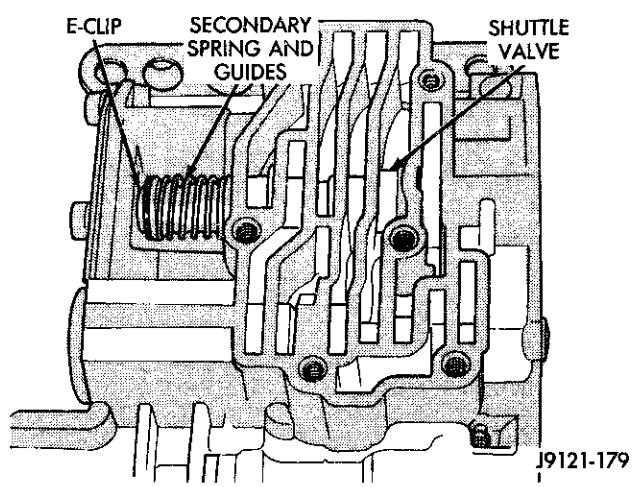

Fig. 63 Shuttle Valve E-Clip And Secondary Spring Location

Mopar AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

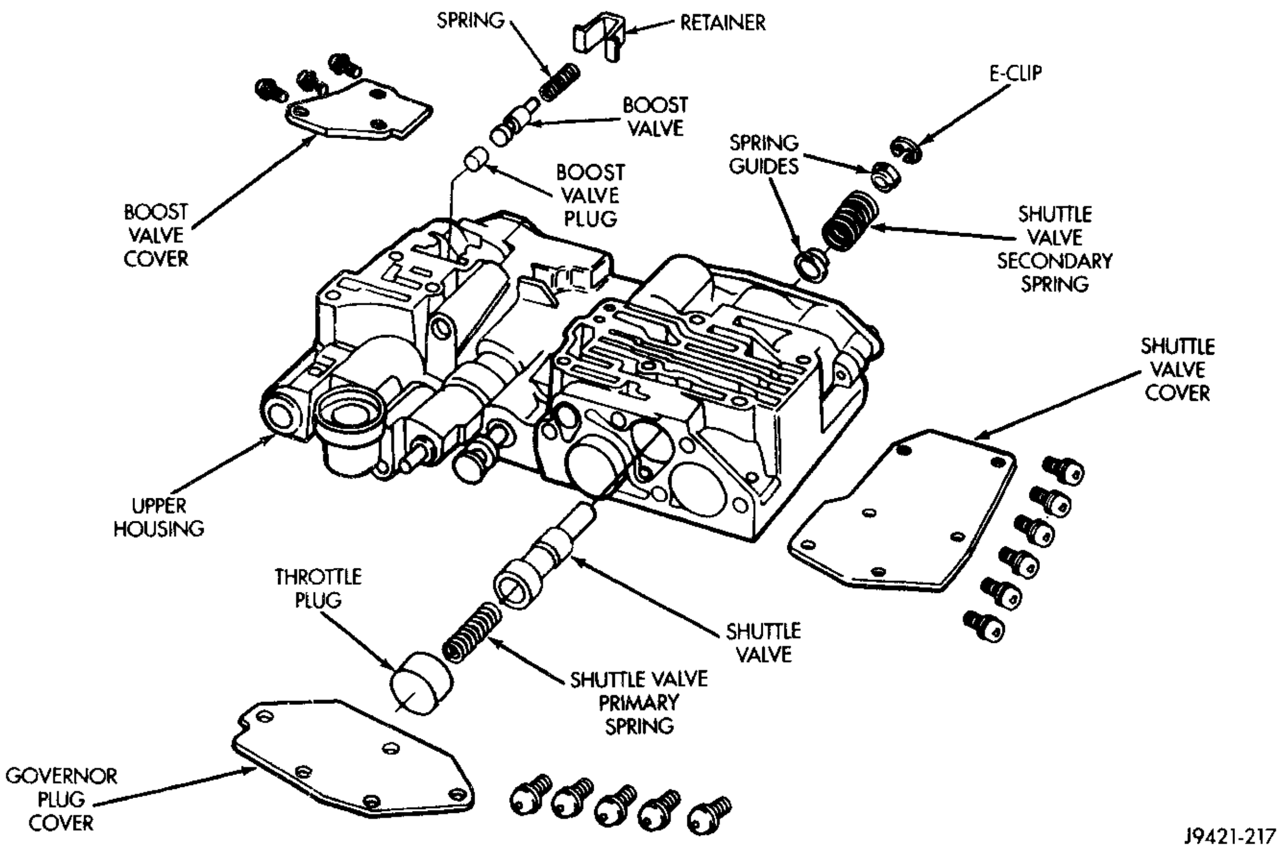

Fig. 64 Shuttle And Boost Valve Components

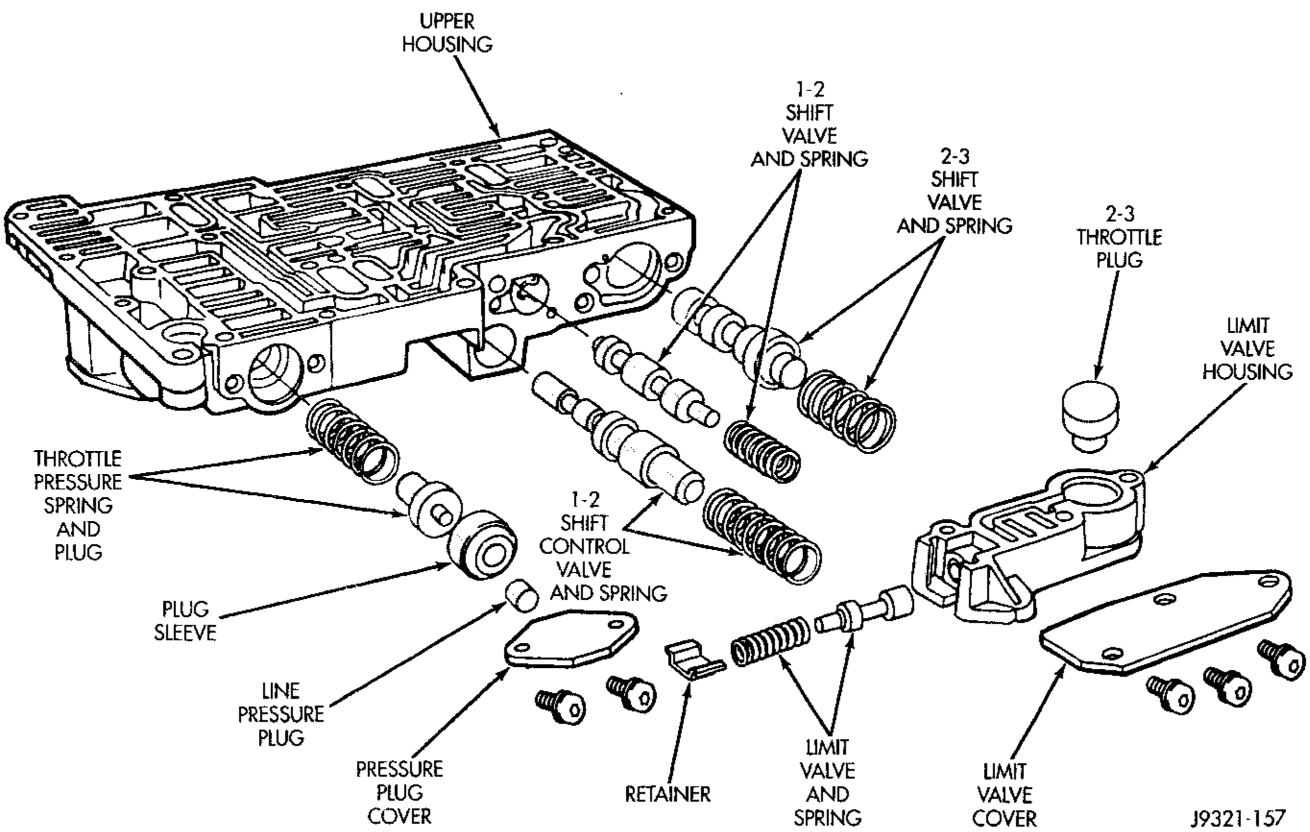

Fig. 65 Upper Housing Shift Valve And Pressure Plug Locations

DISASSEMBLY AND ASSEMBLY (Continued)

VALVE BODY LOWER HOUSING

(1) Remove timing valve cover.
(2) Remove 3-4 timing valve and spring.
(3) Remove 3-4 quick fill valve, spring and plug.
(4) Remove 3-4 shift valve and spring.
(5) Remove converter clutch valve, spring and plug (Fig. 66).
(6) Remove converter clutch timing valve, retainer and valve spring.

3-4 ACCUMULATOR HOUSING

(1) Remove end plate from housing.
(2) Remove piston spring.
(3) Remove piston. Remove and discard piston seals (Fig. 67).

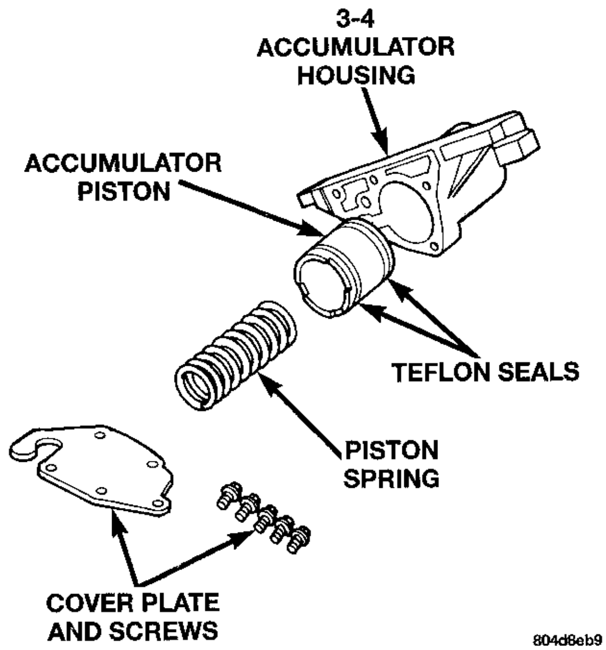

Fig. 67 Accumulator Housing Components

ASSEMBLY

CAUTION: Do not force valves or plugs into place during reassembly. If the valve body bores, valves and plugs are free of distortion or burrs, the valve body components should all slide into place easily. In addition, do not overtighten the transfer plate and valve body screws during reassembly. Overtightening can distort the housings resulting in valve sticking, cross leakage and unsatisfactory operation. Tighten valve body screws to recommended torque only.

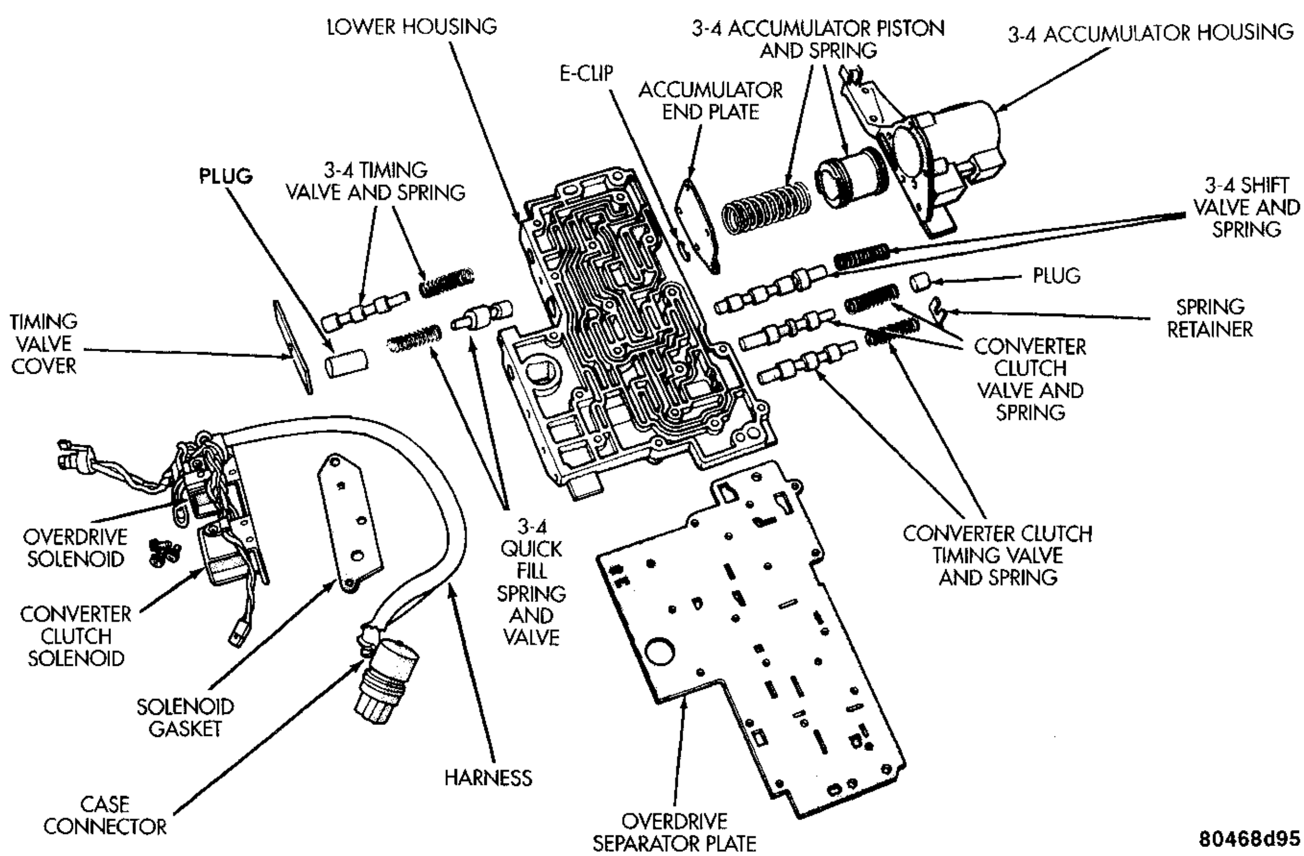

Fig. 66 Lower Housing Shift Valves And Springs

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

LOWER HOUSING

(1) Lubricate valves, springs, and the housing valve and plug bores with clean transmission fluid (Fig. 66).

(2) Install 3-4 timing valve spring and valve in lower housing.

(3) Install 3-4 quick fill valve in lower housing.

(4) Install 3-4 quick fill valve spring and plug in housing.

(5) Install timing valve end plate. Tighten end plate screws to 4 N·m (35 in. lbs.) torque.

3-4 ACCUMULATOR

(1) Lubricate accumulator piston, seals and housing piston bore with clean transmission fluid (Fig. 67).

(2) Install new seal rings on accumulator piston.

(3) Install piston and spring in housing.

(4) Install end plate on housing.

TRANSFER PLATE

(1) Install rear clutch and rear servo check balls in transfer plate (Fig. 68).

(2) Install filter screen in upper housing separator plate (Fig. 69).

(3) Align and position upper housing separator plate on transfer plate (Fig. 70).

(4) Install brace plate (Fig. 70). Tighten brace attaching screws to 4 N·m (35 in. lbs.) torque.

(5) Install remaining separator plate attaching screws. Tighten screws to 4 N·m (35 in. lbs.) torque.

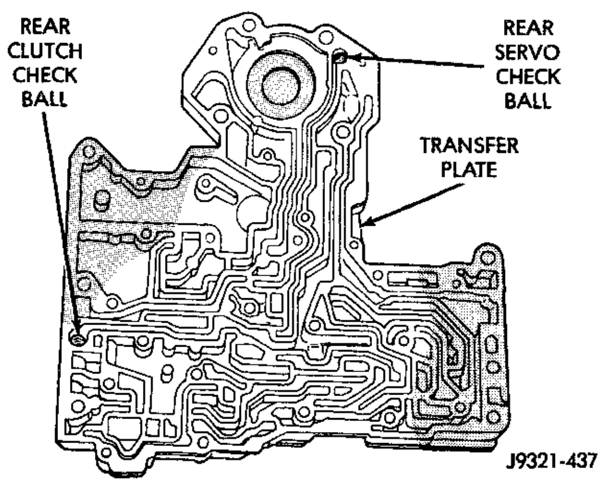

Fig. 68 Rear Clutch And Rear Servo Check Ball Locations

UPPER AND LOWER HOUSING

(1) Position upper housing so internal passages and check ball seats are facing upward. Then install check balls in housing (Fig. 71). Seven check balls are used. The single large check ball is approximately 8.7 mm (11/32 in.) diameter. The single small check ball is approximately 4.8 mm (3/16 in.) in diameter. The remaining 6 check balls are approximately 6.3 mm (1/4 in.) in diameter.

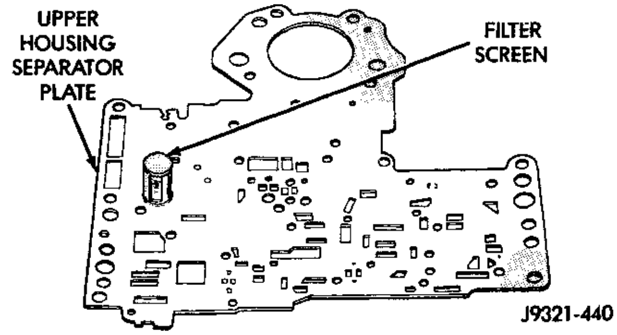

Fig. 69 Separator Plate Filter Screen Installation

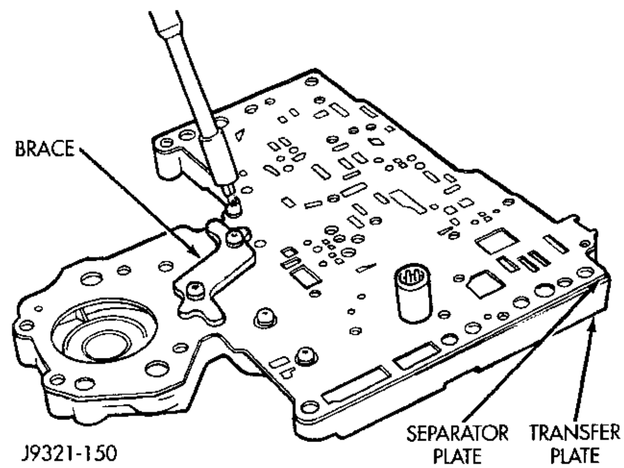

Fig. 70 Brace Plate

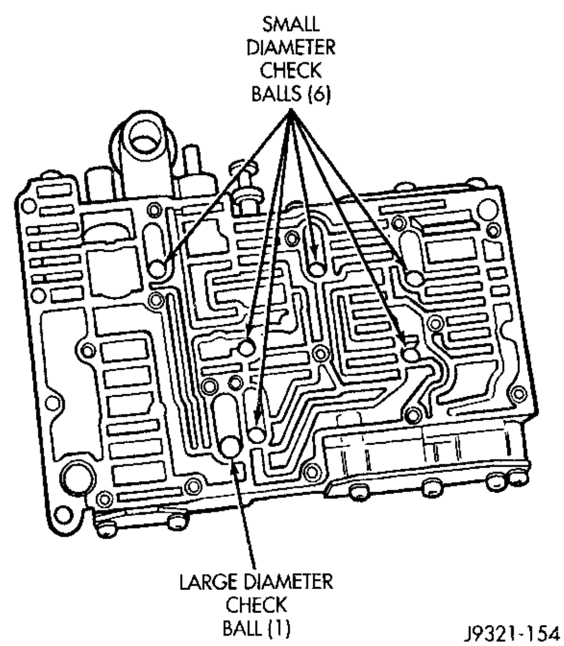

Fig. 71 Check Ball Locations In Upper Housing

DISASSEMBLY AND ASSEMBLY (Continued)

(2) Position assembled transfer plate and upper housing separator plate on upper housing (Fig. 72). Be sure filter screen is seated in proper housing recess.

(3) Install the ECE check ball into the transfer plate (Fig. 58). The ECE check ball is approximately 4.8 mm (3/16 in.) in diameter.

(4) Position lower housing separator plate on transfer plate (Fig. 73).

(5) Install lower housing on assembled transfer plate and upper housing (Fig. 74).

(6) Install and start all valve body screws by hand except for the screws to hold the boost valve tube brace. Save those screws for later installation. Then tighten screws evenly to 4 N·m (35 in. lbs.) torque. Start at center and work out to sides when tightening screws (Fig. 74).

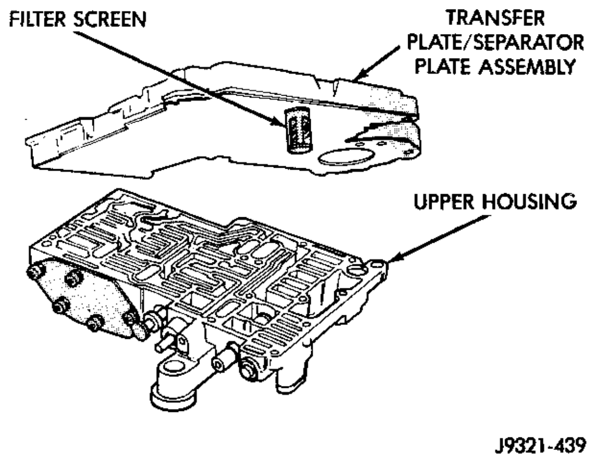

Fig. 72 Installing Transfer Plate On Upper Housing

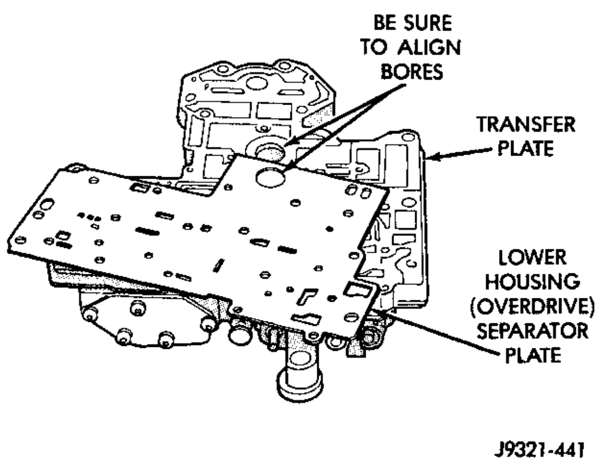

Fig. 73 Lower Housing Separator Plate

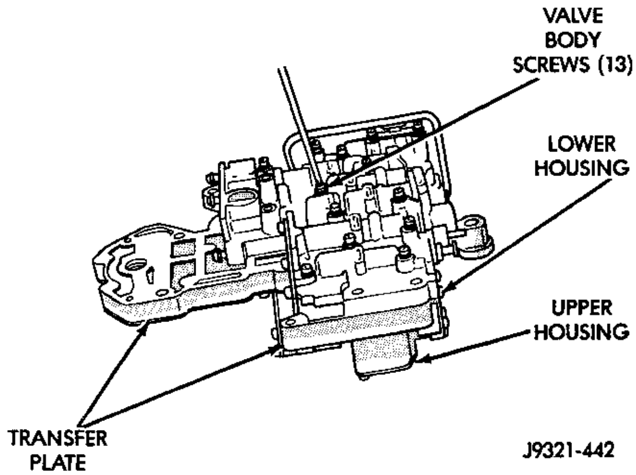

Fig. 74 Installing Lower Housing On Transfer Plate And Upper Housing

UPPER HOUSING VALVE AND PLUG

Refer to (Fig. 75), (Fig. 76) and (Fig. 77) to perform the following steps.

(1) Lubricate valves, plugs, springs with clean transmission fluid.

(2) Assemble regulator valve line pressure plug, sleeve, throttle plug and spring. Insert assembly in upper housing and install cover plate. Tighten cover plate screws to 4 N·m (35 in. lbs.) torque.

(3) Install 1-2 and 2-3 shift valves and springs.

(4) Install 1-2 shift control valve and spring.

(5) Install retainer, spring, limit valve, and 2-3 throttle plug from limit valve housing.

(6) Install limit valve housing and cover plate. Tighten screws to 4 N·m (35 in. lbs.).

(7) Install shuttle valve as follows:

(a) Insert plastic guides in shuttle valve secondary spring and install spring on end of valve.

(b) Install shuttle valve into housing.

(c) Hold shuttle valve in place.

(d) Compress secondary spring and install E-clip in groove at end of shuttle valve.

(e) Verify that spring and E-clip are properly seated before proceeding.

(8) Install shuttle valve cover plate. Tighten cover plate screws to 4 N·m (35 in. lbs.) torque.

(9) Install 1-2 and 2-3 valve governor plugs in valve body.

(10) Install shuttle valve primary spring and throttle plug.

(11) Align and install governor plug cover. Tighten cover screws to 4 N·m (35 in. lbs.) torque.

Mopar AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

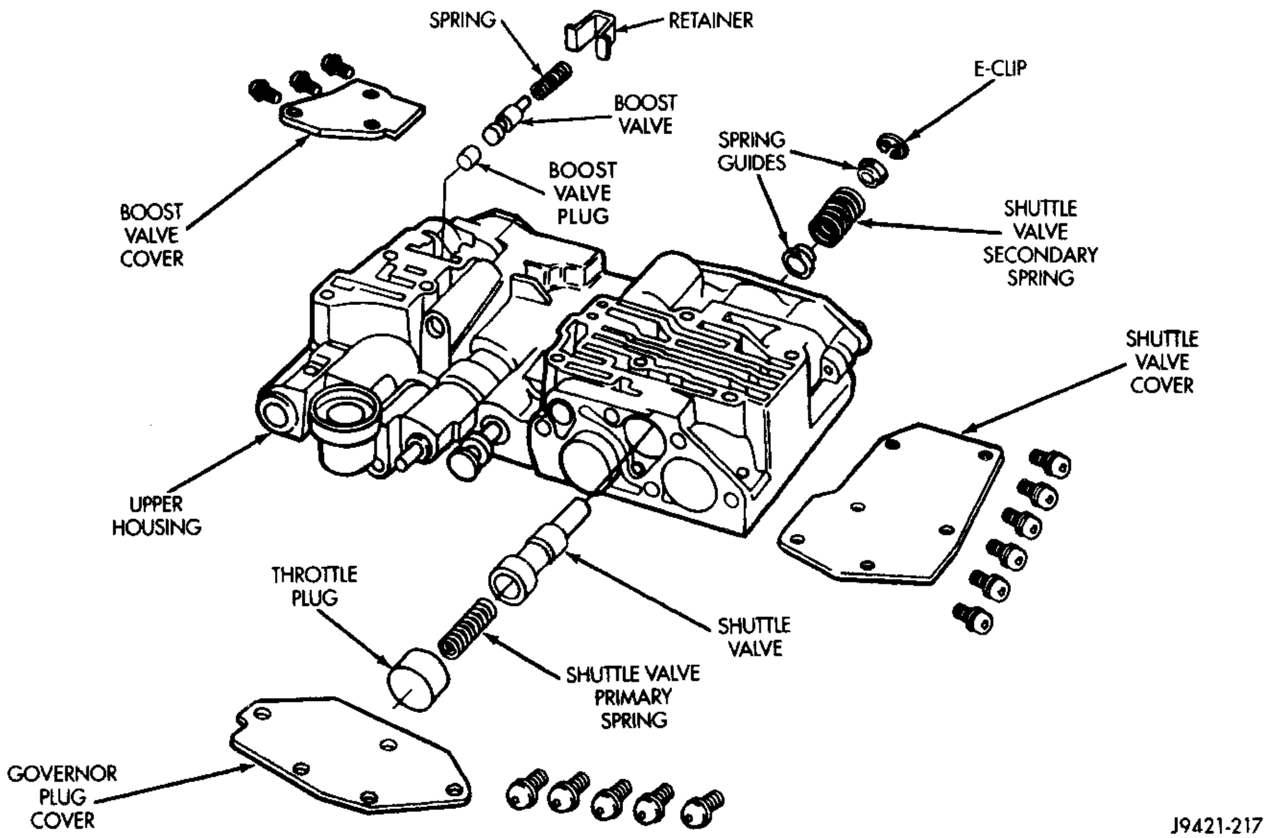

Fig. 75 Shuttle And Boost Valve Components

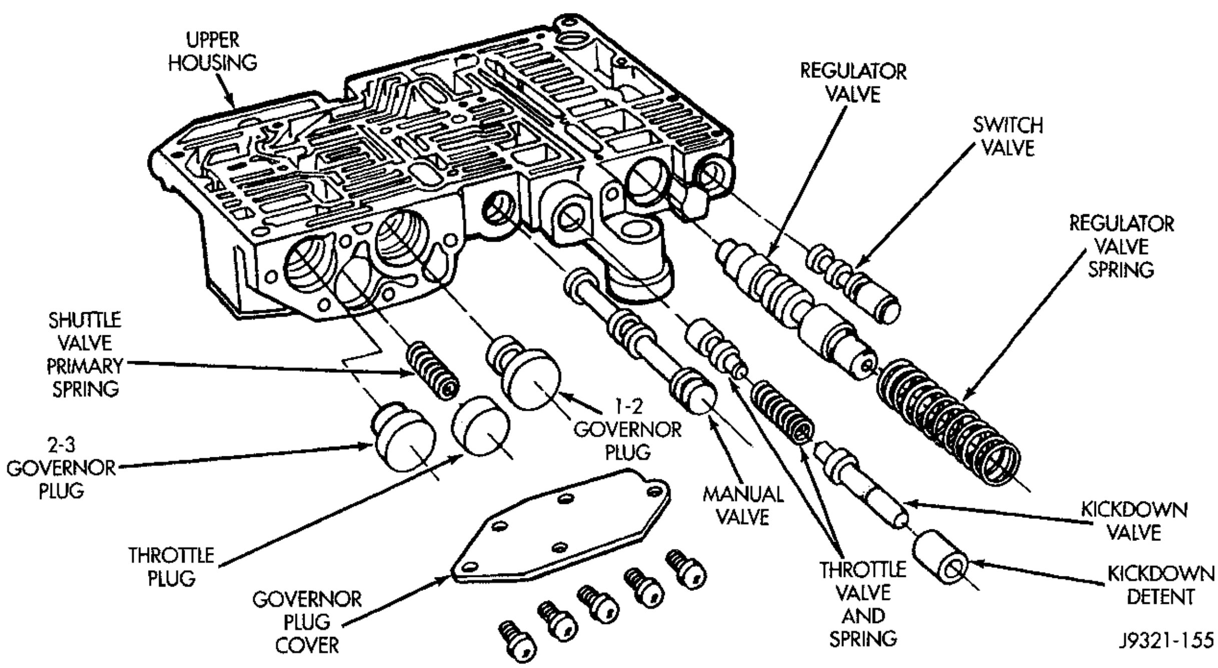

Fig. 76 Upper Housing Control Valve Locations

DISASSEMBLY AND ASSEMBLY (Continued)

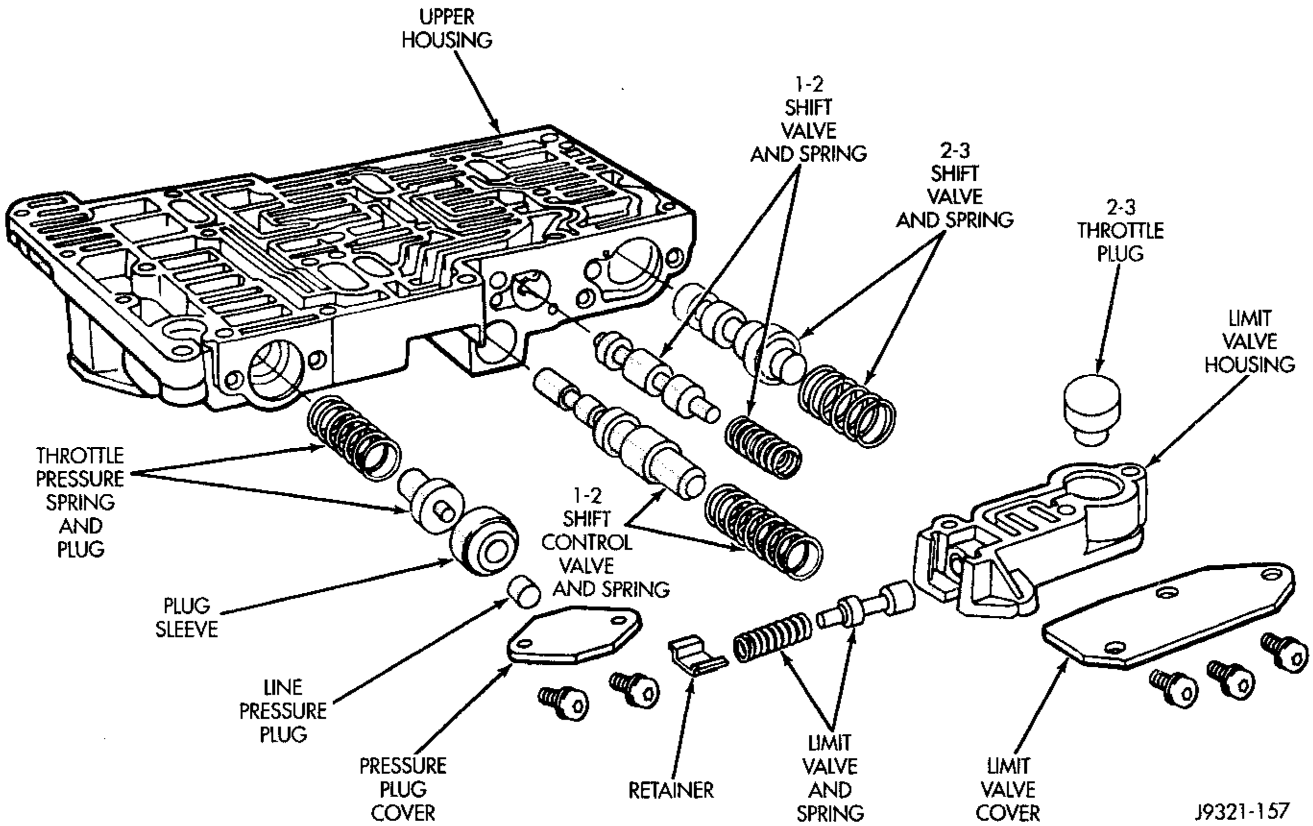

Fig. 77 Upper Housing Shift Valve And Pressure Plug Locations

BOOST VALVE TUBE AND BRACE

(1) Position valve body assembly so lower housing is facing upward (Fig. 78).

(2) Lubricate tube ends and housing ports with transmission fluid or petroleum jelly.

(3) Start tube in lower housing port first. Then swing tube downward and work opposite end of tube into upper housing port (Fig. 78).

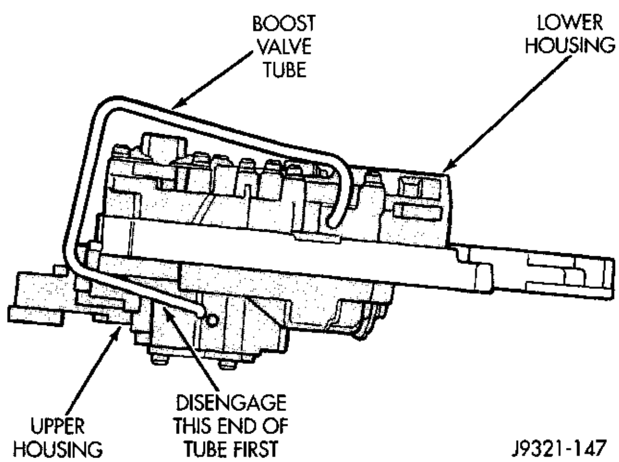

Fig. 78 Boost Valve Tube

(4) Insert and seat each end of tube in housings.

(5) Slide tube brace under tube and into alignment with valve body screw holes (Fig. 79).

(6) Install and finger tighten three screws that secure tube brace to valve body housings (Fig. 79).

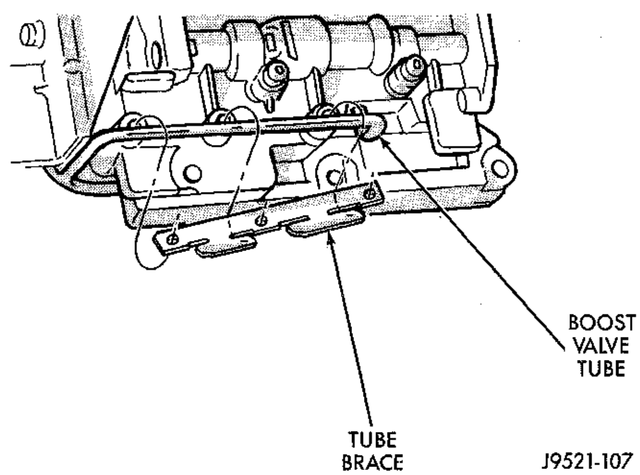

Fig. 79 Boost Valve Tube And Brace

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(7) Bend tube brace tabs up and against tube to hold it in position (Fig. 80).

(8) Tighten all valve body housing screws to 4 N·m (35 in. lbs.) torque after tube and brace are installed. Tighten screws in diagonal pattern starting at center and working outward.

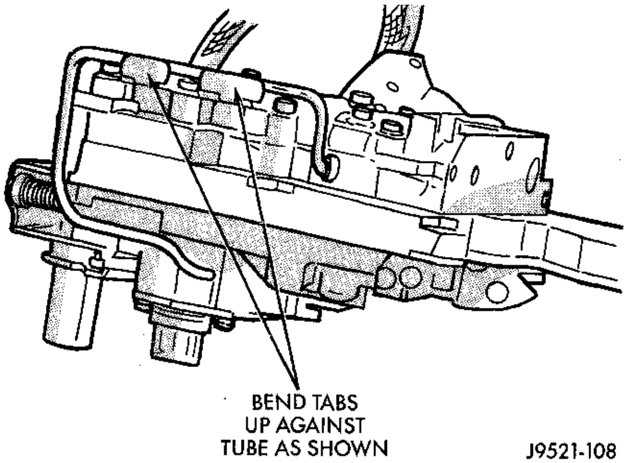

Fig. 80 Securing Boost Valve Tube With Brace Tabs

3-4 ACCUMULATOR

(1) Position converter clutch valve and 3-4 shift valve springs in housing (Fig. 81).

(2) Loosely attach accumulator housing with right-side screw (Fig. 81). Install only one screw at this time as accumulator must be free to pivot upward for ease of installation.

(3) Install 3-4 shift valve and spring.

(4) Install converter clutch timing valve and spring.

(5) Position plug on end of converter clutch valve spring. Then compress and hold springs and plug in place with fingers of one hand.

(6) Swing accumulator housing upward over valve springs and plug.

(7) Hold accumulator housing firmly in place and install remaining two attaching screws. Be sure springs and clutch valve plug are properly seated (Fig. 82). Tighten screws to 4 N·m (35 in. lbs.).

VALVE BODY FINAL

(1) Install boost valve, valve spring, retainer and cover plate. Tighten cover plate screws to 4 N·m (35 in. lbs.) torque.

(2) Insert manual lever detent spring in upper housing.

(3) Position detent ball on end of spring. Then hold detent ball and spring in detent housing with Retainer Tool 6583 (Fig. 83).

(4) Install throttle lever in upper housing. Then install manual lever over throttle lever and start manual lever into housing.

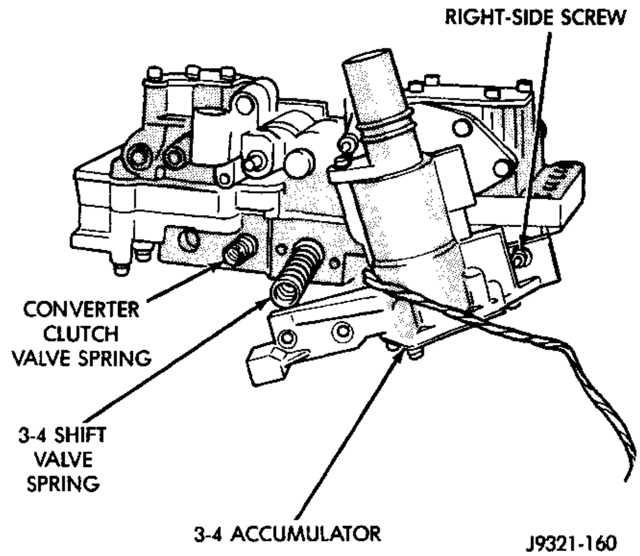

Fig. 81 Converter Clutch And 3-4 Shift Valve Springs

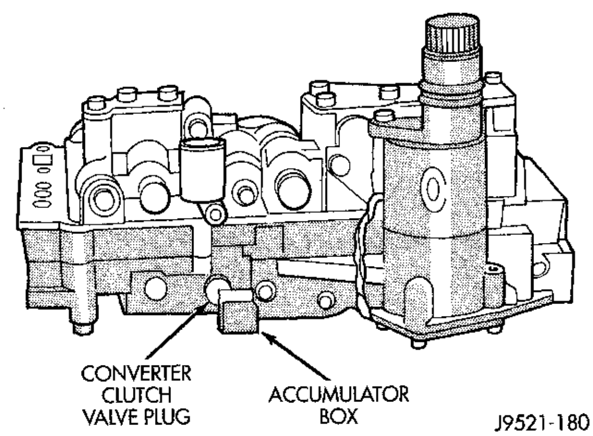

Fig. 82 Seating 3-4 Accumulator On Lower Housing

(5) Align manual lever with detent ball and manual valve. Hold throttle lever upward. Then press down on manual lever until fully seated. Remove detent ball retainer tool after lever is seated.

(6) Then install manual lever seal, washer and E-clip.

(7) Verify that throttle lever is aligned with end of kickdown valve stem and that manual lever arm is engaged in manual valve (Fig. 84).

(8) Position line pressure adjusting screw in adjusting screw bracket.

(9) Install spring on end of line pressure regulator valve.

(10) Install switch valve spring on tang at end of adjusting screw bracket.

(11) Install manual valve.

(12) Install throttle valve and spring.

(13) Install kickdown valve and detent.

DISASSEMBLY AND ASSEMBLY (Continued)

(14) Install pressure regulator valve.

(15) Install switch valve.

(16) Position adjusting screw bracket on valve body. Align valve springs and press bracket into place. Install short, upper bracket screws first and long bottom screw last. Verify that valve springs and bracket are properly aligned. Then tighten all three bracket screws to 4 N·m (35 in. lbs.) torque.

(17) Lubricate solenoid case connector O-rings and shaft of manual lever with light coat of petroleum jelly.

(18) Obtain new fluid filter for valve body but do not install filter at this time.

(19) If line pressure and/or throttle pressure adjustment screw settings were not disturbed, continue with overhaul or reassembly. However, if adjustment screw settings **were** moved or changed, readjust as described in Valve Body Control Pressure Adjustment procedure.

(20) Attach solenoid case connector to 3-4 accumulator with shoulder-type screw. Connector has small locating tang that fits in dimple at top of accumulator housing (Fig. 85). Seat tang in dimple before tightening connector screw.

(21) Install solenoid assembly and gasket. Tighten solenoid attaching screws to 8 N·m (72 in. lbs.) torque.

(22) Verify that solenoid wire harness is properly routed (Fig. 86). **Solenoid harness must be clear of manual lever and park rod and not be pinched between accumulator housing and cover.**

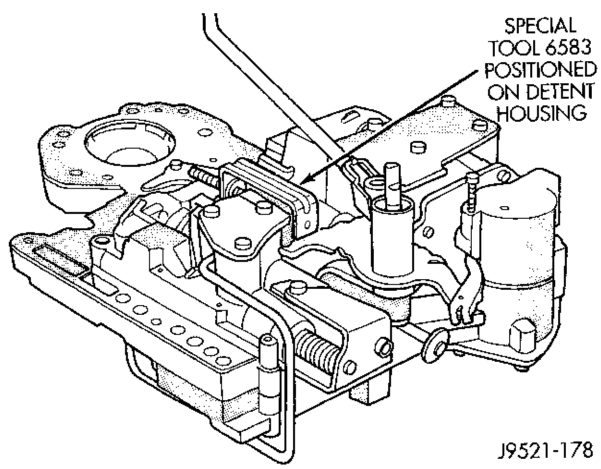

Fig. 83 Detent Ball Spring

GOVERNOR BODY, SENSOR AND SOLENOID

(1) Turn valve body assembly over so accumulator side of transfer plate is facing down.

(2) Install new O-rings on governor pressure solenoid and sensor.

(3) Lubricate solenoid and sensor O-rings with clean transmission fluid.

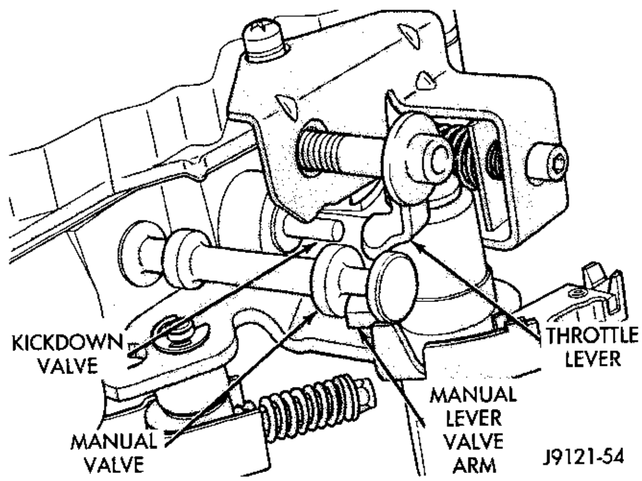

Fig. 84 Manual And Throttle Lever Alignment

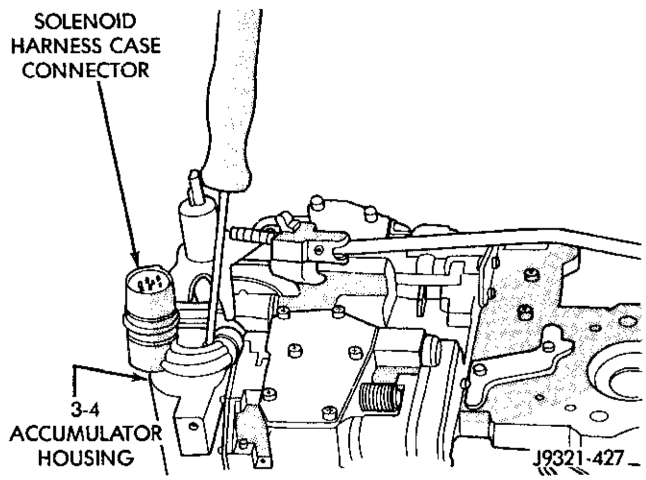

Fig. 85 Solenoid Harness Case Connector Shoulder Bolt

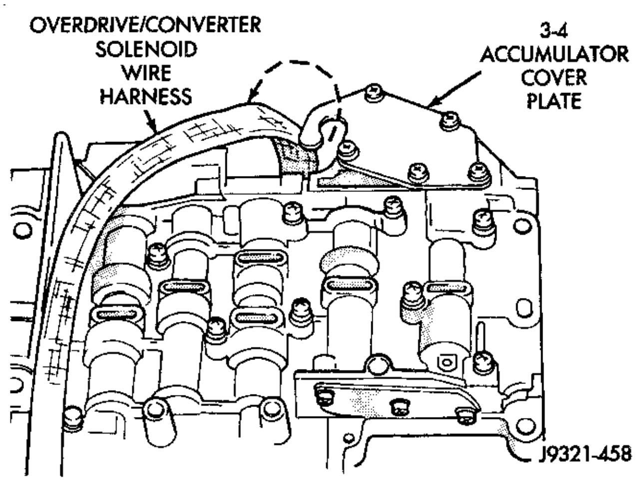

Fig. 86 Solenoid Harness Routing

DISASSEMBLY AND ASSEMBLY (Continued)

(4) Install governor pressure sensor in governor body. Then secure sensor with M-shaped retaining clip.

(5) Install governor pressure solenoid in governor body. Push solenoid in until it snaps into place in body.

(6) Position governor body gasket on transfer plate.

(7) Install retainer plate on governor body and around solenoid. Be sure solenoid connector is positioned in retainer cutout.

(8) Align screw holes in governor body and transfer plate. Then install and tighten governor body screws to 4 N·m (35 in. lbs.) torque.

(9) Connect harness wires to governor pressure solenoid and governor pressure sensor.

(10) Perform Line Pressure and Throttle Pressure adjustments. Refer to adjustment section of this group for proper procedures.

(11) Install fluid filter and pan.

(12) Lower vehicle.

(13) Fill transmission with recommended fluid and road test vehicle to verify repair.

TRANSMISSION

DISASSEMBLY

(1) Clean transmission exterior with steam gun or with solvent. Wear eye protection during cleaning operations.

(2) Place transmission in a vertical position.

(3) Measure and record input shaft end play readings.

(4) Remove shift and throttle levers from valve body manual lever shaft.

(5) Place transmission in horizontal position.

(6) Remove transmission oil pan and gasket.

(7) Remove filter from valve body (Fig. 87). Keep filter screws separate from other valve body screws. Filter screws are longer and should be kept with filter.

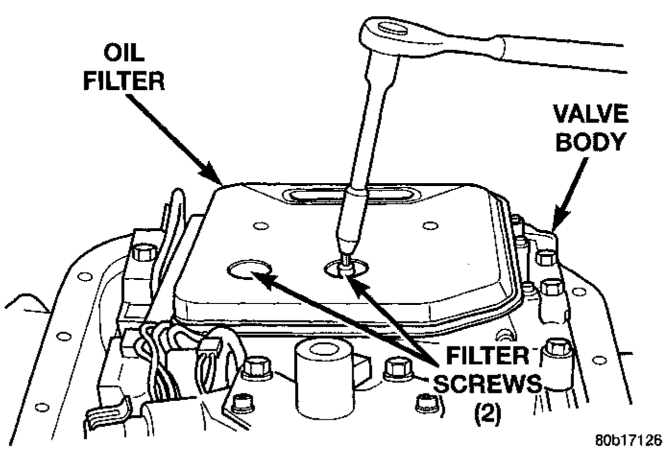

Fig. 87 Oil Filter Removal

(8) Remove park/neutral position switch.

(9) Remove hex head bolts attaching valve body to transmission case (Fig. 88). A total of 10 bolts are used. Note different bolt lengths for assembly reference.

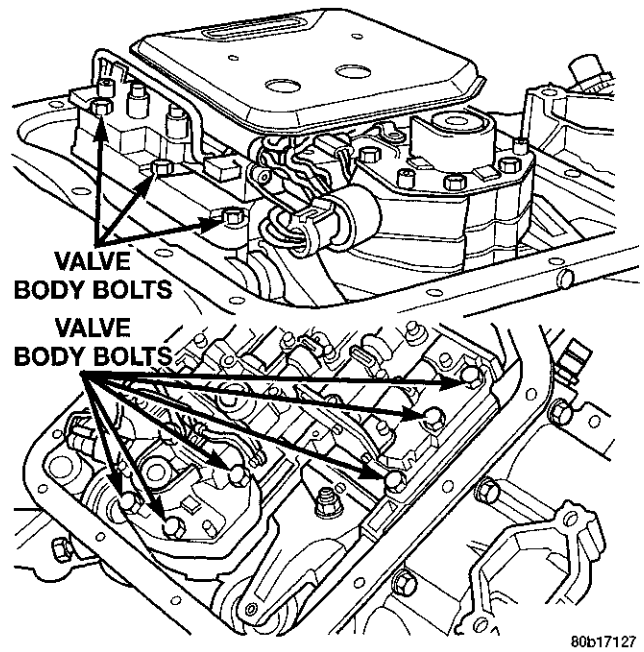

Fig. 88 Valve Body Bolt Locations

(10) Remove valve body assembly. Push valve body harness connector out of case. Then work park rod and valve body out of case (Fig. 89).

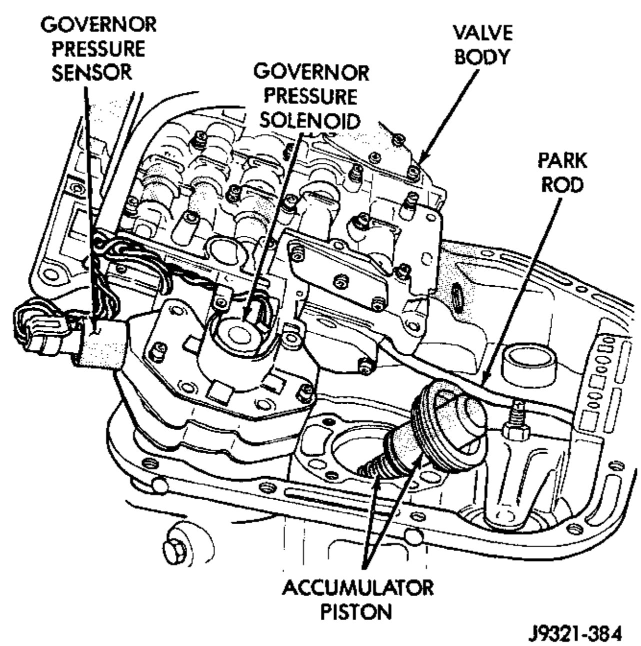

Fig. 89 Valve Body Removal

DISASSEMBLY AND ASSEMBLY (Continued)

(11) Remove accumulator piston and inner and outer springs (Fig. 90).

(12) Remove pump oil seal with suitable pry tool or slide-hammer mounted screw.

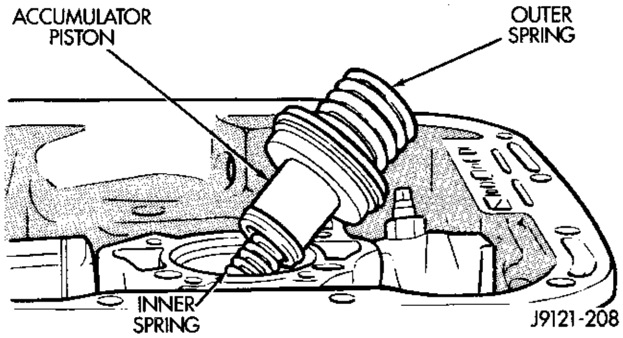

Fig. 90 Accumulator Piston And Springs

(13) Loosen front band adjusting screw locknut 4-5 turns. Then tighten band adjusting screw until band is tight around front clutch retainer. This prevents front/rear clutches from coming out with pump and possibly damaging clutch or pump components.

(14) Remove oil pump bolts.

(15) Thread bolts of Slide Hammer Tools C-3752 into threaded holes in pump body flange (Fig. 91).

(16) Bump slide hammer weights outward to remove pump and reaction shaft support assembly from case (Fig. 91).

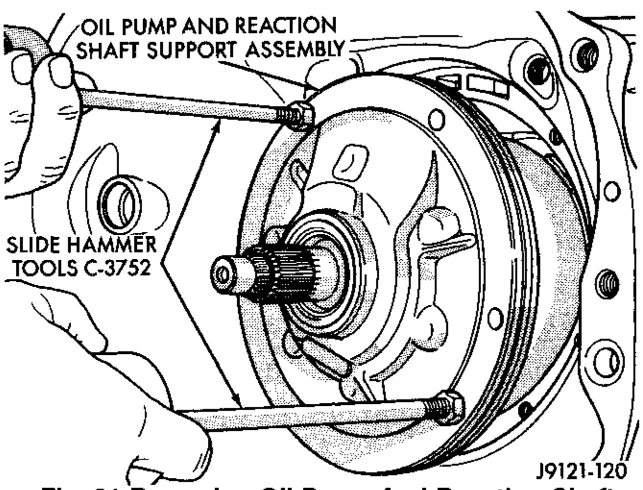

Fig. 91 Removing Oil Pump And Reaction Shaft Support Assembly

(17) Loosen front band adjusting screw until band is completely loose.

(18) Squeeze front band together and remove band strut (Fig. 92).

(19) Remove front band lever (Fig. 93).

(20) Remove front band lever shaft plug, if necessary, from converter housing.

(21) Remove front band lever shaft.

(22) Remove front and rear clutch units as assembly. Grasp input shaft, hold clutch units together and remove them from case (Fig. 94).

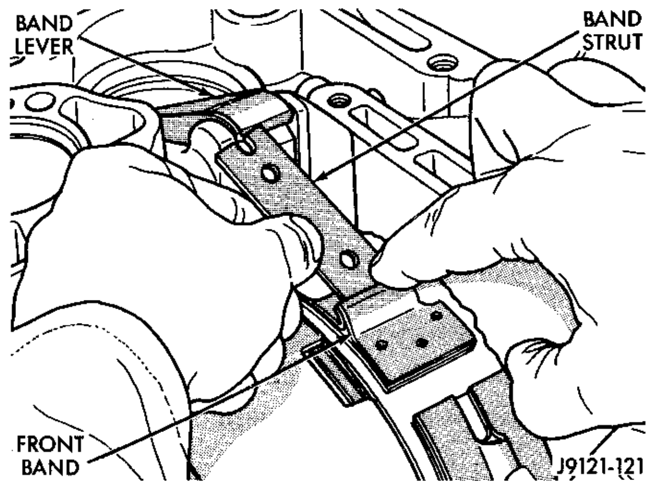

Fig. 92 Removing/Installing Front Band Strut

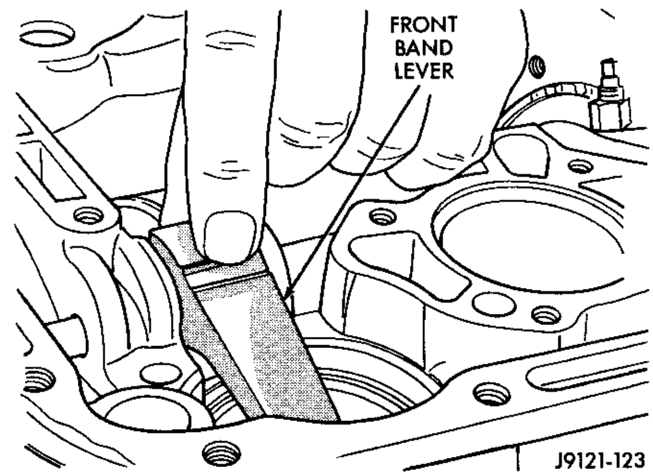

Fig. 93 Removing/Installing Front Band Lever

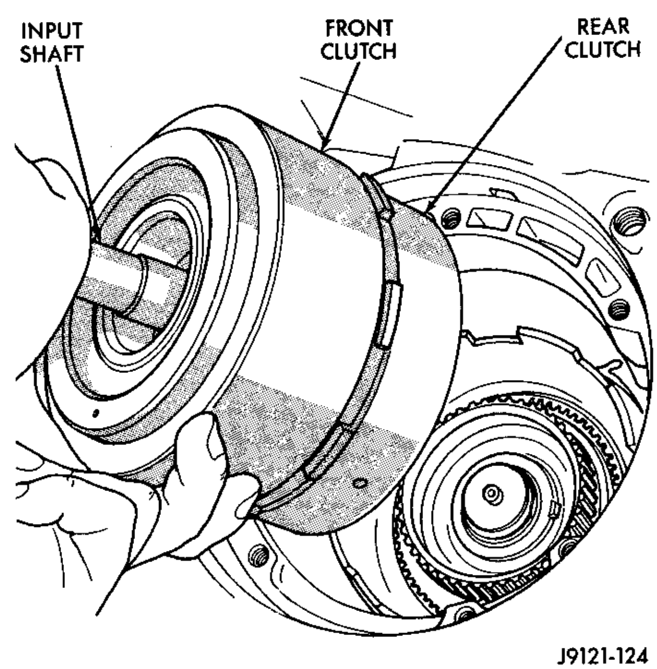

Fig. 94 Removing Front/Rear Clutch Assemblies

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(23) Lift front clutch off rear clutch (Fig. 95). Set clutch units aside for overhaul.

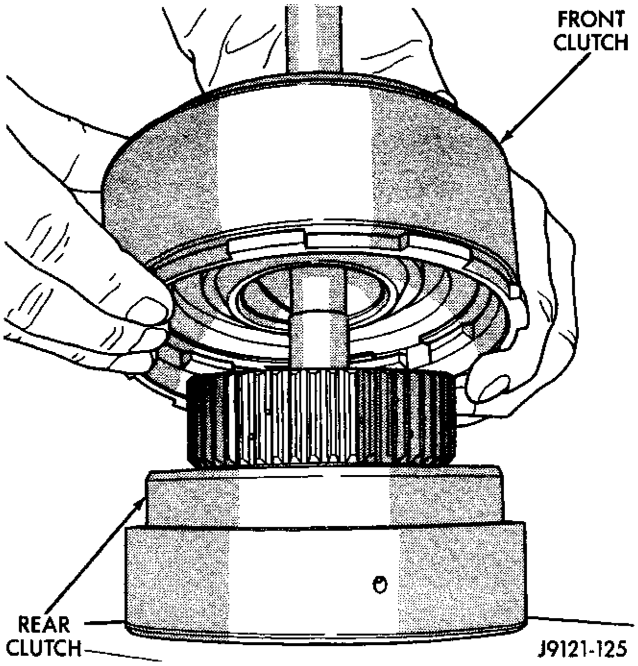

Fig. 95 Separating Front/Rear Clutch Assemblies

(24) Remove intermediate shaft thrust washer from front end of shaft or from rear clutch hub (Fig. 96).

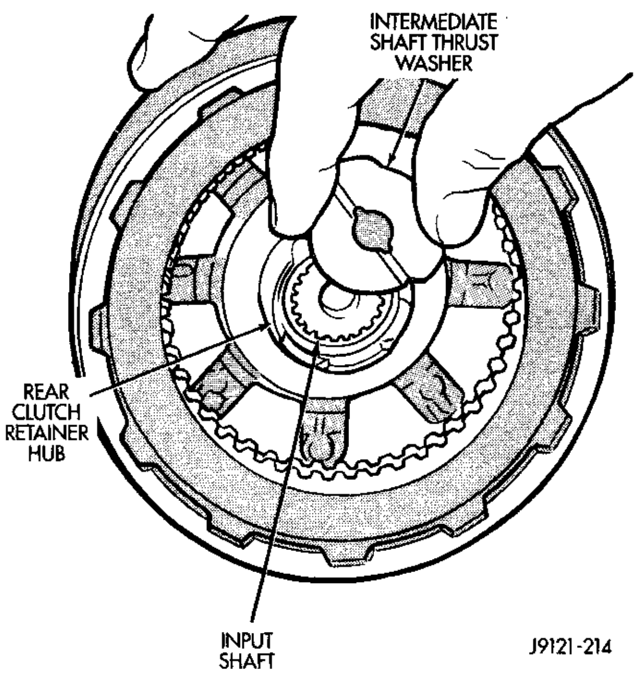

Fig. 96 Removing Intermediate Shaft Thrust Washer

(25) Remove output shaft thrust plate from intermediate shaft hub (Fig. 97).

(26) Slide front band off driving shell (Fig. 98) and remove band from case.

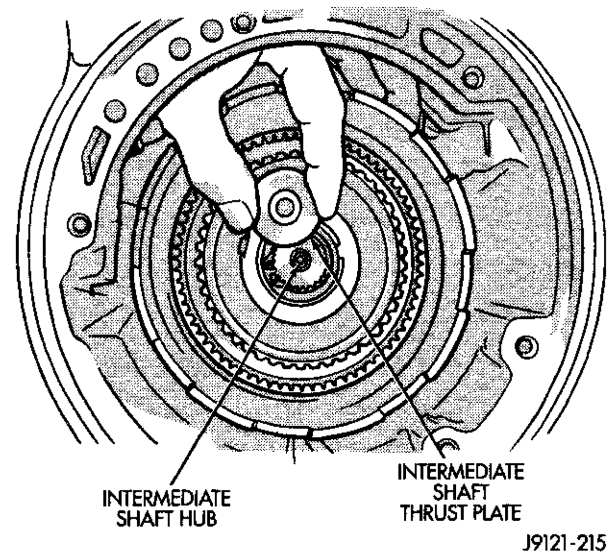

Fig. 97 Removing Intermediate Shaft Thrust Plate

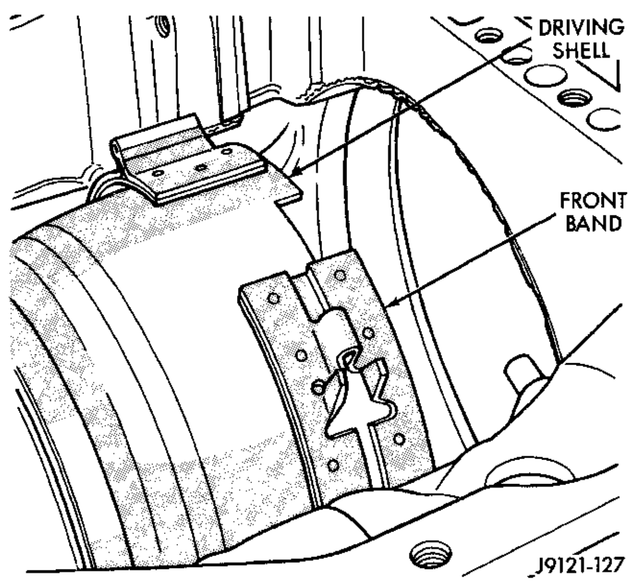

Fig. 98 Front Band Removal/Installation

DISASSEMBLY AND ASSEMBLY (Continued)

(27) Remove planetary geartrain as assembly (Fig. 99). Support geartrain with both hands during removal. Do not allow machined surfaces on intermediate shaft or overdrive piston retainer to become nicked or scratched.

(28) If overdrive unit is not to be serviced, install Alignment Shaft 6227-2 into the overdrive unit to prevent misalignment of the overdrive clutches during service of main transmission components.

(29) Loosen rear band adjusting screw 4-5 turns.

(30) Remove low-reverse drum snap ring (Fig. 100).

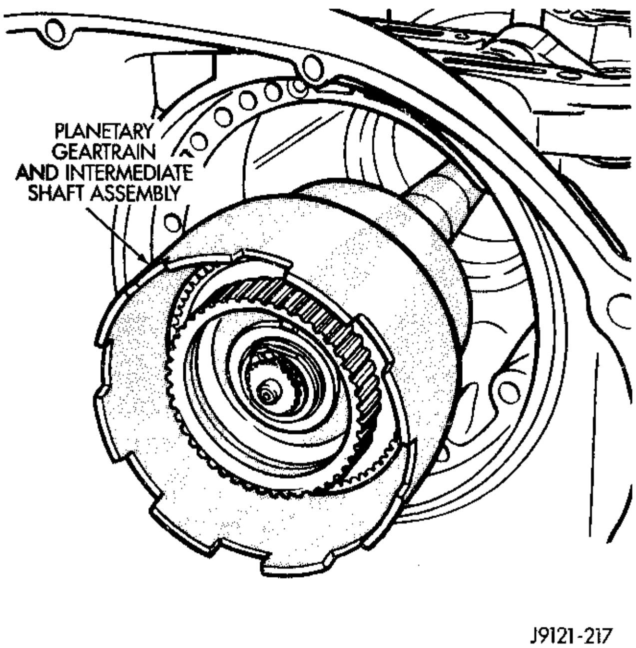

Fig. 99 Removing Planetary Geartrain And Intermediate Shaft Assembly

(31) Remove low-reverse drum and reverse band.

(32) Remove overrunning clutch roller and spring assembly as a unit (Fig. 101).

(33) Compress front servo rod guide about 1/8 inch with Valve Spring Compressor C-3422-B (Fig. 102).

(34) Remove front servo rod guide snap ring. **Exercise caution when removing snap ring. Servo bore can be scratched or nicked if care is not exercised.**

(35) Remove compressor tools and remove front servo rod guide, spring and servo piston.

(36) Compress rear servo spring retainer about 1/16 inch with Valve Spring Compressor C-3422-B (Fig. 103).

(37) Remove rear servo spring retainer snap ring. Then remove compressor tools and remove rear servo spring and piston.

(38) Inspect transmission components.

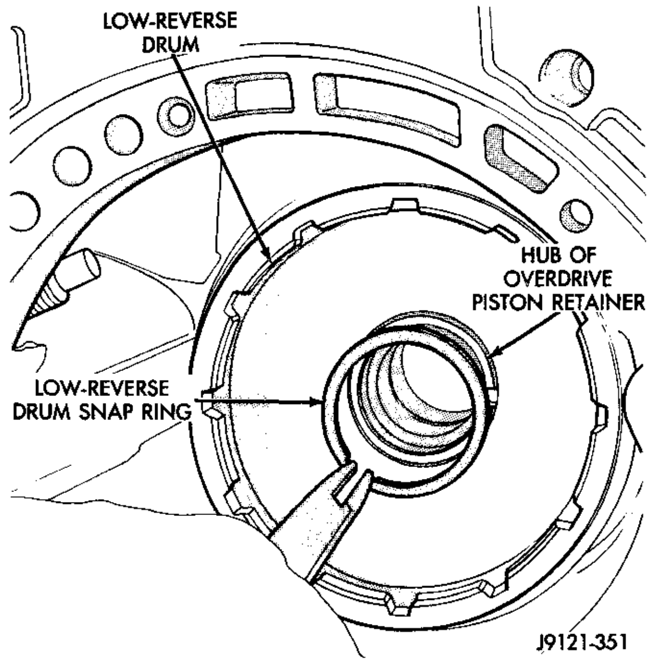

Fig. 100 Removing Low-Reverse Drum Snap Ring

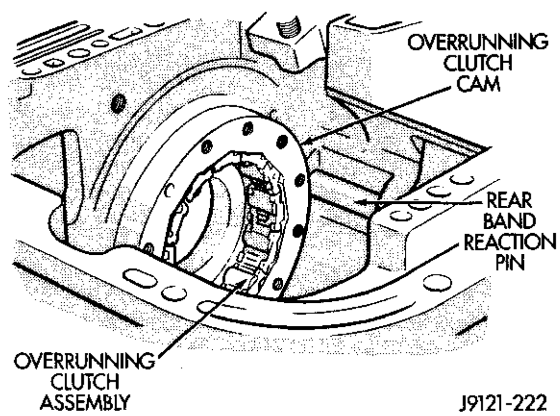

Fig. 101 Overrunning Clutch Assembly Removal

NOTE: TO SERVICE THE OVERRUNNING CLUTCH CAM OR OVERDRIVE PISTON RETAINER, REFER TO OVERRUNNING CLUTCH CAM SERVICE IN THIS SECTION.

ASSEMBLY

Do not allow dirt, grease, or foreign material to enter the case or transmission components during assembly. Keep the transmission case and components clean. Also make sure the tools and workbench area used for assembly operations are equally clean.

Shop towels used for wiping off tools and hands must be made from **lint free** material. Lint will stick to transmission parts and could interfere with valve operation, or even restrict fluid passages.

Lubricate the transmission components with Mopar® transmission fluid during reassembly. Use

DISASSEMBLY AND ASSEMBLY (Continued)

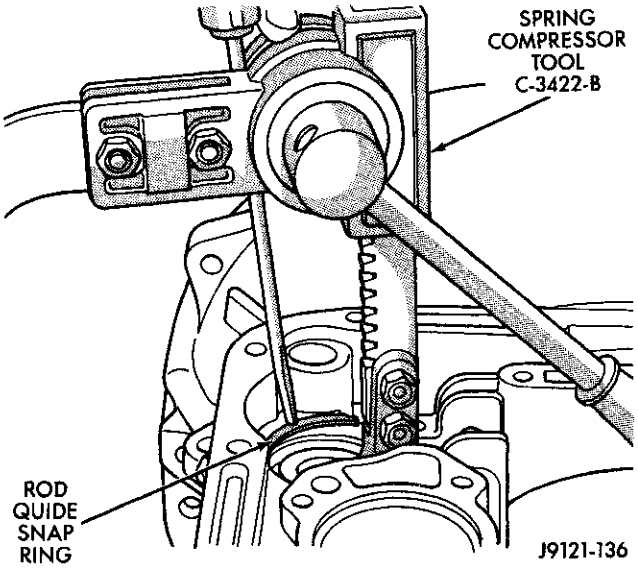

Fig. 102 Compressing Front Servo Rod Guide

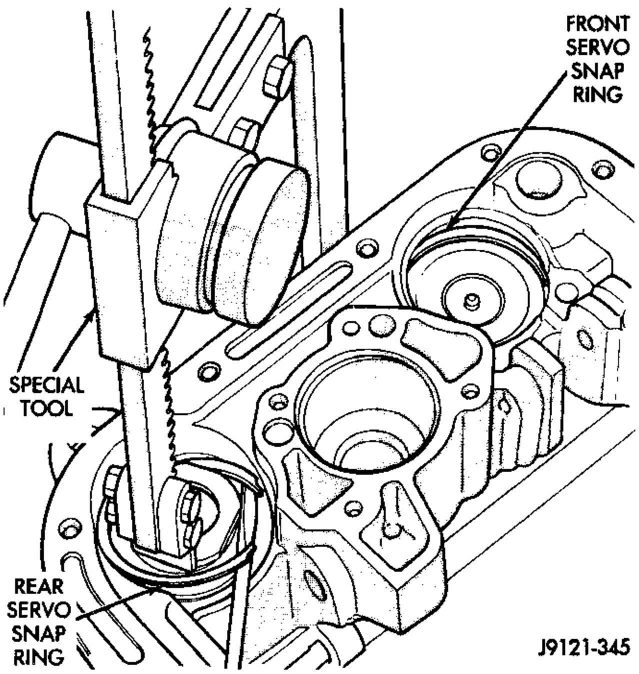

Fig. 103 Compressing Rear Servo Spring

Mopar® Door Ease, or Ru-Glyde on seals and O-rings to ease installation.

Petroleum jelly can also be used to hold thrust washers, thrust plates and gaskets in position during assembly. However, **do not** use chassis grease, bearing grease, white grease, or similar lubricants on any transmission part. These types of lubricants can eventually block or restrict fluid passages and interfere with valve operation. Use petroleum jelly only.

Do not force parts into place. The transmission components and subassemblies are easily installed by hand when properly aligned.

If a part seems extremely difficult to install, it is either misaligned or incorrectly assembled. Also verify that thrust washers, thrust plates and seal rings are correctly positioned before assembly. These parts can interfere with proper assembly if mis-positioned.

The planetary geartrain, front/rear clutch assemblies and oil pump are all much easier to install when the transmission case is upright.

(1) Install rear servo piston, spring and retainer (Fig. 104). Install spring on top of servo piston and install retainer on top of spring.

(2) Install front servo piston assembly, servo spring and rod guide (Fig. 105).

(3) Compress front/rear servo springs with Valve Spring Compressor C-3422-B and install each servo snap ring (Fig. 106).

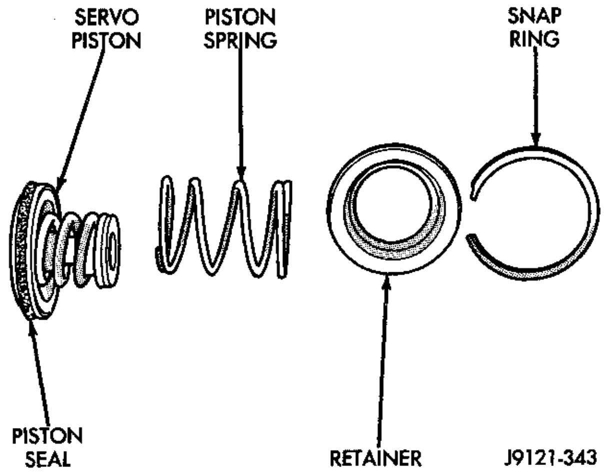

Fig. 104 Rear Servo Components

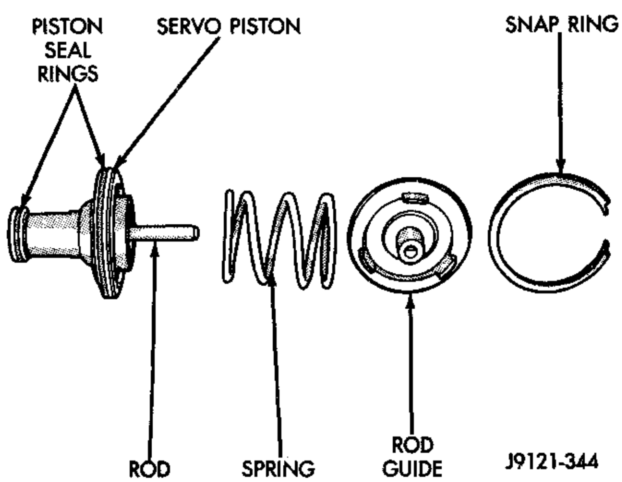

Fig. 105 Front Servo Components

(4) Lubricate clutch cam rollers with transmission fluid.

(5) Install rear band in case (Fig. 107). Be sure twin lugs on band are seated against reaction pin.

DISASSEMBLY AND ASSEMBLY (Continued)

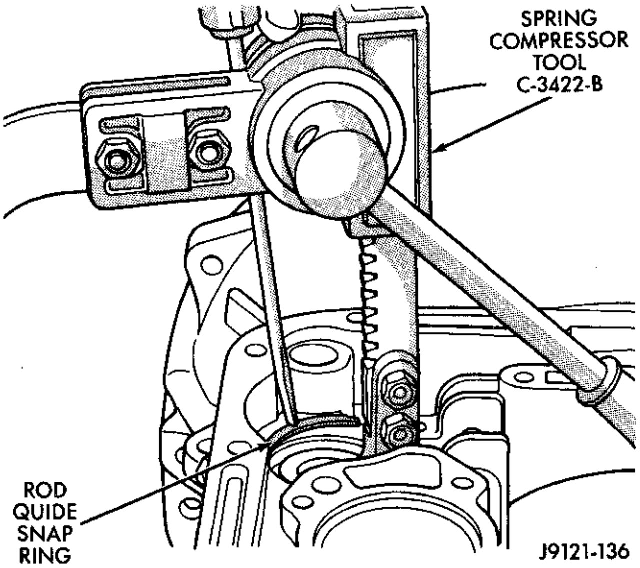

Fig. 106 Compressing Front/Rear Servo Springs

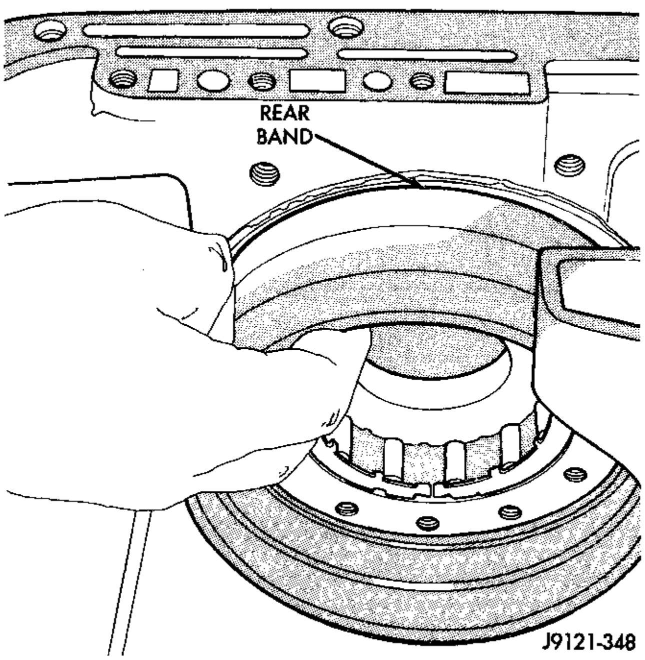

Fig. 107 Rear Band Installation

(6) Install low-reverse drum and check overrunning clutch operation as follows:

(a) Lubricate overrunning clutch race (on drum hub) with transmission fluid.

(b) Guide drum through rear band.

(c) Tilt drum slightly and start race (on drum hub) into overrunning clutch rollers.

(d) Press drum rearward and turn it in clockwise direction until drum seats in overrunning clutch (Fig. 108).

(e) Turn drum back and forth. **Drum should rotate freely in clockwise direction and lock in counterclockwise direction (as viewed from front of case).**

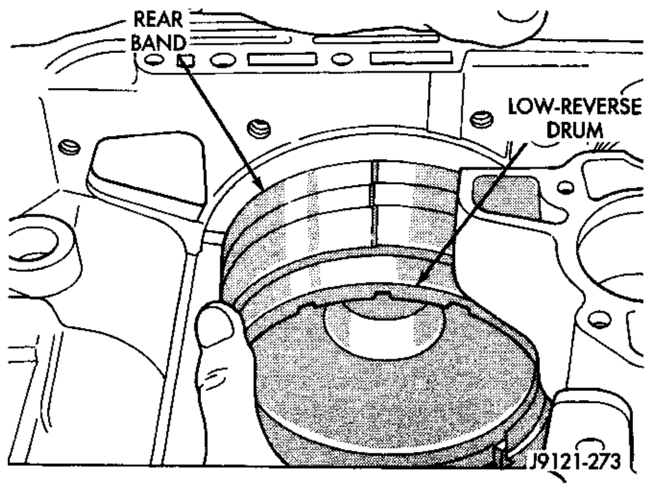

Fig. 108 Installing Low-Reverse Drum

(7) Install snap ring that secures low-reverse drum to hub of overdrive piston retainer (Fig. 109).

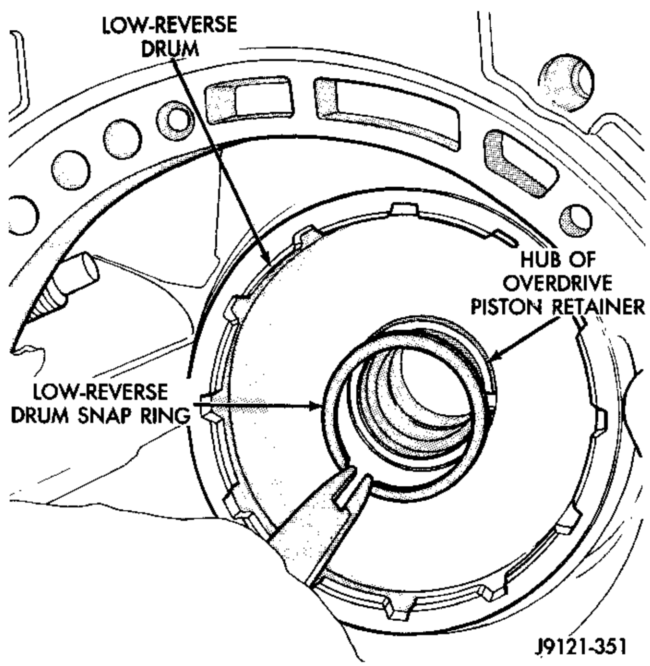

Fig. 109 Installing Low-Reverse Drum Retaining Snap Ring

Mopar AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(8) Install rear band lever and pivot pin (Fig. 110). Align lever with pin bores in case and push pivot pin into place.

(9) Install planetary geartrain assembly (Fig. 111).

(10) Install thrust plate on intermediate shaft hub

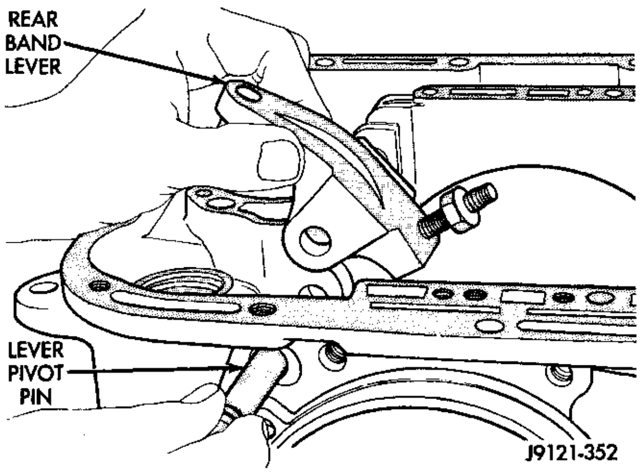

Fig. 110 Rear Band Lever And Pivot Pin Installation

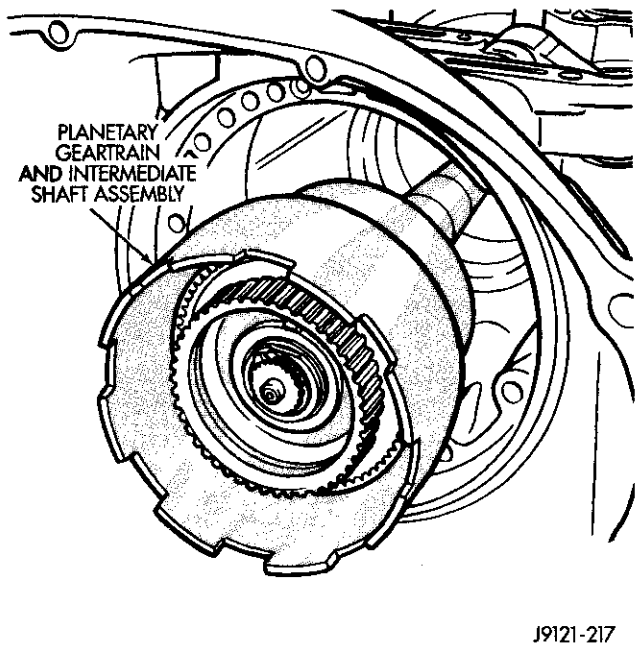

Fig. 111 Installing Planetary Geartrain

(Fig. 112). Use petroleum jelly to hold thrust plate in place.

(11) Check seal ring on rear clutch retainer hub and seal rings on input shaft (Fig. 113). Also verify that shaft seal rings are installed in sequence shown.

(12) Install rear clutch thrust washer (Fig. 114). Use additional petroleum jelly to hold washer in place if necessary.

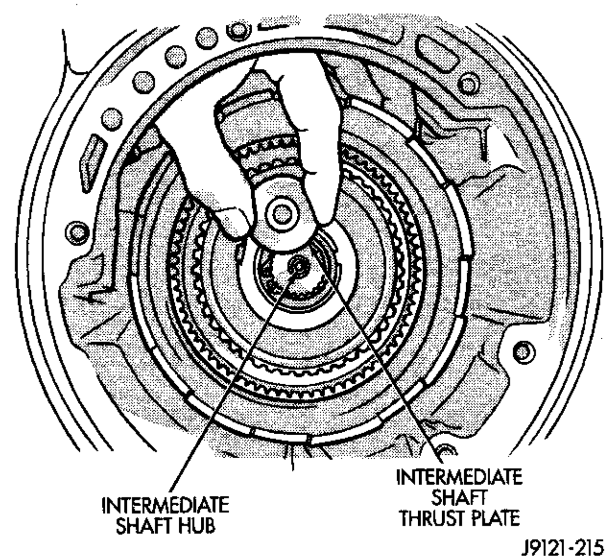

Fig. 112 Installing Intermediate Shaft Thrust Plate

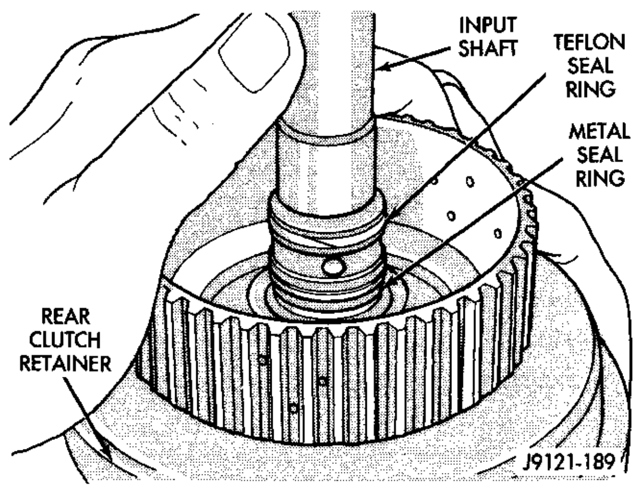

Fig. 113 Input Shaft Seal Ring Location

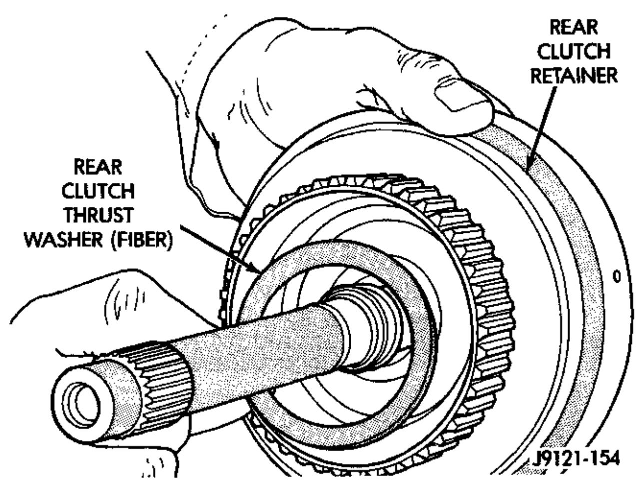

Fig. 114 Installing Rear Clutch Thrust Washer

DISASSEMBLY AND ASSEMBLY (Continued)

(13) Align clutch discs in front clutch and install front clutch on rear clutch (Fig. 115). Rotate front clutch retainer back and forth until completely seated on rear clutch retainer.

(14) Coat intermediate shaft thrust washer with petroleum jelly. Then install washer in rear clutch hub (Fig. 116). Use enough petroleum jelly to hold washer in place. **Be sure grooved side of washer faces rearward (toward output shaft) as shown. Also note that washer only fits one way in clutch hub.** Note thickness of this washer. It is a select fit part and is used to control transmission end play.

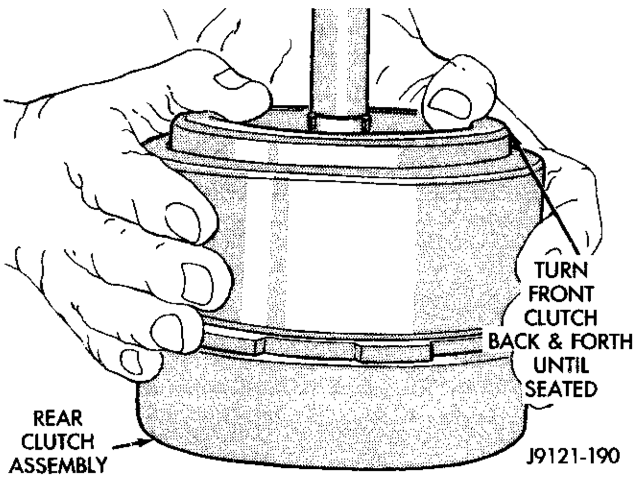

Fig. 115 Assembling Front And Rear Clutch Units

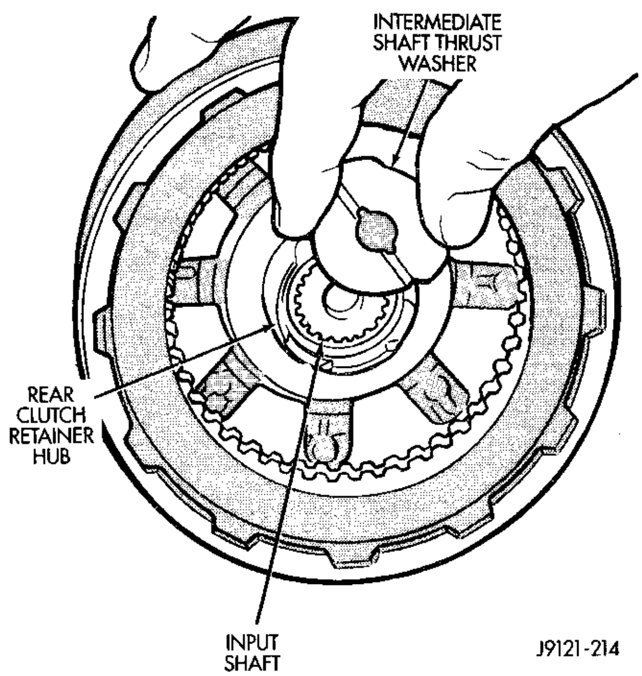

Fig. 116 Installing Intermediate Shaft Thrust Plate

(15) Align drive teeth on rear clutch discs with small screwdriver (Fig. 117). This makes installation on front planetary easier.

(16) Raise front end of transmission upward as far as possible and support case with wood blocks. Front/rear clutch and oil pump assemblies are easier to install if transmission is as close to upright position as possible.

(17) Slide front band into case.

(18) Install front and rear clutch units as assembly (Fig. 118). Align rear clutch with front annulus gear and install assembly in driving shell. **Be sure output shaft thrust washer and thrust plate are not displaced during installation.**

(19) Carefully work assembled clutches back and forth to engage and seat rear clutch discs on front annulus gear. Also be sure front clutch drive lugs are fully engaged in slots of driving shell after installation.

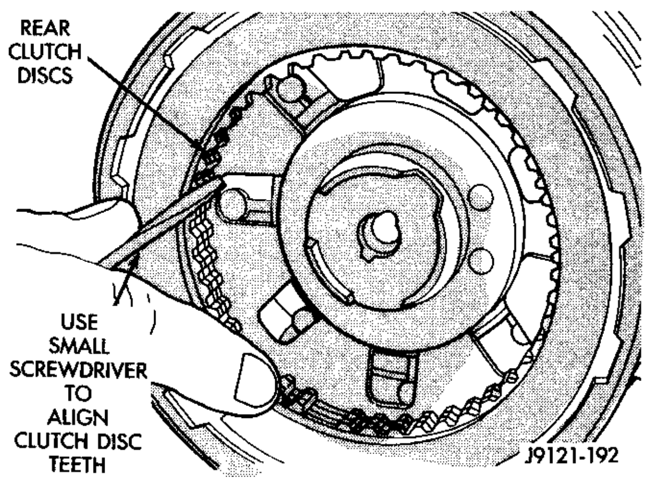

Fig. 117 Aligning Rear Clutch Disc Lugs

DISASSEMBLY AND ASSEMBLY (Continued)

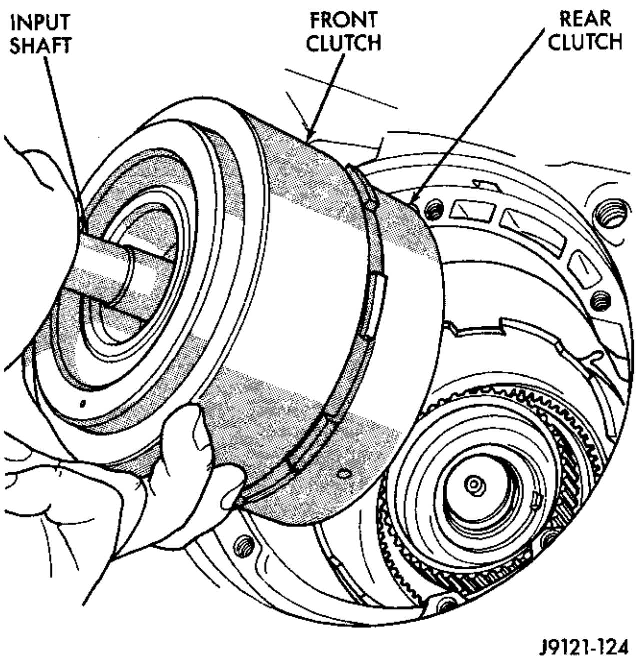

Fig. 118 Installing Front/Rear Clutch Assemblies

(20) Assemble front band strut.

(21) Install front band adjuster, strut and adjusting screw (Fig. 119).

(22) Tighten band adjusting screw until band just grips clutch retainer. Verify that front/rear clutches are still seated before continuing.

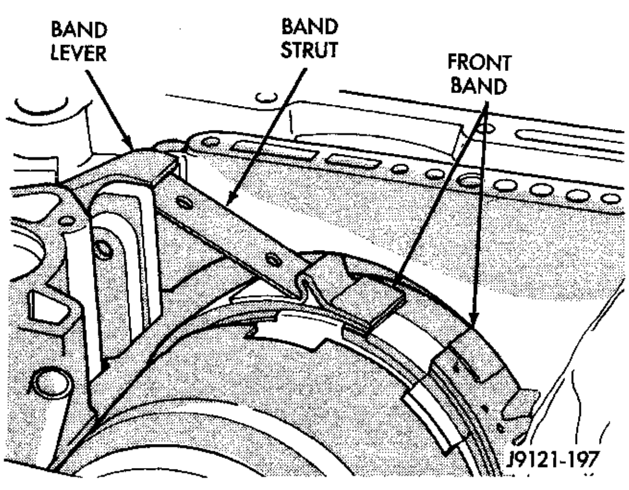

Fig. 119 Front Band Linkage Installation

(23) Check seal rings on reaction shaft support hub. Verify that seal rings are hooked together and that front clutch thrust washer is properly positioned (Fig. 120). Use petroleum jelly to hold thrust washer in place if necessary.

(24) Lubricate oil pump body seal with petroleum jelly. Lubricate pump shaft seal lip with petroleum jelly.

(25) Thread two Pilot Stud Tools C-3288-B into bolt holes in oil pump bore flange (Fig. 121).

(26) Align and install oil pump gasket (Fig. 121).

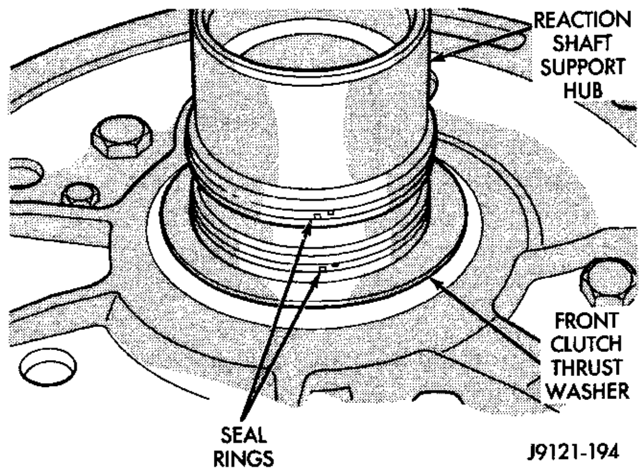

Fig. 120 Reaction Shaft Support Seal Rings And Front Clutch Thrust Washer

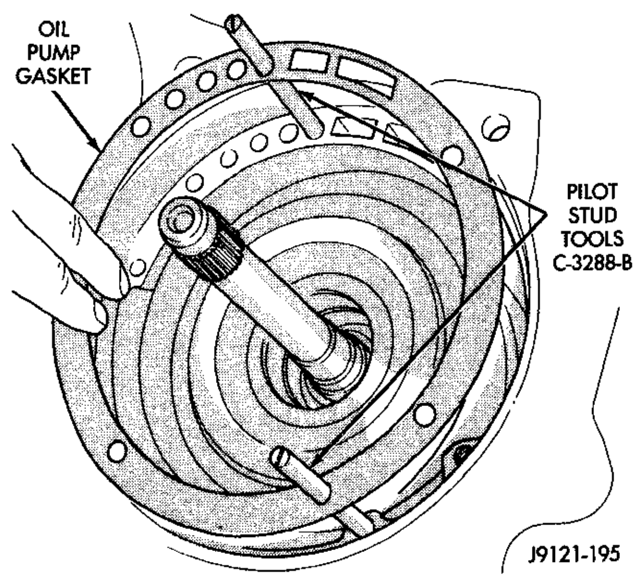

Fig. 121 Installing Pilot Studs And Oil Pump Gasket

DISASSEMBLY AND ASSEMBLY (Continued)

(27) Install oil pump (Fig. 122). Align and position pump on pilot studs. Slide pump down studs and work it into front clutch hub and case by hand. Then install 2 or 3 pump bolts to hold pump in place.

(28) Remove pilot stud tools and install remaining oil pump bolts. Tighten bolts alternately in diagonal pattern to 20 N·m (15 ft. lbs.).

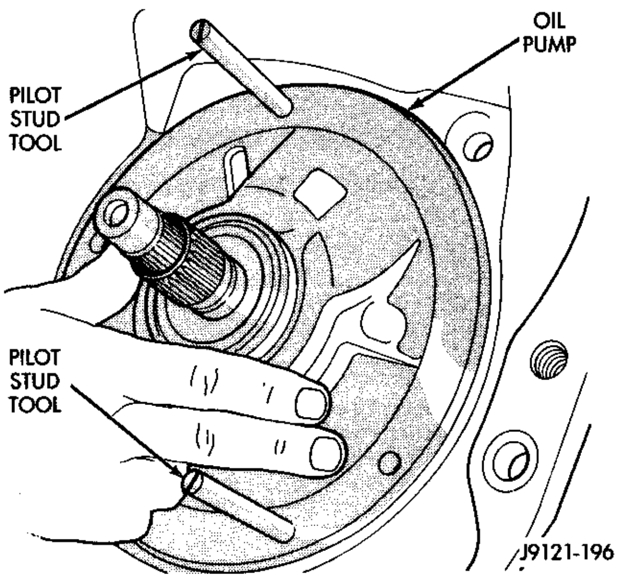

Fig. 122 Installing Oil Pump Assembly In Case

(29) Measure and if necessary, correct input shaft end play as follows (Fig. 123):

(a) Attach dial indicator to converter housing.

(b) Position indicator plunger against input shaft and zero indicator.

(c) Move input shaft in and out and record reading. End play should be 0.56 - 2.31 mm (0.022 - 0.091 in.). Proceed to next step if end play is not within specified limits.

(d) Intermediate shaft thrust washer (in hub of rear clutch retainer) controls end play. Washer is a select fit part and can be changed to adjust end play. If end play turns out to be incorrect, remove oil pump, and clutches. Then install thinner/thicker thrust washer as necessary.

(30) Install accumulator piston and inner and outer springs (Fig. 124).

(31) Verify that valve body solenoid harness is secured in 3-4 accumulator housing cover plate.

(32) Install valve body as follows:

(a) Align and carefully insert park rod into pawl. Rod will make click noise as it enters pawl. Move rod slightly to check engagement.

(b) Align and seat valve body on case. Be sure manual lever shaft and overdrive connector are fully seated in case. Also be sure valve body wiring is not pinched or kinked.

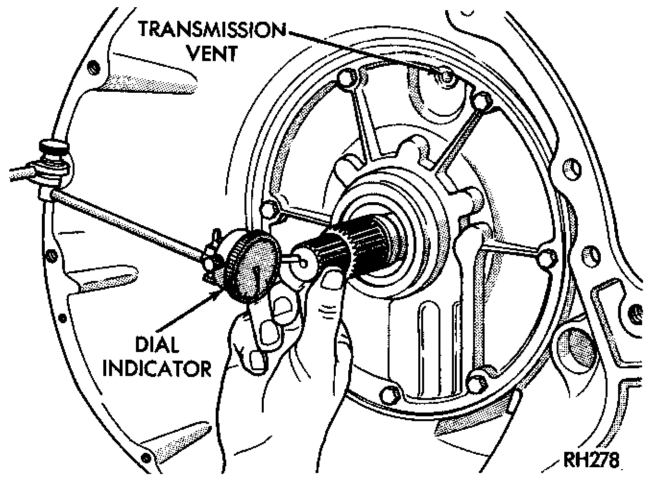

Fig. 123 Measuring Input Shaft End Play

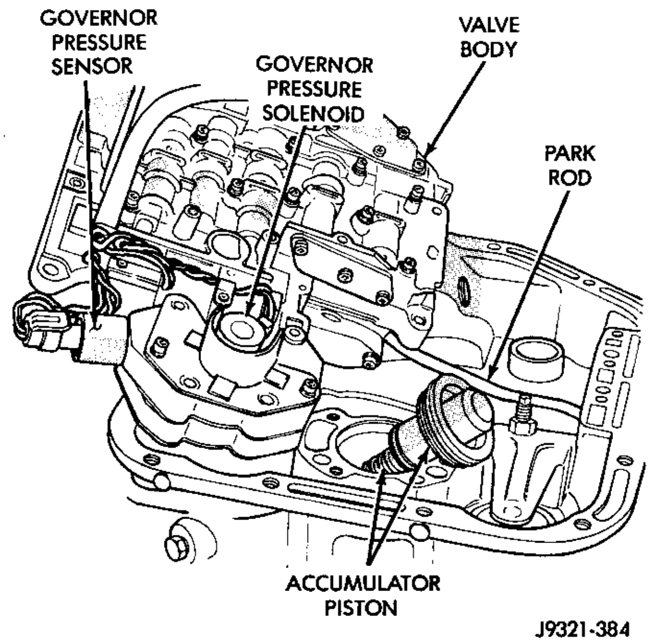

Fig. 124 Accumulator Piston And Springs

(c) Install and start all valve body attaching bolts by hand. Then tighten bolts evenly, in a diagonal pattern to 12 N·m (105 in. lbs.) torque. **Do not overtighten valve body bolts. This could result in distortion and cross leakage after installation..**

CAUTION: It is possible for the park rod to displace into a cavity just above the pawl sprag during installation. Make sure the rod is actually engaged in the pawl and has not displaced into the cavity.

(33) Install new filter on valve body. Tighten filter screws to 4 N·m (35 in. lbs.).

(34) Adjust front and rear bands.

DISASSEMBLY AND ASSEMBLY (Continued)

(35) Install seal on park/neutral position switch (Fig. 125). Then install and tighten switch to 34 N·m (25 ft. lbs.).

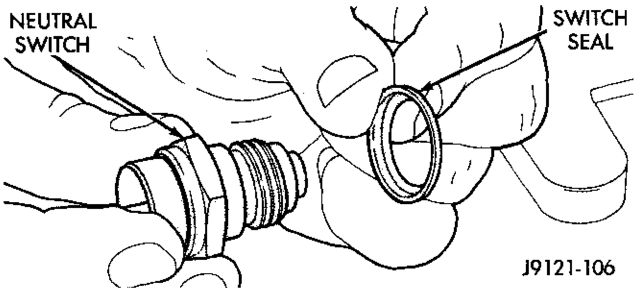

Fig. 125 Park/Neutral Position Switch Seal Position

(36) Install magnet in oil pan. Magnet goes on small protrusion at corner of pan.

(37) Position new oil pan gasket on case and install oil pan. Tighten pan bolts to 17 N·m (13 ft. lbs.).

(38) Install new valve body manual shaft seal in case (Fig. 126). Lubricate seal lip and manual shaft with petroleum jelly. Start seal over shaft and into case. Seat seal with 15/16 inch, deep well socket.

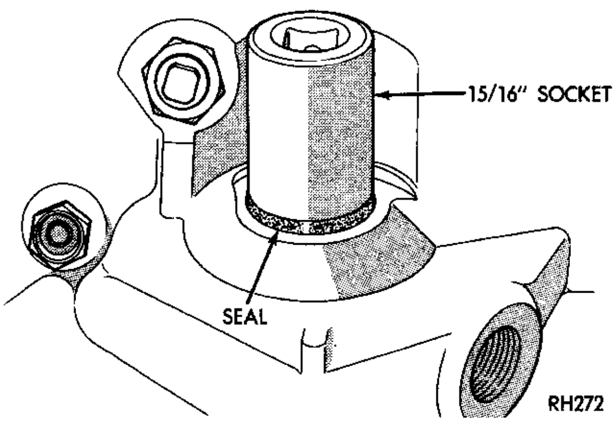

Fig. 126 Installing Manual Lever Shaft Seal

(39) Install throttle valve and shift selector levers on valve body manual lever shaft.

OVERRUNNING CLUTCH CAM/OVERDRIVE PISTON RETAINER

DISASSEMBLY

NOTE: TO SERVICE THE OVERRUNNING CLUTCH CAM AND THE OVERDRIVE PISTON RETAINER, THE TRANSMISSION GEARTRAIN AND OVERDRIVE UNIT MUST BE REMOVED FROM THE TRANSMISSION.

(1) Remove the overdrive piston (Fig. 127).
(2) Remove the overdrive piston retainer bolts.
(3) Remove overdrive piston retainer.
(4) Remove case gasket.
(5) Mark the position of the overrunning clutch cam in the case (Fig. 128).
(6) Remove the overrunning clutch cam bolts.
(7) Remove the overrunning clutch cam.

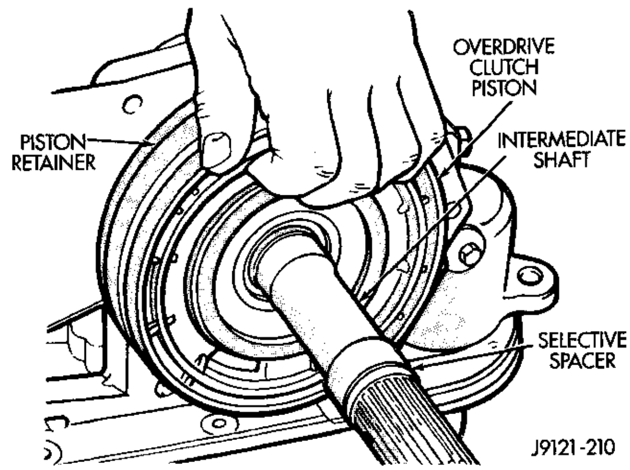

Fig. 127 Overdrive Piston Removal

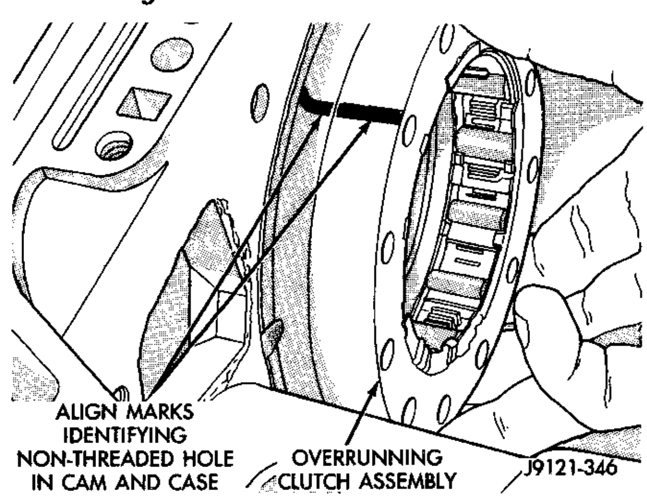

Fig. 128 Overrunning Clutch Cam Removal

DISASSEMBLY AND ASSEMBLY (Continued)

ASSEMBLY

(1) Examine bolt holes in overrunning clutch cam. Note that one hole is **not threaded** (Fig. 129). This hole must align with blank area in clutch cam bolt circle (Fig. 130). Mark hole location on clutch cam and blank area in case with grease pencil, paint stripe, or scribe mark for assembly reference.

(2) Mark location of non-threaded hole in clutch cam and blank area in bolt circle with grease pencil.

(3) Align and install overrunning clutch and cam in case (Fig. 131). **Be sure cam is correctly installed. Bolt holes in cam are slightly countersunk on one side. Be sure this side of cam faces rearward (toward piston retainer).**

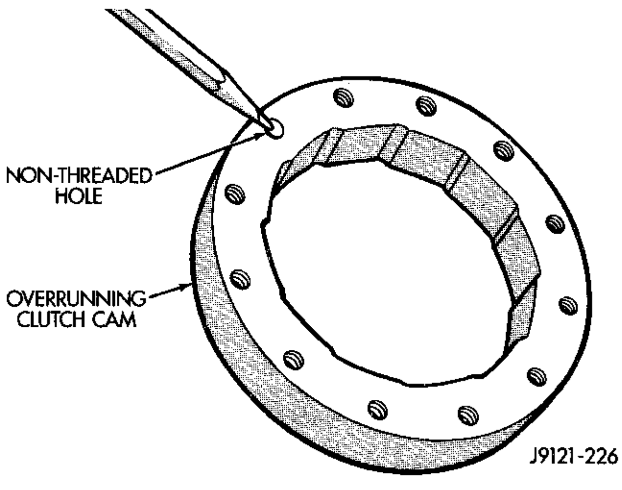

Fig. 129 Location Of Non-Threaded Hole In Clutch Cam

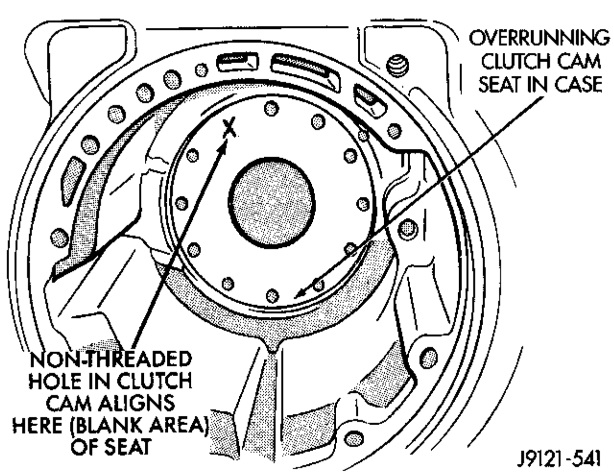

Fig. 130 Location Of Blank Area In Clutch Cam Bolt Circle

(4) Verify that non-threaded hole in clutch cam is properly aligned. Check alignment by threading a bolt into each bolt hole. Adjust clutch cam position if necessary.

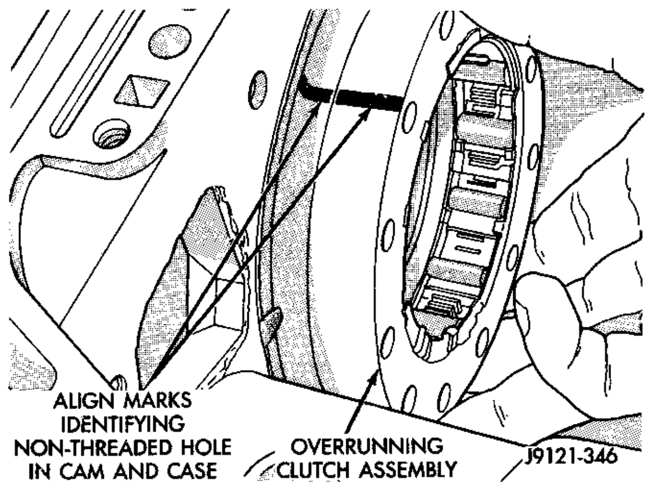

Fig. 131 Overrunning Clutch Installation

(5) Install and tighten overrunning clutch cam bolts to 17 N·m (13 ft. lbs.) torque. Note that clutch cam bolts are shorter than piston retainer bolts.

(6) Install new gasket at rear of transmission case. Use petroleum jelly to hold gasket in place. Be sure to align governor feed holes in gasket with feed passages in case (Fig. 132). Also install gasket before overdrive piston retainer. Center hole in gasket is smaller than retainer and cannot be installed over retainer.

(7) Position overdrive piston retainer on transmission case and align bolt holes in retainer, gasket and case (Fig. 133). Then install and tighten retainer bolts to 17 N·m (13 ft. lbs.) torque.

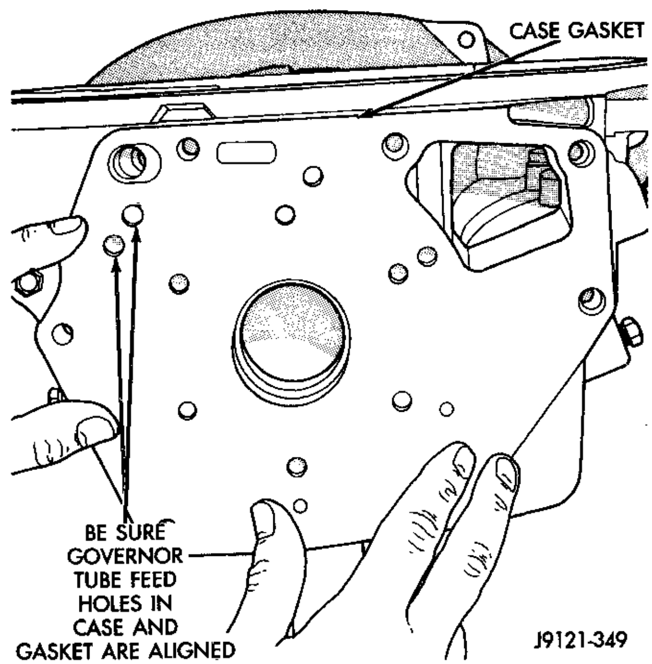

Fig. 132 Installing/Aligning Case Gasket

(8) Install new seals on over drive piston.

Mopar AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

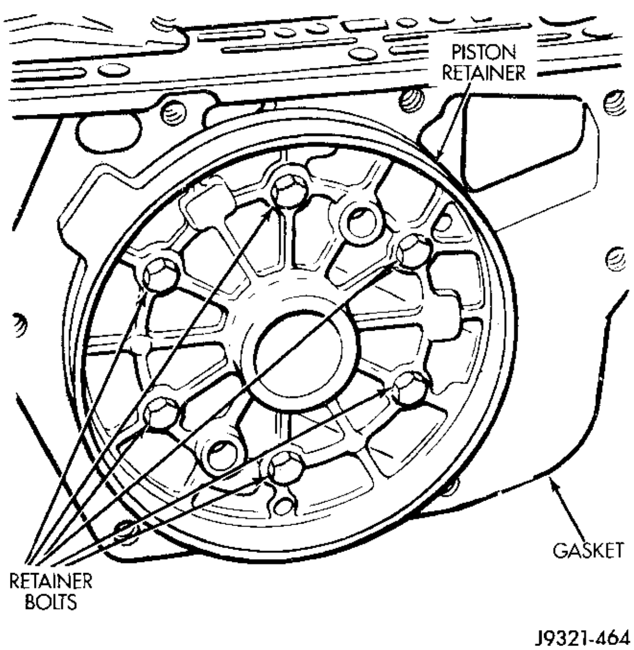

Fig. 133 Aligning Overdrive Piston Retainer

(9) Stand transmission case upright on bellhousing.

(10) Position Guide Ring 8114-1 on outer edge of overdrive piston retainer.

(11) Position Seal Guide 8114-2 on inner edge of overdrive piston retainer.

(12) Install overdrive piston in overdrive piston retainer by: aligning locating lugs on overdrive piston to the two mating holes in retainer.

(a) Aligning locating lugs on overdrive piston to the two mating holes in retainer.

(b) Lubricate overdrive piston seals with Mopar® Door Ease, or equivalent.

(c) Install piston over Seal Guide 8114–2 and inside Guide Ring 8114–1.

(d) Push overdrive piston into position in retainer.

(e) Verify that the locating lugs entered the lug bores in the retainer.

NOTE: INSTALL THE REMAINING TRANSMISSION COMPONENTS AND OVERDRIVE UNIT.

FRONT SERVO PISTON

DISASSEMBLY

(1) Remove seal ring from rod guide (Fig. 134).

(2) Remove small snap ring from servo piston rod. Then remove piston rod, spring and washer from piston.

(3) Remove and discard servo component O-ring and seal rings.

ASSEMBLY

Clean and inspect front servo components.

(1) Lubricate new O-ring and seal rings with petroleum jelly and install them on piston, guide and rod.

(2) Install rod in piston. Install spring and washer on rod. Compress spring and install snap ring (Fig. 134).

(3) Set servo components aside for installation during transmission reassembly.

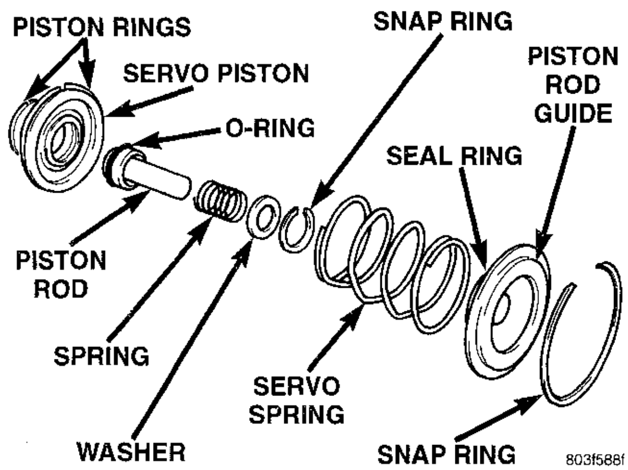

Fig. 134 Front Servo

REAR SERVO PISTON

DISASSEMBLY

(1) Remove small snap ring and remove plug and spring from servo piston (Fig. 135).

(2) Remove and discard servo piston seal ring.

ASSEMBLY

(1) Lubricate piston and guide seals with petroleum jelly. Lubricate other servo parts with Mopar® ATF Plus 3, Type 7176, transmission fluid.

(2) Install new seal ring on servo piston.

(3) Assemble piston, plug, spring and new snap ring.

(4) Lubricate piston seal lip with petroleum jelly.

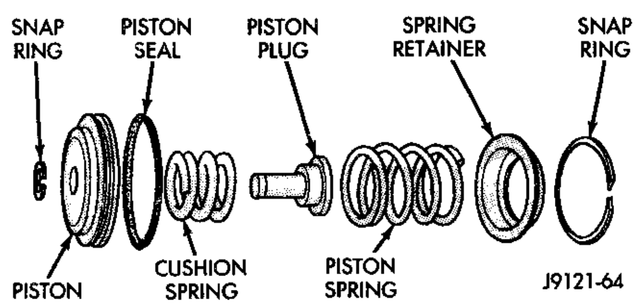

Fig. 135 Rear Servo Components

DISASSEMBLY AND ASSEMBLY (Continued)

OIL PUMP AND REACTION SHAFT SUPPORT

DISASSEMBLY

(1) Remove seal ring from housing and reaction shaft support (Fig. 136).

(2) Mark pump housing and support assembly for alignment reference.

(3) Remove bolts attaching pump body to support (Fig. 137).

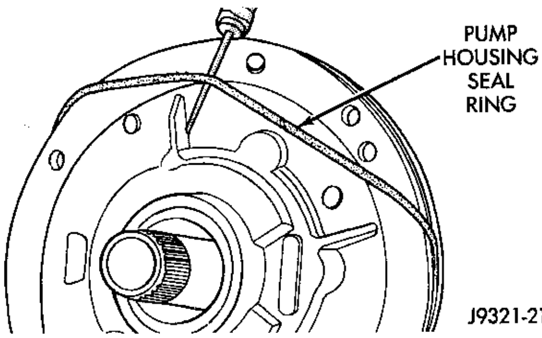

Fig. 136 Removing Pump Seal Ring

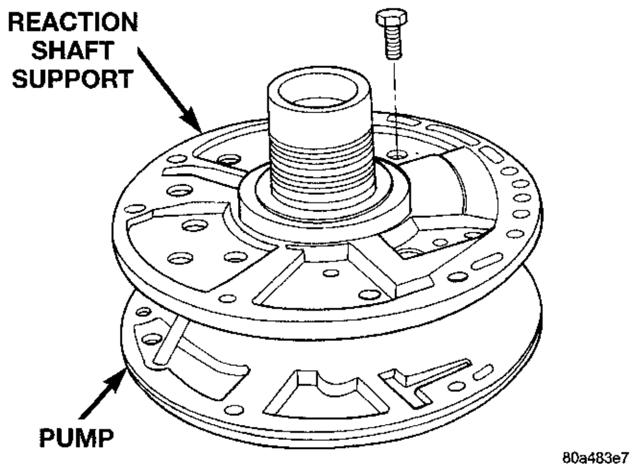

Fig. 137 Pump Support Bolts

(4) Separate support from pump housing (Fig. 138).

(5) Remove inner and outer gears from reaction shaft support (Fig. 139).

(6) If pump seal was not removed during transmission disassembly, remove seal with punch and hammer.

(7) Remove front clutch thrust washer from support hub (Fig. 140).

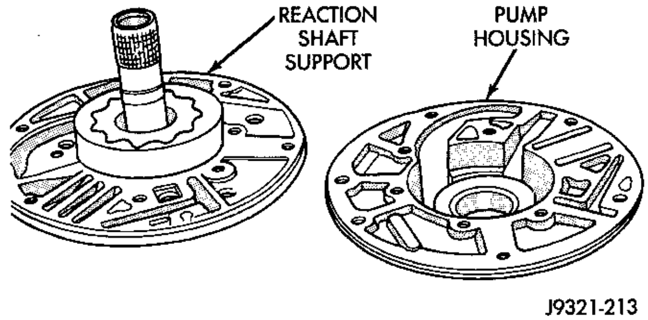

Fig. 138 Separating Pump Housing From Reaction Shaft Support

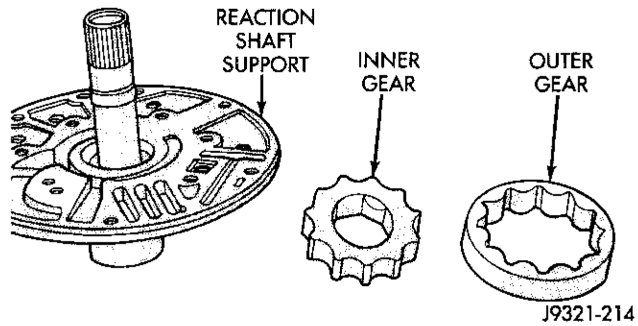

Fig. 139 Pump Gear Removal

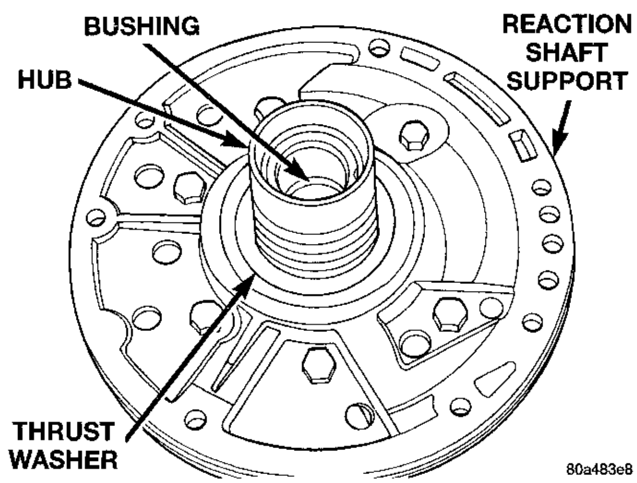

Fig. 140 Support Hub Thrust Washer

DISASSEMBLY AND ASSEMBLY (Continued)

OIL PUMP BUSHING REPLACEMENT

(1) Remove pump bushing with Tool Handle C-4171 and Bushing Remover SP-3551 from Tool Set C-3887-J (Fig. 141).

(2) Install new pump bushing with Tool Handle C-4171 and Bushing Installer SP-5117 (Fig. 141). Bushing should be flush with pump housing bore.

(3) Stake new pump bushing in two places with blunt punch (Fig. 142). Remove burrs from stake points with knife blade afterward.

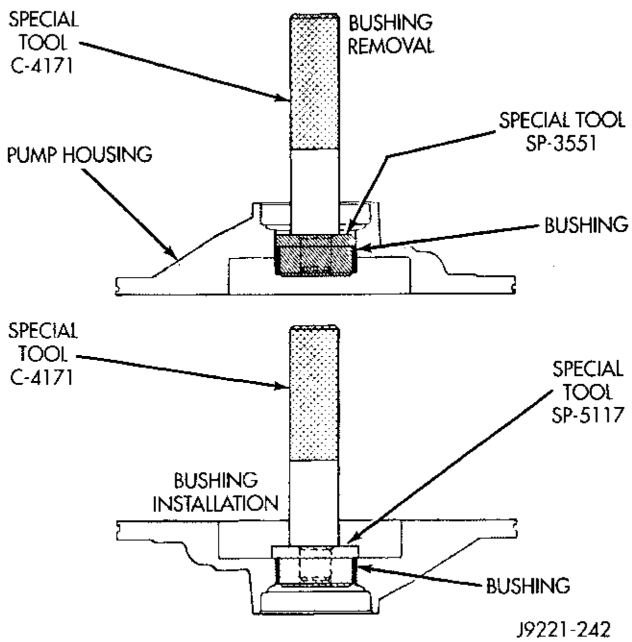

Fig. 141 Removing Oil Pump Bushing

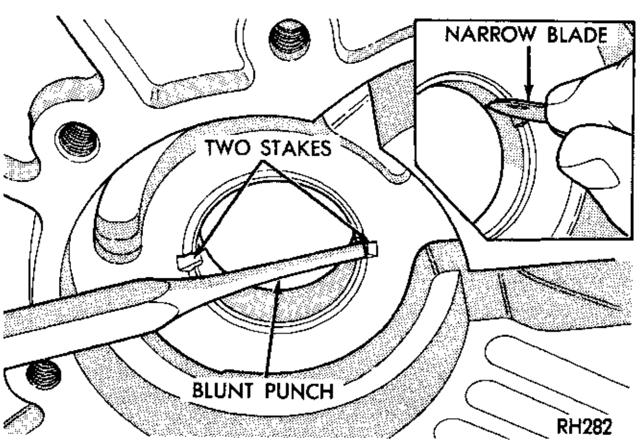

Fig. 142 Staking Oil Pump Bushing

REACTION SHAFT SUPPORT BUSHING REMOVAL

(1) Assemble Bushing Remover Tools SP-1191, 3633 and 5324 (Fig. 143). **Do not clamp any part of reaction shaft or support in vise.**

(2) Hold Cup Tool SP-3633 firmly against reaction shaft and thread remover SP-5324 into bushing as far as possible by hand. Then thread remover tool 3-4 additional turns into bushing with a wrench.

(3) Turn remover tool hex nut down against remover cup to pull bushing from shaft. Clean all chips from shaft after bushing removal.

(4) Lightly grip old bushing in vise or with pliers and back remover tool out of bushing.

(5) Assemble Bushing Installer Tools C-4171 and SP-5325 (Fig. 143).

(6) Slide new bushing onto Installer Tool SP-5325.

(7) Position reaction shaft support upright on a clean smooth surface.

(8) Align bushing in bore. Then tap bushing into place until Bushing Installer SP-5325 bottoms.

(9) Clean reaction shaft support thoroughly after installing bushing.

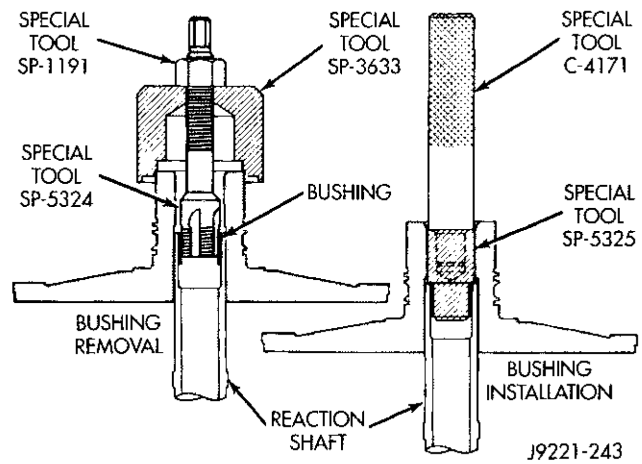

Fig. 143 Replacing Reaction Shaft Support Bushing

ASSEMBLY

(1) Lubricate gear bore in pump housing with transmission fluid.

(2) Lubricate pump gears with transmission fluid.

(3) Support pump housing on wood blocks (Fig. 144).

(4) Install outer gear in pump housing (Fig. 144). Gear can be installed either way (it is not a one-way fit).

(5) Install pump inner gear (Fig. 145).

CAUTION: The pump inner gear is a one way fit. The bore on one side of the gear inside diameter (I.D.) is chamfered. Be sure the chamfered side faces forward (to front of pump).

(6) Install new thrust washer on hub of reaction shaft support. Lubricate washer with transmission fluid or petroleum jelly.

(7) If reaction shaft seal rings are being replaced, install new seal rings on support hub (Fig. 146). Lubricate seal rings with transmission fluid or petro-

DISASSEMBLY AND ASSEMBLY (Continued)

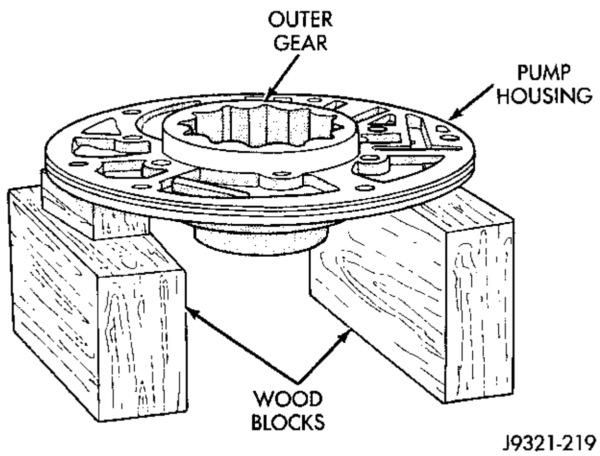

Fig. 144 Supporting Pump And Installing Outer Gear

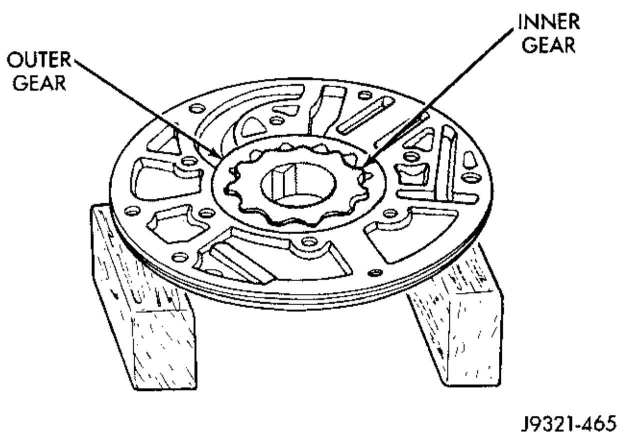

Fig. 145 Pump Inner Gear Installation

leum jelly after installation. Squeeze each ring until ring ends are securely hooked together.

CAUTION: The reaction shaft support seal rings will break if overspread, or twisted. If new rings are being installed, spread them only enough for installation. Also be very sure the ring ends are securely hooked together after installation. Otherwise, the rings will either prevent pump installation, or break during installation.

(8) Install reaction shaft support on pump housing (Fig. 147).

(9) Align reaction support on pump housing. Use alignment marks made at disassembly. Or, rotate support until bolt holes in support and pump housing are all aligned (holes are offset for one-way fit).

(10) Install all bolts that attach support to pump housing. Then tighten bolts finger tight.

(11) Tighten support-to-pump bolts to required torque as follows:

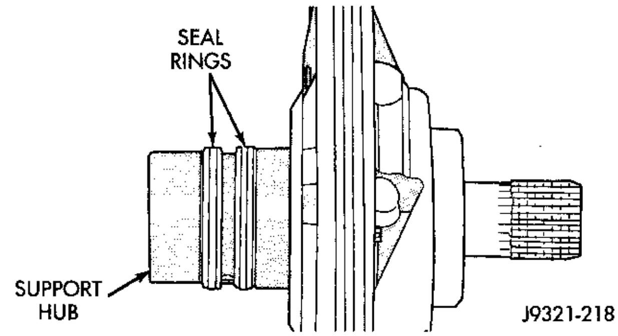

Fig. 146 Hub Seal Ring Position

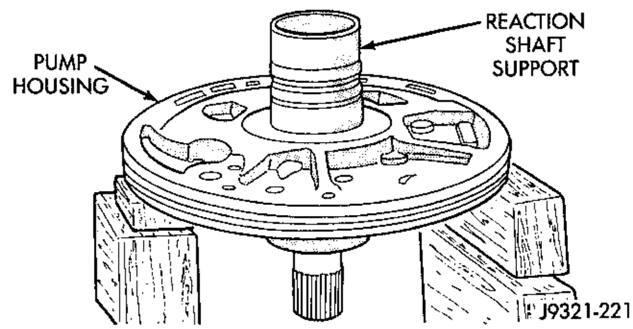

Fig. 147 Assembling Reaction Shaft Support And Pump Housing

(a) Reverse pump assembly and install it in transmission case. Position pump so bolts are facing out and are accessible.

(b) Secure pump assembly in case with 2 or 3 bolts, or with pilot studs.

(c) Tighten support-to-pump bolts to 20 N·m (15 ft. lbs.).

(d) Remove pump assembly from transmission case.

(12) Install new oil seal in pump with Special Tool C-4193 and Tool Handle C-4171 (Fig. 148). Be sure seal lip faces inward.

(13) Install new seal ring around pump housing. Be sure seal is properly seated in groove.

(14) Lubricate lip of pump oil seal and O-ring seal with transmission fluid.

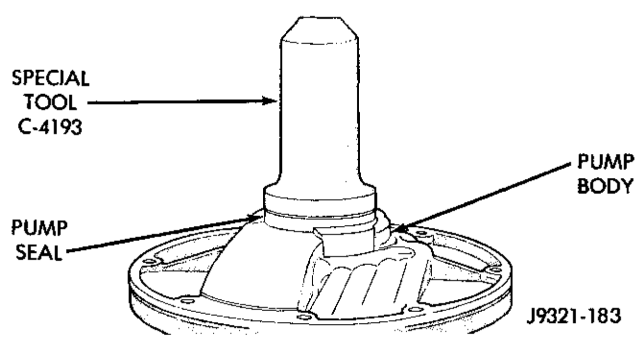

Fig. 148 Pump Oil Seal Installation

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

FRONT CLUTCH

NOTE: The 42RE transmission uses four plates and discs for the front clutch.

DISASSEMBLY

(1) Remove waved snap ring and remove pressure plate, clutch plates and clutch discs (Fig. 149).

(2) Compress clutch piston spring with Compressor Tool C-3575-A (Fig. 150). Be sure legs of tool are seated squarely on spring retainer before compressing spring.

(3) Remove retainer snap ring and remove compressor tool.

(4) Remove spring retainer and clutch spring. Note position of retainer on spring for assembly reference.

(5) Remove clutch piston from clutch retainer. Remove piston by rotating it up and out of retainer.

(6) Remove seals from clutch piston and clutch retainer hub. Discard both seals as they are not reusable.

ASSEMBLY

(1) Soak clutch discs in transmission fluid while assembling other clutch parts.

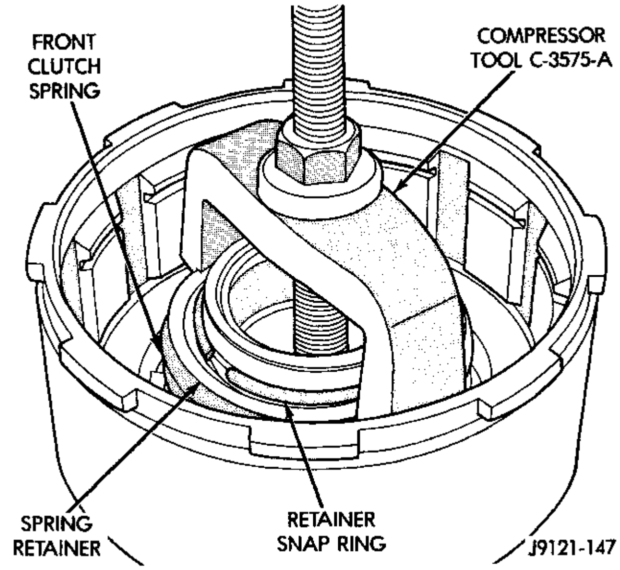

Fig. 150 Compressing Front Clutch Piston Spring

(2) Install new seals on piston and in hub of retainer. Be sure lip of each seal faces interior of clutch retainer.

(3) Lubricate lips of piston and retainer seals with liberal quantity of Mopar® Door Ease. Then lubricate

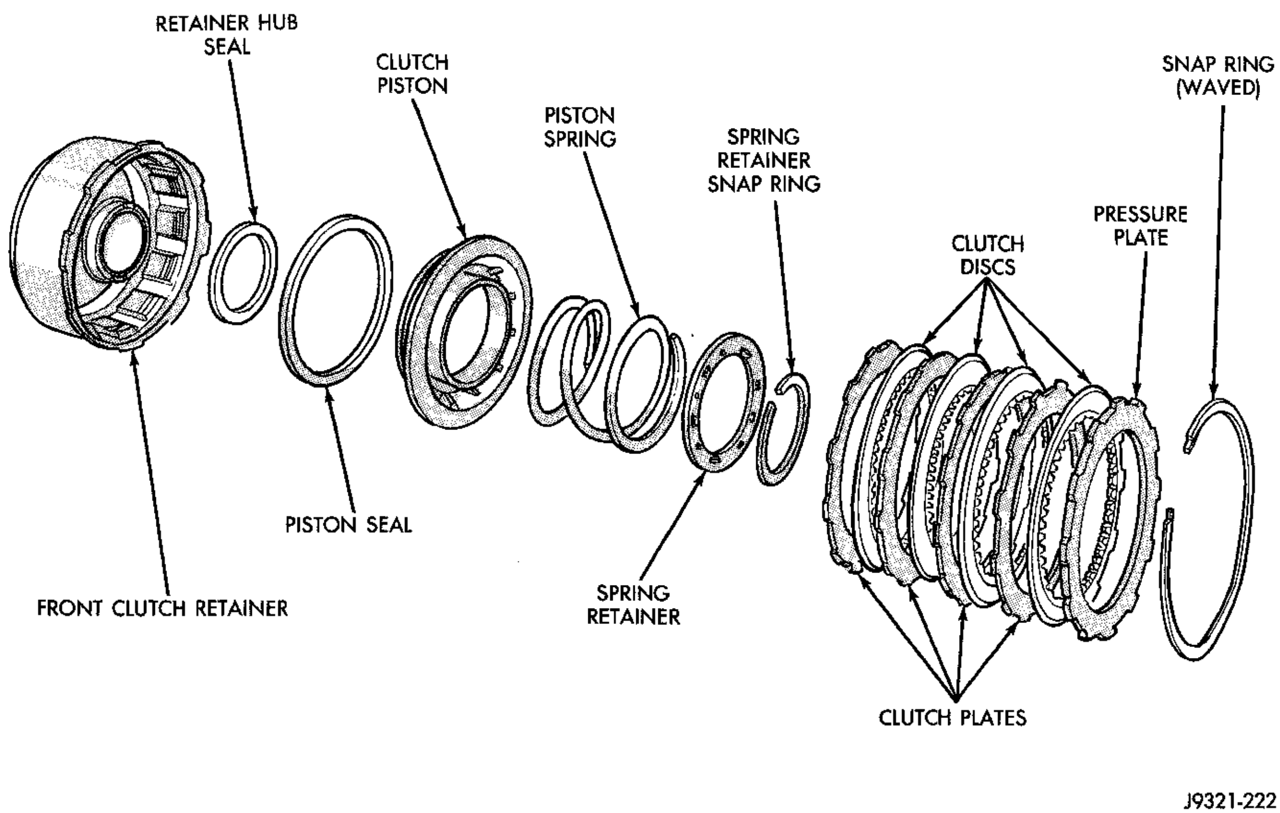

Fig. 149 42RE Front Clutch Components

DISASSEMBLY AND ASSEMBLY (Continued)

retainer hub, bore and piston with light coat of transmission fluid.

(4) Install clutch piston in retainer (Fig. 151). Use twisting motion to seat piston in bottom of retainer.

CAUTION: Never push the clutch piston straight in. This will fold the seals over causing leakage and clutch slip.

(5) Position spring in clutch piston (Fig. 152).

(6) Position spring retainer on top of piston spring (Fig. 153). **Make sure retainer is properly installed. Small raised tabs should be facing upward. Semicircular lugs on underside of retainer are for positioning retainer in spring.**

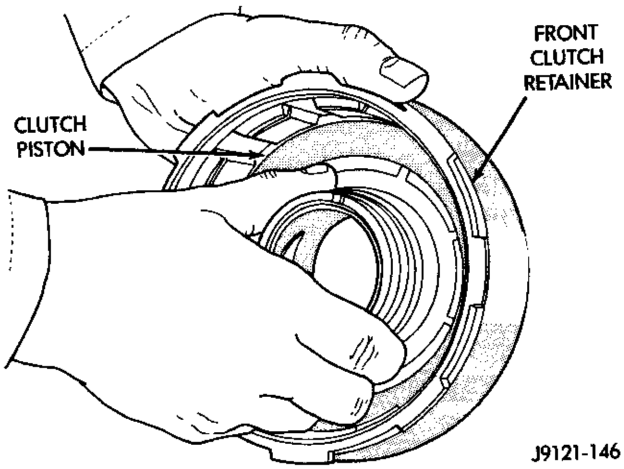

Fig. 151 Front Clutch Piston Installation

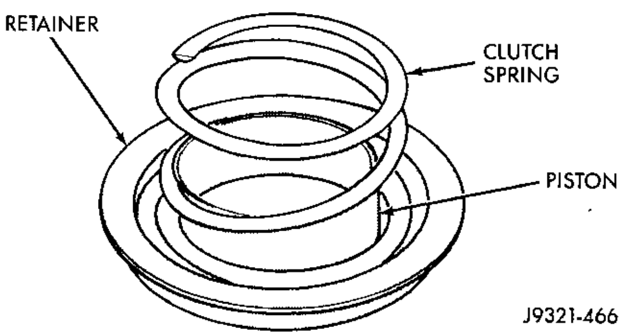

Fig. 152 Clutch Piston Spring Installation

(7) Compress piston spring and retainer with Compressor Tool C-3575-A (Fig. 150). Then install new snap ring to secure spring retainer and spring.

(8) Install clutch plates and discs (Fig. 149). Install steel plate then disc until all plates and discs are installed. The front clutch uses 4 clutch discs and plates in a 42RE transmission.

(9) Install pressure plate and waved snap ring (Fig. 149).

Clearance should be 1.70 to 3.40 mm (0.067 to 0.134 in.). If clearance is incorrect, clutch discs, plates, pressure plates and snap ring may have to be changed.

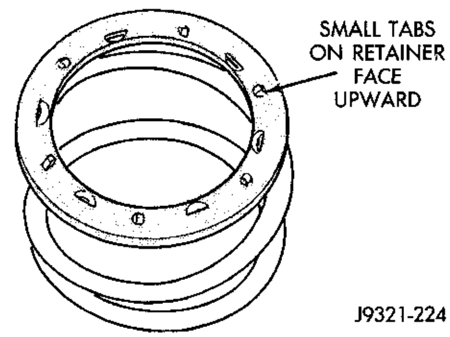

Fig. 153 Correct Spring Retainer Installed Position

REAR CLUTCH

DISASSEMBLY

(1) Remove fiber thrust washer from forward side of clutch retainer.

(2) Remove input shaft front/rear seal rings.

(3) Remove selective clutch pack snap ring (Fig. 154).

(4) Remove top pressure plate, clutch discs, steel plates, bottom pressure plate and wave snap ring and wave spring (Fig. 154).

(5) Remove clutch piston with rotating motion.

(6) Remove and discard piston seals.

(7) Remove input shaft snap-ring (Fig. 155). It may be necessary to press the input shaft in slightly to relieve tension on the snap-ring

(8) Press input shaft out of retainer with shop press and suitable size press tool. Use a suitably sized press tool to support the retainer as close to the input shaft as possible.

ASSEMBLY

(1) Soak clutch discs in transmission fluid while assembling other clutch parts.

(2) Install new seal rings on clutch retainer hub and input shaft if necessary (Fig. 156).

(a) Be sure clutch hub seal ring is fully seated in groove and is not twisted.

(3) Lubricate splined end of input shaft and clutch retainer with transmission fluid. Then press input shaft into retainer. Use a suitably sized press tool to support retainer as close to input shaft as possible.

(4) Install input shaft snap-ring (Fig. 155).

(5) Invert retainer and press input shaft in opposite direction until snap-ring is seated.

(6) Install new seals on clutch piston. Be sure lip of each seal faces interior of clutch retainer.

(7) Lubricate lip of piston seals with generous quantity of Mopar® Door Ease. Then lubricate retainer hub and bore with light coat of transmission fluid.

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

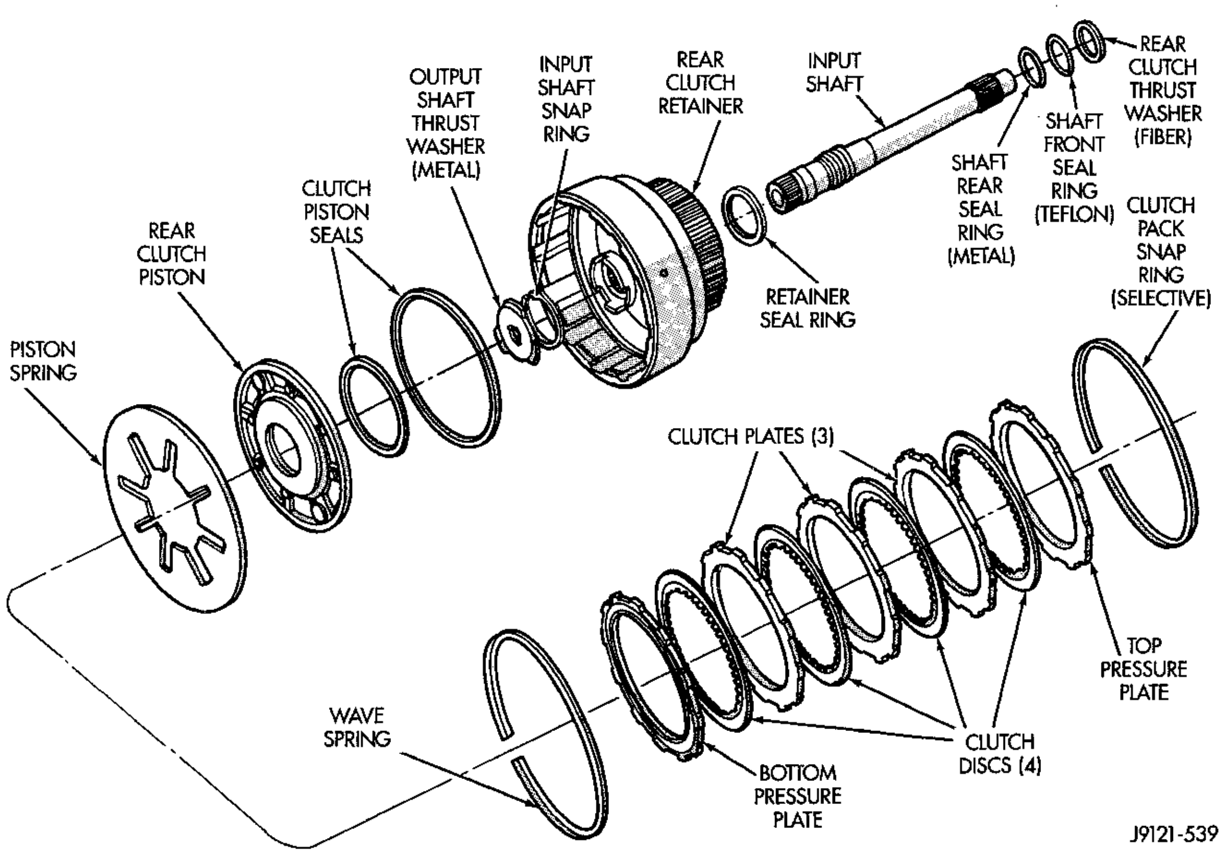

Fig. 154 Rear Clutch Components

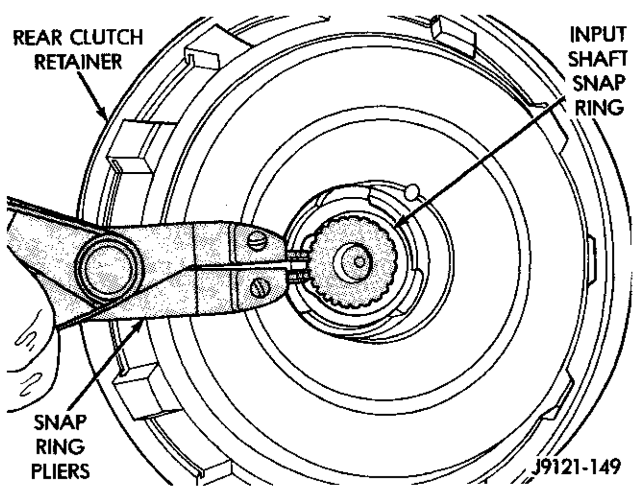

Fig. 155 Removing/Installing Input Shaft Snap-Ring

(8) Install clutch piston in retainer. Use twisting motion to seat piston in bottom of retainer. A thin strip of plastic (about 0.020" thick), can be used to guide seals into place if necessary.

CAUTION: Never push the clutch piston straight in. This will fold the seals over causing leakage and clutch slip. In addition, never use any type of metal tool to help ease the piston seals into place. Metal tools will cut, shave, or score the seals.

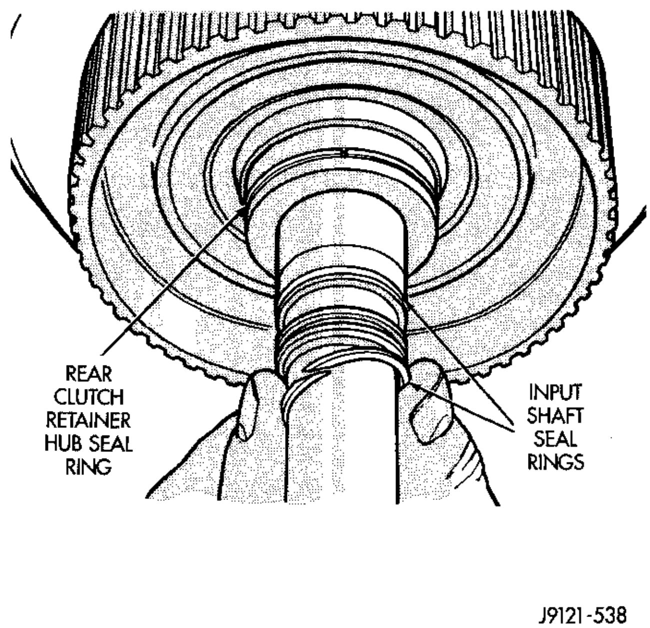

Fig. 156 Rear Clutch Retainer And Input Shaft Seal Ring Installation

DISASSEMBLY AND ASSEMBLY (Continued)

(9) Install piston spring in retainer and on top of piston (Fig. 159). Concave side of spring faces downward (toward piston).

(10) Install wave spring in retainer (Fig. 159). Be sure spring is completely seated in retainer groove.

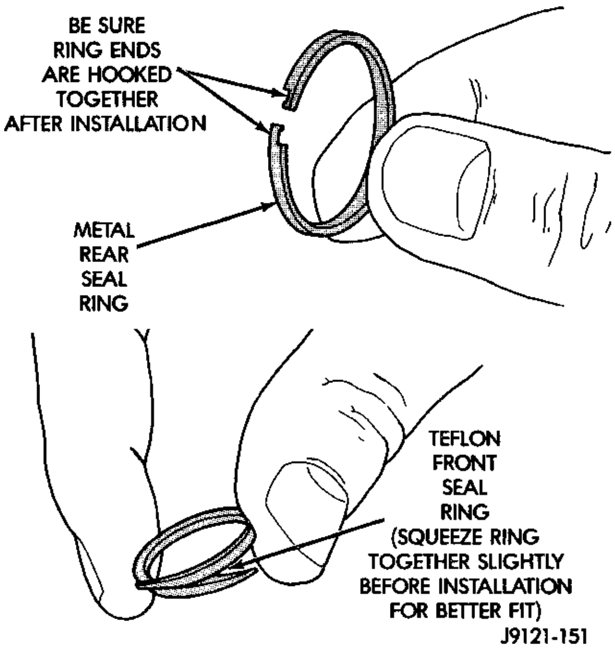

Fig. 157 Input Shaft Seal Ring Identification

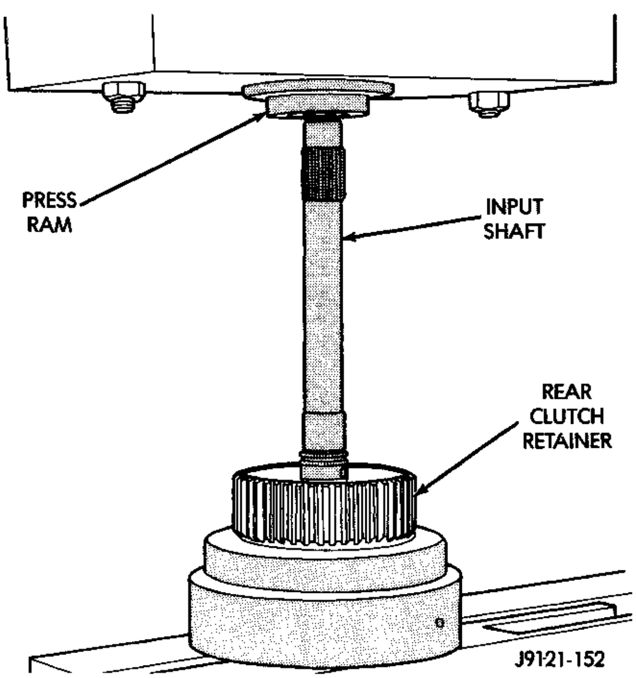

Fig. 158 Pressing Input Shaft Into Rear Clutch Retainer

(11) Install bottom pressure plate (Fig. 154). Ridged side of plate faces downward (toward piston) and flat side toward clutch pack.

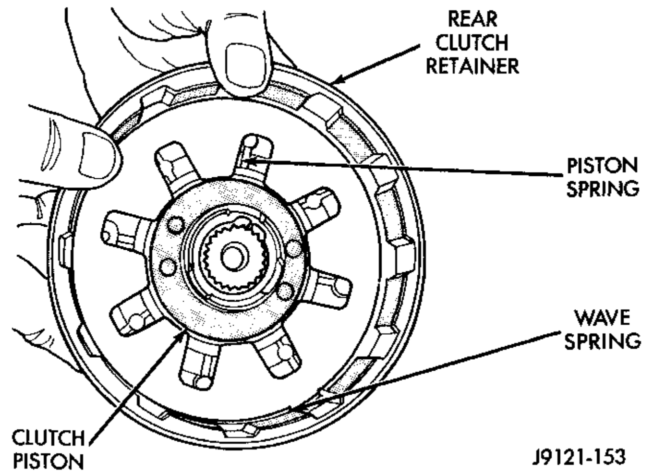

Fig. 159 Piston Spring/Wave Spring Position

(12) Install first clutch disc in retainer on top of bottom pressure plate. Then install a clutch plate followed by a clutch disc until entire clutch pack is installed (4 discs and 3 plates are required) (Fig. 154).

(13) Install top pressure plate.

(14) Install selective snap ring. Be sure snap ring is fully seated in retainer groove.

(15) Using a suitable gauge bar and dial indicator, measure clutch pack clearance (Fig. 160).

(a) Position gauge bar across the clutch drum with the dial indicator pointer on the pressure plate (Fig. 160).

(b) Using two small screw drivers, lift the pressure plate and release it.

(c) Zero the dial indicator.

(d) Lift the pressure plate until it contacts the snap-ring and record the dial indicator reading.

Clearance should be 0.64 - 1.14 mm (0.025 - 0.045 in.). If clearance is incorrect, steel plates, discs, selective snap ring and pressure plates may have to be changed.

The selective snap ring thicknesses are:
- .107–.109 in.
- .098–.100 in.
- .095–.097 in.
- .083–.085 in.
- .076–.078 in.
- .071–.073 in.
- .060–.062 in.

(16) Coat rear clutch thrust washer with petroleum jelly and install washer over input shaft and into clutch retainer (Fig. 161). Use enough petroleum jelly to hold washer in place.

(17) Set rear clutch aside for installation during final assembly.

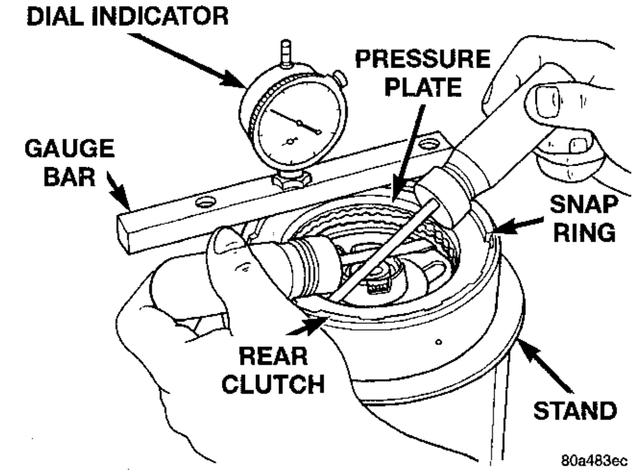

Fig. 160 Checking Rear Clutch Pack Clearance

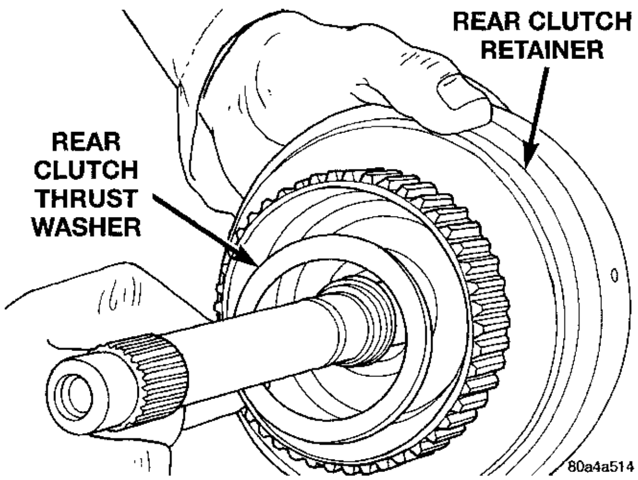

Fig. 161 Installing Rear Clutch Thrust Washer

PLANETARY GEARTRAIN/OUTPUT SHAFT

DISASSEMBLY

(1) Remove planetary snap ring (Fig. 162).

(2) Remove front annulus and planetary assembly from driving shell (Fig. 162).

(3) Remove snap ring that retains front planetary gear in annulus gear (Fig. 163).

(4) Remove tabbed thrust washer and tabbed thrust plate from hub of front annulus (Fig. 164).

(5) Separate front annulus and planetary gears (Fig. 164).

(6) Remove front planetary gear front thrust washer from annulus gear hub.

(7) Separate and remove driving shell, rear planetary and rear annulus from output shaft (Fig. 165).

(8) Remove front planetary rear thrust washer from driving shell.

(9) Remove tabbed thrust washers from rear planetary gear.

(10) Remove lock ring that retains sun gear in driving shell. Then remove sun gear, spacer and thrust plates.

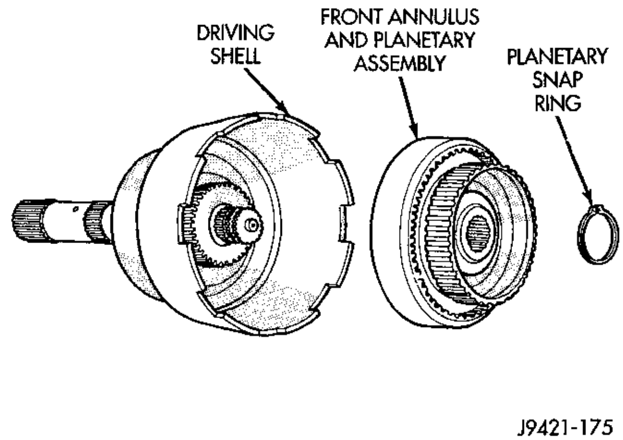

Fig. 162 Front Annulus And Planetary Assembly Removal

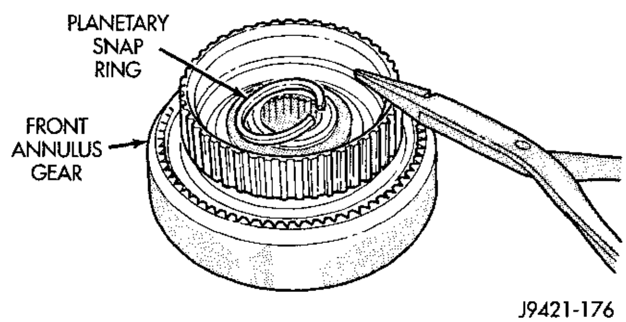

Fig. 163 Front Planetary Snap Ring Removal

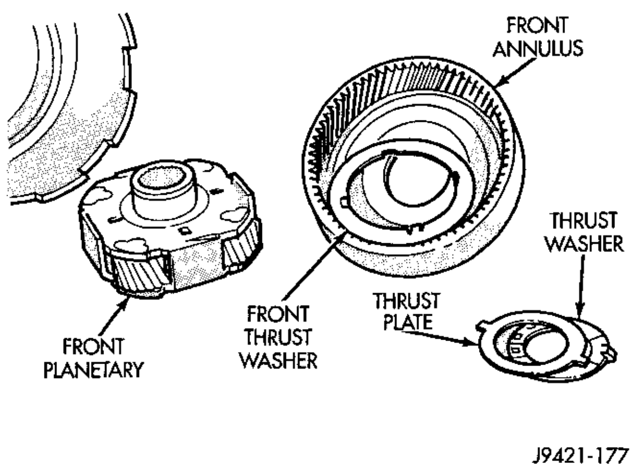

Fig. 164 Front Planetary And Annulus Gear Disassembly

ASSEMBLY

(1) Lubricate output shaft and planetary components with transmission fluid. Use petroleum jelly to

DISASSEMBLY AND ASSEMBLY (Continued)

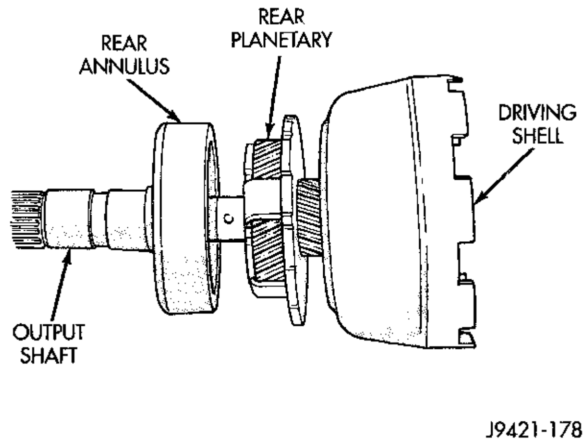

Fig. 165 Removing Driving Shell, Rear Planetary And Rear Annulus

lubricate and hold thrust washers and plates in position.

(2) Assemble rear annulus gear and support if disassembled. Be sure support snap ring is seated and that shoulder-side of support faces rearward (Fig. 166).

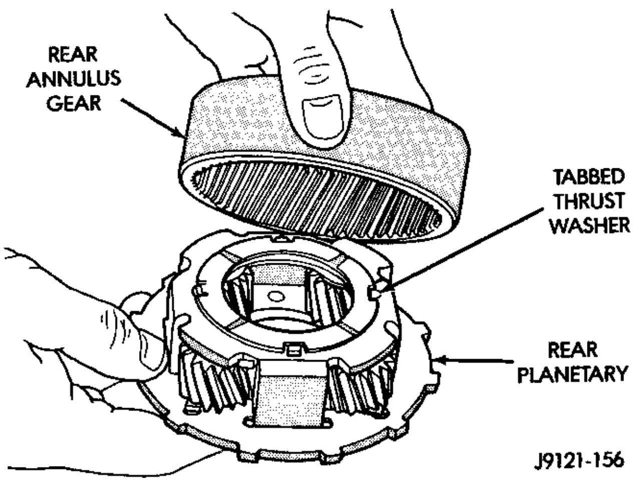

Fig. 166 Assembling Rear Annulus And Planetary Gear

(3) Install rear thrust washer on rear planetary gear. Use enough petroleum jelly to hold washer in place. Also be sure all four washer tabs are properly engaged in gear slots.

(4) Install rear annulus over and onto rear planetary gear (Fig. 166).

(5) Install assembled rear planetary and annulus gear on output shaft (Fig. 167). Verify that assembly is fully seated on shaft.

(6) Install front thrust washer on rear planetary gear (Fig. 168). Use enough petroleum jelly to hold washer on gear. Be sure all four washer tabs are seated in slots.

(7) Install spacer on sun gear (Fig. 169).

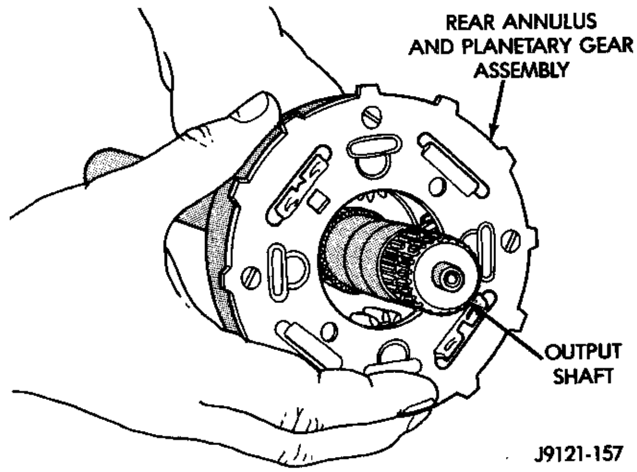

Fig. 167 Installing Rear Annulus And Planetary On Output Shaft

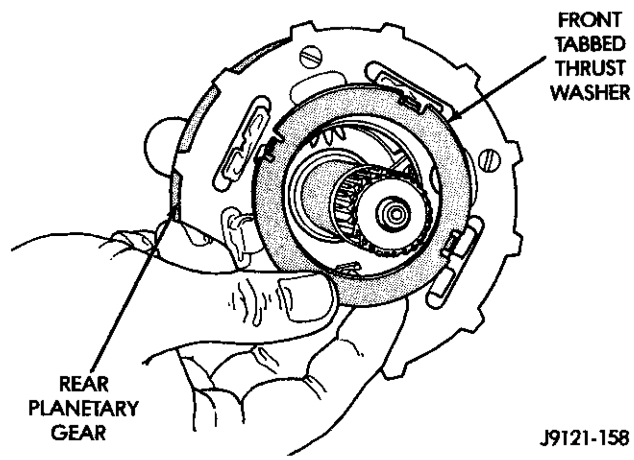

Fig. 168 Installing Rear Planetary Front Thrust Washer

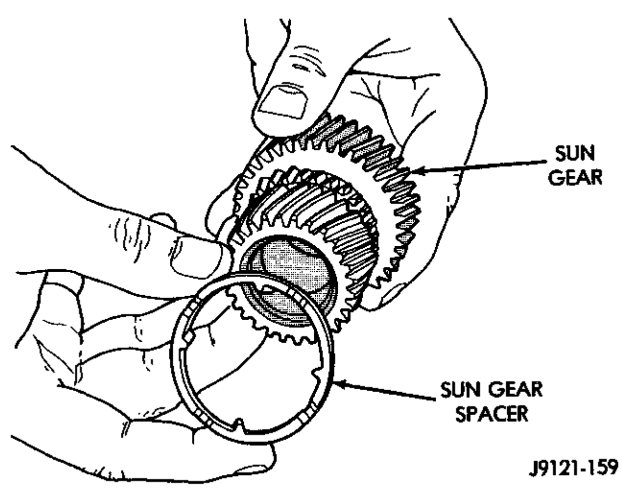

Fig. 169 Installing Spacer On Sun Gear

DISASSEMBLY AND ASSEMBLY (Continued)

(8) Install thrust plate on sun gear (Fig. 170). Note that driving shell thrust plates are interchangeable. Use either plate on sun gear and at front/rear of shell.

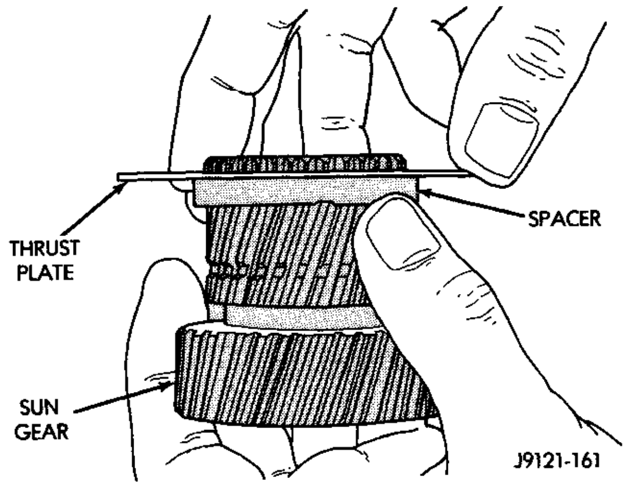

Fig. 170 Installing Driving Shell Front Thrust Plate On Sun Gear

(9) Hold sun gear in place and install thrust plate over sun gear at rear of driving shell (Fig. 171).

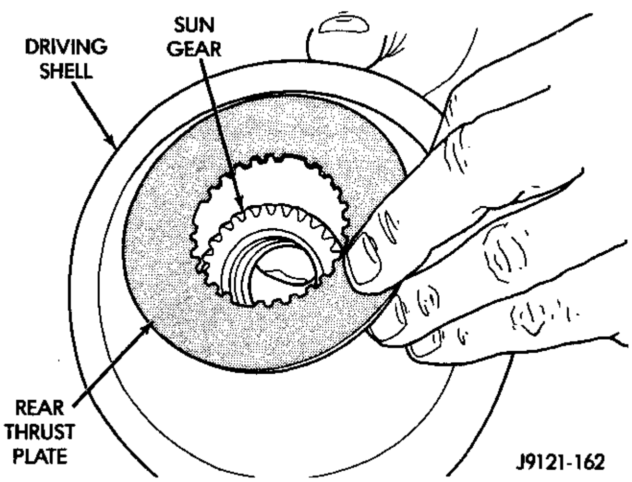

Fig. 171 Installing Driving Shell Rear Thrust Plate

(10) Position wood block on bench and support sun gear on block (Fig. 172). This makes it easier to align and install sun gear lock ring. Keep wood block handy as it will also be used for geartrain end play check.

(11) Align rear thrust plate on driving shell and install sun gear lock ring. Be sure ring is fully seated in sun gear ring groove (Fig. 173).

(12) Install assembled driving shell and sun gear on output shaft (Fig. 174).

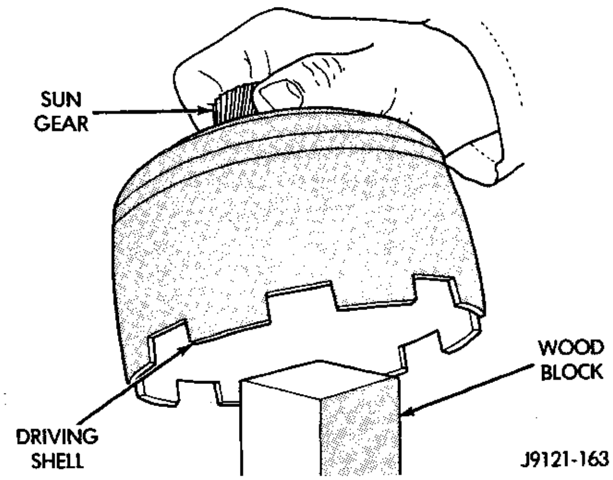

Fig. 172 Supporting Sun Gear On Wood Block

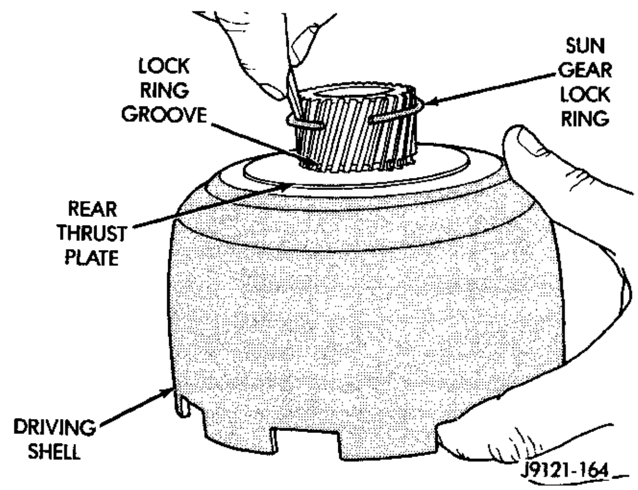

Fig. 173 Installing Sun Gear Lock Ring

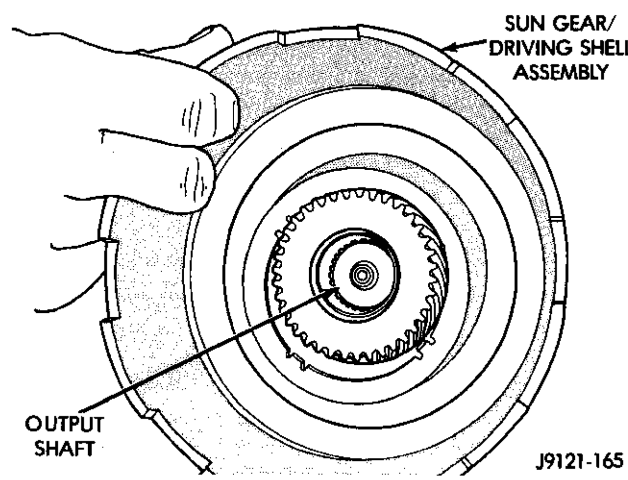

Fig. 174 Installing Assembled Sun Gear And Driving Shell On Output Shaft

DISASSEMBLY AND ASSEMBLY (Continued)

(13) Install rear thrust washer on front planetary gear (Fig. 175). Use enough petroleum jelly to hold washer in place and be sure all four washer tabs are seated.

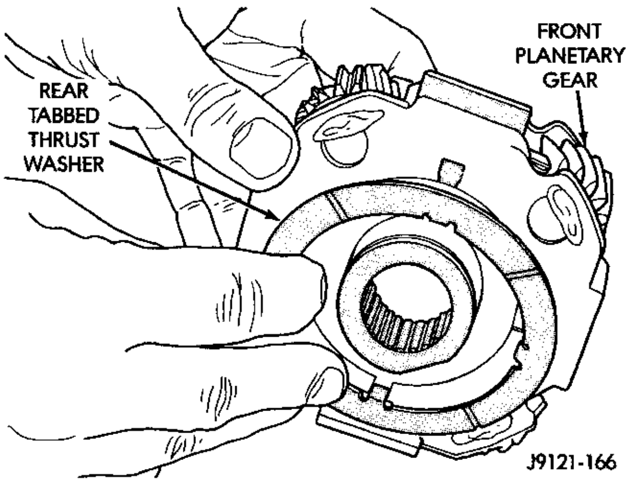

Fig. 175 Installing Rear Thrust Washer On Front Planetary Gear

(14) Install front planetary gear on output shaft and in driving shell (Fig. 176).

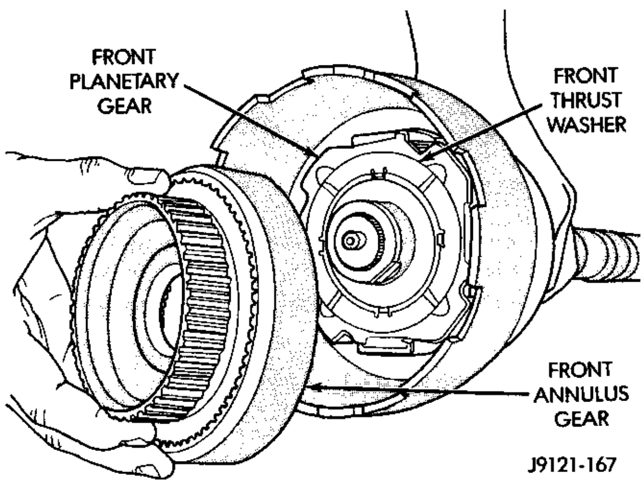

Fig. 176 Installing Front Planetary And Annulus Gears

(15) Install front thrust washer on front planetary gear. Use enough petroleum jelly to hold washer in place and be sure all four washer tabs are seated.

(16) Assemble front annulus gear and support, if necessary. Be sure support snap ring is seated.

(17) Install front annulus on front planetary (Fig. 176).

(18) Position thrust plate on front annulus gear support (Fig. 177). **Note that plate has two tabs on it. These tabs fit in notches of annulus hub.**

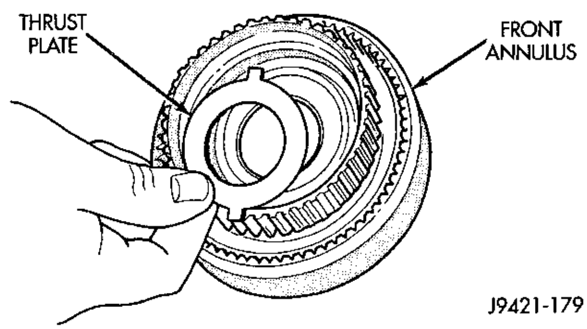

Fig. 177 Positioning Thrust Plate On Front Annulus Support

(19) Install thrust washer in front annulus (Fig. 178). **Align flat on washer with flat on planetary hub. Also be sure washer tab is facing up.**

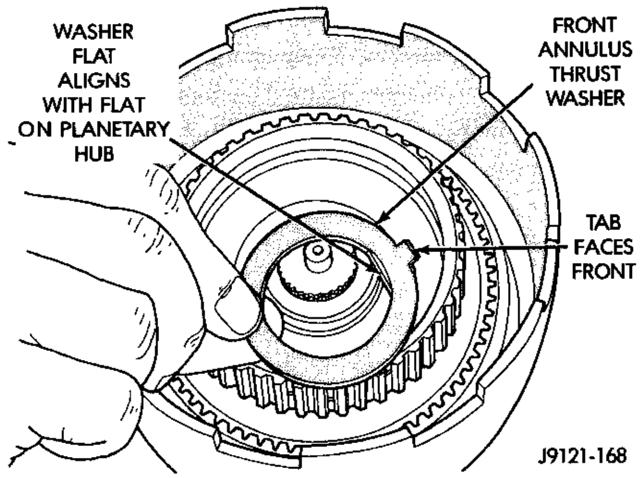

Fig. 178 Installing Front Annulus Thrust Washer

(20) Install front annulus snap ring (Fig. 179). Use snap ring pliers to avoid distorting ring during installation. Also be sure ring is fully seated.

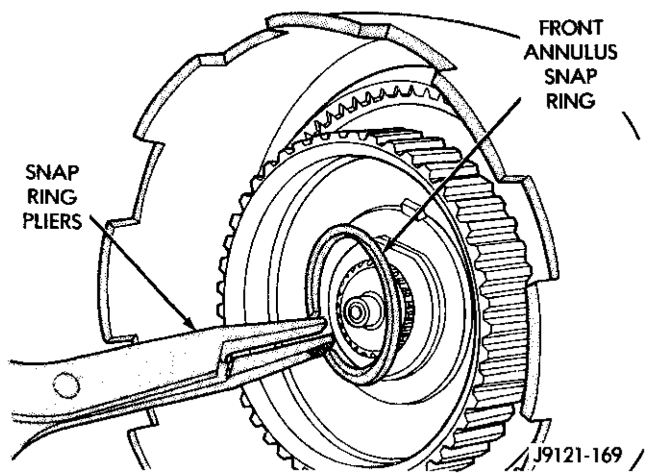

Fig. 179 Installing Front Annulus Snap Ring

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(21) Install planetary selective snap ring with snap ring pliers (Fig. 180). Be sure ring is fully seated.

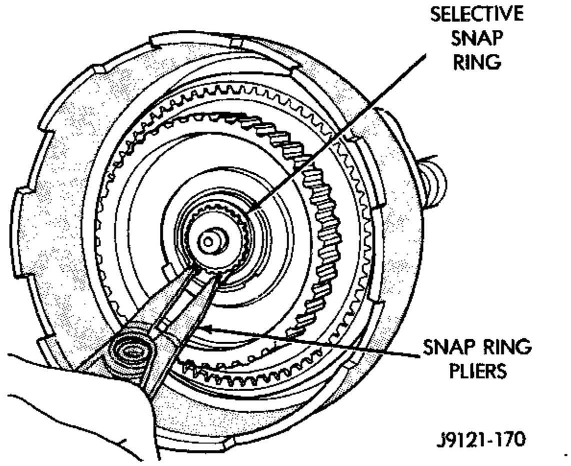

Fig. 180 Installing Planetary Selective Snap Ring

(22) Turn planetary geartrain assembly over so driving shell is facing workbench. Then support geartrain on wood block positioned under forward end of output shaft. This allows geartrain components to move forward for accurate end play check.

(23) Check planetary geartrain end play with feeler gauge (Fig. 181). Gauge goes between shoulder on output shaft and end of rear annulus support.

(24) Geartrain end play should be 0.12 to 1.22 mm (0.005 to 0.048 in.). If end play is incorrect, snap ring (or thrust washers) may have to be replaced. Snap ring is available in three different thicknesses for adjustment purposes.

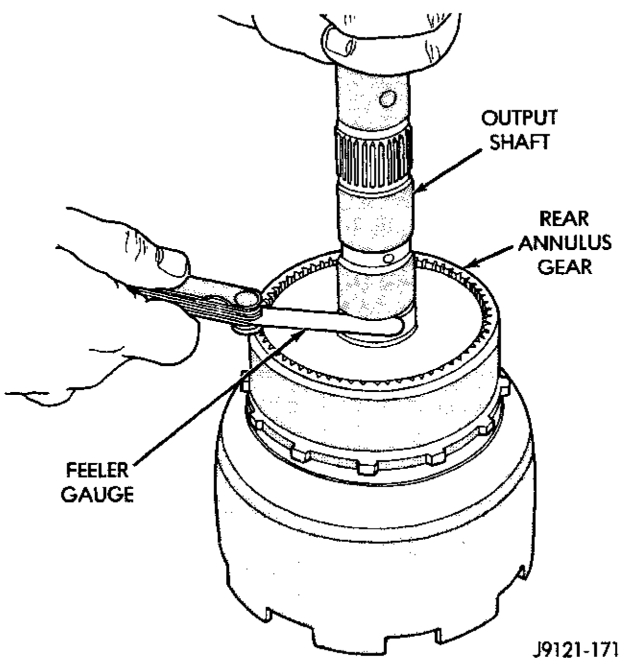

Fig. 181 Checking Planetary Geartrain End Play

OVERDRIVE UNIT

DISASSEMBLY

(1) Remove transmission speed sensor and O-ring seal from overdrive case (Fig. 182).

(2) Remove overdrive piston thrust bearing (Fig. 183).

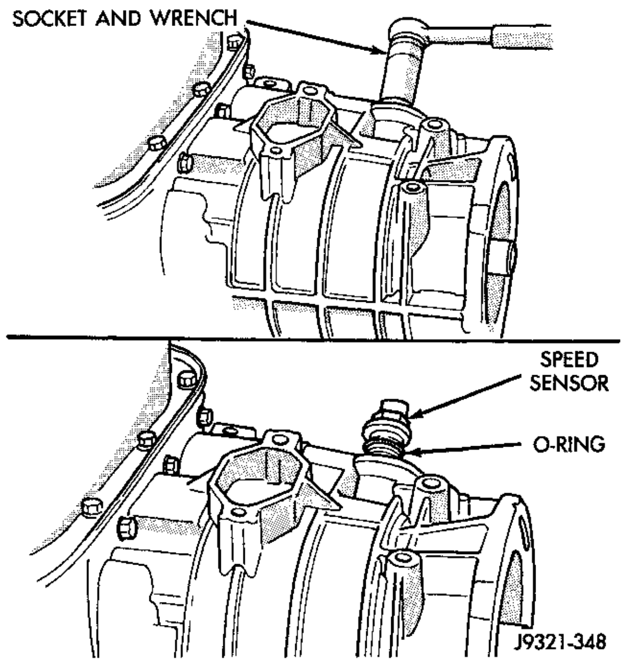

Fig. 182 Transmission Speed Sensor Removal/ Installation

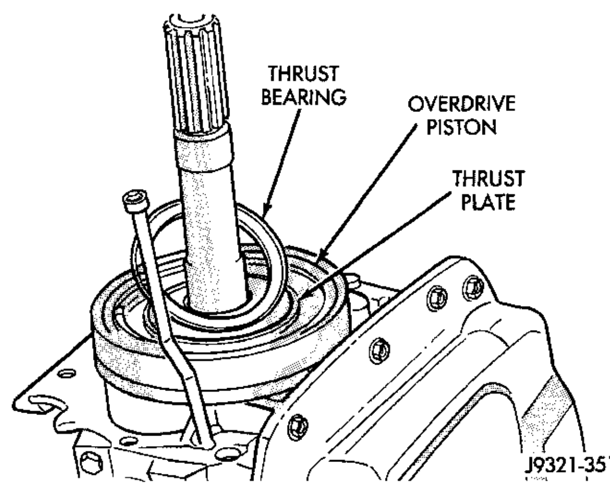

Fig. 183 Overdrive Piston Thrust Bearing Removal/ Installation

DISASSEMBLY AND ASSEMBLY (Continued)

OVERDRIVE PISTON DISASSEMBLY

(1) Remove overdrive piston thrust plate (Fig. 184). Retain thrust plate. It is a select fit part and may possibly be reused.

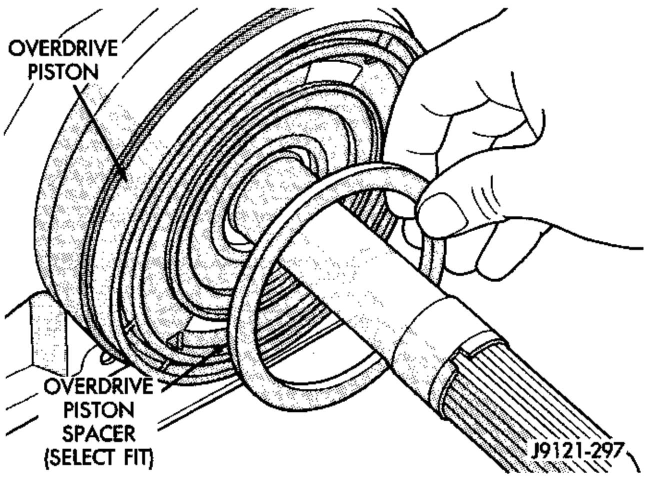

Fig. 184 Overdrive Piston Thrust Plate Removal/ Installation

(2) Remove intermediate shaft spacer (Fig. 185). Retain spacer. It is a select fit part and may possibly be reused.

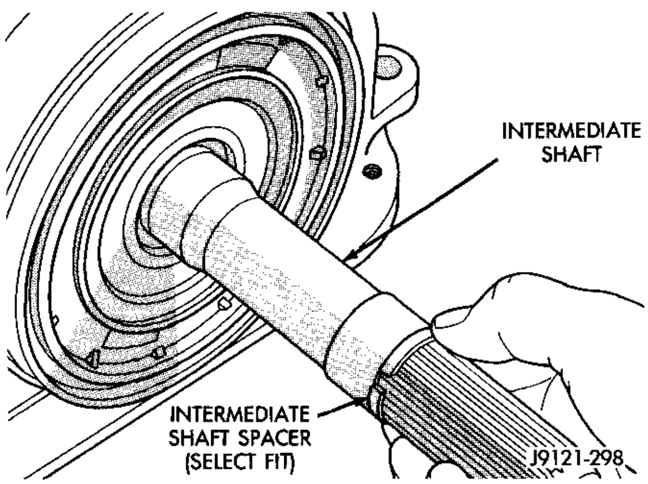

Fig. 185 Intermediate Shaft Spacer Location

(3) Remove overdrive piston from retainer (Fig. 186).

OVERDRIVE CLUTCH PACK DISASSEMBLY

(1) Remove overdrive clutch pack wire retaining ring (Fig. 187).

(2) Remove overdrive clutch pack (Fig. 188).

NOTE: The 42RE transmission has three clutch discs and two clutch plates.

(3) Note position of clutch pack components for assembly reference (Fig. 189).

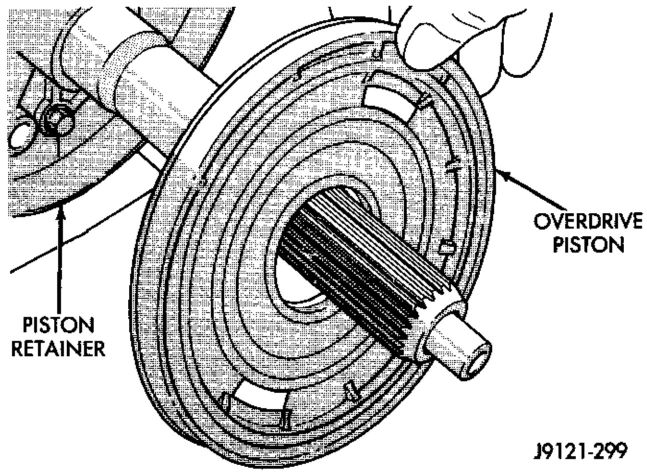

Fig. 186 Overdrive Piston Removal

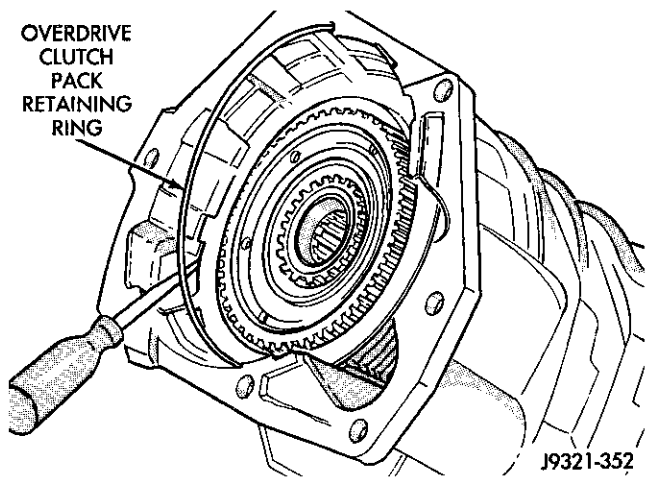

Fig. 187 Removing Overdrive Clutch Pack Retaining Ring

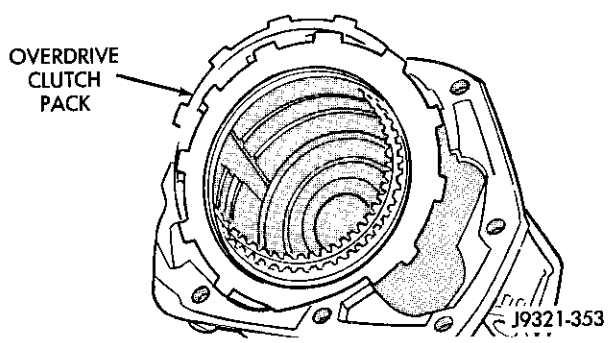

Fig. 188 Overdrive Clutch Pack Removal

DISASSEMBLY AND ASSEMBLY (Continued)

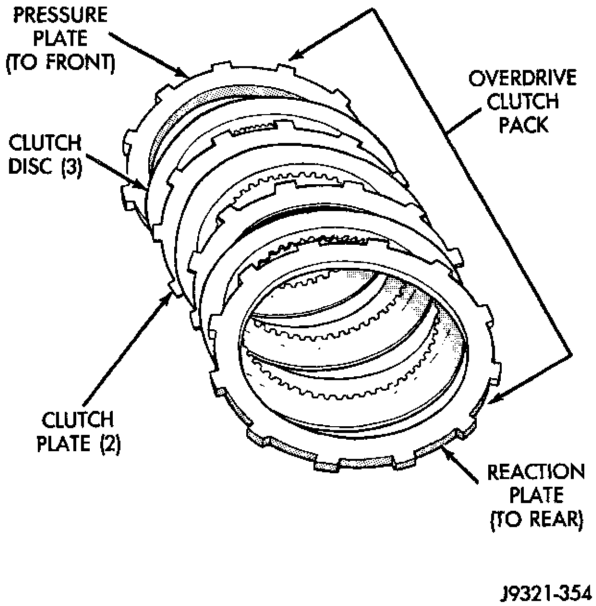

Fig. 189 42RE Overdrive Clutch Component Position

OVERDRIVE GEARTRAIN DISASSEMBLY

(1) Remove overdrive clutch wave spring (Fig. 190).

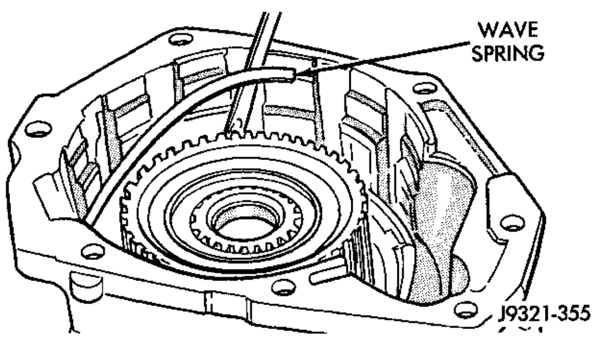

Fig. 190 Overdrive Clutch Wave Spring Removal/ Installation

(2) Remove overdrive clutch reaction snap ring (Fig. 191). Note that snap ring is located in same groove as wave spring.

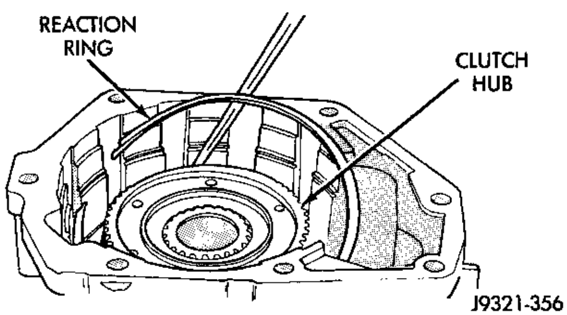

Fig. 191 Overdrive Clutch Reaction Snap Ring Removal/Installation

(3) Remove Torx head screws that attach access cover and gasket to overdrive case (Fig. 192).

(4) Remove access cover and gasket (Fig. 193).

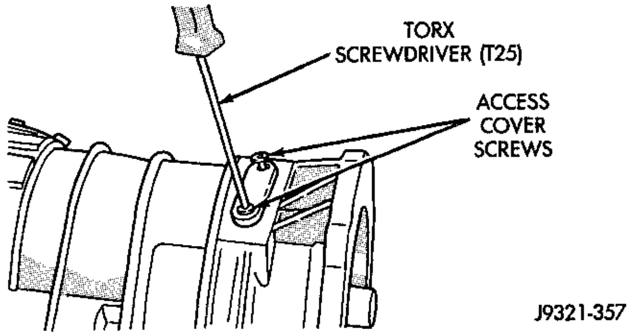

Fig. 192 Access Cover Screw Removal/Installation

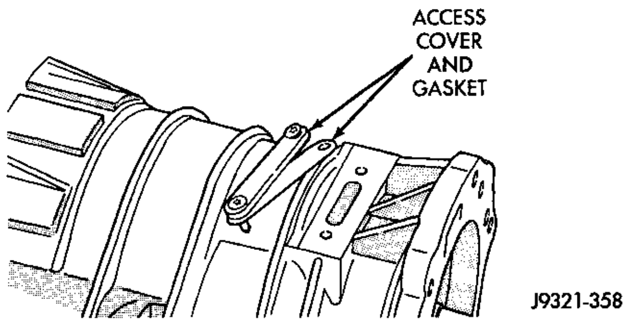

Fig. 193 Access Cover And Gasket Removal/ Installation

(5) Expand output shaft bearing snap ring with expanding-type snap ring pliers. Then push output shaft forward to release shaft bearing from locating ring (Fig. 194).

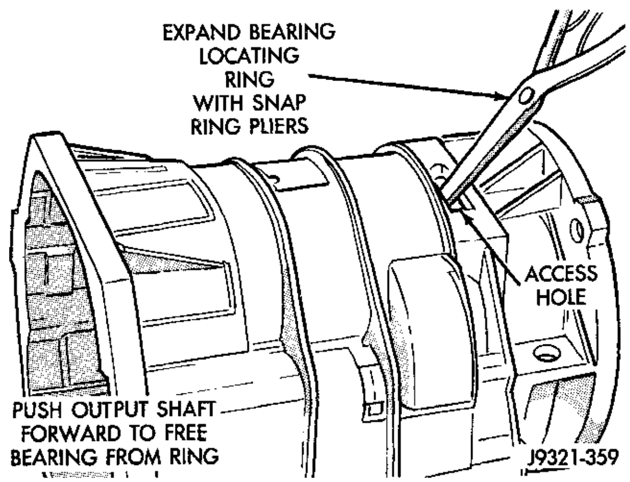

Fig. 194 Releasing Bearing From Locating Ring

DISASSEMBLY AND ASSEMBLY (Continued)

(6) Lift gear case up and off geartrain assembly (Fig. 195).

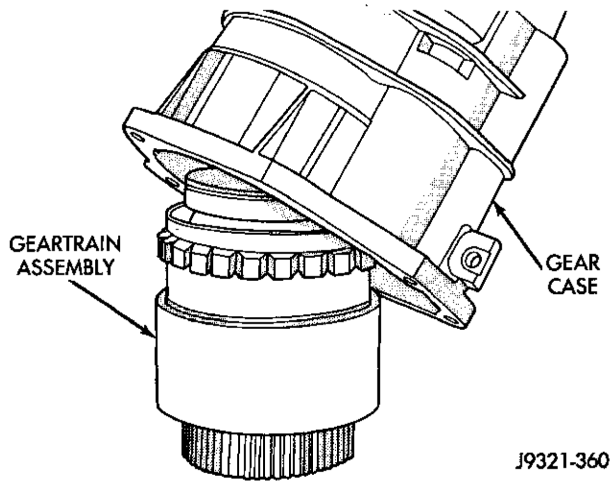

Fig. 195 Removing Gear Case From Geartrain Assembly

(7) Remove snap ring that retains rear bearing on output shaft.

(8) Remove rear bearing from output shaft (Fig. 196).

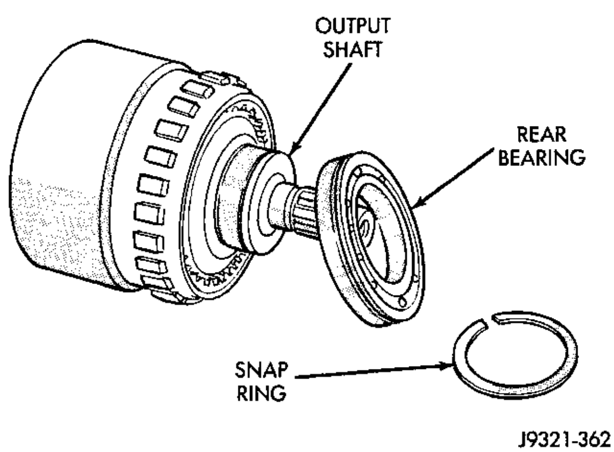

Fig. 196 Rear Bearing Removal

DIRECT CLUTCH, HUB AND SPRING DISASSEMBLY

WARNING: THE NEXT STEP IN DISASSEMBLY INVOLVES COMPRESSING THE DIRECT CLUTCH SPRING. IT IS EXTREMELY IMPORTANT THAT PROPER EQUIPMENT BE USED TO COMPRESS THE SPRING AS SPRING FORCE IS APPROXIMATELY 830 POUNDS. USE SPRING COMPRESSOR TOOL 6227-1 AND A HYDRAULIC SHOP PRESS WITH A MINIMUM RAM TRAVEL OF 5-6 INCHES. THE PRESS MUST ALSO HAVE A BED THAT CAN BE ADJUSTED UP OR DOWN AS REQUIRED. RELEASE CLUTCH SPRING TENSION SLOWLY AND COMPLETELY TO AVOID PERSONAL INJURY.

(1) Mount geartrain assembly in shop press (Fig. 197).

(2) Position Compressor Tool 6227-1 on clutch hub (Fig. 197). Support output shaft flange with steel press plates as shown and center assembly under press ram.

(3) Apply press pressure slowly. Compress hub and spring far enough to expose clutch hub retaining ring and relieve spring pressure on clutch pack snap ring (Fig. 197).

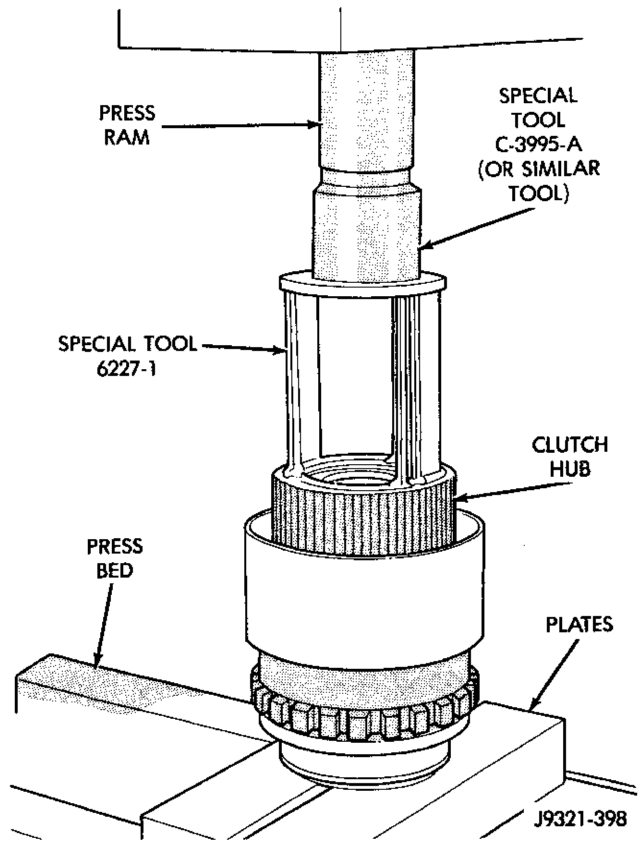

Fig. 197 Geartrain Mounted In Shop Press

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

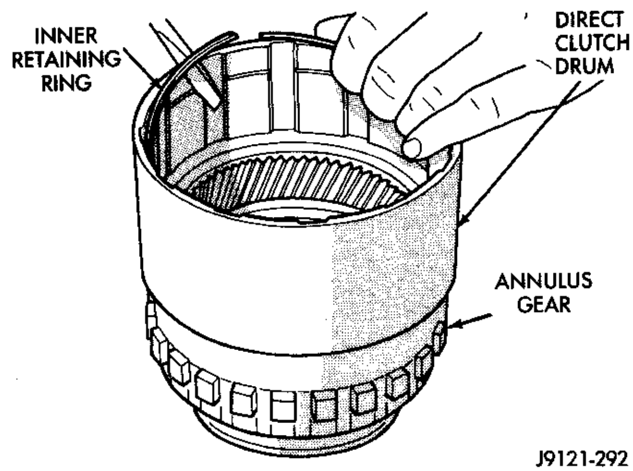

Fig. 205 Clutch Drum Inner Retaining Ring Removal

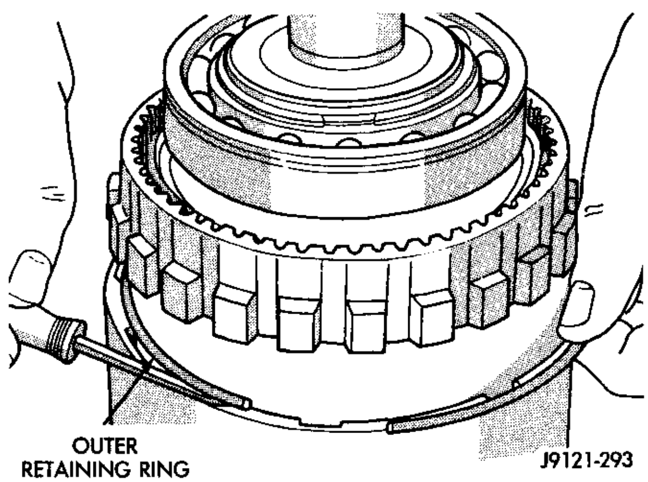

Fig. 206 Clutch Drum Outer Retaining Ring Removal

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(9) Mark annulus gear and output shaft for assembly alignment reference (Fig. 207). Use punch or scriber to mark gear and shaft.

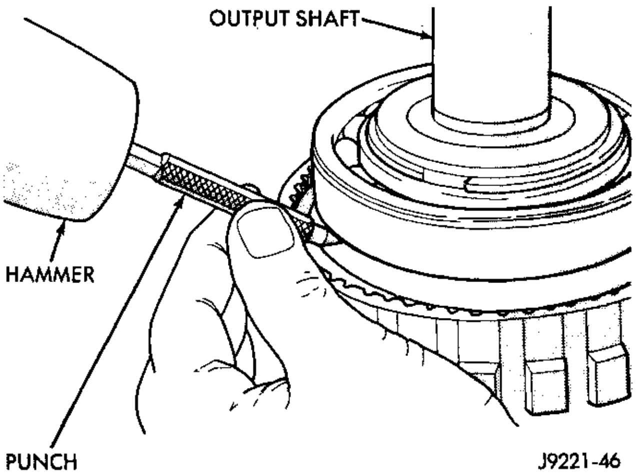

Fig. 207 Marking Annulus Gear And Output Shaft For Assembly Alignment

(10) Remove snap ring that secures annulus gear on output shaft (Fig. 208). Use two screwdrivers to unseat and work snap ring out of groove as shown.

(11) Remove annulus gear from output shaft (Fig. 209). Use rawhide or plastic mallet to tap gear off shaft.

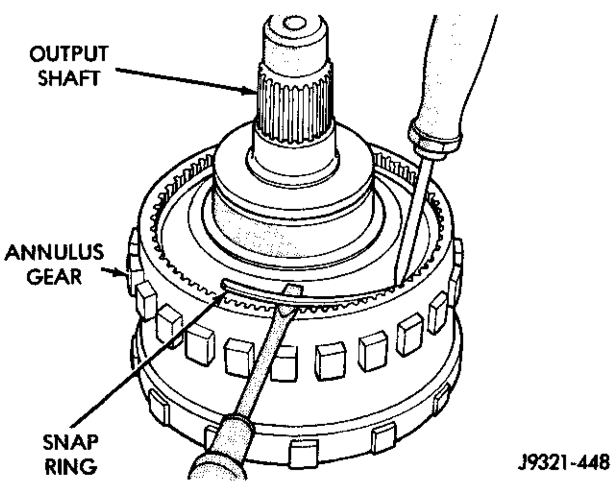

Fig. 208 Annulus Gear Snap Ring Removal

GEAR CASE AND PARK LOCK DISASSEMBLY

(1) Remove locating ring from gear case.

(2) Remove park pawl shaft retaining bolt and remove shaft, pawl and spring.

(3) Remove reaction plug snap ring and remove reaction plug.

(4) Remove output shaft seal.

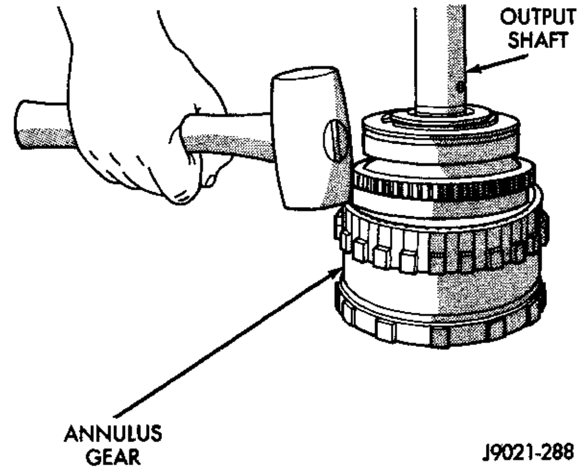

Fig. 209 Annulus Gear Removal

ASSEMBLY

GEARTRAIN AND DIRECT CLUTCH ASSEMBLY

(1) Soak direct clutch and overdrive clutch discs in Mopar® ATF Plus 3, type 7176, transmission fluid. Allow discs to soak for 10-20 minutes.

(2) Install new pilot bushing and clutch hub bushing in output shaft if necessary (Fig. 210). Lubricate bushings with petroleum jelly, or transmission fluid.

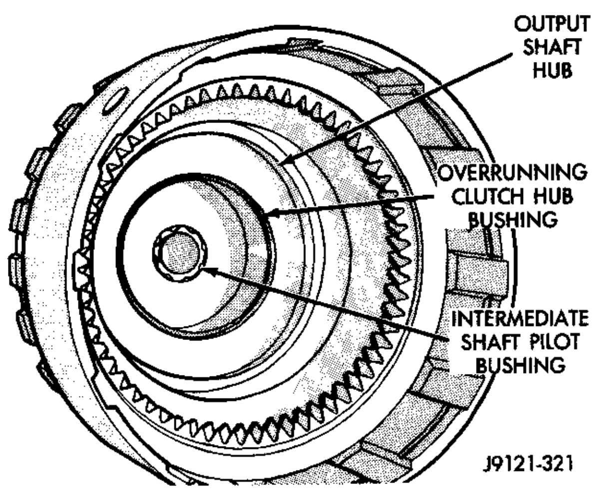

Fig. 210 Output Shaft Pilot Bushing

mopar AUTHENTIC RESTORATION

DISASSEMBLY AND ASSEMBLY (Continued)

(3) Install annulus gear on output shaft, if removed. Then install annulus gear retaining snap ring (Fig. 211).

(4) Align and install clutch drum on annulus gear (Fig. 212). Be sure drum is engaged in annulus gear lugs.

(5) Install clutch drum outer retaining ring (Fig. 212).

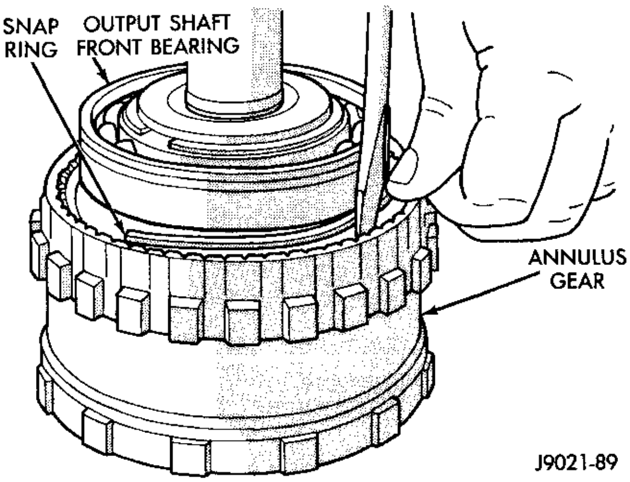

Fig. 211 Annulus Gear Installation

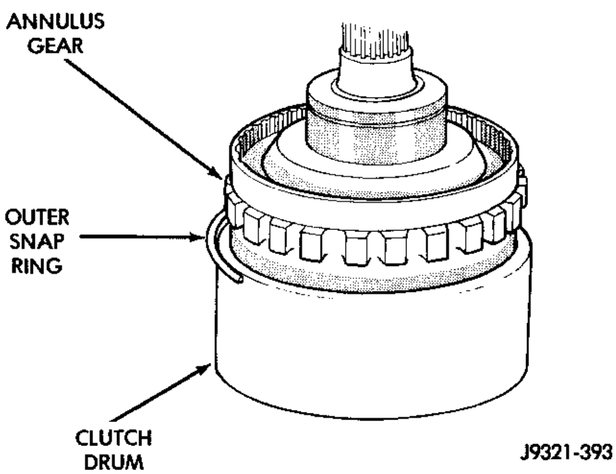

Fig. 212 Clutch Drum And Outer Retaining Ring Installation

(6) Slide clutch drum forward and install inner retaining ring (Fig. 213).

(7) Install rear bearing and snap ring on output shaft (Fig. 214). Be sure locating ring groove in bearing is toward rear.

(8) Install overrunning clutch on hub (Fig. 215). **Note that clutch only fits one way. Shoulder on clutch should seat in small recess at edge of hub.**

(9) Install thrust bearing on overrunning clutch hub. Use generous amount of petroleum jelly to hold bearing in place for installation. **Bearing fits one way only. Be sure bearing is seated squarely against hub. Reinstall bearing if it does not seat squarely.**

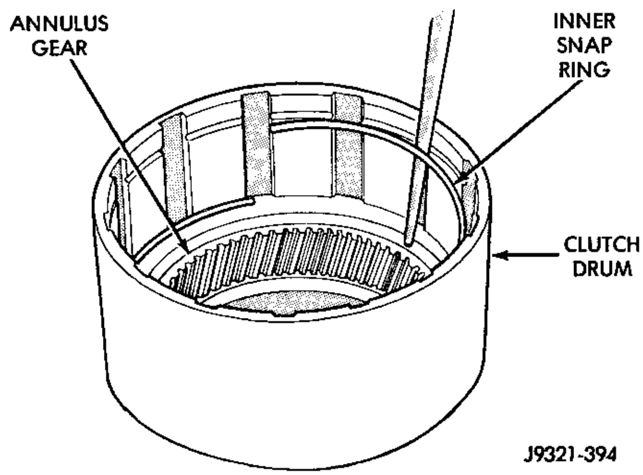

Fig. 213 Clutch Drum Inner Retaining Ring Installation

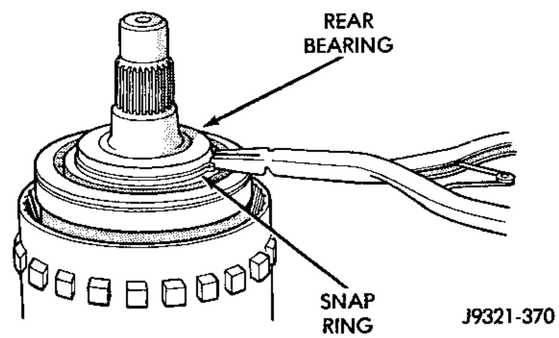

Fig. 214 Rear Bearing And Snap Ring Installation

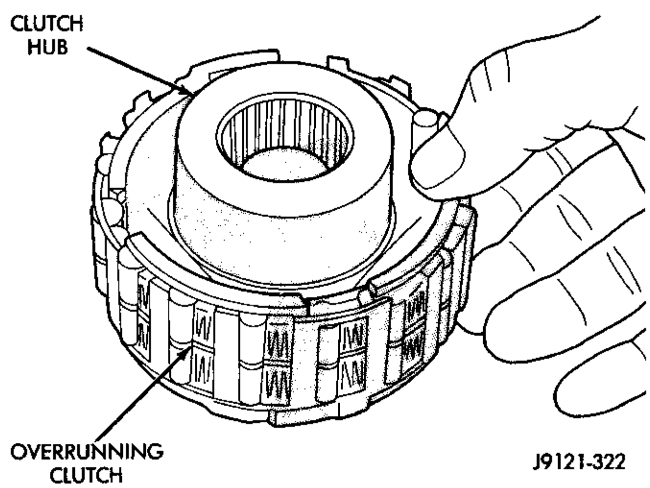

Fig. 215 Assembling Overrunning Clutch And Hub

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(10) Install overrunning clutch in output shaft (Fig. 216). Insert snap ring pliers in hub splines. Expand pliers to grip hub. Then install assembly with counterclockwise, twisting motion.

(11) Install planetary gear in annulus gear (Fig. 217). **Be sure planetary pinions are fully seated in annulus gear before proceeding.**

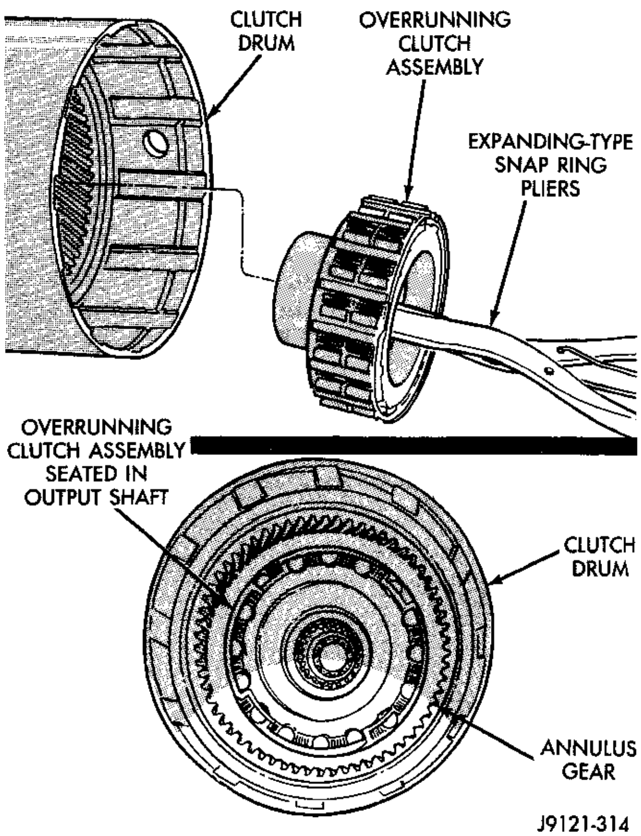

Fig. 216 Overrunning Clutch Installation

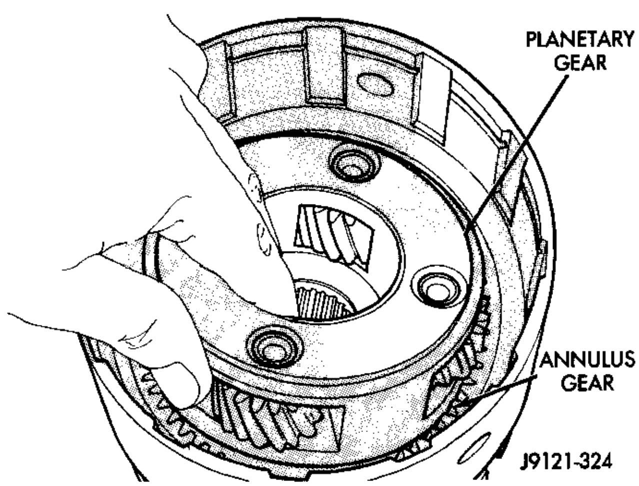

Fig. 217 Planetary Gear Installation

(12) Coat planetary thrust bearing and bearing contact surface of spring plate with generous amount of petroleum jelly. This will help hold bearing in place during installation.

(13) Install planetary thrust bearing on sun gear (Fig. 218). Slide bearing onto gear and seat it against spring plate as shown. **Bearing fits one way only. If it does not seat squarely against spring plate, remove and reposition bearing.**

(14) Install assembled sun gear, spring plate and thrust bearing (Fig. 219). Be sure sun gear and thrust bearing are fully seated before proceeding.

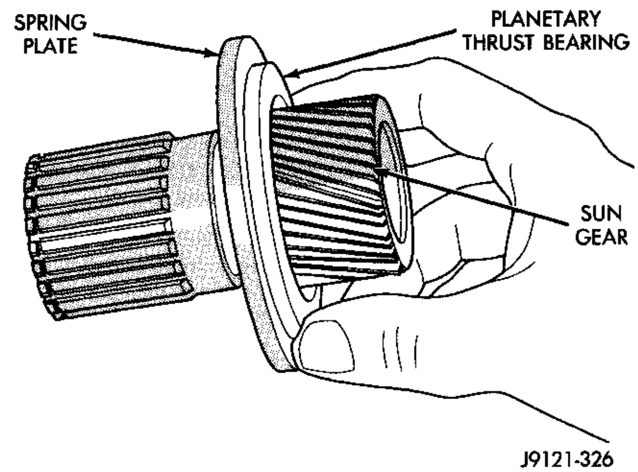

Fig. 218 Planetary Thrust Bearing Installation

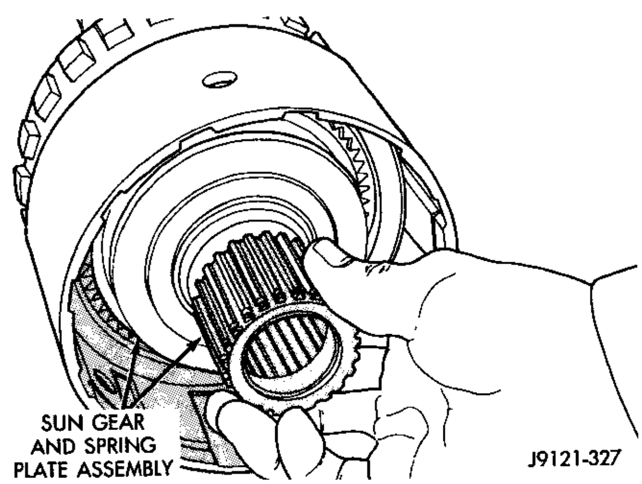

Fig. 219 Sun Gear Installation

(15) Mount assembled output shaft, annulus gear, and clutch drum in shop press. Direct clutch spring, hub and clutch pack are easier to install with assembly mounted in press.

(16) Align splines in hubs of planetary gear and overrunning clutch with Alignment tool 6227-2 (Fig. 220). Insert tool through sun gear and into splines of both hubs. Be sure alignment tool is fully seated before proceeding.

(17) Install direct clutch spring (Fig. 221). Be sure spring is properly seated on spring plate.

mopar AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

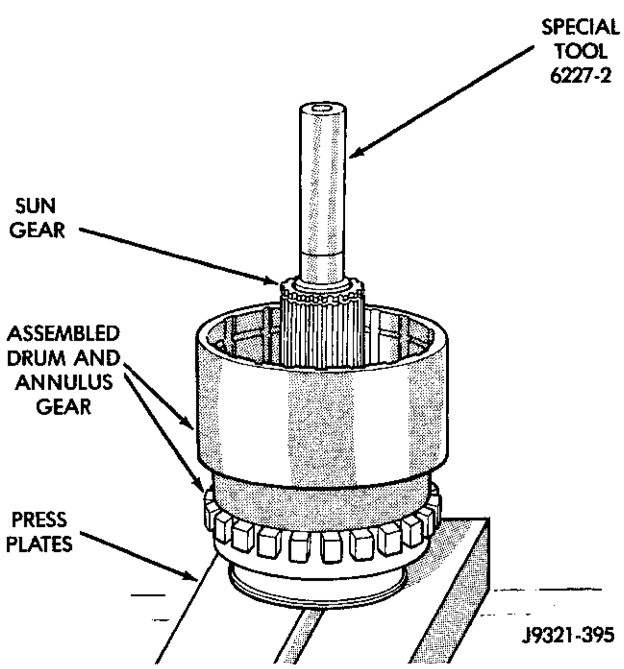

Fig. 220 Alignment Tool Installation

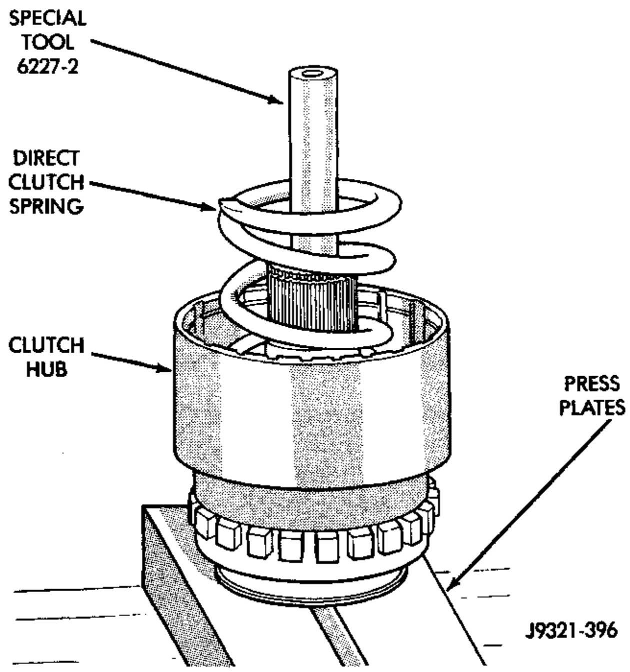

Fig. 221 Direct Clutch Spring Installation

NOTE: The 42RE transmission has 6 direct clutch discs and 5 clutch plates.

(18) Assemble and install direct clutch pack on hub as follows:

(a) Assemble clutch pack components (Fig. 222).

(b) Install direct clutch reaction plate on clutch hub first. **Note that one side of reaction plate is counterbored. Be sure this side faces rearward. Splines at rear of hub are raised slightly. Counterbore in plate fits over raised splines. Plate should be flush with this end of hub (Fig. 223).**

(c) Install first clutch disc followed by a steel plate until all discs and plates have been installed.

(d) Install pressure plate. This is last clutch pack item to be installed. **Be sure plate is**

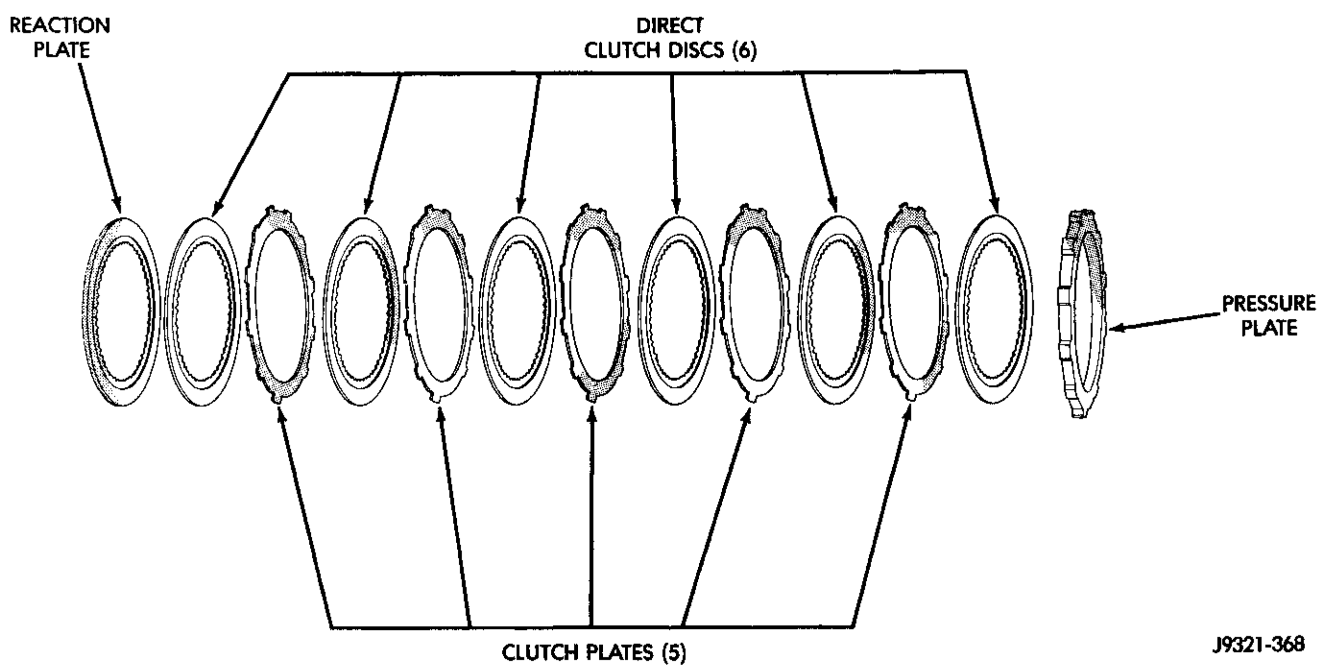

Fig. 222 42RE Direct Clutch Pack Components

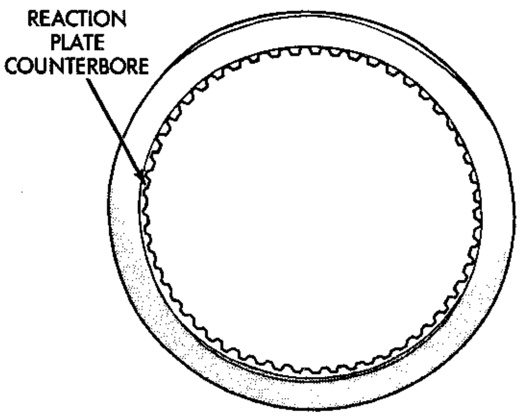
mopar AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

installed with shoulder side facing upward (Fig. 224).

(19) Install clutch hub and clutch pack on direct clutch spring (Fig. 225). **Be sure hub is started on sun gear splines before proceeding.**



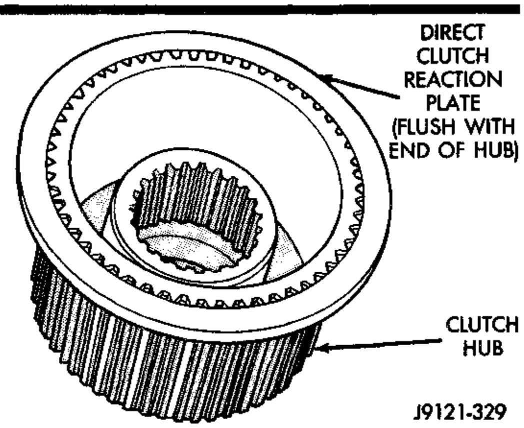


Fig. 223 Correct Position Of Direct Clutch Reaction Plate

WARNING: THE NEXT STEP IN GEARTRAIN ASSEMBLY INVOLVES COMPRESSING THE DIRECT CLUTCH HUB AND SPRING. IT IS EXTREMELY IMPORTANT THAT PROPER EQUIPMENT BE USED TO COMPRESS THE SPRING AS SPRING FORCE IS APPROXIMATELY 830 POUNDS. USE COMPRESSOR TOOL C-6227-1 AND A HYDRAULIC-TYPE SHOP PRESS WITH A MINIMUM RAM TRAVEL OF 6 INCHES. THE PRESS MUST ALSO HAVE A BED THAT CAN BE ADJUSTED UP OR DOWN AS REQUIRED. RELEASE CLUTCH SPRING TENSION SLOWLY AND COMPLETELY TO AVOID PERSONAL INJURY.

(20) Position Compressor Tool 6227-1 on clutch hub.

(21) Compress clutch hub and spring just enough to place tension on hub and hold it in place.

(22) Slowly compress clutch hub and spring. Compress spring and hub only enough to expose ring

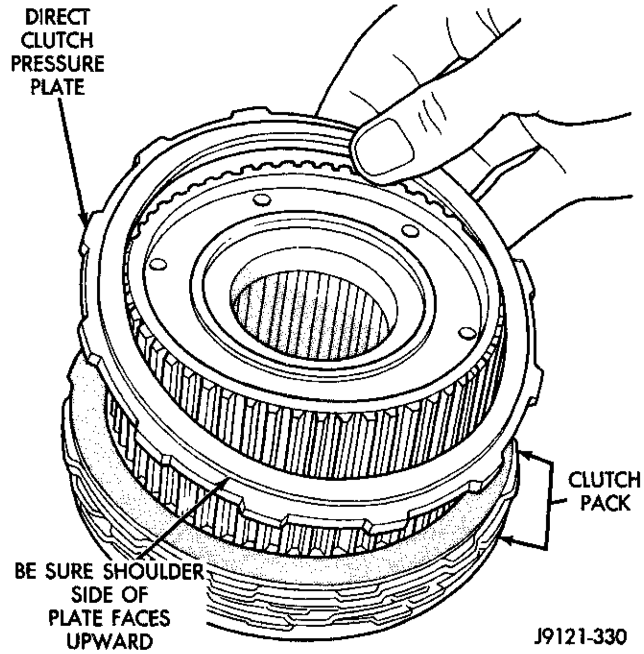

Fig. 224 Correct Position Of Direct Clutch Pressure Plate

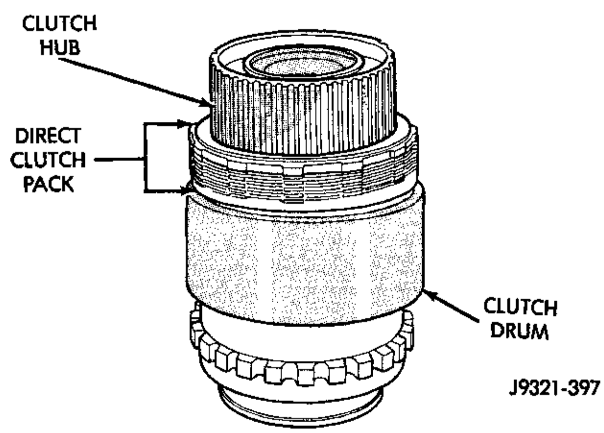

Fig. 225 Direct Clutch Pack And Clutch Hub Installation

grooves for clutch pack snap ring and clutch hub retaining ring.

(23) Realign clutch pack on hub and seat clutch discs and plates in clutch drum.

(24) Install direct clutch pack snap ring (Fig. 226). **Be very sure snap ring is fully seated in clutch drum ring groove.**

(25) Install clutch hub retaining ring (Fig. 227). **Be very sure retaining ring is fully seated in sun gear ring groove.**

(26) Slowly release press ram, remove compressor tools and remove geartrain assembly.

DISASSEMBLY AND ASSEMBLY (Continued)

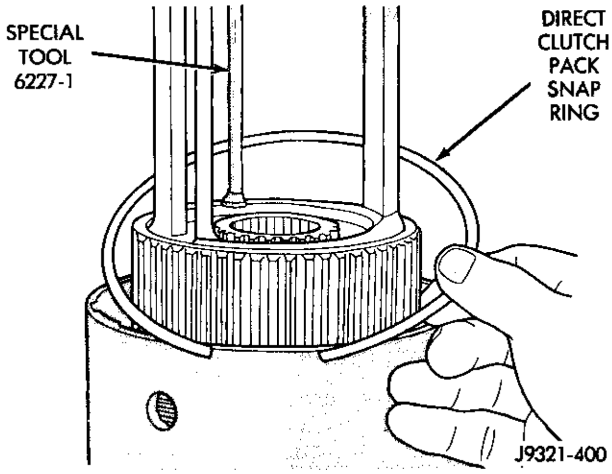

Fig. 226 Direct Clutch Pack Snap Ring Installation

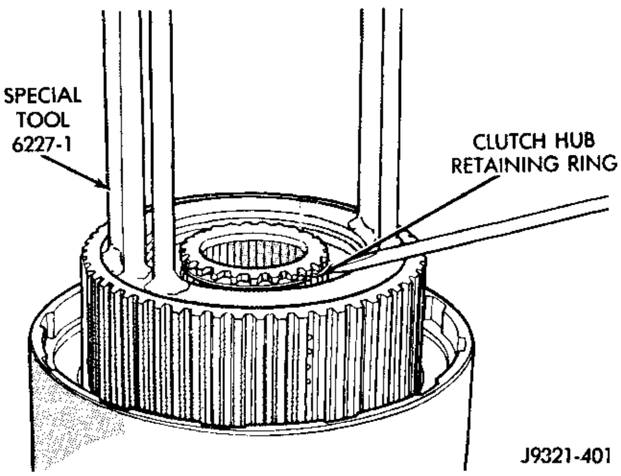

Fig. 227 Clutch Hub Retaining Ring Installation

GEAR CASE ASSEMBLY

(1) Position park pawl and spring in case and install park pawl shaft. Verify that end of spring with 90° bend is hooked to pawl and straight end of spring is seated against case.

(2) Install pawl shaft retaining bolt. Tighten bolt to 27 N·m (20 ft. lbs.) torque.

(3) Install park lock reaction plug. **Note that plug has locating pin at rear (Fig. 228). Be sure pin is seated in hole in case before installing snap ring.**

(4) Install reaction plug snap-ring (Fig. 229). **Compress snap ring only enough for installation; do not distort it.**

(5) Install new seal in gear case. On 4x4 gear case, use Tool Handle C-4171 and Installer C-3860-A to seat seal in case. On 4 x 2 gear case, use same Handle C-4171 and Installer C-3995-A to seat seal in case.

(6) Verify that tab ends of rear bearing locating ring extend into access hole in gear case (Fig. 230).

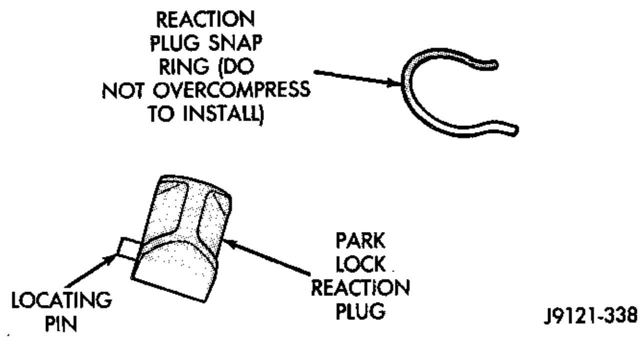

Fig. 228 Reaction Plug Locating Pin And Snap-Ring

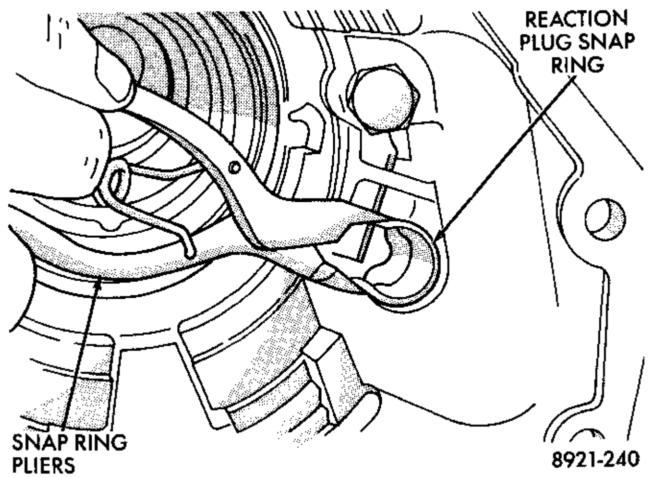

Fig. 229 Reaction Plug And Snap-Ring Installation

(7) Support geartrain on Tool 6227-1 (Fig. 231). Be sure tool is securely seated in clutch hub.

(8) Install overdrive gear case on geartrain (Fig. 231).

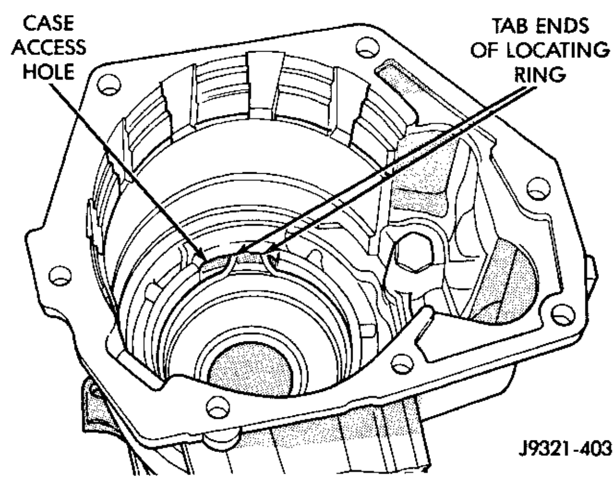

Fig. 230 Correct Rear Bearing Locating Ring Position

(9) Expand front bearing locating ring with snap ring pliers (Fig. 232). Then slide case downward until

DISASSEMBLY AND ASSEMBLY (Continued)

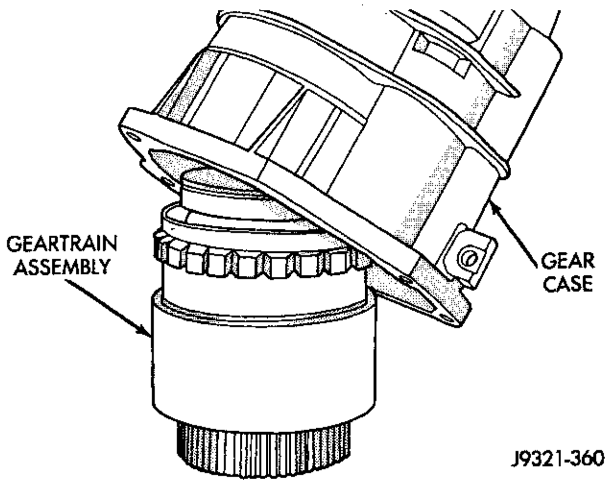

Fig. 231 Overdrive Gear Case Installation

locating ring locks in bearing groove and release snap ring.

(10) Install locating ring access cover and gasket in overdrive unit case (Fig. 233).

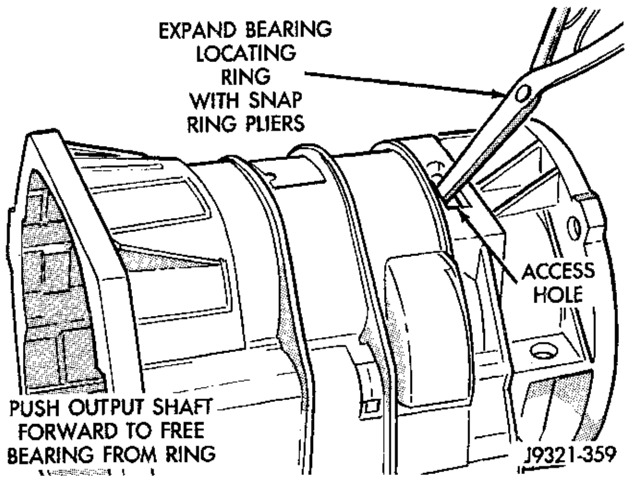

Fig. 232 Seating Locating Ring In Rear Bearing

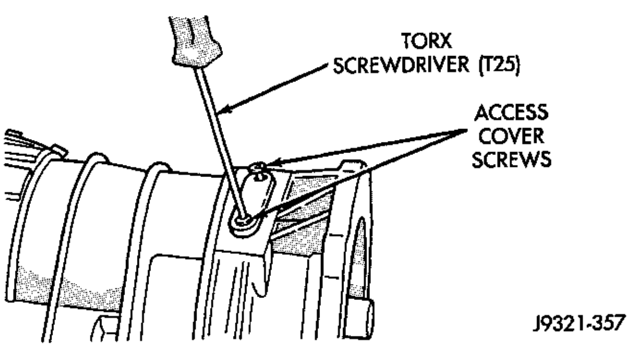

Fig. 233 Locating Ring Access Cover And Gasket Installation

OVERDRIVE CLUTCH ASSEMBLY

(1) Install overdrive clutch reaction ring first. Reaction ring is flat with notched ends (Fig. 234).

(2) Install wave spring on top of reaction ring (Fig. 235). **Reaction ring and wave ring both fit in same ring groove.** Use screwdriver to seat each ring securely in groove. Also ensure that the ends of the two rings are offset from each other.

NOTE: The 42RE transmission has 3 overdrive clutch discs and 2 plates.

(3) Assemble overdrive clutch pack (Fig. 236).

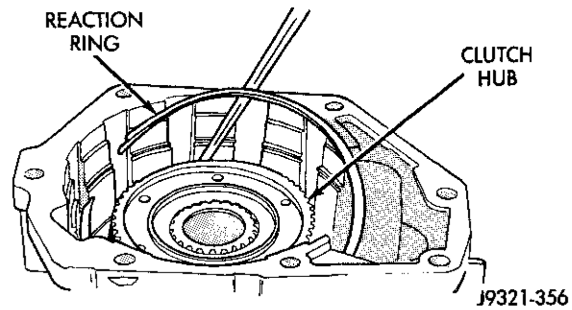

Fig. 234 Overdrive Clutch Reaction Ring Installation

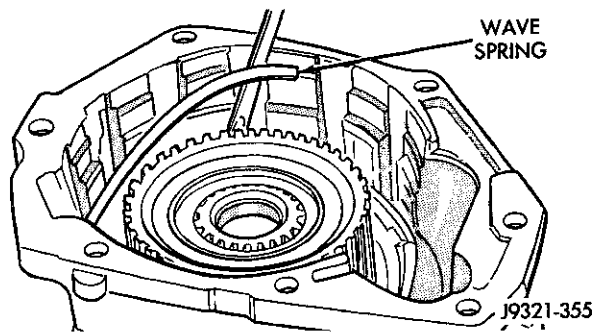

Fig. 235 Overdrive Clutch Wave Spring Installation

(4) Install overdrive clutch reaction plate first.

(5) Install first clutch disc followed by first clutch plate. Then install remaining clutch discs and plates in same order.

(6) Install clutch pack pressure plate.

(7) Install clutch pack wire-type retaining ring (Fig. 237).

INTERMEDIATE SHAFT SPACER SELECTION

(1) Place overdrive unit in vertical position. Mount it on blocks, or in workbench with appropriate size mounting hole cut into it. Be sure unit is facing upward for access to direct clutch hub. Also be sure output shaft is not loaded and internal components are moved rearward for accurate measurement.

(2) Determine correct thickness intermediate shaft spacer as follows:

(a) Insert Special Tool 6312 through sun gear, planetary gear and into pilot bushing in output shaft. Be sure tool bottoms against planetary shoulder.

DISASSEMBLY AND ASSEMBLY (Continued)

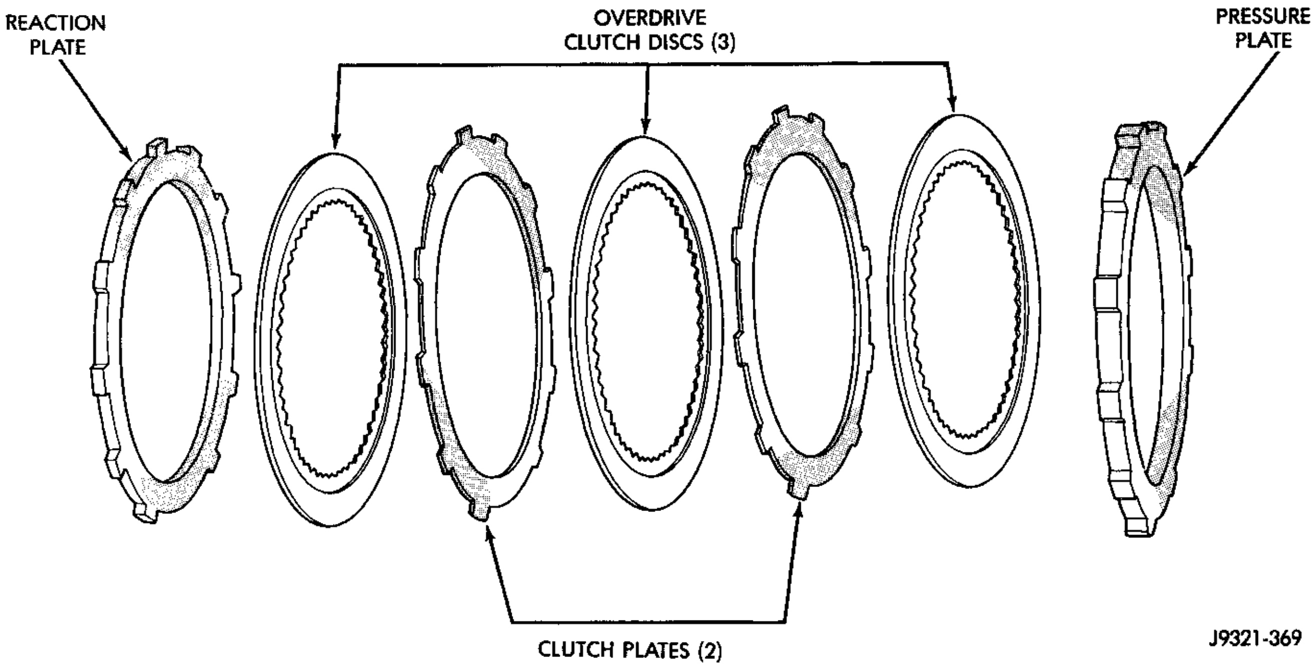

Fig. 236 42RE Overdrive Clutch Components

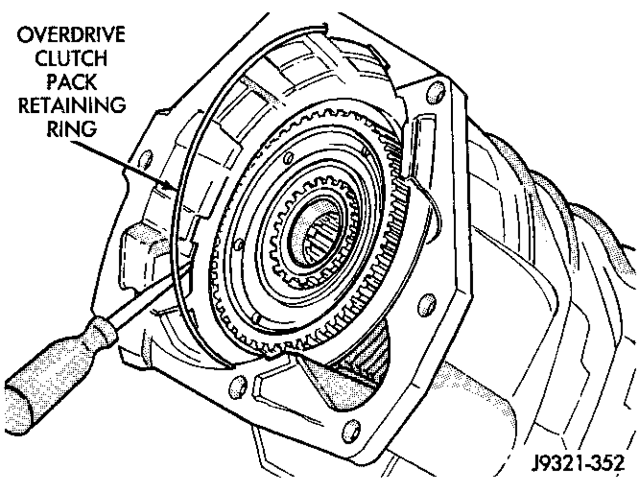

Fig. 237 Overdrive Clutch Pack Retaining Ring Installation

(b) Position Gauge Tool 6311 across face of overdrive case (Fig. 238). Then position Dial Caliper C-4962 over gauge tool.

(c) Extend sliding scale of dial caliper downward through gauge tool slot until scale contacts end of Gauge Alignment Tool 6312. Lock scale in place. Remove dial caliper tool and note distance measured (Fig. 238).

(d) Select proper thickness end play spacer from spacer chart based on distance measured (Fig. 239).

(e) Remove Gauge Alignment Tool 6312.

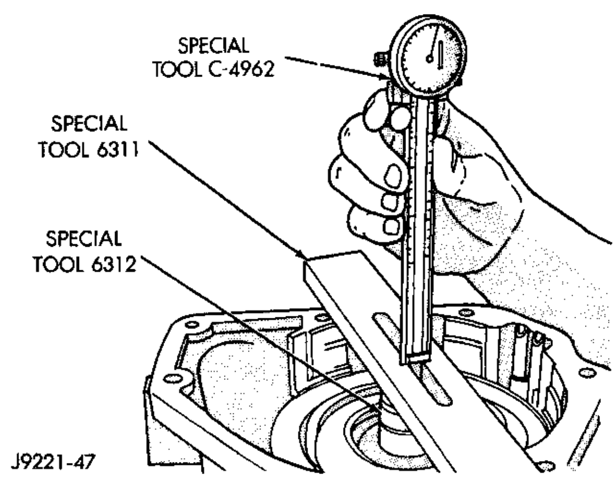

Fig. 238 Shaft End Play Measurement

End Play Measurement (Inches)	Spacer Thickness (Inches)
.7336 - .7505	.158 - .159
.7506 - .7675	.175 - .176
.7676 - .7855	.193 - .194
.7856 - .8011	.211 - .212

J9121-341

Fig. 239 Intermediate Shaft End Play Spacer Selection

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

OD THRUST PLATE SELECTION

(1) Place overdrive unit in vertical position. Mount it on blocks, or in workbench with appropriate size mounting hole cut into it. Be sure unit is facing upward for access to direct clutch hub. Also be sure output shaft is not loaded and internal components are moved rearward for accurate measurement.

(2) Determine correct thickness overdrive piston thrust plate as follows:

(a) Position Gauge Tool 6311 across face of overdrive case. Then position Dial Caliper C-4962 over gauge tool (Fig. 240).

(b) Measure distance to clutch hub thrust bearing seat at four points 90° apart. Then average measurements by adding them and dividing by 4.

(c) Select and install required thrust plate from information in thrust plate chart (Fig. 241).

(3) Leave Alignment Tool 6227-2 in place. Tool will keep planetary and clutch hub splines in alignment until overdrive unit is ready for installation on transmission.

(4) Transmission speed sensor can be installed at this time if desired. However, it is recommended that sensor not be installed until after overdrive unit is secured to transmission.

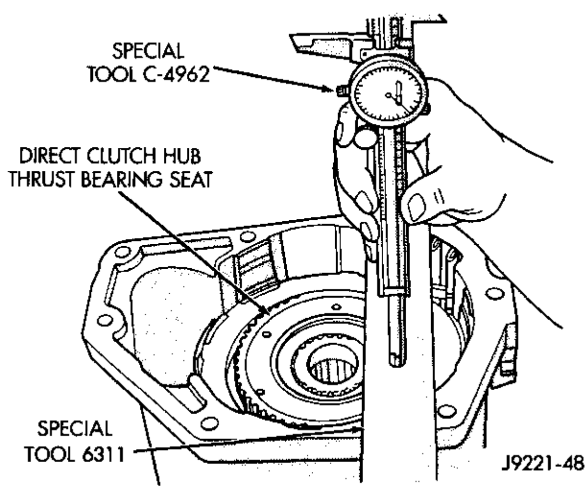

Fig. 240 Overdrive Piston Thrust Plate Measurement

OVERDRIVE PISTON ASSEMBLY

(1) Install new seals on over drive piston.

(2) Stand transmission case upright on bellhousing.

(3) Position Guide Ring 8114-1 on outer edge of overdrive piston retainer.

(4) Position Seal Guide 8114-2 on inner edge of overdrive piston retainer.

(5) Install overdrive piston in overdrive piston retainer by: aligning locating lugs on overdrive piston to the two mating holes in retainer.

(a) Aligning locating lugs on overdrive piston to the two mating holes in retainer.

End Play Measurement (Inches)	Spacer Thickness (Inches)
1.7500 - 1.7649	.108 - .110
1.7650 - 1.7799	.123 - .125
1.7800 - 1.7949	.138 - .140
1.7950 - 1.8099	.153 - .155
1.8100 - 1.8249	.168 - .170
1.8250 - 1.8399	.183 - .185
1.8400 - 1.8549	.198 - .200
1.8550 - 1.8699	.213 - .215
1.8700 - 1.8849	.228 - .230
1.8850 - 1.8999	.243 - .245

J9121-342

Fig. 241 Overdrive Piston Thrust Plate Selection

(b) Lubricate overdrive piston seals with Mopar® Door Ease, or equivalent.

(c) Install piston over Seal Guide 8114–2 and inside Guide Ring 8114–1.

(d) Push overdrive piston into position in retainer.

(e) Verify that the locating lugs entered the lug bores in the retainer.

(6) Install intermediate shaft spacer on intermediate shaft.

(7) Install overdrive piston thrust plate on overdrive piston.

(8) Install overdrive piston thrust bearing on overdrive piston.

(9) Install transmission speed sensor and O-ring seal in overdrive case (Fig. 182).

CLEANING AND INSPECTION

VALVE BODY

Clean the valve housings, valves, plugs, springs, and separator plates with a standard parts cleaning solution only. Do not use gasoline, kerosene, or any type of caustic solution.

Do not immerse any of the electrical components in cleaning solution. Clean the governor solenoid and sensor and the dual solenoid and harness assembly by wiping them off with dry shop towels only.

Dry all except the electrical parts with compressed air. Make sure all passages are clean and free from obstructions. **Do not use rags or shop towels to dry or wipe off valve body components. Lint from these materials can stick to valve body parts, interfere with valve operation, and clog filters and fluid passages.**

Wipe the governor pressure sensor and solenoid valve with dry, lint free shop towels only. The O-rings on the sensor and solenoid valve are the only service-

CLEANING AND INSPECTION (Continued)

able components. Be sure the vent ports in the solenoid valve are open and not blocked by dirt or debris. Replace the valve and/or sensor only when DRB scan tool diagnosis indicates this is necessary. Or, if either part has sustained physical damage (dented, deformed, broken, etc.).

CAUTION: Do not turn the small screw at the end of the solenoid valve for any reason. Turning the screw in either direction will ruin solenoid calibration and result in solenoid failure. In addition, the filter on the solenoid valve is NOT serviceable. Do not try to remove the filter as this will damage the valve housing.

Inspect the throttle and manual valve levers and shafts. Do not attempt to straighten a bent shaft or correct a loose lever. Replace these components if worn, bent, loose or damaged in any way.

Inspect all of the valve body mating surfaces for scratches, nicks, burrs, or distortion. Use a straightedge to check surface flatness. Minor scratches may be removed with crocus cloth using only very light pressure.

Minor distortion of a valve body mating surface may be corrected by smoothing the surface with a sheet of crocus cloth. Position the crocus cloth on a surface plate, sheet of plate glass or equally flat surface. If distortion is severe or any surfaces are heavily scored, the valve body will have to be replaced.

CAUTION: Many of the valves and plugs, such as the throttle valve, shuttle valve plug, 1-2 shift valve and 1-2 governor plug, are made of coated aluminum. Aluminum components are identified by the dark color of the special coating applied to the surface (or by testing with a magnet). Do not sand aluminum valves or plugs under any circumstances. This practice could damage the special coating causing the valves/plugs to stick and bind.

Inspect the valves and plugs for scratches, burrs, nicks, or scores. Minor surface scratches on steel valves and plugs can be removed with crocus cloth but **do not round off the edges of the valve or plug lands.** Maintaining sharpness of these edges is vitally important. The edges prevent foreign matter from lodging between the valves and plugs and the bore.

Inspect all the valve and plug bores in the valve body. Use a penlight to view the bore interiors. Replace the valve body if any bores are distorted or scored. Inspect all of the valve body springs. The springs must be free of distortion, warpage or broken coils.

Check the two separator plates for distortion or damage of any kind. Inspect the upper housing, lower housing, 3-4 accumulator housing, and transfer plate carefully. Be sure all fluid passages are clean and clear. Check condition of the upper housing and transfer plate check balls as well. The check balls and ball seats must not be worn or damaged.

Trial fit each valve and plug in its bore to check freedom of operation. When clean and dry, the valves and plugs should drop freely into the bores.

Valve body bores do not change dimensionally with use. If the valve body functioned correctly when new, it will continue to operate properly after cleaning and inspection. It should not be necessary to replace a valve body assembly unless it is damaged in handling.

The only serviceable valve body components are listed below. The remaining valve body components are serviced only as part of a complete valve body assembly. Serviceable parts are:

- dual solenoid and harness assembly
- solenoid gasket
- solenoid case connector O-rings and shoulder bolt
- switch valve and spring
- pressure adjusting screw and bracket assembly
- throttle lever
- manual lever and shaft seal
- throttle lever shaft seal, washer, and E-clip
- fluid filter and screws
- detent ball and spring
- valve body screws
- governor pressure solenoid
- governor pressure sensor and retaining clip
- park lock rod and E-clip

TRANSMISSION

GENERAL INFORMATION

Inspect the transmission bushings during overhaul. Bushing condition is important as worn, scored bushings contribute to low pressures, clutch slip and accelerated wear of other components. However, do not replace bushings as a matter of course. Replace bushings only when they are actually worn, or scored.

Use recommended tools to replace bushings. The tools are sized and designed to remove, install, and seat bushings correctly. The bushing replacement tools are included in Bushing Tool Set C-3887-B.

Pre-sized service bushings are available for replacement purposes. Only the sun gear bushings are not serviced. Low cost of the sun gear assembly makes it easier to simply replace the gear and bushings as an assembly.

Heli-Coil inserts can be used to repair damaged, stripped or worn threads in aluminum parts. These

CLEANING AND INSPECTION (Continued)

inserts are available from most automotive parts suppliers. Stainless steel inserts are recommended.

The use of crocus cloth is permissible where necessary, providing it is used carefully. When used on shafts, or valves, use extreme care to avoid rounding off sharp edges. Sharp edges are vital as they prevent foreign matter from getting between the valve and valve bore.

Do not reuse oil seals, gaskets, seal rings, or O-rings during overhaul. Replace these parts as a matter of course. Also do not reuse snap rings or E-clips that are bent or distorted. Replace these parts as well.

Lubricate transmission parts with Mopar® ATF Plus, Type 7176, transmission fluid during overhaul and assembly. Use petroleum jelly, Mopar® Door Ease, or Ru-Glyde to prelubricate seals, O-rings, and thrust washers. Petroleum jelly can also be used to hold parts in place during reassembly.

TRANSMISSION CASE CLEANING AND INSPECTION

Clean the case in a solvent tank. Flush the case bores and fluid passages thoroughly with solvent. Dry the case and all fluid passages with compressed air. Be sure all solvent is removed from the case and that all fluid passages are clear.

NOTE: Do not use shop towels or rags to dry the case (or any other transmission component) unless they are made from lint-free materials. Lint will stick to case surfaces and transmission components and circulate throughout the transmission after assembly. A sufficient quantity of lint can block fluid passages and interfere with valve body operation.

Inspect the case for cracks, porous spots, worn bores, or damaged threads. Damaged threads can be repaired with Helicoil thread inserts. However, the case will have to be replaced if it exhibits any type of damage or wear.

Lubricate the front band adjusting screw threads with petroleum jelly and thread the screw part-way into the case. Be sure the screw turns freely.

OVERRUNNING CLUTCH/LOW-REVERSE DRUM/OVERDRIVE PISTON RETAINER

Clean the overrunning clutch assembly, clutch cam, low-reverse drum, and overdrive piston retainer in solvent. Dry them with compressed air after cleaning.

Inspect condition of each clutch part after cleaning. Replace the overrunning clutch roller and spring assembly if any rollers or springs are worn or damaged, or if the roller cage is distorted, or damaged. Replace the cam if worn, cracked or damaged.

Replace the low-reverse drum if the clutch race, roller surface or inside diameter is scored, worn or damaged. **Do not remove the clutch race from the low-reverse drum under any circumstances. Replace the drum and race as an assembly if either component is damaged.**

Examine the overdrive piston retainer carefully for wear, cracks, scoring or other damage. Be sure the retainer hub is a snug fit in the case and drum. Replace the retainer if worn or damaged.

ACCUMULATOR

Inspect the accumulator piston and seal rings (Fig. 242). Replace the seal rings if worn or cut. Replace the piston if chipped or cracked.

Check condition of the accumulator inner and outer springs (Fig. 242). Replace the springs if the coils are cracked, distorted or collapsed.

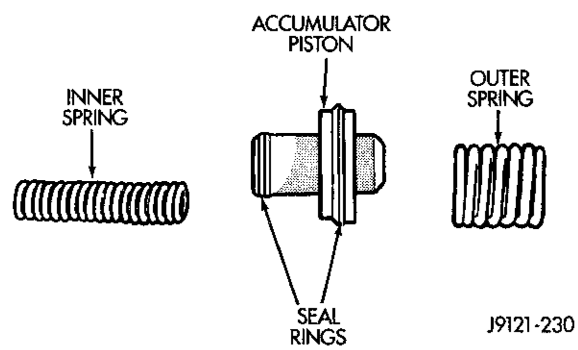

Fig. 242 Accumulator Components

FRONT SERVO

Clean the servo piston components with solvent and dry them with compressed air. Wipe the band clean with lint free shop towels.

Replace the front band if distorted, lining is burned, flaking off, or worn to the point where the grooves in the lining material are no longer visible.

Inspect the servo components. Replace the springs if collapsed, distorted or broken. Replace the guide, rod and piston if cracked, bent, or worn. Discard the servo snap ring if distorted or warped.

Check the servo piston bore for wear. If the bore is severely scored, or damaged, it will be necessary to replace the case.

Replace any servo component if doubt exists about condition. Do not reuse suspect parts.

REAR SERVO

Remove and discard the servo piston seal ring (Fig. 243). Then clean the servo components with solvent and dry with compressed air. Replace either spring if collapsed, distorted or broken. Replace the plug and piston if cracked, bent, or worn. Discard the servo snap rings and use a new ones at assembly.

CLEANING AND INSPECTION (Continued)

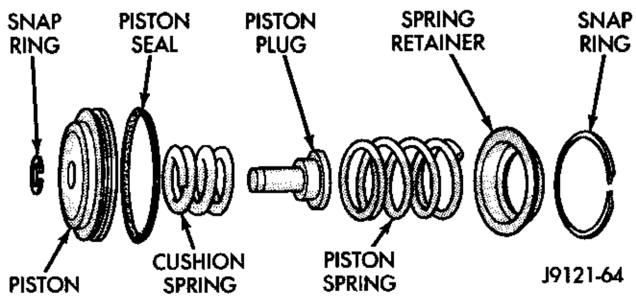

Fig. 243 Rear Servo Components

OIL PUMP AND REACTION SHAFT SUPPORT

(1) Clean pump and support components with solvent and dry them with compressed air.

(2) Check condition of the seal rings and thrust washer on the reaction shaft support. The seal rings do not need to be replaced unless cracked, broken, or severely worn.

(3) Inspect the pump and support components. Replace the pump or support if the seal ring grooves or machined surfaces are worn, scored, pitted, or damaged. Replace the pump gears if pitted, worn chipped, or damaged.

(4) Inspect the pump bushing. Then check the reaction shaft support bushing. Replace either bushing only if heavily worn, scored or damaged. It is not necessary to replace the bushings unless they are actually damaged.

(5) Install the gears in the pump body and measure pump component clearances as follows:

(a) Clearance between outer gear and reaction shaft housing should be 0.010 to 0.063 mm (0.0004 to 0.0025 in.). Clearance between inner gear and reaction shaft housing should be 0.010 to 0.063 mm (0.0004 to 0.0025 in.). Both clearances can be measured at the same time by:

(I) Installing the pump gears in the pump housing.

(II) Position an appropriate piece of Plastigage® across both gears.

(III) Align the plastigage to a flat area on the reaction shaft housing.

(IV) Install the reaction shaft to the pump housing.

(V) Separate the reaction shaft housing from the pump housing and measure the Plastigage® following the instructions supplied with it.

(b) Clearance between inner gear tooth and outer gear should be 0.08 to 0.19 mm (0.0035 to 0.0075 in.). Measure clearance with an appropriate feeler gauge.

(c) Clearance between outer gear and pump housing should also be 0.010 to 0.19 mm (0.0035 to 0.0075 in.). Measure clearance with an appropriate feeler gauge.

FRONT CLUTCH

Clean and inspect the front clutch components. Replace the clutch discs if warped, worn, scored, burned or charred, or if the facing is flaking off. Replace the steel plates if heavily scored, warped, or broken. Be sure the driving lugs on the plates are in good condition. The lugs must not be bent, cracked or damaged in any way.

Replace the clutch spring and spring retainer if either is distorted, warped or broken.

Check the lug grooves in the clutch retainer. The steel plates should slide freely in the slots. Replace the retainer if the grooves are worn or damaged.

Check action of the check ball in the retainer (Fig. 244). The ball must move freely and not stick.

NOTE: Inspect the clutch retainer bushings carefully (Fig. 245). The retainer bushings are NOT serviceable. It will be necessary to replace the retainer if either bushing is scored, or worn.

Inspect the piston and retainer seal surfaces for nicks or scratches. Minor scratches can be removed with crocus cloth. However, replace the piston and/or retainer if the seal surfaces are seriously scored.

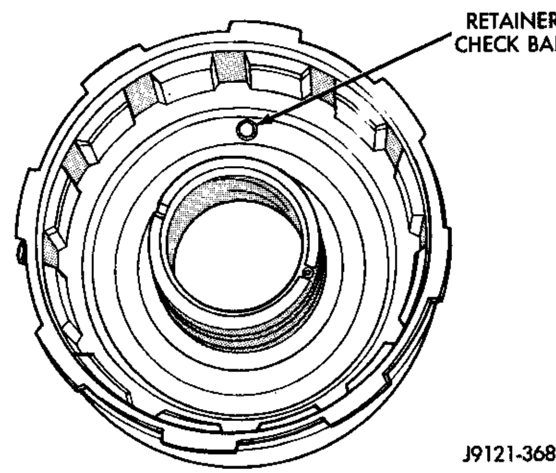

Fig. 244 Front Clutch Piston Retainer Check Ball Location

REAR CLUTCH

Clean the clutch components with solvent and dry them with compressed air. Do not use rags or shop towels to dry any of the clutch parts. Lint from such materials will adhere to component surfaces and could restrict or block fluid passages after assembly.

Replace the clutch discs if warped, worn, scored, burned/charred, the lugs are damaged, or if the facing is flaking off. Replace the top and bottom pressure plates if scored, warped, or cracked. Be sure the driving lugs on the pressure and clutch plates are also in good condition. The lugs must not be bent, cracked or damaged in any way.

Mopar AUTHENTIC RESTORATION PRODUCT

CLEANING AND INSPECTION (Continued)

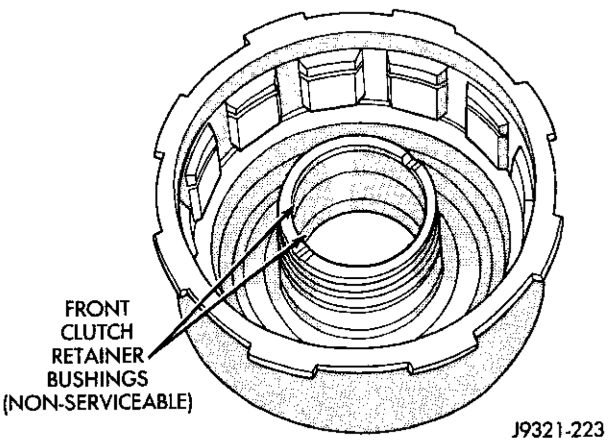

Fig. 245 Retainer Bushing Location/Inspection

Replace the piston spring and wave spring if either part is distorted, warped or broken.

Check the lug grooves in the clutch retainer. The clutch and pressure plates should slide freely in the slots. Replace the retainer if the grooves are worn or damaged. Also check action of the check balls in the retainer and piston. Each check ball must move freely and not stick.

Replace the retainer bushing if worn, scored, or doubt exists about bushing condition.

Inspect the piston and retainer seal surfaces for nicks or scratches. Minor scratches can be removed with crocus cloth. However, replace the piston and/or retainer if the seal surfaces are seriously scored.

Check condition of the fiber thrust washer and metal output shaft thrust washer. Replace either washer if worn or damaged.

Check condition of the seal rings on the input shaft and clutch retainer hub. Replace the seal rings only if worn, distorted, or damaged. The input shaft front seal ring is teflon with chamfered ends. The rear ring is metal with interlocking ends.

Check the input shaft for wear, or damage. Replace the shaft if worn, scored or damaged in any way.

PLANETARY GEARTRAIN

Clean the planetary components in solvent and dry them with compressed air.

Check sun gear and driving shell condition. Replace the gear if damaged or if the bushings are scored or worn. The bushings are not serviceable. Replace the driving shell if worn, cracked or damaged.

Replace planetary gear sets if gears, pinion pins, or carrier are damaged in any way. Replace the annulus gears and supports if either component is worn or damaged.

Inspect the geartrain spacers, thrust plates, snap rings, and thrust washers. Replace any of these parts that are worn, distorted or damaged. Do not attempt to reuse these parts.

The planetary gear thrust washers are different sizes. The large diameter washers go on the front planetary and the smaller washers go on the rear planetary. All the washers have four locating tabs on them. These tabs fit in the holes or slots provided in each planetary gear.

Inspect the output shaft carefully. Pay particular attention to the machined bushing/bearing surfaces on the shaft and the governor valve shaft bore at the shaft rear.

Replace the output shaft if the machined surfaces are scored, pitted, or damaged in any way. Also replace the shaft if the splines are damaged, or exhibits cracks at any location (especially at the governor valve shaft bore).

The annulus gears can be removed from their supports if necessary. Just remove the snap rings and separate the two parts when replacement is necessary. In addition, the annulus gear bushings can be replaced if severely worn, or scored. However it is not necessary to replace the bushings if they only exhibit normal wear. Check bushing fit on the output shaft to be sure.

OVERDRIVE UNIT

Clean the geartrain and case components with solvent. Dry all parts except the bearings with compressed air. Allow bearings to air dry.

Do not use shop towels for wiping parts dry unless the towels are made from a lint-free material. A sufficient quantity of lint (from shop towels, cloths, rags, etc.) could plug the transmission filter and fluid passages.

Discard the old case gasket and seals. Do not attempt to salvage these parts. They are not reusable. Replace any of the overdrive unit snap rings if distorted or damaged.

Minor nicks or scratches on components can be smoothed with crocus cloth. However, do not attempt to reduce severe scoring on any components with abrasive materials. Replace severely scored components; do not try to salvage them.

Check condition of the park lock components and the overdrive case.

Replace the case if cracked, scored, or damaged. Replace the park lock pawl, plug, or spring if worn or damaged. Be sure the bullet at the end of the park lock rod is in good condition. Replace the rod if the bullet is worn or the rod itself is bent or distorted. Do not attempt to straighten the rod.

Check the bushings in the overdrive case. Replace the bushings if severely scored or worn. Also replace the case seal if loose, distorted, or damaged.

CLEANING AND INSPECTION (Continued)

Examine the overdrive and direct clutch discs and plates. Replace the discs if the facing is worn, severely scored, or burned and flaking off. Replace the clutch plates if worn, heavily scored, or cracked. Check the lugs on the clutch plates for wear. The plates should slide freely in the drum. Replace the plates or drum if binding occurs.

Check condition of the annulus gear, direct clutch hub, clutch drum and clutch spring. Replace the gear, hub and drum if worn or damaged. Replace the spring if collapsed, distorted, or cracked.

Be sure the splines and lugs on the gear, drum and hub are in good condition. The clutch plates and discs should slide freely in these components.

Inspect the thrust bearings and spring plate. Replace the plate if worn or scored. Replace the bearings if rough, noisy, brinnelled, or worn.

Inspect the planetary gear assembly and the sun gear and bushings. If either the sun gear or the bushings are damaged, replace the gear and bushings as an assembly. The gear and bushings are not serviced separately.

The planetary carrier and pinions must be in good condition. Also be sure the pinion pins are secure and in good condition. Replace the carrier if worn or damaged.

Inspect the overrunning clutch and race. The race surface should be smooth and free of scores. Replace the overrunning clutch assembly or the race if either assembly is worn or damaged in any way.

Inspect the output shaft and governor components. Replace the shaft pilot bushing and inner bushing if damaged. Replace either shaft bearing if rough or noisy. Replace the bearing snap rings if distorted or cracked.

Check the machined surfaces on the output shaft. These surfaces should clean and smooth. Very minor nicks or scratches can be smoothed with crocus cloth. Replace the shaft if worn, scored or damaged in any way.

Inspect the output shaft bushings. The small bushing is the intermediate shaft pilot bushing. The large bushing is the overrunning clutch hub bushing. Replace either bushing if scored, pitted, cracked, or worn.

ADJUSTMENTS

TRANSMISSION THROTTLE VALVE CABLE ADJUSTMENT

The transmission throttle valve is operated by a cam on the valve body throttle lever. The throttle lever is actuated by a cable connected to the engine throttle body lever (Fig. 246). A retaining clip at the engine-end of the cable is removed to provide for cable adjustment. The retaining clip is then installed back onto the throttle valve cable to lock in the adjustment.

A correctly adjusted throttle valve cable, will cause the throttle lever on the transmission to move simultaneously with the throttle body lever from the idle position. Proper adjustment allows simultaneous movement without causing the transmission throttle lever to move ahead of, or lag behind the throttle body lever.

THROTTLE VALVE CABLE ADJUSTMENT CHECK

(1) Turn ignition key to OFF position.

(2) Remove air cleaner.

(3) Verify that throttle body lever is at curb idle position. Then verify that transmission throttle lever (Fig. 246) is also at idle (full forward) position.

(4) Slide cable off attachment stud on throttle body lever (Fig. 246).

(5) Compare position of cable end to attachment stud on throttle body lever:

(a) Cable end and attachment stud should be aligned (or centered on one another) to within 1 mm (0.039 in.) in either direction.

(b) If cable end and attachment stud are misaligned (off center), cable will have to be adjusted as described in following procedure.

(6) Reconnect cable end to attachment stud. Then with aid of a helper, observe movement of transmission throttle lever and lever on throttle body.

(a) If both levers move simultaneously from idle to half-throttle and back to idle position, adjustment is correct.

(b) If transmission throttle lever moves ahead of, or lags behind throttle body lever, cable adjustment will be necessary. Or, if throttle body lever prevents transmission lever from returning to closed position, cable adjustment will be necessary.

THROTTLE VALVE CABLE ADJUSTMENT PROCEDURE

(1) Turn ignition switch to OFF position and shift into Park.

(2) Remove air cleaner.

(3) Disconnect cable end from attachment stud on throttle body. **Carefully slide cable off stud. Do not pull or pry cable off.**

(4) Verify that transmission throttle lever is in idle (full forward) position. Then be sure lever on throttle body is at curb idle position.

(5) Insert a small screwdriver under edge of retaining clip and remove retaining clip.

(6) Center cable end on attachment stud to within 1 mm (0.039 in.).

(7) Install retaining clip onto cable housing.

(8) Check cable adjustment. Be sure transmission throttle lever and lever on throttle body move simul-

ADJUSTMENTS (Continued)

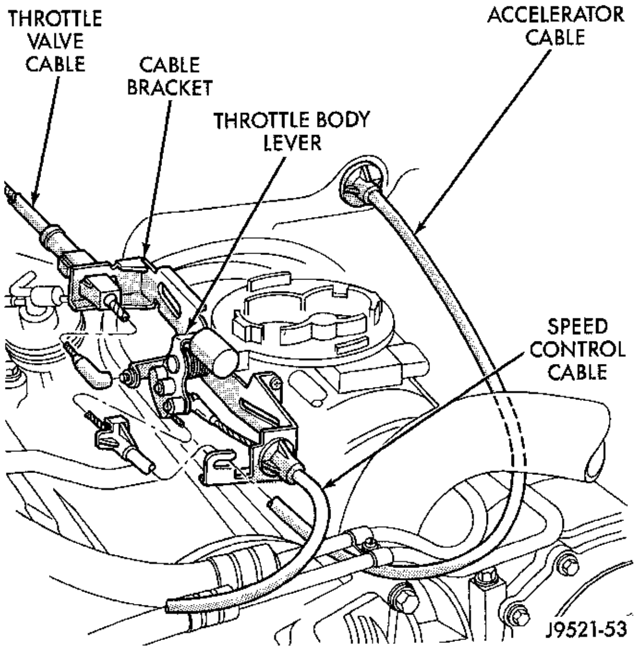

Fig. 246 Throttle Valve Cable Attachment —At Engine

taneously and as described in cable adjustment checking procedure.

GEARSHIFT LINKAGE ADJUSTMENT

Check linkage adjustment by starting engine in Park and Neutral. Adjustment is acceptable if the engine starts in only these two positions. Adjustment is incorrect if the engine starts in one position but not both positions

If the engine starts in any other position, or if the engine will not start in any position, the park/neutral switch is probably faulty.

LINKAGE ADJUSTMENT

Check condition of the shift linkage (Fig. 247). Do not attempt adjustment if any component is loose, worn, or bent. Replace any suspect components.

Replace the grommet securing the shift rod or torque rod in place if either rod was removed from the grommet. Remove the old grommet as necessary and use suitable pliers to install the new grommet.

(1) Shift transmission into Park.

(2) Raise and support vehicle.

(3) Loosen lock bolt in front shift rod adjusting swivel (Fig. 247).

(4) Ensure that the shift rod slides freely in the swivel. Lube rod and swivel as necessary.

(5) Move transmission shift lever fully rearward to the Park detent.

(6) Center adjusting swivel on shift rod.

(7) Tighten swivel lock bolt to 10 N·m (90 in. lbs.).

(8) Lower vehicle and verify proper adjustment.

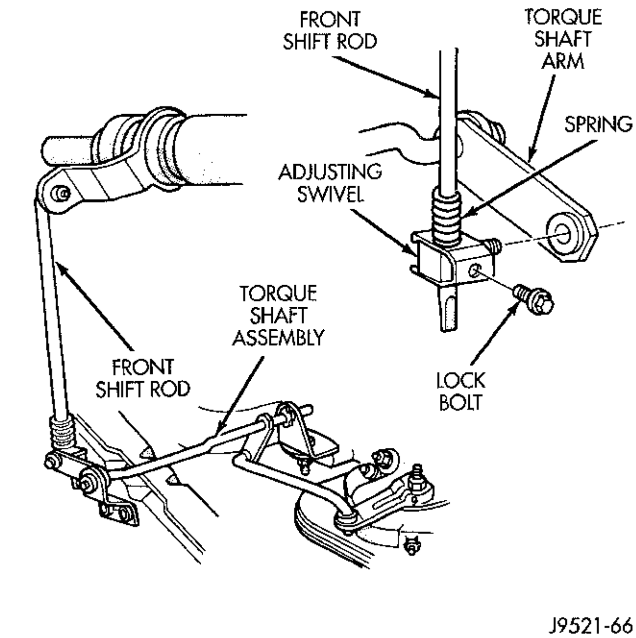

Fig. 247 Linkage Adjustment Components

BAND ADJUSTMENTS

FRONT BAND ADJUSTMENT

The front (kickdown) band adjusting screw is located on the left side of the transmission case above the manual valve and throttle valve levers.

(1) Raise vehicle.

(2) Loosen band adjusting screw locknut (Fig. 248). Then back locknut off 3-5 turns. Be sure adjusting screw turns freely in case. Apply lubricant to screw threads if necessary.

(3) Tighten band adjusting screw to 8 N·m (72 in. lbs.) torque with Inch Pound Torque Wrench C-3380-A, a 3-in. extension and 5/16 socket.

CAUTION: If Adapter C-3705 is needed to reach the adjusting screw (Fig. 249), tighten the screw to only 5 N·m (47-50 in. lbs.) torque.

(4) Back off front band adjusting screw 3-5/8 turns.

(5) Hold adjuster screw in position and tighten locknut to 41 N·m (30 ft. lbs.) torque.

(6) Lower vehicle.

REAR BAND ADJUSTMENT

The transmission oil pan must be removed for access to the rear band adjusting screw.

(1) Raise vehicle.

(2) Remove transmission oil pan and drain fluid.

(3) Loosen band adjusting screw locknut 5-6 turns (Fig. 250). Be sure adjusting screw turns freely in lever.

ADJUSTMENTS (Continued)

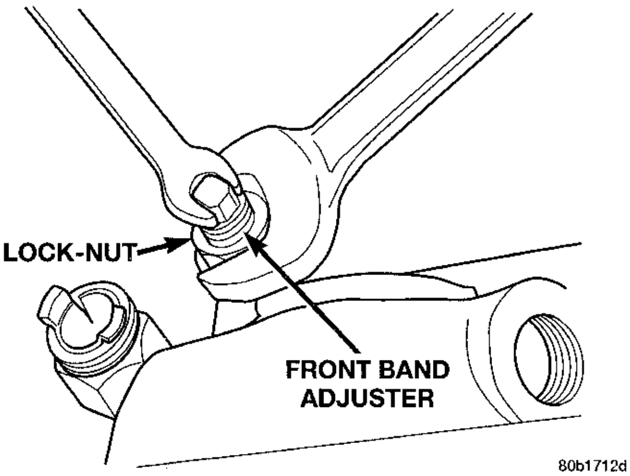

Fig. 248 Front Band Adjustment Screw Location

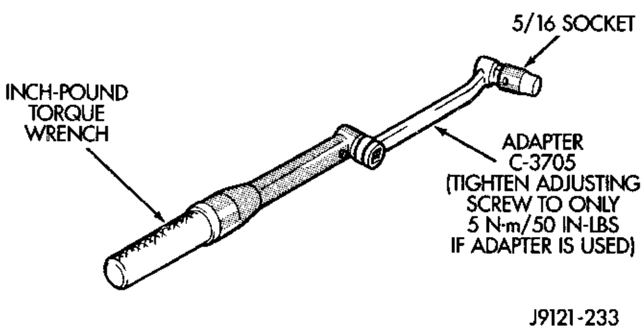

Fig. 249 Band Adjustment Adapter Tool

(4) Tighten adjusting screw to 8 N·m (72 in. lbs.) torque.

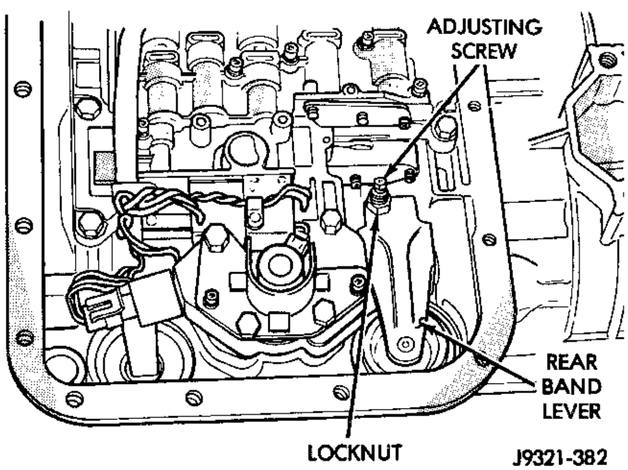

Fig. 250 Rear Band Adjusting Screw Location

(5) Back off adjusting screw 4 turns.

(6) Hold adjusting screw in place and tighten locknut to 34 N·m (25 ft. lbs.) torque.

(7) Position new gasket on oil pan and install pan on transmission. Tighten pan bolts to 17 N·m (13 ft. lbs.) torque.

(8) Lower vehicle and refill transmission with Mopar® ATF Plus 3, Type 7176 fluid.

VALVE BODY

CONTROL PRESSURE ADJUSTMENTS

There are two control pressure adjustments on the valve body;

- Line Pressure
- Throttle Pressure

Line and throttle pressures are interdependent because each affects shift quality and timing. As a result, both adjustments must be performed properly and in the correct sequence. Adjust line pressure first and throttle pressure last.

LINE PRESSURE ADJUSTMENT

Measure distance from the valve body to the inner edge of the adjusting screw with an accurate steel scale (Fig. 251).

Distance should be 33.4 mm (1-5/16 in.).

If adjustment is required, turn the adjusting screw in, or out, to obtain required distance setting.

NOTE: The 33.4 mm (1-5/16 in.) setting is an approximate setting. Manufacturing tolerances may make it necessary to vary from this dimension to obtain desired pressure.

One complete turn of the adjusting screw changes line pressure approximately 1-2/3 psi (9 kPa).

Turning the adjusting screw counterclockwise increases pressure while turning the screw clockwise decreases pressure.

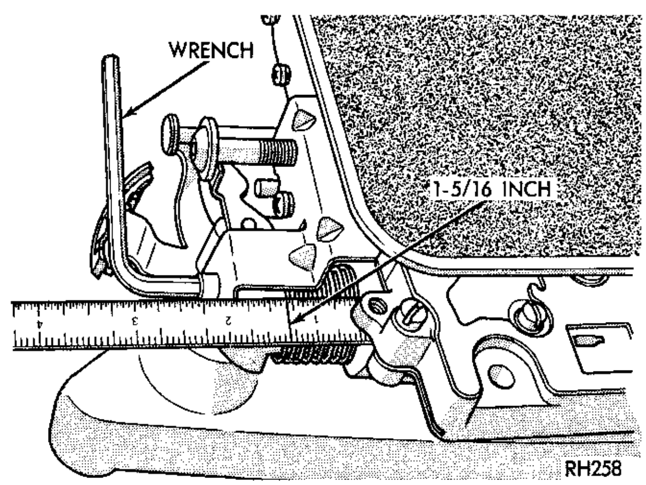

Fig. 251 Line Pressure Adjustment

THROTTLE PRESSURE ADJUSTMENT

Insert Gauge Tool C-3763 between the throttle lever cam and the kickdown valve stem (Fig. 252).

AUTHENTIC RESTORATION PRODUCT

ADJUSTMENTS (Continued)

Push the gauge tool inward to compress the kickdown valve against the spring and bottom the throttle valve.

Maintain pressure against kickdown valve spring. Turn throttle lever stop screw until the screw head touches throttle lever tang and the throttle lever cam touches gauge tool.

NOTE: The kickdown valve spring must be fully compressed and the kickdown valve completely bottomed to obtain correct adjustment.

Overdrive piston thrust plate	Thrust plate and spacer are select fit. Refer to size charts and selection procedures in Overdrive Unit D&A procedures	
Intermiediate shaft spacer		

PRESSURE TEST

Overdrive clutch	Fourth gear only	Pressure should be 469-496 kPa (68-72 psi) with closed throttle and increase to 620-896 kPa (90-130 psi) at 1/2 to 3/4 throttle.
Line pressure (at accumulator)	Closed throttle	372-414 kPa (54-60 psi).
Front servo	Third gear only	No more than 21 kPa (3 psi) lower than line pressure.
Rear servo	1 range	No more than 21 kPa (3 psi) lower than line pressure.
	R range	1103 kPa (160 psi) at idle, builds to 1862 kPa (270 psi) at 1600 rpm.
Governor	D range closed throttle	Pressure should respond smoothly to changes in mph and return to 0-7 kPa (0-1.5 psi) when stopped with transmission in D, 1, 2. Pressure above 7 kPa (1.5 psi) at stand still will prevent transmission from downshifting.

INDEX

Mopar AUTHENTIC RESTORATION PRODUCT

GENERAL INFORMATION

46/47RE TRANSMISSION

The 46/47RE transmissions are four speed fully automatic transmissions with an electronic governor (Fig. 1) and (Fig. 2). First through third gear ranges are provided by the clutches, bands, overrunning clutch, and planetary gear sets in the transmission. Fourth gear range is provided by the overdrive unit that contains an overdrive clutch, direct clutch, planetary gear set, and overrunning clutch. The overdrive clutch is applied in fourth gear only. The direct clutch is applied in all ranges except fourth gear. The transmissions are equipped with a lock-up clutch in the torque converter. The torque converter clutch is controlled by the Powertrain Control Module (PCM). The torque converter clutch is hydraulically applied and is released when fluid is vented from the hydraulic circuit by the torque converter control (TCC) solenoid on the valve body. The torque converter clutch engages in fourth gear, and in third gear when the O/D switch is OFF. Engagement occurs when the vehicle is cruising on a level plane after the vehicle has warmed up. The torque converter clutch disengages when the vehicle begins to go uphill or the accelerator is applied. The torque converter clutch feature increases fuel economy and reduces the transmission fluid temperature. Both transmissions are cooled by an integral fluid cooler inside the radiator.

GENERAL INFORMATION (Continued)

TRANSMISSION IDENTIFICATION

Transmission identification numbers are stamped on the left side of the case just above the oil pan gasket surface (Fig. 3). Refer to this information when ordering replacement parts.

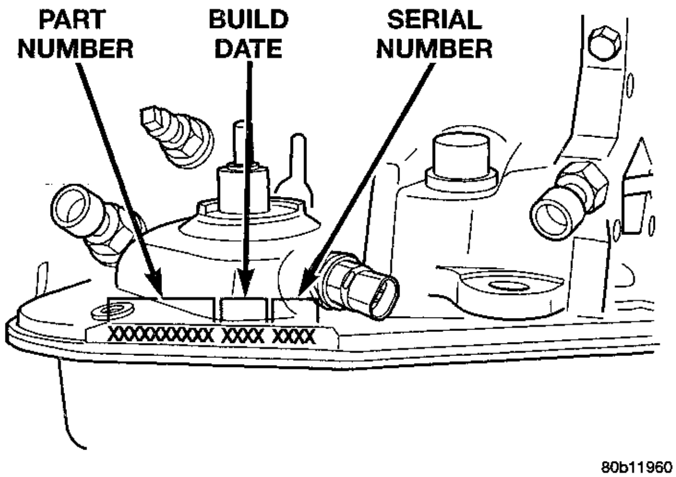

Fig. 3 Transmission Part And Serial Number Location

RECOMMENDED FLUID

Mopar® ATF Plus 3, Type 7176 automatic transmission fluid is the recommended fluid for Chrysler automatic transmissions.

Dexron II fluid IS NOT recommended. Clutch chatter can result from the use of improper fluid.

EFFECTS OF INCORRECT FLUID LEVEL

A low fluid level allows the pump to take in air along with the fluid. Air in the fluid will cause fluid pressures to be low and develop slower than normal. If the transmission is overfilled, the gears churn the fluid into foam. This aerates the fluid and causing the same conditions occurring with a low level. In either case, air bubbles cause fluid overheating, oxidation and varnish buildup which interferes with valve, clutch and servo operation. Foaming also causes fluid expansion which can result in fluid overflow from the transmission vent or fill tube. Fluid overflow can easily be mistaken for a leak if inspection is not careful.

CAUSES OF BURNT FLUID

Burnt, discolored fluid is a result of overheating which has two primary causes.

(1) A result of restricted fluid flow through the main and/or auxiliary cooler. This condition is usually the result of a faulty or improperly installed drainback valve, a damaged main cooler, or severe restrictions in the coolers and lines caused by debris or kinked lines.

(2) Heavy duty operation with a vehicle not properly equipped for this type of operation. Trailer towing or similar high load operation will overheat the transmission fluid if the vehicle is improperly equipped. Such vehicles should have an auxiliary transmission fluid cooler, a heavy duty cooling system, and the engine/axle ratio combination needed to handle heavy loads.

FLUID CONTAMINATION

Transmission fluid contamination is generally a result of:

- adding incorrect fluid
- failure to clean dipstick and fill tube when checking level
- engine coolant entering the fluid
- internal failure that generates debris
- overheat that generates sludge (fluid breakdown)
- failure to reverse flush cooler and lines after repair
- failure to replace contaminated converter after repair

The use of non recommended fluids can result in transmission failure. The usual results are erratic shifts, slippage, abnormal wear and eventual failure due to fluid breakdown and sludge formation. Avoid this condition by using recommended fluids only.

The dipstick cap and fill tube should be wiped clean before checking fluid level. Dirt, grease and other foreign material on the cap and tube could fall into the tube if not removed beforehand. Take the time to wipe the cap and tube clean before withdrawing the dipstick.

Engine coolant in the transmission fluid is generally caused by a cooler malfunction. The only remedy is to replace the radiator as the cooler in the radiator is not a serviceable part. If coolant has circulated through the transmission for some time, an overhaul may also be necessary; especially if shift problems had developed.

The transmission cooler and lines should be reverse flushed whenever a malfunction generates sludge and/or debris. The torque converter should also be replaced at the same time.

Failure to flush the cooler and lines will result in recontamination. Flushing applies to auxiliary coolers as well. The torque converter should also be replaced whenever a failure generates sludge and debris. This is necessary because normal converter flushing procedures will not remove all contaminants.

ELECTRONIC LOCK-UP TORQUE CONVERTER

The torque converter is a hydraulic device that couples the engine crankshaft to the transmission.

GENERAL INFORMATION (Continued)

The torque converter consists of an outer shell with an internal turbine, a stator, an overrunning clutch, an impeller, and an electronically applied converter clutch. Torque multiplication is created when the stator directs the hydraulic flow from the turbine to rotate the impeller in the direction the engine crankshaft is turning. The turbine transfers power to the planetary gear sets in the transmission. The transfer of power into the impeller assists torque multiplication. At low vehicle-speed, the overrunning clutch holds the stator stationary (during torque multiplication) and allows the stator to freewheel at high vehicle speed. The converter clutch engagement reduces engine speed. Clutch engagement also provides reduced transmission fluid temperatures. The torque converter hub drives the transmission oil (fluid) pump.

The torque converter is a sealed, welded unit that is not repairable and is serviced as an assembly.

CAUTION: The torque converter must be replaced if a transmission failure results in large amounts of metal or fiber contamination in the fluid.

TRANSMISSION GEAR RATIOS

46/47RE gear ratios are:

- 2.45:1 (first gear)
- 1.45:1 (second gear)
- 1.00:1 (third gear)
- 0.69:1 (fourth gear)
- 2.21 (reverse)

GEARSHIFT MECHANISM

The gear shift mechanism provides six shift positions which are:

- park (P)
- reverse (R)
- neutral (N)
- drive (D)
- manual second (2)
- manual low (1)

Manual low (1) range provides first gear only. Overrun braking is also provided in this range. Manual second (2) range provides first and second gear only.

Drive range provides first, second third and overdrive fourth gear ranges. The shift into overdrive fourth gear range occurs only after the transmission has completed the shift into D third gear range. No further movement of the shift mechanism is required to complete the 3-4 shift.

The fourth gear upshift occurs automatically when the overdrive selector switch is in the ON position.

DESCRIPTION AND OPERATION

ELECTRONIC GOVERNOR

Governor pressure is controlled electronically. Components used for governor pressure control include:

- Governor body
- Valve body transfer plate
- Governor pressure solenoid valve
- Governor pressure sensor
- Fluid temperature thermistor
- Throttle position sensor (TPS)
- Transmission speed sensor
- Powertrain control module (PCM)

GOVERNOR PRESSURE SOLENOID VALVE

The solenoid valve is a duty-cycle solenoid which regulates the governor pressure needed for upshifts and downshifts. It is an electro-hydraulic device located in the governor body on the valve body transfer plate (Fig. 4).

The inlet side of the solenoid valve is exposed to normal transmission line pressure. The outlet side of the valve leads to the valve body governor circuit.

The solenoid valve regulates line pressure to produce governor pressure. The average current supplied to the solenoid controls governor pressure. One amp current produces zero kPa/psi governor pressure. Zero amps sets the maximum governor pressure.

The powertrain control module (PCM) turns on the trans control relay which supplies electrical power to the solenoid valve. Operating voltage is 12 volts (DC). The PCM controls the ground side of the solenoid using the governor pressure solenoid control circuit.

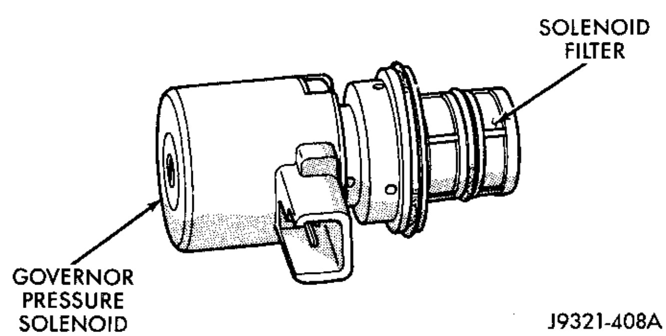

Fig. 4 Governor Pressure Solenoid Valve

GOVERNOR PRESSURE SENSOR

The governor pressure sensor measures output pressure of the governor pressure solenoid valve (Fig. 5).

The sensor output signal provides the necessary feedback to the PCM. This feedback is needed to adequately control governor pressure.

DESCRIPTION AND OPERATION (Continued)

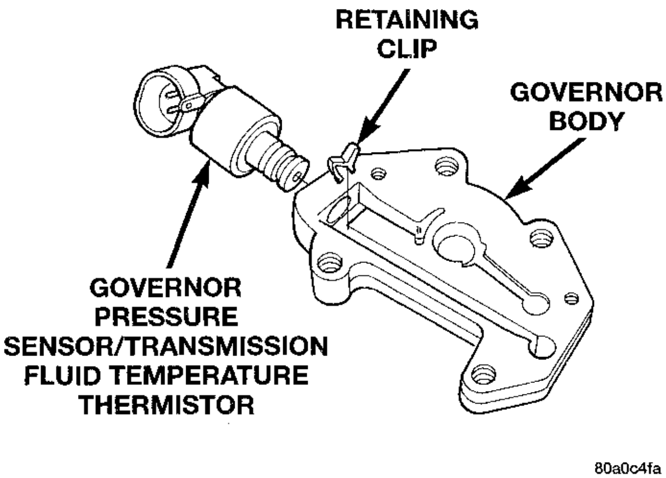

Fig. 5 Governor Pressure Sensor

GOVERNOR BODY AND TRANSFER PLATE

The transfer plate is designed to supply transmission line pressure to the governor pressure solenoid valve and to return governor pressure.

The governor pressure solenoid valve is mounted in the governor body. The body is bolted to the lower side of the transfer plate (Fig. 5). The transfer plate channels line pressure to the solenoid valve through the governor body. It also channels governor pressure from the solenoid valve to the governor circuit. It is the solenoid valve that develops the necessary governor pressure.

TRANSMISSION FLUID TEMPERATURE THERMISTOR

Transmission fluid temperature readings are supplied to the transmission control module by the thermistor. The temperature readings are used to control engagement of the fourth gear overdrive clutch, the converter clutch, and governor pressure. Normal resistance value for the thermistor at room temperature is approximately 1000 ohms.

The PCM prevents engagement of the converter clutch and overdrive clutch, when fluid temperature is below approximately 10°C (50°F).

If fluid temperature exceeds 126°C (260°F), the PCM causes a 4-3 downshift and engage the converter clutch. Engagement is according to the third gear converter clutch engagement schedule.

The overdrive OFF lamp in the instrument panel illuminates when the shift back to third occurs. The transmission will not allow fourth gear operation until fluid temperature decreases to approximately 110°C (230°F).

The thermistor is part of the governor pressure sensor assembly and is immersed in transmission fluid at all times.

TRANSMISSION SPEED SENSOR

The speed sensor (Fig. 6) is located in the overdrive gear case. The sensor is positioned over the park gear and monitors transmission output shaft rotating speed. Speed sensor signals are triggered by the park gear lugs as they rotate past the sensor pickup face. Input signals from the sensor are sent to the transmission control module for processing. The vehicle speed sensor also serves as a backup for the transmission speed sensor. Signals from this sensor are shared with the powertrain control module.

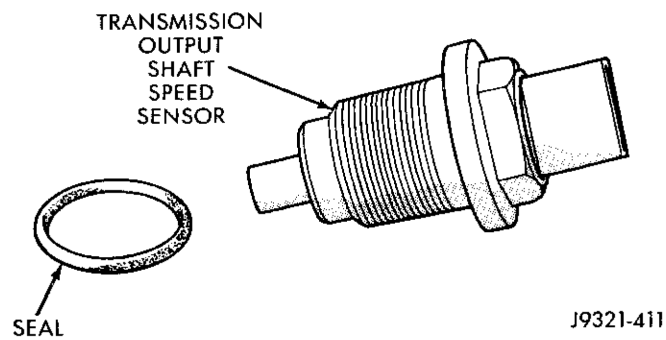

Fig. 6 Transmission Output Speed Sensor

THROTTLE POSITION SENSOR (TPS)

The TPS provides throttle position input signals to the PCM. This input signal is used to determine overdrive and converter clutch shift schedule and to select the proper governor curve.

POWERTRAIN CONTROL MODULE (PCM)

The PCM controls operation of the converter clutch, overdrive clutch, and governor pressure solenoid.

The control module determines transmission shift points based on input signals from the transmission thermistor, transmission output shaft speed sensor, crankshaft position sensor, vehicle speed sensor, throttle position sensor, and battery temperature sensor.

GOVERNOR PRESSURE CURVES

There are four governor pressure curves programmed into the transmission control module. The different curves allow the control module to adjust governor pressure for varying conditions. One curve is used for operation when fluid temperature is at, or below, 1°C (30°F). A second curve is used when fluid temperature is at, or above, 10°C (50°F) during normal city or highway driving. A third curve is used during wide-open throttle operation. The fourth curve is used when driving with the transfer case in low range.

Mopar AUTHENTIC RESTORATION PRODUCT

DESCRIPTION AND OPERATION (Continued)

SHIFT VALVE OPERATION

The shift valves are moved by a combination of throttle and governor pressure. The governor pressure is generated by electrical components.

The conditions under which a shift to fourth will not occur are:

- Overdrive switch is Off
- Transmission fluid temperature is below 10° C (50° F) or above 121° C (250° F)
- Shift to third not yet completed
- Vehicle speed too low for 3-4 shift to occur
- Battery temperature below –5° F.

HYDRAULIC CONTROL SYSTEM

The hydraulic control system provides fully automatic operation. The system performs five basic functions which are: pressure supply, pressure regulation, flow control, clutch/band application, and lubrication.

PRESSURE REGULATION

The pressure regulator valve maintains line pressure. The amount of pressure developed is controlled by throttle pressure which is dependent on the degree of throttle opening. The regulator valve is located in the valve body.

The throttle valve determines line pressure and shift speed. Governor pressure increases in proportion to vehicle speed. The throttle valve controls upshift and downshift speeds by regulating pressure according to throttle position.

Shift Valve Flow Control

The manual valve is operated by the gearshift linkage and provides the operating range selected by the driver.

The 1-2 shift valve provides 1-2 or 2-1 shifts and the 2-3 shift valve provides 2-3 or 3-2 shifts.

The kickdown valve provides forced 3-2 or 3-1 downshifts depending on vehicle speed. Downshifts occur when the throttle is opened beyond downshift detent position. Detent is reached just before wide open throttle position.

The 2-3 valve throttle pressure plug provides 3-2 downshifts at varying throttle openings depending on vehicle speed.

The 1-2 shift control valve transmits 1-2 shift pressure to the accumulator piston. This controls kickdown band capacity on 1-2 upshifts and 3-2 downshifts.

The 3-4 shift, quick fill, and timing valves plus the 3-4 accumulator, are only actuated when the overdrive solenoid is energized. The solenoid contains a check ball that controls a vent port to the 3-4 valves. The check ball either diverts line pressure away from or directly to the 3-4 valves.

The limit valve determines maximum speed at which a 3-2 part throttle kickdown can be made. On transmissions without a limit valve, maximum speed for a 3-2 kickdown is at detent position.

The 2-3 shuttle valve has two functions. The first is fast front band release and smooth engagement during lift-foot 2-3 upshifts. The second is to regulate front clutch and band application during 3-2 downshifts.

The 3-4 timing valve is moved by line pressure coming through the 3-4 shift valve. The timing valve holds the 2-3 shift valve in an upshift position. The purpose is to prevent the 2-3 valve from up or downshifting before the 3-4 valve.

The 3-4 accumulator is mounted on the overdrive housing and performs the same function as the 2-3 accumulator; it is used to smooth engagement during a 3-4 shift.

The switch valve directs fluid apply pressure to the converter clutch in one position and releases it in the opposite position. It also directs oil to the cooling and lube circuits. The switch valve regulates oil pressure to the torque converter by limiting maximum oil pressure to 130 psi.

OVERDRIVE OFF SWITCH

The overdrive OFF (control) switch is located in the instrument panel. The switch is a momentary contact device that signals the PCM to toggle current status of the overdrive function. At key-on, overdrive operation is allowed. Pressing the switch once causes the overdrive OFF mode to be entered and the overdrive OFF switch lamp to be illuminated. Pressing the switch a second time causes normal overdrive operation to be restored and the overdrive lamp to be turned off. The overdrive OFF mode defaults to ON after the ignition switch is cycled OFF and ON. The normal position for the control switch is the ON position. The switch must be in this position to energize the solenoid and allow a 3-4 upshift. The control switch indicator light illuminates only when the overdrive switch is turned to the OFF position, or when illuminated by the transmission control module.

3-4 SHIFT SEQUENCE

The overdrive clutch is applied in fourth gear only. The direct clutch is applied in all ranges except fourth gear. Fourth gear overdrive range is electronically controlled and hydraulically activated. Various sensor inputs are supplied to the powertrain control module to operate the overdrive solenoid on the valve body. The solenoid contains a check ball that opens and closes a vent port in the 3-4 shift valve feed passage. The overdrive solenoid (and check ball) are not energized in first, second, third, or reverse gear. The vent port remains open, diverting line pressure from the 2-3 shift valve away from the 3-4 shift valve. The overdrive control switch must be in the ON position

DESCRIPTION AND OPERATION (Continued)

to transmit overdrive status to the PCM. A 3-4 upshift occurs only when the overdrive solenoid is energized by the PCM. The PCM energizes the overdrive solenoid during the 3-4 upshift. This causes the solenoid check ball to close the vent port allowing line pressure from the 2-3 shift valve to act directly on the 3-4 upshift valve. Line pressure on the 3-4 shift valve overcomes valve spring pressure moving the valve to the upshift position. This action exposes the feed passages to the 3-4 timing valve, 3-4 quick fill valve, 3-4 accumulator, and ultimately to the overdrive piston. Line pressure through the timing valve moves the overdrive piston into contact with the overdrive clutch. The direct clutch is disengaged before the overdrive clutch is engaged. The boost valve provides increased fluid apply pressure to the overdrive clutch during 3-4 upshifts, and when accelerating in fourth gear. The 3-4 accumulator cushions overdrive clutch engagement to smooth 3-4 upshifts. The accumulator is charged at the same time as apply pressure acts against the overdrive piston.

CONVERTER CLUTCH ENGAGEMENT

Converter clutch engagement in third or fourth gear range is controlled by sensor inputs to the powertrain control module. Inputs that determine clutch engagement are: coolant temperature, engine rpm, vehicle speed, throttle position, and manifold vacuum. The torque converter clutch is engaged by the clutch solenoid on the valve body. The clutch can be engaged in third and fourth gear ranges depending on overdrive control switch position. If the overdrive control switch is in the normal ON position, the clutch will engage after the shift to fourth gear, and above approximately 72 km/h (45 mph). If the control switch is in the OFF position, the clutch will engage after the shift to third gear, at approximately 56 km/h (35 mph) at light throttle.

QUICK FILL VALVE

The 3-4 quick fill valve provides faster engagement of the overdrive clutch during 3-4 upshifts. The valve temporarily bypasses the clutch piston feed orifice at the start of a 3-4 upshift. This exposes a larger passage into the piston retainer resulting in a much faster clutch fill and apply sequence. The quick fill valve does not bypass the regular clutch feed orifice throughout the 3-4 upshift. Instead, once a predetermined pressure develops within the clutch, the valve closes the bypass. Clutch fill is then completed through the regular feed orifice.

CONVERTER DRAINBACK VALVE

The drainback valve is located in the transmission cooler outlet (pressure) line. The valve prevents fluid from draining from the converter into the cooler and lines when the vehicle is shut down for lengthy periods. Production valves have a hose nipple at one end, while the opposite end is threaded for a flare fitting. All valves have an arrow (or similar mark) to indicate direction of flow through the valve.

DIAGNOSIS AND TESTING

AUTOMATIC TRANSMISSION DIAGNOSIS

Automatic transmission problems can be a result of poor engine performance, incorrect fluid level, incorrect linkage or cable adjustment, band or hydraulic control pressure adjustments, hydraulic system malfunctions or electrical/mechanical component malfunctions. Begin diagnosis by checking the easily accessible items such as: fluid level and condition, linkage adjustments and electrical connections. A road test will determine if further diagnosis is necessary.

PRELIMINARY DIAGNOSIS

Two basic procedures are required. One procedure for vehicles that are drivable and an alternate procedure for disabled vehicles (will not back up or move forward).

VEHICLE IS DRIVEABLE

(1) Check for transmission fault codes using DRB scan tool.

(2) Check fluid level and condition.

(3) Adjust throttle and gearshift linkage if complaint was based on delayed, erratic, or harsh shifts.

(4) Road test and note how transmission upshifts, downshifts, and engages.

(5) Perform stall test if complaint is based on sluggish acceleration. Or, if abnormal throttle opening is needed to maintain normal speeds with a properly tuned engine.

(6) Perform hydraulic pressure test if shift problems were noted during road test.

(7) Perform air-pressure test to check clutch-band operation.

VEHICLE IS DISABLED

(1) Check fluid level and condition.

(2) Check for broken or disconnected gearshift or throttle linkage.

(3) Check for cracked, leaking cooler lines, or loose or missing pressure-port plugs.

(4) Raise and support vehicle on safety stands, start engine, shift transmission into gear, and note following:

(a) If propeller shaft turns but wheels do not, problem is with differential or axle shafts.

(b) If propeller shaft does not turn and transmission is noisy, stop engine. Remove oil pan, and

AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING (Continued)

check for debris. If pan is clear, remove transmission and check for damaged drive plate, converter, oil pump, or input shaft.

(c) If propeller shaft does not turn and transmission is not noisy, perform hydraulic-pressure test to determine if problem is hydraulic or mechanical.

PARK/NEUTRAL POSITION SWITCH

The center terminal of the park/neutral position switch is the starter-circuit terminal. It provides the ground for the starter solenoid circuit through the selector lever in PARK and NEUTRAL positions only. The outer terminals on the switch are for the backup lamp circuit.

SWITCH TEST

To test the switch, remove the wiring connector. Test for continuity between the center terminal and the transmission case. Continuity should exist only when the transmission is in PARK or NEUTRAL.

Shift the transmission into REVERSE and test continuity at the switch outer terminals. Continuity should exist only when the transmission is in REVERSE. Continuity should not exist between the outer terminals and the case.

Check gearshift linkage adjustment before replacing a switch that tests faulty.

OVERDRIVE ELECTRICAL CONTROLS

The overdrive off switch, valve body solenoid, case connectors and related wiring can all be tested with a 12 volt test lamp or a volt/ohmmeter. Check continuity of each component when diagnosis indicates this is necessary. Refer to Group 8W, Wiring Diagrams, for component locations and circuit information.

Switch and solenoid continuity should be checked whenever the transmission fails to shift into fourth gear range.

GEARSHIFT LINKAGE AND THROTTLE CABLE

GEARSHIFT LINKAGE

Gearshift linkage adjustment is important because it positions the valve body manual valve. Incorrect adjustment will cause creeping in Neutral, premature clutch wear, delayed engagement in any gear, or a no-start in Park or Neutral position.

Proper operation of the park/neutral position switch will provide a quick check of linkage adjustment.

THROTTLE VALVE CABLE ADJUSTMENT

Throttle valve cable adjustment is important to proper operation. This adjustment positions the throttle valve which controls shift speed, quality and part throttle downshift sensitivity.

If cable setting is too short, early shifts and slippage between shifts may occur. If the setting is too long, shifts may be delayed and part throttle downshifts may be very sensitive.

ROAD TESTING

Before road testing, be sure the fluid level and control cable adjustments have been checked and adjusted if necessary. Verify that diagnostic trouble codes have been resolved.

Observe engine performance during the road test. A poorly tuned engine will not allow accurate analysis of transmission operation.

Operate the transmission in all gear ranges. Check for shift variations and engine flare which indicates slippage. Note if shifts are harsh, spongy, delayed, early, or if part throttle downshifts are sensitive.

Slippage indicated by engine flare, usually means clutch, band or overrunning clutch problems. If the condition is advanced, an overhaul will be necessary to restore normal operation.

A slipping clutch or band can often be determined by comparing which internal units are applied in the various gear ranges. The Clutch and Band Application chart provides a basis for analyzing road test results.

ANALYZING ROAD TEST

Refer to the Clutch and Band Application chart and note which elements are in use in the various gear ranges.

Note that the rear clutch is applied in all forward ranges (D, 2, 1). The transmission overrunning clutch is applied in first gear (D, 2 and 1 ranges) only. The rear band is applied in 1 and R range only.

Note that the overdrive clutch is applied only in fourth gear and the overdrive direct clutch and overrunning clutch are applied in all ranges except fourth gear.

For example: If slippage occurs in first gear in D and 2 range but not in 1 range, the transmission overrunning clutch is faulty. Similarly, if slippage occurs in any two forward gears, the rear clutch is slipping.

Applying the same method of analysis, note that the front and rear clutches are applied simultaneously only in D range third and fourth gear. If the transmission slips in third gear, either the front clutch or the rear clutch is slipping.

If the transmission slips in fourth gear but not in third gear, the overdrive clutch is slipping. By selecting another gear which does not use these clutches, the slipping unit can be determined. For example, if the transmission also slips in Reverse, the front clutch is slipping. If the transmission does not slip in Reverse, the rear clutch is slipping.

DIAGNOSIS AND TESTING (Continued)

1-Range (Manual Low)			X	X	X		X	X

J9421-218

Clutch And Band Application Chart

If slippage occurs during the 3-4 shift or only in fourth gear, the overdrive clutch is slipping. Similarly, if the direct clutch were to fail, the transmission would lose both reverse gear and overrun braking in 2 position (manual second gear).

If the transmission will not shift to fourth gear, the control switch, overdrive solenoid or related wiring may also be the problem cause.

This process of elimination can be used to identify a slipping unit and check operation. Proper use of the Clutch and Band Application Chart is the key.

Although road test analysis will help determine the slipping unit, the actual cause of a malfunction usually cannot be determined until hydraulic and air pressure tests are performed. Practically any condition can be caused by leaking hydraulic circuits or sticking valves.

Unless a malfunction is obvious, such as no drive in D range first gear, do not disassemble the transmission. Perform the hydraulic and air pressure tests to help determine the probable cause.

HYDRAULIC PRESSURE TEST

Hydraulic test pressures range from a low of one psi (6.895 kPa) governor pressure, to 300 psi (2068 kPa) at the rear servo pressure port in reverse.

An accurate tachometer and pressure test gauges are required. Test Gauge C-3292 has a 100 psi range and is used at the accumulator, governor, and front servo ports. Test Gauge C-3293-SP has a 300 psi range and is used at the rear servo and overdrive ports where pressures exceed 100 psi.

Pressure Test Port Locations

Test ports are located at both sides of the transmission case (Fig. 7).

Line pressure is checked at the accumulator port on the right side of the case. The front servo pressure port is at the right side of the case just behind the filler tube opening.

The rear servo and governor pressure ports are at the right rear of the transmission case. The overdrive clutch pressure port is at the left rear of the case.

Test One - Transmission In Manual Low

NOTE: This test checks pump output, pressure regulation, and condition of the rear clutch and servo circuit. Both test gauges are required for this test.

(1) Connect tachometer to engine. Position tachometer so it can be observed from driver seat if helper will be operating engine. Raise vehicle on hoist that will allow rear wheels to rotate freely.

(2) Connect 100 psi Gauge C-3292 to accumulator port. Then connect 300 psi Gauge C-3293-SP to rear servo port.

(3) Disconnect throttle and gearshift cables from levers on transmission valve body manual shaft.

(4) Have helper start and run engine at 1000 rpm.

(5) Move transmission shift lever fully forward into 1 range.

(6) Gradually move transmission throttle lever from full forward to full rearward position and note pressures on both gauges:

mopar AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING (Continued)

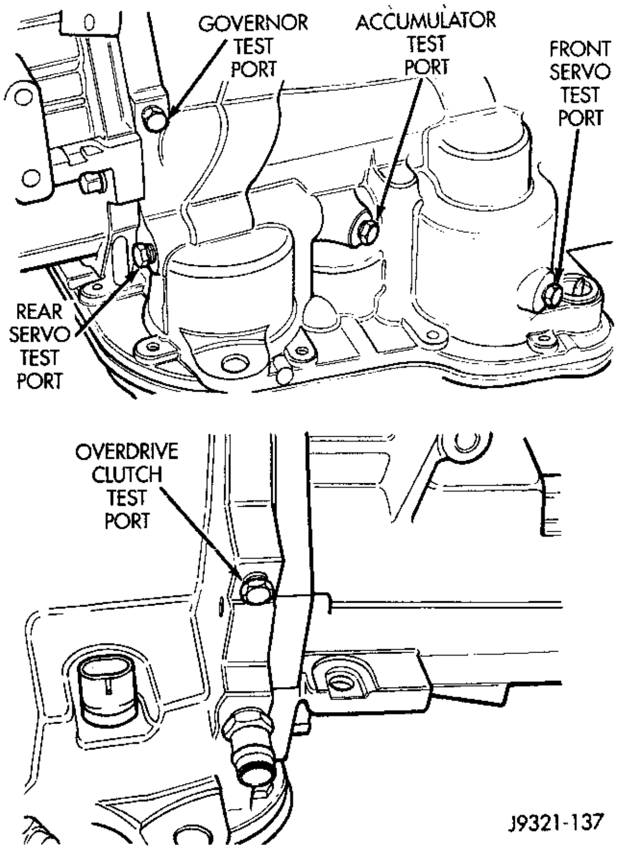

Fig. 7 Pressure Test Port Locations

- Line pressure at accumulator port should be 54-60 psi (372-414 kPa) with throttle lever forward and gradually increase to 90-96 psi (621-662 kPa) as throttle lever is moved rearward.
- Rear servo pressure should be same as line pressure within 3 psi (20.68 kPa).

Test Two—Transmission In 2 Range

NOTE: This test checks pump output, line pressure and pressure regulation. Use 100 psi Test Gauge C-3292 for this test.

(1) Leave vehicle in place on hoist and leave Test Gauge C-3292 connected to accumulator port.
(2) Have helper start and run engine at 1000 rpm.
(3) Move transmission shift lever one detent rearward from full forward position. This is 2 range.
(4) Move transmission throttle lever from full forward to full rearward position and read pressure on gauge.
(5) Line pressure should be 54-60 psi (372-414 kPa) with throttle lever forward and gradually increase to 90-96 psi (621-662 kPa) as lever is moved rearward.

Test Three—Transmission In D Range Third Gear

NOTE: This test checks pressure regulation and condition of the clutch circuits. Both test gauges are required for this test.

(1) Turn OD switch off.
(2) Leave vehicle on hoist and leave Gauge C-3292 in place at accumulator port.
(3) Move Gauge C-3293-SP over to front servo port for this test.
(4) Have helper start and run engine at 1600 rpm for this test.
(5) Move transmission shift lever two detents rearward from full forward position. This is D range.
(6) Read pressures on both gauges as transmission throttle lever is gradually moved from full forward to full rearward position:

- Line pressure at accumulator in D range third gear, should be 54-60 psi (372-414 kPa) with throttle lever forward and increase as lever is moved rearward.
- Front servo pressure in D range third gear, should be within 3 psi (21 kPa) of line pressure up to kickdown point.

Test Four—Transmission In Reverse

NOTE: This test checks pump output, pressure regulation and the front clutch and rear servo circuits. Use 300 psi Test Gauge C-3293-SP for this test.

(1) Leave vehicle on hoist and leave gauge C3292 in place at accumulator port.
(2) Move 300 psi Gauge C-3293-SP back to rear servo port.
(3) Have helper start and run engine at 1600 rpm for test.
(4) Move transmission shift lever four detents rearward from full forward position. This is Reverse range.
(5) Move transmission throttle lever fully forward then fully rearward and note reading at Gauge C-3293-SP.
(6) Pressure should be 145 - 175 psi (1000-1207 kPa) with throttle lever forward and increase to 230 - 280 psi (1586-1931 kPa) as lever is gradually moved rearward.

DIAGNOSIS AND TESTING (Continued)

Test Five—Governor Pressure

NOTE: This test checks governor operation by measuring governor pressure response to changes in vehicle speed. It is usually not necessary to check governor operation unless shift speeds are incorrect or if the transmission will not downshift. The test should be performed on the road or on a hoist that will allow the rear wheels to rotate freely.

(1) Move 100 psi Test Gauge C-3292 to governor pressure port.

(2) Move transmission shift lever two detents rearward from full forward position. This is D range.

(3) Have helper start and run engine at curb idle speed. Then firmly apply service brakes so wheels will not rotate.

(4) Note governor pressure:

- Governor pressure should be no more than 20.6 kPa (3 psi) at curb idle speed and wheels not rotating.
- If pressure exceeds 20.6 kPa (3 psi), a fault exists in governor pressure control system.

(5) Release brakes, slowly increase engine speed, and observe speedometer and pressure test gauge (do not exceed 30 mph on speedometer). Governor pressure should increase in proportion to vehicle speed. Or approximately 6.89 kPa (1 psi) for every 1 mph.

(6) Governor pressure rise should be smooth and drop back to no more than 20.6 kPa (3 psi), after engine returns to curb idle and brakes are applied to prevent wheels from rotating.

(7) Compare results of pressure test with analysis chart.

Test Six—Transmission In Overdrive Fourth Gear

NOTE: This test checks line pressure at the overdrive clutch in fourth gear range. Use 300 psi Test Gauge C-3292 for this test. The test should be performed on the road or on a chassis dyno.

(1) Remove tachometer; it is not needed for this test.

(2) Move 300 psi Gauge to overdrive clutch pressure test port. Then remove other gauge and reinstall test port plug.

(3) Lower vehicle.

(4) Turn OD switch on.

(5) Secure test gauge so it can be viewed from drivers seat.

(6) Start engine and shift into D range.

(7) Increase vehicle speed gradually until 3-4 shift occurs and note gauge pressure.

(8) Pressure should be 469-496 kPa (68-72 psi) with closed throttle and increase to 620-827 kPa (90-120 psi) at 1/2 to 3/4 throttle. Note that pressure can increase to around 896 kPa (130 psi) at full throttle.

(9) Return to shop or move vehicle off chassis dyno.

PRESSURE TEST ANALYSIS CHART

TEST CONDITION	INDICATION
Line pressure OK during any one test	Pump and regulator valve OK
Line pressure OK in R but low in D, 2, 1	Leakage in rear clutch area (seal rings, clutch seals)
Pressure low in D Fourth Gear Range	Overdrive clutch piston seal, or check ball problem
Pressure OK in 1, 2 but low in D3 and R	Leakage in front clutch area
Pressure OK in 2 but low in R and 1	Leakage in rear servo
Front servo pressure low in 2	Leakage in servo; broken servo ring or cracked servo piston
Pressure low in all positions	Clogged filter, stuck regulator valve, worn or faulty pump, low oil level
Governor pressure too high at idle speed	Governor pressure solenoid valve system fault. Refer to diagnostic book.
Governor pressure low at all mph figures	Faulty governor pressure solenoid, transmission control module, or governor pressure sensor
Lubrication pressure low at all throttle positions	Clogged fluid cooler or lines, seal rings leaking, worn pump bushings, pump, clutch retainer, or clogged filter.
Line pressure high	Output shaft plugged, sticky regulator valve
Line pressure low	Sticky regulator valve, clogged filter, worn pump

CONVERTER STALL TEST

Stall testing involves determining maximum engine speed obtainable at full throttle with the rear wheels locked and the transmission in D range. This test checks the holding ability of the converter overrunning and transmission clutches.

WARNING: NEVER ALLOW ANYONE TO STAND DIRECTLY IN LINE WITH THE VEHICLE FRONT OR REAR DURING A STALL TEST. ALWAYS BLOCK THE WHEELS AND FULLY APPLY THE SERVICE AND PARKING BRAKES DURING THE TEST.

AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING (Continued)

STALL TEST PROCEDURE

(1) Connect tachometer to engine. Position tachometer so it can be viewed from driver's seat.

(2) Drive vehicle to bring transmission fluid up to normal operating temperature. Vehicle can be driven on road or on chassis dynamometer, if available.

(3) Check transmission fluid level. Add fluid if necessary.

(4) Block front wheels.

(5) Fully apply service and parking brakes.

(6) Open throttle completely and record maximum engine speed registered on tachometer. It takes 4-10 seconds to reach max rpm. **Once max rpm has been achieved, do not hold wide open throttle for more than 4-5 seconds.**

CAUTION: Stalling the converter causes a rapid increase in fluid temperature. To avoid fluid overheating, hold the engine at maximum rpm for no more than 5 seconds. If engine exceeds 2500 rpm during the test, release the accelerator pedal immediately; transmission clutch slippage is occurring.

(7) If a second stall test is required, cool down fluid before proceeding. Shift into NEUTRAL and run engine at 1000 rpm for 20-30 seconds to cool fluid.

STALL TEST ANALYSIS

Stall Speed Too High

If the stall speed exceeds 2500 rpm, transmission clutch slippage is indicated.

Stall Speed Low

Low stall speed with a properly tuned engine indicate a torque converter overrunning clutch problem. The condition should be confirmed by road testing. A stall speed 250-350 rpm below normal indicates the converter overrunning clutch is slipping. The vehicle also exhibits poor acceleration but operates normally once highway cruise speeds are reached. Torque converter replacement will be necessary.

Stall Speed Normal But Acceleration Poor

If stall speeds are normal (1800-2300 rpm) but abnormal throttle opening is required for acceleration, or to maintain cruise speed, the converter overrunning clutch is seized. The torque converter will have to be replaced.

Converter Noise During Test

A whining noise caused by fluid flow is normal during a stall test. However, loud metallic noises indicate a damaged converter. To confirm that the noise is originating from the converter, operate the vehicle at light throttle in DRIVE and NEUTRAL on a hoist and listen for noise coming from the converter housing.

AIR TESTING TRANSMISSION CLUTCH AND BAND OPERATION

Air-pressure testing can be used to check transmission front/rear clutch and band operation. The test can be conducted with the transmission either in the vehicle or on the work bench, as a final check, after overhaul.

Air-pressure testing requires that the oil pan and valve body be removed from the transmission. The servo and clutch apply passages are shown (Fig. 8).

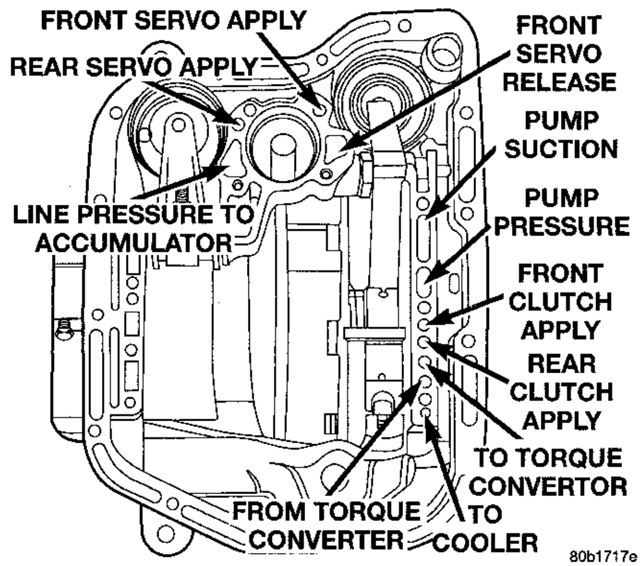

Fig. 8 Air Pressure Test Passages

Front Clutch Air Test

Place one or two fingers on the clutch housing and apply air pressure through front clutch apply passage. Piston movement can be felt and a soft thump heard as the clutch applies.

Rear Clutch Air Test

Place one or two fingers on the clutch housing and apply air pressure through rear clutch apply passage. Piston movement can be felt and a soft thump heard as the clutch applies.

Front Servo Air Test

Apply air pressure to the front servo apply passage. The servo rod should extend and cause the band to tighten around the drum. Spring pressure should release the servo when air pressure is removed.

Rear Servo Air Test

Apply air pressure to the rear servo apply passage. The servo rod should extend and cause the band to

DIAGNOSIS AND TESTING (Continued)

tighten around the drum. Spring pressure should release the servo when air pressure is removed.

CONVERTER HOUSING FLUID LEAK DIAGNOSIS

When diagnosing converter housing fluid leaks, two items must be established before repair.

(1) Verify that a leak condition actually exists.

(2) Determined the true source of the leak.

Some suspected converter housing fluid leaks may not be leaks at all. They may only be the result of residual fluid in the converter housing, or excess fluid spilled during factory fill or fill after repair. Converter housing leaks have several potential sources. Through careful observation, a leak source can be identified before removing the transmission for repair. Pump seal leaks tend to move along the drive hub and onto the rear of the converter. Pump O-ring or pump body leaks follow the same path as a seal leak (Fig. 9). Pump vent or pump attaching bolt leaks are generally deposited on the inside of the converter housing and not on the converter itself (Fig. 9). Pump seal or gasket leaks usually travel down the inside of the converter housing. Front band lever pin plug leaks are generally deposited on the housing and not on the converter.

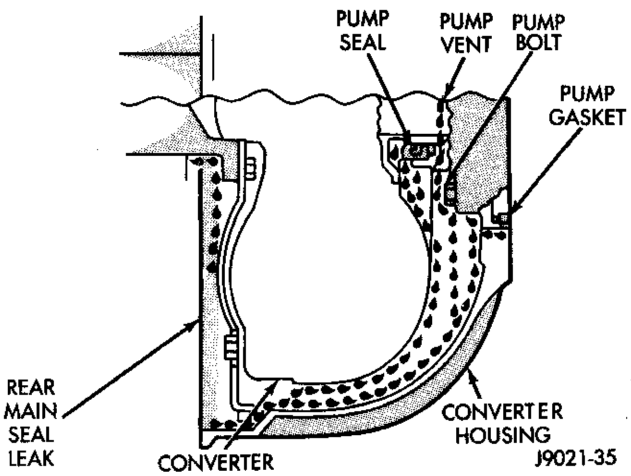

Fig. 9 Converter Housing Leak Paths

TORQUE CONVERTER LEAK POINTS

Possible sources of converter leaks are:

(1) Leaks at the weld joint around the outside diameter weld (Fig. 10).

(2) Leaks at the converter hub weld (Fig. 10).

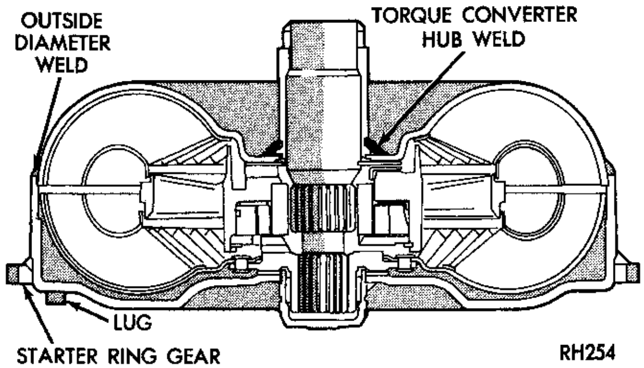

Fig. 10 Converter Leak Points—Typical

CONVERTER HOUSING AREA LEAK CORRECTION

(1) Remove converter.

(2) Tighten front band adjusting screw until band is tight around front clutch retainer. This prevents front/rear clutches from coming out when oil pump is removed.

(3) Remove oil pump and remove pump seal. Inspect pump housing drainback and vent holes for obstructions. Clear holes with solvent and wire.

(4) Inspect pump bushing and converter hub. If bushing is scored, replace it. If converter hub is scored, either polish it with crocus cloth or replace converter.

(5) Install new pump seal, O-ring, and gasket. Replace oil pump if cracked, porous or damaged in any way. Be sure to loosen the front band before installing the oil pump, damage to the oil pump seal may occur if the band is still tightened to the front clutch retainer.

(6) Loosen kickdown lever pin access plug three turns. Apply Loctite 592, or Permatex No. 2 to plug threads and tighten plug to 17 N·m (150 in. lbs.) torque.

(7) Adjust front band.

(8) Lubricate pump seal and converter hub with transmission fluid or petroleum jelly and install converter.

(9) Install transmission and converter housing dust shield.

(10) Lower vehicle.

DIAGNOSIS TABLES AND CHARTS—RE TRANSMISSION

The diagnosis charts provide additional reference when diagnosing a transmission fault. The charts provide general information on a variety of transmission, overdrive unit and converter clutch fault conditions.

The hydraulic flow charts in the Schematics and Diagrams section of this group, outline fluid flow and hydraulic circuitry. Circuit operation is provided for neutral, third, fourth and reverse gear ranges. Normal working pressures are also supplied for each of the gear ranges.

AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING (Continued)

DIAGNOSIS CHARTS

CONDITION	POSSIBLE CAUSES	CORRECTION
HARSH ENGAGEMENT (FROM NEUTRAL TO DRIVE OR REVERSE)	1. Fluid Level Low	1. Add Fluid
	2. Throttle Linkage Misadjusted	2. Adjust linkage - setting may be too long.
	3. Mount and Driveline Bolts Loose	3. Check engine mount, transmission mount, propeller shaft, rear spring to body bolts, rear control arms, crossmember and axle bolt torque. Tighten loose bolts and replace missing bolts.
	4. U-Joint Worn/Broken	4. Remove propeller shaft and replace U-Joint.
	5. Axle Backlash Incorrect	5. Check per Service Manual. Correct as needed.
	6. Hydraulic Pressure Incorrect	6. Check pressure. Remove, overhaul or adjust valve body as needed.
	7. Band Misadjusted.	7. Adjust rear band.
	8. Valve Body Check Balls Missing.	8. Inspect valve body for proper check ball installation.
	9. Axle Pinion Flange Loose.	9. Replace nut and check pinion threads before installing new nut. Replace pinion gear if threads are damaged.
	10. Clutch, band or planetary component damaged.	10. Remove, disassemble and repair transmission as necessary.
	11. Converter Clutch Faulty.	11. Replace converter and flush cooler and line before installing new converter.

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
DELAYED ENGAGEMENT (FROM NEUTRAL TO DRIVE OR REVERSE)	1. Fluid Level Low.	1. Correct level and check for leaks.
	2. Filter Clogged.	2. Change filter.
	3. Gearshift Linkage Misadjusted.	3. Adjust linkage and repair linkage if worn or damaged.
	4. Torque Converter Drain Back (Oil drains from torque converter into transmission sump)	4. If vehicle moves normally after 5 seconds after shifting into gear, no repair is necessary. If longer, inspect pump bushing for wear. Replace pump house.
	5. Rear Band Misadjusted.	5. Adjust band.
	6. Valve Body Filter Plugged.	6. Replace fluid and filter. If oil pan and old fluid were full of clutch disc material and/or metal particles, overhaul will be necessary.
	7. Oil Pump Gears Worn/Damaged.	7. Remove transmission and replace oil pump.
	8. Governor Circuit and Solenoid Valve Electrical Fault.	8. Test with DRB scan tool and repair as required.
	9. Hydraulic Pressure Incorrect.	9. Perform pressure test, remove transmission and repair as needed.
	10. Reaction Shaft Seal Rings Worn/Broken.	10. Remove transmission, remove oil pump and replace seal rings.
	11. Rear Clutch/Input Shaft, Rear Clutch Seal Rings Damaged.	11. Remove and disassemble transmission and repair as necessary.
	12. Regulator Valve Stuck.	12. Clean.
	13. Cooler Plugged.	13. Transfer case failure can plug cooler.
NO DRIVE RANGE (REVERSE OK)	1. Fluid Level Low.	1. Add fluid and check for leaks if drive is restored.
	2. Gearshift Linkage/Cable Loose/Misadjusted.	2. Repair or replace linkage components.
	3. Rear Clutch Burnt.	3. Remove and disassemble transmission and rear clutch and seals. Repair/replace worn or damaged parts as needed.
	4. Valve Body Malfunction.	4. Remove and disassemble valve body. Replace assembly if any valves or bores are damaged.
	5. Transmission Overrunning Clutch Broken.	5. Remove and disassemble transmission. Replace overrunning clutch.
	6. Input Shaft Seal Rings Worn/ Damaged.	6. Remove and disassemble transmission. Replace seal rings and any other worn or damaged parts.
	7. Front Planetary Failed Broken.	7. Remove and repair.

AUTHENTIC RESTORATION PRODUCT Mopar

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO DRIVE OR REVERSE (VEHICLE WILL NOT MOVE)	1. Fluid Level Low.	1. Add fluid and check for leaks if drive is restored.
	2. Gearshift Linkage/Cable Loose/Misadjusted.	2. Inspect, adjust and reassemble linkage as needed. Replace worn/damaged parts.
	3. U-Joint/Axle/Transfer Case Broken.	3. Perform preliminary inspection procedure for vehicle that will not move. Refer to procedure in diagnosis section.
	4. Filter Plugged.	4. Remove and disassemble transmission. Repair or replace failed components as needed. Replace filter. If filter and fluid contained clutch material or metal particles, an overhaul may be necessary. Perform lube flow test. Flush oil. Replace cooler as necessary.
	5. Oil Pump Damaged.	5. Perform pressure test to confirm low pressure. Replace pump body assembly if necessary.
	6. Valve Body Malfunctioned.	6. Check and inspect valve body. Replace valve body (as assembly) if any valve or bore is damaged. Clean and reassemble correctly if all parts are in good condition.
	7. Transmission Internal Component Damaged.	7. Remove and disassemble transmission. Repair or replace failed components as needed.
	8. Park Sprag not Releasing - Check Stall Speed, Worn/Damaged/ Stuck.	8. Remove, disassemble, repair.
	9. Torque Converter Damage.	9. Inspect and replace as required.

mopar AUTHENTIC RESTORATION

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
SHIFTS DELAYED OR ERRATIC (SHIFTS ALSO HARSH AT TIMES)	1. Fluid Level Low/High.	1. Correct fluid level and check for leaks if low.
	2. Fluid Filter Clogged.	2. Replace filter. If filter and fluid contained clutch material or metal particles, an overhaul may be necessary. Perform lube flow test.
	3. Throttle Linkage Misadjusted.	3. Adjust linkage as described in service section.
	4. Throttle Linkage Binding.	4. Check cable for binding. Check for return to closed throttle at transmission.
	5. Gearshift Linkage/Cable Misadjusted.	5. Adjust linkage/cable as described in service section.
	6. Clutch or Servo Failure.	6. Remove valve body and air test clutch, and band servo operation. Disassemble and repair transmission as needed.
	7. Governor Circuit Electrical Fault.	7. Test using DRB scan tool and repair as required.
	8. Front Band Misadjusted.	8. Adjust band.
	9. Pump Suction Passage Leak.	9. Check for excessive foam on dipstick after normal driving. Check for loose pump bolts, defective gasket. Replace pump assembly if needed.
NO REVERSE (D RANGES OK)	1. Gearshift Linkage/Cable Misadjusted/Damaged.	1. Repair or replace linkage parts as needed.
	2. Park Sprag Sticking.	2. Replace overdrive annulus gear.
	3. Rear Band Misadjusted/Worn.	3. Adjust band; replace.
	4. Valve Body Malfunction.	4. Remove and service valve body. Replace valve body if any valves or valve bores are worn or damaged.
	5. Rear Servo Malfunction.	5. Remove and disassemble transmission. Replace worn/ damaged servo parts as necessary.
	6. Direct Clutch in Overdrive Worn	6. Disassemble overdrive. Replace worn or damaged parts.
	7. Front Clutch Burnt.	7. Remove and disassemble transmission. Replace worn, damaged clutch parts as required.
HAS FIRST/REVERSE ONLY (NO 1-2 OR 2-3 UPSHIFT)	1. Governor Circuit Electrical Fault.	1. Test using DRB scan tool and repair as required.
	2. Valve Body Malfunction.	2. Repair stuck 1-2 shift valve or governor plug.
	3. Front Servo/Kickdown Band Damaged/Burned.	3. Repair/replace.

AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
MOVES IN 2ND OR 3RD GEAR, ABRUPTLY DOWNSHIFTS TO LOW	1. Valve Body Malfunction.	1. Remove, clean and inspect. Look for stuck 1-2 valve or governor plug.
	2. Governor Valve Sticking.	2. Remove, clean and inspect. Replace faulty parts.
NO LOW GEAR (MOVES IN 2ND OR 3RD GEAR ONLY)	1. Governor Valve Sticking.	1. Remove governor, clean, inspect and repair as required.
	2. Governor Circuit Electrical Fault.	2. Test with DRB scan tool and repair as required.
	3. Valve Body Malfunction.	3. Remove, clean and inspect. Look for sticking 1-2 shift valve, 2-3 shift valve, governor plug or broken springs.
	4. Front Servo Piston Cocked in Bore.	4. Inspect servo and repair as required.
	5. Front Band Linkage Malfunction	5. Inspect linkage and look for bind in linkage.
NO KICKDOWN OR NORMAL DOWNSHIFT	1. Throttle Linkage Misadjusted.	1. Adjust linkage.
	2. Accelerator Pedal Travel Restricted.	2. Verify floor mat is not under pedal, repair worn accelerator cable or bent brackets.
	3. Valve Body Hydraulic Pressures Too High or Too Low Due to Valve Body Malfunction or Incorrect Hydraulic Control Pressure Adjustments.	3. Perform hydraulic pressure tests to determine cause and repair as required. Correct valve body pressure adjustments as required.
	4. Governor Circuit Electrical Fault.	4. Test with DRB scan tool and repair as required.
	5. Valve Body Malfunction.	5. Perform hydraulic pressure tests to determine cause and repair as required. Correct valve body pressure adjustments as required.
	6. TPS Malfunction.	6. Replace sensor, check with DRB scan tool.
	7. PCM Malfunction.	7. Check with DRB scan tool and replace if required.
	8. Valve Body Malfunction.	8. Repair sticking 1-2, 2-3 shift valves, governor plugs, 3-4 solenoid, 3-4 shift valve, 3-4 timing valve.

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
STUCK IN LOW GEAR (WILL NOT UPSHIFT)	1. Throttle Linkage Misadjusted/ Stuck.	1. Adjust linkage and repair linkage if worn or damaged. Check for binding cable or missing return spring.
	2. Gearshift Linkage Misadjusted.	2. Adjust linkage and repair linkage if worn or damaged.
	3. Governor Component Electrical Fault.	3. Check operating pressures and test with DRB scan tool, repair faulty component.
	4. Front Band Out of Adjustment.	4. Adjust Band.
	5. Clutch or Servo Malfunction.	5. Air pressure check operation of clutches and bands. Repair faulty component.
CREEPS IN NEUTRAL	1. Gearshift Linkage Misadjusted.	1. Adjust linkage.
	2. Rear Clutch Dragging/Warped.	2. Disassemble and repair.
	3. Valve Body Malfunction.	3. Perform hydraulic pressure test to determine cause and repair as required.
BUZZING NOISE	1. Fluid Level Low	1. Add fluid and check for leaks.
	2. Shift Cable Misassembled.	2. Route cable away from engine and bell housing.
	3. Valve Body Misassembled.	3. Remove, disassemble, inspect valve body. Reassemble correctly if necessary. Replace assembly if valves or springs are damaged. Check for loose bolts or screws.
	4. Pump Passages Leaking	4. Check pump for porous casting, scores on mating surfaces and excess rotor clearance. Repair as required. Loose pump bolts.
	5. Cooling System Cooler Plugged.	5. Flow check cooler circuit. Repair as needed.
	6. Overrunning Clutch Damaged.	6. Replace clutch.
SLIPS IN REVERSE ONLY	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Gearshift Linkage Misadjusted.	2. Adjust linkage.
	3. Rear Band Misadjusted.	3. Adjust band.
	4. Rear Band Worn.	4. Replace as required.
	5. Overdrive Direct Clutch Worn.	5. Disassemble overdrive. Repair as needed.
	6. Hydraulic Pressure Too Low.	6. Perform hydraulic pressure tests to determine cause.
	7. Rear Servo Leaking.	7. Air pressure check clutch-servo operation and repair as required.
	8. Band Linkage Binding.	8. Inspect and repair as required.

AUTHENTIC RESTORATION PRODUCT Mopar

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
SLIPS IN FORWARD DRIVE RANGES	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Fluid Foaming.	2. Check for high oil level, bad pump gasket or seals, dirt between pump halves and loose pump bolts. Replace pump if necessary.
	3. Throttle Linkage Misadjusted.	3. Adjust linkage.
	4. Gearshift Linkage Misadjusted.	4. Adjust linkage.
	5. Rear Clutch Worn.	5. Inspect and replace as needed.
	6. Low Hydraulic Pressure Due to Worn Pump, Incorrect Control Pressure Adjustments, Valve Body Warpage or Malfunction, Sticking, Leaking Seal Rings, Clutch Seals Leaking, Servo Leaks, Clogged Filter or Cooler Lines	6. Perform hydraulic and air pressure tests to determine cause.
	7. Rear Clutch Malfunction, Leaking Seals or Worn Plates.	7. Air pressure check clutch-servo operation and repair as required.
	8. Overrunning Clutch Worn, Not Holding (Slips in 1 Only).	8. Replace Clutch.
SLIPS IN LOW GEAR "D" ONLY, BUT NO IN 1 POSITION	Overrunning Clutch Faulty.	Replace overrunning clutch.
GROWLING, GRATING OR SCRAPING NOISES	1. Drive Plate Broken.	1. Replace.
	2. Torque Converter Bolts Hitting Dust Shield.	2. Dust shield bent. Replace or repair.
	3. Planetary Gear Set Broken/ Seized.	3. Check for debris in oil pan and repair as required.
	4. Overrunning Clutch Worn/Broken.	4. Inspect and check for debris in oil pan. Repair as required.
	5. Oil Pump Components Scored/ Binding.	5. Remove, inspect and repair as required.
	6. Output Shaft Bearing or Bushing Damaged.	6. Remove, inspect and repair as required.
	7. Clutch Operation Faulty.	7. Perform air pressure check and repair as required.
	8. Front and Rear Bands Misadjusted.	8. Adjust bands.

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
DRAGS OR LOCKS UP	1. Fluid Level Low.	1. Check and adjust level.
	2. Clutch Dragging/Failed	2. Air pressure check clutch operation and repair as required.
	3. Front or Rear Band Misadjusted.	3. Adjust bands.
	4. Case Leaks Internally.	4. Check for leakage between passages in case.
	5. Servo Band or Linkage Malfunction.	5. Air pressure check servo operation and repair as required.
	6. Overrunning Clutch Worn.	6. Remove and inspect clutch. Repair as required.
	7. Planetary Gears Broken.	7. Remove, inspect and repair as required (look for debris in oil pan).
	8. Converter Clutch Dragging.	8. Check for plugged cooler. Perform flow check. Inspect pump for excessive side clearance. Replace pump as required.
NO 4-3 DOWNSHIFT	1. Circuit Wiring and/or Connectors Shorted.	1. Test wiring and connectors with test lamp and volt/ohmmeter. Repair wiring as necessary. Replace connectors and/or harnesses as required.
	2. PCM Malfunction.	2. Check PCM operation with DRB scan tool. Replace PCM only if faulty.
	3. TPS Malfunction	3. Check TPS with DRB scan tool at PCM.
	4. Lockup Solenoid Not Venting.	4. Remove valve body and replace solenoid assembly if plugged or shorted.
	5. Overdrive Solenoid Not Venting.	5. Remove valve body and replace solenoid if plugged or shorted.
	6. Valve Body Valve Sticking.	6. Repair stuck 3-4 shift valve or lockup timing valve.
NO 4-3 DOWNSHIFT WHEN CONTROL SWITCH IS TURNED OFF	1. Control Switch Open/Shorted.	1. Test and replace switch if faulty.
	2. Overdrive Solenoid Connector Shorted.	2. Test solenoids and replace if seized or shorted.
	3. PCM Malfunction.	3. Test with DRB scan tool. Replace PCM if faulty.
	4. Valve Body Stuck Valves.	4. Repair stuck 3-4, lockup or lockup timing valve.
CLUNK NOISE FROM DRIVELINE ON CLOSED THROTTLE 4-3 DOWNSHIFT	1. Transmission Fluid Low.	1. Add Fluid.
	2. Throttle Cable Misadjusted.	2. Adjust cable.
	3. Overdrive Clutch Select Spacer Wrong Spacer.	3. Replace overdrive piston thrust plate spacer.

Mopar AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
3-4 UPSHIFT OCCURS IMMEDIATELY AFTER 2-3 SHIFT	1. Overdrive Solenoid Connector or Wiring Shorted.	1. Test connector and wiring for loose connections, shorts or ground and repair as needed.
	2. TPS Malfunction.	2. Test TPS and replace as necessary. Check with DRB scan tool.
	3. PCM Malfunction.	3. Test PCM with DRB scan tool and replace controller if faulty.
	4. Overdrive Solenoid Malfunction.	4. Replace solenoid.
	5. Valve Body Malfunction.	5. Remove, disassemble, clean and inspect valve body components. Make sure all valves and plugs slide freely in bores. Polish valves with crocus cloth if needed.
WHINE/NOISE RELATED TO ENGINE SPEED	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Shift Cable Incorrect Routing.	2. Check shift cable for correct routing. Should not touch engine or bell housing.

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NO 3-4 UPSHIFT	1. Dash O/D Switch In OFF Position.	1. Turn control switch to ON position.
	2. Overdrive Circuit Fuse Blown.	2. Replace fuse. Determine why fuse failed and repair as necessary (i.e., shorts or grounds in circuit).
	3. O/D Switch Wire Shorted/Open Cut.	3. Check wires/connections with 12V test lamp and voltmeter. Repair damaged or loose wire/connection as necessary.
	4. Distance or Coolant Sensor Malfunction.	4. Check with DRB scan tool and repair or replace as necessary.
	5. TPS Malfunction.	5. Check with DRB scan tool and replace if necessary.
	6. Neutral Switch to PCM Wire Shorted/Cut.	6. Test switch as described in service section and replace if necessary. Engine no start.
	7. PCM Malfunction.	7. Check with DRB scan tool and replace if necessary.
	8. Overdrive Solenoid Shorted/ Open.	8. Replace solenoid if shorted or open and repair loose or damaged wires (DRB scan tool).
	9. Solenoid Feed Orifice in Valve Body Blocked.	9. Remove, disassemble, and clean valve body thoroughly. Check feed orifice.
	10. Overdrive Clutch Failed.	10. Disassemble overdrive and repair as needed.
	11. Hydraulic Pressure Low.	11. Pressure test transmission to determine cause.
	12. Valve Body Valve Stuck.	12. Repair stuck 3-4 shift valve, 3-4 timing valve.
	13. O/D Piston Incorrect Spacer.	13. Remove unit, check end play and install correct spacer.
	14. Overdrive Piston Seal Failure.	14. Replace both seals.
	15. O/D Check Valve/Orifice Failed.	15. Check for free movement and secure assembly (in piston retainer). Check ball bleed orifice.

AUTHENTIC RESTORATION PRODUCT mopar

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
SLIPS IN OVERDRIVE FOURTH GEAR	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Overdrive Clutch Pack Worn.	2. Remove overdrive unit and rebuild clutch pack.
	3. Overdrive Piston Retainer Bleed Orifice Blown Out.	3. Disassemble transmission, remove retainer and replace orifice.
	4. Overdrive Piston or Seal Malfunction.	4. Remove overdrive unit. Replace seals if worn. Replace piston if damaged. If piston retainer is damaged, remove and disassemble the transmission.
	5. 3-4 Shift Valve, Timing Valve or Accumulator Malfunction.	5. Remove and overhaul valve body. Replace accumulator seals. Make sure all valves operate freely in bores and do not bind or stick. Make sure valve body screws are correctly tightened and separator plates are properly positioned.
	6. Overdrive Unit Thrust Bearing Failure.	6. Disassemble overdrive unit and replace thrust bearing (NO. 1 thrust bearing is between overdrive piston and clutch hub; NO. 2 thrust bearing is between the planetary gear and the direct clutch spring plate; NO. 3 thrust bearing is between overrunning clutch hub and output shaft).
	7. O/D Check Valve/Bleed Orifice Failure.	7. Check for function/secure orifice insert in O/D piston retainer.
DELAYED 3-4 UPSHIFT (SLOW TO ENGAGE)	1. Fluid Level Low.	1. Add fluid and check for leaks.
	2. Throttle Valve Cable Misadjusted.	2. Adjust throttle valve cable.
	3. Overdrive Clutch Pack Worn/ Burnt.	3. Remove unit and rebuild clutch pack.
	4. TPS Faulty.	4. Test with DRB scan tool and replace as necessary
	5. Overdrive Clutch Bleed Orifice Plugged.	5. Disassemble transmission and replace orifice.
	6. Overdrive Solenoid or Wiring Shorted/Open.	6. Test solenoid and check wiring for loose/corroded connections or shorts/grounds. Replace solenoid if faulty and repair wiring if necessary.
	7. Overdrive Excess Clearance	7. Remove unit. Measure end play and select proper spacer.
	8. O/D Check Valve Missing or Stuck.	8. Check for presence of check valve. Repair or replace as required.
TORQUE CONVERTER LOCKS UP IN SECOND AND/OR THIRD GEAR	Lockup Solenoid, Relay or Wiring Shorted/Open.	Test solenoid, relay and wiring for continuity, shorts or grounds. Replace solenoid and relay if faulty. Repair wiring and connectors as necessary.

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
HARSH 1-2, 2-3, 3-4 OR 3-2 SHIFTS	Lockup Solenoid Malfunction.	Remove valve body and replace solenoid assembly.
NO START IN PARK OR NEUTRAL	1. Gearshift Linkage/Cable Misadjusted.	1. Adjust linkage/cable.
	2. Neutral Switch Wire Open/Cut.	2. Check continuity with test lamp. Repair as required.
	3. Neutral Switch Faulty.	3. Refer to service section for test and replacement procedure.
	4. Neutral Switch Connect Faulty.	4. Connectors spread open. Repair.
	5. Valve Body Manual Lever Assembly Bent/Worn/Broken.	5. Inspect lever assembly and replace if damaged.
NO REVERSE (OR SLIPS IN REVERSE)	1. Direct Clutch Pack (front clutch) Worn.	1. Disassemble unit and rebuild clutch pack.
	2. Rear Band Misadjusted.	2. Adjust band.
	3. Front Clutch Malfunctioned/ Burned.	3. Air-pressure test clutch operation. Remove and rebuild if necessary.
	4. Overdrive Thrust Bearing Failure.	4. Disassemble geartrain and replace bearings.
	5. Direct Clutch Spring Collapsed/ Broken.	5. Remove and disassemble unit. Check clutch position and replace spring.

Mopar AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
OIL LEAKS.	1. Fluid Lines and Fittings Loose/Leaks/Damaged.	1. Tighten fittings. If leaks persist, replace fittings and lines if necessary.
	2. Fill Tube (where tube enters case) Leaks/Damaged.	2. Replace tube seal. Inspect tube for cracks in fill tube.
	3. Pressure Port Plug Loose Loose/Damaged.	3. Tighten to correct torque. Replace plug or reseal if leak persists.
	4. Pan Gasket Leaks.	4. Tighten pan screws (150 in. lbs.). If leaks persist, replace gasket.
	5. Valve Body Manual Lever Shaft Seal Leaks/Worn.	5. Replace shaft seal.
	6. Rear Bearing Access Plate Leaks.	6. Replace gasket. Tighten screws.
	7. Gasket Damaged or Bolts are Loose.	7. Replace bolts or gasket or tighten both.
	8. Adapter/Extension Gasket Damaged Leaks/Damaged.	8. Replace gasket.
	9. Neutral Switch Leaks/Damaged.	9. Replace switch and gasket.
	10. Converter Housing Area Leaks.	10. Check for leaks at seal caused by worn seal or burr on converter hub (cutting seal), worn bushing, missing oil return, oil in front pump housing or hole plugged. Check for leaks past O-ring seal on pump or past pump-to-case bolts; pump housing porous, oil coming out vent due to overfill or leak past front band shaft access plug.
	11. Pump Seal Leaks/Worn/ Damaged.	11. Replace seal.
	12. Torque Converter Weld Leak/Cracked Hub.	12. Replace converter.
	13. Case Porosity Leaks.	13. Replace case.
NOISY OPERATION IN FOURTH GEAR ONLY	1. Overdrive Clutch Discs, Plates or Snap Rings Damaged.	1. Remove unit and rebuild clutch pack.
	2. Overdrive Piston or Planetary Thrust Bearing Damaged.	2. Remove and disassemble unit. Replace either thrust bearing if damaged.
	3. Output Shaft Bearings Scored/ Damaged.	3. Remove and disassemble unit. Replace either bearing if damaged.
	4. Planetary Gears Worn/Chipped.	4. Remove and overhaul overdrive unit.
	5. Overdrive Unit Overrunning Clutch Rollers Worn/Scored.	5. Remove and overhaul overdrive unit.

SERVICE PROCEDURES

FLUID LEVEL CHECK

Transmission fluid level should be checked monthly under normal operation. If the vehicle is used for trailer towing or similar heavy load hauling, check fluid level and condition weekly. Fluid level is checked with the engine running at curb idle speed, the transmission in NEUTRAL and the transmission fluid at normal operating temperature.

FLUID LEVEL CHECK PROCEDURE

(1) Transmission fluid must be at normal operating temperature for accurate fluid level check. Drive vehicle if necessary to bring fluid temperature up to normal hot operating temperature of 82°C (180°F).

(2) Position vehicle on level surface.

(3) Start and run engine at curb idle speed.

(4) Apply parking brakes.

(5) Shift transmission momentarily into all gear ranges. Then shift transmission back to Neutral.

(6) Clean top of filler tube and dipstick to keep dirt from entering tube.

(7) Remove dipstick (Fig. 11) and check fluid level as follows:

(a) Correct acceptable level is in crosshatch area.

(b) Correct maximum level is to MAX arrow mark.

(c) Incorrect level is at or below MIN line.

(d) If fluid is low, add only enough Mopar® ATF Plus 3 to restore correct level. Do not overfill.

CAUTION: Do not overfill the transmission. Overfilling may cause leakage out the pump vent which can be mistaken for a pump seal leak. Overfilling will also cause fluid aeration and foaming as the excess fluid is picked up and churned by the gear train. This will significantly reduce fluid life.

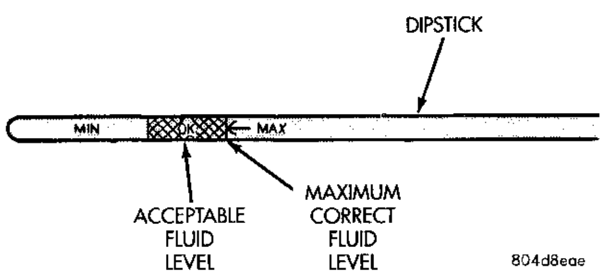

Fig. 11 Dipstick Fluid Level Marks—Typical

FLUID AND FILTER REPLACEMENT

Refer to the Maintenance Schedules in Group 0, Lubrication and Maintenance, for proper service intervals. The service fluid fill after a filter change is approximately 3.8 liters (4.0 quarts).

REMOVAL

(1) Hoist and support vehicle on safety stands.

(2) Place a large diameter shallow drain pan beneath the transmission pan.

(3) Remove bolts holding front and sides of pan to transmission (Fig. 12).

(4) Loosen bolts holding rear of pan to transmission.

(5) Slowly separate front of pan away from transmission allowing the fluid to drain into drain pan.

(6) Hold up pan and remove remaining bolt holding pan to transmission.

(7) While holding pan level, lower pan away from transmission.

(8) Pour remaining fluid in pan into drain pan.

(9) Remove screws holding filter to valve body (Fig. 13).

(10) Separate filter from valve body and pour fluid in filter into drain pan.

(11) Dispose of used trans fluid and filter properly.

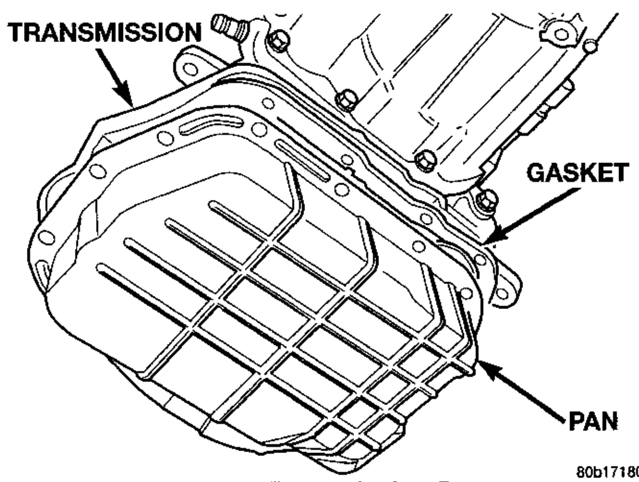

Fig. 12 Transmission Pan

INSPECTION

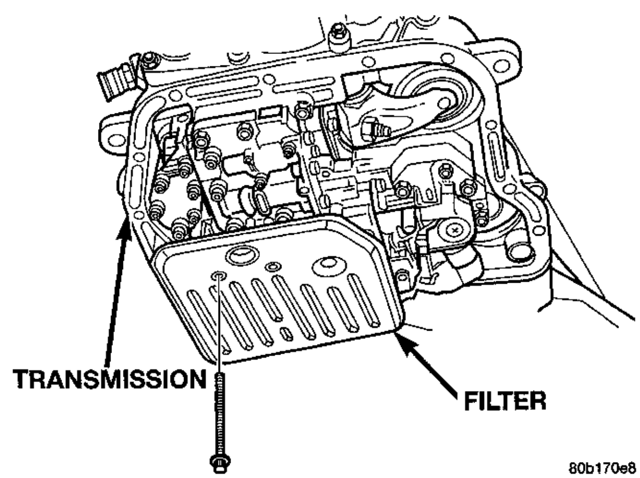

Fig. 13 Transmission Filter

Inspect bottom of pan and magnet for excessive amounts of metal or fiber contamination. A light

Mopar AUTHENTIC RESTORATION PRODUCT

SERVICE PROCEDURES (Continued)

coating of clutch or band material on the bottom of the pan does not indicate a problem unless accompanied by slipping condition or shift lag. If fluid and pan are contaminated with excessive amounts or debris, refer to the diagnosis section of this group.

Check the adjustment of the front and rear bands, adjust if necessary.

CLEANING

(1) Using a suitable solvent, clean pan and magnet.

(2) Using a suitable gasket scraper, clean gasket material from gasket surface of transmission case and the gasket flange around the pan.

INSTALLATION

(1) Place replacement filter in position on valve body.

(2) Install screws to hold filter to valve body (Fig. 13). Tighten screws to 4 N·m (35 in. lbs.) torque.

(3) Place new gasket in position on pan and install pan on transmission.

(4) Place pan in position on transmission.

(5) Install screws to hold pan to transmission (Fig. 12). Tighten bolts to 17 N·m (150 in. lbs.) torque.

(6) Lower vehicle and fill transmission with Mopar® ATF Plus 3, type 7176 fluid.

TRANSMISSION FILL PROCEDURE

To avoid overfilling transmission after a fluid change or overhaul, perform the following procedure:

(1) Remove dipstick and insert clean funnel in transmission fill tube.

(2) Add following initial quantity of Mopar® ATF Plus 3 to transmission:

(a) If only fluid and filter were changed, add **3 pints (1-1/2 quarts)** of ATF Plus 3 to transmission.

(b) If transmission was completely overhauled, torque converter was replaced or drained, and cooler was flushed, add **12 pints (6 quarts)** of ATF Plus 3 to transmission.

(3) Apply parking brakes.

(4) Start and run engine at normal curb idle speed.

(5) Apply service brakes, shift transmission through all gear ranges then back to NEUTRAL, set parking brake, and leave engine running at curb idle speed.

(6) Remove funnel, insert dipstick and check fluid level. If level is low, **add fluid to bring level to MIN mark on dipstick.** Check to see if the oil level is equal on both sides of the dipstick. If one side is noticably higher than the other, the dipstick has picked up some oil from the dipstick tube. Allow the oil to drain down the dipstick tube and re-check.

(7) Drive vehicle until transmission fluid is at normal operating temperature.

(8) With the engine running at curb idle speed, the gear selector in NEUTRAL, and the parking brake applied, check the transmission fluid level.

CAUTION: Do not overfill transmission, fluid foaming and shifting problems can result.

(9) Add fluid to bring level up to MAX arrow mark.

When fluid level is correct, shut engine off, release park brake, remove funnel, and install dipstick in fill tube.

CONVERTER DRAINBACK CHECK VALVE SERVICE

The converter drainback check valve is located in the cooler outlet (pressure) line near the radiator lower tank. The valve prevents fluid drainback when the vehicle is parked for lengthy periods. The valve check ball is spring loaded and has an opening pressure of approximately 2 psi.

The valve is serviced as an assembly; it is not repairable. Do not clean the valve if restricted, or contaminated by sludge, or debris. If the valve fails, or if a transmission malfunction occurs that generates sludge and/or clutch particles and metal shavings, the valve must be replaced.

The valve must be removed whenever the cooler and lines are reverse flushed. The valve can be flow tested when necessary. The procedure is exactly the same as for flow testing a cooler.

If the valve is restricted, installed backwards, or in the wrong line, it will cause an overheating condition and possible transmission failure.

CAUTION: The drainback valve is a one-way flow device. It must be properly oriented in terms of flow direction for the cooler to function properly. The valve must be installed in the pressure line. Otherwise flow will be blocked and would cause an overheating condition and eventual transmission failure.

OIL PUMP VOLUME CHECK

After the new or repaired transmission has been installed, fill to the proper level with Mopar® ATF PLUS 3 (Type 7176) automatic transmission fluid. The volume should be checked using the following procedure:

(1) Disconnect the **From cooler** line at the transmission and place a collecting container under the disconnected line.

CAUTION: With the fluid set at the proper level, fluid collection should not exceed (1) quart or internal damage to the transmission may occur.

Mopar AUTHENTIC RESTORATION

SERVICE PROCEDURES (Continued)

(2) Run the engine **at curb idle speed**, with the shift selector in neutral.

(3) If fluid flow is intermittent or it takes more than 20 seconds to collect one quart of ATF PLUS 3, disconnect the **To Cooler** line at the transaxle.

(4) Refill the transaxle to proper level and recheck pump volume.

(5) If flow is found to be within acceptable limits, replace the cooler. Then fill transmission to the proper level, using Mopar® ATF PLUS 3 (Type 7176) automatic transmission fluid.

(6) If fluid flow is still found to be inadequate, check the line pressure using the Transaxle Hydraulic Pressure Test procedure.

FLUSHING COOLERS AND TUBES

When a transmission failure has contaminated the fluid, the oil cooler(s) must be flushed. The cooler bypass valve in the transmission must be replaced also. The torque converter must also be replaced. This will insure that metal particles or sludged oil are not later transferred back into the reconditioned (or replaced) transmission.

The only recommended procedure for flushing coolers and lines is to use Tool 6906 Cooler Flusher.

WARNING: WEAR PROTECTIVE EYEWEAR THAT MEETS THE REQUIREMENTS OF OSHA AND ANSI Z87.1–1968. WEAR STANDARD INDUSTRIAL RUBBER GLOVES.

KEEP LIGHTED CIGARETTES, SPARKS, FLAMES, AND OTHER IGNITION SOURCES AWAY FROM THE AREA TO PREVENT THE IGNITION OF COMBUSTIBLE LIQUIDS AND GASES. KEEP A CLASS (B) FIRE EXTINGUISHER IN THE AREA WHERE THE FLUSHER WILL BE USED.

KEEP THE AREA WELL VENTILATED.

DO NOT LET FLUSHING SOLVENT COME IN CONTACT WITH YOUR EYES OR SKIN: IF EYE CONTAMINATION OCCURS, FLUSH EYES WITH WATER FOR 15 TO 20 SECONDS. REMOVE CONTAMINATED CLOTHING AND WASH AFFECTED SKIN WITH SOAP AND WATER. SEEK MEDICAL ATTENTION.

COOLER FLUSH USING TOOL 6906

(1) Remove cover plate filler plug on Tool 6906. Fill reservoir 1/2 to 3/4 full of fresh flushing solution. Flushing solvents are petroleum based solutions generally used to clean automatic transmission components. **DO NOT** use solvents containing acids, water, gasoline, or any other corrosive liquids.

(2) Reinstall filler plug on Tool 6906.

(3) Verify pump power switch is turned OFF. Connect red alligator clip to positive (+) battery post. Connect black (-) alligator clip to a good ground.

(4) Disconnect the cooler lines at the transmission.

NOTE: When flushing transmission cooler and lines, ALWAYS reverse flush.

(5) Connect the BLUE pressure line to the OUTLET (From) cooler line.

(6) Connect the CLEAR return line to the INLET (To) cooler line

(7) Turn pump ON for two to three minutes to flush cooler(s) and lines. Monitor pressure readings and clear return lines. Pressure readings should stabilize below 20 psi. for vehicles equipped with a single cooler and 30 psi. for vehicles equipped with dual coolers. If flow is intermittent or exceeds these pressures, replace cooler.

(8) Turn pump OFF.

(9) Disconnect CLEAR suction line from reservoir at cover plate. Disconnect CLEAR return line at cover plate, and place it in a drain pan.

(10) Turn pump ON for 30 seconds to purge flushing solution from cooler and lines. Turn pump OFF.

(11) Place CLEAR suction line into a one quart container of Mopar® ATF Plus 3, type 7176 automatic transmission fluid.

(12) Turn pump ON until all transmission fluid is removed from the one quart container and lines. This purges any residual cleaning solvent from the transmission cooler and lines. Turn pump OFF.

(13) Disconnect alligator clips from battery. Reconnect flusher lines to cover plate, and remove flushing adapters from cooler lines.

ALUMINUM THREAD REPAIR

Damaged or worn threads in the aluminum transaxle case and valve body can be repaired by the use of Heli-Coils, or equivalent. This repair consists of drilling out the worn-out damaged threads. Then tap the hole with a special Heli-Coil tap, or equivalent, and installing a Heli-Coil insert, or equivalent, into the hole. This brings the hole back to its original thread size.

Heli-Coil, or equivalent, tools and inserts are readily available from most automotive parts suppliers.

REMOVAL AND INSTALLATION

TRANSMISSION

The overdrive unit can be removed and serviced separately. It is not necessary to remove the entire transmission assembly to perform overdrive unit repairs.

If only the overdrive unit requires service, refer to the overdrive unit removal and installation procedures.

Mopar AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

CAUTION: The transmission and torque converter must be removed as an assembly to avoid component damage. The converter drive plate, pump bushing, or oil seal can be damaged if the converter is left attached to the driveplate during removal. Be sure to remove the transmission and converter as an assembly.

REMOVAL

(1) Disconnect battery negative cable.

(2) Disconnect and lower or remove necessary exhaust components.

(3) Remove engine-to-transmission struts, if equipped (Fig. 14).

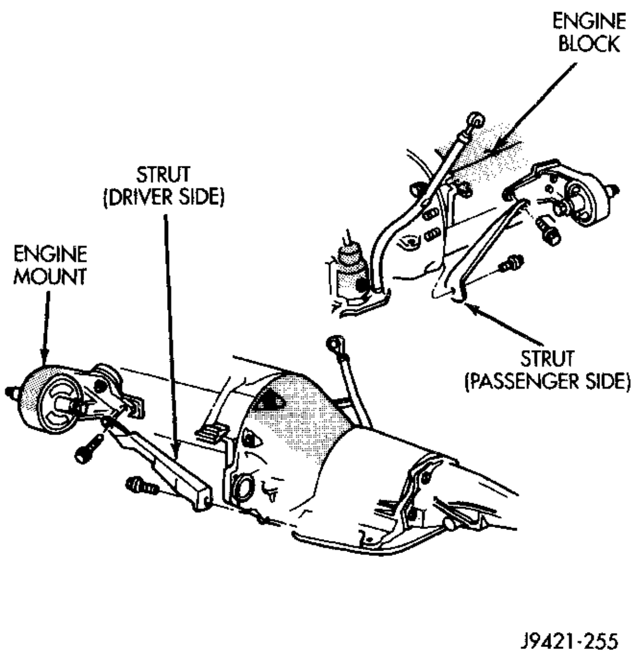

Fig. 14 Transmission-To-Engine Strut Attachment

(4) Disconnect fluid cooler lines at transmission.

(5) Remove starter motor.

(6) Disconnect and remove the crankshaft position sensor. Retain the sensor attaching bolts.

(7) Remove torque converter access cover.

(8) If transmission is being removed for overhaul, remove transmission oil pan, drain fluid and reinstall pan.

(9) Remove fill tube bracket bolts and pull tube out of transmission. Retain fill tube seal (Fig. 14). On 4 x 4 models, it will also be necessary to remove bolt attaching transfer case vent tube to converter housing (Fig. 15).

(10) Mark torque converter and drive plate for assembly alignment. Note that bolt holes in crankshaft flange, drive plate and torque converter all have one offset hole.

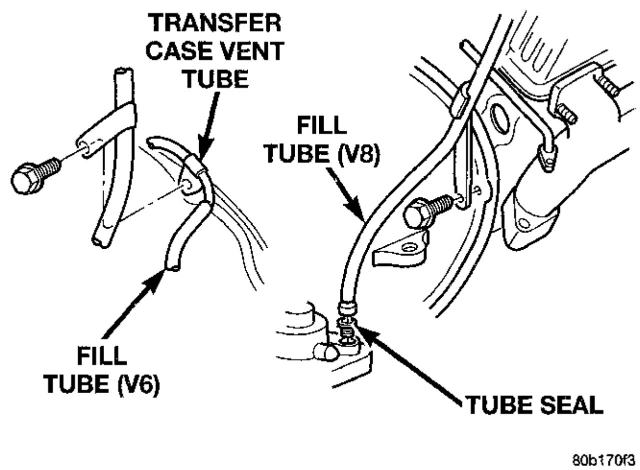

Fig. 15 Fill Tube Attachment

(11) Rotate crankshaft in clockwise direction until converter bolts are accessible. Then remove bolts one at a time. Rotate crankshaft with socket wrench on dampener bolt.

(12) Mark propeller shaft and axle yokes for assembly alignment. Then disconnect and remove propeller shaft. On 4 x 4 models, remove both propeller shafts.

(13) Disconnect wires from park/neutral position switch and transmission solenoid.

(14) Disconnect gearshift rod and torque shaft assembly from transmission.

(15) Disconnect throttle valve cable from transmission bracket and throttle valve lever.

(16) On 4 x 4 models, disconnect shift rod from transfer case shift lever.

(17) Support rear of engine with safety stand or jack.

(18) Raise transmission slightly with service jack to relieve load on crossmember and supports.

(19) Remove bolts securing rear support and cushion to transmission and crossmember. Raise transmission slightly, slide exhaust hanger arm from bracket (Fig. 16) and remove rear support.

(20) Remove bolts attaching crossmember to frame and remove crossmember.

(21) On 4 x 4 models, remove transfer case with transmission jack or aid of helper.

(22) Remove all converter housing bolts.

(23) Carefully work transmission and torque converter assembly rearward off engine block dowels.

(24) Lower transmission and remove assembly from under the vehicle.

(25) To remove torque converter, remove C-clamp from edge of bell housing and carefully slide torque converter out of the transmission.

REMOVAL AND INSTALLATION (Continued)

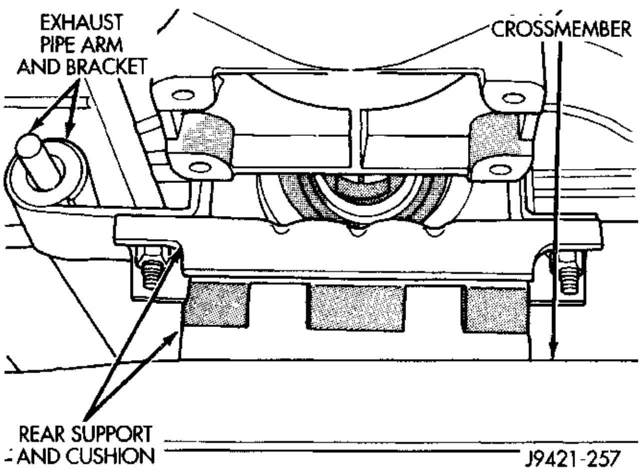

Fig. 16 Rear Support Cushion

INSTALLATION

(1) Check torque converter hub and hub drive notches for sharp edges burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper and crocus cloth if necessary. The hub must be smooth to avoid damaging pump seal at installation.

(2) Lubricate converter drive hub and oil pump seal lip with transmission fluid.

(3) Lubricate converter pilot hub with transmission fluid.

(4) Align and install converter in oil pump.

(5) Carefully insert converter in oil pump. Then rotate converter back and forth until fully seated in pump gears.

(6) Check converter seating with steel scale and straightedge (Fig. 17). Surface of converter lugs should be 1/2 in. to rear of straightedge when converter is fully seated.

(7) Temporarily secure converter with C-clamp.

(8) Position transmission on jack and secure it with chains.

(9) Check condition of converter driveplate. Replace the plate if cracked, distorted or damaged. **Also be sure transmission dowel pins are seated in engine block and protrude far enough to hold transmission in alignment.**

(10) Raise transmission and align converter with drive plate and converter housing with engine block.

(11) Move transmission forward. Then raise, lower or tilt transmission to align converter housing with engine block dowels.

(12) Rotate converter so alignment marks scribed on converter are aligned with mark on driveplate.

(13) Carefully work transmission forward and over engine block dowels until converter hub is seated in crankshaft.

(14) Install bolts attaching converter housing to engine.

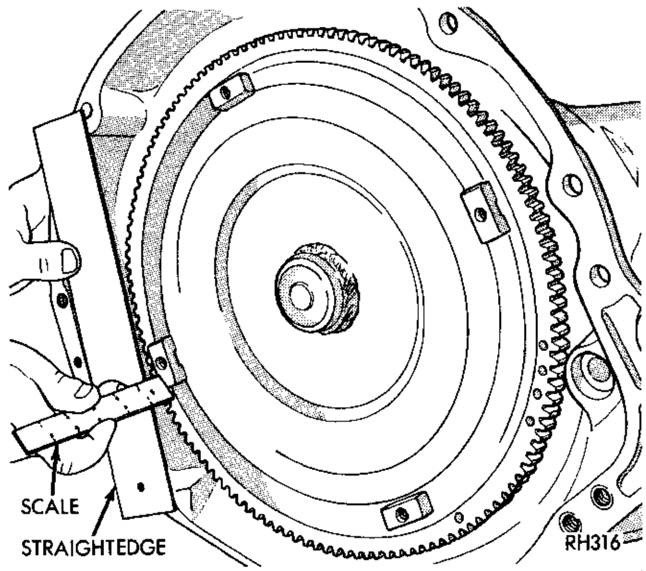

Fig. 17 Typical Method Of Checking Converter Seating

(15) Install rear support. Then lower transmission onto crossmember and install bolts attaching transmission mount to crossmember.

(16) Remove engine support fixture.

(17) Install crankshaft position sensor.

(18) Install new plastic retainer grommet on any shift linkage rod or lever that was disconnected. Grommets should not be reused. Use pry tool to remove rod from grommet and cut away old grommet. Use pliers to snap new grommet into lever and to snap rod into grommet at assembly.

(19) Connect gearshift and throttle cable to transmission.

(20) Connect wires to park/neutral position switch, transmission solenoid(s) and oxygen sensor. Be sure transmission harnesses are properly routed.

CAUTION: It is essential that correct length bolts be used to attach the converter to the driveplate. Bolts that are too long will damage the clutch surface inside the converter.

(21) Install torque converter-to-driveplate bolts. On models with 10.75 in. converter, tighten bolts to 31 N·m (270 in. lbs.). On models with 12.2 in. converter, tighten bolts to 47 N·m (35 ft. lbs.).

(22) Install converter housing access cover.

(23) Install starter motor and cooler line bracket.

(24) Connect cooler lines to transmission.

(25) Install transmission fill tube. Install new seal on tube before installation.

(26) Install exhaust components.

(27) Align and connect propeller shaft.

(28) Adjust gearshift linkage and throttle valve cable if necessary.

REMOVAL AND INSTALLATION (Continued)

(29) Lower vehicle.

(30) Fill transmission with Mopar® ATF Plus 3, Type 7176 fluid.

TORQUE CONVERTER

REMOVAL

(1) Remove transmission and torque converter from vehicle.

(2) Place a suitable drain pan under the converter housing end of the transmission.

CAUTION: Verify that transmission is secure on the lifting device or work surface, the center of gravity of the transmission will shift when the torque converter is removed creating an unstable condition.

The torque converter is a heavy unit. Use caution when separating the torque converter from the transmission.

(3) Pull the torque converter forward until the center hub clears the oil pump seal.

(4) Separate the torque converter from the transmission.

INSTALLATION

Check converter hub and drive notches for sharp edges, burrs, scratches, or nicks. Polish the hub and notches with 320/400 grit paper or crocus cloth if necessary. The hub must be smooth to avoid damaging the pump seal at installation.

(1) Lubricate converter hub and oil pump seal lip with transmission fluid.

(2) Place torque converter in position on transmission.

CAUTION: Do not damage oil pump seal or bushing while inserting torque converter into the front of the transmission.

(3) Align torque converter to oil pump seal opening.

(4) Insert torque converter hub into oil pump.

(5) While pushing torque converter inward, rotate converter until converter is fully seated in the oil pump gears.

(6) Check converter seating with a scale and straightedge (Fig. 18). Surface of converter lugs should be 1/2 in. to rear of straightedge when converter is fully seated.

(7) If necessary, temporarily secure converter with C-clamp attached to the converter housing.

(8) Install the transmission in the vehicle.

(9) Fill the transmission with the recommended fluid.

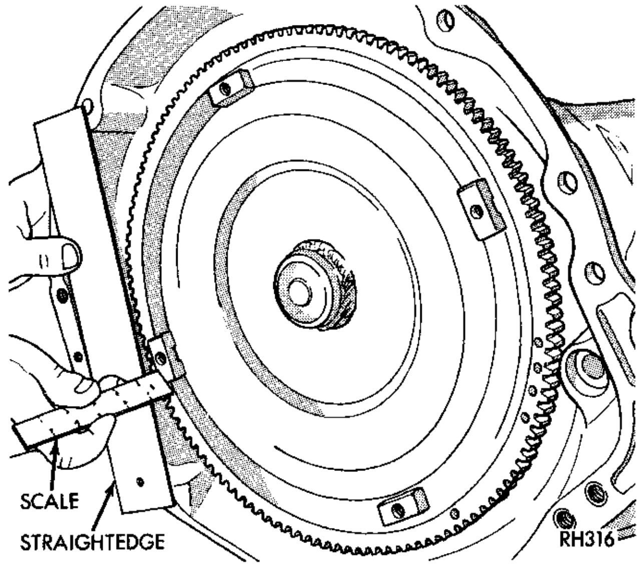

Fig. 18 Checking Torque Converter Seating

YOKE SEAL REPLACEMENT

REMOVAL

(1) Raise vehicle.

(2) Mark propeller shaft and axle yoke for alignment reference.

(3) Disconnect and remove propeller shaft.

(4) Remove old seal with Seal Remover C-3985-B (Fig. 19) from overdrive housing.

INSTALLATION

(1) Place seal in position on overdrive housing.

(2) Drive seal into overdrive housing with Seal Installer C-3995-A (Fig. 20).

(3) Carefully guide propeller shaft slip yoke into housing and onto output shaft splines. Align marks made at removal and connect propeller shaft to rear axle pinion yoke.

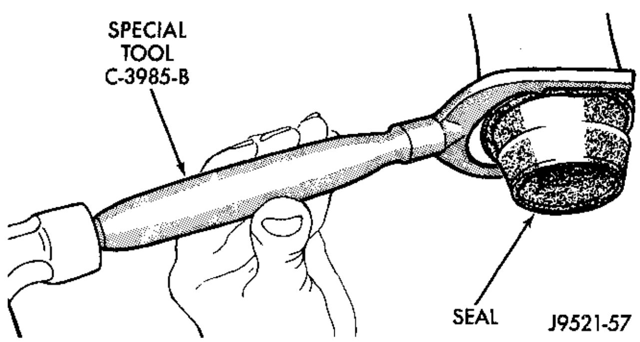

Fig. 19 Removing Overdrive Housing Yoke Seal

PARK/NEUTRAL POSITION SWITCH

REMOVAL

(1) Raise vehicle and position drain pan under switch.

REMOVAL AND INSTALLATION (Continued)

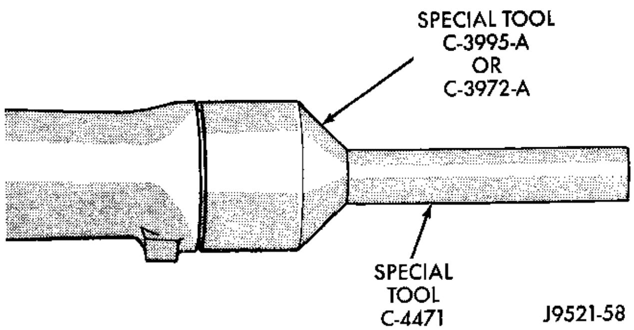

Fig. 20 Installing Overdrive Housing Yoke Seal

(2) Disconnect switch wires.
(3) Remove switch from case.

INSTALLATION

(1) Move shift lever to Park and Neutral positions. Verify that switch operating lever fingers are centered in switch opening in case (Fig. 21).

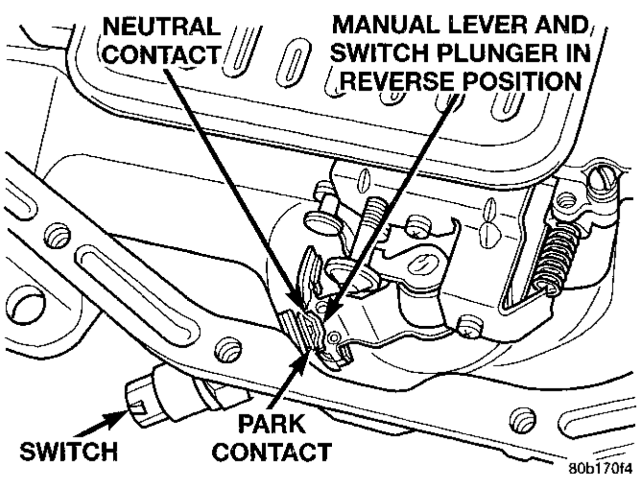

Fig. 21 Park/Neutral Position Switch

(2) Install new seal on switch and install switch in case. Tighten switch to 34 N·m (25 ft. lbs.) torque.
(3) Test continuity of new switch with 12V test lamp.
(4) Connect switch wires and lower vehicle.
(5) Top off transmission fluid level.

GOVERNOR SOLENOID AND PRESSURE SENSOR

REMOVAL

(1) Hoist and support vehicle on safety stands.
(2) Remove transmission fluid pan and filter.
(3) Disengage wire connectors from pressure sensor and solenoid (Fig. 22).
(4) Remove screws holding pressure solenoid retainer to governor body.
(5) Separate solenoid retainer from governor (Fig. 23).
(6) Pull solenoid from governor body (Fig. 24).
(7) Remove bolts holding governor body to valve body.
(8) Separate governor body from valve body (Fig. 25).
(9) Remove governor body gasket.
(10) Remove retainer holding pressure sensor to governor body.
(11) Pull pressure sensor from governor body (Fig. 26).

INSTALLATION

Before installing the pressure sensor and solenoid in the governor body, replace O-ring seals, clean the gasket surfaces and replace gasket.

(1) Lubricate O-ring on pressure sensor with transmission fluid.
(2) Align pressure sensor to bore in governor body (Fig. 26).
(3) Push pressure sensor into governor body.
(4) Install retainer to hold pressure sensor to governor body.
(5) Place gasket in position on back of governor body (Fig. 25).
(6) Place governor body in position on valve body.
(7) Install bolts to hold governor body to valve body.
(8) Lubricate O-ring, on pressure solenoid, with transmission fluid.
(9) Align pressure solenoid to bore in governor body (Fig. 24).
(10) Push solenoid into governor body.
(11) Place solenoid retainer in position on governor (Fig. 23).
(12) Install screws to hold pressure solenoid retainer to governor body.
(13) Engage wire connectors into pressure sensor and solenoid (Fig. 22).
(14) Install transmission fluid pan and (new) filter.
(15) Lower vehicle and road test to verify repair.

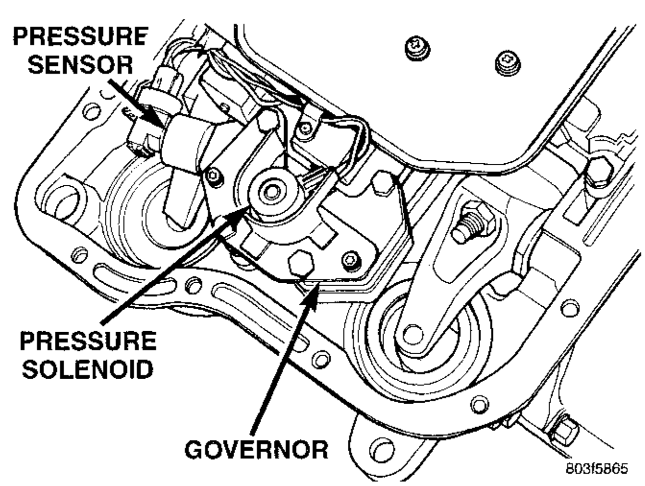

Fig. 22 Governor Solenoid And Pressure Sensor

REMOVAL AND INSTALLATION (Continued)

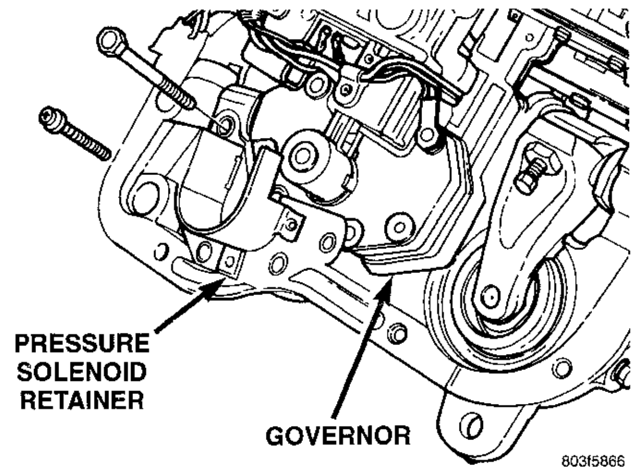

Fig. 23 Pressure Solenoid Retainer

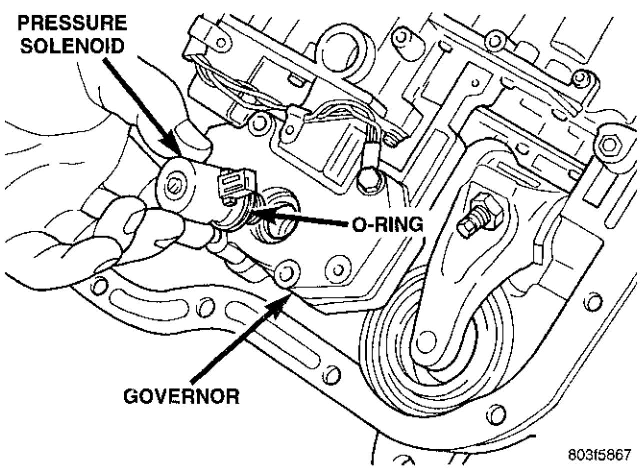

Fig. 24 Pressure Solenoid and O-ring

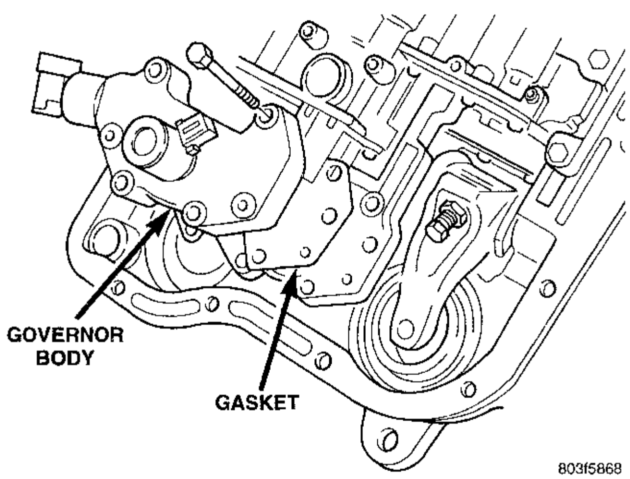

Fig. 25 Governor Body and Gasket

VALVE BODY

The valve body can be removed for service without having to remove the transmission assembly.

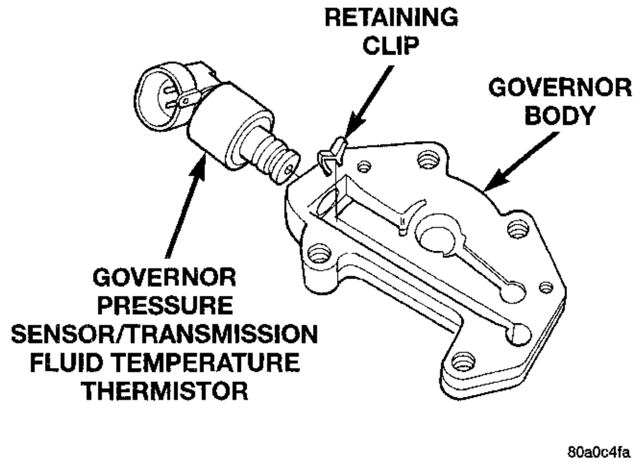

Fig. 26 Pressure Sensor and Retainer

The valve body can be disassembled for cleaning and inspection of the individual components. Refer to Disassembly and Assembly section for proper procedures.

The only replaceable valve body components are:

- Manual lever.
- Manual lever washer, seal, E-clip, and shaft seal.
- Manual lever detent ball.
- Throttle lever.
- Fluid filter.
- Pressure adjusting screw bracket.
- Governor pressure solenoid.
- Governor pressure sensor.
- Converter clutch/overdrive solenoid assembly and harness (includes sump temperature thermistor).
- Governor housing gasket.
- Solenoid case connector O-rings.

The remaining valve body components are serviced only as part of a complete valve body assembly.

REMOVAL

(1) Shift transmission into NEUTRAL.

(2) Raise vehicle.

(3) Remove gearshift and throttle levers from shaft of valve body manual lever.

(4) Disconnect wires at solenoid case connector (Fig. 27).

(5) Position drain pan under transmission oil pan.

(6) Remove transmission oil pan and gasket.

(7) Remove fluid filter from valve body.

(8) Remove bolts attaching valve body to transmission case.

(9) Lower valve body enough to remove accumulator piston and springs.

(10) Work manual lever shaft and electrical connector out of transmission case.

REMOVAL AND INSTALLATION (Continued)

(11) Lower valve body, rotate valve body away from case, pull park rod out of sprag, and remove valve body (Fig. 28).

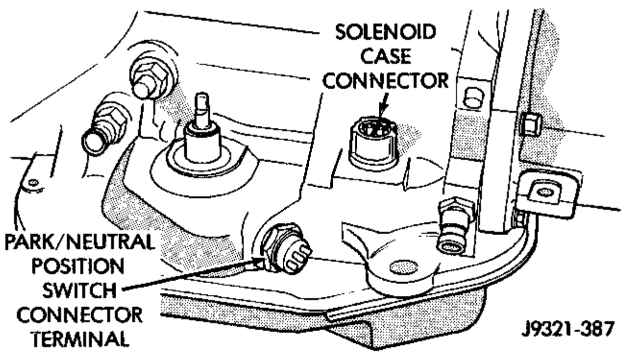

Fig. 27 Transmission Case Connector

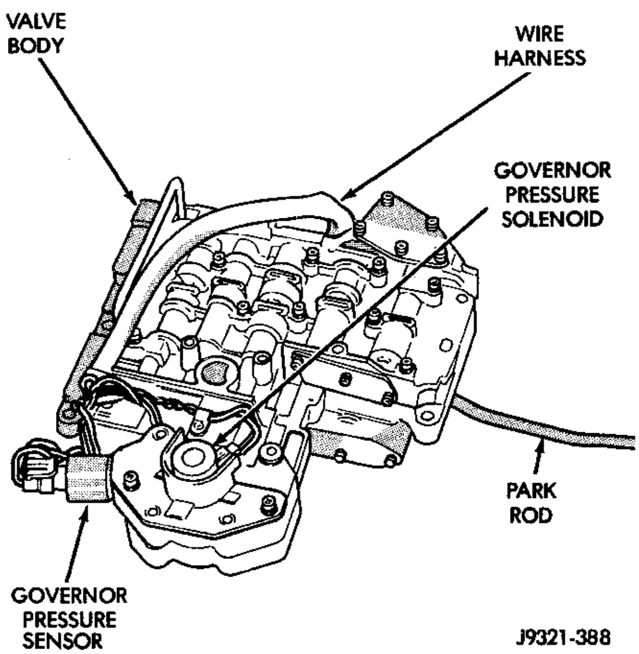

Fig. 28 Valve Body

INSTALLATION

(1) Check condition of O-ring seals on valve body harness connector (Fig. 29). Replace seals on connector body if cut or worn.

(2) Check condition of manual lever shaft seal in transmission case. Replace seal if lip is cut or worn. Install new seal with 15/16 deep well socket (Fig. 30).

(3) Check condition of seals on accumulator piston (Fig. 31). Install new piston seals, if necessary.

(4) Place valve body manual lever in low (1 position) so ball on park lock rod will be easier to install in sprag.

(5) Lubricate shaft of manual lever with petroleum jelly. This will ease inserting shaft through seal in case.

(6) Lubricate seal rings on valve body harness connector with petroleum jelly.

(7) Position valve body in case and work end of park lock rod into and through pawl sprag. Turn propeller shaft to align sprag and park lock teeth if necessary. The rod will click as it enters pawl. Move rod to check engagement.

CAUTION: It is possible for the park rod to displace into a cavity just above the pawl sprag during installation. Make sure the rod is actually engaged in the pawl and has not displaced into this cavity.

(8) Install accumulator springs and piston into case. Then swing valve body over piston and outer spring to hold it in place.

(9) Align accumulator piston and outer spring, manual lever shaft and electrical connector in case.

(10) Then seat valve body in case and install one or two bolts to hold valve body in place.

(11) Tighten valve body bolts alternately and evenly to 11 N·m (100 in. lbs.) torque.

(12) Install new fluid filter on valve body. Tighten filter screws to 4 N·m (35 in. lbs.) torque.

(13) Install throttle and gearshift levers on valve body manual lever shaft.

(14) Check and adjust front and rear bands if necessary.

(15) Connect solenoid case connector wires.

(16) Install oil pan and new gasket. Tighten pan bolts to 17 N·m (13 ft. lbs.) torque.

(17) Lower vehicle and fill transmission with Mopar® ATF Plus 3, type 7176 fluid.

(18) Check and adjust gearshift and throttle valve cables, if necessary.

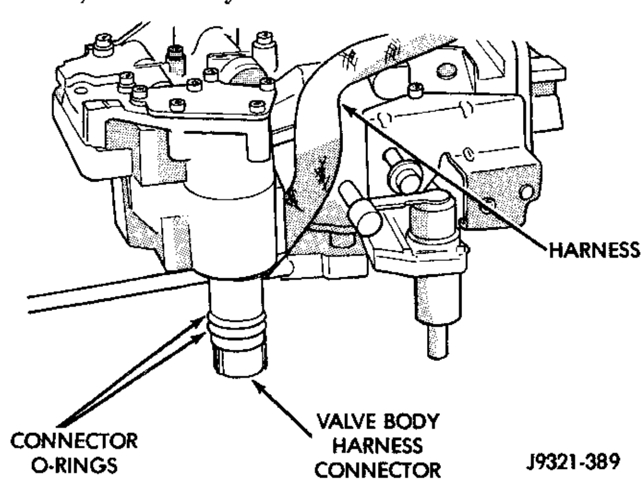

Fig. 29 Valve Body Harness Connector O-Ring Seal

REMOVAL AND INSTALLATION (Continued)

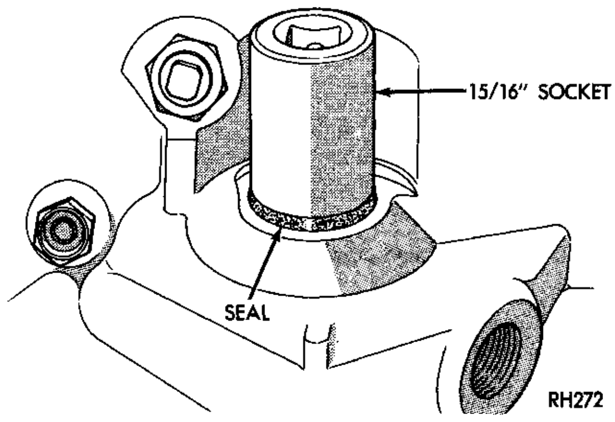

Fig. 30 Manual Lever Shaft Seal

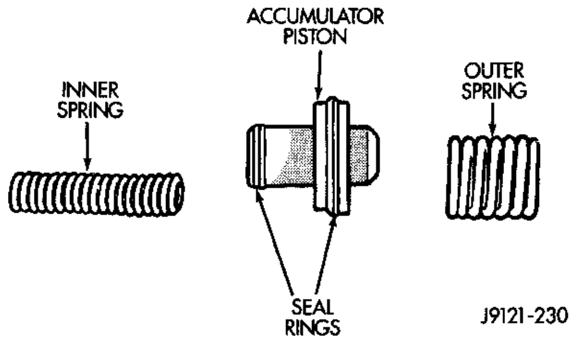

Fig. 31 Accumulator Piston Components

OVERDRIVE UNIT

REMOVAL

(1) Shift transmission into Park.

(2) Raise vehicle.

(3) Mark propeller shaft universal joint(s) and axle pinion yoke for alignment reference at installation.

(4) Disconnect and remove propeller shaft(s).

(5) Remove transmission oil pan, remove gasket, drain oil and reinstall pan.

(6) If overdrive unit had malfunctioned, or if fluid is contaminated, remove entire transmission. If diagnosis indicated overdrive problems only, remove just the overdrive unit.

(7) Support transmission with transmission jack.

(8) Remove vehicle speed sensor and speedometer adapter, if necessary.

(9) Remove bolts attaching overdrive unit to transmission (Fig. 32).

CAUTION: Support the overdrive unit with a jack before moving it rearward. This is necessary to prevent damaging the intermediate shaft. Do not allow the shaft to support the entire weight of the overdrive unit.

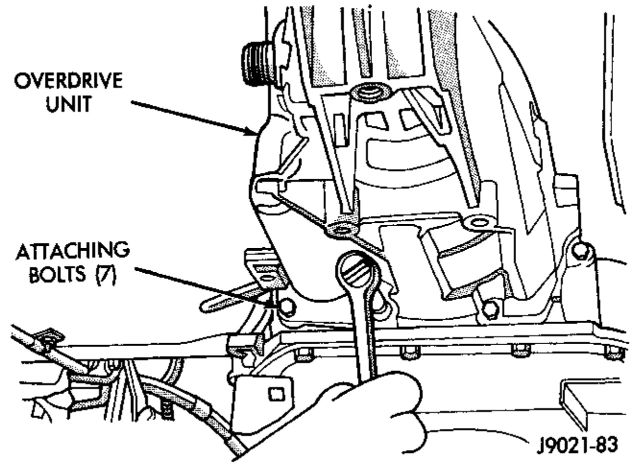

Fig. 32 Overdrive Unit Bolts

(10) Carefully work overdrive unit off intermediate shaft. Do not tilt unit during removal. Keep it as level as possible.

(11) If overdrive unit does not require service, immediately insert Alignment Tool 6227-2 in splines of planetary gear and overrunning clutch to prevent splines from rotating out of alignment. If misalignment occurs, overdrive unit will have to be disassembled in order to realign splines.

(12) Remove and retain overdrive piston thrust bearing. Bearing may remain on piston or in clutch hub during removal.

(13) Position drain pan on workbench.

(14) Place overdrive unit over drain pan. Tilt unit to drain residual fluid from case.

(15) Examine fluid for clutch material or metal fragments. If fluid contains these items, overhaul will be necessary.

(16) If overdrive unit does not require any service, leave alignment tool in position. Tool will prevent accidental misalignment of planetary gear and overrunning clutch splines.

INSTALLATION

(1) Be sure overdrive unit Alignment Tool 6227-2 is fully seated before moving unit. If tool is not seated and gear splines rotate out of alignment, overdrive unit will have to be disassembled in order to realign splines.

(2) If overdrive piston retainer was not removed during service and original case gasket is no longer reusable, prepare new gasket by trimming it.

(3) Cut out old case gasket around piston retainer with razor knife (Fig. 33).

(4) Use old gasket as template and trim new gasket to fit.

(5) Position new gasket over piston retainer and on transmission case. Use petroleum jelly to hold

REMOVAL AND INSTALLATION (Continued)

gasket in place if necessary. Do not use any type of sealer to secure gasket. Use petroleum jelly only.

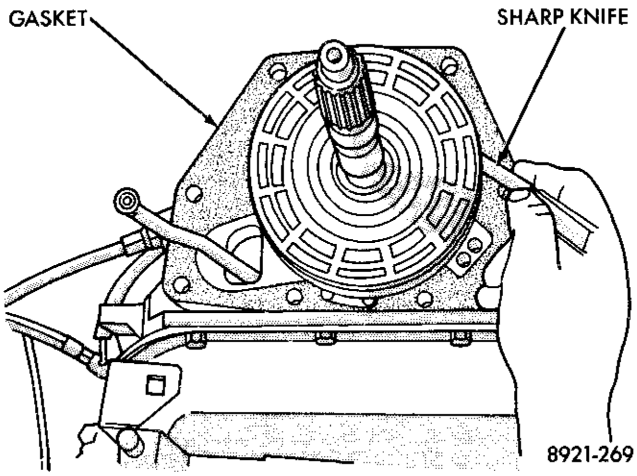

Fig. 33 Trimming Overdrive Case Gasket

(6) Install selective spacer on intermediate shaft, if removed. Spacer goes in groove just rearward of shaft rear splines (Fig. 34).

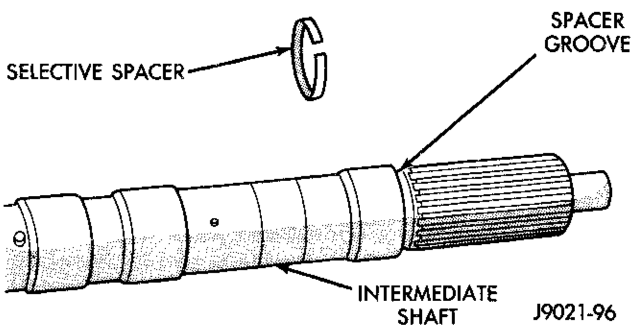

Fig. 34 Intermediate Shaft Selective Spacer Location

(7) Install thrust bearing in overdrive unit sliding hub. Use petroleum jelly to hold bearing in position.

CAUTION: Be sure the shoulder on the inside diameter of the bearing is facing forward.

(8) Verify that splines in overdrive planetary gear and overrunning clutch hub are aligned with Alignment Tool 6227-2. Overdrive unit cannot be installed if splines are not aligned. If splines have rotated out of alignment, unit will have to be disassembled to realign splines.

(9) Carefully slide Alignment Tool 6227-2 out of overdrive planetary gear and overrunning clutch splines.

(10) Raise overdrive unit and carefully slide it straight onto intermediate shaft. Insert park rod into park lock reaction plug at same time. Avoid tilting overdrive during installation as this could cause planetary gear and overrunning clutch splines to rotate out of alignment. If this occurs, it will be necessary to remove and disassemble overdrive unit to realign splines.

(11) Work overdrive unit forward on intermediate shaft until seated against transmission case.

(12) Install bolts attaching overdrive unit to transmission unit. Tighten bolts in diagonal pattern to 34 N·m (25 ft-lbs).

(13) Install speed sensor and speedometer adapter. Be sure to index adapter.

(14) Connect speed sensor and overdrive wires.

(15) Align and install propeller shaft.

OVERDRIVE HOUSING BUSHING

REMOVAL

(1) Remove overdrive housing yoke seal.

(2) Insert Remover 6957 into overdrive housing. Tighten tool to bushing and remove bushing (Fig. 35).

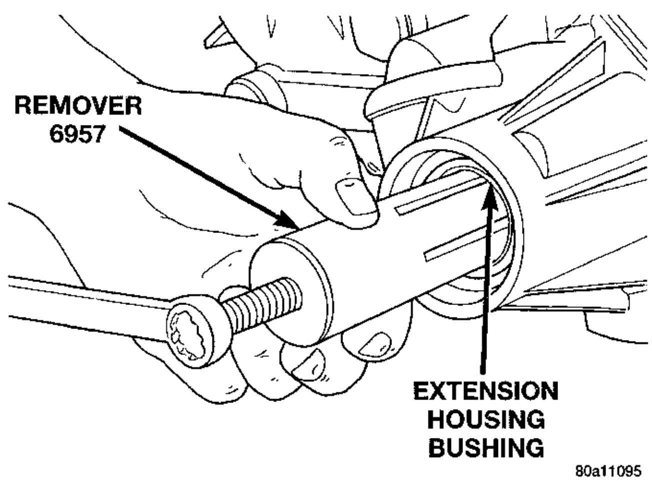

Fig. 35 Bushing Removal—Typical

INSTALLATION

(1) Align bushing oil hole with oil slot in overdrive housing.

(2) Tap bushing into place with Installer 6951 and Handle C-4171.

(3) Install new oil seal in housing using Seal Installer C-3995–A (Fig. 36).

OUTPUT SHAFT REAR BEARING

REMOVAL

(1) Remove overdrive unit from the vehicle.

(2) Remove overdrive geartrain from housing.

(3) Remove snap ring holding output shaft rear bearing into overdrive housing (Fig. 37).

(4) Using a suitable driver inserted through the rear end of housing, drive bearing from housing.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

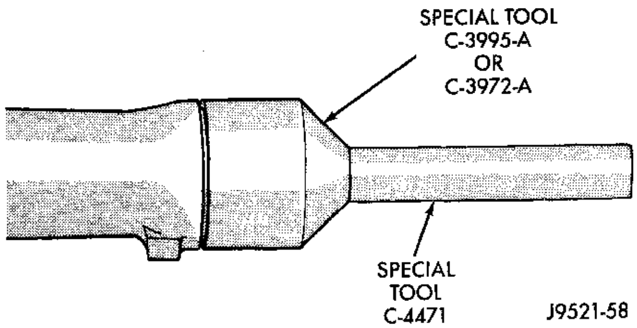

Fig. 36 Overdrive Housing Seal Installation

INSTALLATION

(1) Place replacement bearing in position in housing.
(2) Using a suitable driver, drive bearing into housing until the snap ring groove is visible.
(3) Install snap ring to hold bearing into housing (Fig. 37).
(4) Install overdrive geartrain into housing.
(5) Install overdrive unit in vehicle.

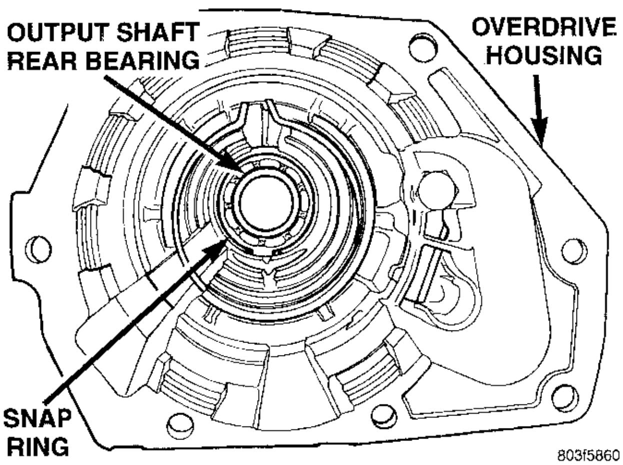

Fig. 37 Output Shaft Rear Bearing

OUTPUT SHAFT FRONT BEARING

REMOVAL

(1) Remove overdrive unit from the vehicle.
(2) Remove overdrive geartrain from housing.
(3) Remove snap ring holding output shaft front bearing to overdrive geartrain. (Fig. 38).
(4) Pull bearing from output shaft.

INSTALLATION

(1) Place replacement bearing in position on geartrain with locating retainer groove toward the rear.
(2) Push bearing onto shaft until the snap ring groove is visible.
(3) Install snap ring to hold bearing onto output shaft (Fig. 38).
(4) Install overdrive geartrain into housing.
(5) Install overdrive unit in vehicle.

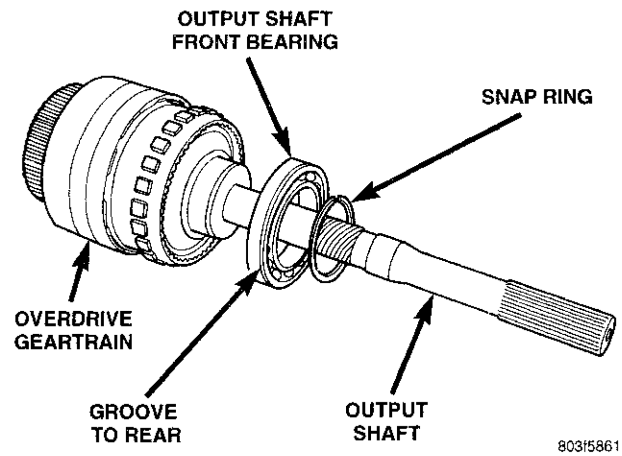

Fig. 38 Output Shaft Front Bearing

DISASSEMBLY AND ASSEMBLY

VALVE BODY

Remove the valve body from the transmission, refer to Removal and Installation procedures section in this group.

DISASSEMBLY

CAUTION: Do not clamp any valve body component in a vise. This practice can damage the component resulting in unsatisfactory operation after assembly and installation. Do not use pliers to remove any of the valves, plugs or springs and do not force any of the components out or into place. The valves and valve body housings will be damaged if force is used. Tag or mark the valve body springs for reference as they are removed. Do not allow them to become intermixed.

(1) Remove fluid filter.
(2) Disconnect wires from governor pressure sensor and solenoid (Fig. 39).

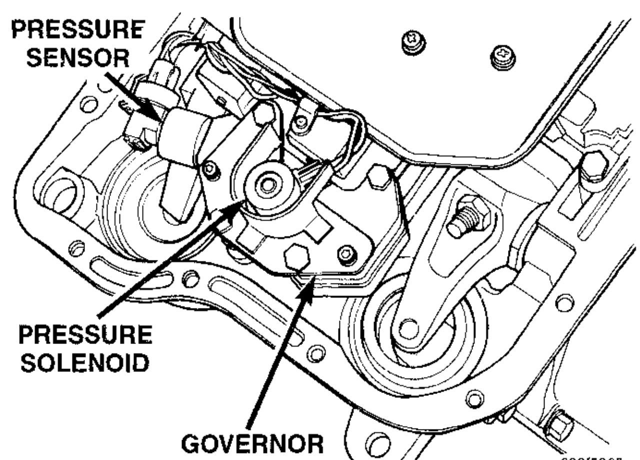

Fig. 39 Governor Pressure Solenoid And Sensor Wire Locations

DISASSEMBLY AND ASSEMBLY (Continued)

(3) Remove screws attaching governor body and retainer plate to transfer plate (Fig. 40).

(4) Remove retainer plate, governor body and gasket from transfer plate (Fig. 41).

(5) Disconnect wires from governor pressure sensor, if not done previously.

(6) Remove governor pressure sensor from governor body. Sensor is retained in body with M-shaped spring clip (Fig. 42). Remove clip with small pointed tool and slide sensor out of body.

(7) Remove governor pressure solenoid by pulling it straight out of bore in governor body (Fig. 43). Remove and discard solenoid O-rings if worn, cut, or torn.

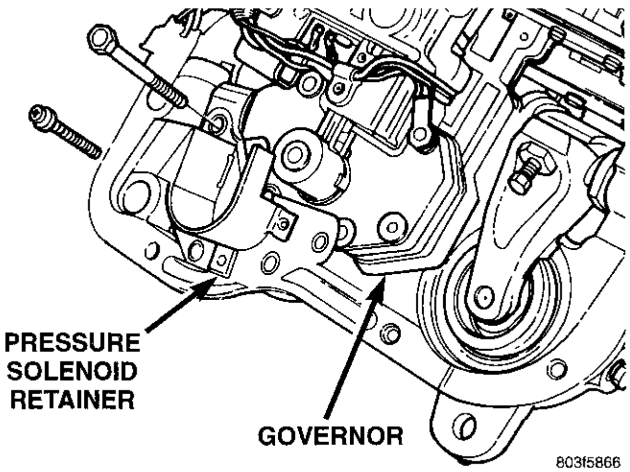

Fig. 40 Governor Body And Retainer Plate Attaching Screw

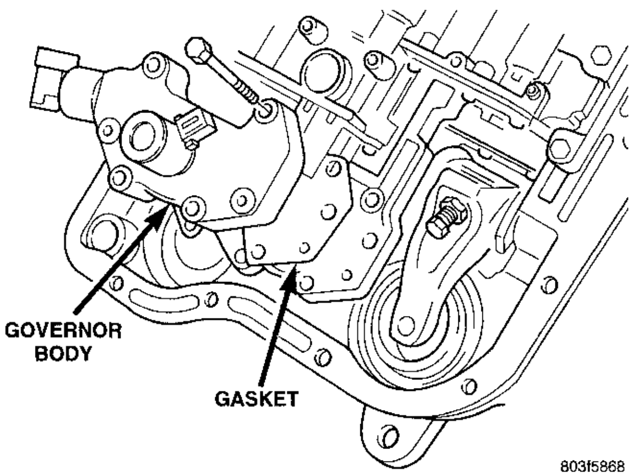

Fig. 41 Governor Body And Gasket

(8) Remove transmission fluid filter.

(9) Remove small shoulder bolt that secures solenoid harness case connector to 3-4 accumulator housing (Fig. 44). **Retain shoulder bolt. Either tape it to harness or thread it back into accumulator housing after connector removal.**

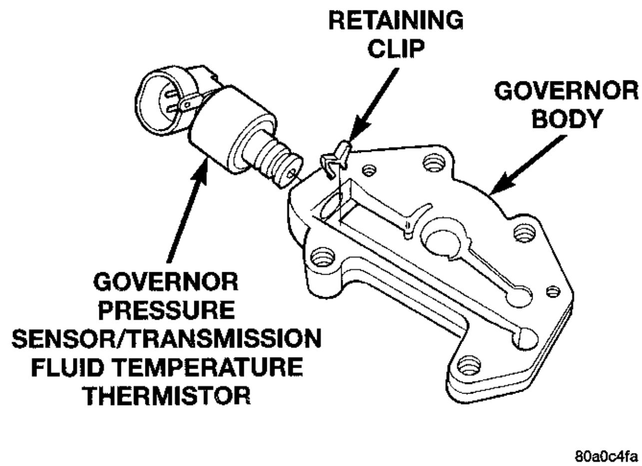

Fig. 42 Governor Pressure Sensor

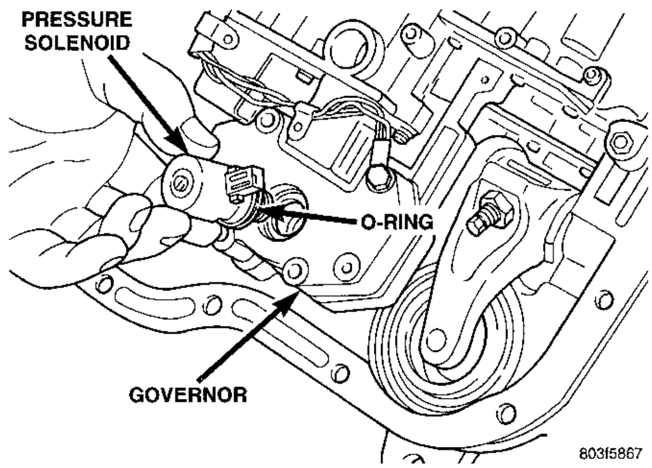

Fig. 43 Governor Pressure Solenoid

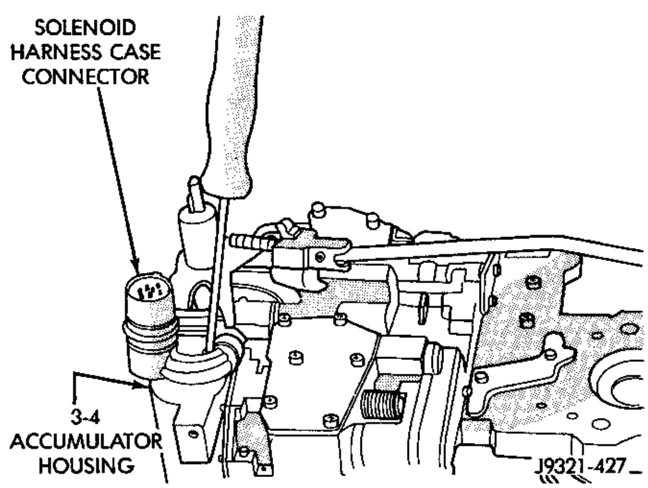

Fig. 44 Solenoid Harness Case Connector Shoulder Bolt

DISASSEMBLY AND ASSEMBLY (Continued)

(10) Unhook overdrive/converter solenoid harness from 3-4 accumulator cover plate (Fig. 45).

(11) Turn valve body over and remove screws that attach overdrive/converter solenoid assembly to valve body (Fig. 46).

(12) Remove solenoid and harness assembly from valve body (Fig. 47).

(13) Remove boost valve cover (Fig. 48).

(14) Remove boost valve retainer, valve spring and boost valve (Fig. 49).

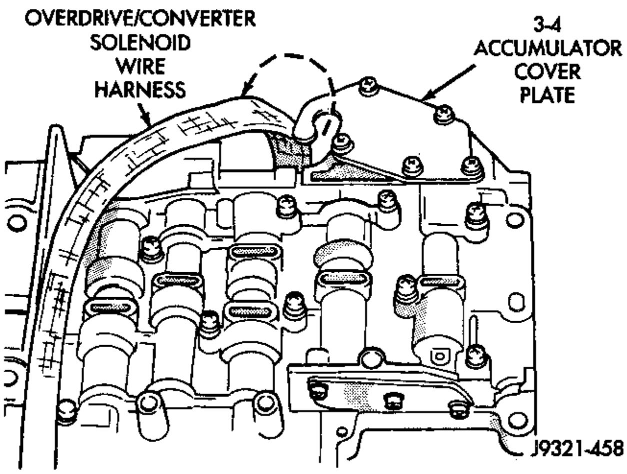

Fig. 45 Unhooking Solenoid Harness From Accumulator Cover Plate

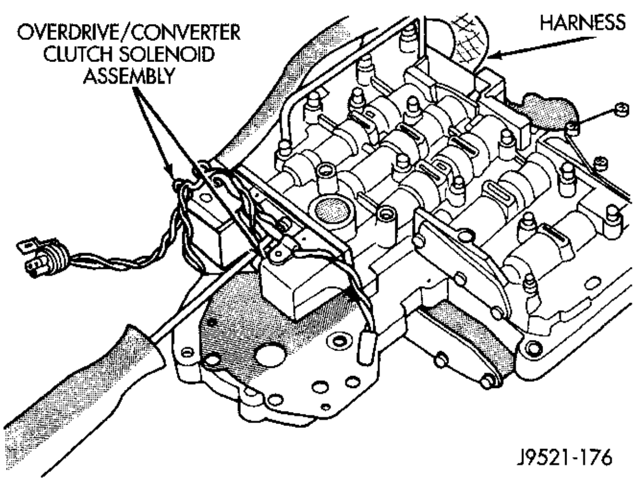

Fig. 46 Solenoid Assembly Screws

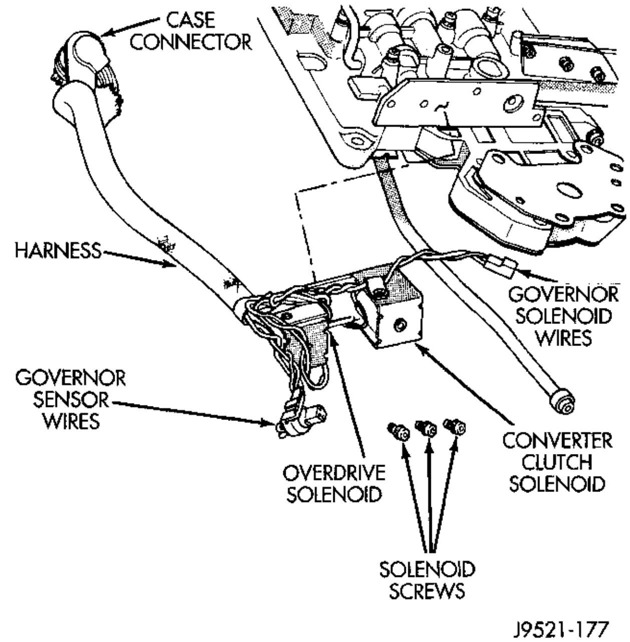

Fig. 47 Solenoid Assembly

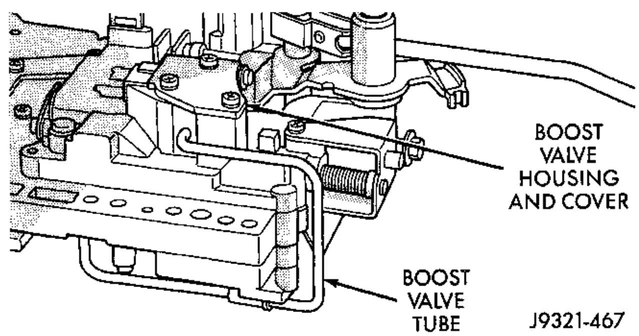

Fig. 48 Boost Valve Cover Location

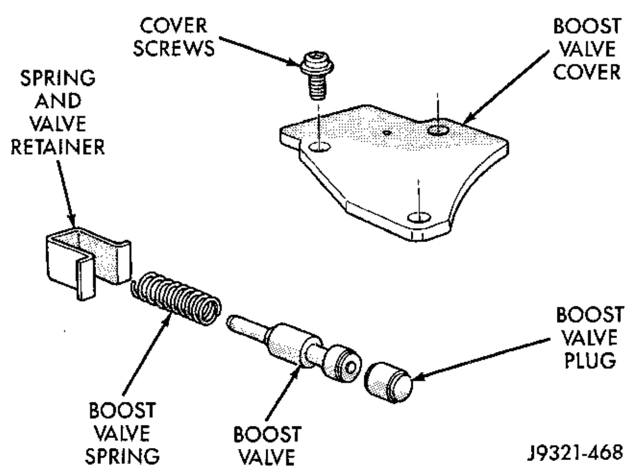

Fig. 49 Boost Valve Components

DISASSEMBLY AND ASSEMBLY (Continued)

(15) Secure detent ball and spring with Retainer Tool 6583 (Fig. 50).

(16) Remove park rod E-clip and separate rod from manual lever (Fig. 51).

(17) Remove E-clip and washer that retains throttle lever shaft in manual lever (Fig. 52).

(18) Remove manual lever and throttle lever (Fig. 53). Rotate and lift manual lever off valve body and throttle lever shaft. Then slide throttle lever out of valve body.

(19) Position pencil magnet next to detent housing to catch detent ball and spring. Then carefully remove Retainer Tool 6583 and remove detent ball and spring (Fig. 54).

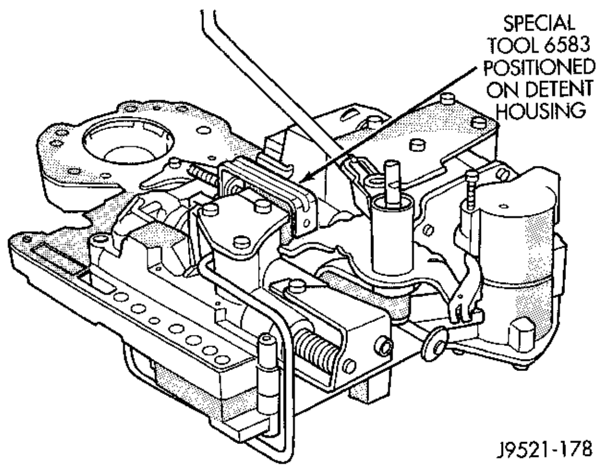

Fig. 50 Detent Ball And Spring

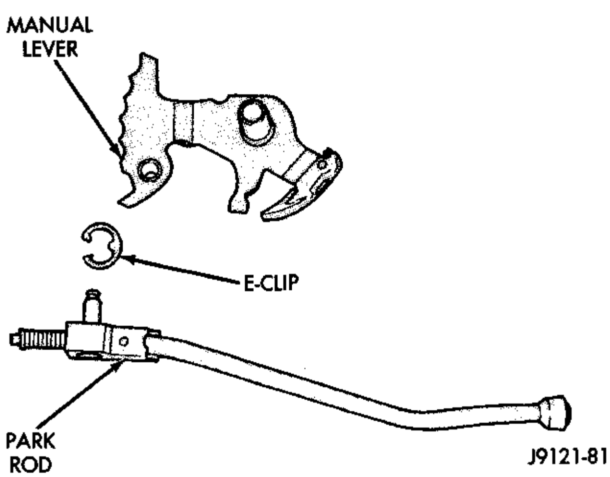

Fig. 51 Park Rod

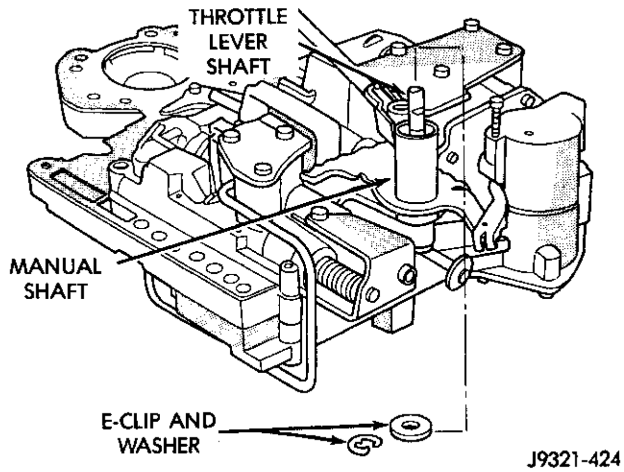

Fig. 52 Throttle Lever E-Clip And Washer

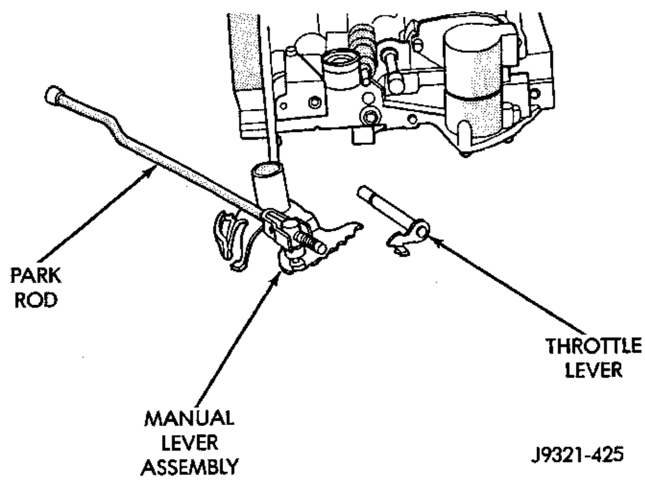

Fig. 53 Manual And Throttle Lever

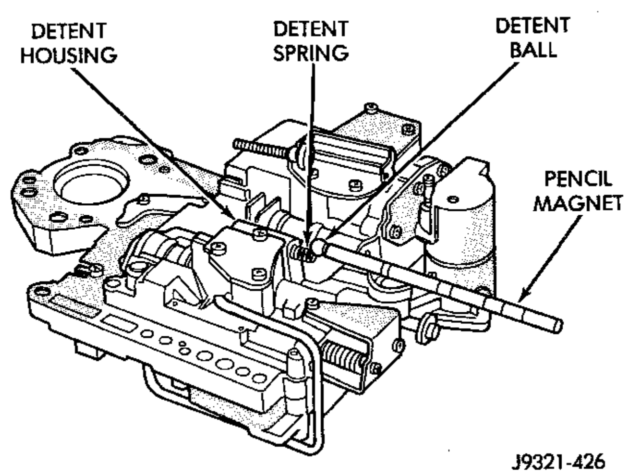

Fig. 54 Detent Ball And Spring

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(20) Remove screws attaching pressure adjusting screw bracket to valve body and transfer plate (Fig. 55). Hold bracket firmly against spring tension while removing last screw.

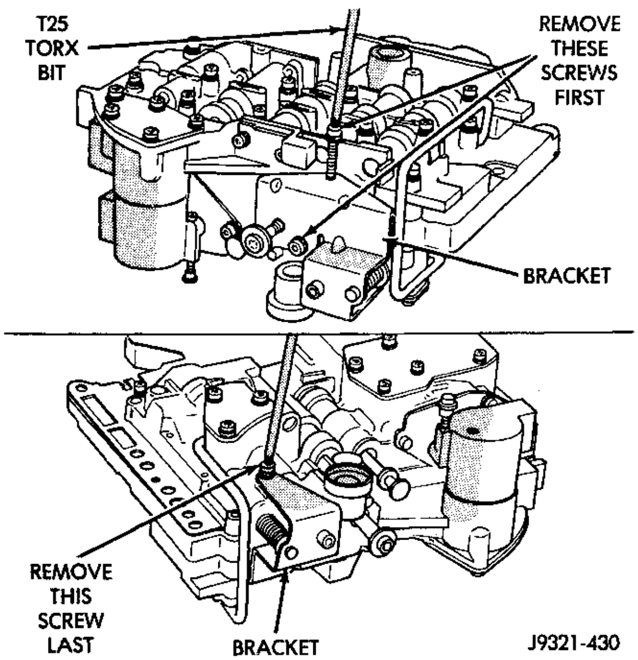

Fig. 55 Adjusting Screw Bracket Fastener

(21) Remove adjusting screw bracket, line pressure adjusting screw, pressure regulator valve spring and switch valve spring (Fig. 56). **Do not remove throttle pressure adjusting screw from bracket and do not disturb setting of either adjusting screw during removal.**

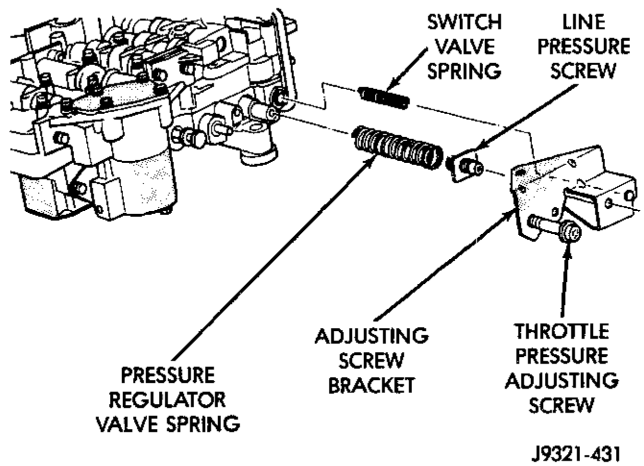

Fig. 56 Adjusting Screw Bracket And Spring

(22) Turn upper housing over and remove switch valve, regulator valve and spring, and manual valve (Fig. 57).

(23) Remove kickdown detent, kickdown valve, and throttle valve and spring (Fig. 57).

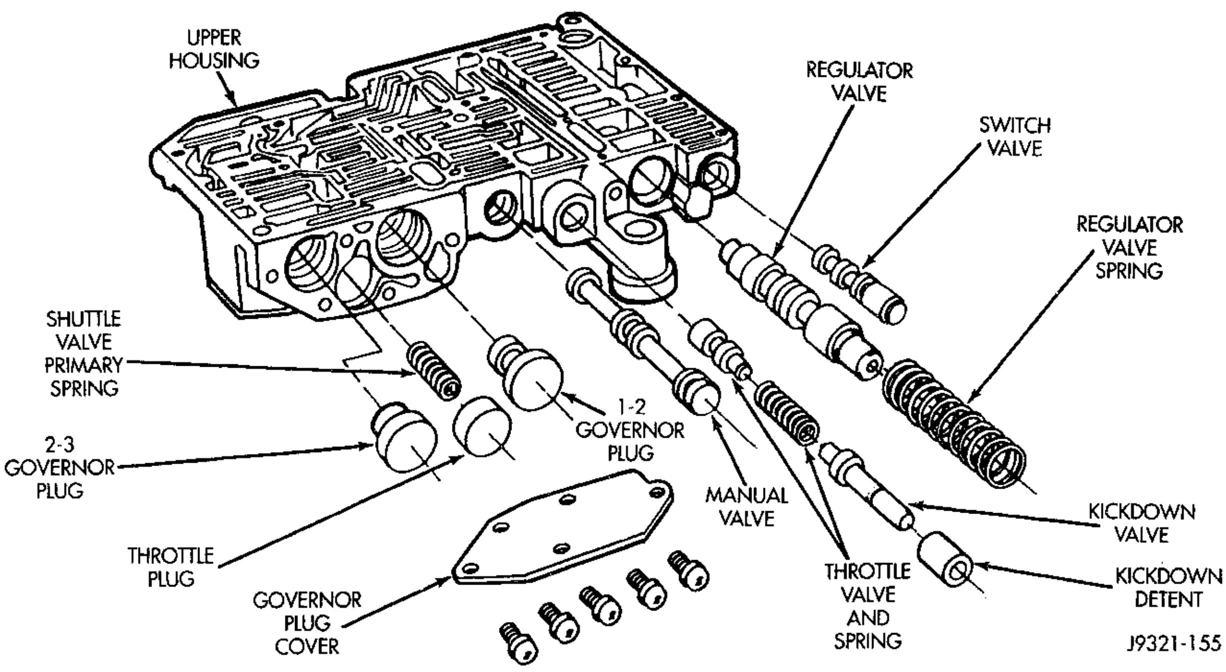

Fig. 57 Upper Housing Control Valve Locations

DISASSEMBLY AND ASSEMBLY (Continued)

(24) Loosen left-side 3-4 accumulator housing attaching screw about 2-3 threads. Then remove center and right-side housing attaching screws (Fig. 58).

(25) Carefully rotate 3-4 accumulator housing upward and remove 3-4 shift valve spring and converter clutch valve plug and spring (Fig. 59).

(26) Remove left-side screw and remove 3-4 accumulator housing from valve body (Fig. 60).

(27) Bend back tabs on boost valve tube brace (Fig. 61).

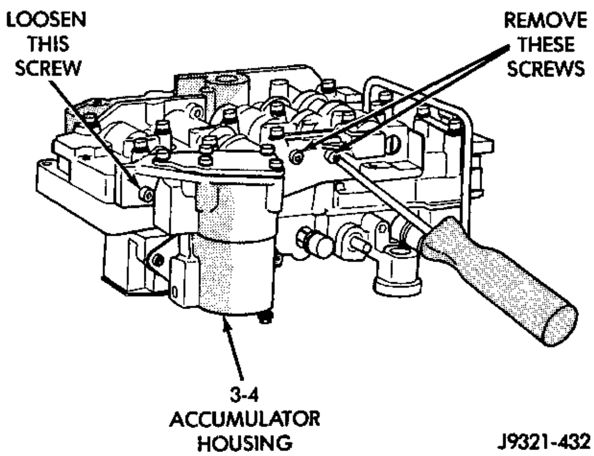

Fig. 58 Accumulator Housing Screw Locations

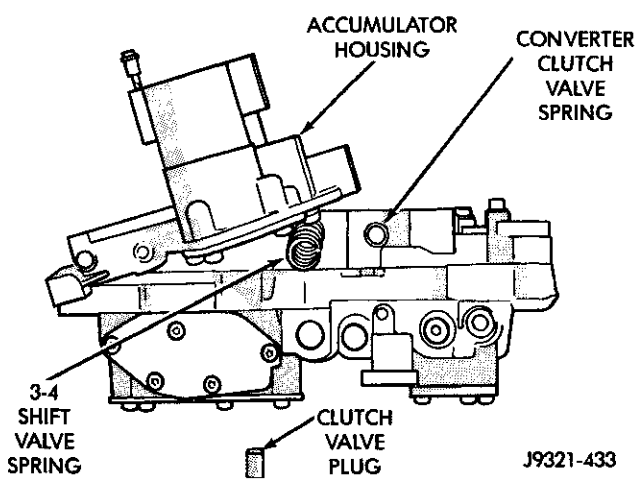

Fig. 59 3-4 Shift And Converter Clutch Valve Springs And Plug

(28) Remove boost valve connecting tube (Fig. 62). Disengage tube from upper housing port first. Then rock opposite end of tube back and forth to work it out of lower housing.

CAUTION: Do not use tools to loosen or pry the connecting tube out of the valve body housings. Loosen and remove the tube by hand only.

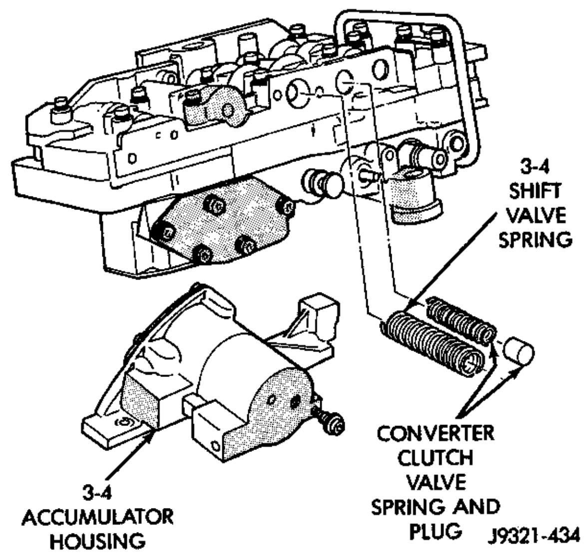

Fig. 60 Accumulator Housing, Valve Springs And Plug

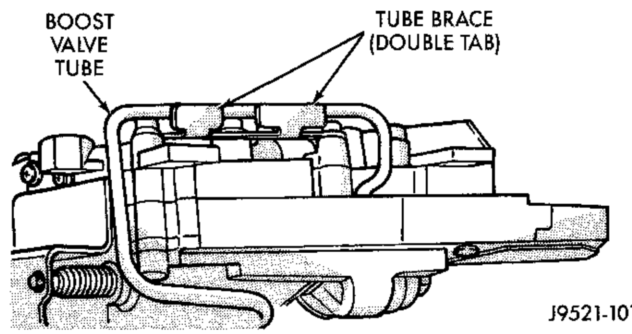

Fig. 61 Boost Valve Tube Brace

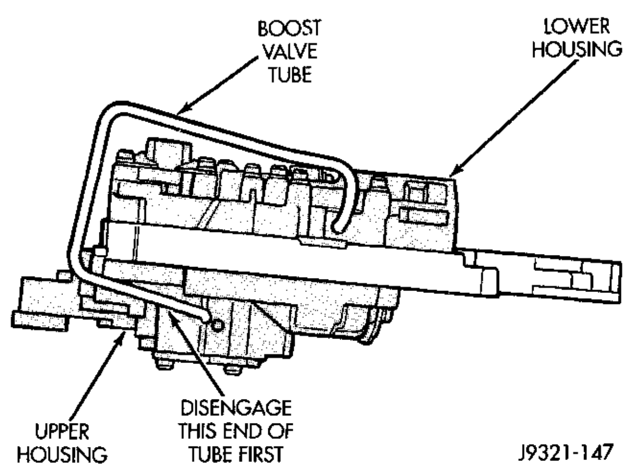

Fig. 62 Boost Valve Tube

mopar AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(29) Turn valve body over so lower housing is facing upward (Fig. 63). In this position, the two check balls in upper housing will remain in place and not fall out when lower housing and separator plate are removed.

(30) Remove screws attaching valve body lower housing to upper housing and transfer plate (Fig. 63). **Note position of boost valve tube brace for assembly reference.**

(31) Remove lower housing and overdrive separator plate from transfer plate (Fig. 63).

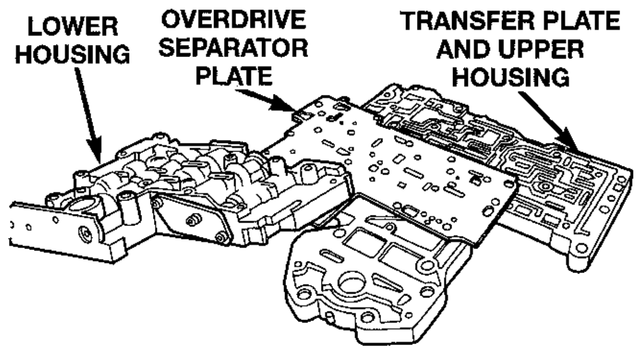

Fig. 63 Lower Housing

(32) Remove the ECE check ball from the transfer plate (Fig. 64). The ECE check ball is approximately 4.8 mm (3/16 in.) in diameter.

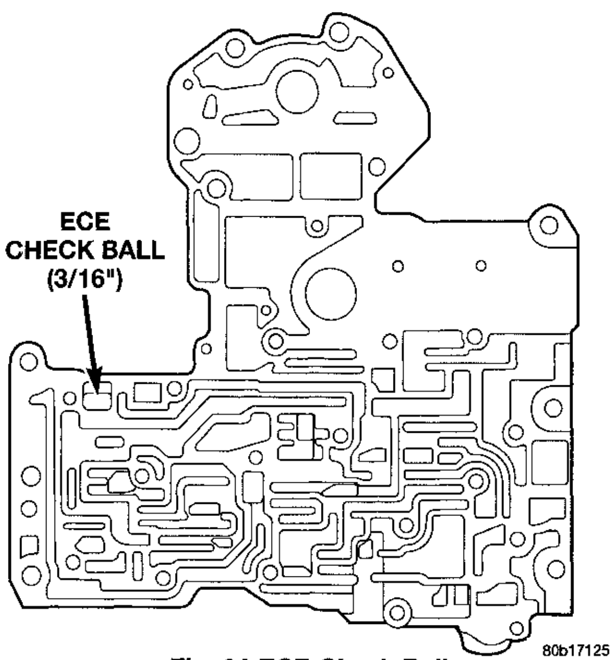

Fig. 64 ECE Check Ball

(33) Remove transfer plate from upper housing (Fig. 65).

(34) Turn transfer plate over so upper housing separator plate is facing upward.

(35) Remove upper housing separator plate from transfer plate (Fig. 66). Note position of filter in separator plate for assembly reference.

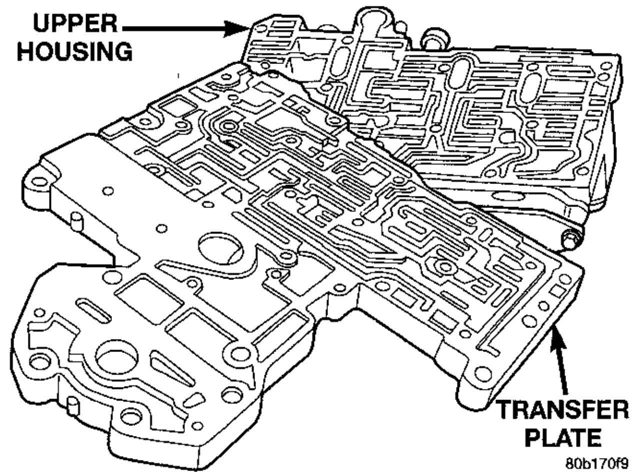

Fig. 65 Transfer Plate

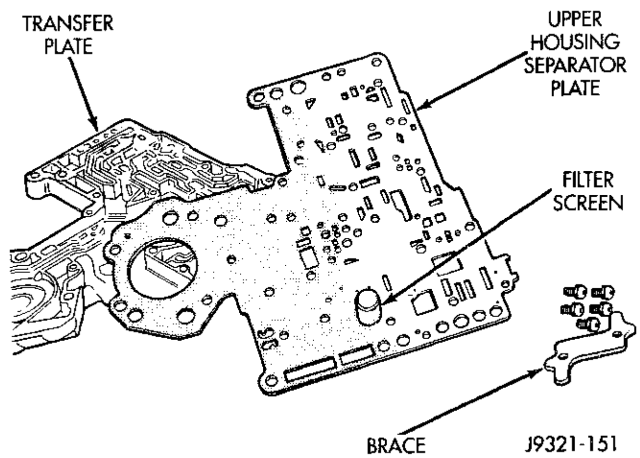

Fig. 66 Upper Housing Separator Plate

(36) Remove rear clutch and rear servo check balls from transfer plate. Note check ball location for assembly reference (Fig. 67).

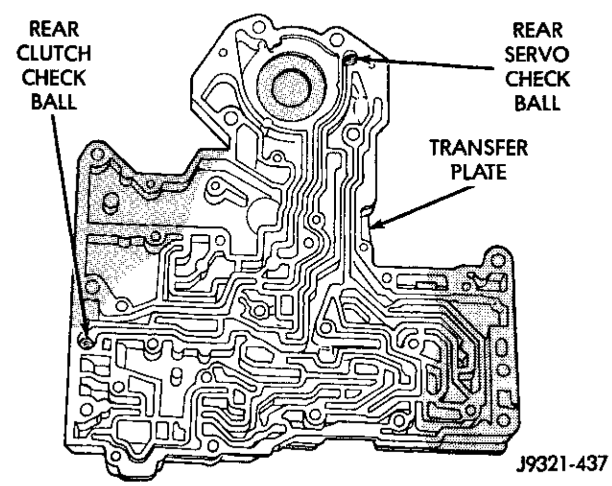

Fig. 67 Rear Clutch And Rear Servo Check Ball Locations

DISASSEMBLY AND ASSEMBLY (Continued)

VALVE BODY UPPER HOUSING

(1) Note location of check balls in valve body upper housing (Fig. 68). Then remove the one large diameter and the six smaller diameter check balls.

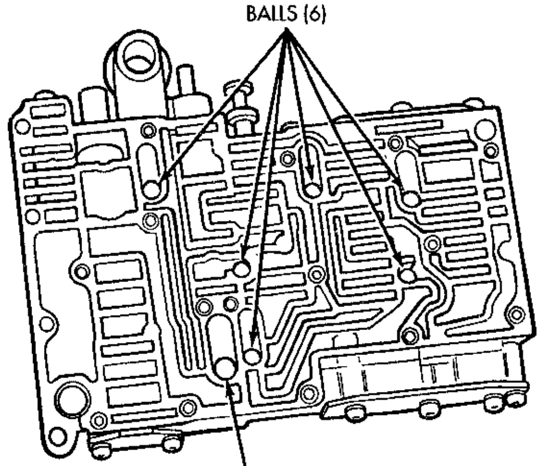

Fig. 68 Check Ball Locations In Upper Housing

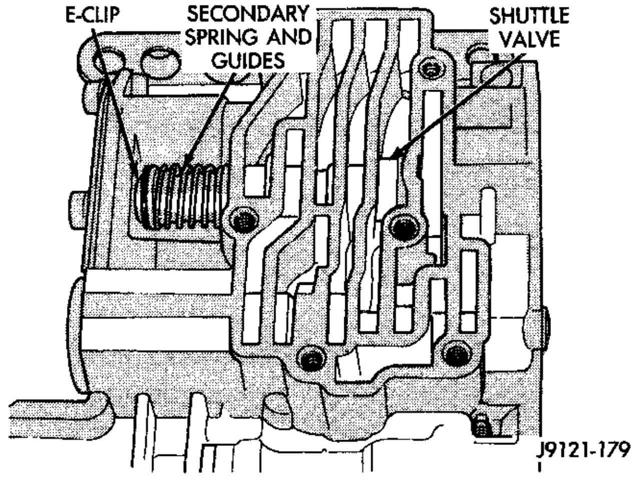

Fig. 69 Shuttle Valve E-Clip And Secondary Spring Location

(2) Remove governor plug and shuttle valve covers (Fig. 70).

(3) Remove E-clip that secures shuttle valve secondary spring on valve stem (Fig. 69).

(4) Remove throttle plug, primary spring, shuttle valve, secondary spring, and spring guides (Fig. 70).

(5) Remove boost valve retainer, spring and valve if not previously removed.

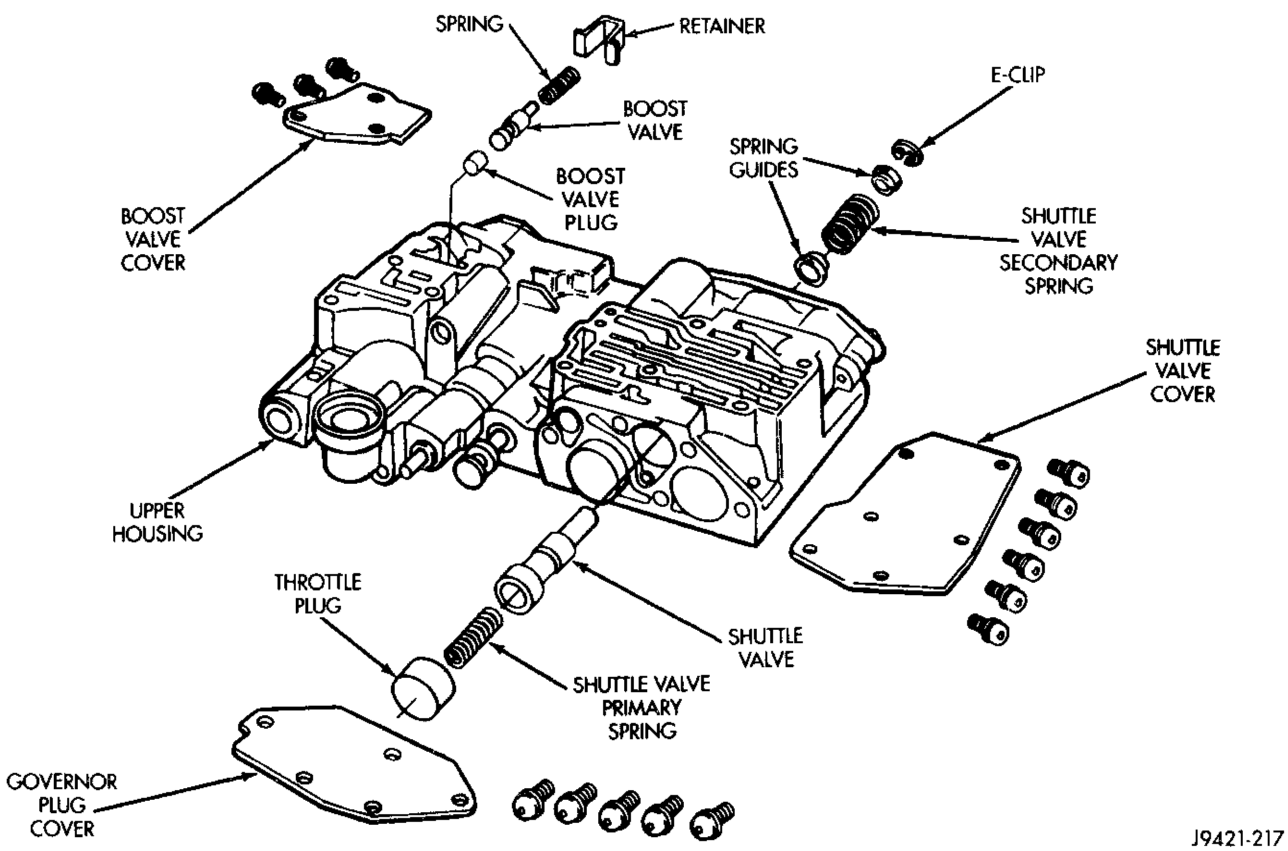

Fig. 70 Shuttle And Boost Valve Components

Mopar AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(6) Remove throttle plug and 1-2 and 2-3 governor plugs (Fig. 57).

(7) Turn upper housing around and remove limit valve and shift valve covers (Fig. 71).

(8) Remove limit valve housing. Then remove retainer, spring, limit valve, and 2-3 throttle plug from limit valve housing (Fig. 71).

(9) Remove 1-2 shift control valve and spring (Fig. 71).

(10) Remove 1-2 shift valve and spring (Fig. 71).

(11) Remove 2-3 shift valve and spring from valve body (Fig. 71).

(12) Remove pressure plug cover (Fig. 71).

(13) Remove line pressure plug, sleeve, throttle pressure plug and spring (Fig. 71).

VALVE BODY LOWER HOUSING

(1) Remove timing valve cover.

(2) Remove 3-4 timing valve and spring.

(3) Remove 3-4 quick fill valve, spring and plug.

(4) Remove 3-4 shift valve and spring.

(5) Remove converter clutch valve, spring and plug (Fig. 72).

(6) Remove converter clutch timing valve, retainer and valve spring.

3-4 ACCUMULATOR HOUSING

(1) Remove end plate from housing.

(2) Remove piston spring.

(3) Remove piston. Remove and discard piston seals (Fig. 73).

ASSEMBLY

CAUTION: Do not force valves or plugs into place during reassembly. If the valve body bores, valves and plugs are free of distortion or burrs, the valve body components should all slide into place easily. In addition, do not overtighten the transfer plate and valve body screws during reassembly. Overtightening can distort the housings resulting in valve sticking, cross leakage and unsatisfactory operation. Tighten valve body screws to recommended torque only.

LOWER HOUSING

(1) Lubricate valves, springs, and the housing valve and plug bores with clean transmission fluid (Fig. 72).

(2) Install 3-4 timing valve spring and valve in lower housing.

(3) Install 3-4 quick fill valve in lower housing.

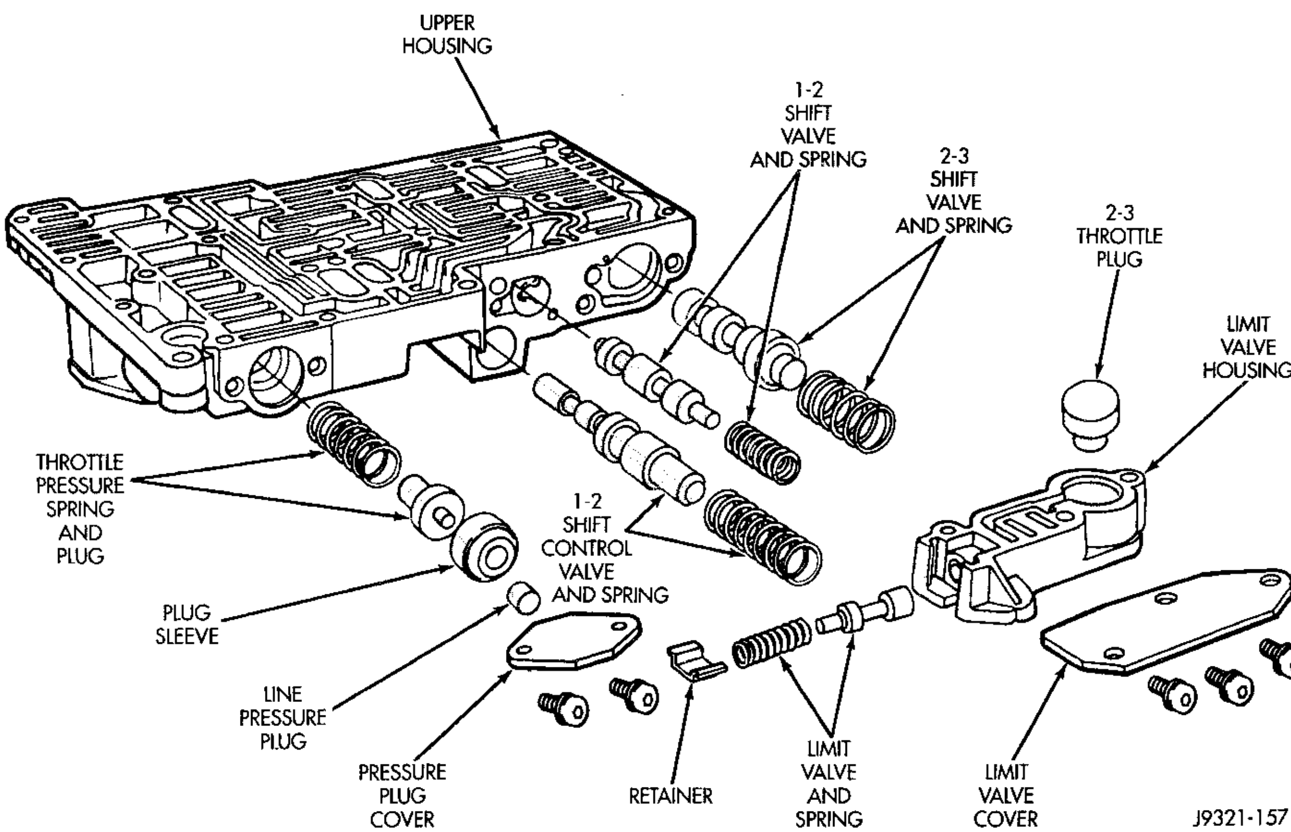

Fig. 71 Upper Housing Shift Valve And Pressure Plug Locations

DISASSEMBLY AND ASSEMBLY (Continued)

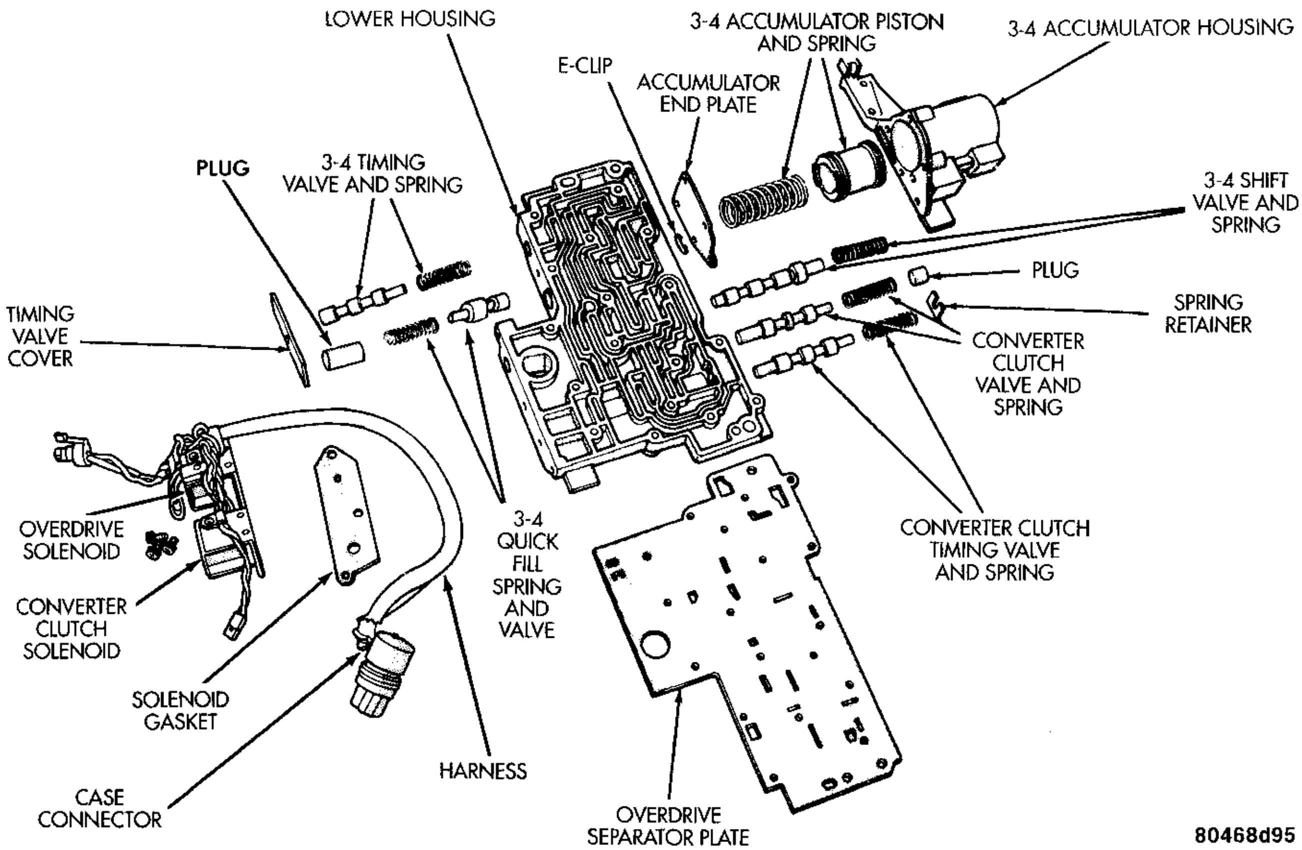

Fig. 72 Lower Housing Shift Valves And Springs

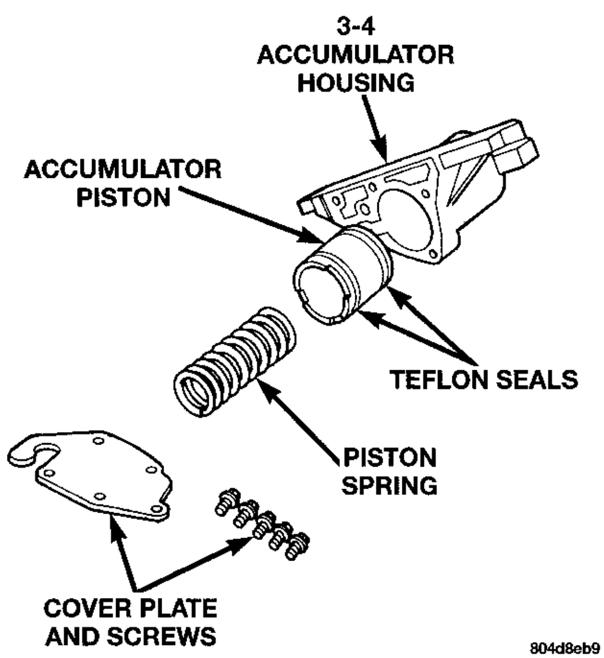

Fig. 73 Accumulator Housing Components

(4) Install 3-4 quick fill valve spring and plug in housing.

(5) Install timing valve end plate. Tighten end plate screws to 4 N·m (35 in. lbs.) torque.

3-4 ACCUMULATOR

(1) Lubricate accumulator piston, seals and housing piston bore with clean transmission fluid (Fig. 73).

(2) Install new seal rings on accumulator piston.

(3) Install piston and spring in housing.

(4) Install end plate on housing.

DISASSEMBLY AND ASSEMBLY (Continued)

TRANSFER PLATE

(1) Install rear clutch and rear servo check balls in transfer plate (Fig. 74).

(2) Install filter screen in upper housing separator plate (Fig. 75).

(3) Align and position upper housing separator plate on transfer plate (Fig. 76).

(4) Install brace plate (Fig. 76). Tighten brace attaching screws to 4 N·m (35 in. lbs.) torque.

(5) Install remaining separator plate attaching screws. Tighten screws to 4 N·m (35 in. lbs.) torque.

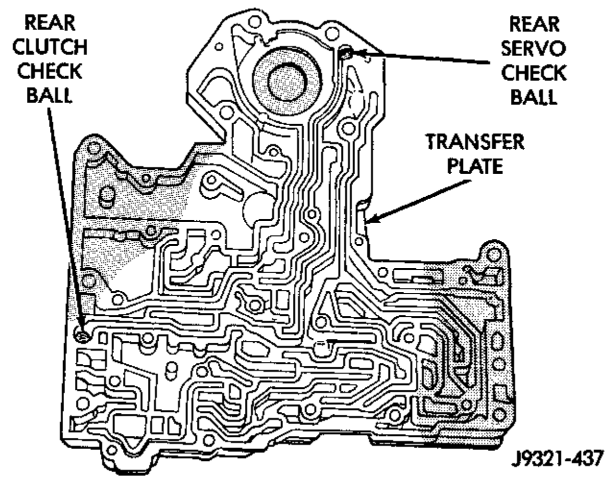

Fig. 74 Rear Clutch And Rear Servo Check Ball Locations

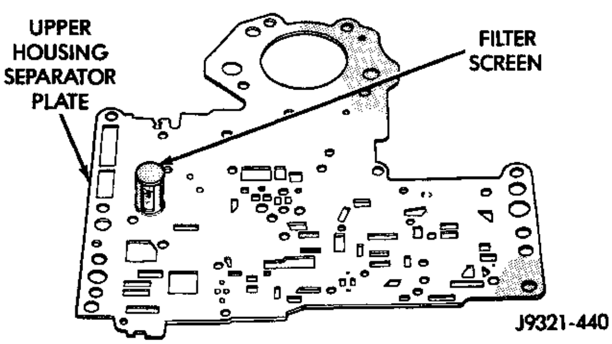

Fig. 75 Separator Plate Filter Screen Installation

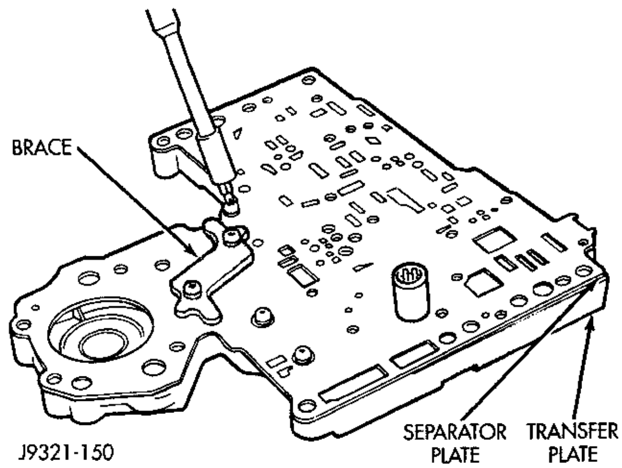

Fig. 76 Brace Plate

UPPER AND LOWER HOUSING

(1) Position upper housing so internal passages and check ball seats are facing upward. Then install check balls in housing (Fig. 77). Eight check balls are used. The single large check ball is approximately 8.7 mm (11/32 in.) diameter. The single small check ball is approximately 4.8 mm (3/16 in.) in diameter. The remaining 6 check balls are approximately 6.3 mm (1/4 in.) in diameter.

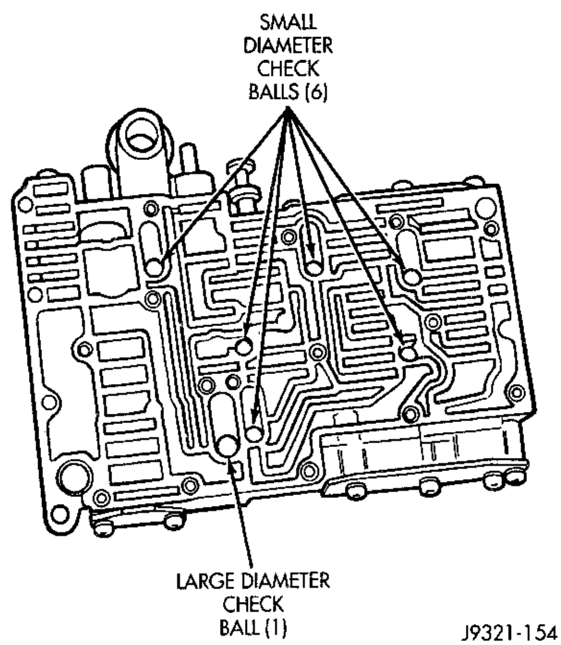

Fig. 77 Check Ball Locations In Upper Housing

DISASSEMBLY AND ASSEMBLY (Continued)

(2) Position assembled transfer plate and upper housing separator plate on upper housing (Fig. 78). Be sure filter screen is seated in proper housing recess.

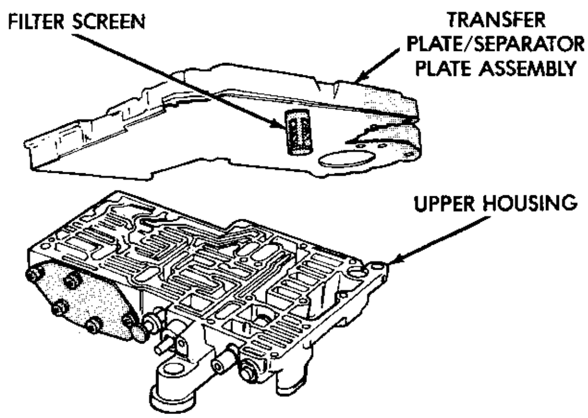

Fig. 78 Installing Transfer Plate On Upper Housing

(3) Install the ECE check ball into the transfer plate (Fig. 64). The ECE check ball is approximately 4.8 mm (3/16 in.) in diameter.

(4) Position lower housing separator plate on transfer plate (Fig. 79).

(5) Install lower housing on assembled transfer plate and upper housing (Fig. 80).

(6) Install and start all valve body screws by hand except for the screws to hold the boost valve tube brace. Save those screws for later installation. Then tighten screws evenly to 4 N·m (35 in. lbs.) torque. Start at center and work out to sides when tightening screws (Fig. 80).

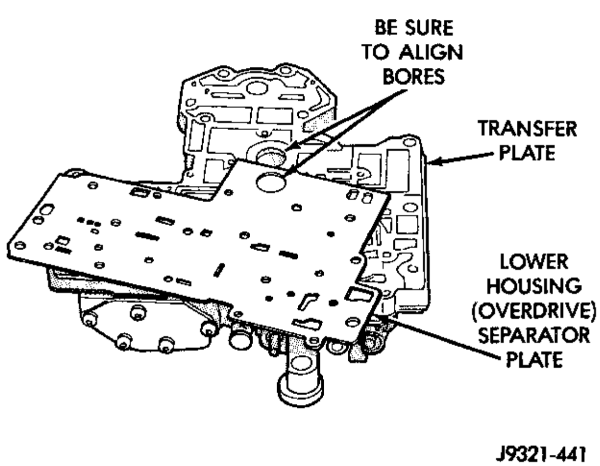

Fig. 79 Lower Housing Separator Plate

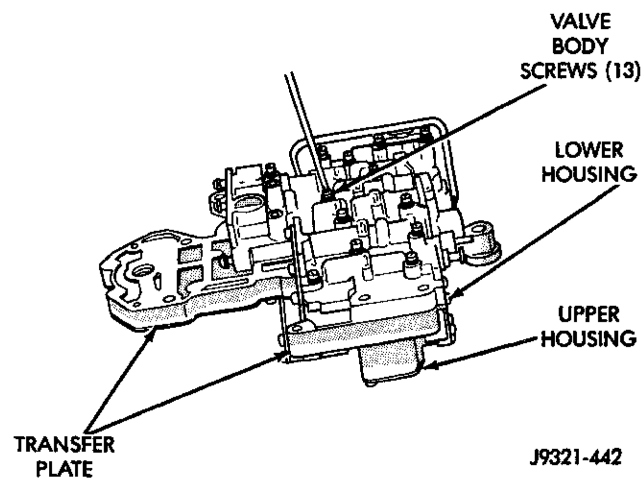

Fig. 80 Installing Lower Housing On Transfer Plate And Upper Housing

UPPER HOUSING VALVE AND PLUG

Refer to (Fig. 81), (Fig. 82) and (Fig. 83) to perform the following steps.

(1) Lubricate valves, plugs, springs with clean transmission fluid.

(2) Assemble regulator valve line pressure plug, sleeve, throttle plug and spring. Insert assembly in upper housing and install cover plate. Tighten cover plate screws to 4 N·m (35 in. lbs.) torque.

(3) Install 1-2 and 2-3 shift valves and springs.

(4) Install 1-2 shift control valve and spring.

(5) Install retainer, spring, limit valve, and 2-3 throttle plug from limit valve housing.

(6) Install limit valve housing and cover plate. Tighten screws to 4 N·m (35 in. lbs.).

(7) Install shuttle valve as follows:

(a) Insert plastic guides in shuttle valve secondary spring and install spring on end of valve.

(b) Install shuttle valve into housing.

(c) Hold shuttle valve in place.

(d) Compress secondary spring and install E-clip in groove at end of shuttle valve.

(e) Verify that spring and E-clip are properly seated before proceeding.

(8) Install shuttle valve cover plate. Tighten cover plate screws to 4 N·m (35 in. lbs.) torque.

(9) Install 1-2 and 2-3 valve governor plugs in valve body.

(10) Install shuttle valve primary spring and throttle plug.

(11) Align and install governor plug cover. Tighten cover screws to 4 N·m (35 in. lbs.) torque.

Mopar AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

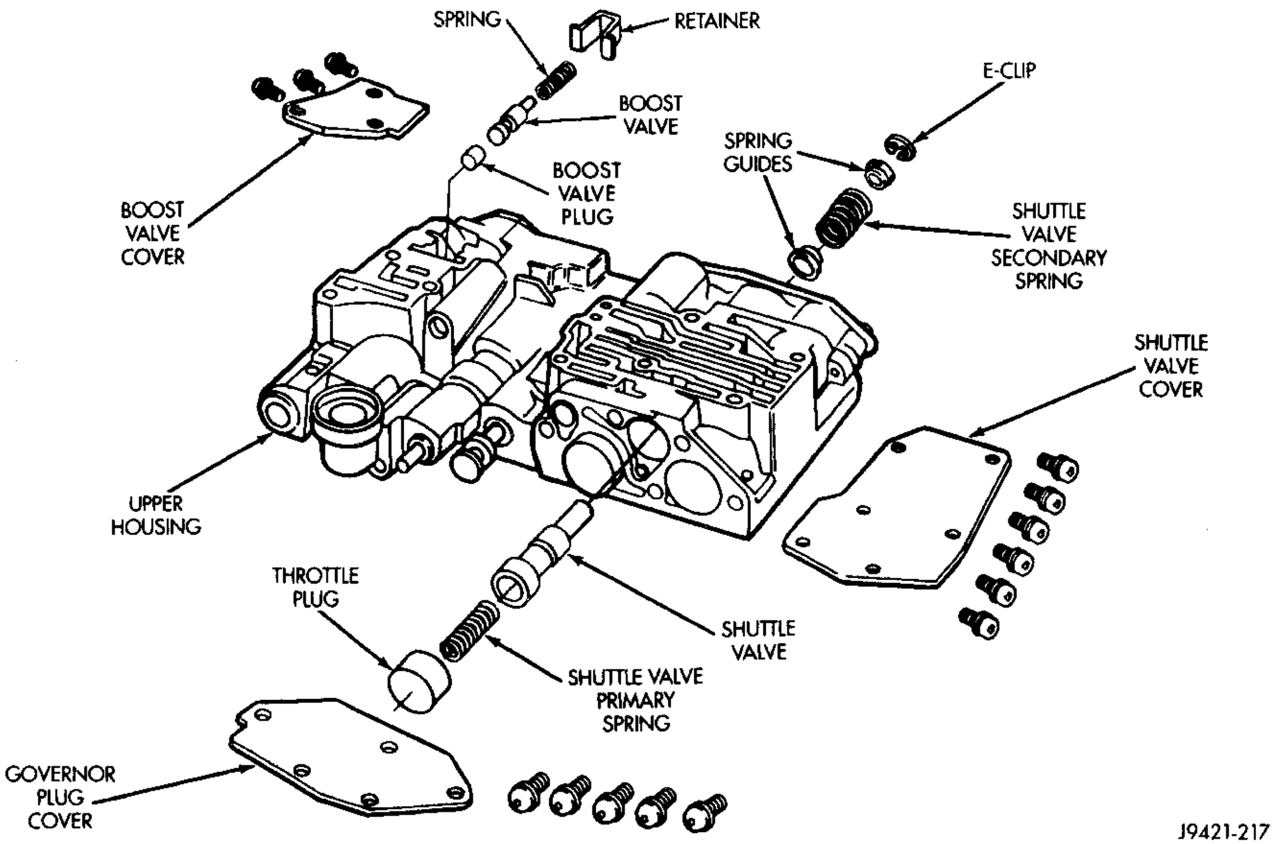

Fig. 81 Shuttle And Boost Valve Components

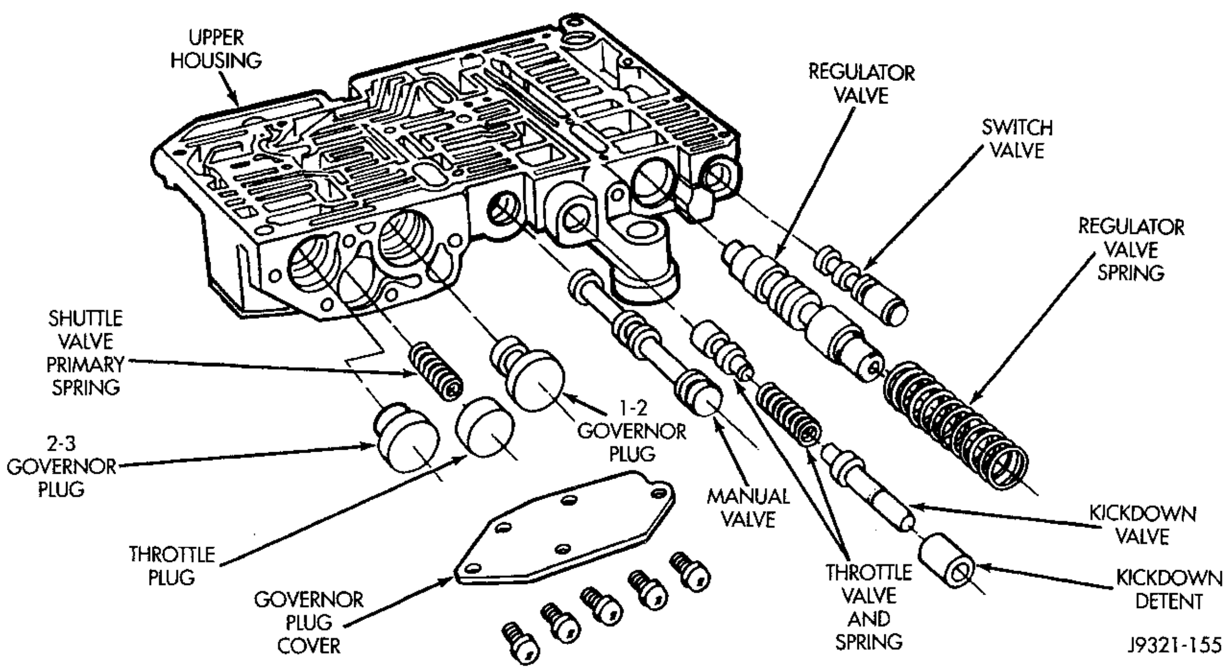

Fig. 82 Upper Housing Control Valve Locations

DISASSEMBLY AND ASSEMBLY (Continued)

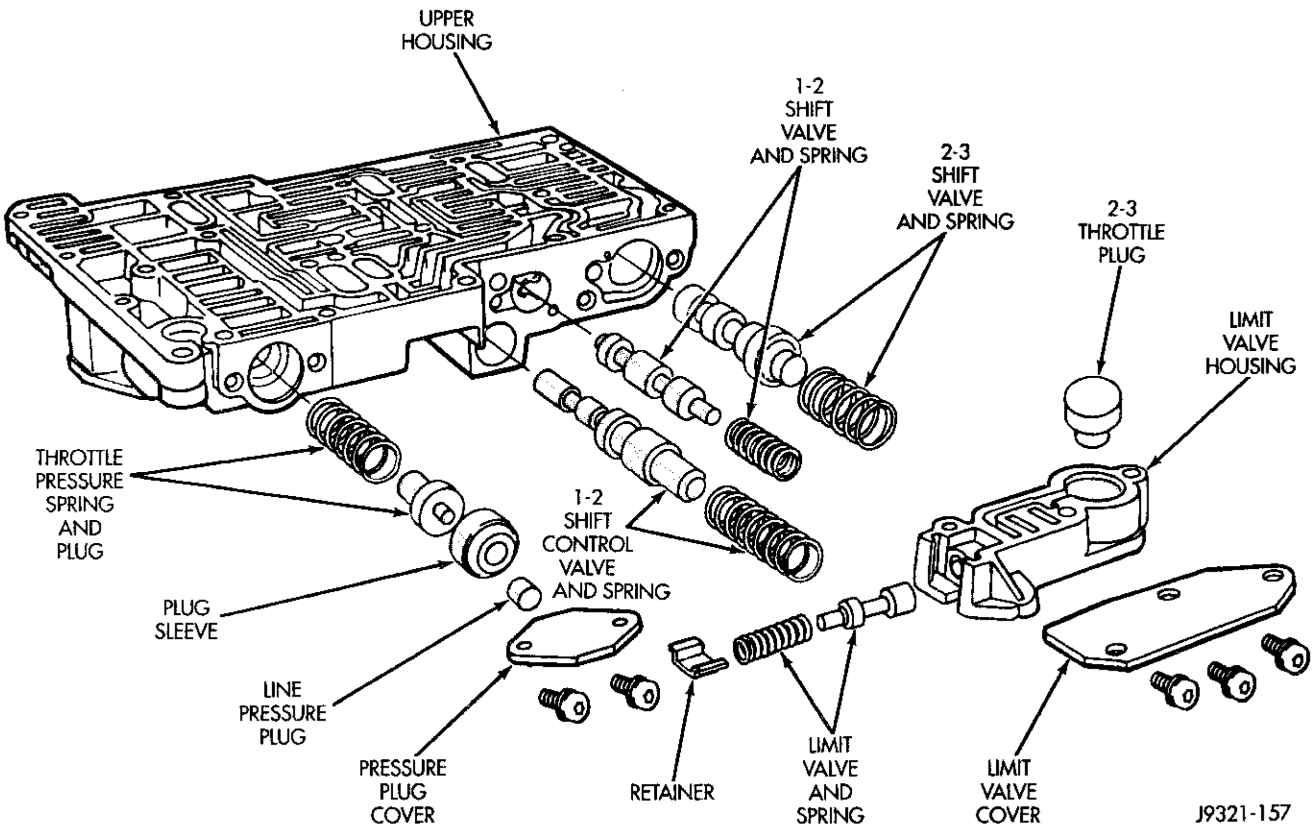

Fig. 83 Upper Housing Shift Valve And Pressure Plug Locations

BOOST VALVE TUBE AND BRACE

(1) Position valve body assembly so lower housing is facing upward (Fig. 84).

(2) Lubricate tube ends and housing ports with transmission fluid or petroleum jelly.

(3) Start tube in lower housing port first. Then swing tube downward and work opposite end of tube into upper housing port (Fig. 84).

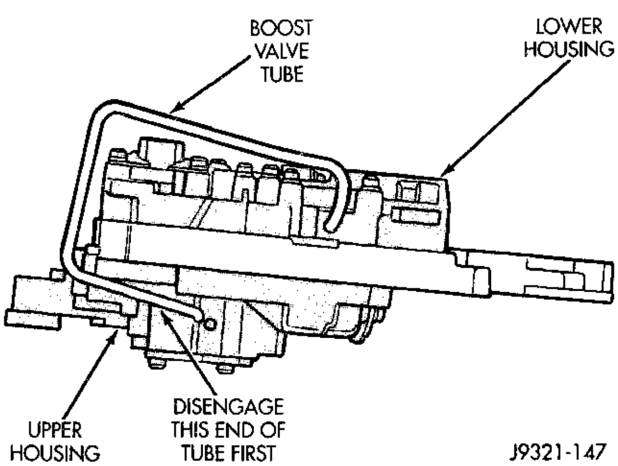

Fig. 84 Boost Valve Tube

(4) Insert and seat each end of tube in housings.

(5) Slide tube brace under tube and into alignment with valve body screw holes (Fig. 85).

(6) Install and finger tighten three screws that secure tube brace to valve body housings (Fig. 85).

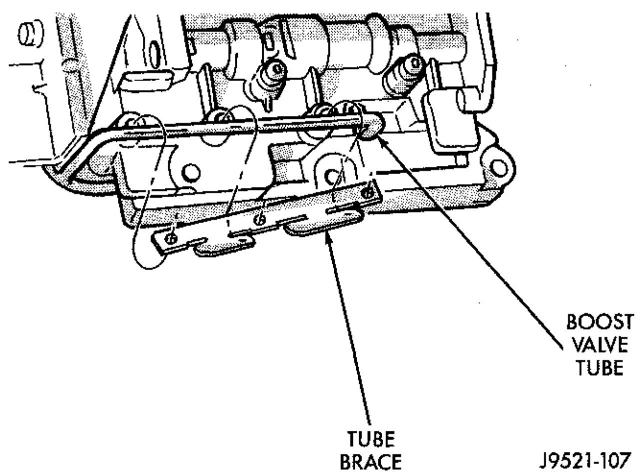

Fig. 85 Boost Valve Tube And Brace

Mopar AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(7) Bend tube brace tabs up and against tube to hold it in position (Fig. 86).

(8) Tighten all valve body housing screws to 4 N·m (35 in. lbs.) torque after tube and brace are installed. Tighten screws in diagonal pattern starting at center and working outward.

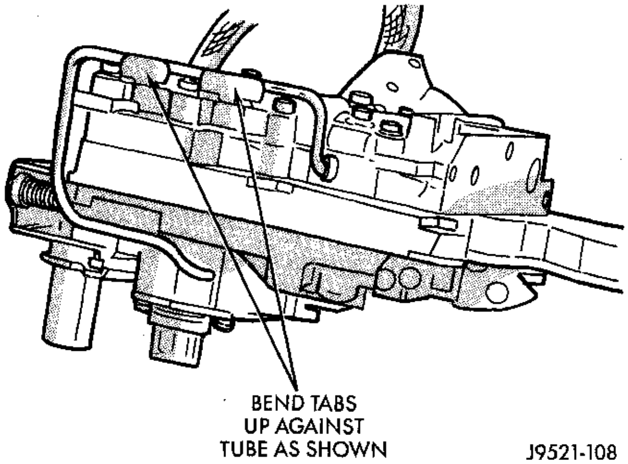

Fig. 86 Securing Boost Valve Tube With Brace Tabs

3-4 ACCUMULATOR

(1) Position converter clutch valve and 3-4 shift valve springs in housing (Fig. 87).

(2) Loosely attach accumulator housing with right-side screw (Fig. 87). Install only one screw at this time as accumulator must be free to pivot upward for ease of installation.

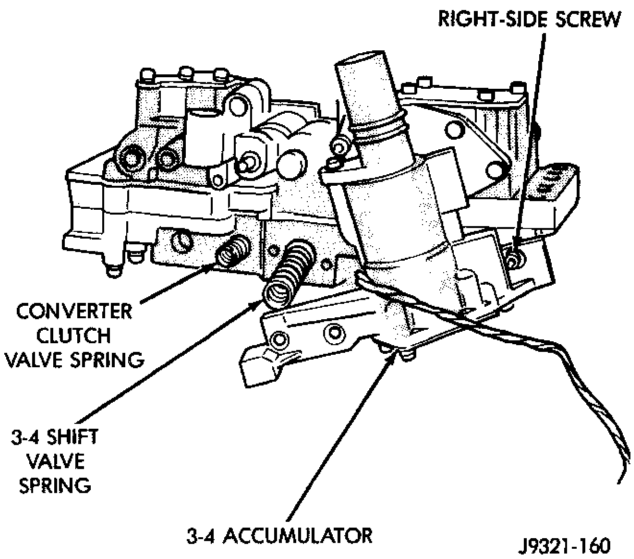

Fig. 87 Converter Clutch And 3-4 Shift Valve Springs

(3) Install 3-4 shift valve and spring.

(4) Install converter clutch timing valve and spring.

(5) Position plug on end of converter clutch valve spring. Then compress and hold springs and plug in place with fingers of one hand.

(6) Swing accumulator housing upward over valve springs and plug.

(7) Hold accumulator housing firmly in place and install remaining two attaching screws. Be sure springs and clutch valve plug are properly seated (Fig. 88). Tighten screws to 4 N·m (35 in. lbs.).

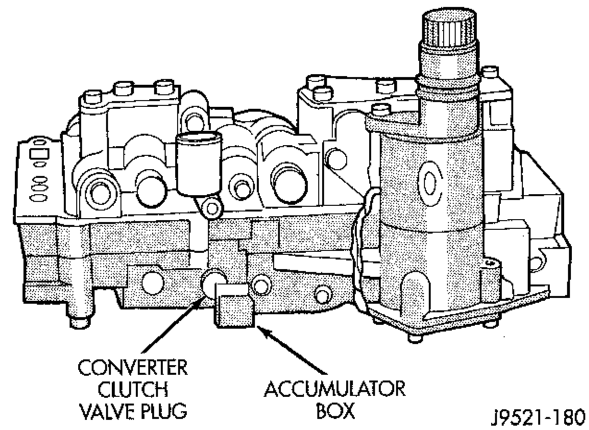

Fig. 88 Seating 3-4 Accumulator On Lower Housing

VALVE BODY FINAL

(1) Install boost valve, valve spring, retainer and cover plate. Tighten cover plate screws to 4 N·m (35 in. lbs.) torque.

(2) Insert manual lever detent spring in upper housing.

(3) Position detent ball on end of spring. Then hold detent ball and spring in detent housing with Retainer Tool 6583 (Fig. 89).

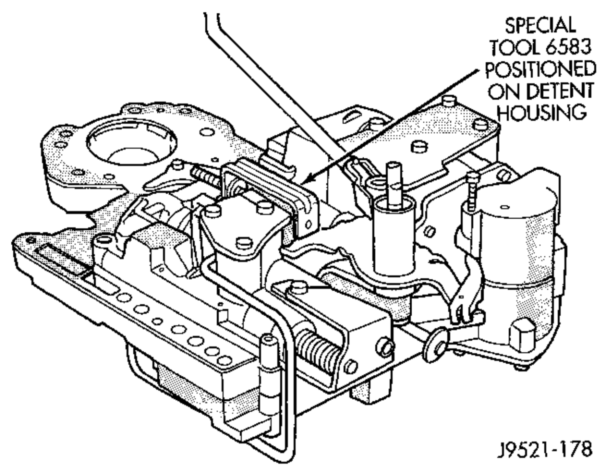

Fig. 89 Detent Ball Spring

(4) Install throttle lever in upper housing. Then install manual lever over throttle lever and start manual lever into housing.

DISASSEMBLY AND ASSEMBLY (Continued)

(5) Align manual lever with detent ball and manual valve. Hold throttle lever upward. Then press down on manual lever until fully seated. Remove detent ball retainer tool after lever is seated.

(6) Then install manual lever seal, washer and E-clip.

(7) Verify that throttle lever is aligned with end of kickdown valve stem and that manual lever arm is engaged in manual valve (Fig. 90).

(8) Position line pressure adjusting screw in adjusting screw bracket.

(9) Install spring on end of line pressure regulator valve.

(10) Install switch valve spring on tang at end of adjusting screw bracket.

(11) Install manual valve.

(12) Install throttle valve and spring.

(13) Install kickdown valve and detent.

(14) Install pressure regulator valve.

(15) Install switch valve.

(16) Position adjusting screw bracket on valve body. Align valve springs and press bracket into place. Install short, upper bracket screws first and long bottom screw last. Verify that valve springs and bracket are properly aligned. Then tighten all three bracket screws to 4 N·m (35 in. lbs.) torque.

(17) Lubricate solenoid case connector O-rings and shaft of manual lever with light coat of petroleum jelly.

(18) Obtain new fluid filter for valve body but do not install filter at this time.

(19) If line pressure and/or throttle pressure adjustment screw settings were not disturbed, continue with overhaul or reassembly. However, if adjustment screw settings **were** moved or changed, readjust as described in Valve Body Control Pressure Adjustment procedure.

(20) Attach solenoid case connector to 3-4 accumulator with shoulder-type screw. Connector has small locating tang that fits in dimple at top of accumulator housing (Fig. 91). Seat tang in dimple before tightening connector screw.

(21) Install solenoid assembly and gasket. Tighten solenoid attaching screws to 8 N·m (72 in. lbs.) torque.

(22) Verify that solenoid wire harness is properly routed (Fig. 92). **Solenoid harness must be clear of manual lever and park rod and not be pinched between accumulator housing and cover.**

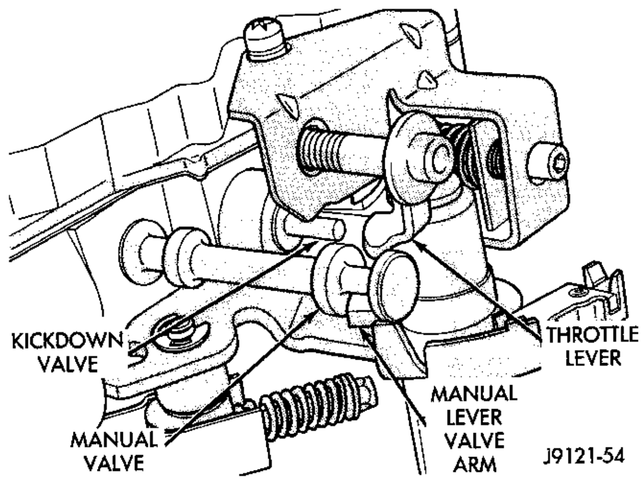

Fig. 90 Manual And Throttle Lever Alignment

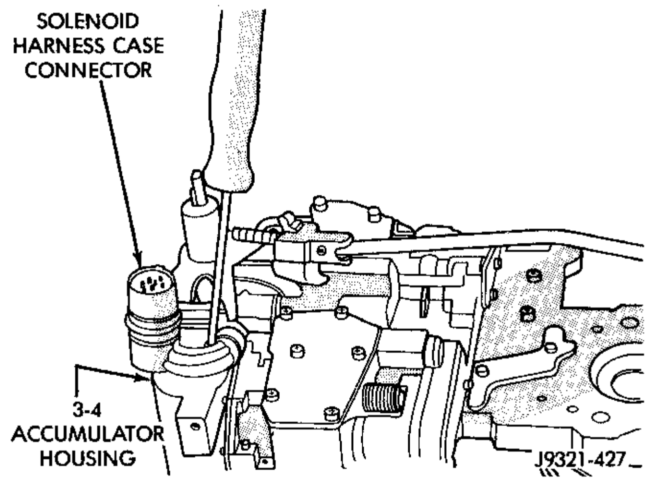

Fig. 91 Solenoid Harness Case Connector Shoulder Bolt

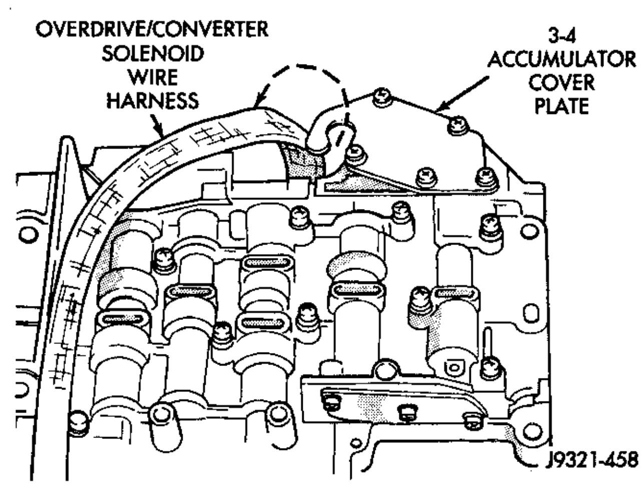

Fig. 92 Solenoid Harness Routing

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

GOVERNOR BODY, SENSOR AND SOLENOID

(1) Turn valve body assembly over so accumulator side of transfer plate is facing down.

(2) Install new O-rings on governor pressure solenoid and sensor (Fig. 93).

(3) Lubricate solenoid and sensor O-rings with clean transmission fluid.

(4) Install governor pressure sensor in governor body. Then secure sensor with M-shaped retaining clip (Fig. 93).

(5) Install governor pressure solenoid in governor body (Fig. 94). Push solenoid in until it snaps into place in body.

(6) Position governor body gasket on transfer plate (Fig. 95).

(7) Install retainer plate on governor body and around solenoid (Fig. 96). Be sure solenoid connector is positioned in retainer cutout.

(8) Align screw holes in governor body and transfer plate. Then install and tighten governor body screws to 4 N·m (35 in. lbs.) torque.

(9) Connect harness wires to governor pressure solenoid and governor pressure sensor (Fig. 97).

(10) Perform Line Pressure and Throttle Pressure adjustments, refer to adjustment section of this group for proper procedures.

(11) Install fluid filter and pan.

(12) Lower vehicle.

(13) Fill transmission with recommended fluid and road test vehicle to verify repair.

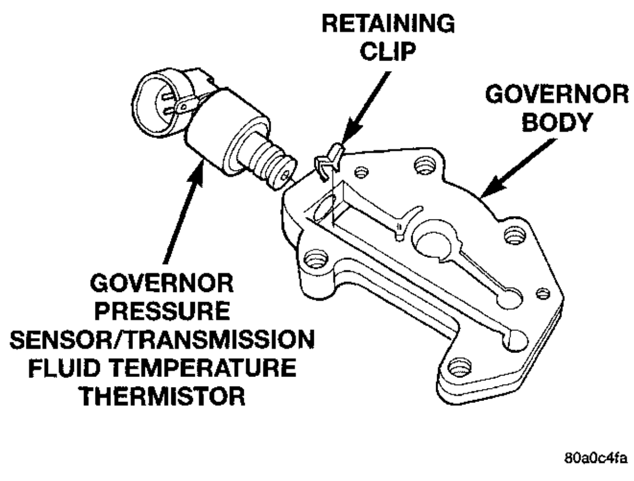

Fig. 93 Governor Pressure Sensor

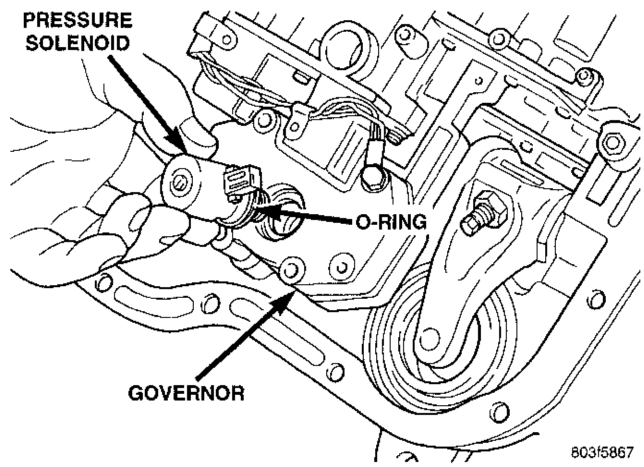

Fig. 94 Governor Pressure Solenoid

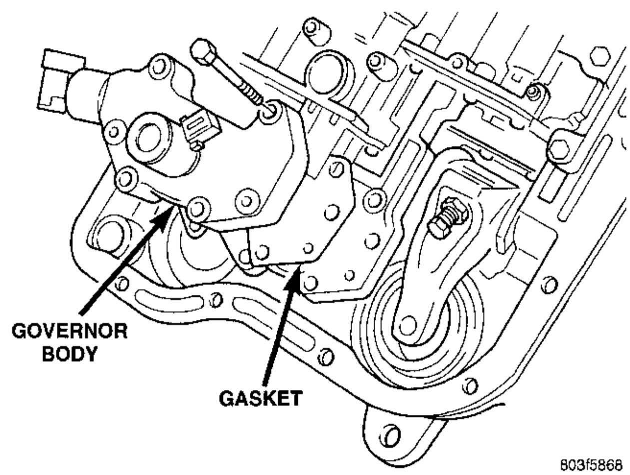

Fig. 95 Governor Body And Gasket

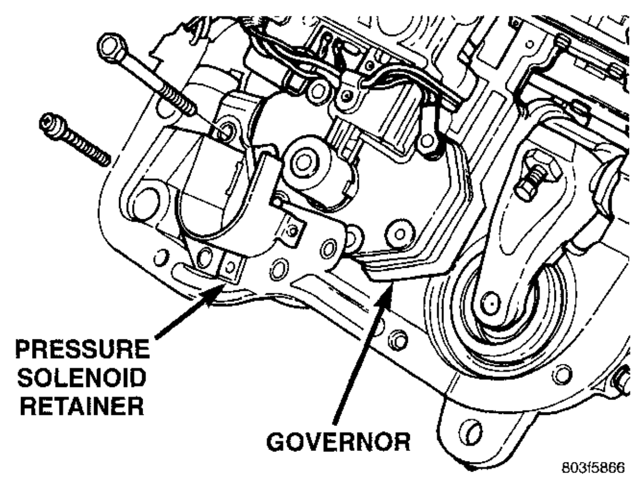

Fig. 96 Pressure Solenoid Retainer

DISASSEMBLY AND ASSEMBLY (Continued)

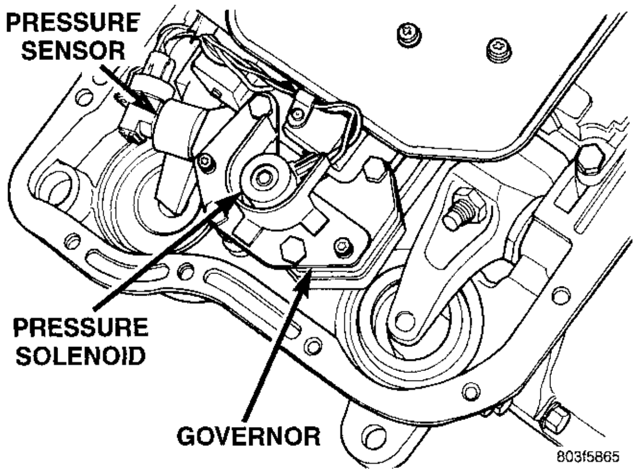

Fig. 97 Governor Pressure Sensor And Solenoid Connectors

TRANSMISSION

DISASSEMBLY

(1) Drain fluid from transmission.

(2) Clean exterior of transmission with suitable solvent or pressure washer.

(3) Remove torque converter from front of transmission.

(4) Remove throttle and shift levers from valve body manual shaft and throttle lever shaft.

(5) Place transmission in vertical position.

(6) Measure and record the input shaft end-play measurement.

(7) Mount transmission in repair stand C-3750-B or similar type stand (Fig. 98).

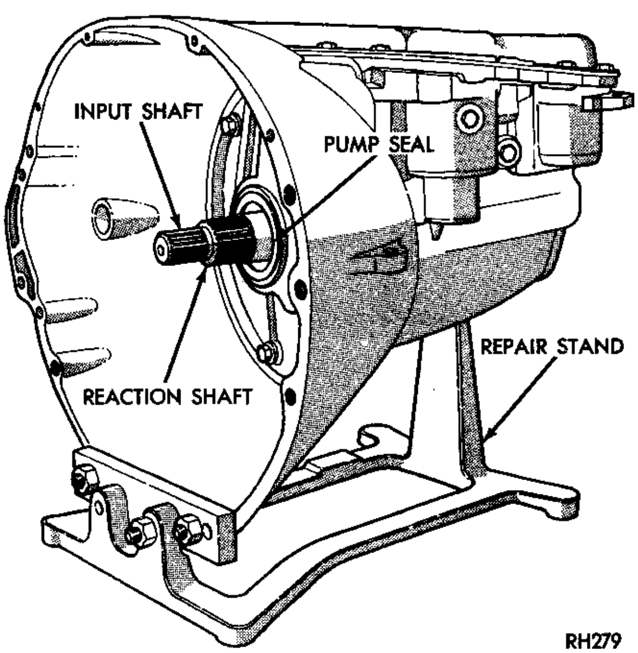

Fig. 98 Repair Stand

(8) Remove fluid pan and filter.

(9) Remove park/neutral position switch and seal (Fig. 99).

(10) Remove valve body and electronic governor.

(11) Remove accumulator outer spring, piston and inner spring (Fig. 100). Note position of piston and springs for assembly reference. Remove and discard piston seals if worn or cut.

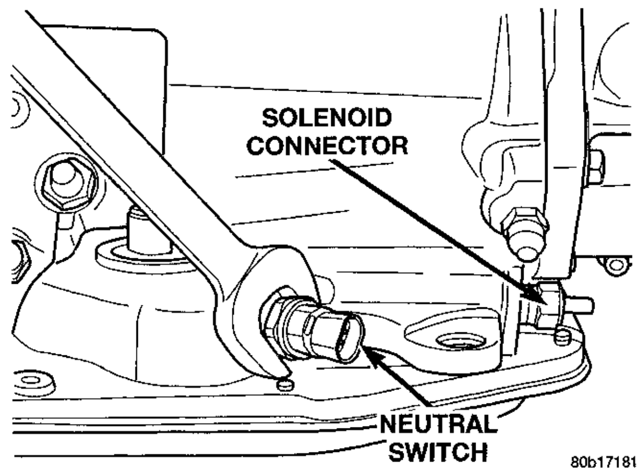

Fig. 99 Park/Neutral Position Switch

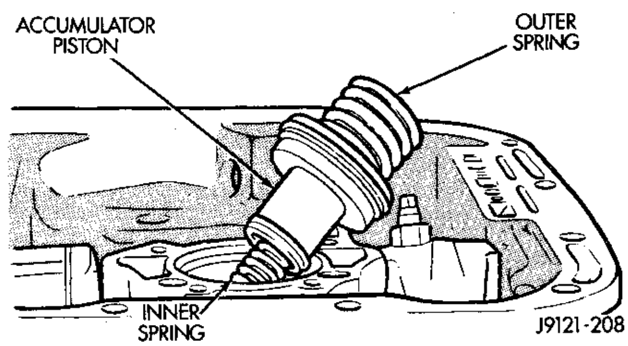

Fig. 100 Accumulator Component Removal

(12) Remove pump oil seal with suitable pry tool or slide-hammer mounted screw.

mopar AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(13) Remove front band lever pin access plug (Fig. 101). Use square end of 1/4 in. drive extension to remove plug as shown.

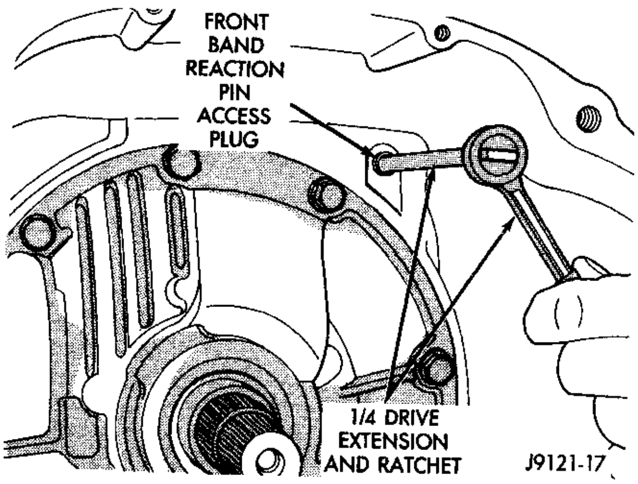

Fig. 101 Front Band Lever Pin Access Plug

(14) Remove oil pump and reaction shaft support assembly as follows:

(a) Tighten front band adjusting screw until band is tight around front clutch retainer (Fig. 102). This will prevent retainer from coming out with pump and possibly damaging clutch or pump components.

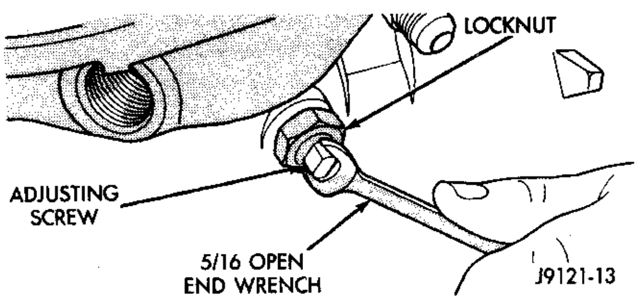

Fig. 102 Tightening Front Band To Hold Front Clutch In Place

(b) Remove oil pump bolts.

(c) Thread Slide Hammer Tools C-3752 into threaded holes in flange of oil pump housing (Fig. 103).

(d) Remove oil pump and reaction shaft support by bumping slide hammers outward alternately to pull pump from case (Fig. 104).

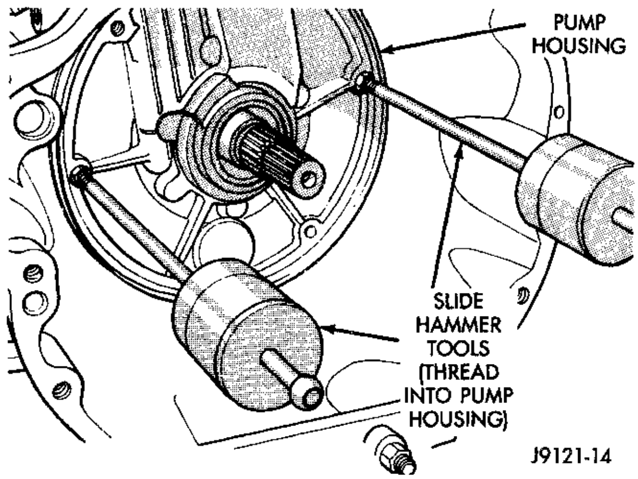

Fig. 103 Oil Pump Removal Tools

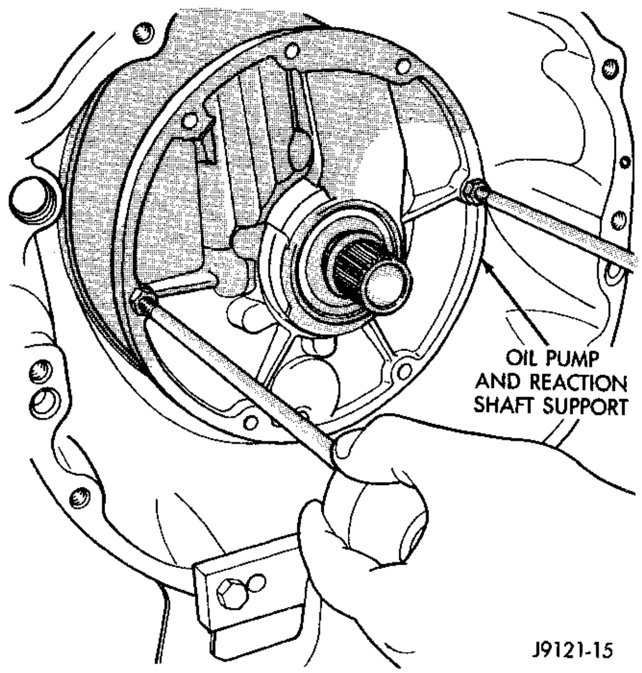

Fig. 104 Oil Pump Removal

DISASSEMBLY AND ASSEMBLY (Continued)

(15) Remove oil pump gasket (Fig. 105). Note gasket position in case for assembly reference.

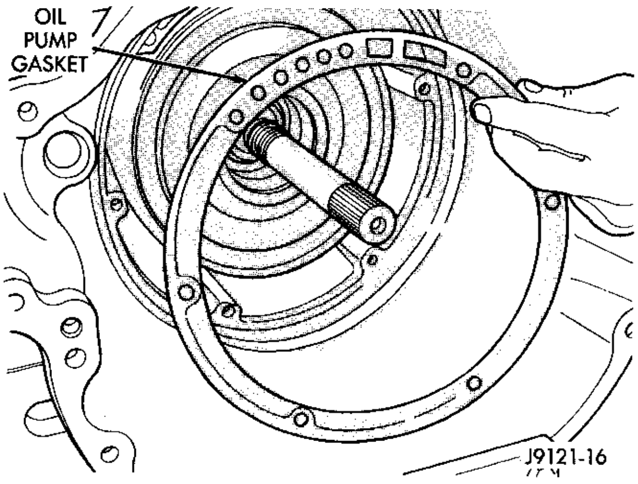

Fig. 105 Oil Pump Gasket

(16) Loosen front band adjusting screw until band is completely loose.

(17) Remove front band strut and anchor (Fig. 106).

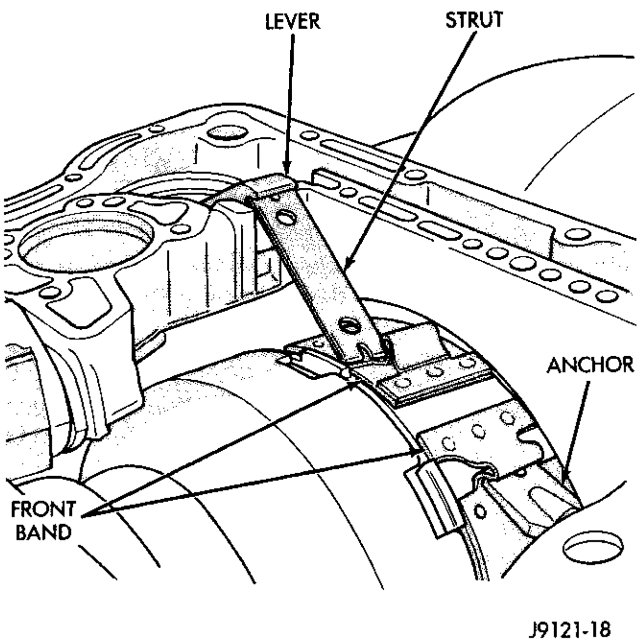

Fig. 106 Front Band Linkage

(18) Squeeze front band together slightly and slide band over front clutch retainer and out of case (Fig. 107).

(19) Remove front and rear clutch assemblies as a unit (Fig. 108).

(20) Remove front band reaction pin and lever. Start pin through lever and out of case bore with drift or punch. Then use pencil magnet to withdraw pin completely (Fig. 109).

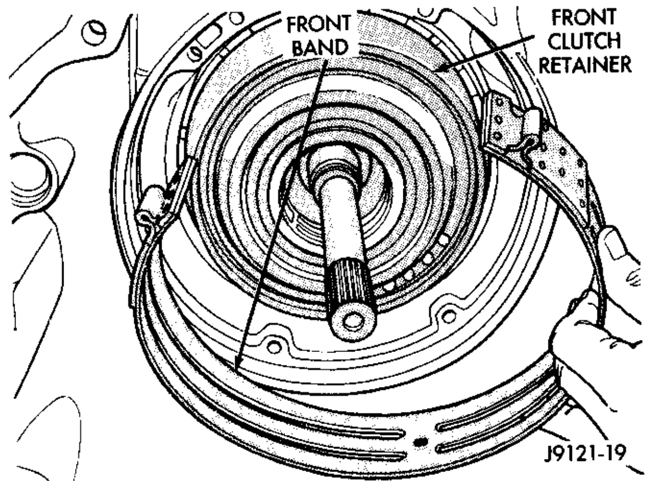

Fig. 107 Front Band

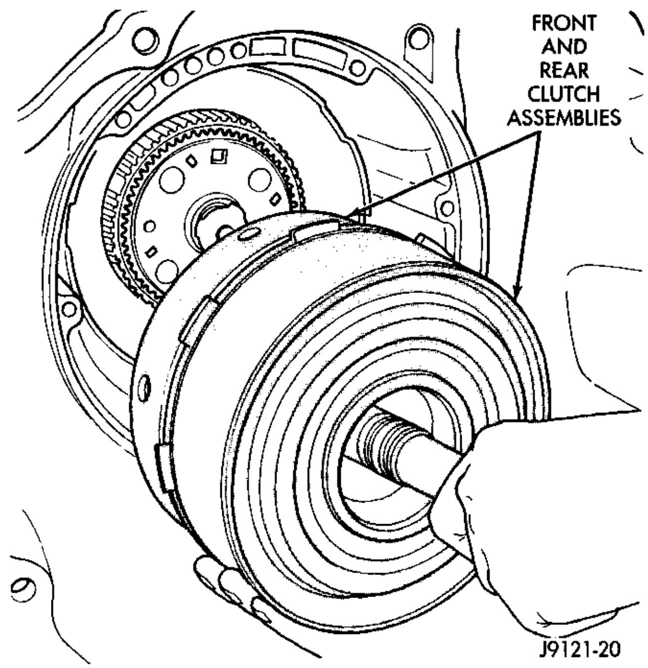

Fig. 108 Removing Front/Rear Clutch Assemblies

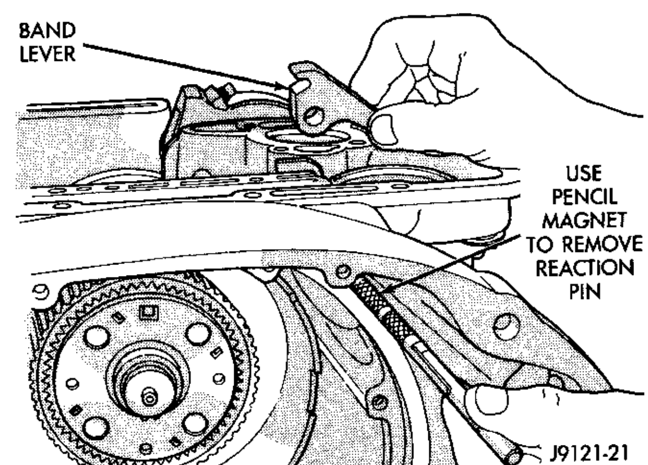

Fig. 109 Front Band Lever And Pin

DISASSEMBLY AND ASSEMBLY (Continued)

(21) Remove intermediate shaft thrust washer. Triangular shaped washer will either be on shaft pilot hub or in rear clutch retainer (Fig. 110).

(22) Remove thrust plate from intermediate shaft hub (Fig. 111).

(23) Remove intermediate shaft-planetary geartrain assembly (Fig. 112).

(24) If overdrive unit is not to be serviced, install Alignment Shaft 6227-2 into the overdrive unit to prevent misalignment of the overdrive clutches during service of main transmission components.

(25) Loosen rear band locknut and loosen adjusting screw 3-4 turns.

(26) Remove snap ring that retains low-reverse drum on overdrive piston retainer hub (Fig. 113).

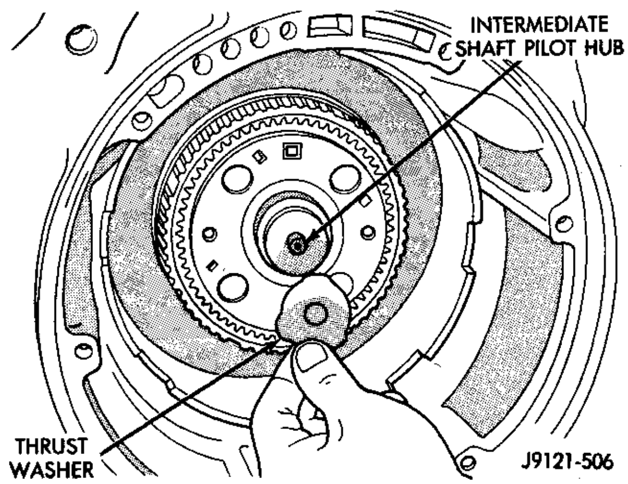

Fig. 110 Intermediate Shaft Thrust Washer

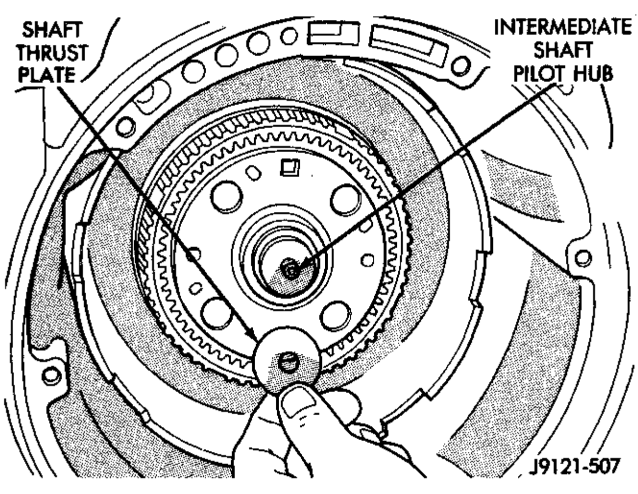

Fig. 111 Intermediate Shaft Thrust Plate

(27) Slide low-reverse drum and thrust washer off piston retainer hub and out of rear band (Fig. 114).

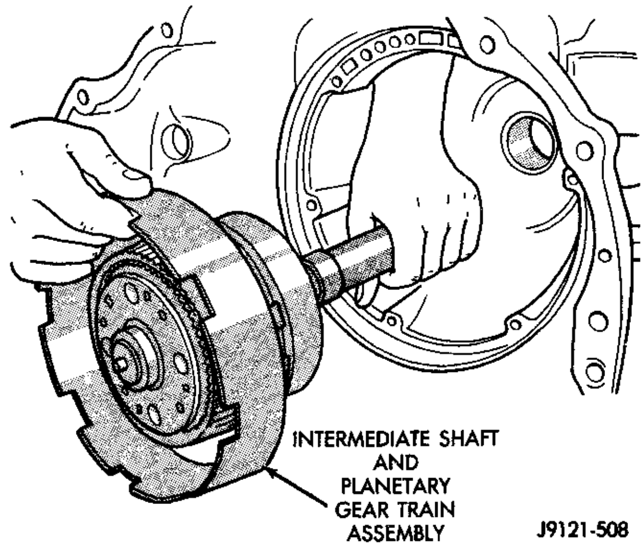

Fig. 112 Intermediate Shaft And Planetary Geartrain

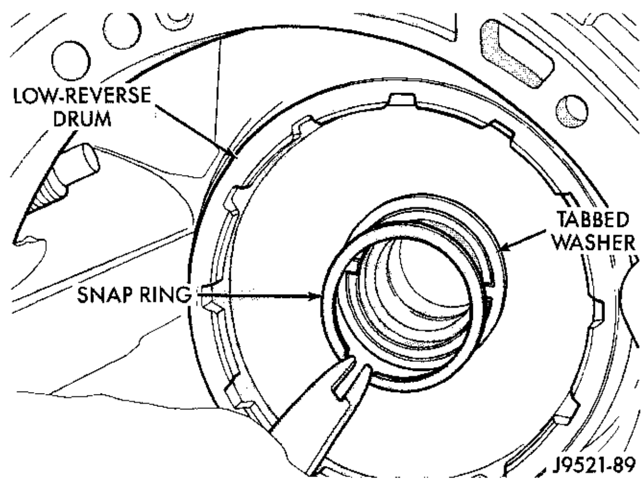

Fig. 113 Low-Reverse Drum Snap Ring

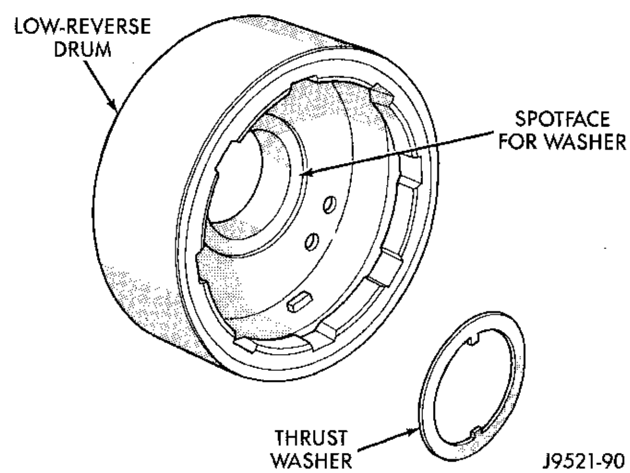

Fig. 114 Low-Reverse Drum And Thrust Washer

DISASSEMBLY AND ASSEMBLY (Continued)

(28) Note that overrunning clutch race will remain on splines of low-reverse drum after removal (Fig. 115). **The race is a permanent press fit on the hub splines. Do not attempt to remove the race.**

(29) Remove overrunning clutch assembly (Fig. 116). Assembly can be removed without displacing rollers and springs if care is exercised. Note position of rollers and springs for assembly reference.

(30) Remove rear band adjusting lever, reaction lever and pin (Fig. 117).

(31) Remove strut from rear band. Keep strut with levers and pin for cleaning, inspection and assembly reference.

(32) Remove rear band and link (Fig. 118).

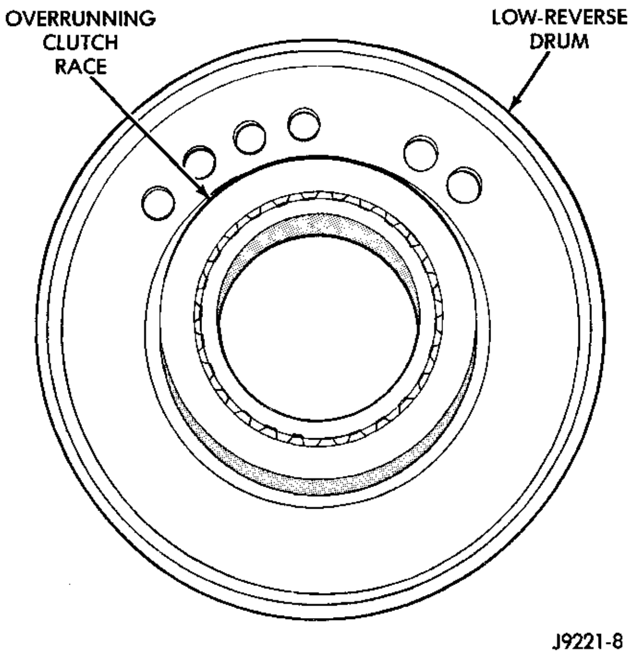

Fig. 115 Overrunning Clutch Race Position On Low-Reverse Drum

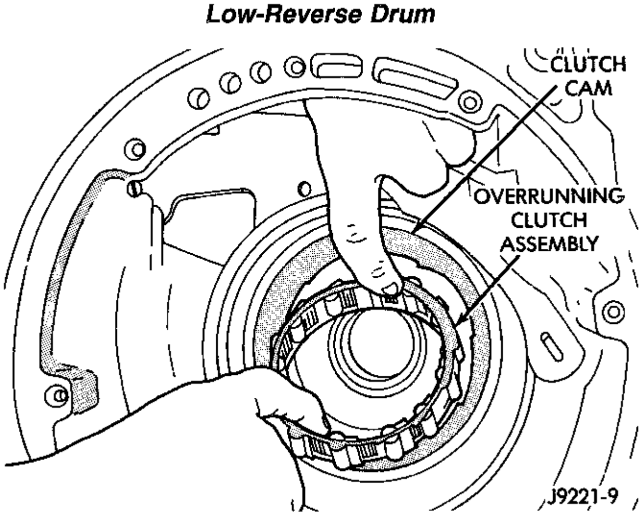

Fig. 116 Overrunning Clutch

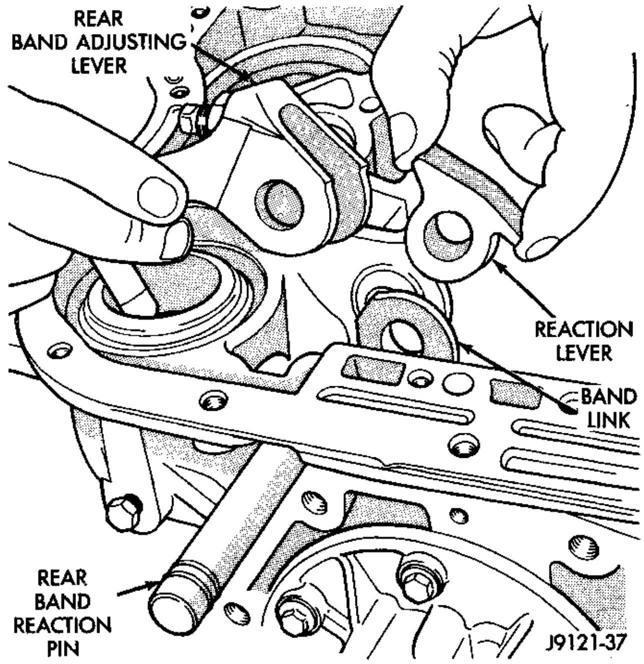

Fig. 117 Rear Band Levers And Pins

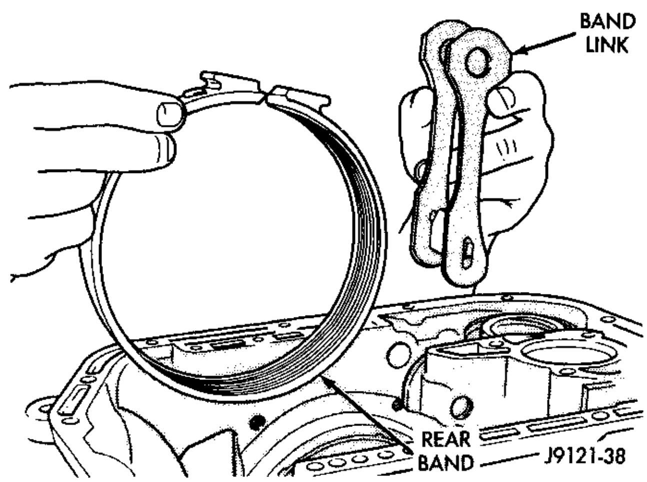

Fig. 118 Rear Band And Link

DISASSEMBLY AND ASSEMBLY (Continued)

(33) Compress front servo rod guide with large C-clamp and Tool C-4470, or Compressor Tool C-3422-B (Fig. 119). Compress guide only enough to permit snap ring removal (about 1/8 in.).

(34) Remove servo piston snap ring (Fig. 119). Unseat one end of ring. Then carefully work removal tool around back of ring until free of ring groove. **Exercise caution when removing snap ring. Servo bore can be scratched or nicked if care is not exercised.**

(35) Remove tools and remove servo piston and spring.

(36) Compress rear servo piston with C-clamp and Tool C-4470, or Valve Spring Compressor C-3422-B (Fig. 120). Compress servo spring retainer only enough to permit snap ring removal.

(37) Remove servo piston snap ring (Fig. 120). Start one end of ring out of bore. Then carefully work removal tool around back of snap ring until free of ring groove. **Exercise caution when removing snap ring. Servo bore can be scratched or nicked if care is not exercised.**

(38) Remove tools and remove rear servo retainer, spring and piston assembly.

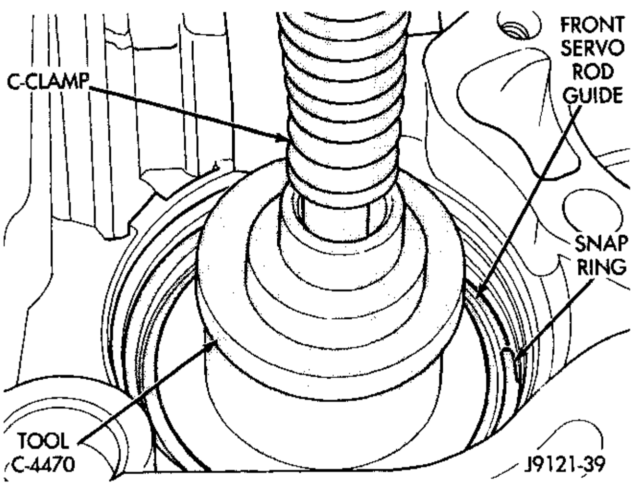

Fig. 119 Front Servo Retaining Snap Ring

ASSEMBLY

Do not allow dirt, grease, or foreign material to enter the case or transmission components during assembly. Keep the transmission case and components clean. Also make sure the tools and workbench area used for reassembly operations are equally clean.

Shop towels used for wiping off tools and your hands must be made from **lint free** materials. Lint will stick to transmission parts and could interfere with valve operation or even restrict fluid passages.

Lubricate transmission clutch and gear components with Mopar® ATF Plus 3, type 7176, during

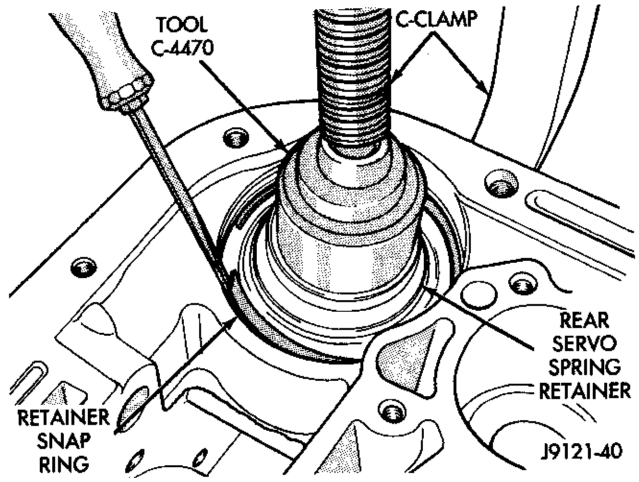

Fig. 120 Rear Servo Retaining Snap Ring

reassembly. Soak clutch discs in transmission fluid before installation.

Use Mopar® Door Ease, or Ru-Glyde on piston seals and O-rings to ease installation. Petroleum jelly can also be used to lubricate and hold thrust washers and plates in position during assembly.

Do not use chassis grease, bearing grease, white grease, or similar lubricants on any part. These types of lubricants can eventually block or restrict fluid passages and valve operation. Use petroleum jelly only.

Do not force parts into place. The transmission components and sub-assemblies are easily installed by hand when properly aligned. If a part seems difficult to install, it is either misaligned or incorrectly assembled. Verify that thrust washers, thrust plates and seal rings are correctly positioned.

The planetary geartrain, front/rear clutch assemblies and oil pump are all much easier to install when the transmission case is upright. Either tilt the case upward with wood blocks, or cut a hole in the bench large enough for the intermediate shaft and rear support. Then lower the shaft and support into the hole and support the rear of the case directly on the bench.

FRONT/REAR SERVO

(1) Lubricate rear servo piston seal with Mopar® Door Ease or ATF Plus 3. Lubricate servo bore in case with ATF Plus 3.

(2) Install rear servo piston in case. Position piston at slight angle to bore and insert piston with twisting motion (Fig. 121).

(3) Install rear servo spring and retainer in case bore (Fig. 122). Be sure spring is seated on piston.

(4) Compress rear servo piston with C-clamp or Valve Spring Compressor C-3422-B and install servo piston snap ring (Fig. 123).

DISASSEMBLY AND ASSEMBLY (Continued)

(5) Lubricate front servo piston components and servo bore in case with transmission fluid.

(6) Install front servo piston in bore. Carefully "run" small, suitable tool around piston ring to press it back into groove and ease installation (Fig. 124). Rotate piston into bore at same time. Rock piston slightly to ease piston ring past snap ring groove and into bore.

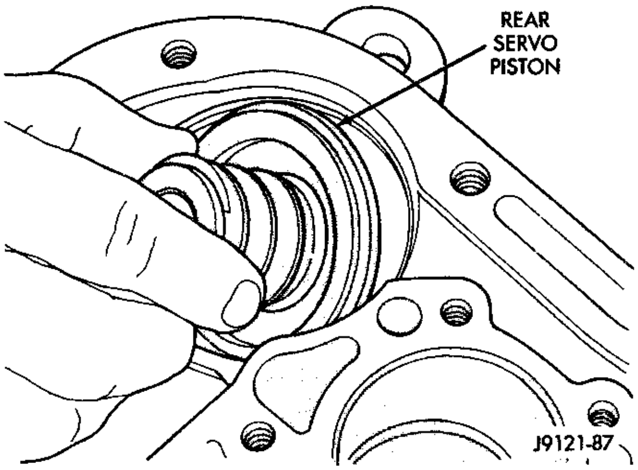

Fig. 121 Rear Servo Piston

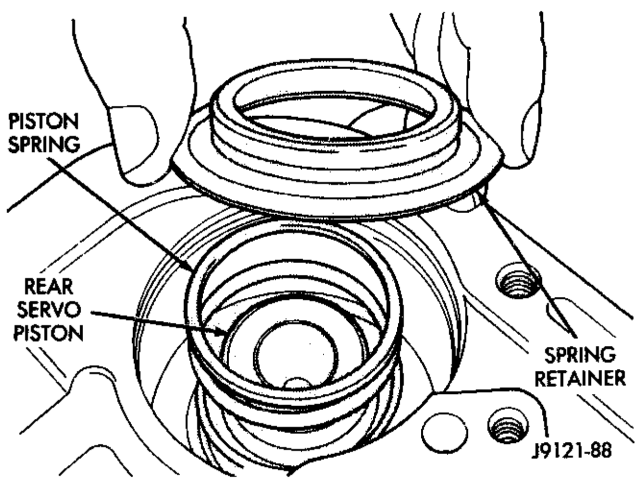

Fig. 122 Rear Servo Piston Spring And Retainer

(7) Bottom front servo piston in bore and install servo spring.

(8) Install front servo piston rod guide as follows:

(a) Place Tool SP-5560 (or similar size tool) on guide and position C-clamp on tool and case (Fig. 125).

(b) Slowly compress rod guide while simultaneously easing seal ring into bore with suitable tool.

(9) Install rod guide snap ring (Fig. 125).

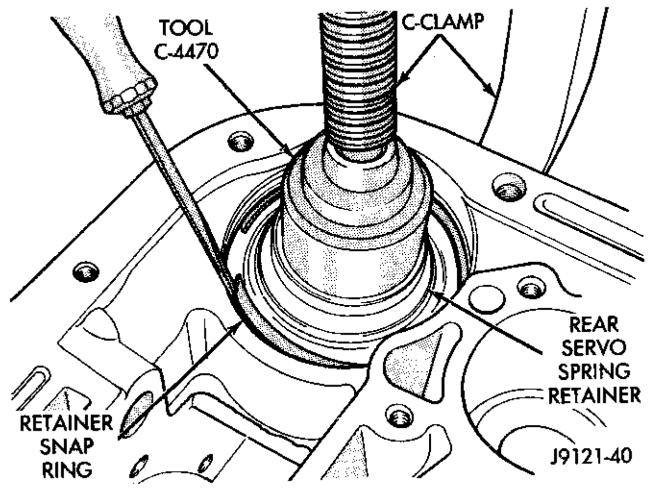

Fig. 123 Rear Servo Snap Ring

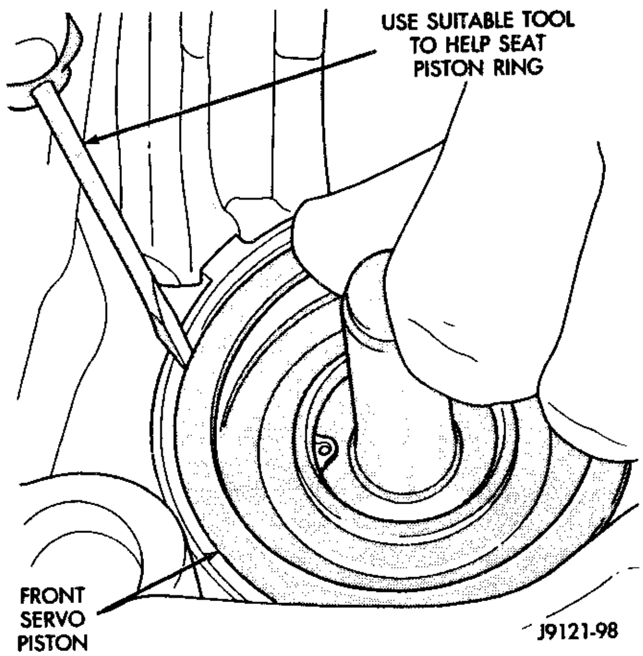

Fig. 124 Front Servo Piston

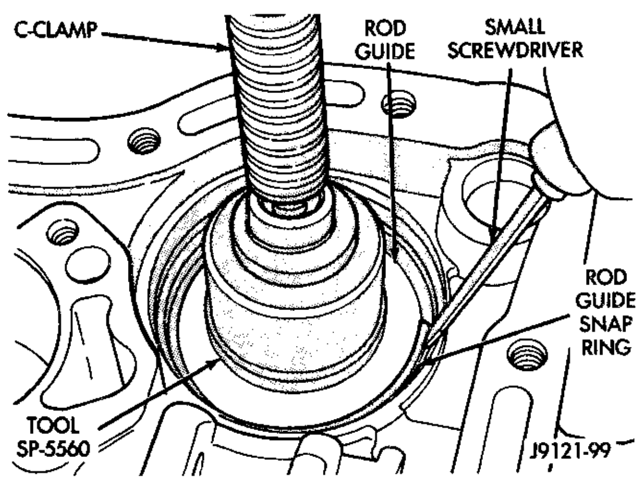

Fig. 125 Front Servo Rod Guide And Snap Ring

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

OVERRUNNING CLUTCH, REAR BAND, AND LOW-REVERSE DRUM

(1) Install overrunning clutch components if not yet installed.

(2) Position rear band and link in case (Fig. 126).

(3) Install low-reverse drum (Fig. 127). Slide drum through rear band, onto piston retainer hub and into engagement with overrunning clutch and race.

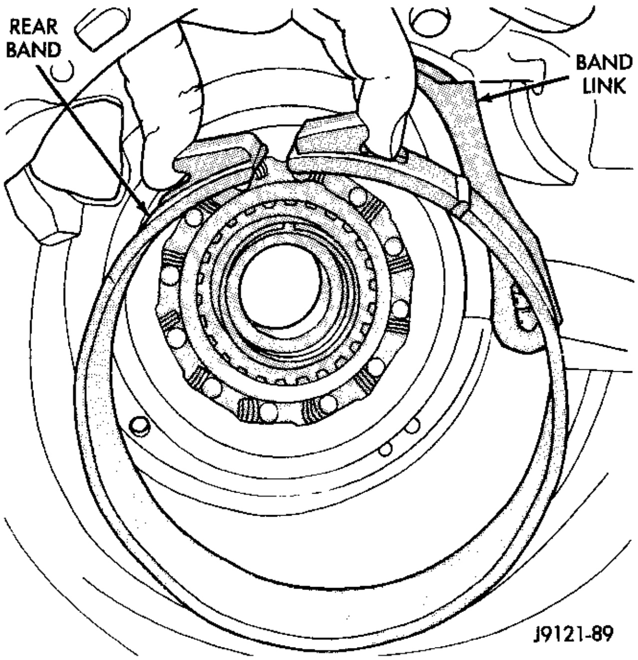

Fig. 126 Rear Band And Link

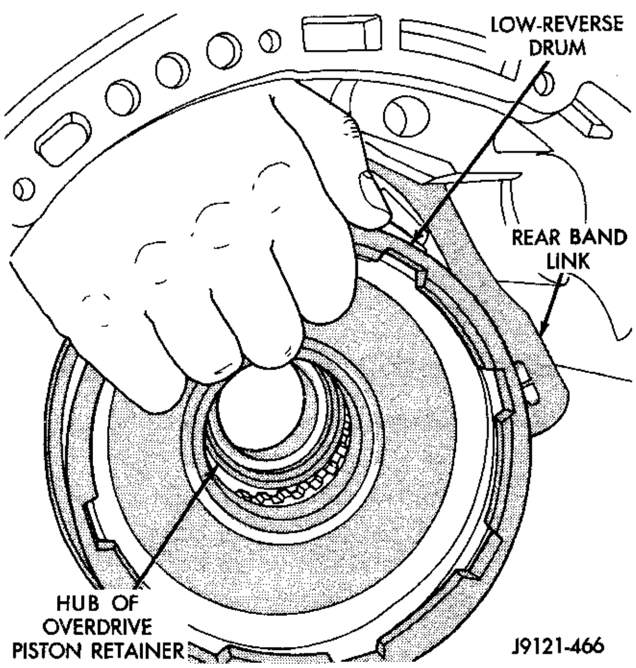

Fig. 127 Low-Reverse Drum

(4) Install thrust washer in low-reverse drum spot-face (Fig. 128). Use petroleum jelly to hold washer in place.

(5) Install snap ring that secures low-reverse drum to piston retainer hub (Fig. 128).

(6) Insert band reaction pin part way into case and band link (Fig. 129).

(7) Install rear band adjusting lever, reaction lever, and strut (Fig. 130). Be sure levers and strut are aligned and engaged before seating band reaction pin in case.

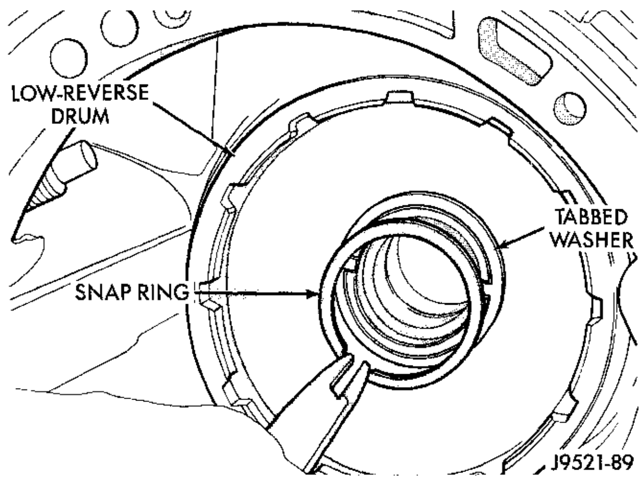

Fig. 128 Low-Reverse Drum Snap Ring

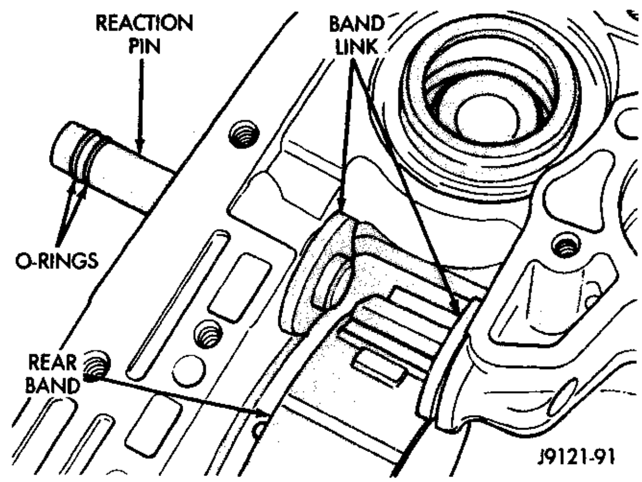

Fig. 129 Rear Band Reaction Pin

DISASSEMBLY AND ASSEMBLY (Continued)

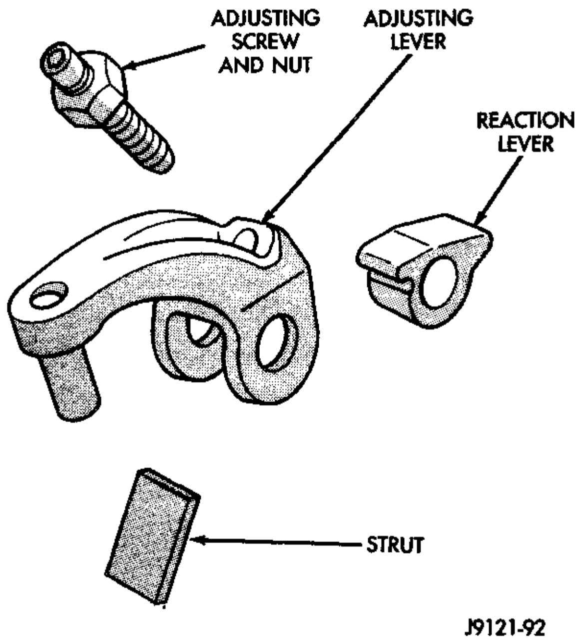

Fig. 130 Rear Band Levers And Strut

PLANETARY GEARTRAIN, FRONT/REAR CLUTCH, AND FRONT BAND

(1) Remove Alignment Shaft 6227-2, if installed previously.

(2) Install assembled intermediate shaft and planetary geartrain (Fig. 131). **Support shaft carefully during installation. Do not allow shaft bearing/bushing surfaces to become nicked or scratched.**

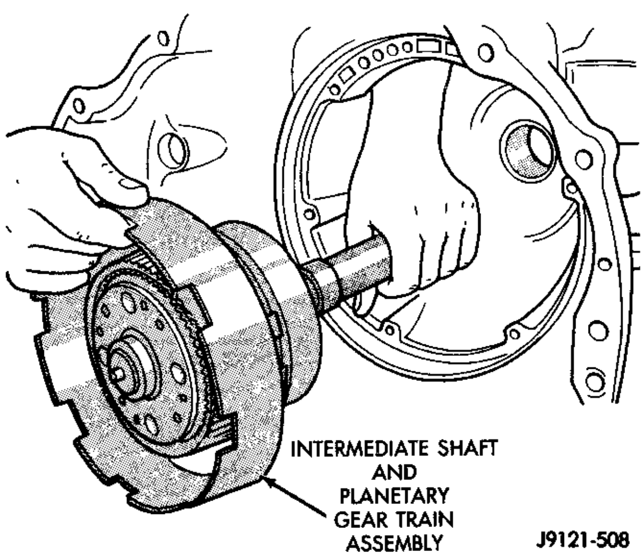

Fig. 131 Intermediate Shaft And Planetary Geartrain

(3) Lubricate intermediate shaft thrust plate with petroleum jelly and install plate on shaft pilot hub (Fig. 132).

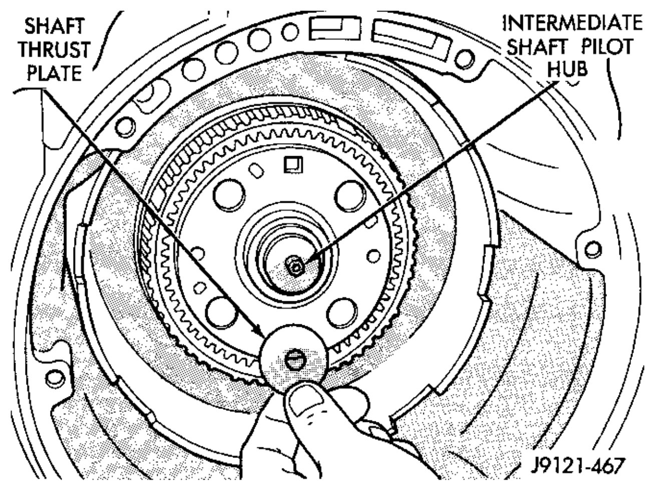

Fig. 132 Intermediate Shaft Thrust Plate

(4) Check input shaft front seal rings, fiber thrust washer and rear seal ring (Fig. 133). Be ends of rear seal ring are hooked together and diagonal cut ends of front seal rings are firmly seated against each other as shown. Lubricate seal rings with petroleum jelly after checking them.

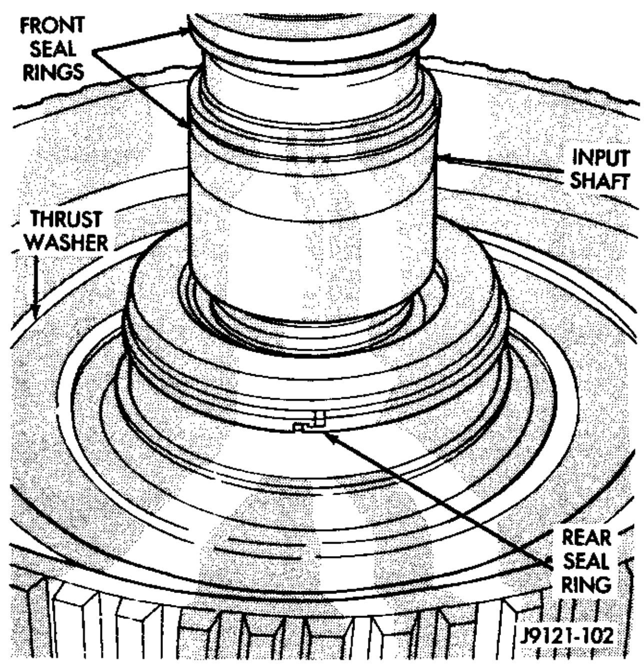

Fig. 133 Input Shaft Seal Ring And Thrust Washer

DISASSEMBLY AND ASSEMBLY (Continued)

(5) Assemble front and rear clutches (Fig. 134). Align lugs on front clutch discs. Mount front clutch on rear clutch. Turn front clutch retainer back and forth until front clutch discs are fully seated on rear clutch splined hub.

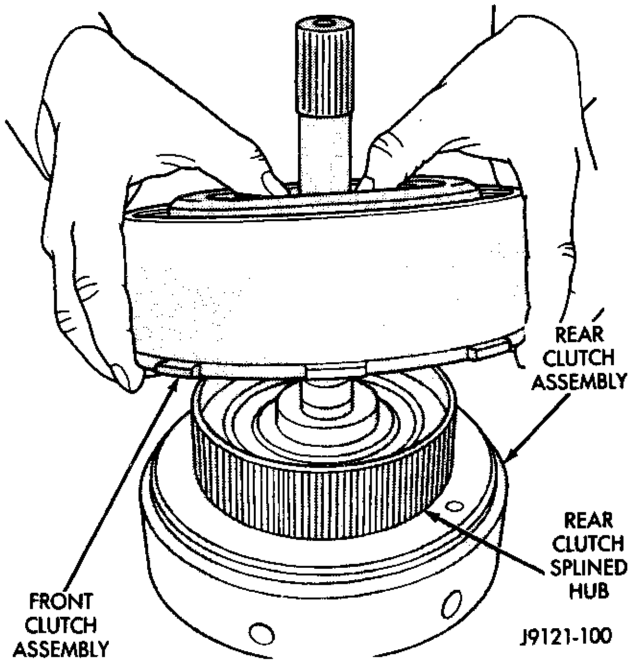

Fig. 134 Assembling Front And Rear Clutches

(6) Install intermediate shaft thrust washer in hub of rear clutch retainer (Fig. 135). Use petroleum jelly to hold washer in place. Position washer so grooves are facing outward. **Washer only fits one way in clutch retainer hub.**

(7) Place transmission case in upright position, or place blocks under front end of transmission repair stand to tilt case rearward. This makes it easier to install front/rear clutch assembly.

(8) Align discs in rear clutch. Then install and engage assembly in front planetary and driving shell (Fig. 136). Turn clutch retainers back and forth until both clutches are seated.

(9) Position front band lever in case and over servo rod guide. Then install front band lever pin in case and slide it through lever.

(10) Coat threads of front band pin access plug with sealer and install it in case. Tighten plug to 17 N·m (13 ft. lbs.) torque.

(11) Slide front band over front clutch retainer and install front band strut and anchor (Fig. 137).

(12) Tighten front band adjusting screw until band is tight on clutch retainer. This will hold clutches in place while oil pump is being installed. **Verify that front/rear clutch assembly is still properly seated before tightening band.**

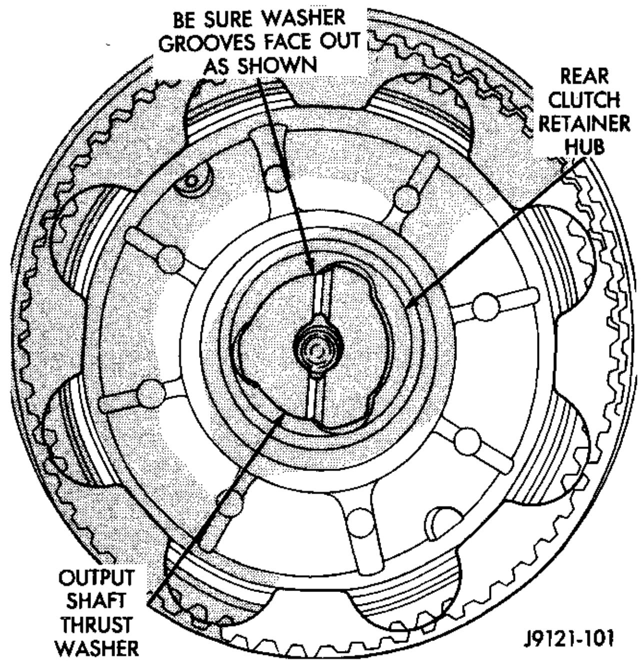

Fig. 135 Intermediate Shaft Thrust Washer

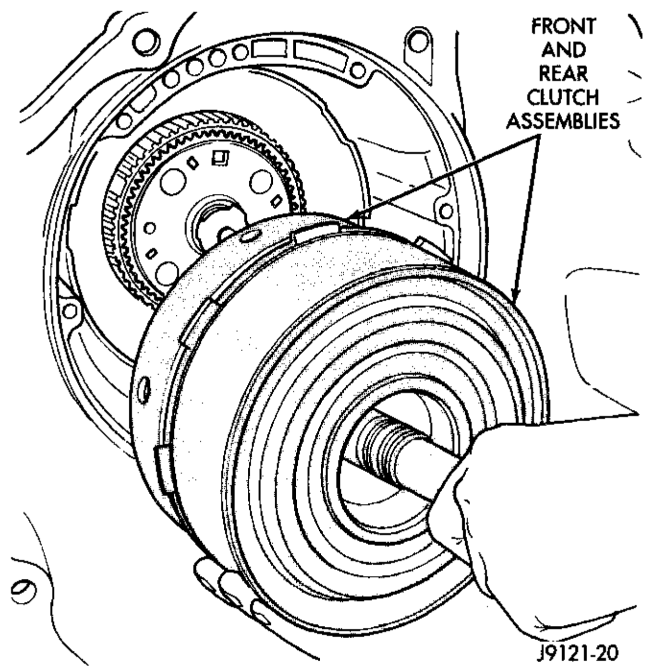

Fig. 136 Front/Rear Clutch Assemblies

DISASSEMBLY AND ASSEMBLY (Continued)

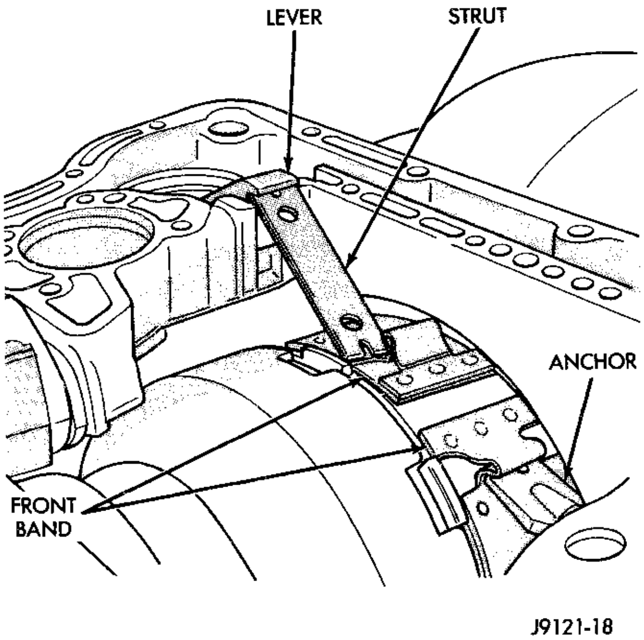

Fig. 137 Front Band And Linkage

OIL PUMP

(1) Install oil pump Pilot Studs C-3288-B in case (Fig. 138).

(2) Install new oil pump gasket on pilot studs and seat it in case. Be sure gasket is properly aligned with fluid passages in case (Fig. 138).

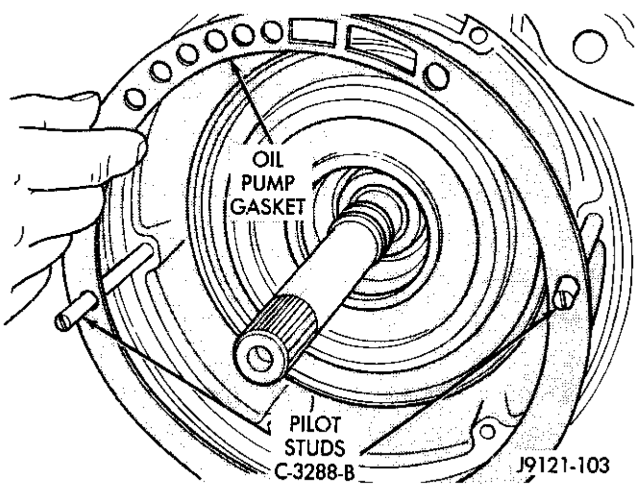

Fig. 138 Oil Pump Gasket And Pilot Studs

(3) Coat front clutch thrust washer with petroleum jelly to hold it in place. Then install washer over reaction shaft hub and seat it on pump (Fig. 139).

CAUTION: The thrust washer bore (I.D.), is chamfered on one side. Make sure the chamfered side is installed so it faces the pump.

(4) Check seal rings on reaction shaft support. Be sure rings are hooked together correctly. Also be sure

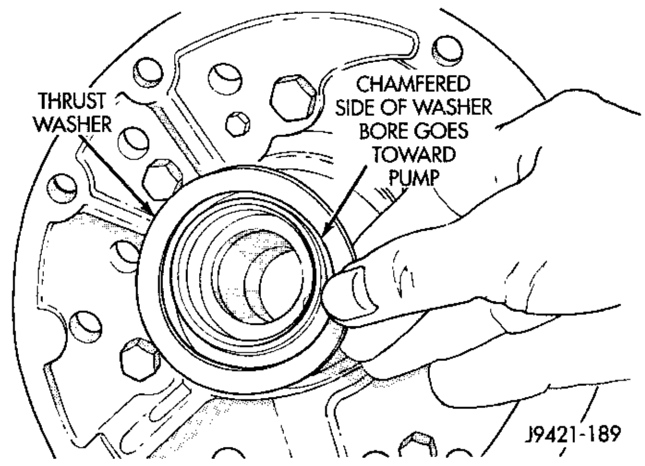

Fig. 139 Front Clutch Thrust Washer

fiber thrust washer is in position (Fig. 140). Use extra petroleum jelly to hold washer in place if necessary.

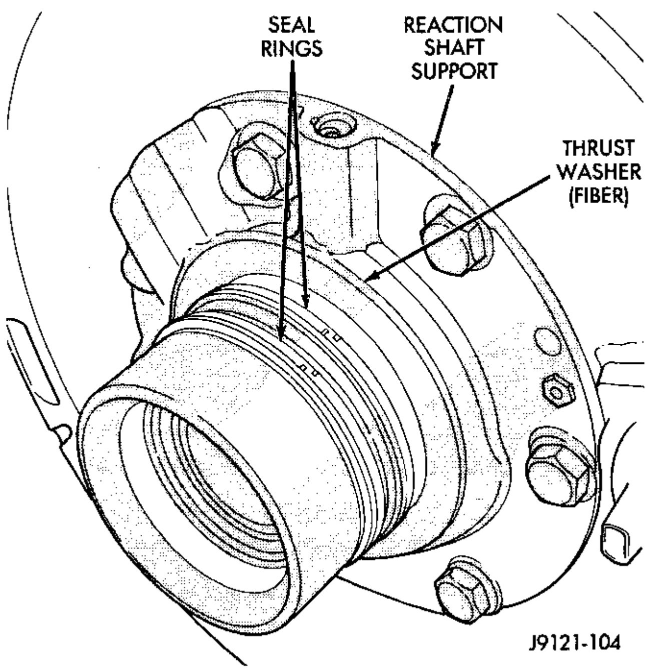

Fig. 140 Reaction Shaft Seal Ring And Thrust Washer

(5) Lubricate oil pump seals with petroleum Mopar® ATF Plus 3, type 7176.

(6) Mount oil pump on pilot studs and slide pump into case opening (Fig. 141). **Work pump into case by hand. Do not use a mallet or similar tools to seat pump.**

(7) Remove pilot studs and install oil pump bolts. Tighten pump bolts alternately and evenly to fully seat pump in case. Then final-tighten pump bolts to 20 N·m (15 ft. lbs.) torque.

DISASSEMBLY AND ASSEMBLY (Continued)

(8) Verify correct installation. Rotate input and intermediate shafts and check for bind. If bind exists, components are either mis-assembled, or not seated. Disassemble and correct as necessary before proceeding.

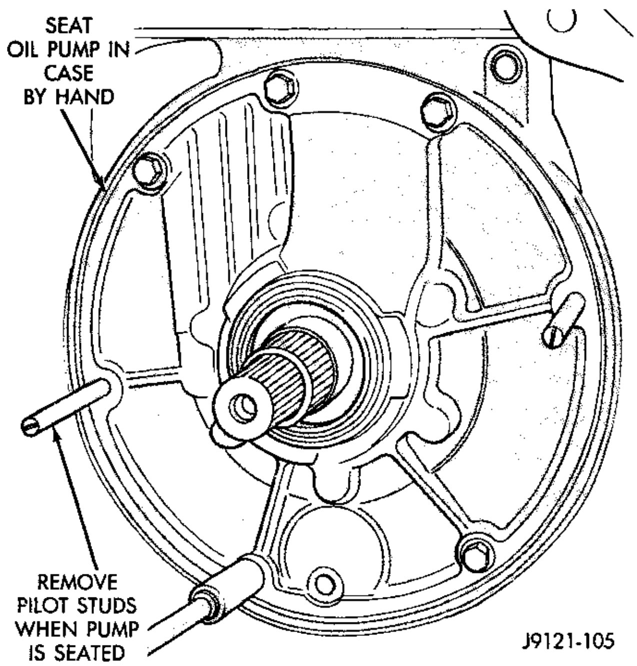

Fig. 141 Oil Pump

INPUT SHAFT END PLAY CHECK

NOTE: Overdrive unit must be installed in order to correctly measure the input shaft end-play.

(1) Check input shaft end play as follows.
(2) Attach dial indicator to converter housing (Fig. 142). Position indicator plunger against input shaft and zero indicator.
(3) Move input shaft in and out and record reading.
(4) End play should be 0.86 - 2.13 mm (0.034 - 0.084 in.).
(5) If end play is incorrect, change intermediate shaft thrust washer. The thrust washer controls end play and is available in three thicknesses for adjustment purposes.

ACCUMULATOR, VALVE BODY, OIL PAN, AND TORQUE CONVERTER

(1) Install accumulator inner spring, piston and outer spring (Fig. 143).
(2) Verify that park/neutral position switch has **not** been installed in case. Valve body can not be installed if switch is in position.
(3) Install new valve body manual shaft seal in case (Fig. 144). Lubricate seal lip and manual shaft

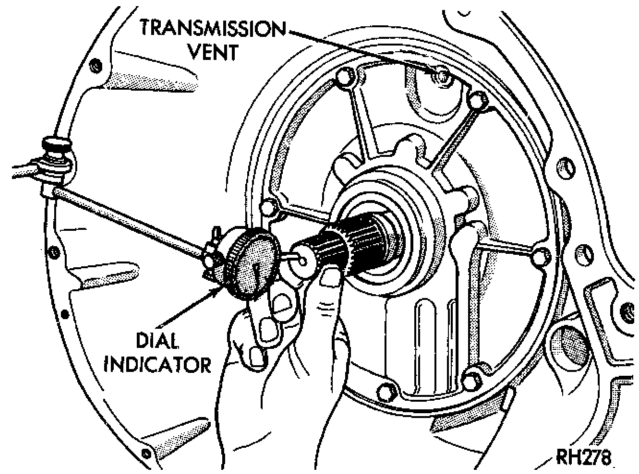

Fig. 142 Checking Input Shaft End Play

with petroleum jelly. Start seal over shaft and into case. Seat seal with 15/16 inch, deep well socket.
(4) Install valve body as follows:
(a) Start park rod into park pawl. If rod will not slide past park pawl, pawl is engaged in park gear. Rotate overdrive output shaft with suitable size 12 point socket; this will free pawl and allow rod to engage.
(b) Align and seat valve body on case. Be sure manual lever shaft and overdrive connector are fully seated in case.
(c) Install and start all valve body attaching bolts by hand. Then tighten bolts evenly, in a diagonal pattern to 12 N·m (105 in. lbs.) torque. **Do not overtighten valve body bolts. This could result in distortion and cross leakage after installation..**
(5) Install new filter on valve body. Tighten filter screws to 4 N·m (35 in. lbs.).
(6) Install seal on park/neutral position switch. Then install and tighten switch to 34 N·m (25 ft. lbs.).

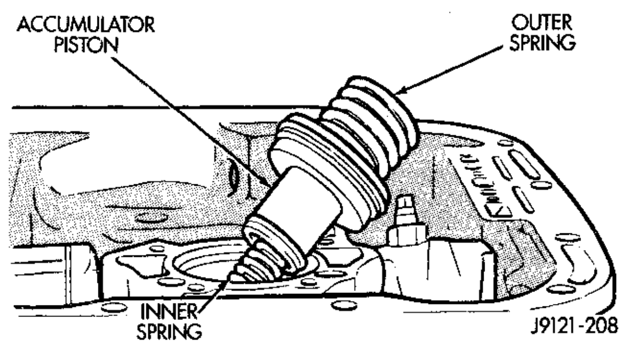

Fig. 143 Accumulator Piston And Springs

DISASSEMBLY AND ASSEMBLY (Continued)

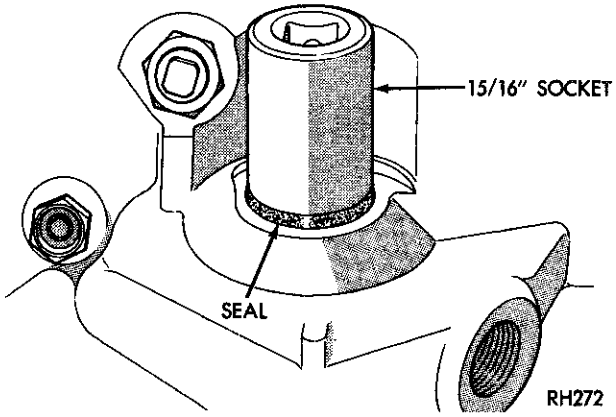

Fig. 144 Manual Lever Shaft Seal

CAUTION: If the condition of the transmission before the overhaul procedure caused excessive metallic or fiber contamination in the fluid, replace the torque converter and reverse flush the cooler(s) and cooler lines. Fluid contamination and transmission failure can result if not done.

(7) Install torque converter. Use C-clamp or metal strap to hold converter in place for installation.

BAND ADJUSTMENT AND FINAL

(1) Adjust front and rear bands as follows:
(a) Loosen locknut on each band adjusting screw 4-5 turns.
(b) Tighten both adjusting screws to 8 N·m (72 in. lbs.).
(c) Back off front band adjusting screw 2-7/8 turns.
(d) Back off rear band adjusting screw 2 turns.
(e) Hold each adjusting screw in position and tighten locknut to 34 N·m (25 ft. lbs.) torque.
(2) Install magnet in oil pan. Magnet seats on small protrusion at corner of pan.
(3) Position new oil pan gasket on case and install oil pan. Tighten pan bolts to 17 N·m (13 ft. lbs.).
(4) Install throttle valve and shift selector levers on valve body manual lever shaft.
(5) Apply small quantity of dielectric grease to terminal pins of solenoid case connector and neutral switch.
(6) Fill transmission with recommended fluid. Refer to Service Procedures section of this group.
(7) Road test vehicle to verify repair.

OVERRUNNING CLUTCH CAM/OVERDRIVE PISTON RETAINER

NOTE: TO SERVICE THE OVERRUNNING CLUTCH CAM AND THE OVERDRIVE PISTON RETAINER, THE TRANSMISSION GEARTRAIN AND OVERDRIVE UNIT MUST BE REMOVED FROM THE TRANSMISSION.

DISASSEMBLY

(1) Remove the overdrive piston (Fig. 145).
(2) Remove the overdrive piston retainer bolts.
(3) Remove overdrive piston retainer.
(4) Remove case gasket.
(5) Tap old cam out of case with pin punch. Insert punch through bolt holes at rear of case (Fig. 146). Alternate position of punch to avoid cocking cam during removal.
(6) Clean clutch cam bore and case. Be sure to remove all chips/shavings generated during cam removal.

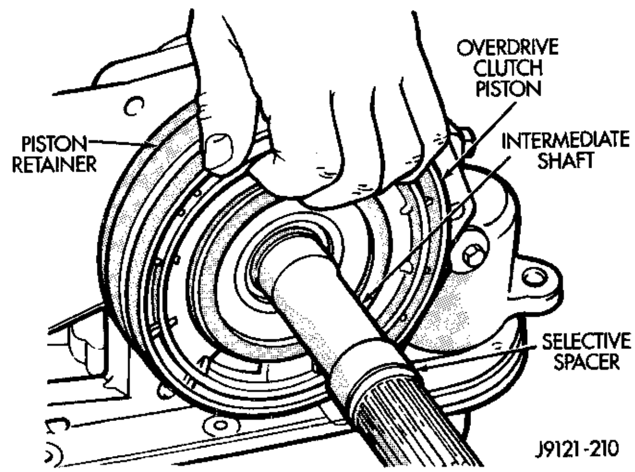

Fig. 145 Overdrive Piston Removal

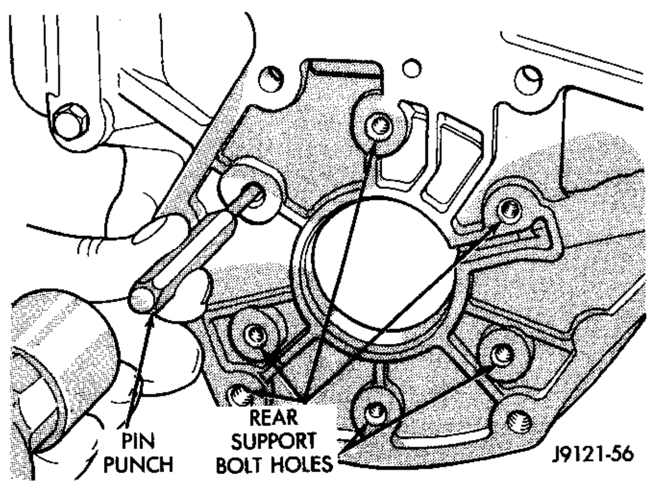

Fig. 146 Overrunning Clutch Cam

ASSEMBLY

(1) Temporarily install overdrive piston retainer in case. Use 3-4 bolts to secure retainer.
(2) Align and start new clutch cam and spring retainer in case. Be sure serrations on cam and in

Mopar AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

case are aligned (Fig. 147). Then tap cam into case just enough to hold it in place.

(3) **Verify that cam is correctly positioned before proceeding any further. Narrow ends of cam ramps should be to left when cam is viewed from front end of case** (Fig. 147).

(4) Insert Adapter Tool SP-5124 into piston retainer (Fig. 148).

(5) Assemble Puller Bolt SP-3701 and Press Plate SP-3583-A (Fig. 149).

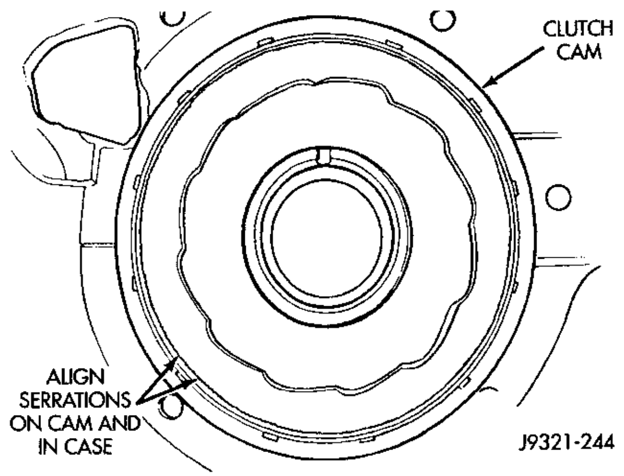

Fig. 147 Positioning Replacement Clutch Cam In Case

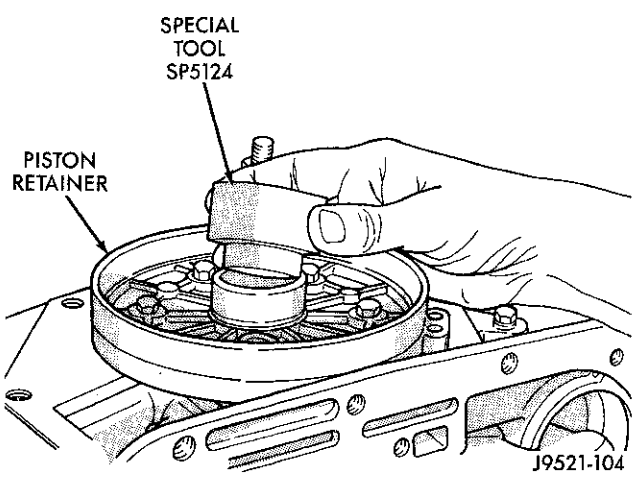

Fig. 148 Positioning Adapter Tool In Overdrive Piston Retainer

(6) Install assembled puller plate and bolt (Fig. 150). Insert bolt through cam, case and adapter tool. Be sure plate is seated squarely on cam.

(7) Hold puller plate and bolt in place and install puller nut SP-3701 on puller bolt (Fig. 151).

(8) Tighten puller nut to press clutch cam into case (Fig. 151). **Be sure cam is pressed into case evenly and does not become cocked.**

(9) Remove clutch cam installer tools.

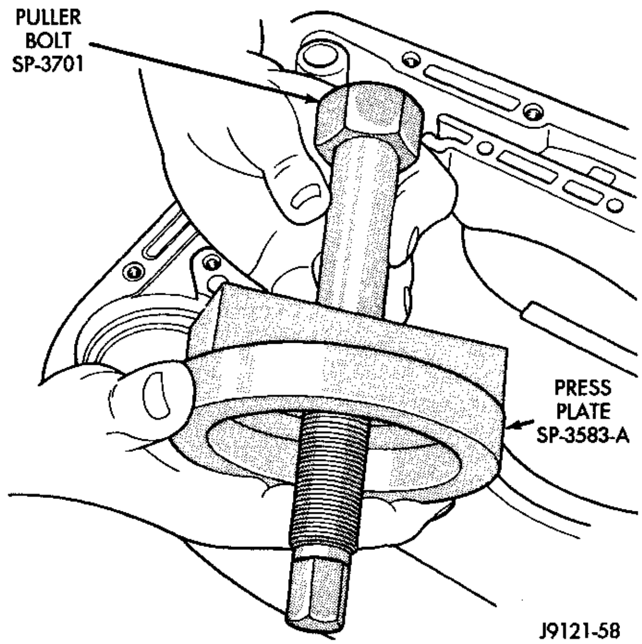

Fig. 149 Assembling Clutch Cam Puller Bolt And Press Plate

(10) **Stake case in 12 places around clutch cam to help secure cam in case. Use blunt punch or chisel to stake case.**

(11) Remove piston retainer from case. Cover retainer with plastic sheeting, or paper to keep it dust free.

(12) Clean case and cam thoroughly. Be sure any chips/shavings generated during cam installation are removed from case.

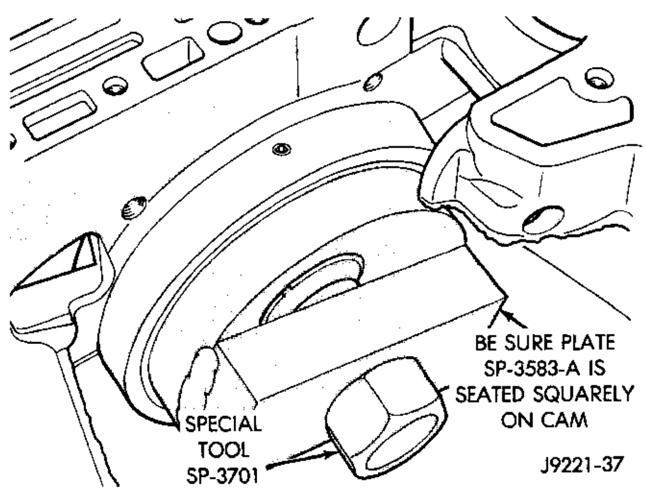

Fig. 150 Positioning Puller Plate On Clutch Cam

(13) Install new gasket at rear of transmission case. Use petroleum jelly to hold gasket in place. Be sure to align governor feed holes in gasket with feed passages in case (Fig. 152). Also install gasket before overdrive piston retainer. Center hole in gasket is

DISASSEMBLY AND ASSEMBLY (Continued)

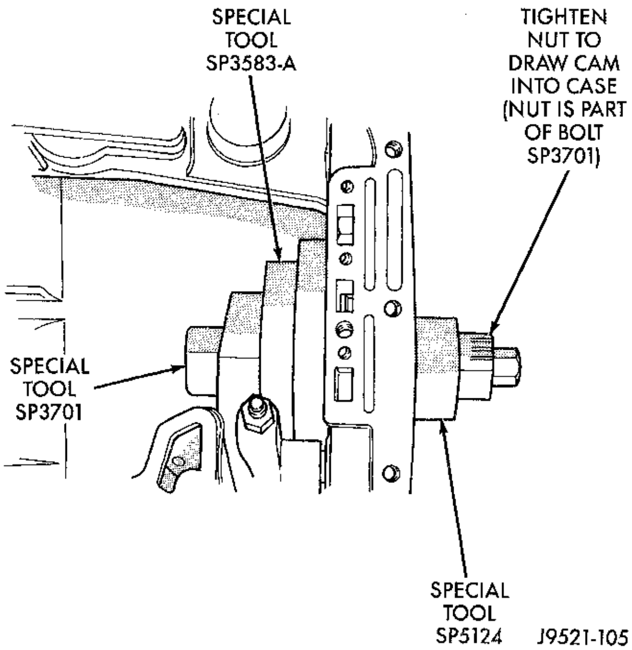

Fig. 151 Pressing Overrunning Clutch Cam Into Case

smaller than retainer and cannot be installed over retainer.

(14) Position overdrive piston retainer on transmission case and align bolt holes in retainer, gasket and case (Fig. 153). Then install and tighten retainer bolts to 17 N·m (13 ft. lbs.) torque.

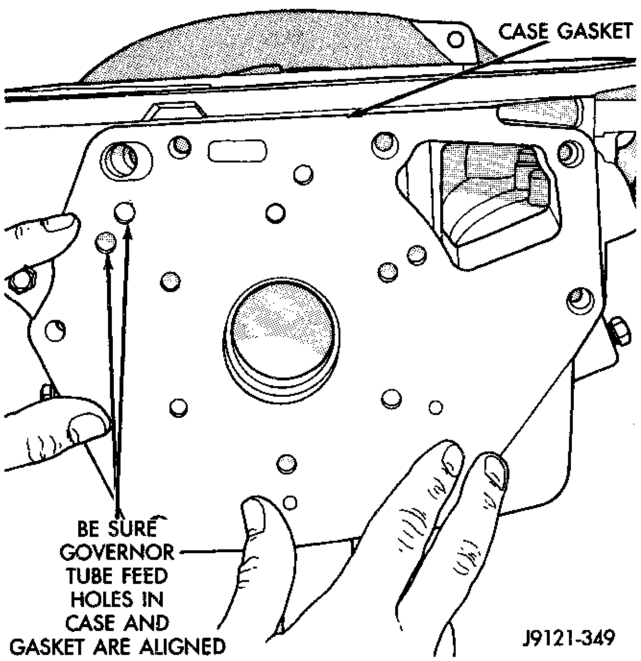

Fig. 152 Installing/Aligning Case Gasket

(15) Install new seals on overdrive piston.

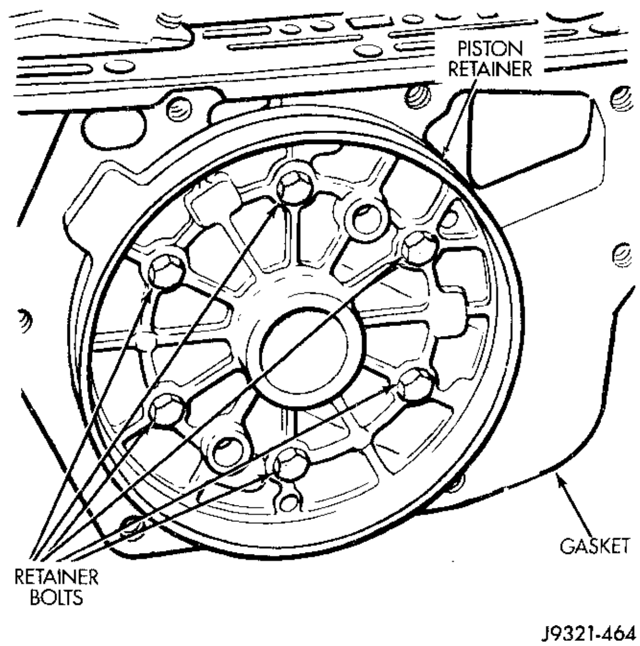

Fig. 153 Aligning Overdrive Piston Retainer

(16) Stand transmission case upright on bellhousing.

(17) Position Guide Ring 8114-1 on outer edge of overdrive piston retainer.

(18) Position Seal Guide 8114-3 on inner edge of overdrive piston retainer.

(19) Install overdrive piston in overdrive piston retainer by: aligning locating lugs on overdrive piston to the two mating holes in retainer.

(a) Aligning locating lugs on overdrive piston to the two mating holes in retainer.

(b) Lubricate overdrive piston seals with Mopar® Door Ease, or equivalent.

(c) Install piston over Seal Guide 8114–3 and inside Guide Ring 8114–1.

(d) Push overdrive piston into position in retainer.

(e) Verify that the locating lugs entered the lug bores in the retainer.

NOTE: INSTALL THE REMAINING TRANSMISSION COMPONENTS AND OVERDRIVE UNIT.

FRONT SERVO PISTON

DISASSEMBLY

(1) Remove seal ring from rod guide (Fig. 154).

(2) Remove small snap ring from servo piston rod. Then remove piston rod, spring and washer from piston.

(3) Remove and discard servo component O-ring and seal rings.

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

ASSEMBLY

Clean and inspect front servo components.

(1) Lubricate new O-ring and seal rings with petroleum jelly and install them on piston, guide and rod.

(2) Install rod in piston. Install spring and washer on rod. Compress spring and install snap ring (Fig. 154).

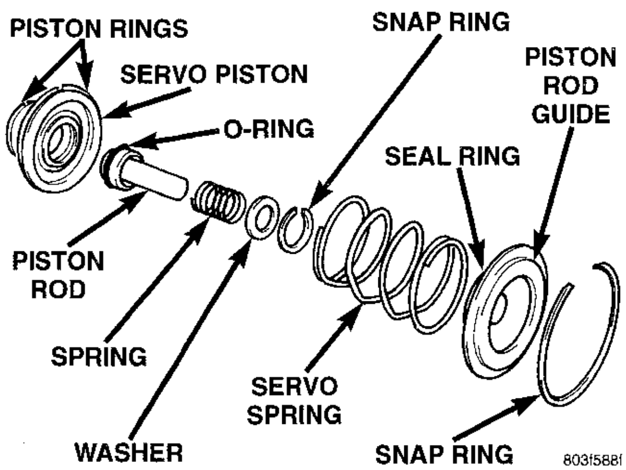

Fig. 154 Front Servo

REAR SERVO PISTON

DISASSEMBLY

(1) Remove small snap ring and remove plug and spring from servo piston (Fig. 155).

(2) Remove and discard servo piston seal ring.

ASSEMBLY

(1) Lubricate piston and guide seals with petroleum jelly. Lubricate other servo parts with Mopar® ATF Plus 3, Type 7176, transmission fluid.

(2) Install new seal ring on servo piston.

(3) Assemble piston, plug, spring and new snap ring.

(4) Lubricate piston seal lip with petroleum jelly.

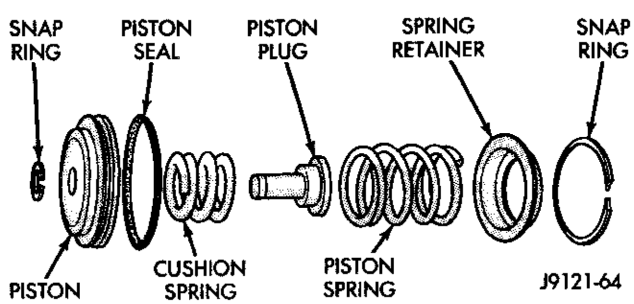

Fig. 155 Rear Servo Components

OIL PUMP AND REACTION SHAFT SUPPORT

DISASSEMBLY

(1) Mark position of support in oil pump body for assembly alignment reference. Use scriber or paint to make alignment marks.

(2) Place pump body on two wood blocks.

(3) Remove reaction shaft support bolts and separate support from pump body (Fig. 156).

(4) Remove pump inner and outer gears (Fig. 157).

(5) Remove O-ring seal from pump body (Fig. 158). Discard seal after removal.

(6) Remove oil pump seal with Remover Tool C-3981. Discard seal after removal.

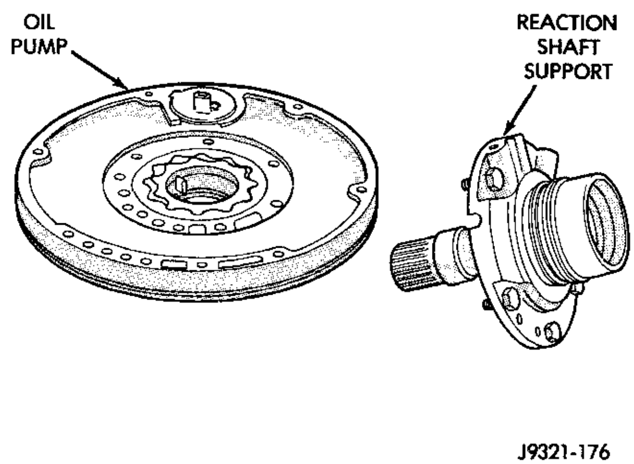

Fig. 156 Reaction Shaft Support

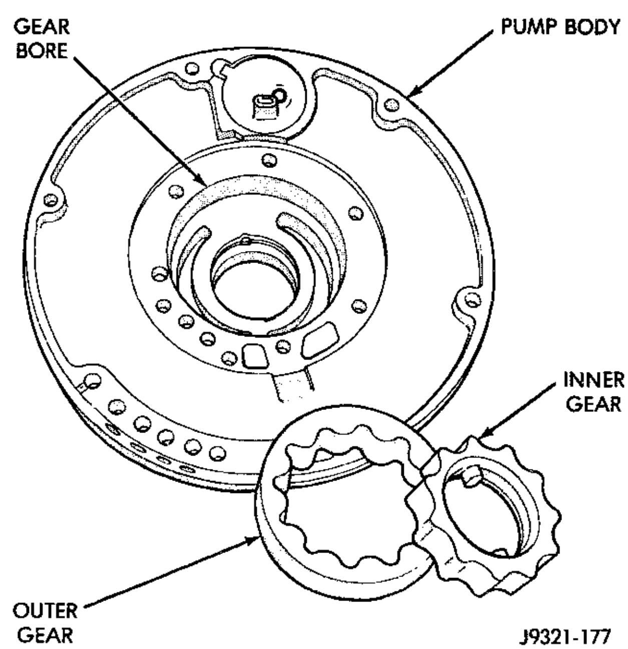

Fig. 157 Pump Gear

DISASSEMBLY AND ASSEMBLY (Continued)

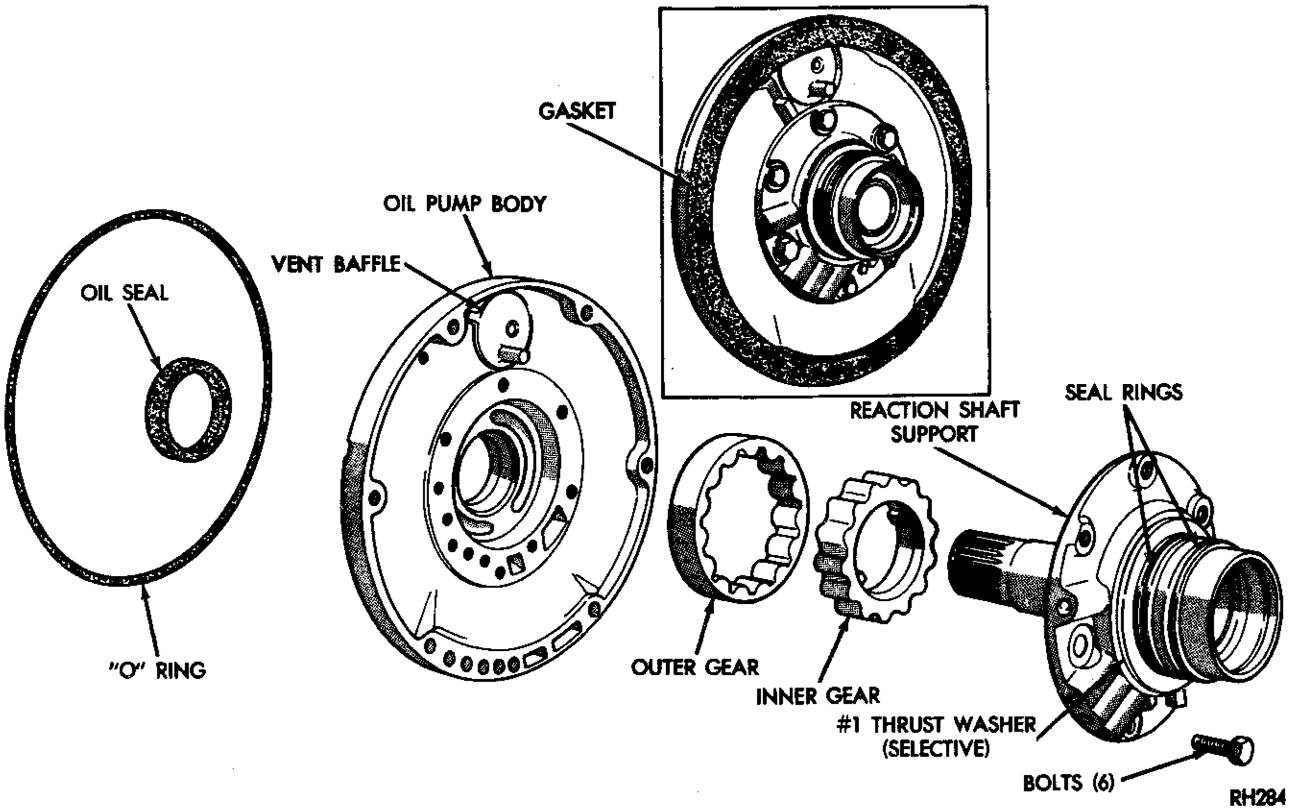

Fig. 158 Oil Pump And Reaction Shaft Components

OIL PUMP BUSHING REMOVAL

(1) Position pump housing on clean, smooth surface with gear cavity facing down.

(2) Remove bushing with Tool Handle C-4171 and Bushing Remover SP-3550 (Fig. 159).

REACTION SHAFT SUPPORT BUSHING REMOVAL

(1) Assemble Cup Tool SP-3633, Nut SP-1191 and Bushing Remover SP-5301 (Fig. 161).

(2) Hold cup tool firmly against reaction shaft. Thread remover tool into bushing as far as possible by hand.

(3) Using wrench, thread remover tool an additional 3-4 turns into bushing to firmly engage tool.

(4) Tighten tool hex nut against cup tool to pull bushing from shaft. Clean all chips from shaft and support after bushing removal.

ASSEMBLY

OIL PUMP BUSHING INSTALLATION

(1) Assemble Tool Handle C-4171 and Bushing Installer SP-5118.

(2) Place bushing on installer tool and start bushing into shaft.

(3) Tap bushing into place until Installer Tool SP-5118 bottoms in pump cavity. Keep tool and bushing square with bore. Do not allow bushing to become cocked during installation.

(4) Stake pump bushing in two places with blunt punch. Remove burrs from stake points with knife blade (Fig. 160).

REACTION SHAFT SUPPORT BUSHING INSTALLATION

(1) Place reaction shaft support upright on a clean, smooth surface.

(2) Assemble Bushing Installer Tools C-4171 and SP-5302. Then slide new bushing onto installer tool (Fig. 161).

(3) Start bushing in shaft. Tap bushing into shaft until installer tool bottoms against support flange.

(4) Clean reaction shaft support thoroughly after bushing replacement (to remove any chips).

(1) Lubricate pump gears with transmission fluid and install them in pump body.

(2) Install thrust washer on reaction shaft support hub. Lubricate washer with petroleum jelly or transmission fluid before installation.

(3) If reaction shaft seal rings are being replaced, install new seal rings on support hub. Lubricate seal rings with transmission fluid or petroleum jelly after installation. Squeeze each ring until ring ends are securely hooked together.

DISASSEMBLY AND ASSEMBLY (Continued)

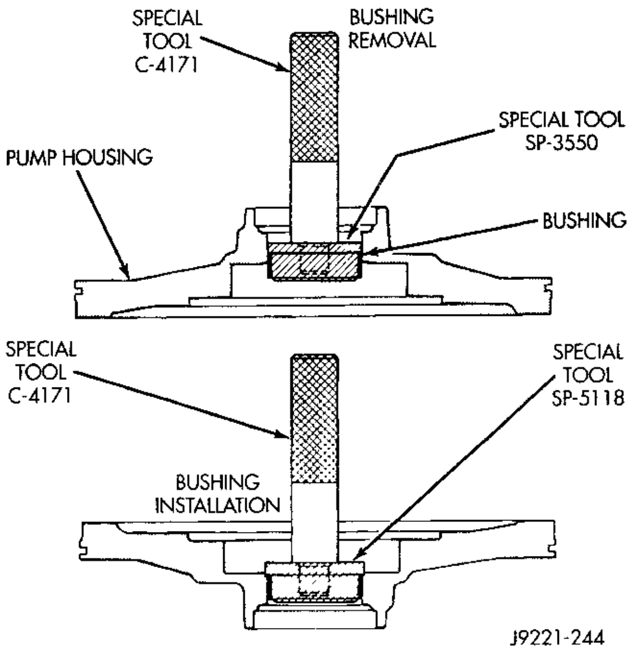

Fig. 159 Oil Pump Bushing

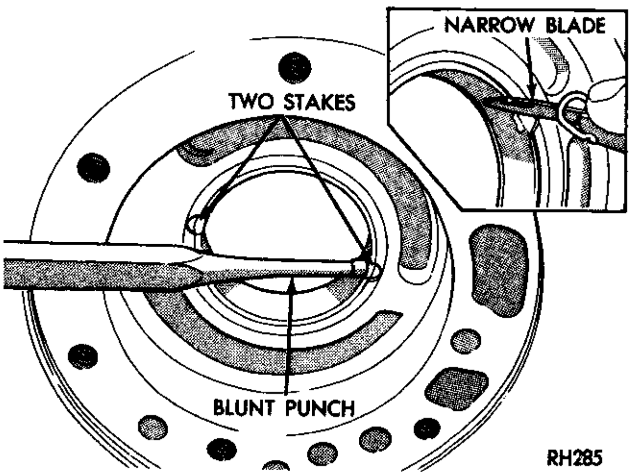

Fig. 160 Staking-Deburring Oil Pump Bushing

CAUTION: The reaction shaft support seal rings will break if overspread, or twisted. If new rings are being installed, spread them only enough for installation. Also be very sure the ring ends are securely hooked together after installation. Otherwise, the rings will either prevent pump installation, or break during installation.

(4) Align and install reaction shaft support on pump body.

(5) Install bolts attaching reaction shaft support to pump. Tighten bolts to 20 N·m (175 in. lbs.) torque.

(6) Install new pump seal with Installer Tool C-3860-A (Fig. 162). Use hammer or mallet to tap seal into place.

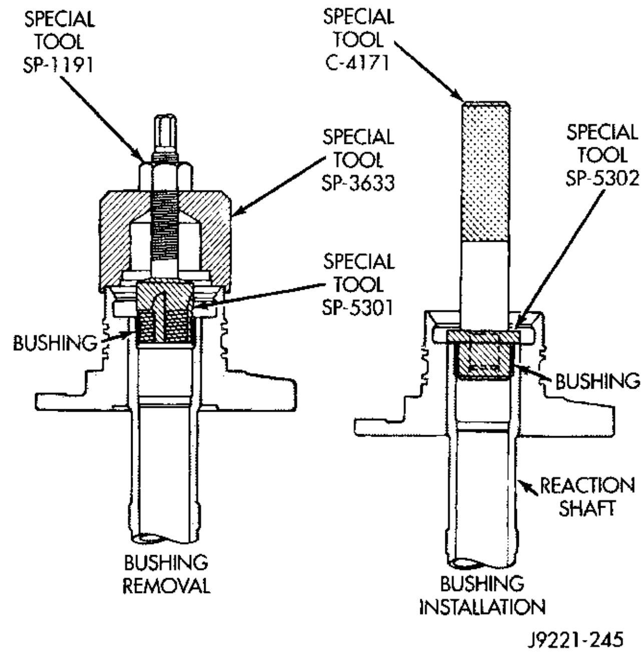

Fig. 161 Reaction Shaft Bushing

(7) Install new O-ring on pump body. Lubricate oil seal and O-ring with petroleum jelly.

(8) Cover pump assembly to prevent dust entry and set aside for assembly installation.

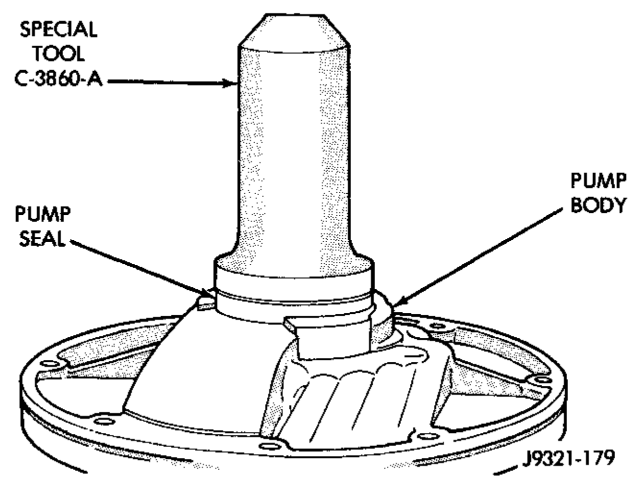

Fig. 162 Oil Pump Seal

FRONT CLUTCH

DISASSEMBLY

(1) Remove waved snap ring and remove reaction plate, clutch plates and clutch discs.

(2) Compress clutch piston retainer and piston springs with Compressor Tool C-3863-A (Fig. 163).

(3) Remove retainer snap ring and remove compressor tool.

DISASSEMBLY AND ASSEMBLY (Continued)

(4) Remove clutch piston springs (Fig. 164). **Note position of piston springs for assembly reference.**

(5) Remove clutch piston from retainer with a twisting motion.

(6) Remove and discard clutch piston inner and outer seals.

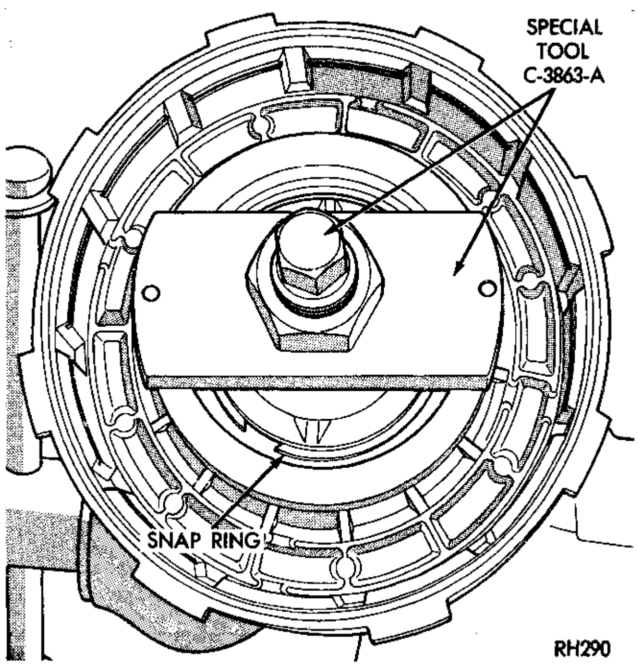

Fig. 163 Removing Front Clutch Spring Retainer Snap Ring

(7) Assemble Tool Handle C-4171 and Bushing Remover SP-3629 (Fig. 165).

(8) Insert remover tool in bushing and drive bushing straight out of clutch retainer.

ASSEMBLY

NOTE: The 46RE transmission uses 3 discs in the front clutch. The 47RE transmission uses 4 discs.

(1) Mount Bushing Installer SP-5511 on tool handle (Fig. 165).

(2) Slide new bushing onto installer tool and start bushing into retainer.

(3) Tap new bushing into place until installer tool bottoms against clutch retainer.

(4) Remove installer tools and clean retainer thoroughly.

(5) Soak clutch discs in transmission fluid.

(6) Install new inner and outer seals on clutch piston. Be sure seal lips face interior of retainer.

(7) Lubricate new inner and outer piston seals with Ru-Glyde, or Mopar® Door Ease.

(8) Install clutch piston in retainer. Use twisting motion to seat piston in bottom of retainer. A thin strip of plastic (about 0.015 - 0.020 in. thick), can be used to guide seals into place if necessary.

CAUTION: Never push the clutch piston straight in. This will fold the seals over causing leakage and clutch slip. In addition, never use any type of metal tool to help ease the piston seals into place. Metal tools will cut, shave, or score the seals.

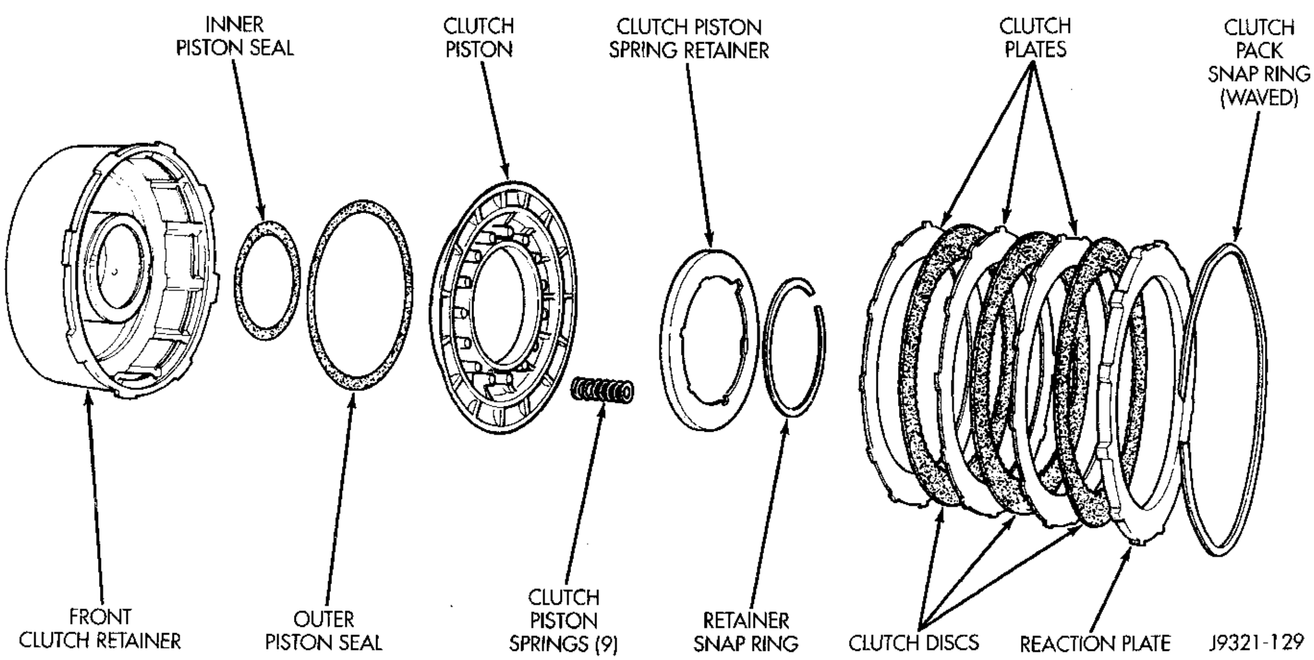

Fig. 164 46RE Front Clutch Components

DISASSEMBLY AND ASSEMBLY (Continued)

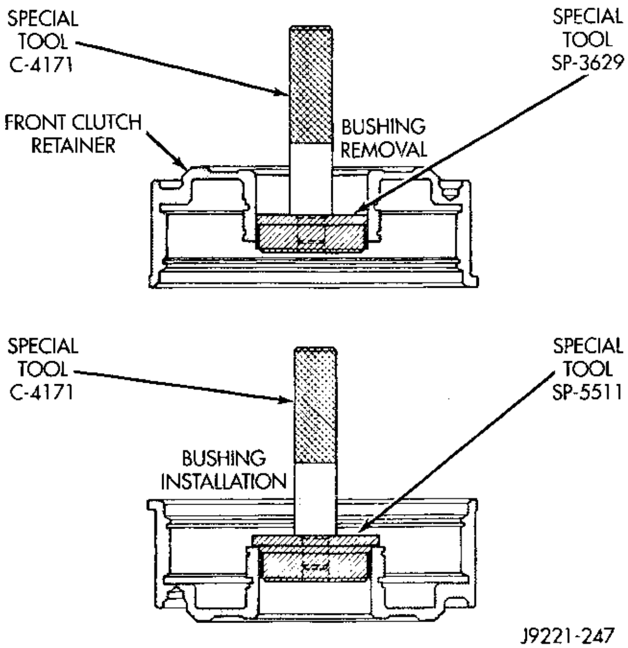

Fig. 165 Front Clutch Retainer Bushing Replacement Tools

(9) Install and position nine clutch piston springs (Fig. 166).

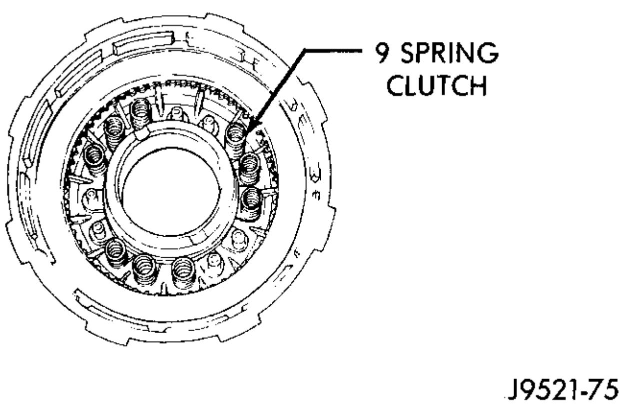

Fig. 166 Front Clutch Spring Position

(10) Install spring retainer on top of piston springs.

(11) Compress spring retainer and piston springs with Tool C-3863-A.

(12) Install spring retainer snap ring and remove compressor tool.

(13) Install clutch plates and discs (Fig. 164). Three clutch discs, three steel plates and one reaction plate are required.

(14) Install reaction plate followed by waved snap ring.

(15) Check clutch pack clearance with feeler gauge (Fig. 167). Clearance between waved spring and pressure plate should 1.78 - 3.28 mm (0.070 - 0.129 in.).

If clearance is incorrect, clutch plates, clutch discs, snap ring, or pressure plate may have to be changed.

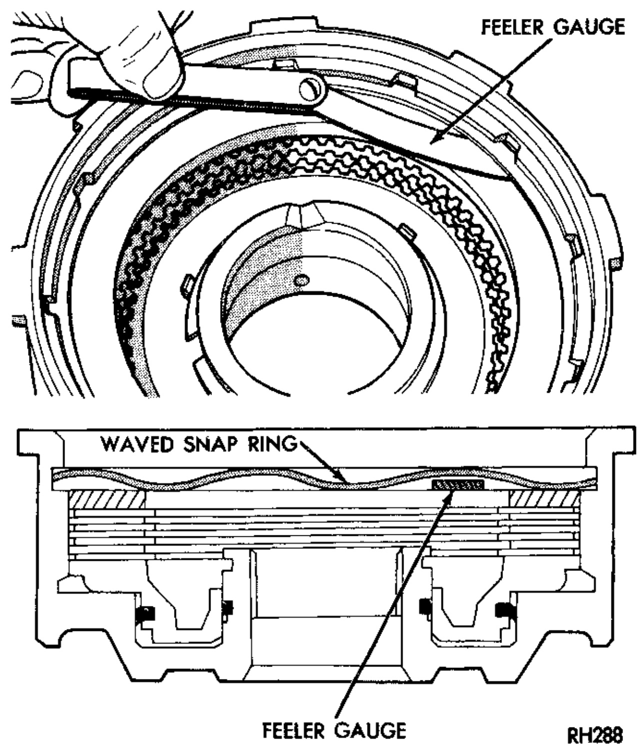

Fig. 167 Typical Method Of Measuring Front Clutch Pack Clearance

REAR CLUTCH

DISASSEMBLY

(1) Remove clutch pack select fit snap ring.

(2) Remove reaction plate and remove clutch plates and discs (Fig. 168).

(3) Remove pressure plate, wave spring, spacer ring and piston spring from clutch retainer.

(4) Remove clutch piston from piston retainer with a twisting motion.

(5) Remove input shaft thrust washer, if washer remained in piston retainer hub during removal.

(6) Remove seals from clutch piston. Discard seals after removal.

If the input shaft must be replaced, first remove the retaining ring that secures the shaft in the piston retainer hub. Then press the old shaft out of the retainer with a shop press using suitable press tools to press on the shaft and to support the retainer hub as close to the shaft as possible.

ASSEMBLY

(1) Lubricate the splines of the new shaft with petroleum jelly or Mopar® ATF Plus 3, type 7176. Then align the shaft in the piston retainer and carefully press it into place using suitable press tools to press the shaft and to support the retainer hub as

DISASSEMBLY AND ASSEMBLY (Continued)

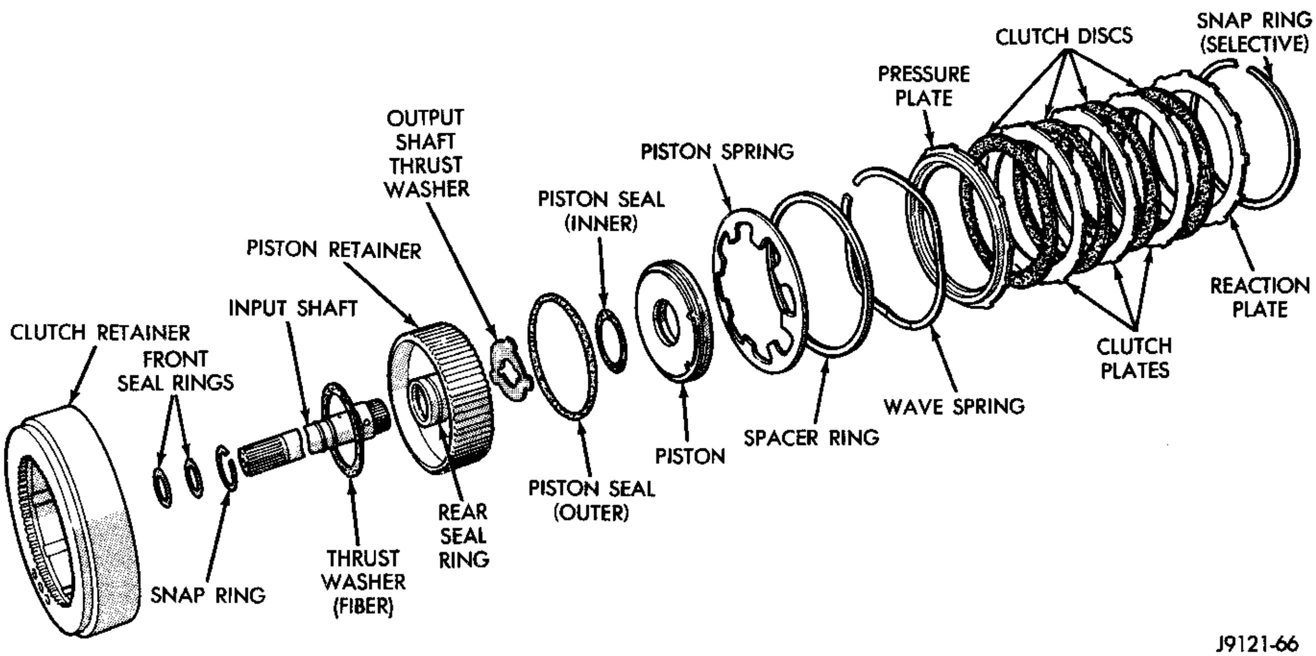

Fig. 168 Rear Clutch Components

close to the shaft as possible. Do not allow the shaft to become cocked during installation. The retainer can be cracked if misalignment occurs.

(2) Install the shaft retaining ring after pressing the shaft into place. Be sure the ring is fully seated before proceeding with clutch assembly.

(3) Invert the input shaft in the press and using the same tools as in removal, press on shaft enough to seat the snap-ring into the retainer.

(4) Soak clutch discs in transmission fluid before assembly.

(5) Install new seals on clutch piston. Lubricate piston seals with Mopar® Door Ease, or Ru-Glyde to ease installation. **Be sure seal lips face input shaft.**

(6) Install clutch piston in retainer. Use twisting motion to seat piston in bottom of retainer. A thin strip of plastic (about 0.020″ thick), can be used to guide seals into place if necessary.

CAUTION: Never push the clutch piston straight in. This will fold the seals over causing leakage and clutch slip. In addition, never use any type of metal tool to help ease the piston seals into place. Metal tools will cut, shave, or score the seals.

(7) Assemble piston retainer and clutch retainer.

(8) Support clutch retainer with wood blocks, or insert input shaft through pre-drilled hole in work-bench. Clutch pack components are easier to install if retainers are properly supported.

(9) Install piston spring in clutch retainer. Concave side of spring faces upward and away from clutch piston.

(10) Install spacer ring on top of piston spring.

(11) Install wave spring on top of spacer ring. Then seat wave spring in retainer groove. **If wave spring will not seat properly, spacer ring has probably shifted over and into wave spring groove in retainer. Use small screwdriver to realign spacer ring if necessary.**

(12) Install inner pressure plate in clutch retainer.

(13) Install first clutch disc followed by steel plate until all discs and plates are installed. 4 clutch discs and steel plates are required (Fig. 168).

(14) Install reaction plate on top of last clutch disc.

(15) Install selective snap ring to secure clutch pack in retainer.

(16) Install new seal rings on input shaft if necessary (Fig. 169). Be very sure ring ends are all securely hooked together before proceeding.

(17) Check clutch pack clearance with feeler gauge (Fig. 170). Clearance should be 0.63 to 1.14 mm (0.025 to 0.045 in.).

(18) If clutch pack clearance is incorrect, clutch pack snap ring, may have to be replaced.

(19) Install thrust washer on piston retainer hub. Use petroleum jelly to hold thrust washer in place.

DISASSEMBLY AND ASSEMBLY (Continued)

PLANETARY GEARTRAIN/OUTPUT SHAFT

DISASSEMBLY

(1) Remove planetary snap ring from intermediate shaft (Fig. 171). Discard snap ring as it is not reusable.

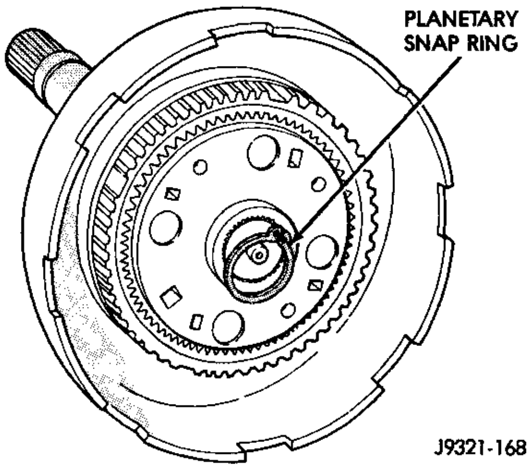

Fig. 171 Removing Planetary Snap Ring

(2) Remove front planetary gear and front annulus gear as assembly (Fig. 172).

(3) Remove front planetary gear and thrust washer from front annulus gear (Fig. 173). Note thrust washer position for assembly reference.

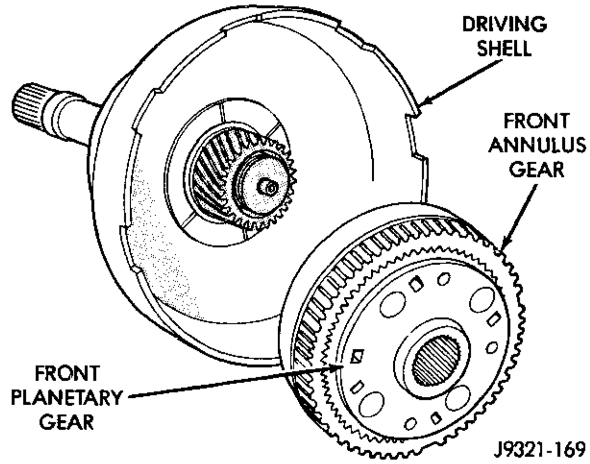

Fig. 172 Removing Front Planetary And Annulus Gears

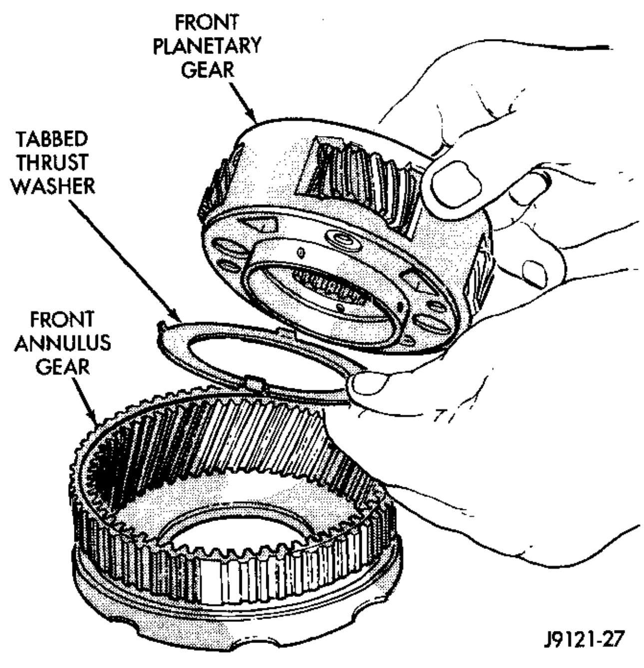

Fig. 173 Disassembling Front Planetary And Annulus Gears

DISASSEMBLY AND ASSEMBLY (Continued)

(4) Remove tabbed thrust washer from driving shell (Fig. 174). Note washer position for assembly reference.

(5) Remove sun gear and driving shell as assembly (Fig. 175).

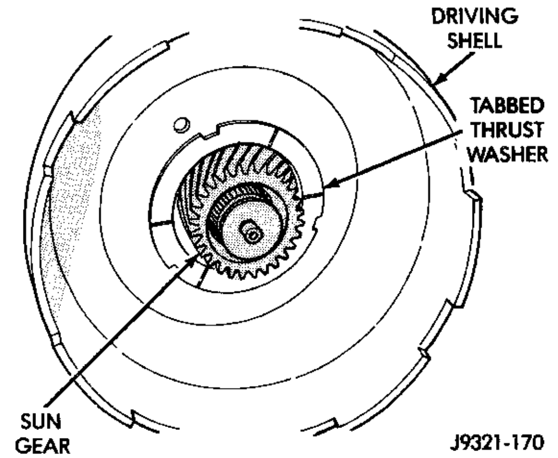

Fig. 174 Driving Shell Thrust Washer Removal

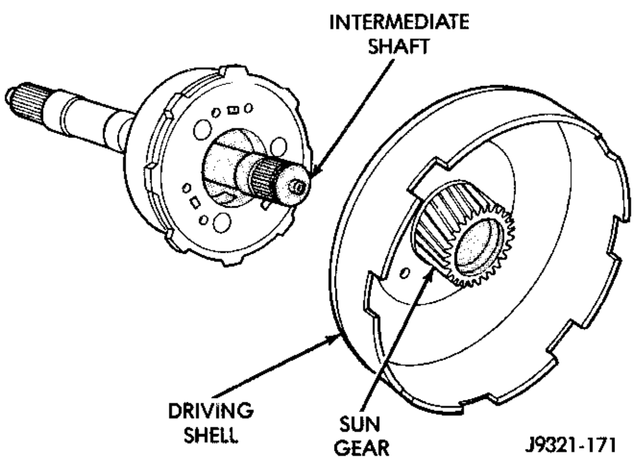

Fig. 175 Sun Gear And Driving Shell Removal

(6) Remove tabbed thrust washer from rear planetary gear (Fig. 176). Note washer position on gear for assembly reference.

(7) Remove rear planetary gear and rear annulus gear from intermediate shaft (Fig. 177).

(8) Remove thrust plate from rear annulus gear (Fig. 178).

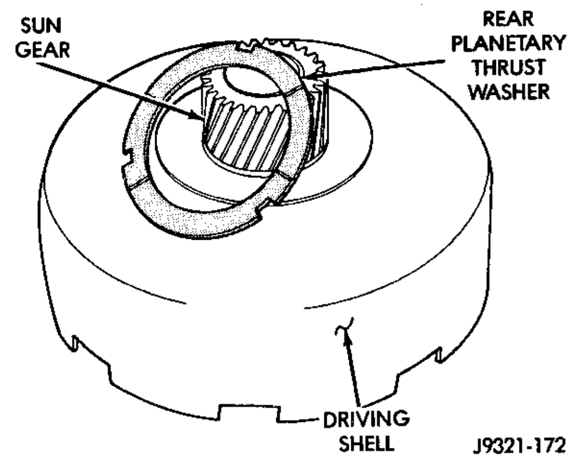

Fig. 176 Rear Planetary Thrust Washer Removal

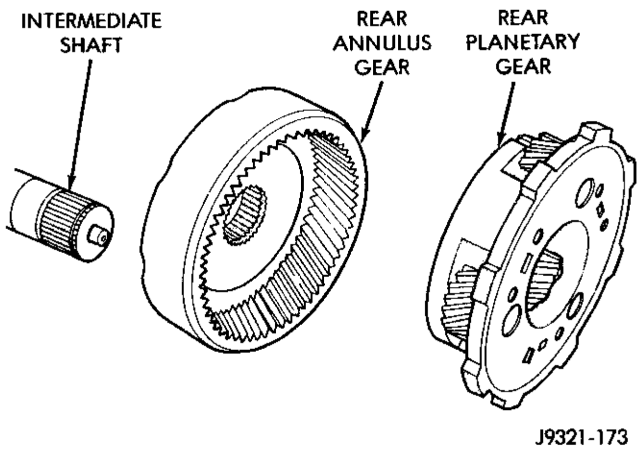

Fig. 177 Rear Planetary And Annulus Gear Removal

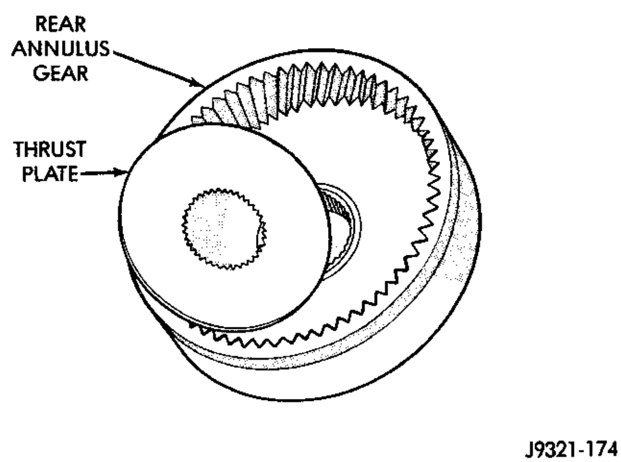

Fig. 178 Rear Annulus Thrust Plate Removal

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

ASSEMBLY

(1) Lubricate sun gear and planetary gears with transmission fluid during assembly. Use petroleum jelly to lubricate intermediate shaft bushing surfaces, thrust washers and thrust plates and to hold these parts in place during assembly.

(2) Install front snap ring on sun gear and install gear in driving shell. Then install thrust plate over sun gear and against rear side of driving shell (Fig. 179). Install rear snap ring to secure sun gear and thrust plate in driving shell.

(3) Install rear annulus gear on intermediate shaft (Fig. 180).

(4) Install thrust plate in annulus gear (Fig. 181). Be sure plate is seated on shaft splines and against gear.

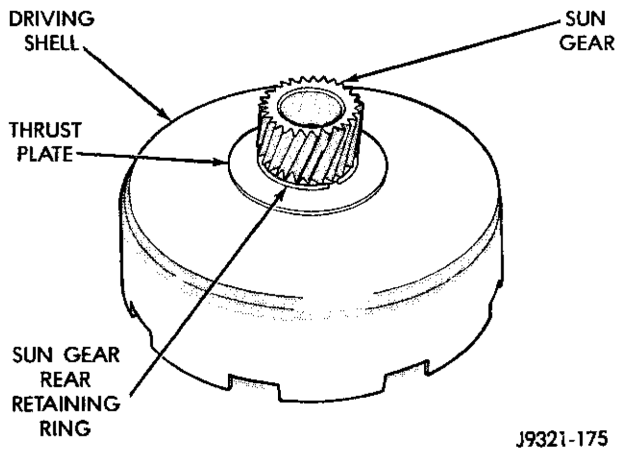

Fig. 179 Sun Gear Installation

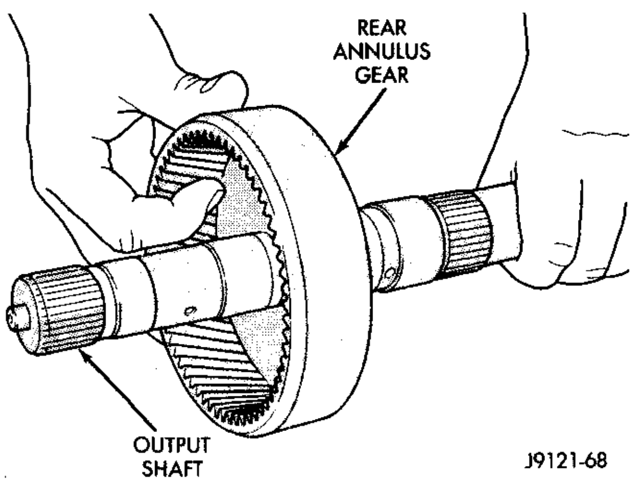

Fig. 180 Installing Rear Annulus Gear On Intermediate Shaft

(5) Install rear planetary gear in rear annulus gear (Fig. 182). Be sure planetary carrier is seated against annulus gear.

(6) Install tabbed thrust washer on front face of rear planetary gear (Fig. 183). Seat washer tabs in

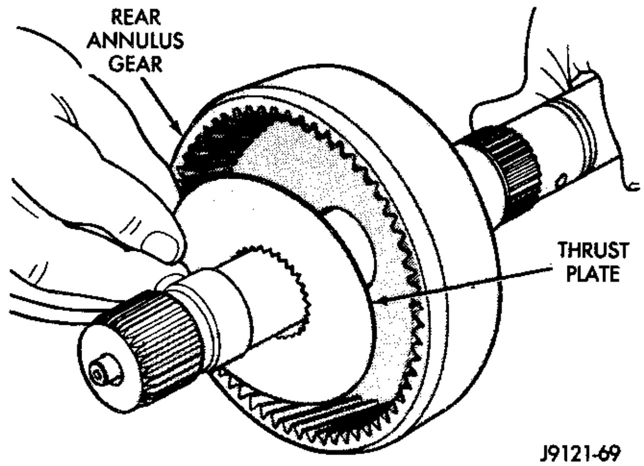

Fig. 181 Installing Rear Annulus Thrust Plate

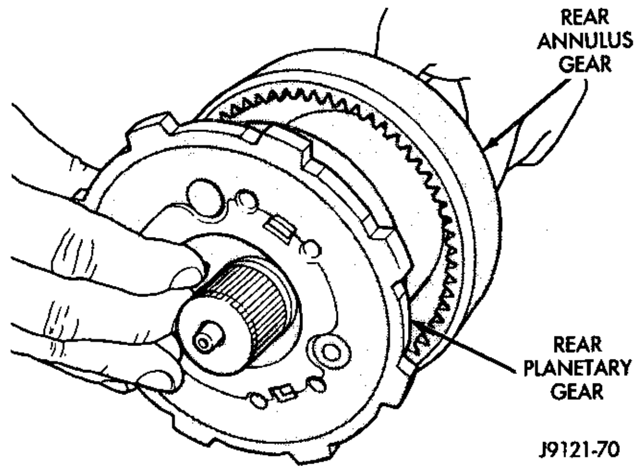

Fig. 182 Installing Rear Planetary Gear

matching slots in face of gear carrier. Use extra petroleum jelly to hold washer in place if desired.

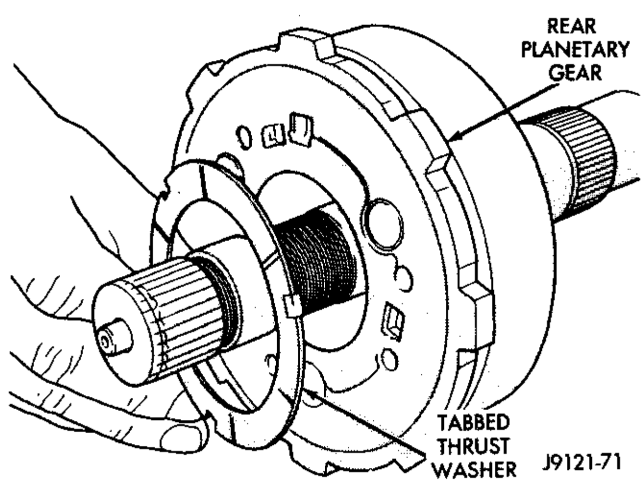

Fig. 183 Installing Rear Planetary Thrust Washer

DISASSEMBLY AND ASSEMBLY (Continued)

(7) Lubricate sun gear bushings with petroleum jelly or transmission fluid.

(8) Install sun gear and driving shell on intermediate shaft (Fig. 184). Seat shell against rear planetary gear. Verify that thrust washer on planetary gear was not displaced during installation.

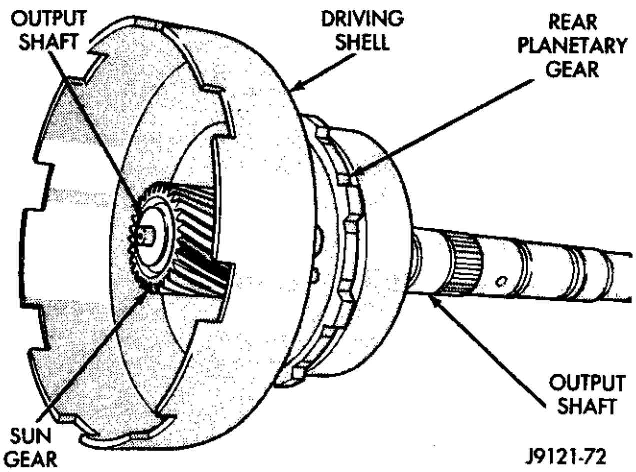

Fig. 184 Installing Sun Gear And Driving Shell

(9) Install tabbed thrust washer in driving shell (Fig. 185), be sure washer tabs are seated in tab slots of driving shell. Use extra petroleum jelly to hold washer in place if desired.

(10) Install tabbed thrust washer on front planetary gear (Fig. 186). Seat washer tabs in matching slots in face of gear carrier. Use extra petroleum jelly to hold washer in place if desired.

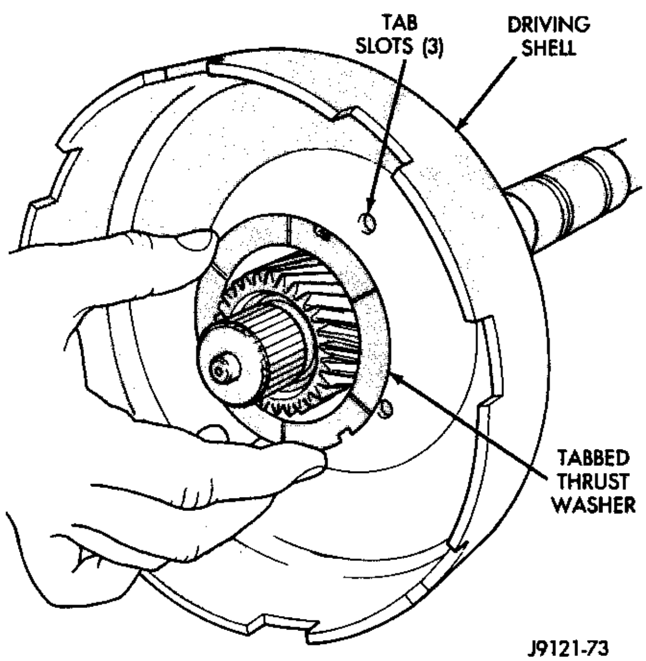

Fig. 185 Installing Driving Shell Thrust Washer

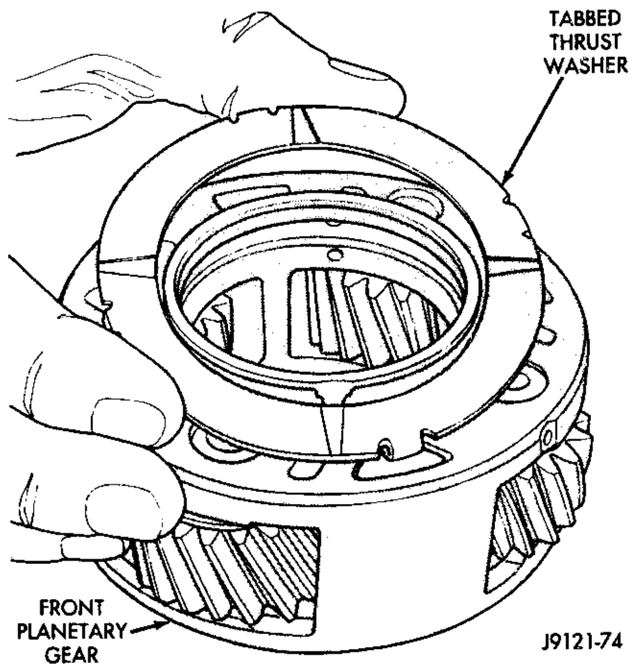

Fig. 186 Installing Thrust Washer On Front Planetary Gear

(11) Install front annulus gear over and onto front planetary gear (Fig. 187). Be sure gears are fully meshed and seated.

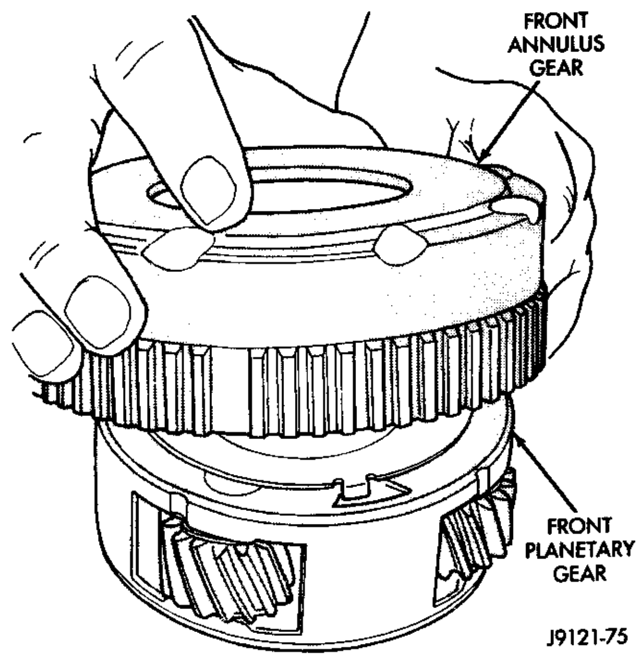

Fig. 187 Assembling Front Planetary And Annulus Gears

Mopar AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(12) Install front planetary and annulus gear assembly (Fig. 188). Hold gears together and slide them onto shaft. Be sure planetary pinions are seated on sun gear and that planetary carrier is seated on intermediate shaft.

(13) Place geartrain in upright position. Rotate gears to be sure all components are seated and properly assembled. Snap ring groove at forward end of intermediate shaft will be completely exposed when components are assembled correctly.

(14) Install new planetary snap ring in groove at end of intermediate shaft (Fig. 189).

(15) Turn planetary geartrain over. Position wood block under front end of intermediate shaft and support geartrain on shaft. Be sure all geartrain parts have moved forward against planetary snap ring. This is important for accurate end play check.

(16) Check planetary geartrain end play with feeler gauge (Fig. 190). Insert gauge between rear annulus gear and shoulder on intermediate shaft as shown. End play should be 0.15 to 1.22 mm (0.006 to 0.048 in.).

(17) If end play is incorrect, install thinner/thicker planetary snap ring as needed.

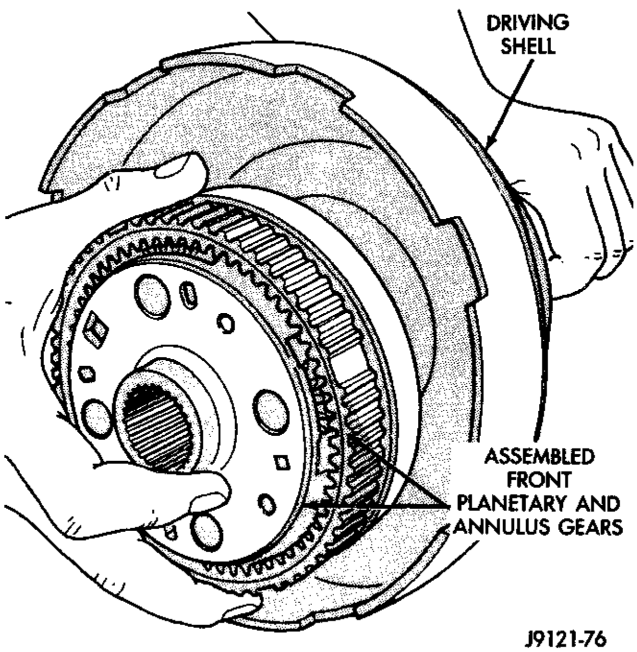

Fig. 188 Installing Front Planetary And Annulus Gear Assembly

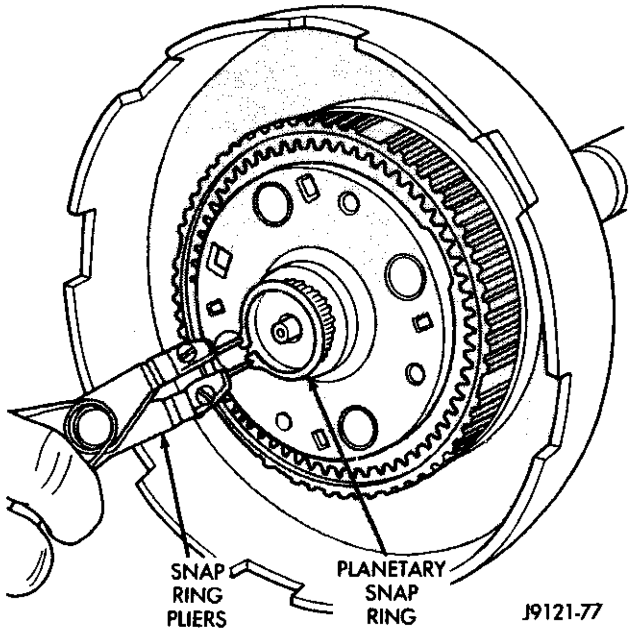

Fig. 189 Installing Planetary Snap Ring

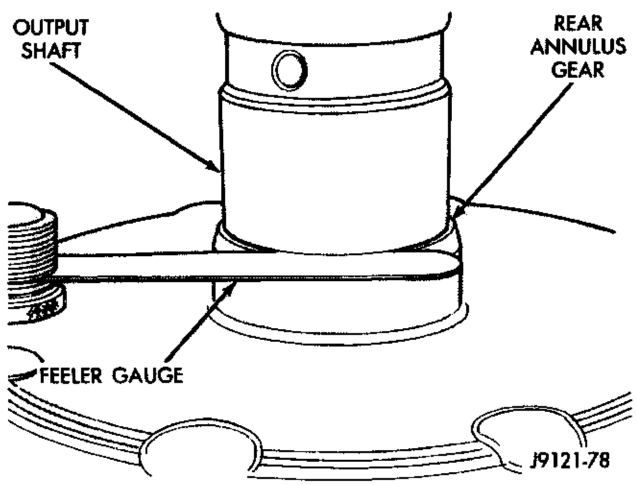

Fig. 190 Checking Planetary Geartrain End Play

DISASSEMBLY AND ASSEMBLY (Continued)

OVERDRIVE UNIT

DISASSEMBLY

(1) Remove transmission speed sensor and O-ring seal from overdrive case (Fig. 191).

(2) Remove overdrive piston thrust bearing (Fig. 192).

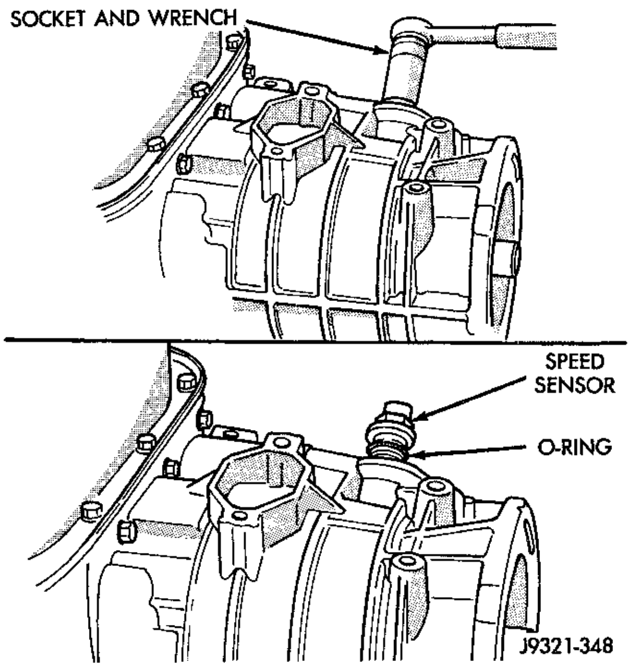

Fig. 191 Transmission Speed Sensor Removal/ Installation

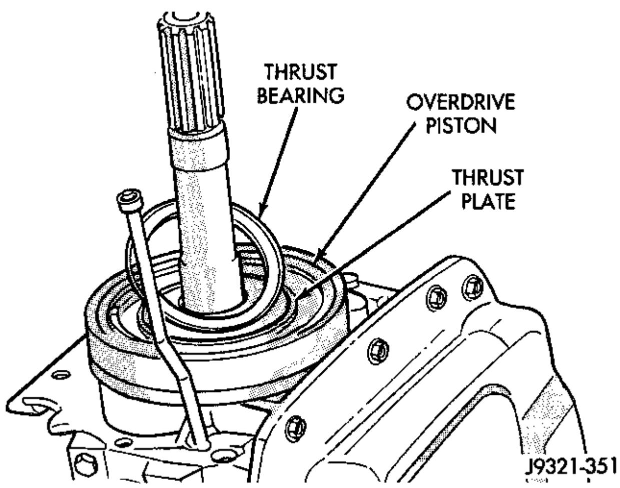

Fig. 192 Overdrive Piston Thrust Bearing Removal/ Installation

OVERDRIVE PISTON

(1) Remove overdrive piston thrust plate (Fig. 193). Retain thrust plate. It is a select fit part and may possibly be reused.

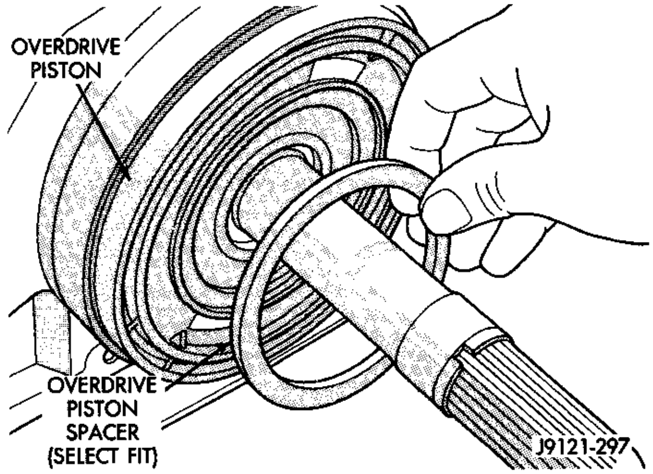

Fig. 193 Overdrive Piston Thrust Plate Removal/ Installation

(2) Remove intermediate shaft spacer (Fig. 194). Retain spacer. It is a select fit part and may possibly be reused.

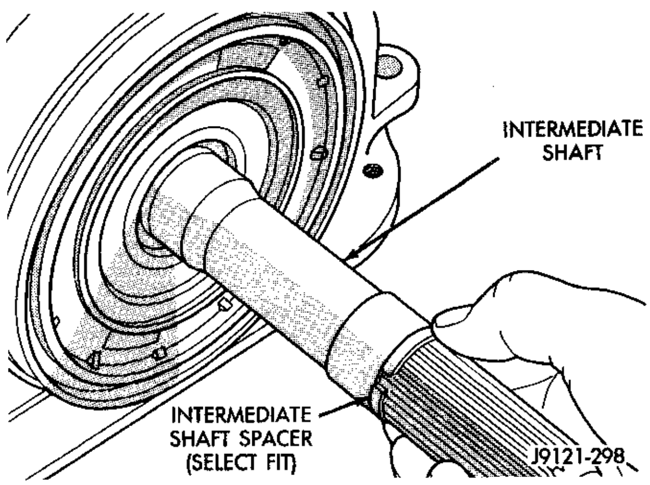

Fig. 194 Intermediate Shaft Spacer Location

(3) Remove overdrive piston from retainer (Fig. 195).

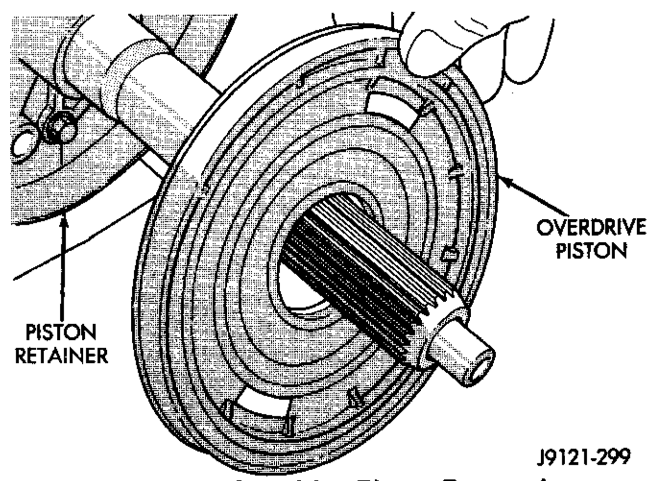

Fig. 195 Overdrive Piston Removal

mopar AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

OVERDRIVE CLUTCH PACK

NOTE: The overdrive clutch pack in the 46RE transmission uses 4 clutch discs. The overdrive clutch pack in the 47RE uses 5 discs.

(1) Remove overdrive clutch pack wire retaining ring (Fig. 196).

(2) Remove overdrive clutch pack (Fig. 197).

(3) Note position of clutch pack components for assembly reference (Fig. 198).

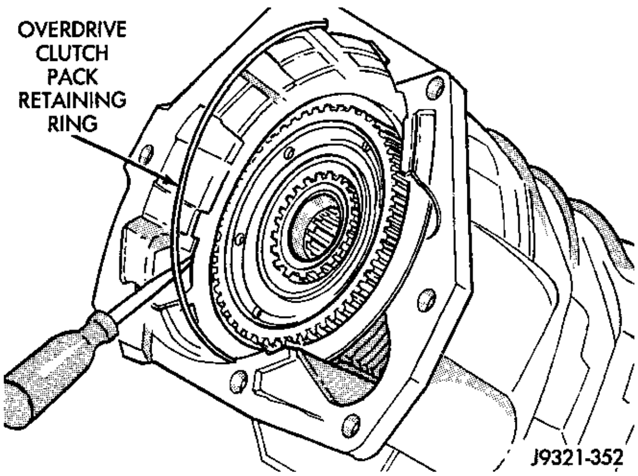

Fig. 196 Removing Overdrive Clutch Pack Retaining Ring

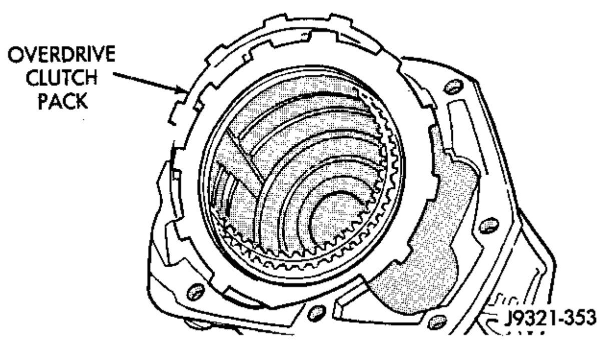

Fig. 197 Overdrive Clutch Pack Removal

OVERDRIVE GEARTRAIN

(1) Remove overdrive clutch wave spring (Fig. 199).

(2) Remove overdrive clutch reaction snap ring (Fig. 200). Note that snap ring is located in same groove as wave spring.

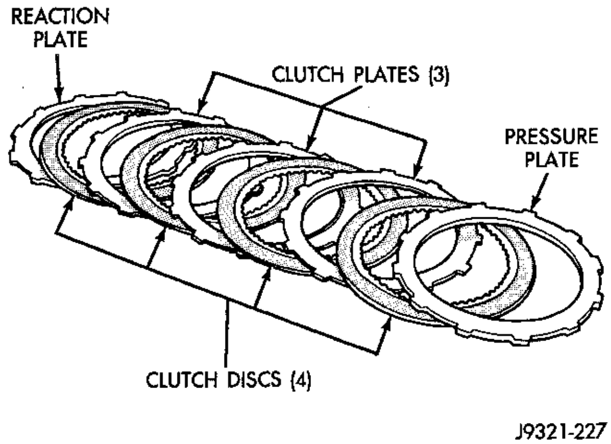

Fig. 198 46RE Overdrive Clutch Component Position

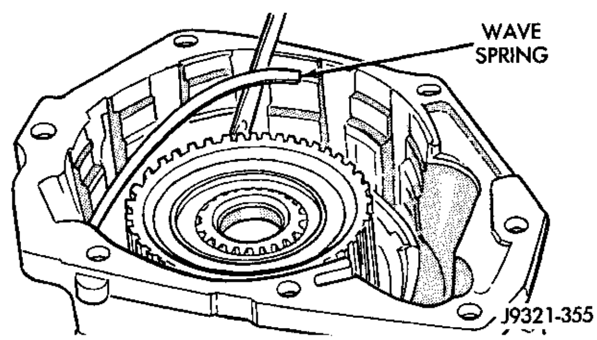

Fig. 199 Overdrive Clutch Wave Spring Removal/ Installation

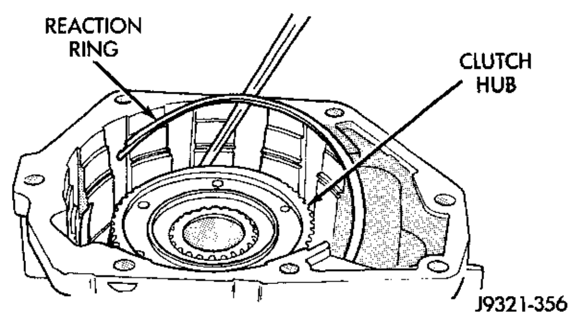

Fig. 200 Overdrive Clutch Reaction Snap Ring Removal/Installation

DISASSEMBLY AND ASSEMBLY (Continued)

(3) Remove Torx head screws that attach access cover and gasket to overdrive case (Fig. 201).

(4) Remove access cover and gasket (Fig. 202).

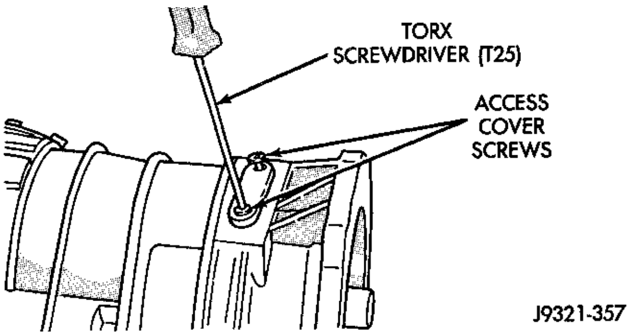

Fig. 201 Access Cover Screw Removal/Installation

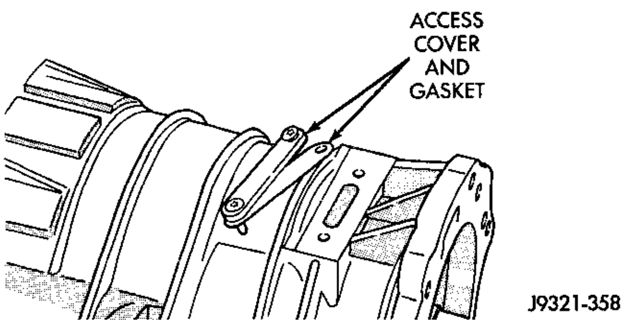

Fig. 202 Access Cover And Gasket Removal/ Installation

(5) Expand output shaft bearing snap ring with expanding-type snap ring pliers. Then push output shaft forward to release shaft bearing from locating ring (Fig. 203).

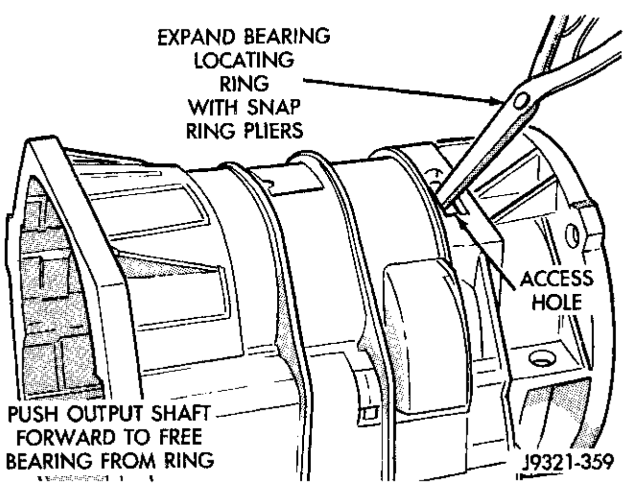

Fig. 203 Releasing Bearing From Locating Ring

(6) Lift gear case up and off geartrain assembly (Fig. 204).

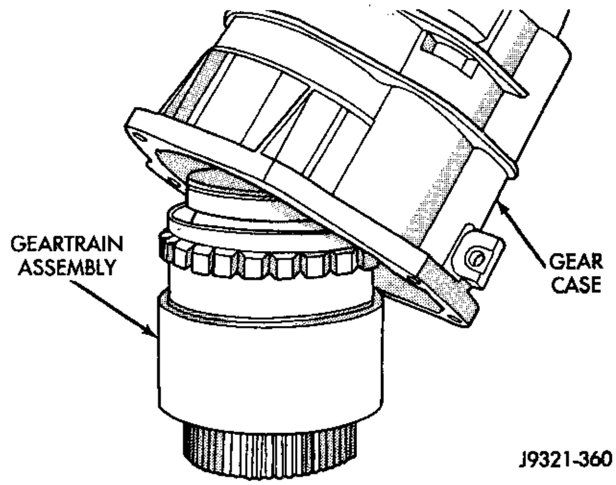

Fig. 204 Removing Gear Case From Geartrain Assembly

(7) Remove snap ring that retains rear bearing on output shaft.

(8) Remove rear bearing from output shaft (Fig. 205).

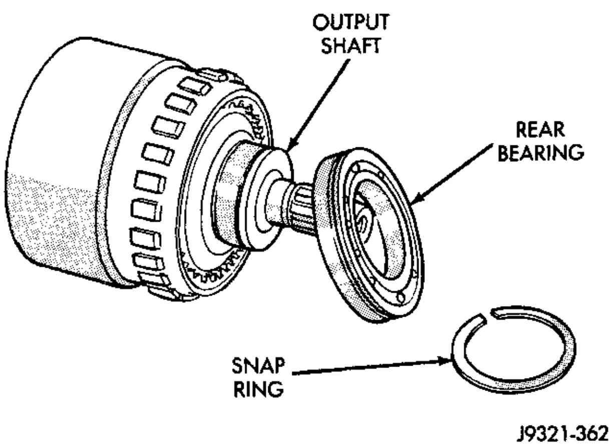

Fig. 205 Rear Bearing Removal

DISASSEMBLY AND ASSEMBLY (Continued)

DIRECT CLUTCH, HUB AND SPRING

NOTE: The direct clutch in the 46RE uses 8 clutch discs. The direct clutch in the 47RE uses 10 clutch discs.

WARNING: THE NEXT STEP IN DISASSEMBLY INVOLVES COMPRESSING THE DIRECT CLUTCH SPRING. IT IS EXTREMELY IMPORTANT THAT PROPER EQUIPMENT BE USED TO COMPRESS THE SPRING AS SPRING FORCE IS APPROXIMATELY 830 POUNDS. USE SPRING COMPRESSOR TOOL 6227-1 AND A HYDRAULIC SHOP PRESS WITH A MINIMUM RAM TRAVEL OF 5-6 INCHES. THE PRESS MUST ALSO HAVE A BED THAT CAN BE ADJUSTED UP OR DOWN AS REQUIRED. RELEASE CLUTCH SPRING TENSION SLOWLY AND COMPLETELY TO AVOID PERSONAL INJURY.

(1) Mount geartrain assembly in shop press (Fig. 206).

(2) Position Compressor Tool 6227-1 on clutch hub (Fig. 206). Support output shaft flange with steel press plates as shown and center assembly under press ram.

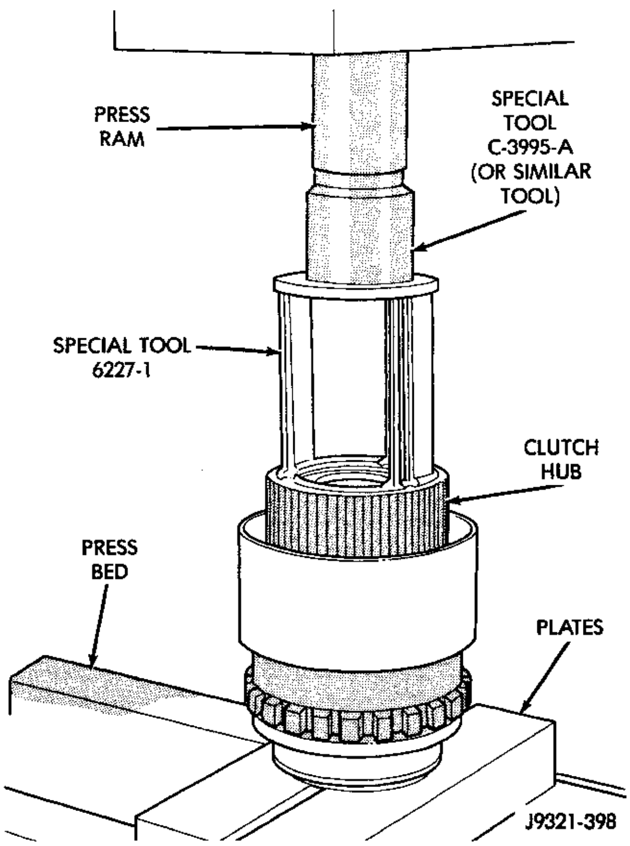

Fig. 206 Geartrain Mounted In Shop Press

(3) Apply press pressure slowly. Compress hub and spring far enough to expose clutch hub retaining ring and relieve spring pressure on clutch pack snap ring (Fig. 206).

(4) Remove direct clutch pack snap ring (Fig. 207).

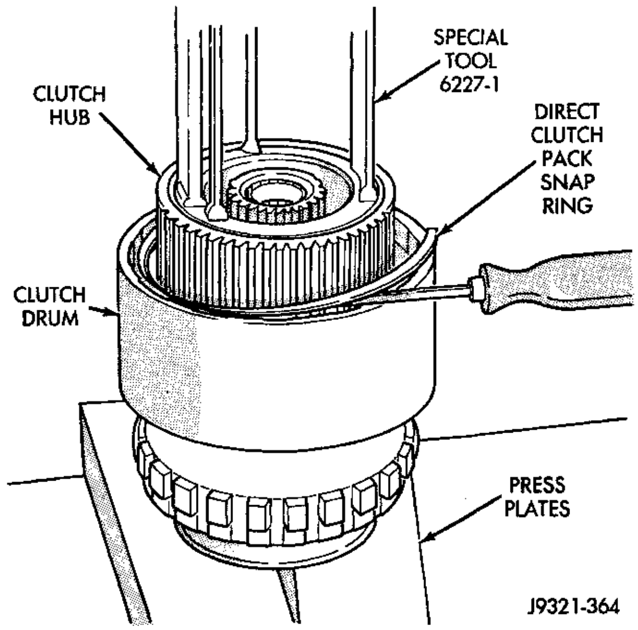

Fig. 207 Direct Clutch Pack Snap Ring Removal

(5) Remove direct clutch hub retaining ring (Fig. 208).

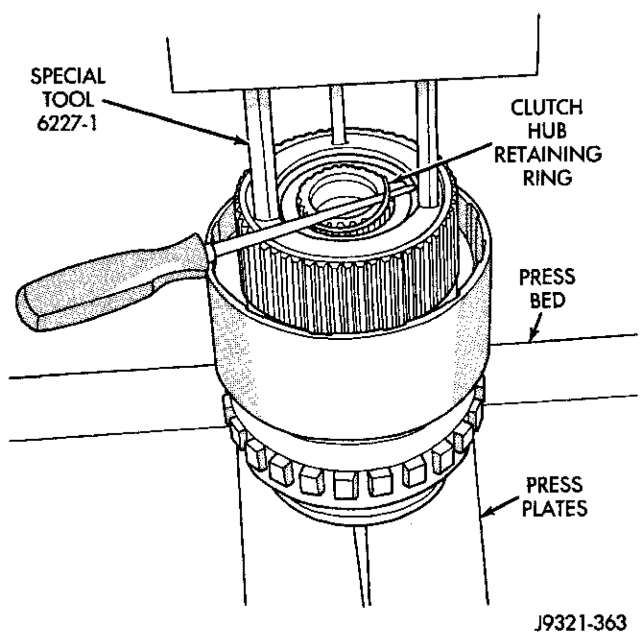

Fig. 208 Direct Clutch Hub Retaining Ring Removal

DISASSEMBLY AND ASSEMBLY (Continued)

(6) Release press load slowly and completely (Fig. 209).

(7) Remove Special Tool 6227-1. Then remove clutch pack from hub (Fig. 209).

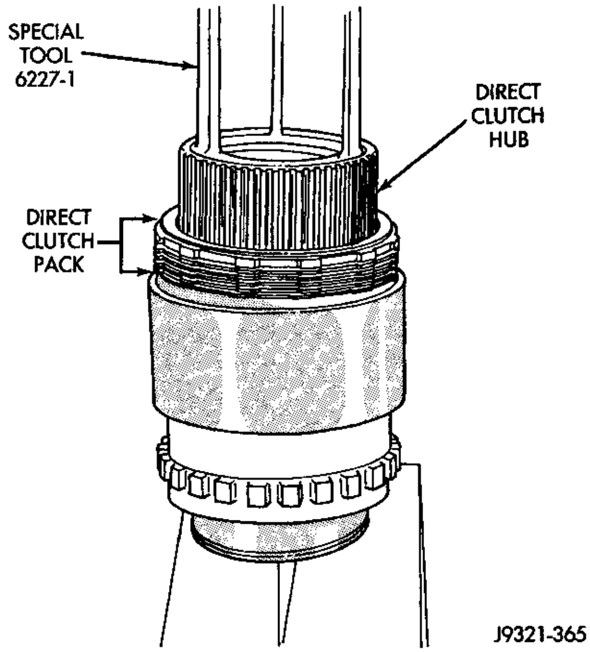

Fig. 209 Direct Clutch Pack Removal

Geartrain

(1) Remove direct clutch hub and spring (Fig. 210).

(2) Remove sun gear and spring plate. Then remove planetary thrust bearing and planetary gear (Fig. 211).

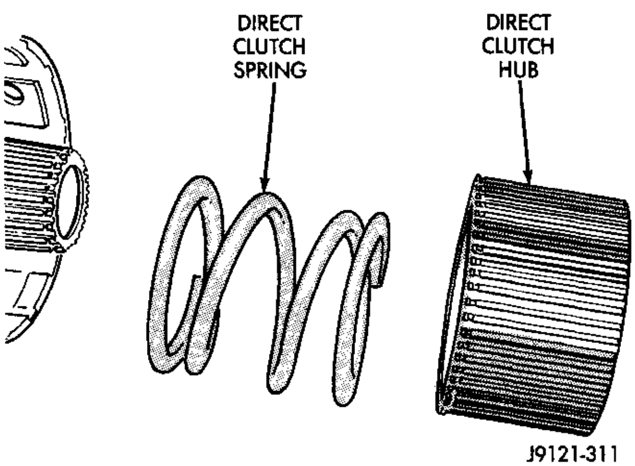

Fig. 210 Direct Clutch Hub And Spring Removal

(3) Remove overrunning clutch assembly with expanding type snap ring pliers (Fig. 212). Insert pliers into clutch hub. Expand pliers to grip hub splines and remove clutch with counterclockwise, twisting motion.

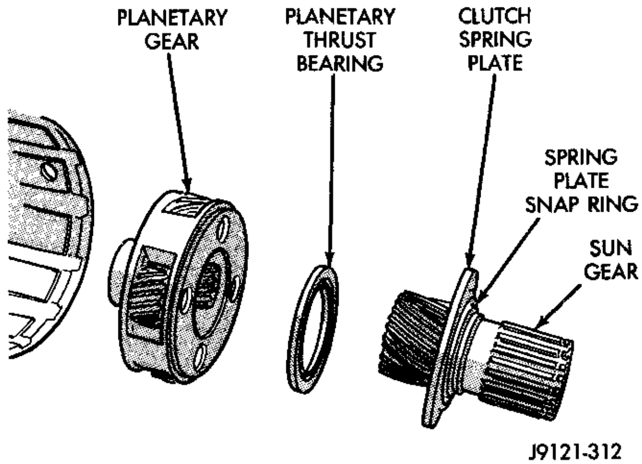

Fig. 211 Removing Sun Gear, Thrust Bearing And Planetary Gear

(4) Remove thrust bearing from overrunning clutch hub.

(5) Remove overrunning clutch from hub.

(6) Mark position of annulus gear and direct clutch drum for assembly alignment reference (Fig. 213). Use small center punch or scriber to make alignment marks.

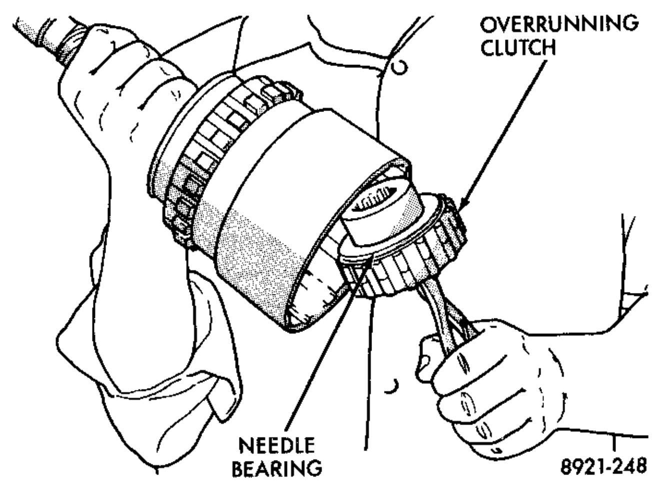

Fig. 212 Overrunning Clutch Assembly Removal/ Installation

(7) Remove direct clutch drum rear retaining ring (Fig. 214).

(8) Remove direct clutch drum outer retaining ring (Fig. 215).

(9) Mark annulus gear and output shaft for assembly alignment reference (Fig. 216). Use punch or scriber to mark gear and shaft.

(10) Remove snap ring that secures annulus gear on output shaft (Fig. 217). Use two screwdrivers to unseat and work snap ring out of groove as shown.

DISASSEMBLY AND ASSEMBLY (Continued)

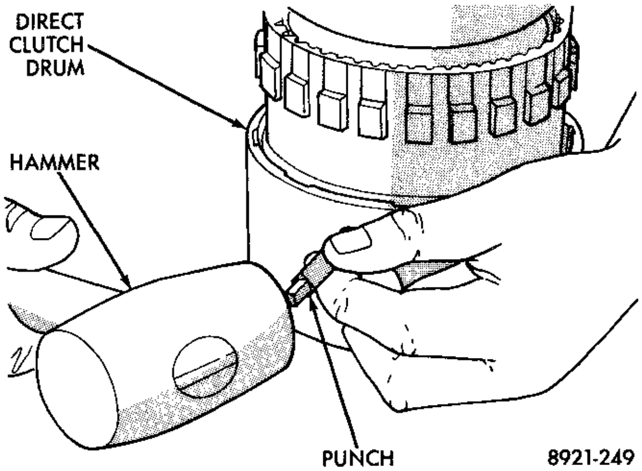

Fig. 213 Marking Direct Clutch Drum And Annulus Gear For Assembly Alignment

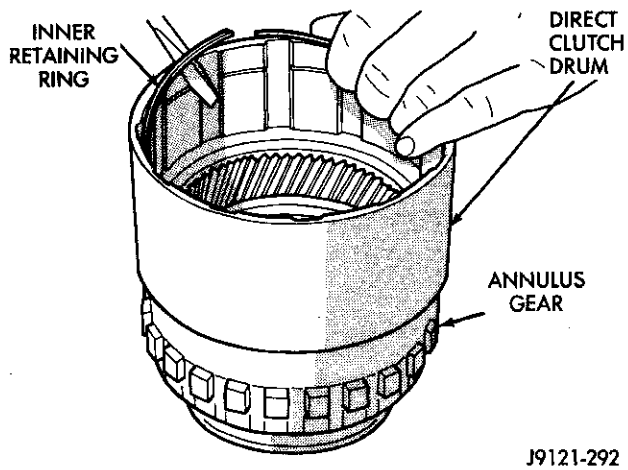

Fig. 214 Clutch Drum Inner Retaining Ring Removal

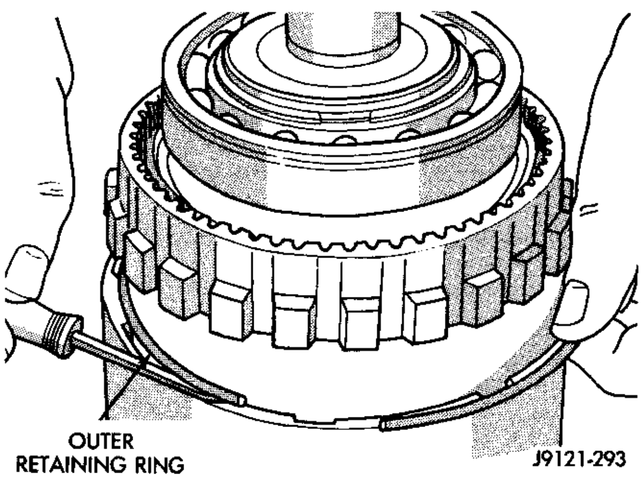

Fig. 215 Clutch Drum Outer Retaining Ring Removal

(11) Remove annulus gear from output shaft (Fig. 218). Use rawhide or plastic mallet to tap gear off shaft.

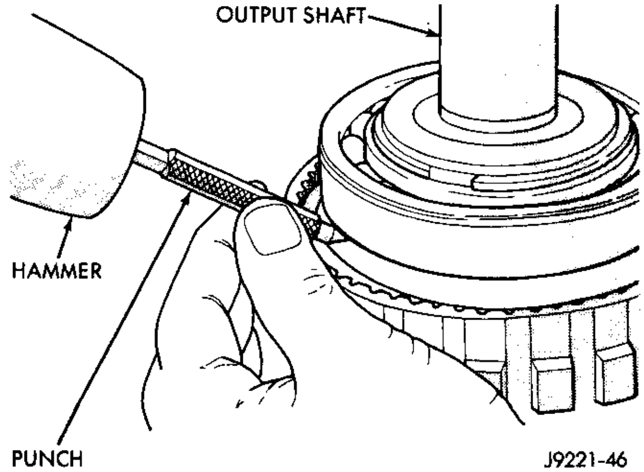

Fig. 216 Marking Annulus Gear And Output Shaft For Assembly Alignment

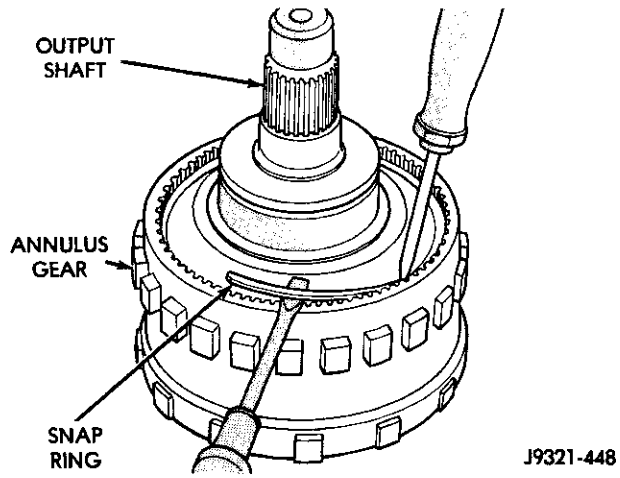

Fig. 217 Annulus Gear Snap Ring Removal

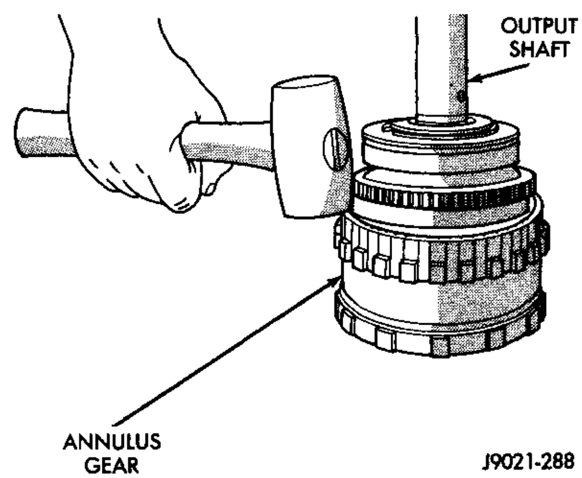

Fig. 218 Annulus Gear Removal

DISASSEMBLY AND ASSEMBLY (Continued)

GEAR CASE AND PARK LOCK

(1) Remove locating ring from gear case.
(2) Remove park pawl shaft retaining bolt and remove shaft, pawl and spring.
(3) Remove reaction plug snap ring and remove reaction plug.
(4) Remove output shaft seal.

ASSEMBLY

GEARTRAIN AND DIRECT CLUTCH

(1) Soak direct clutch and overdrive clutch discs in Mopar® ATF Plus transmission fluid. Allow discs to soak for 10-20 minutes.
(2) Install new pilot bushing and clutch hub bushing in output shaft if necessary (Fig. 219). Lubricate bushings with petroleum jelly, or transmission fluid.

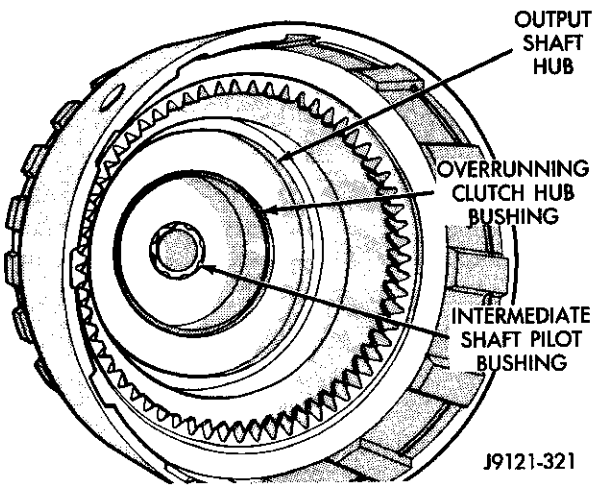

Fig. 219 Output Shaft Pilot Bushing

(3) Install annulus gear on output shaft, if removed. Then install annulus gear retaining snap ring (Fig. 220).
(4) Align and install clutch drum on annulus gear (Fig. 221). Be sure drum is engaged in annulus gear lugs.
(5) Install clutch drum outer retaining ring (Fig. 221).
(6) Slide clutch drum forward and install inner retaining ring (Fig. 222).

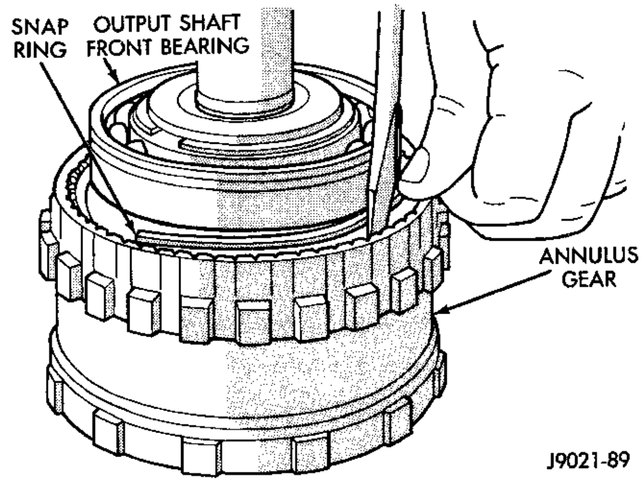

Fig. 220 Annulus Gear Installation

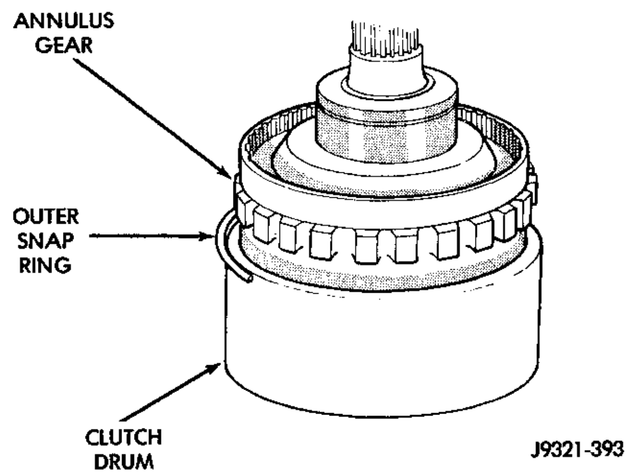

Fig. 221 Clutch Drum And Outer Retaining Ring Installation

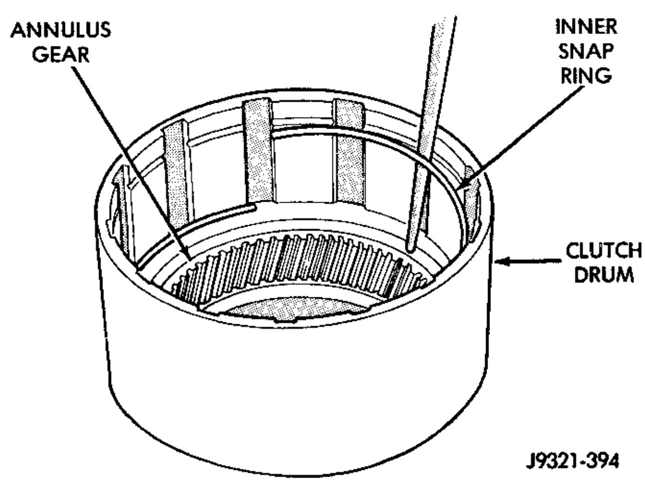

Fig. 222 Clutch Drum Inner Retaining Ring Installation

DISASSEMBLY AND ASSEMBLY (Continued)

(7) Install rear bearing and snap ring on output shaft (Fig. 223). Be sure locating ring groove in bearing is toward rear.

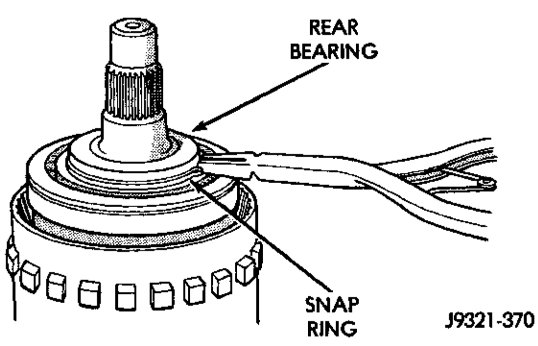

Fig. 223 Rear Bearing And Snap Ring Installation

(8) Install overrunning clutch on hub (Fig. 224). **Note that clutch only fits one way. Shoulder on clutch should seat in small recess at edge of hub.**

(9) Install thrust bearing on overrunning clutch hub. Use generous amount of petroleum jelly to hold bearing in place for installation. **Bearing fits one way only. Be sure bearing is seated squarely against hub. Reinstall bearing if it does not seat squarely.**

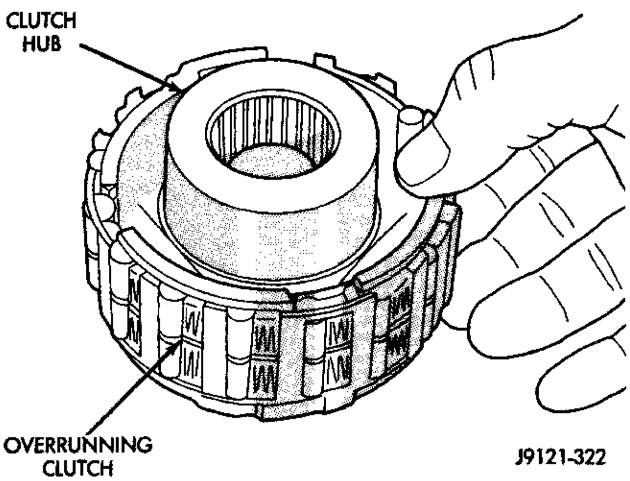

Fig. 224 Assembling Overrunning Clutch And Hub

(10) Install overrunning clutch in output shaft (Fig. 225). Insert snap ring pliers in hub splines. Expand pliers to grip hub. Then install assembly with counterclockwise, twisting motion.

(11) Install planetary gear in annulus gear (Fig. 226). **Be sure planetary pinions are fully seated in annulus gear before proceeding.**

(12) Coat planetary thrust bearing and bearing contact surface of spring plate with generous amount of petroleum jelly. This will help hold bearing in place during installation.

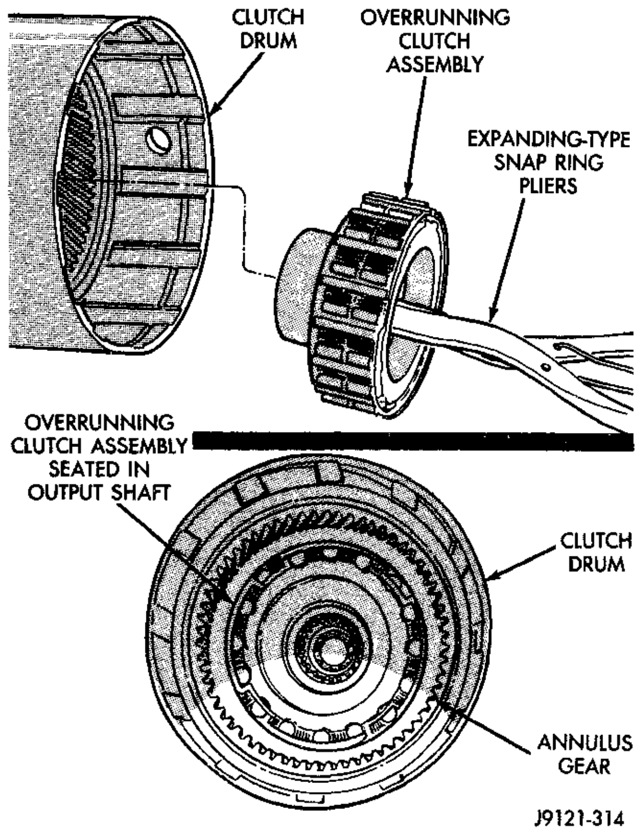

Fig. 225 Overrunning Clutch Installation

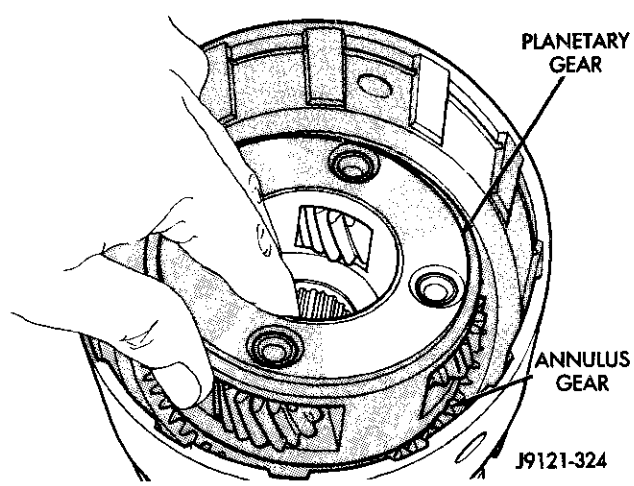

Fig. 226 Planetary Gear Installation

DISASSEMBLY AND ASSEMBLY (Continued)

(13) Install planetary thrust bearing on sun gear (Fig. 227). Slide bearing onto gear and seat it against spring plate as shown. **Bearing fits one way only. If it does not seat squarely against spring plate, remove and reposition bearing.**

(14) Install assembled sun gear, spring plate and thrust bearing (Fig. 228). Be sure sun gear and thrust bearing are fully seated before proceeding.

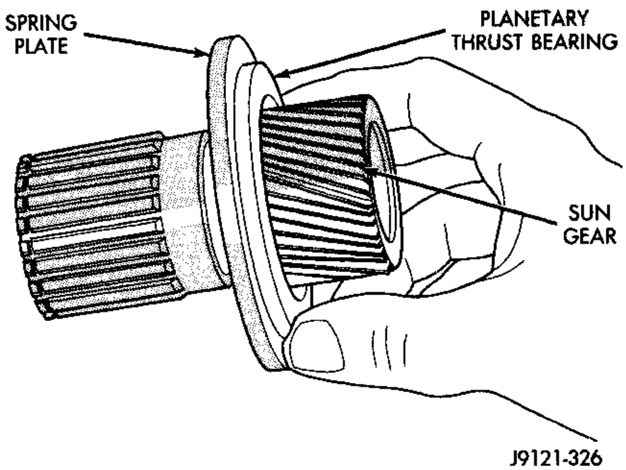

Fig. 227 Planetary Thrust Bearing Installation

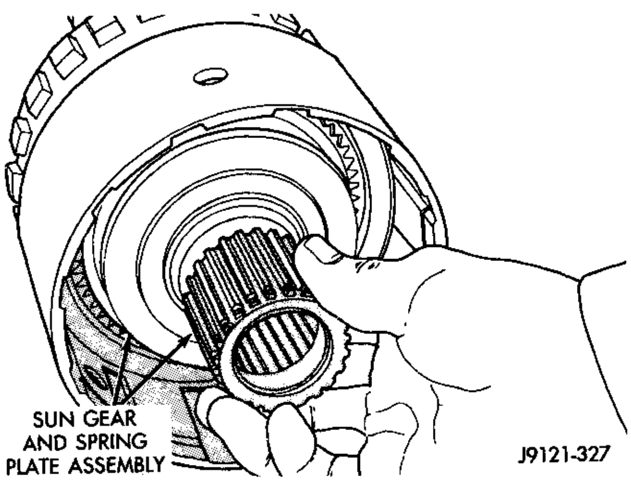

Fig. 228 Sun Gear Installation

(15) Mount assembled output shaft, annulus gear, and clutch drum in shop press. Direct clutch spring, hub and clutch pack are easier to install with assembly mounted in press.

(16) Align splines in hubs of planetary gear and overrunning clutch with Alignment tool 6227-2 (Fig. 229). Insert tool through sun gear and into splines of both hubs. Be sure alignment tool is fully seated before proceeding.

(17) Install direct clutch spring (Fig. 230). Be sure spring is properly seated on spring plate.

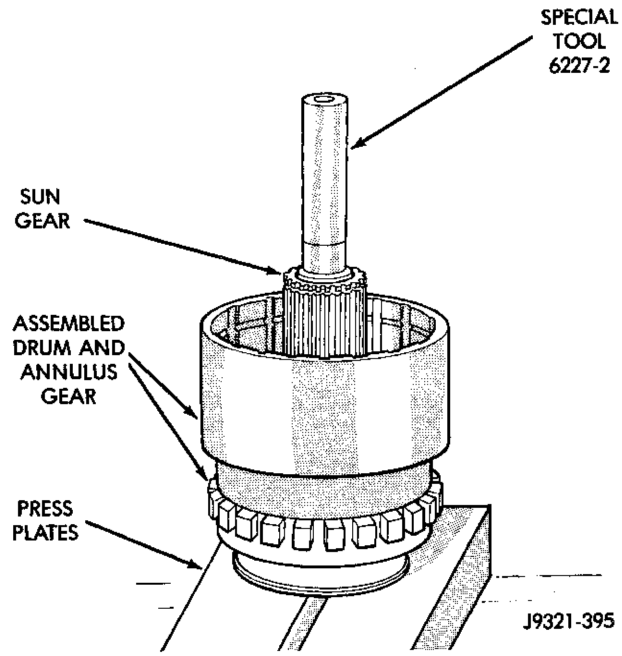

Fig. 229 Alignment Tool Installation

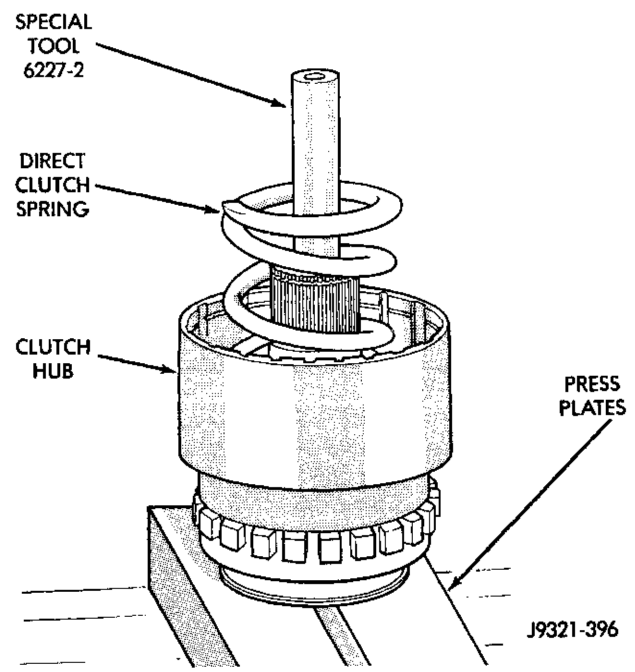

Fig. 230 Direct Clutch Spring Installation

NOTE: The direct clutch in the 46RE uses 8 clutch discs. The direct clutch in the 47RE uses 10 clutch discs.

(18) Assemble and install direct clutch pack on hub as follows:

(a) Assemble clutch pack components (Fig. 231).

(b) Install direct clutch reaction plate on clutch hub first. **Note that one side of reaction plate**

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

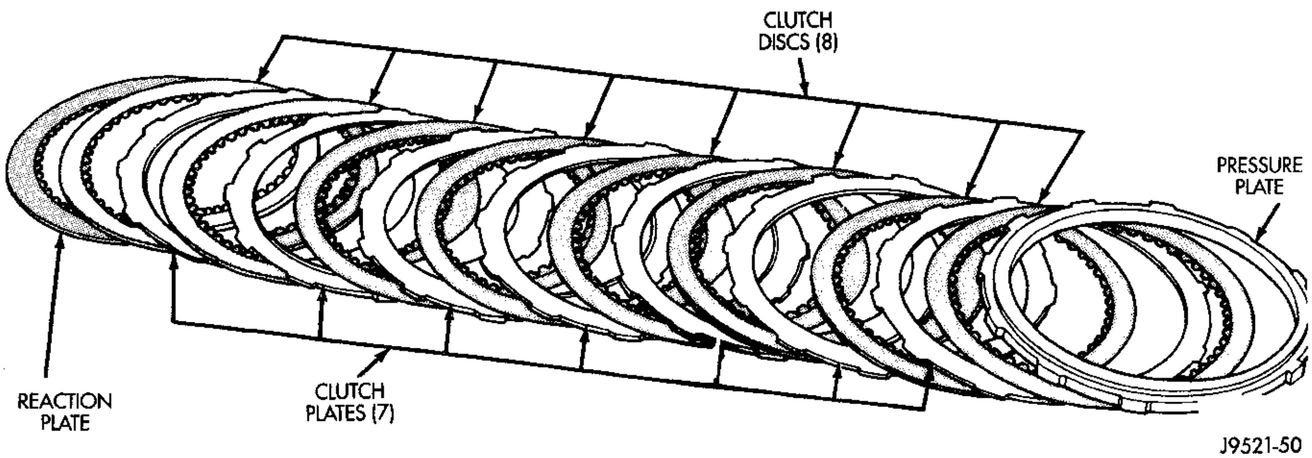

Fig. 231 46RE Direct Clutch Pack Components

is counterbored. Be sure this side faces rearward. Splines at rear of hub are raised slightly. Counterbore in plate fits over raised splines. Plate should be flush with this end of hub (Fig. 232).

(c) Install first clutch disc followed by a steel plate until all discs and plates have been installed.

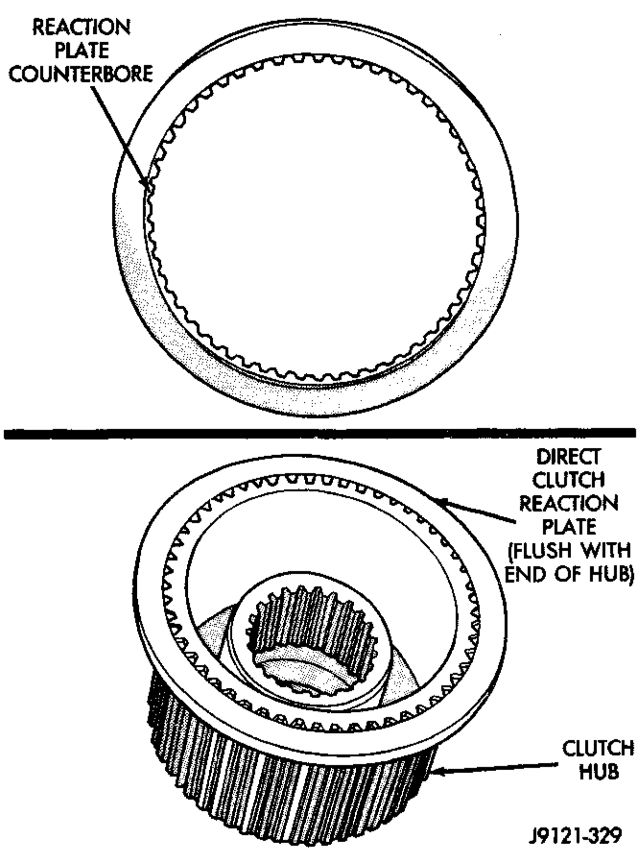

Fig. 232 Correct Position Of Direct Clutch Reaction Plate

(d) Install pressure plate. This is last clutch pack item to be installed. **Be sure plate is installed with shoulder side facing upward (Fig. 233).**

(19) Install clutch hub and clutch pack on direct clutch spring (Fig. 234). **Be sure hub is started on sun gear splines before proceeding.**

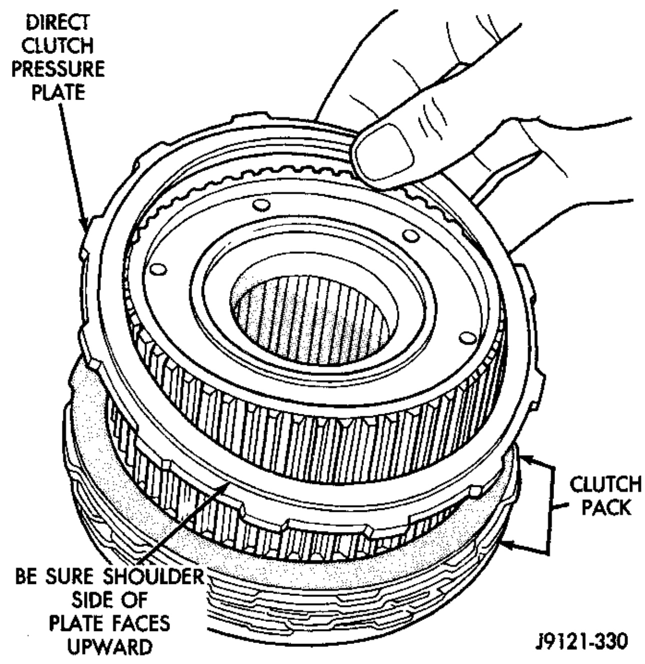

Fig. 233 Correct Position Of Direct Clutch Pressure Plate

DISASSEMBLY AND ASSEMBLY (Continued)

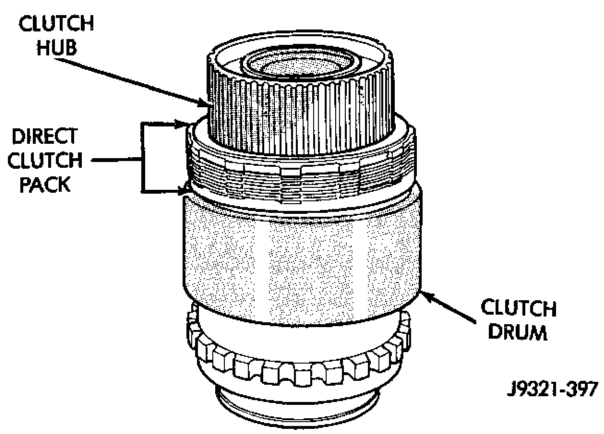

Fig. 234 Direct Clutch Pack And Clutch Hub Installation

WARNING: THE NEXT STEP IN GEARTRAIN ASSEMBLY INVOLVES COMPRESSING THE DIRECT CLUTCH HUB AND SPRING. IT IS EXTREMELY IMPORTANT THAT PROPER EQUIPMENT BE USED TO COMPRESS THE SPRING AS SPRING FORCE IS APPROXIMATELY 830 POUNDS. USE COMPRESSOR TOOL C-6227-1 AND A HYDRAULIC-TYPE SHOP PRESS WITH A MINIMUM RAM TRAVEL OF 6 INCHES. THE PRESS MUST ALSO HAVE A BED THAT CAN BE ADJUSTED UP OR DOWN AS REQUIRED. RELEASE CLUTCH SPRING TENSION SLOWLY AND COMPLETELY TO AVOID PERSONAL INJURY.

(20) Position Compressor Tool 6227-1 on clutch hub.

(21) Compress clutch hub and spring just enough to place tension on hub and hold it in place.

(22) Slowly compress clutch hub and spring. Compress spring and hub only enough to expose ring grooves for clutch pack snap ring and clutch hub retaining ring.

(23) Realign clutch pack on hub and seat clutch discs and plates in clutch drum.

(24) Install direct clutch pack snap ring (Fig. 235). **Be very sure snap ring is fully seated in clutch drum ring groove.**

(25) Install clutch hub retaining ring (Fig. 236). **Be very sure retaining ring is fully seated in sun gear ring groove.**

(26) Slowly release press ram, remove compressor tools and remove geartrain assembly.

GEAR CASE

(1) Position park pawl and spring in case and install park pawl shaft. Verify that end of spring with 90° bend is hooked to pawl and straight end of spring is seated against case.

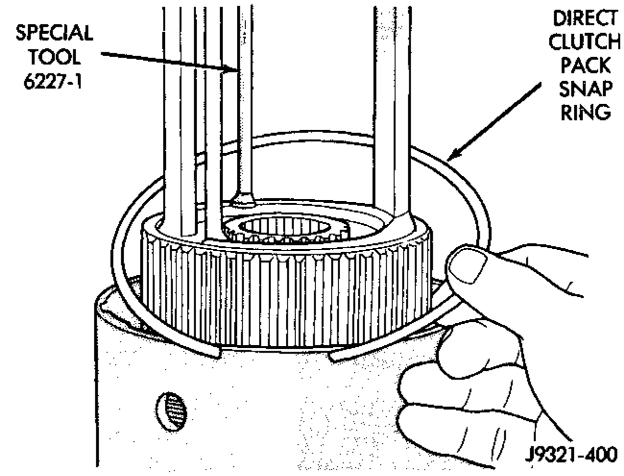

Fig. 235 Direct Clutch Pack Snap Ring Installation

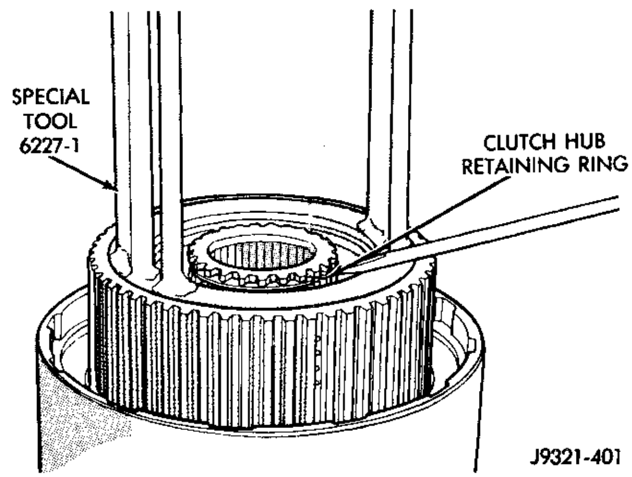

Fig. 236 Clutch Hub Retaining Ring Installation

(2) Install pawl shaft retaining bolt. Tighten bolt to 27 N·m (20 ft. lbs.) torque.

(3) Install park lock reaction plug. **Note that plug has locating pin at rear (Fig. 237). Be sure pin is seated in hole in case before installing snap ring.**

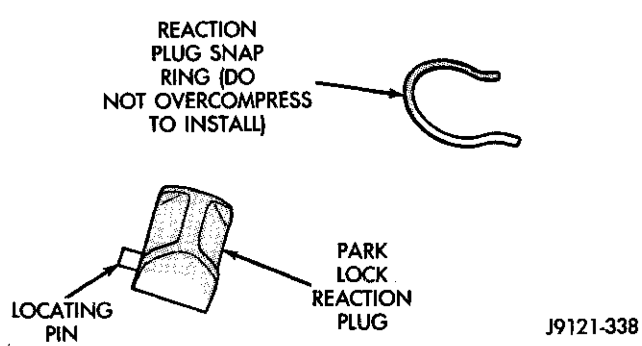

Fig. 237 Reaction Plug Locating Pin And Snap-Ring

DISASSEMBLY AND ASSEMBLY (Continued)

(4) Install reaction plug snap-ring (Fig. 238). **Compress snap ring only enough for installation; do not distort it.**

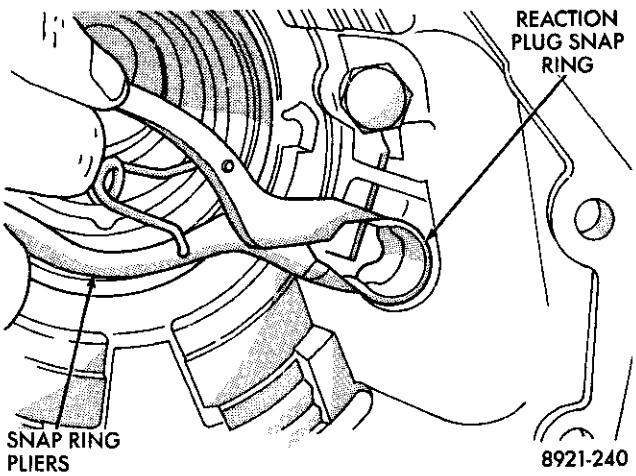

Fig. 238 Reaction Plug And Snap-Ring Installation

(5) Install new seal in gear case. Use Handle C-4171 and Installer C-3995-A to seat seal in case.

(6) Verify that tab ends of rear bearing locating ring extend into access hole in gear case (Fig. 239).

(7) Support geartrain on Tool 6227-1 (Fig. 240). Be sure tool is securely seated in clutch hub.

(8) Install overdrive gear case on geartrain (Fig. 240).

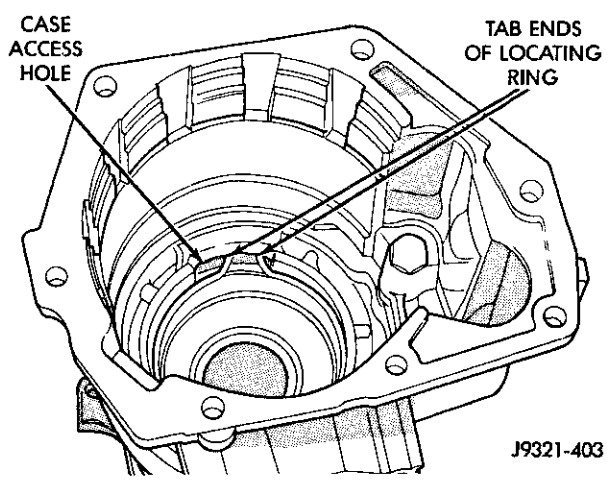

Fig. 239 Correct Rear Bearing Locating Ring Position

(9) Expand front bearing locating ring with snap ring pliers (Fig. 241). Then slide case downward until locating ring locks in bearing groove and release snap ring.

(10) Install locating ring access cover and gasket in overdrive unit case (Fig. 242).

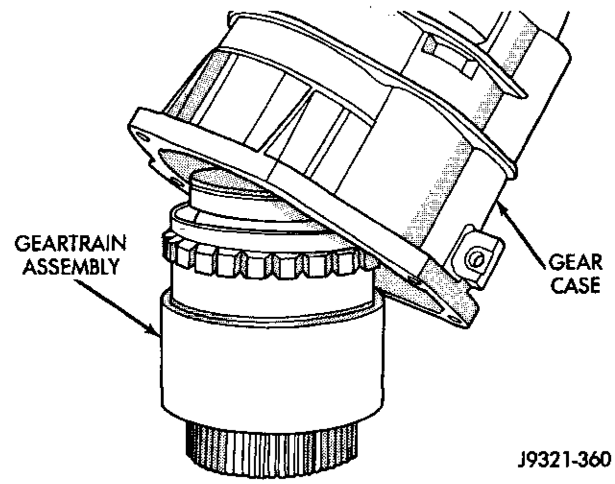

Fig. 240 Overdrive Gear Case Installation

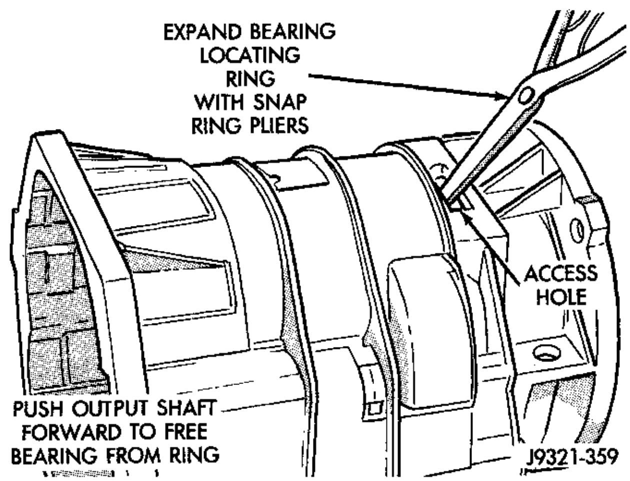

Fig. 241 Seating Locating Ring In Rear Bearing

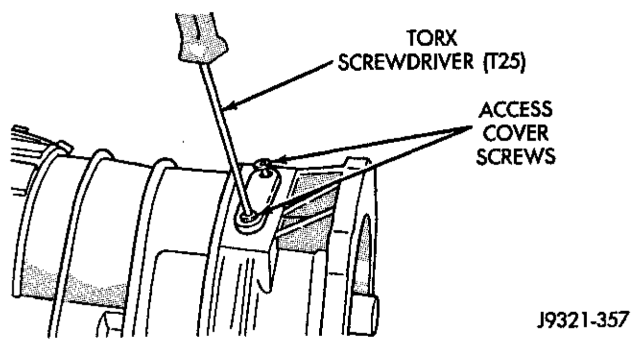

Fig. 242 Locating Ring Access Cover And Gasket Installation

OVERDRIVE CLUTCH

NOTE: The overdrive clutch pack in the 46RE transmission uses 4 clutch discs. The overdrive clutch pack in the 47RE uses 5 discs.

DISASSEMBLY AND ASSEMBLY (Continued)

(1) Install overdrive clutch reaction ring first. Reaction ring is flat with notched ends (Fig. 243).

(2) Install wave spring on top of reaction ring (Fig. 244). **Reaction ring and wave ring both fit in same ring groove.** Use screwdriver to seat each ring securely in groove. Also ensure that the ends of the two rings are offset from each other.

(3) Assemble overdrive clutch pack (Fig. 245).

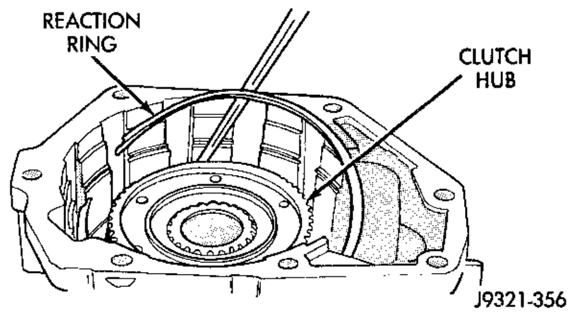

Fig. 243 Overdrive Clutch Reaction Ring Installation

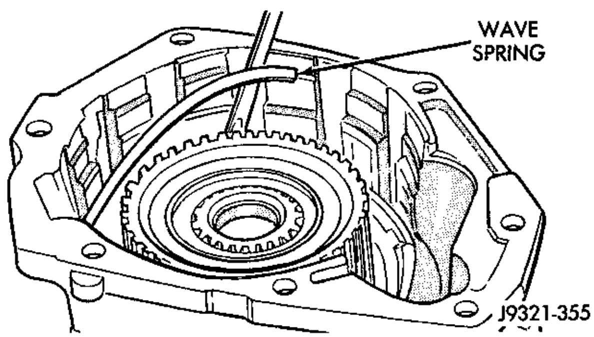

Fig. 244 Overdrive Clutch Wave Spring Installation

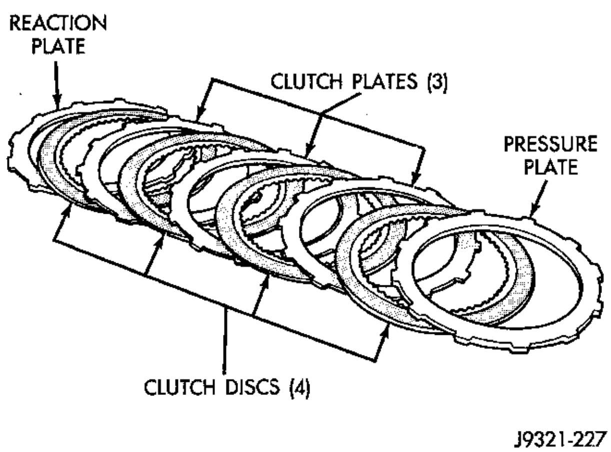

Fig. 245 46RE Overdrive Clutch Components

(4) Install overdrive clutch reaction plate first.

(5) Install first clutch disc followed by first clutch plate. Then install remaining clutch discs and plates in same order.

(6) Install clutch pack pressure plate.

(7) Install clutch pack wire-type retaining ring (Fig. 246).

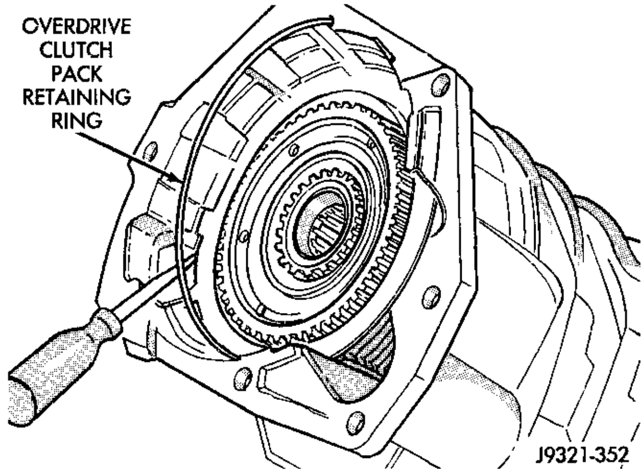

Fig. 246 Overdrive Clutch Pack Retaining Ring Installation

INTERMEDIATE SHAFT SPACER SELECTION

(1) Place overdrive unit in vertical position. Mount it on blocks, or in workbench with appropriate size mounting hole cut into it. Be sure unit is facing upward for access to direct clutch hub. Also be sure output shaft is not loaded and internal components are moved rearward for accurate measurement.

(2) Determine correct thickness intermediate shaft spacer as follows:

(a) Insert Special Tool 6312 through sun gear, planetary gear and into pilot bushing in output shaft. Be sure tool bottoms against planetary shoulder.

(b) Position Gauge Tool 6311 across face of overdrive case (Fig. 247). Then position Dial Caliper C-4962 over gauge tool.

(c) Extend sliding scale of dial caliper downward through gauge tool slot until scale contacts end of Gauge Alignment Tool 6312. Lock scale in place. Remove dial caliper tool and note distance measured (Fig. 247).

(d) Select proper thickness end play spacer from spacer chart based on distance measured (Fig. 248).

(e) Remove Gauge Alignment Tool 6312.

OD THRUST PLATE SELECTION

(1) Place overdrive unit in vertical position. Mount it on blocks, or in workbench with appropriate size mounting hole cut into it. Be sure unit is facing upward for access to direct clutch hub. Also be sure output shaft is not loaded and internal components are moved rearward for accurate measurement.

(2) Determine correct thickness overdrive piston thrust plate as follows:

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

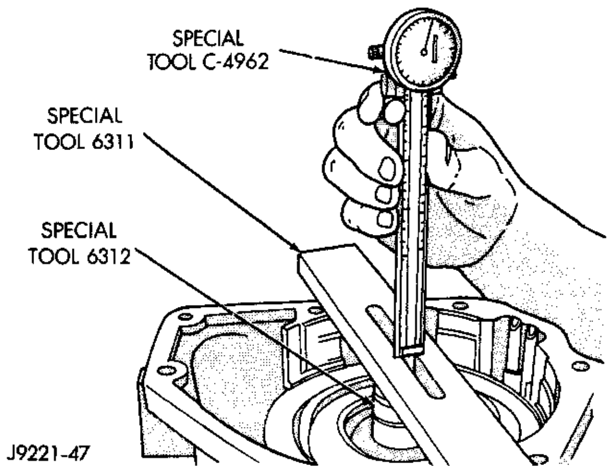

Fig. 247 Shaft End Play Measurement

End Play Measurement (Inches)	Spacer Thickness (Inches)
.7336 - .7505	.158 - .159
.7506 - .7675	.175 - .176
.7676 - .7855	.193 - .194
.7856 - .8011	.211 - .212

J9121-341

Fig. 248 Intermediate Shaft End Play Spacer Selection

(a) Position Gauge Tool 6311 across face of overdrive case. Then position Dial Caliper C-4962 over gauge tool (Fig. 249).

(b) Measure distance to clutch hub thrust bearing seat at four points 90° apart. Then average measurements by adding them and dividing by 4.

(c) Select and install required thrust plate from information in thrust plate chart (Fig. 250).

(3) Leave Alignment Tool 6227-2 in place. Tool will keep planetary and clutch hub splines in alignment until overdrive unit is ready for installation on transmission.

(4) Transmission speed sensor can be installed at this time if desired. However, it is recommended that sensor not be installed until after overdrive unit is secured to transmission.

OVERDRIVE PISTON

(1) Install new seals on overdrive piston.

(2) Stand transmission case upright on bellhousing.

(3) Position Guide Ring 8114-1 on outer edge of overdrive piston retainer.

(4) Position Seal Guide 8114-3 on inner edge of overdrive piston retainer.

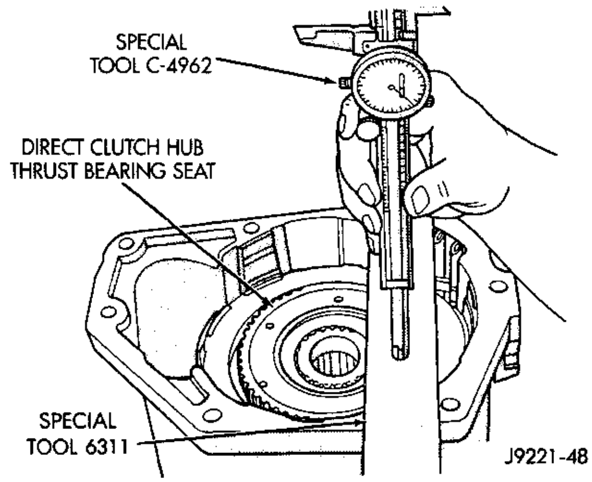

Fig. 249 Overdrive Piston Thrust Plate Measurement

End Play Measurement (Inches)	Spacer Thickness (Inches)
1.7500 - 1.7649	.108 - .110
1.7650 - 1.7799	.123 - .125
1.7800 - 1.7949	.138 - .140
1.7950 - 1.8099	.153 - .155
1.8100 - 1.8249	.168 - .170
1.8250 - 1.8399	.183 - .185
1.8400 - 1.8549	.198 - .200
1.8550 - 1.8699	.213 - .215
1.8700 - 1.8849	.228 - .230
1.8850 - 1.8999	.243 - .245

J9121-342

Fig. 250 Overdrive Piston Thrust Plate Selection

(5) Install overdrive piston in overdrive piston retainer by:

(a) Aligning locating lugs on overdrive piston to the two mating holes in retainer.

(b) Lubricate overdrive piston seals with Mopar® Door Ease, or equivalent.

(c) Install piston over Seal Guide 8114–3 and inside Guide Ring 8114–1.

(d) Push overdrive piston into position in retainer.

(e) Verify that the locating lugs entered the lug bores in the retainer.

(6) Install intermediate shaft spacer on intermediate shaft.

(7) Install overdrive piston thrust plate on overdrive piston.

(8) Install overdrive piston thrust bearing on overdrive piston.

(9) Install transmission speed sensor and O-ring seal in overdrive case.

CLEANING AND INSPECTION

VALVE BODY

Clean the valve housings, valves, plugs, springs, and separator plates with a standard parts cleaning solution only. Do not use gasoline, kerosene, or any type of caustic solution.

Do not immerse any of the electrical components in cleaning solution. Clean the governor solenoid and sensor and the dual solenoid and harness assembly by wiping them off with dry shop towels only.

Dry all except the electrical parts with compressed air. Make sure all passages are clean and free from obstructions. **Do not use rags or shop towels to dry or wipe off valve body components. Lint from these materials can stick to valve body parts, interfere with valve operation, and clog filters and fluid passages.**

Wipe the governor pressure sensor and solenoid valve with dry, lint free shop towels only. The O-rings on the sensor and solenoid valve are the only serviceable components. Be sure the vent ports in the solenoid valve are open and not blocked by dirt or debris. Replace the valve and/or sensor only when DRB scan tool diagnosis indicates this is necessary. Or, if either part has sustained physical damage (dented, deformed, broken, etc.).

CAUTION: Do not turn the small screw at the end of the solenoid valve for any reason. Turning the screw in either direction will ruin solenoid calibration and result in solenoid failure. In addition, the filter on the solenoid valve is NOT serviceable. Do not try to remove the filter as this will damage the valve housing.

Inspect the throttle and manual valve levers and shafts (Fig. 251). Do not attempt to straighten a bent shaft or correct a loose lever. Replace these components if worn, bent, loose or damaged in any way.

Inspect all of the valve body mating surfaces for scratches, nicks, burrs, or distortion. Use a straightedge to check surface flatness. Minor scratches may be removed with crocus cloth using only very light pressure.

Minor distortion of a valve body mating surface may be corrected by smoothing the surface with a sheet of crocus cloth. Position the crocus cloth on a surface plate, sheet of plate glass or equally flat surface. If distortion is severe or any surfaces are heavily scored, the valve body will have to be replaced.

CAUTION: Many of the valves and plugs, such as the throttle valve, shuttle valve plug, 1-2 shift valve and 1-2 governor plug, are made of coated aluminum. Aluminum components are identified by the dark color of the special coating applied to the surface (or by testing with a magnet). Do not sand aluminum valves or plugs under any circumstances. This practice could damage the special coating causing the valves/plugs to stick and bind.

Inspect the valves and plugs for scratches, burrs, nicks, or scores. Minor surface scratches on steel valves and plugs can be removed with crocus cloth but **do not round off the edges of the valve or plug lands.** Maintaining sharpness of these edges is vitally important. The edges prevent foreign matter from lodging between the valves and plugs and the bore.

Inspect all the valve and plug bores in the valve body. Use a penlight to view the bore interiors. Replace the valve body if any bores are distorted or scored. Inspect all of the valve body springs. The springs must be free of distortion, warpage or broken coils.

Check the two separator plates for distortion or damage of any kind. Inspect the upper housing, lower housing, 3-4 accumulator housing, and transfer plate carefully. Be sure all fluid passages are clean and clear. Check condition of the upper housing and transfer plate check balls as well. The check balls and ball seats must not be worn or damaged.

Trial fit each valve and plug in its bore to check freedom of operation. When clean and dry, the valves and plugs should drop freely into the bores.

Valve body bores do not change dimensionally with use. If the valve body functioned correctly when new, it will continue to operate properly after cleaning and inspection. It should not be necessary to replace a valve body assembly unless it is damaged in handling.

The only serviceable valve body components are listed below. The remaining valve body components are serviced only as part of a complete valve body assembly. Serviceable parts are:

- dual solenoid and harness assembly
- solenoid gasket
- solenoid case connector O-rings and shoulder bolt
- switch valve and spring
- pressure adjusting screw and bracket assembly
- throttle lever
- manual lever and shaft seal
- throttle lever shaft seal, washer, and E-clip
- fluid filter and screws
- detent ball and spring
- valve body screws
- governor pressure solenoid
- governor pressure sensor and retaining clip
- park lock rod and E-clip

Mopar AUTHENTIC RESTORATION PRODUCT

CLEANING AND INSPECTION (Continued)

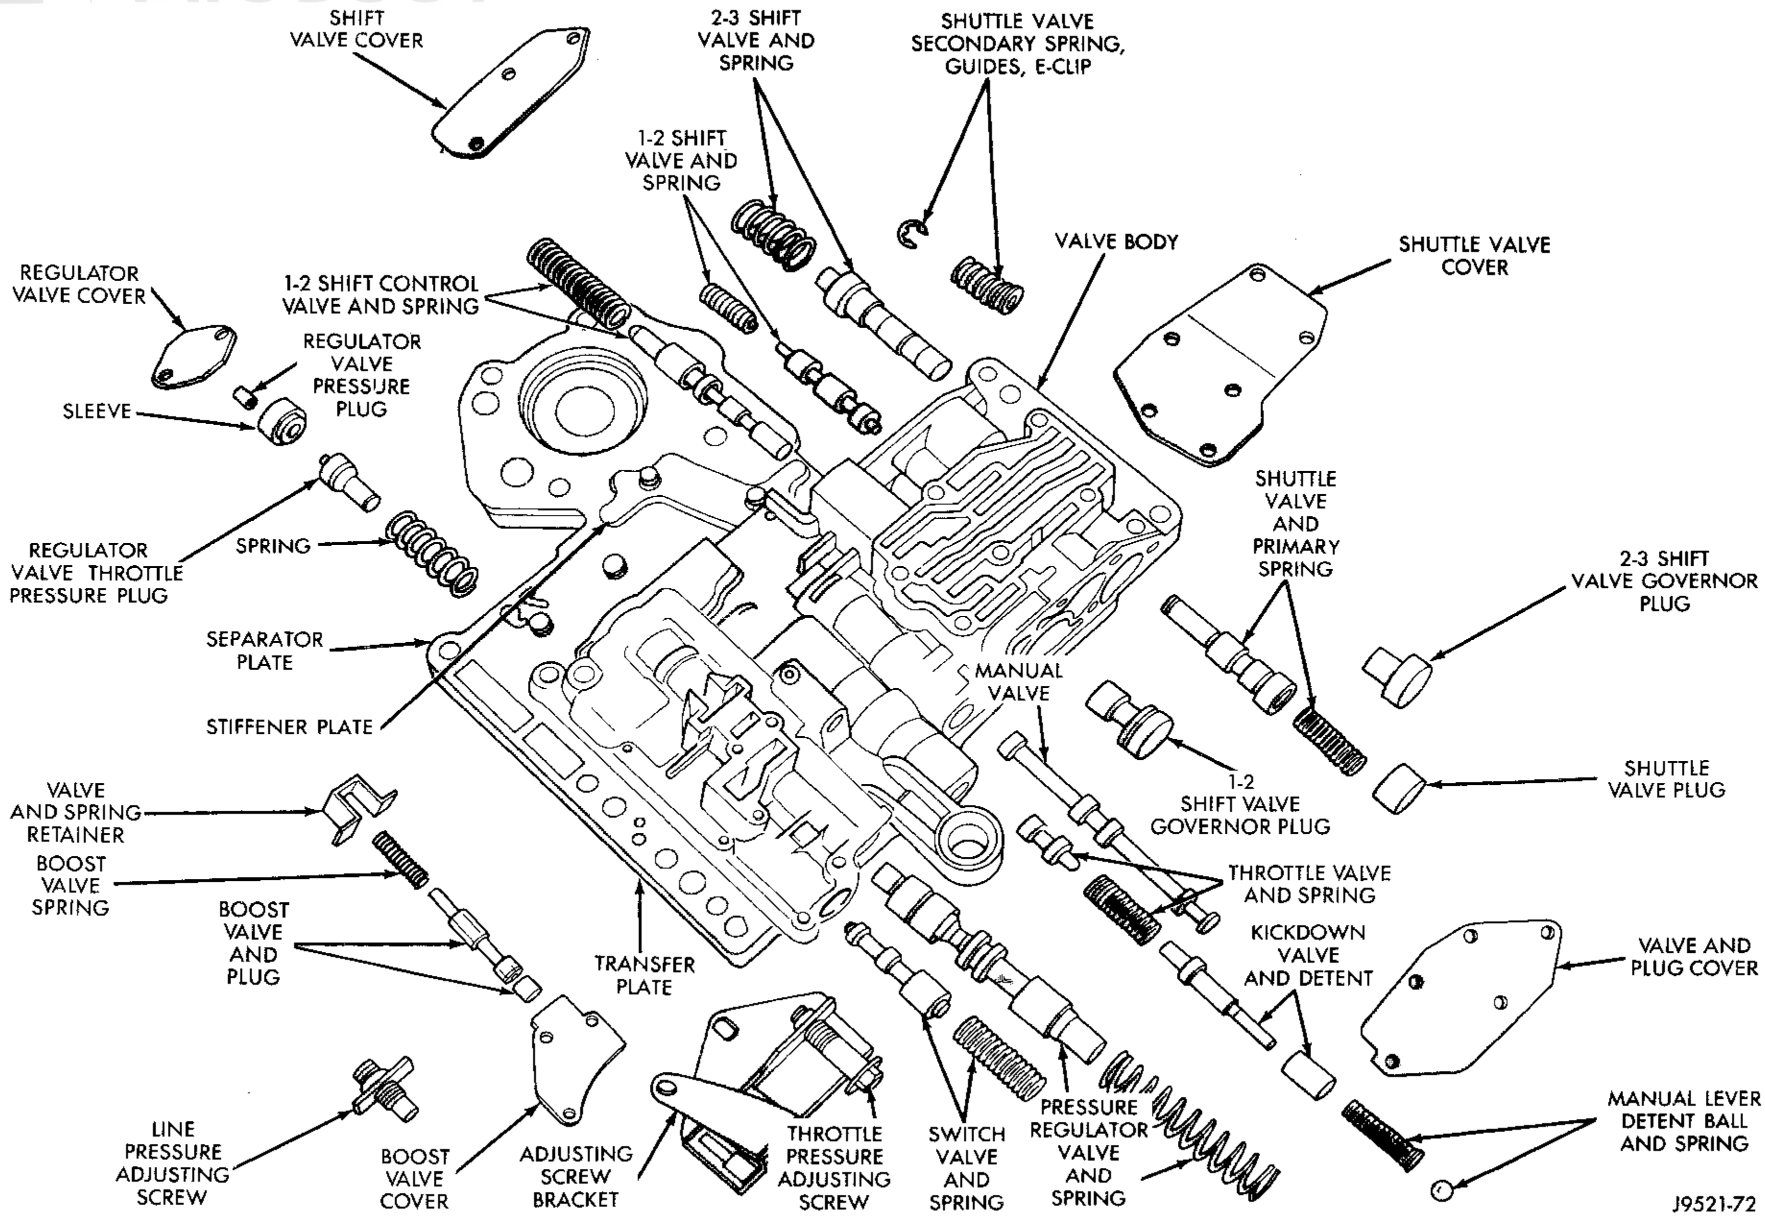

Fig. 251 Upper Housing Valves, Plug, Springs And Brackets

CLEANING AND INSPECTION (Continued)

TRANSMISSION

GENERAL INFORMATION

Inspect the transmission bushings during overhaul. Bushing condition is important as worn, scored bushings contribute to low pressures, clutch slip and accelerated wear of other components. However, do not replace bushings as a matter of course. Replace bushings only when they are actually worn, or scored.

Use recommended tools to replace bushings. The tools are sized and designed to remove, install, and seat bushings correctly. The bushing replacement tools are included in Bushing Tool Set C-3887-B.

Pre-sized service bushings are available for replacement purposes. Only the sun gear bushings are not serviced. Low cost of the sun gear assembly makes it easier to simply replace the gear and bushings as an assembly.

Heli-Coil inserts can be used to repair damaged, stripped or worn threads in aluminum parts. These inserts are available from most automotive parts suppliers. Stainless steel inserts are recommended.

The use of crocus cloth is permissible where necessary, providing it is used carefully. When used on shafts, or valves, use extreme care to avoid rounding off sharp edges. Sharp edges are vital as they prevent foreign matter from getting between the valve and valve bore.

Do not reuse oil seals, gaskets, seal rings, or O-rings during overhaul. Replace these parts as a matter of course. Also do not reuse snap rings or E-clips that are bent or distorted. Replace these parts as well.

Lubricate transmission parts with Mopar® ATF Plus, Type 7176, transmission fluid during overhaul and assembly. Use petroleum jelly, Mopar® Door Ease, or Ru-Glyde to prelubricate seals, O-rings, and thrust washers. Petroleum jelly can also be used to hold parts in place during reassembly.

TRANSMISSION CASE CLEANING AND INSPECTION

Clean the case in a solvent tank. Flush the case bores and fluid passages thoroughly with solvent. Dry the case and all fluid passages with compressed air. Be sure all solvent is removed from the case and that all fluid passages are clear.

NOTE: Do not use shop towels or rags to dry the case (or any other transmission component) unless they are made from lint-free materials. Lint will stick to case surfaces and transmission components and circulate throughout the transmission after assembly. A sufficient quantity of lint can block fluid passages and interfere with valve body operation.

Inspect the case for cracks, porous spots, worn bores, or damaged threads. Damaged threads can be repaired with Helicoil thread inserts. However, the case will have to be replaced if it exhibits any type of damage or wear.

Lubricate the front band adjusting screw threads with petroleum jelly and thread the screw part-way into the case. Be sure the screw turns freely.

OVERRUNNING CLUTCH/LOW-REVERSE DRUM/OVERDRIVE PISTON RETAINER

Clean the overrunning clutch assembly, clutch cam, low-reverse drum, and overdrive piston retainer in solvent. Dry them with compressed air after cleaning.

Inspect condition of each clutch part after cleaning. Replace the overrunning clutch roller and spring assembly if any rollers or springs are worn or damaged, or if the roller cage is distorted, or damaged. Replace the cam if worn, cracked or damaged.

Replace the low-reverse drum if the clutch race, roller surface or inside diameter is scored, worn or damaged. **Do not remove the clutch race from the low-reverse drum under any circumstances. Replace the drum and race as an assembly if either component is damaged.**

Examine the overdrive piston retainer carefully for wear, cracks, scoring or other damage. Be sure the retainer hub is a snug fit in the case and drum. Replace the retainer if worn or damaged.

ACCUMULATOR

Inspect the accumulator piston and seal rings (Fig. 252). Replace the seal rings if worn or cut. Replace the piston if chipped or cracked.

Check condition of the accumulator inner and outer springs (Fig. 252). Replace the springs if the coils are cracked, distorted or collapsed.

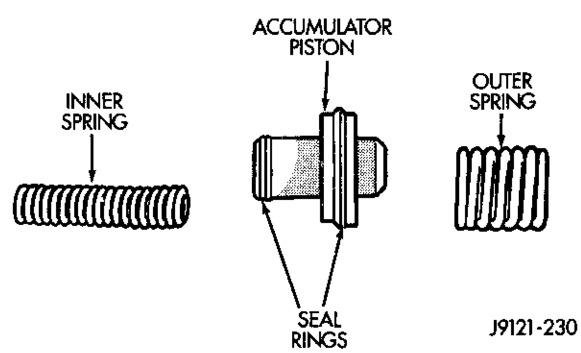

Fig. 252 Accumulator Components

FRONT SERVO

Clean the servo piston components with solvent and dry them with compressed air. Wipe the band clean with lint free shop towels.

AUTHENTIC RESTORATION PRODUCT

CLEANING AND INSPECTION (Continued)

Replace the front band if distorted, lining is burned, flaking off, or worn to the point where the grooves in the lining material are no longer visible.

Inspect the servo components. Replace the springs if collapsed, distorted or broken. Replace the guide, rod and piston if cracked, bent, or worn. Discard the servo snap ring if distorted or warped.

Check the servo piston bore for wear. If the bore is severely scored, or damaged, it will be necessary to replace the case.

Replace any servo component if doubt exists about condition. Do not reuse suspect parts.

REAR SERVO

Remove and discard the servo piston seal ring (Fig. 253). Then clean the servo components with solvent and dry with compressed air. Replace either spring if collapsed, distorted or broken. Replace the plug and piston if cracked, bent, or worn. Discard the servo snap rings and use a new ones at assembly.

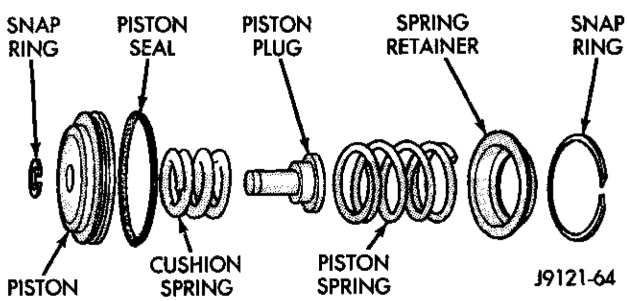

Fig. 253 Rear Servo Components

OIL PUMP AND REACTION SHAFT SUPPORT

Clean pump and support components with solvent and dry them with compressed air.

Check condition of the seal rings and thrust washer on the reaction shaft support. The seal rings do not need to be replaced unless cracked, broken, or severely worn.

Inspect the pump and support components. Replace the pump or support if the seal ring grooves or machined surfaces are worn, scored, pitted, or damaged. Replace the pump gears if pitted, worn chipped, or damaged.

Check the pump vent. The vent must be secure. Replace the pump body if the vent is cracked, broken, or loose.

Inspect the pump bushing. Then check the reaction shaft support bushing. Replace either bushing only if heavily worn, scored or damaged. It is not necessary to replace the bushings unless they are actually damaged.

(1) Install the gears in the pump body and measure pump component clearances as follows:

(a) Clearance between outer gear and reaction shaft housing should be 0.010 to 0.063 mm (0.0004 to 0.0025 in.). Clearance between inner gear and reaction shaft housing should be 0.010 to 0.063 mm (0.0004 to 0.0025 in.). Both clearances can be measured at the same time by:

(I) Installing the pump gears in the pump housing.

(II) Position an appropriate piece of Plastigage™ across both gears.

(III) Align the plastigage to a flat area on the reaction shaft housing.

(IV) Install the reaction shaft to the pump housing.

(V) Separate the reaction shaft housing from the pump housing and measure the Plastigage™ following the instructions supplied with it.

(b) Clearance between inner gear tooth and outer gear should be 0.08 to 0.19 mm (0.0035 to 0.0075 in.). Measure clearance with an appropriate feeler gauge (Fig. 254).

(c) Clearance between outer gear and pump housing should also be 0.010 to 0.19 mm (0.0035 to 0.0075 in.). Measure clearance with an appropriate feeler gauge.

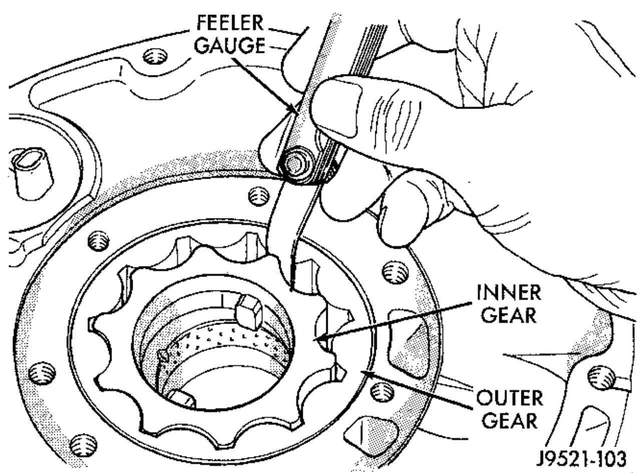

Fig. 254 Checking Pump Gear Tip Clearance

FRONT CLUTCH

Clean and inspect the front clutch components. Replace the clutch discs if warped, worn, scored, burned or charred, the lugs are damaged, or if the facing is flaking off. Replace the steel plates and reaction plate if heavily scored, warped, or broken. Be sure the driving lugs on the discs and plate are also in good condition. The lugs must not be bent, cracked or damaged in any way.

Replace the piston springs and spring retainer if either are distorted, warped or broken.

Check the lug grooves in the clutch piston retainer. The steel plates should slide freely in the slots. Replace the piston retainer if the grooves are worn or damaged. Also check action of the check ball in the

CLEANING AND INSPECTION (Continued)

piston retainer. The ball must move freely and not stick.

Replace the retainer bushing if worn, scored, or there is any doubt about bushing condition.

Inspect the piston and retainer seal surfaces for nicks or scratches. Minor scratches can be removed with crocus cloth. However, replace the piston and/or retainer if the seal surfaces are seriously scored.

Check the clutch piston check ball. The ball should be securely in place. Replace the piston if the ball is missing, or seized in place.

REAR CLUTCH

Clean the clutch components with solvent and dry them with compressed air.

Check condition of the input shaft seal rings. It is not necessary to remove or replace rings unless they are broken, cracked, or no longer securely hooked together.

Inspect the input shaft splines and machined surfaces. Very minor nicks or scratches can be smoothed off with crocus cloth. replace the shaft if the splines are damaged, or any of the machined surfaces are severely scored.

Replace the clutch discs if warped, worn, scored, burned/charred, the lugs are damaged, or if the facing is flaking off.

Replace the steel plates and the pressure plate if heavily scored, warped, or broken. Be sure the driving lugs on the discs and plates are also in good condition. The lugs must not be bent, cracked or damaged in any way.

Replace the piston spring and wave spring if either part is distorted, warped or broken.

Check the lug grooves in the clutch retainer. The steel plates should slide freely in the slots. Replace the retainer if the grooves are worn or damaged. Also check action of the retainer check ball. The ball must move freely and not stick.

Inspect the piston and retainer seal surfaces for nicks or scratches. Minor scratches can be removed with crocus cloth. However, replace the piston and/or retainer if the seal surfaces are seriously damaged.

Check thrust washer condition. Washer thickness should be 1.55 to 1.60 mm (0.061 to 0.063 in.). Replace the washer if worn or damaged.

Check condition of the two seal rings on the input shaft and the single seal ring on the piston retainer hub. Replace the seal rings only if severely worn, cracked, or cannot be hooked together.

PLANETARY GEARTRAIN/OUTPUT SHAFT

Clean the intermediate shaft and planetary components in solvent and dry them with compressed air.

Inspect the planetary gear sets and annulus gears. The planetary pinions, shafts, washers, and retaining pins are serviceable. However, if a pinion carrier is damaged, the entire planetary gear set must be replaced as an assembly.

Replace the annulus gears if the teeth are chipped, broken, or worn, or the gear is cracked. Replace the planetary thrust plates and the tabbed thrust washers if cracked, scored or worn.

Inspect the machined surfaces of the intermediate shaft. Be sure the oil passages are open and clear. Replace the shaft if scored, pitted, or damaged.

Inspect the sun gear and driving shell. If either component is worn or damaged, remove the sun gear rear retaining ring and separate the sun gear and thrust plate from the driving shell. Then replace the necessary component.

Replace the sun gear as an assembly if the gear teeth are chipped or worn. Also replace the gear as an assembly if the bushings are scored or worn. The sun gear bushings are not serviceable. Replace the thrust plate if worn, or severely scored. Replace the driving shell if distorted, cracked, or damaged in any way.

Replace all snap rings during geartrain assembly. Reusing snap rings is not recommended.

OVERDRIVE UNIT

Clean the geartrain and case components with solvent. Dry all parts except the bearings with compressed air. Allow bearings to air dry.

Do not use shop towels for wiping parts dry unless the towels are made from a lint-free material. A sufficient quantity of lint (from shop towels, cloths, rags, etc.) could plug the transmission filter and fluid passages.

Discard the old case gasket and seals. Do not attempt to salvage these parts. They are not reusable. Replace any of the overdrive unit snap rings if distorted or damaged.

Minor nicks or scratches on components can be smoothed with crocus cloth. However, do not attempt to reduce severe scoring on any components with abrasive materials. Replace severely scored components; do not try to salvage them.

Check condition of the park lock components and the overdrive case.

Replace the case if cracked, scored, or damaged. Replace the park lock pawl, plug, or spring if worn or damaged. Be sure the bullet at the end of the park lock rod is in good condition. Replace the rod if the bullet is worn or the rod itself is bent or distorted. Do not attempt to straighten the rod.

Check the bushings in the overdrive case. Replace the bushings if severely scored or worn. Also replace the case seal if loose, distorted, or damaged.

Examine the overdrive and direct clutch discs and plates. Replace the discs if the facing is worn,

Mopar AUTHENTIC RESTORATION PRODUCT

CLEANING AND INSPECTION (Continued)

severely scored, or burned and flaking off. Replace the clutch plates if worn, heavily scored, or cracked. Check the lugs on the clutch plates for wear. The plates should slide freely in the drum. Replace the plates or drum if binding occurs.

Check condition of the annulus gear, direct clutch hub, clutch drum and clutch spring. Replace the gear, hub and drum if worn or damaged. Replace the spring if collapsed, distorted, or cracked.

Be sure the splines and lugs on the gear, drum and hub are in good condition. The clutch plates and discs should slide freely in these components.

Inspect the thrust bearings and spring plate. Replace the plate if worn or scored. Replace the bearings if rough, noisy, brinnelled, or worn.

Inspect the planetary gear assembly and the sun gear and bushings. If either the sun gear or the bushings are damaged, replace the gear and bushings as an assembly. The gear and bushings are not serviced separately.

The planetary carrier and pinions must be in good condition. Also be sure the pinion pins are secure and in good condition. Replace the carrier if worn or damaged.

Inspect the overrunning clutch and race. The race surface should be smooth and free of scores. Replace the overrunning clutch assembly or the race if either assembly is worn or damaged in any way.

Inspect the output shaft and governor components. Replace the shaft pilot bushing and inner bushing if damaged. Replace either shaft bearing if rough or noisy. Replace the bearing snap rings if distorted or cracked.

Check the machined surfaces on the output shaft. These surfaces should clean and smooth. Very minor nicks or scratches can be smoothed with crocus cloth. Replace the shaft if worn, scored or damaged in any way.

Inspect the output shaft bushings. The small bushing is the intermediate shaft pilot bushing. The large bushing is the overrunning clutch hub bushing. Replace either bushing if scored, pitted, cracked, or worn.

ADJUSTMENTS

TRANSMISSION THROTTLE VALVE CABLE ADJUSTMENT

The transmission throttle valve is operated by a cam on the valve body throttle lever. The throttle lever is actuated by a cable connected to the engine throttle body lever (Fig. 255). A retaining clip at the engine-end of the cable is removed to provide for cable adjustment. The retaining clip is then installed back onto the throttle valve cable to lock in the adjustment.

A correctly adjusted throttle valve cable, will cause the throttle lever on the transmission to move simultaneously with the throttle body lever from the idle position. Proper adjustment allows simultaneous movement without causing the transmission throttle lever to move ahead of, or lag behind the throttle body lever.

THROTTLE VALVE CABLE ADJUSTMENT CHECK

(1) Turn ignition key to OFF position.

(2) Remove air cleaner.

(3) Verify that throttle body lever is at curb idle position. Then verify that transmission throttle lever (Fig. 255) is also at idle (full forward) position.

(4) Slide cable off attachment stud on throttle body lever (Fig. 255).

(5) Compare position of cable end to attachment stud on throttle body lever:

(a) Cable end and attachment stud should be aligned (or centered on one another) to within 1 mm (0.039 in.) in either direction.

(b) If cable end and attachment stud are misaligned (off center), cable will have to be adjusted as described in following procedure.

(6) Reconnect cable end to attachment stud. Then with aid of a helper, observe movement of transmission throttle lever and lever on throttle body.

(a) If both levers move simultaneously from idle to half-throttle and back to idle position, adjustment is correct.

(b) If transmission throttle lever moves ahead of, or lags behind throttle body lever, cable adjustment will be necessary. Or, if throttle body lever prevents transmission lever from returning to closed position, cable adjustment will be necessary.

THROTTLE VALVE CABLE ADJUSTMENT PROCEDURE

(1) Turn ignition switch to OFF position and shift into Park.

(2) Remove air cleaner.

(3) Disconnect cable end from attachment stud on throttle body. **Carefully slide cable off stud. Do not pull or pry cable off.**

(4) Verify that transmission throttle lever is in idle (full forward) position. Then be sure lever on throttle body is at curb idle position.

(5) Insert a small screwdriver under edge of retaining clip and remove retaining clip.

(6) Center cable end on attachment stud to within 1 mm (0.039 in.).

(7) Install retaining clip onto cable housing.

(8) Check cable adjustment. Be sure transmission throttle lever and lever on throttle body move simultaneously and as described in cable adjustment checking procedure.

ADJUSTMENTS (Continued)

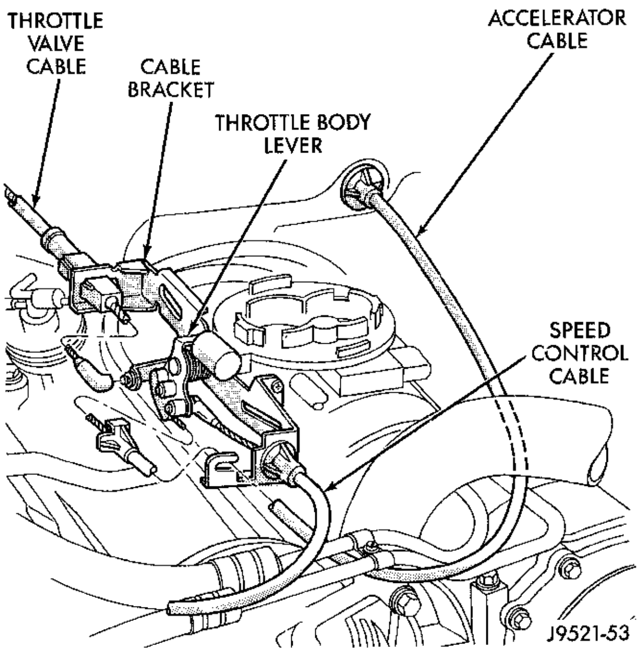

Fig. 255 Throttle Valve Cable Attachment —At Engine

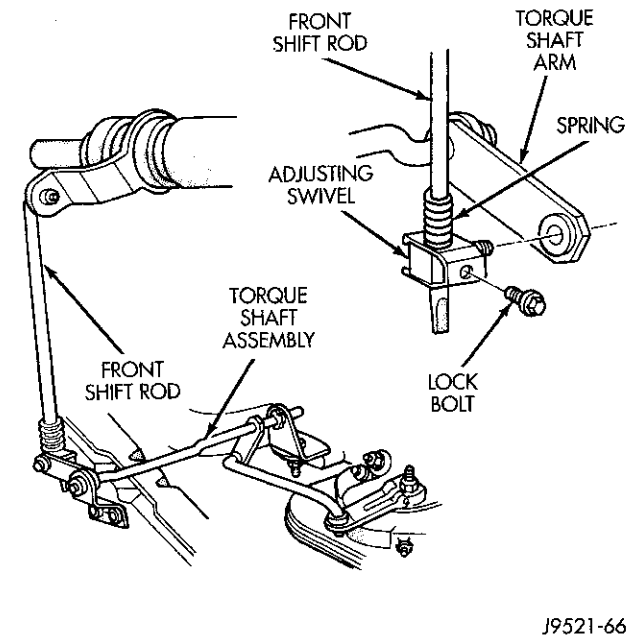

Fig. 256 Linkage Adjustment Components

GEARSHIFT LINKAGE ADJUSTMENT

Check linkage adjustment by starting engine in Park and Neutral. Adjustment is acceptable if the engine starts in only these two positions. Adjustment is incorrect if the engine starts in one position but not both positions

If the engine starts in any other position, or if the engine will not start in any position, the park/neutral switch is probably faulty.

LINKAGE ADJUSTMENT

Check condition of the shift linkage (Fig. 256). Do not attempt adjustment if any component is loose, worn, or bent. Replace any suspect components.

Replace the grommet securing the shift rod or torque rod in place if either rod was removed from the grommet. Remove the old grommet as necessary and use suitable pliers to install the new grommet.

(1) Shift transmission into Park.

(2) Raise and support vehicle.

(3) Loosen lock bolt in front shift rod adjusting swivel (Fig. 256).

(4) Ensure that the shift rod slides freely in the swivel. Lube rod and swivel as necessary.

(5) Move transmission shift lever fully rearward to the Park detent.

(6) Center adjusting swivel on shift rod.

(7) Tighten swivel lock bolt to 10 N·m (90 in. lbs.).

(8) Lower vehicle and verify proper adjustment.

FRONT BAND ADJUSTMENT

The front (kickdown) band adjusting screw is located on the left side of the transmission case above the manual valve and throttle valve levers.

(1) Raise vehicle.

(2) Loosen band adjusting screw locknut (Fig. 257). Then back locknut off 3-5 turns. Be sure adjusting screw turns freely in case. Apply lubricant to screw threads if necessary.

(3) Tighten band adjusting screw to 8 N·m (72 in. lbs.) torque with Inch Pound Torque Wrench C-3380-A, a 3-in. extension and 5/16 socket.

CAUTION: If Adapter C-3705 is needed to reach the adjusting screw (Fig. 258), tighten the screw to only 5 N·m (47-50 in. lbs.) torque.

46RE TRANSMISSION

- Back off front band adjusting screw 2-7/8 turns.
- Hold adjuster screw in position and tighten locknut to 41 N·m (30 ft. lbs.) torque.

47RE TRANSMISSION

- Back off front band adjusting screw 1-7/8 turns.
- Hold adjuster screw in position and tighten locknut to 41 N·m (30 ft. lbs.) torque.

(4) Lower vehicle.

ADJUSTMENTS (Continued)

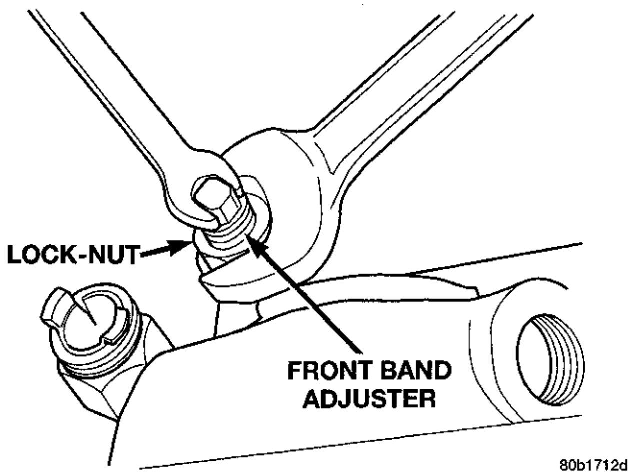

Fig. 257 Front Band Adjustment Screw Location

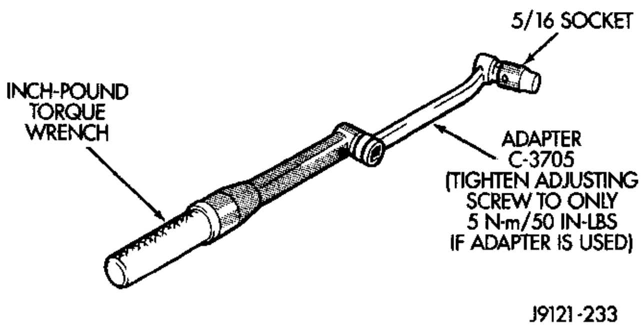

Fig. 258 Band Adjustment Adapter Tool

REAR BAND ADJUSTMENT

The transmission oil pan must be removed for access to the rear band adjusting screw.

(1) Raise vehicle.

(2) Remove transmission oil pan and drain fluid.

(3) Loosen band adjusting screw locknut 5-6 turns. Be sure adjusting screw turns freely in lever.

(4) Tighten adjusting screw to 8 N·m (72 in. lbs.) torque (Fig. 259).

46RE TRANSMISSION

- Back off adjusting screw 2 turns.
- Hold adjusting screw in place and tighten locknut to 34 N·m (25 ft. lbs.) torque.

47RE TRANSMISSION

- Back off adjusting screw 3 turns.
- Hold adjusting screw in place and tighten locknut to 34 N·m (25 ft. lbs.) torque.

(5) Position new gasket on oil pan and install pan on transmission. Tighten pan bolts to 17 N·m (13 ft. lbs.) torque.

(6) Lower vehicle and refill transmission with Mopar® ATF Plus 3, Type 7176 fluid.

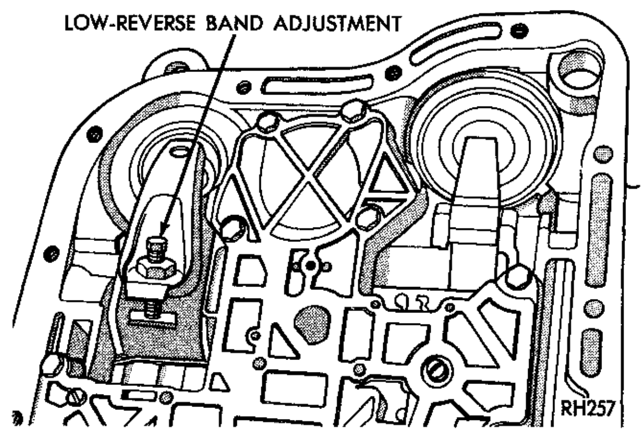

Fig. 259 Rear Band Adjustment Screw Location

VALVE BODY

CONTROL PRESSURE ADJUSTMENTS

There are two control pressure adjustments on the valve body;

- Line Pressure
- Throttle Pressure

Line and throttle pressures are interdependent because each affects shift quality and timing. As a result, both adjustments must be performed properly and in the correct sequence. Adjust line pressure first and throttle pressure last.

ADJUSTMENTS (Continued)

LINE PRESSURE ADJUSTMENT

Measure distance from the valve body to the inner edge of the adjusting screw with an accurate steel scale (Fig. 260).

Distance should be 33.4 mm (1-5/16 in.).

If adjustment is required, turn the adjusting screw in, or out, to obtain required distance setting.

NOTE: The 33.4 mm (1-5/16 in.) setting is an approximate setting. Manufacturing tolerances may make it necessary to vary from this dimension to obtain desired pressure.

One complete turn of the adjusting screw changes line pressure approximately 1-2/3 psi (9 kPa).

Turning the adjusting screw counterclockwise increases pressure while turning the screw clockwise decreases pressure.

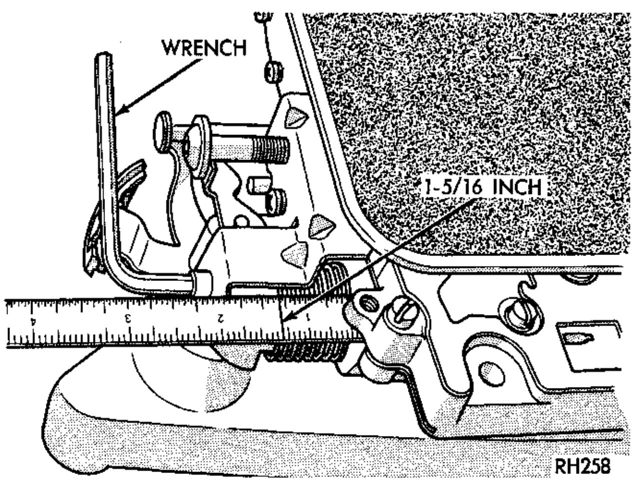

Fig. 260 Line Pressure Adjustment

THROTTLE PRESSURE ADJUSTMENT

Insert Gauge Tool C-3763 between the throttle lever cam and the kickdown valve stem (Fig. 261).

Push the gauge tool inward to compress the kickdown valve against the spring and bottom the throttle valve.

Maintain pressure against kickdown valve spring. Turn throttle lever stop screw until the screw head touches throttle lever tang and the throttle lever cam touches gauge tool.

NOTE: The kickdown valve spring must be fully compressed and the kickdown valve completely bottomed to obtain correct adjustment.

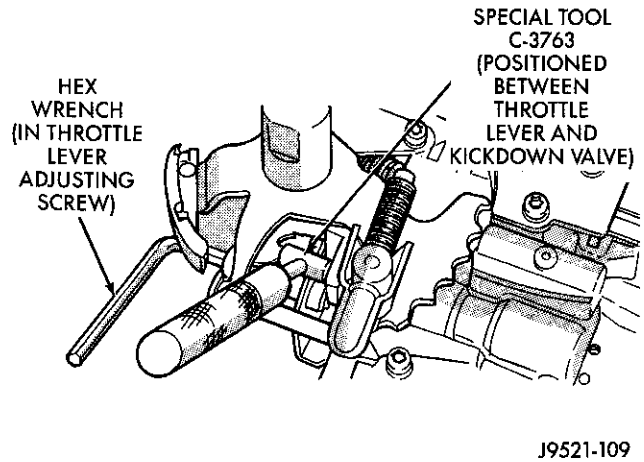

Fig. 261 Throttle Pressure Adjustment

Output shaft thrust washer (rear clutch hub)	1.3-1.4 mm 1.75-1.8 mm 2.1-2.2 mm	0.052-0.054 in. 0.068-0.070 in. 0.083-0.085 in.
Rear clutch pack snap ring	1.5-1.6 mm 1.9-1.95 mm	0.060-0.062 in. 0.074-0.076 in.
Planetary geartrain snap ring (at front of output shaft)	1.4-1.5 mm 1.6-1.7 mm	0.055-0.059 in. 0.062-0.066 in.

Overdrive piston thrust plate	Thrust plate and spacer are select fit components. Refer to size charts and
Intermediate shaft spacer	selection procedures in Overdrive Unit disassembly and assembly section.

PRESSURE TEST

Overdrive clutch	Fourth gear only	Pressure should be 469-496 kPa (68-72 psi) with closed throttle and increase to 620-896 kPa (90-130 psi) at 1/2 to 3/4 throttle.
Line pressure (at accumulator)	Closed throttle	372-414 kPa (54-60 psi).
Front servo	Third gear only	No more than 21 kPa (3 psi) lower than line pressure.
Rear servo	1 range R range	No more than 21 kPa (3 psi) lower than line pressure. 1103 kPa (160 psi) at idle, builds to 1862 kPa (270 psi) at 1600 rpm.
Governor	D range closed throttle	Pressure should respond smoothly to changes in mph and return to 0-7 kPa (0-1.5 psi) when stopped with transmission in D, 1, 2. Pressure above 7 kPa (1.5 psi) at stand still will prevent transmission from downshifting.

NV231HD AND NV241LD TRANSFER CASE

INDEX

GENERAL INFORMATION

NV231HD AND NV241LD INTRODUCTION

The NV231HD and NV241LD are part-time transfer cases with a low-range gear system. They provide three operating ranges plus a Neutral position. The low range position provides a gear reduction ratio of 2.72:1 for increased low speed torque capability. Operating ranges are: 2-high, 4-high and 4-low.

The gear cases, retainer and extension are all of aluminum. Drive sprockets and an interconnecting drive chain are used to transmit engine torque to the front/rear propeller shafts. The mainshaft, input gear and front output shaft are supported by ball and needle bearings.

OPERATING RANGES

Transfer case operating ranges are:

- 4x2 (2-wheel drive)
- 4x4 (4-wheel drive)
- 4 Lo (4-wheel drive low range

The 4x2 range is for use on any road surface at any time.

The 4x4 and 4 Lo ranges are for off road use only. They are not for use on hard surface roads. The only exception being when the road surface is covered by ice and snow.

The low range reduction gear system is operative in 4 Lo range only. This range is for extra pulling power in off road situations. Low range reduction ratio is 2.72:1.

A front axle disconnect system is used to achieve two-wheel drive mode. The axle disconnect vacuum motor is actuated by a vacuum switch on the transfer case. The switch is operated by the transfer case range rod.

SHIFT MECHANISM

The transfer case is operated by an adjustable floor mounted shift linkage. The transfer case shift lever is directly attached to the shift sector. The sector operates the range and mode forks within the transfer case.

A straight line shift pattern is used with a neutral detent. Lever range positions are imprinted in the shift knob.

TRANSFER CASE IDENTIFICATION

An identification tag (Fig. 1) is attached to the rear case of every transfer case. The tag provides the transfer case model number, assembly number, serial number, and low range ratio.

The transfer case serial number also represents the date of buil.

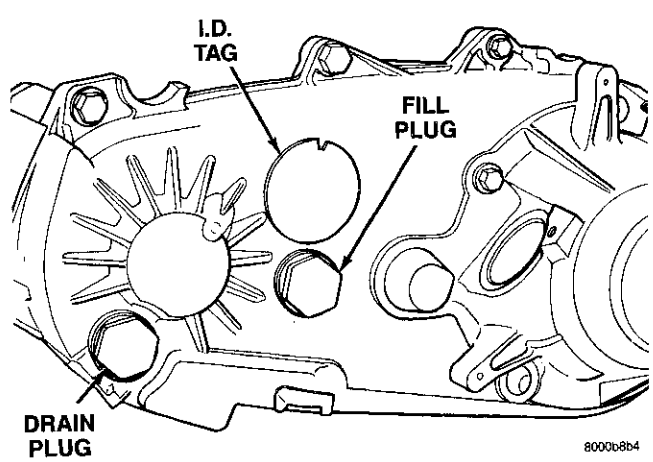

Fig. 1 Transfer Case Identification Tag—Typical

AUTHENTIC RESTORATION PRODUCT

GENERAL INFORMATION (Continued)

RECOMMENDED LUBRICANT AND FILL LEVEL

Recommended lubricant for the NV231HD and NV241LD transfer case models is Mopar® Dexron II, or ATF Plus. Use this fluid for topping off the level, refilling after service, or normal fluid changes.

Do not use anti-friction additives or similar products in the NV231HD or NV241LD transfer cases. Use recommended lubricant only.

Approximate lubricant refill capacities are 1.5 to 2 liters (3 to 3.6 pints) for the NV231HD and 2.7 L (5.0 pts.) for the NV241LD.

Correct fluid level for the transfer cases is to the bottom edge of the fill plug hole. Be sure that the vehicle is level when checking the fill level.

DIAGNOSIS AND TESTING

SERVICE DIAGNOSIS

Before beginning repair on a suspected transfer case malfunction, check all other driveline components beforehand.

The actual cause of a problem may be related to such items as: front hubs, axles, propeller shafts, wheels and tires, transmission, or clutch instead. If all other driveline components are in good condition and operating properly, refer to the Service Diagnosis chart for further information.

DIAGNOSIS AND TESTING (Continued)

SERVICE DIAGNOSIS

Condition	Possible Cause	Correction
TRANSFER CASE DIFFICULT TO SHIFT OR WILL NOT SHIFT INTO DESIRED RANGE	(1) Vehicle speed too great to permit shifting. (2) If vehicle was operated for extended period in 4H mode on dry paved surface, driveline torque load may cause difficulty. (3) Transfer case external shift linkage binding. (4) Insufficient or incorrect lubricant. (5) Internal components binding, worn or damaged.	(1) Stop vehicle and shift into desired range. Or reduce speed to 3-4 km/h (2-3 mph) before attempting to shift. (2) Stop vehicle, shift transmission to Neutral, shift transfer case to 2H mode and operate vehicle in 2H on dry paved surfaces. (3) Lubricate, repair or replace linkage bushings or tighten loose components as necessary. (4) Drain and refill to edge of fill hole with DEXRON II® or MOPAR-MERCON® Automatic Transmission Fluid. (5) Disassemble unit and replace worn or damaged components as necessary.
TRANSFER CASE NOISY IN ALL DRIVE MODES	(1) Insufficient or incorrect lubricant.	(1) Drain and refill to edge of fill hole with DEXRON II® or MOPAR-MERCON® Automatic Transmission Fluid. Check for leaks and repair if necessary. **Note: If unit is still noisy after drain and refill, disassembly and inspection may be required to locate source of noise.**
NOISY IN – OR JUMPS OUT OF – FOUR WHEEL DRIVE LOW RANGE	(1) Transfer case not completely engaged in 4L position. (2) Shift linkage out of adjustment. (3) Shift linkage loose or binding. (4) Range fork damaged, inserts worn, or fork is binding on shift rail. (5) Low range gear worn or damaged.	(1) Stop vehicle, shift transfer case to Neutral, then shift back into 4L position. (2) Adjust linkage. (3) Tighten, lubricate or repair linkage as necessary. (4) Disassemble unit and repair as necessary. (5) Disassemble and repair as necessary.
LUBRICANT LEAKING FROM OUTPUT SHAFT SEALS OR FROM VENT	(1) Transfer case overfilled. (2) Vent closed or restricted. (3) Output shaft seals damaged or installed incorrectly.	(1) Drain to correct level. (2) Clear or replace vent if necessary. (3) Replace seals. Be sure seal lip faces interior of case when installed. Also be sure yoke seal surfaces are not scored or nicked. Remove scores and nicks with fine sandpaper or replace yoke(s) if necessary.
ABNORMAL TIRE WEAR	(1) Extended operation on dry hard surface (paved) roads in 4H range.	(1) Operate in 2H on hard surface (paved) roads.

J9021-118

Mopar AUTHENTIC RESTORATION PRODUCT

SERVICE PROCEDURES

FLUID DRAIN/REFILL

(1) Raise vehicle.
(2) Position drain pan under transfer case.
(3) Remove drain and fill plugs and drain lubricant completely.
(4) Install drain plug. Tighten plug to 41-54 N·m (30-40 ft. lbs.).
(5) Remove drain pan.
(6) Fill transfer case to bottom edge of fill plug opening with Mopar® Dexron II.
(7) Install and tighten fill plug to 41-54 N·m (30-40 ft. lbs.).
(8) Lower vehicle.

REMOVAL AND INSTALLATION

TRANSFER CASE

REMOVAL

(1) Raise and support vehicle.
(2) Remove skid plate, if equipped.
(3) Position drain oil container under transfer case.
(4) Remove transfer case drain plug and drain lubricant into container.
(5) Disconnect vent hose and vacuum harness at transfer case switch.
(6) Disconnect shift rod from grommet in transfer case shift lever, or from floor shift arm whichever provides easy access. Use channel lock style pliers to press rod out of lever grommet.
(7) Support transmission with jack stand.
(8) Remove rear crossmember.
(9) Mark front and rear propeller shafts for assembly reference.
(10) Remove front and rear propeller shafts.
(11) Support transfer case with suitable jack. Secure transfer case to jack with safety chains.
(12) Remove nuts attaching transfer case to transmission.
(13) Move transfer case assembly rearward until free of transmission output shaft.
(14) Lower jack and move transfer case from under vehicle.

INSTALLATION

(1) Align and seat transfer case on transmission. Be sure transfer case input gear splines are aligned with transmission output shaft. Align splines by rotating transfer case rear output shaft yoke if necessary. Do not install any transfer case attaching nuts until the transfer case is completely seated against the transmission.
(2) Install and tighten transfer case attaching nuts. If case has 5/16 in. studs, tighten nuts to 30-41 N·m (22-30 ft.lbs.). If case has 3/8 studs, tighten nuts to 41-47 N·m (30-35 ft. lbs.).
(3) Install rear crossmember.
(4) Remove jack stand from under transmission.
(5) Align and connect propeller shafts.
(6) Connect vacuum harness and vent hose.
(7) Connect shift rod to transfer case lever or floor shift arm. Use channel lock style pliers to press rod back into lever grommet.
(8) Adjust shift linkage, if necessary.
(9) Fill transfer case with recommended transmission fluid and install fill plug.
(10) Install skid plate, if equipped.
(11) Lower vehicle

SHIFT LEVER

REMOVAL

(1) Shift transfer case into 4L.
(2) Remove transfer case shifter knob cap.
(3) Remove nut holding shifter knob to shift lever.
(4) Remove shifter knob.
(5) Raise and support vehicle.
(6) Loosen adjusting trunnion lock bolt and slide shift rod out of trunnion. If rod lacks enough travel to come out of trunnion, push trunnion out of shift lever.
(7) Remove bolts holding shift lever to the underside of the body.
(8) Separate shift lever from vehicle.

INSTALLATION

(1) Position shift lever on vehicle. Use care when passing the shift lever through the shifter boot to prevent damage to the shifter boot.
(2) Install bolts to hold shift lever to the underside of the body.
(3) Install trunnion to shift lever, if necessary.
(4) Install shift rod to trunnion, if necessary.
(5) Lower vehicle.
(6) Install shift knob on shift lever.
(7) Install nut to hold shifter knob to shift lever.
(8) Install shifter knob cap.
(9) Adjust the transfer case shift linkage.
(10) Verify transfer case operation.

FRONT OUTPUT SHAFT SEAL—NV231HD

REMOVAL

(1) Raise vehicle.
(2) Remove front propeller shaft. Refer to Group 3, Differential and Driveline, for proper procedure.
(3) Remove companion flange (Fig. 2).

REMOVAL AND INSTALLATION (Continued)

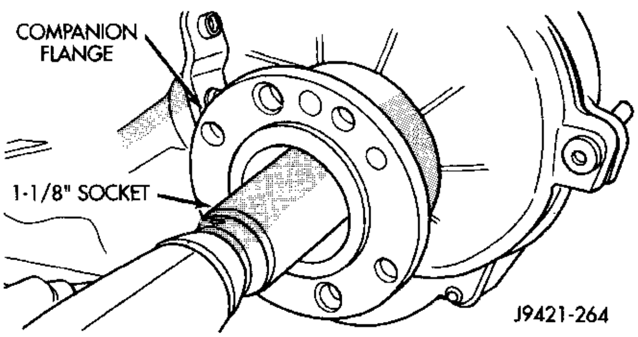

Fig. 2 Removing Companion Flange Nut

(4) Remove companion flange from output shaft. Use a suitable puller if flange can not be removed by hand.

(5) Remove companion flange rubber seal from front output shaft (Fig. 3).

(6) Remove seal from front case with pry tool (Fig. 4).

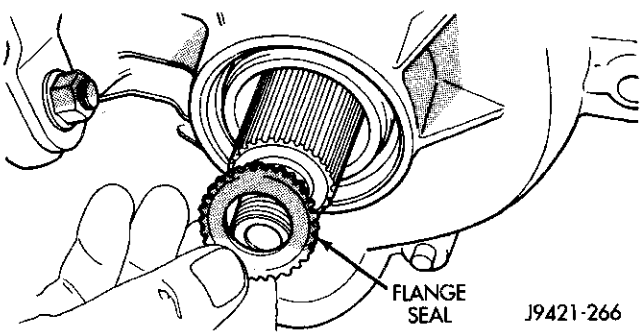

Fig. 3 Companion Flange Seal Removal

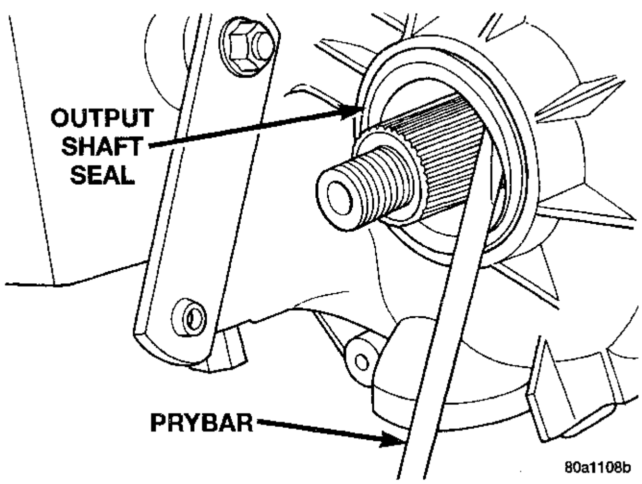

Fig. 4 Remove Front Output Shaft Seal

INSTALLATION

(1) Install new front output seal in front case with Installer Tool 8143 as follows:

(a) Place new seal on tool. Garter spring on seal goes toward interior of case.

(b) Start seal in bore with light taps from hammer (Fig. 5). Once seal is started, continue tapping seal into bore until installer tool seats against case.

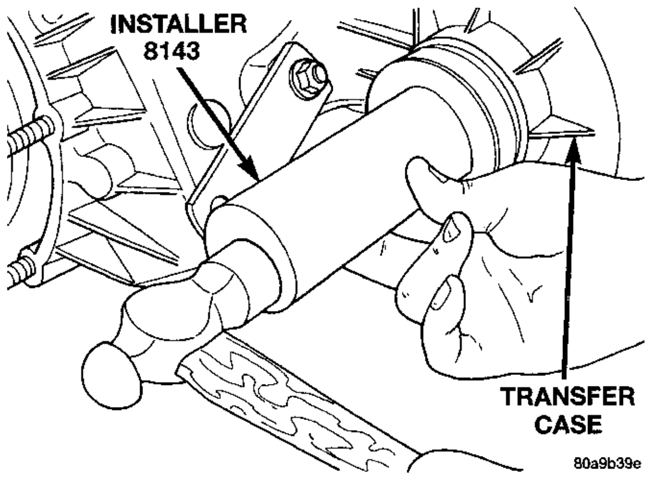

Fig. 5 Front Output Seal Installation

(2) Install companion flange seal on front shaft (Fig. 6).

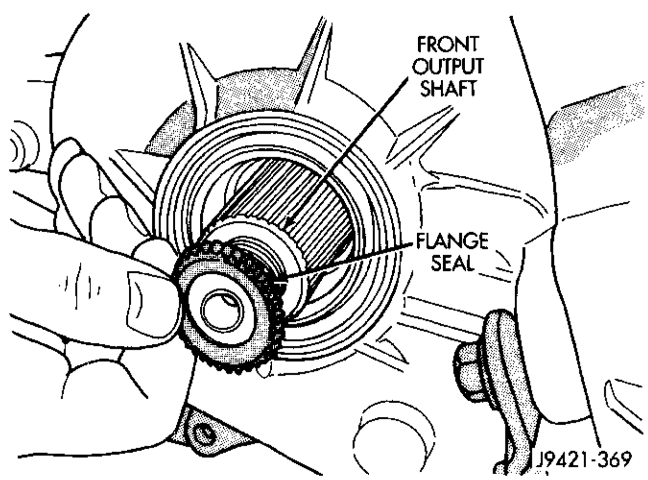

Fig. 6 Installing Flange Seal On Front Shaft

(3) Install companion flange on front shaft (Fig. 7). Then install and tighten flange nut to 176-271 N·m (130-200 ft. lbs.) torque.

(4) Install propeller shaft. Refer to Group 3, Differential and Driveline, for proper procedures.

FRONT OUTPUT SHAFT SEAL—NV241LD

REMOVAL

(1) Shift transfer case into neutral.

(2) Remove companion flange nut (Fig. 8). Discard nut after removal. It is not reusable.

(3) Remove companion flange from output shaft. Use a suitable puller if flange can not be removed by hand.

mopar AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

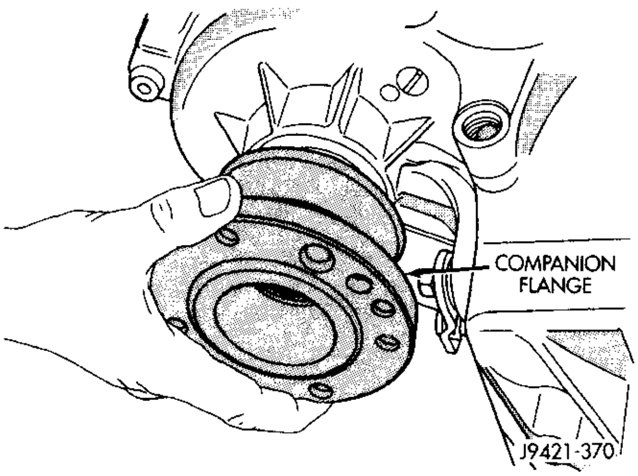

Fig. 7 Installing Companion Flange On Front Shaft

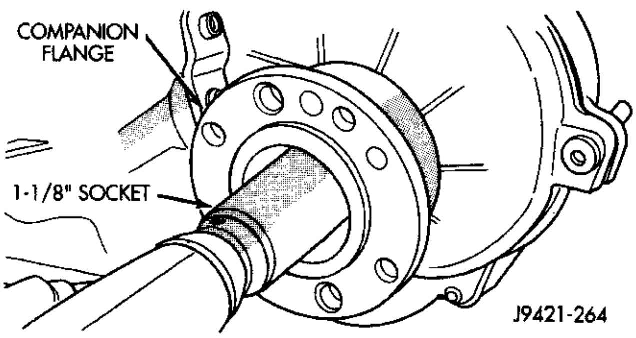

Fig. 8 Removing Companion Flange Nut

(4) Remove companion flange rubber seal from front output shaft (Fig. 9).

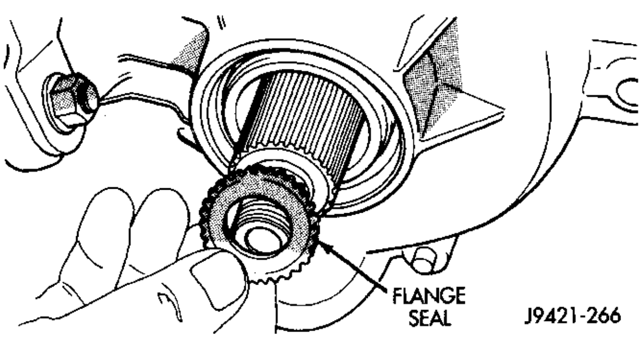

Fig. 9 Companion Flange Seal Removal

(5) Remove front output shaft seal with suitable pry tool, or a slide hammer mounted screw.

INSTALLATION

(1) Install new front output seal in front case with Installer Tool 6888 and Tool Handle C-4171 (Fig. 10) as follows:

(a) Place new seal on tool. Garter spring on seal goes toward interior of case.

(b) Start seal in bore. Once seal is started, continue tapping seal into bore until installer tool bottoms against case.

(c) Remove installer and verify that seal is recessed the proper amount. Seal should be 2.03 to 2.5 mm (0.080 to 0.100 in.) below top edge of seal bore in front case (Fig. 11). This is correct final seal position.

CAUTION: Be sure the front output seal is seated below the top edge of the case bore as shown. The seal could loosen, or become cocked if not seated to recommended depth.

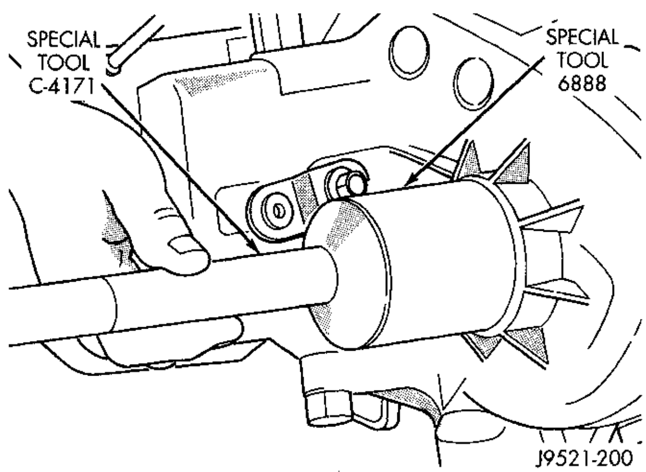

Fig. 10 Front Output Seal Installation

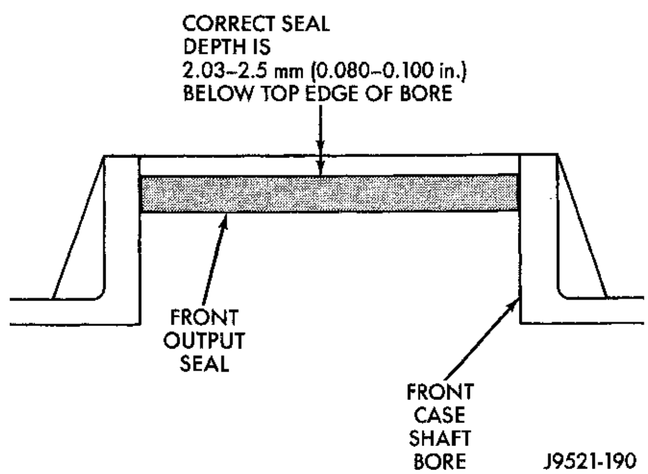

Fig. 11 Checking Front Output Seal Installation Depth

REMOVAL AND INSTALLATION (Continued)

(2) Install companion flange seal on front shaft (Fig. 12).

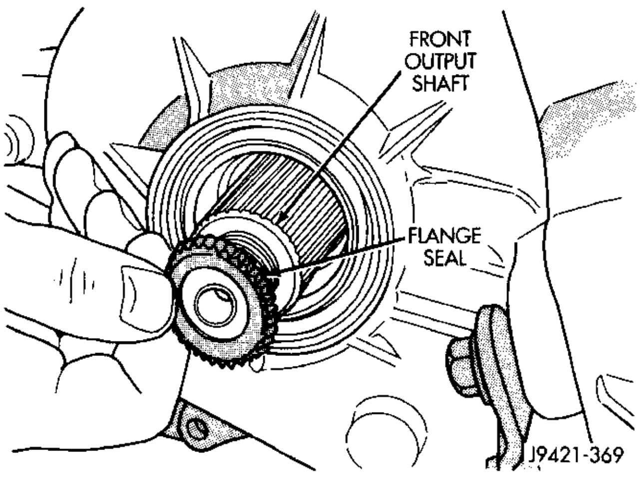

Fig. 12 Installing Flange Seal On Front Shaft

(3) Install companion flange on front shaft (Fig. 13). Then install and tighten flange nut to 176-271 N·m (130-200 ft. lbs.) torque.

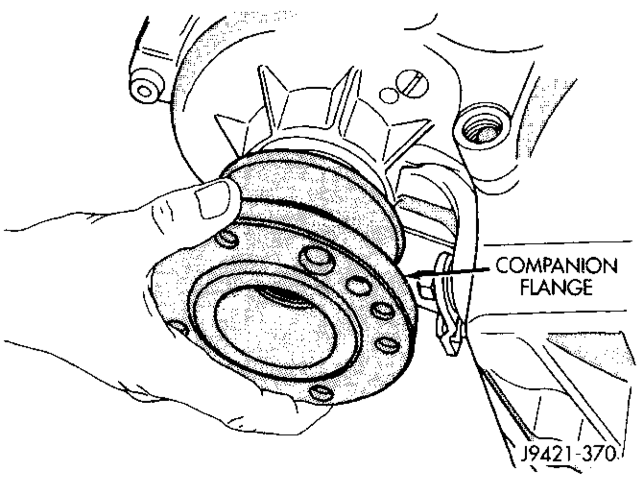

Fig. 13 Installing Companion Flange On Front Shaft

REAR RETAINER BUSHING AND SEAL

REMOVAL

(1) Raise and support vehicle.

(2) Remove rear propeller shaft. Refer to Group 3, Differential and Driveline, for proper procedure.

(3) Using a suitable pry tool or slide-hammer mounted screw, remove the rear retainer seal.

(4) Using Remover 8158, remove bushing from rear retainer.

INSTALLATION

(1) Clean fluid residue from sealing surface and inspect for defects.

(2) Position replacement bushing in rear retainer with fluid port in bushing aligned with slot in housing.

(3) Using Installer 8157, drive bushing into housing until installer seats against case.

(4) Using Installer D-163, install seal in rear retainer (Fig. 14).

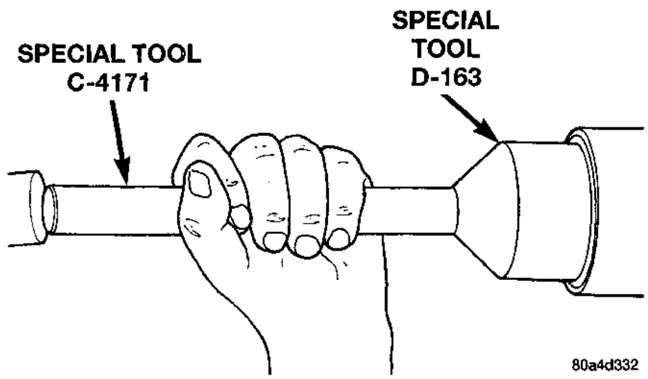

Fig. 14 Install Rear Retainer Seal

(5) Install propeller shaft.

(6) Verify proper fluid level.

(7) Lower vehicle.

DISASSEMBLY AND ASSEMBLY

TRANSFER CASE

DISASSEMBLY

Position transfer case in a shallow drain pan. Remove drain plug and drain any remaining lubricant remaining in case.

REAR EXTENSION, RETAINER AND REAR CASE

(1) Remove rear extension bolts (Fig. 15).

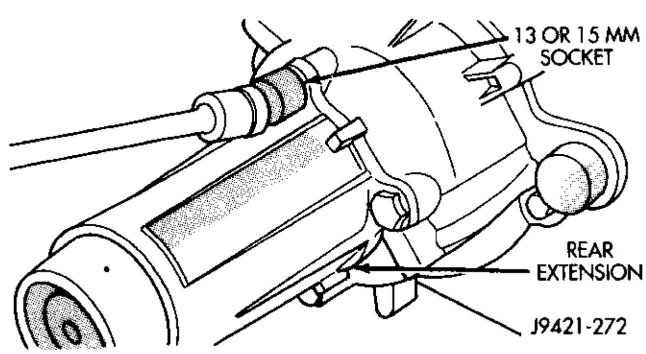

Fig. 15 Rear Extension Bolt Removal

(2) Remove rear extension (Fig. 16). Tap extension once or twice with a plastic mallet to break sealer bead and loosen it. Seal at rear of extension is serviceable. If seal is damaged, it can be removed with small chisel and punch.

Mopar AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

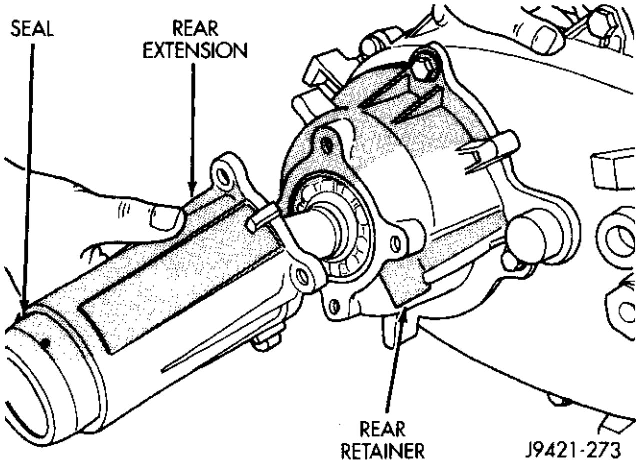

Fig. 16 Rear Extension Removal

(3) Remove output bearing retaining ring with heavy duty snap ring pliers (Fig. 17).

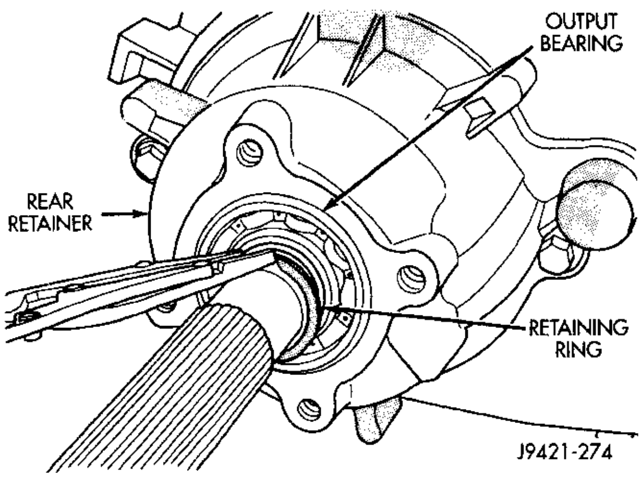

Fig. 17 Removing Output Bearing Retaining Ring

(4) Remove rear retainer bolts (Fig. 18).

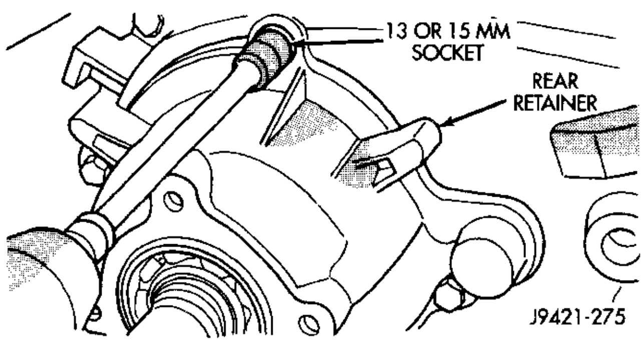

Fig. 18 Removing Rear Extension Bolts

(5) Loosen rear retainer with pry bar placed under flange (Fig. 19).

(6) Remove rear retainer and output bearing as assembly (Fig. 20).

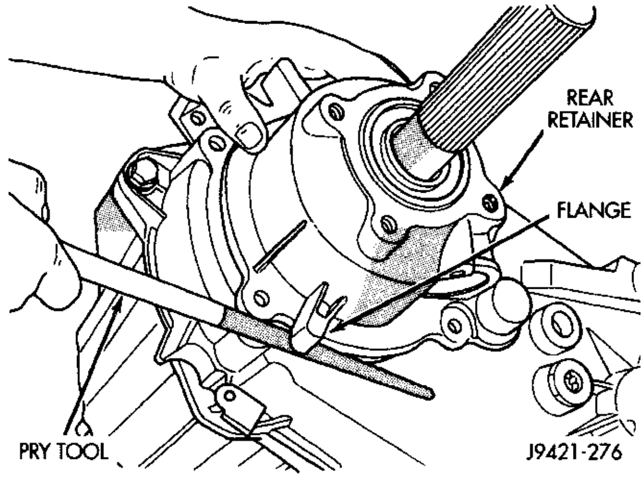

Fig. 19 Loosening Rear Retainer

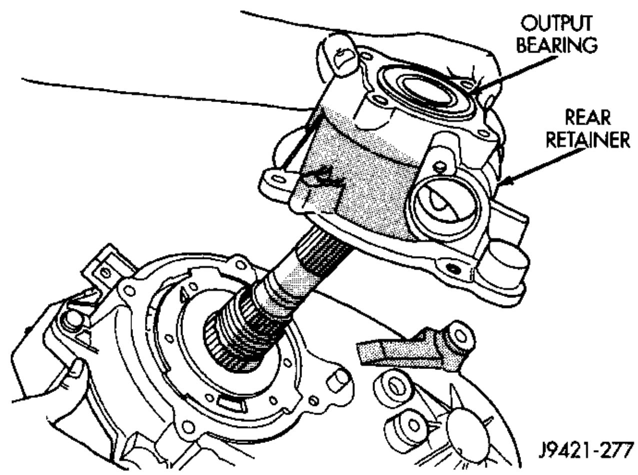

Fig. 20 Rear Retainer Removal

COMPANION FLANGE AND SHIFT LEVER REMOVAL

(1) Shift transfer case into neutral.

(2) Remove companion flange nut (Fig. 21). Discard nut after removal. It is not reusable.

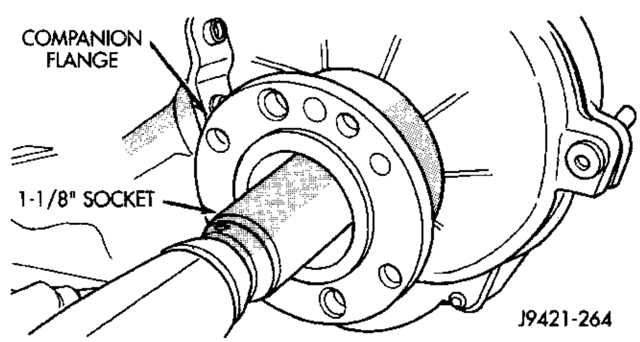

Fig. 21 Removing Companion Flange Nut

(3) Remove companion flange from front output shaft. Use a suitable puller if flange can not be removed by hand.

DISASSEMBLY AND ASSEMBLY (Continued)

(4) Remove companion flange rubber seal from front output shaft (Fig. 22).

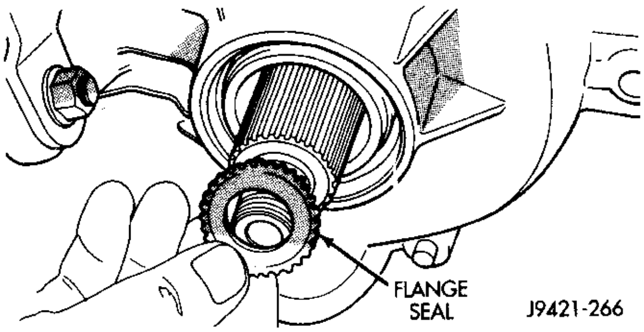

Fig. 22 Companion Flange Seal Removal

(5) Remove nut and washer that retain shift lever to sector shaft. Then remove shift lever from shaft (Fig. 23).

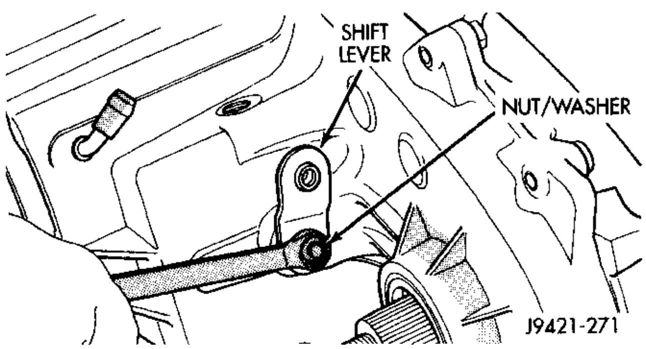

Fig. 23 Shift Lever Removal

FRONT OUTPUT SHAFT AND DRIVE CHAIN REMOVAL

(1) Remove output bearing retaining ring with heavy duty snap ring pliers.
(2) Remove output shaft bearing.
(3) Note position of bolts that attach rear case to front case (Fig. 24). Some bolts/studs at ends of case require flat washers. Mark position of these bolts with paint or scriber.
(4) Remove rear case-to-front case bolts.
(5) Loosen rear case with pry tool to break sealer bead. Insert tool in slot at each end of case (Fig. 25).
(6) Unseat rear case from alignment dowels (Fig. 26).
(7) Remove rear case and oil pump assembly from front case.

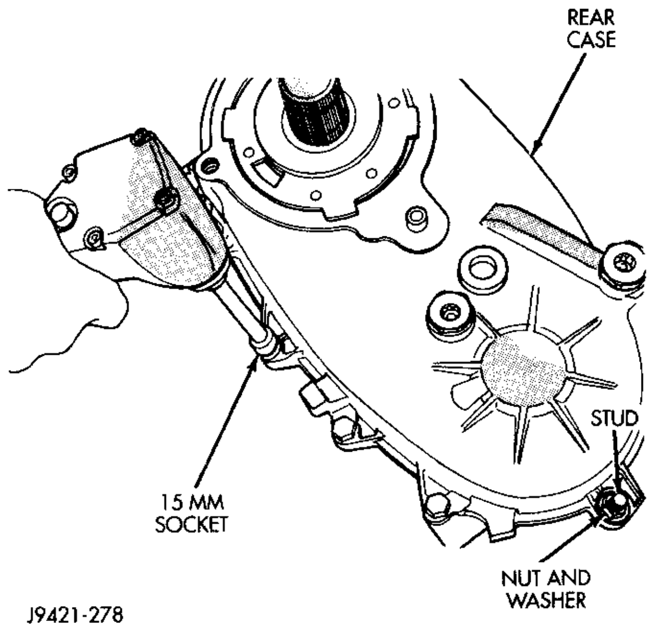

Fig. 24 Removing Case Attaching Bolts

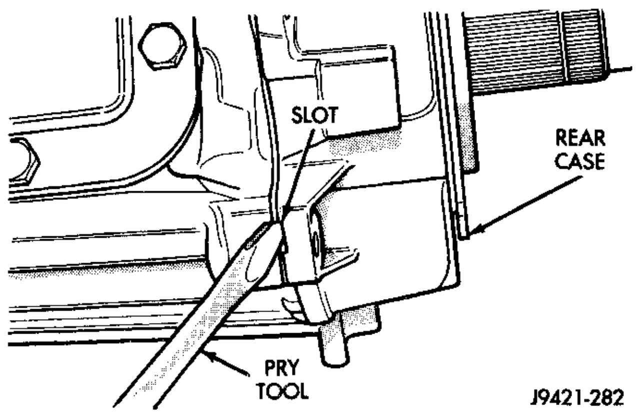

Fig. 25 Loosening Rear Case (Breaking Sealer Bead)

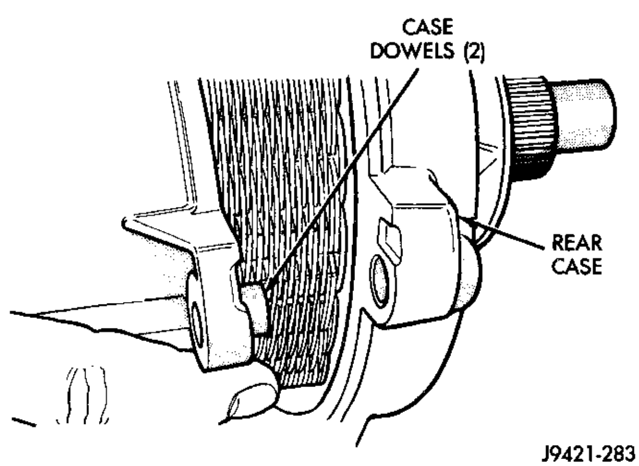

Fig. 26 Removing Rear Case From Alignment Dowels

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(8) Remove shift rail cup and spring (Fig. 27).

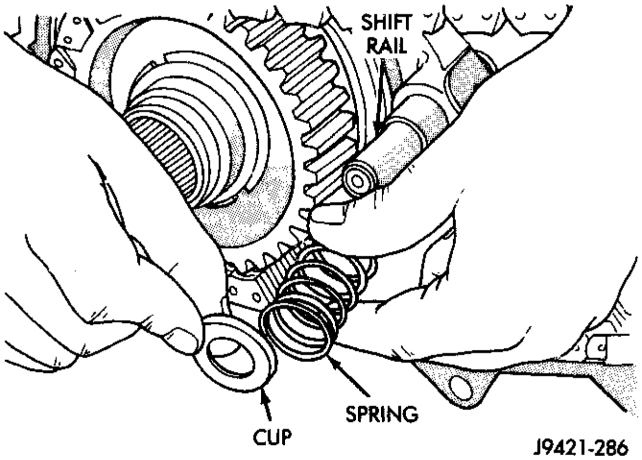

Fig. 27 Shift Rail Cup And Spring Removal

(9) Remove front sprocket retaining ring (Fig. 28).

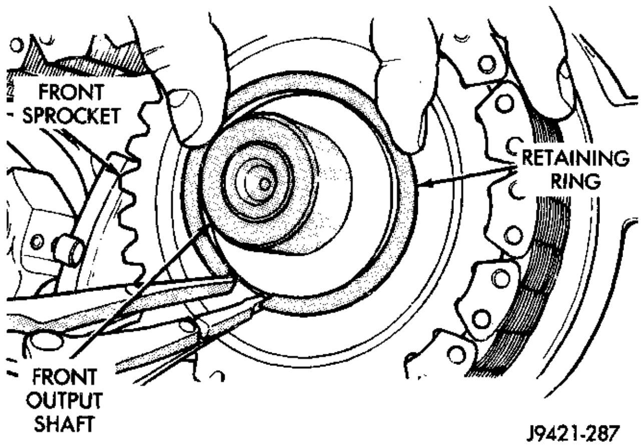

Fig. 28 Removing Front Sprocket Retaining Ring

(10) Pull mainshaft, front sprocket and chain outward about 25.4 mm (1–inch) simultaneously (Fig. 29).

(11) Remove chain from mainshaft drive sprocket and remove front sprocket and chain as assembly.

SHIFT FORK AND MAINSHAFT REMOVAL

(1) Remove vacuum/indicator switch (Fig. 30).

(2) Loosen poppet plunger screw (Fig. 31).

(3) Remove poppet plunger screw and spring (Fig. 32). Note that screw has O-ring seal. Remove and discard seal this seal.

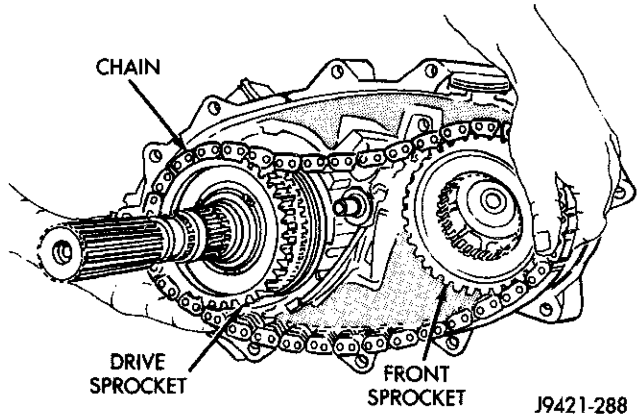

Fig. 29 Removing Drive Chain And Front Sprocket

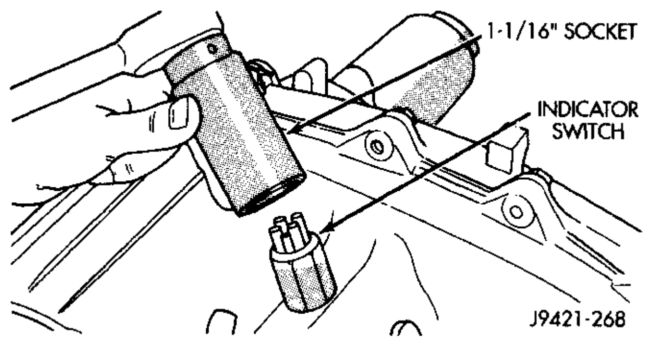

Fig. 30 Vacuum/Indicator Switch Removal

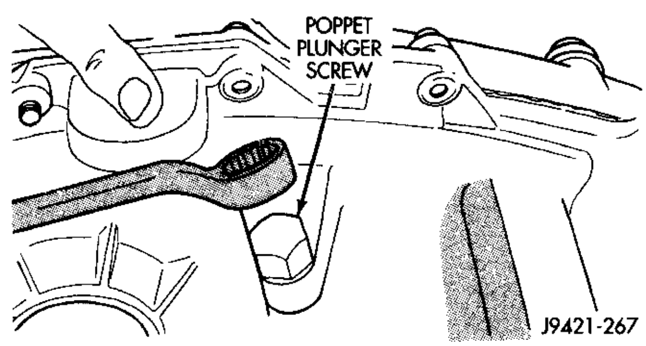

Fig. 31 Loosening Poppet Plunger Screw

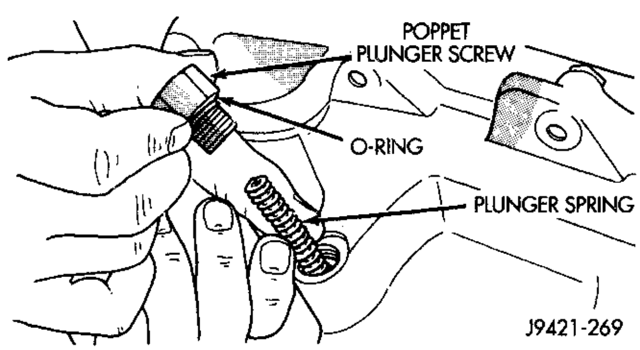

Fig. 32 Poppet Plunger Screw And Spring Removal

DISASSEMBLY AND ASSEMBLY (Continued)

(4) Remove poppet plunger with magnet (Fig. 33).

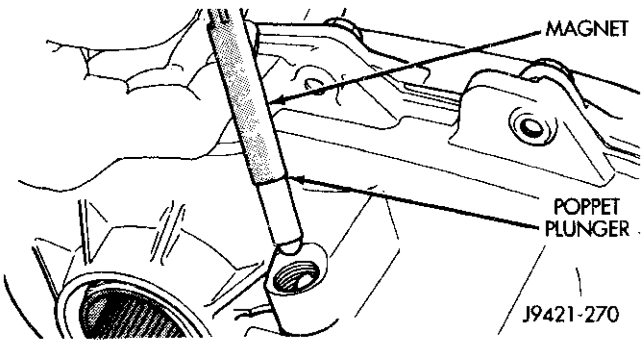

Fig. 33 Poppet Plunger Removal

(5) Remove front output shaft from bearing in case (Fig. 34).

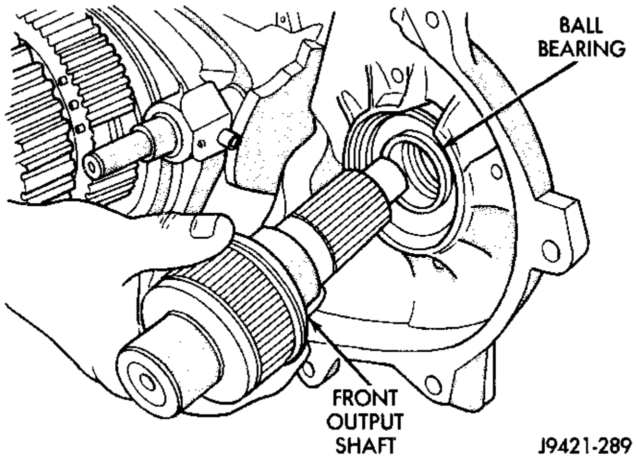

Fig. 34 Front Output Shaft Removal

(6) Pull mainshaft assembly out of input gear, mode sleeve and case.

(7) Remove mode fork, mode sleeve, and shift rail as assembly (Fig. 35). Note which way sleeve fits in fork (short side of sleeve goes to front).

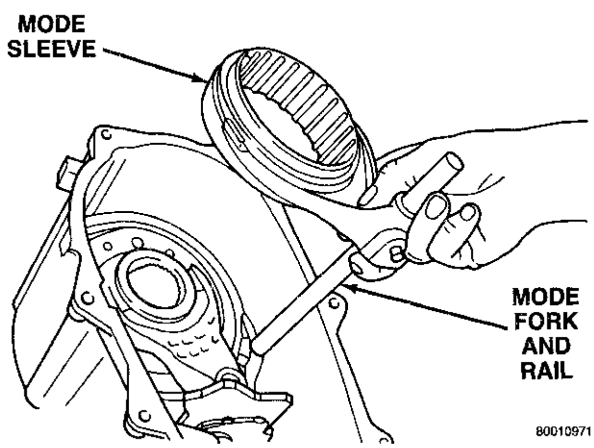

Fig. 35 Mode Fork And Sleeve Removal

(8) Remove range fork retaining ring.

Remove range fork and hub as an assembly (Fig. 36). Note fork position for installation reference.

(9) Remove shift sector (Fig. 37).

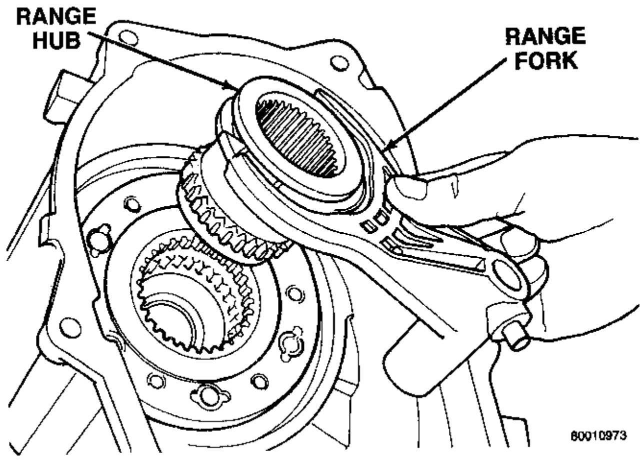

Fig. 36 Range Fork And Hub Removal

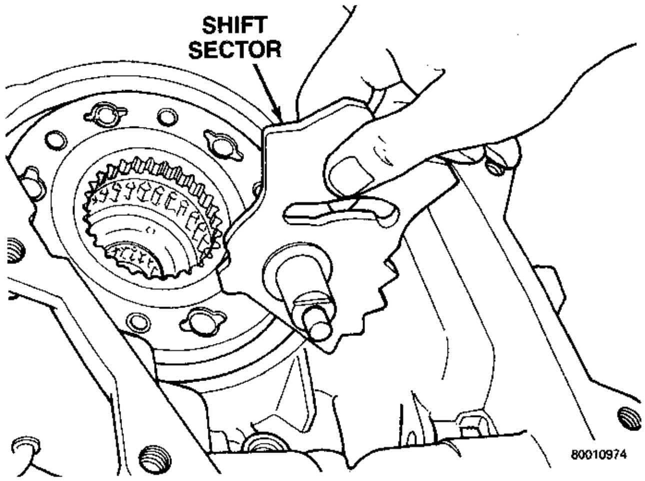

Fig. 37 Shift Sector Removal

DISASSEMBLY AND ASSEMBLY (Continued)

(10) Remove shift sector shaft nylon retainer and O–ring from shaft bore in front case (Fig. 38).

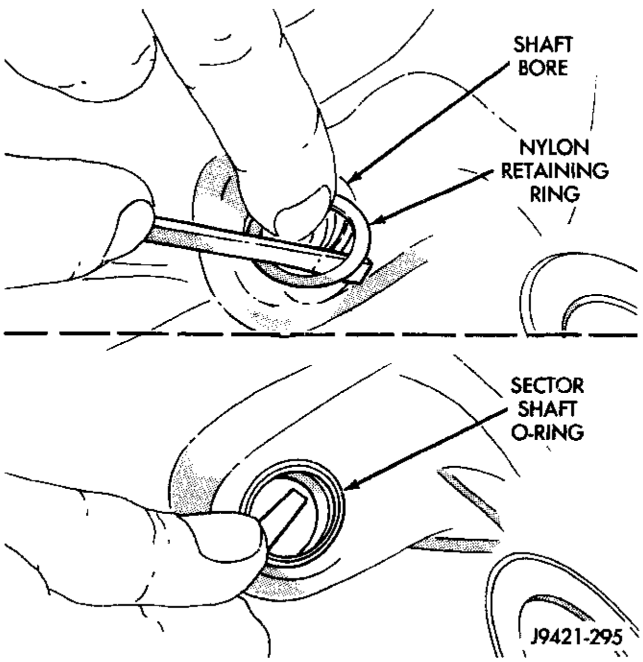

Fig. 38 Removing Sector Shaft O–Ring And Retainer

MAINSHAFT DISASSEMBLY

(1) Remove mode hub retaining ring with heavy duty snap-ring pliers (Fig. 39).

(2) Slide mode hub off mainshaft (Fig. 40).

(3) Slide drive sprocket off mainshaft (Fig. 41).

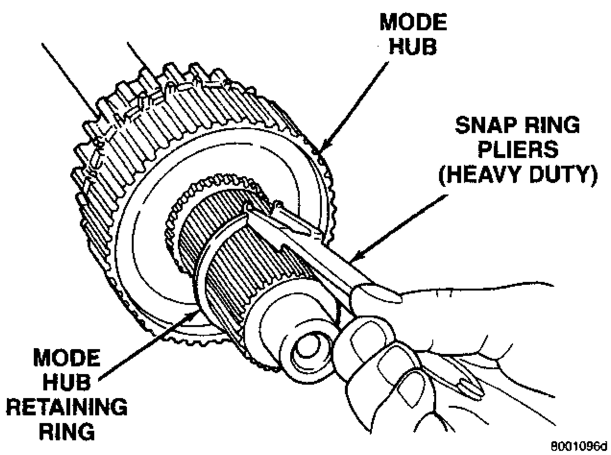

Fig. 39 Mode Hub Retaining Ring Removal

INPUT AND PLANETARY GEAR REMOVAL

(1) Remove front bearing retainer attaching bolts (Fig. 42).

(2) Remove front bearing retainer. Pry retainer loose with pry tool positioned in slots at each end of retainer (Fig. 43).

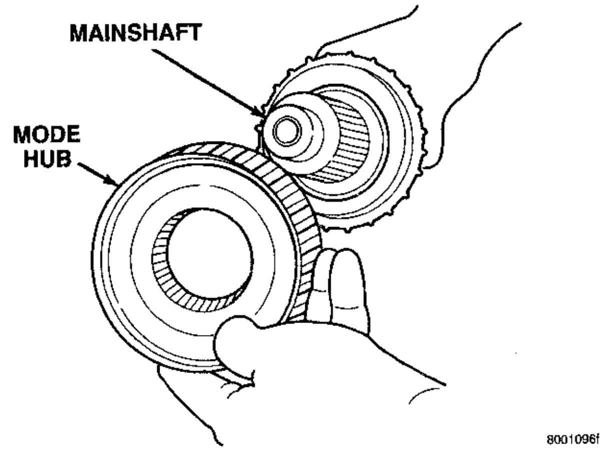

Fig. 40 Mode Hub Removal

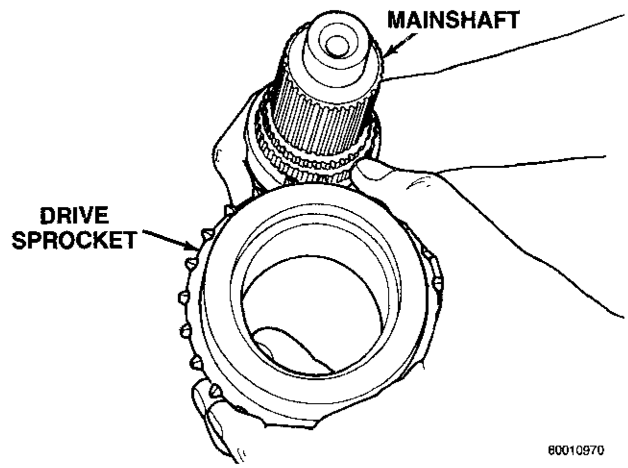

Fig. 41 Drive Sprocket Removal

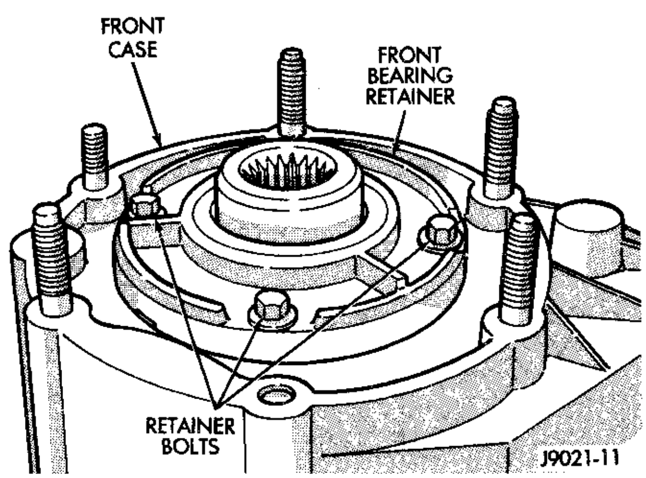

Fig. 42 Front Bearing Retainer Bolts

(3) Remove front bearing retainer seal. Tap seal out with drift and hammer.

(4) Remove input gear retaining ring with heavy duty snap ring pliers (Fig. 44).

DISASSEMBLY AND ASSEMBLY (Continued)

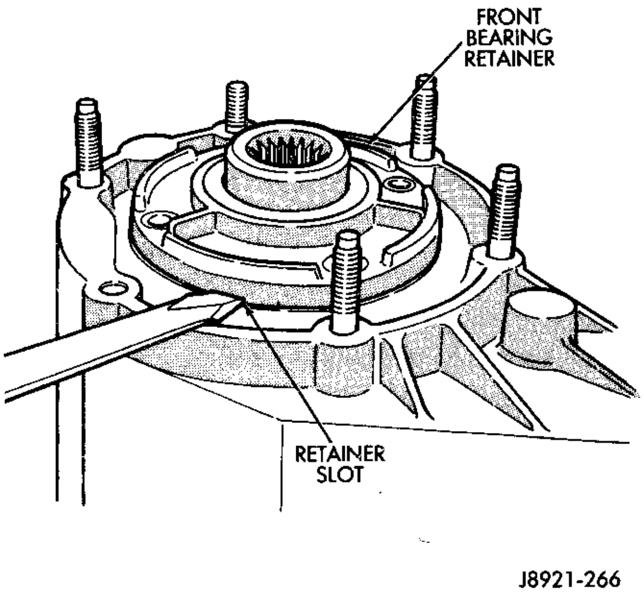

Fig. 43 Front Bearing Retainer Removal

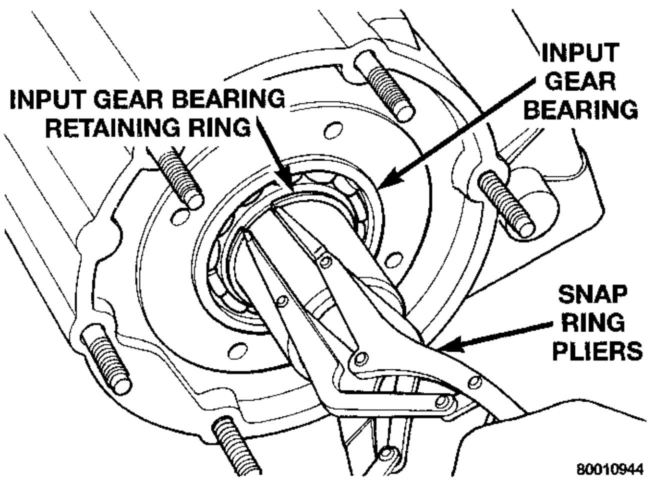

Fig. 44 Removing Input Gear Retaining ring

(5) Place front case in horizontal position. Then remove input gear and low range gear as an assembly (Fig. 45). Tap gear out of bearing with plastic mallet, if necessary.

INPUT AND PLANETARY GEAR DISASSEMBLY

(1) Remove snap-ring that retains input gear in low range gear (Fig. 46).

(2) Remove retainer (Fig. 47).

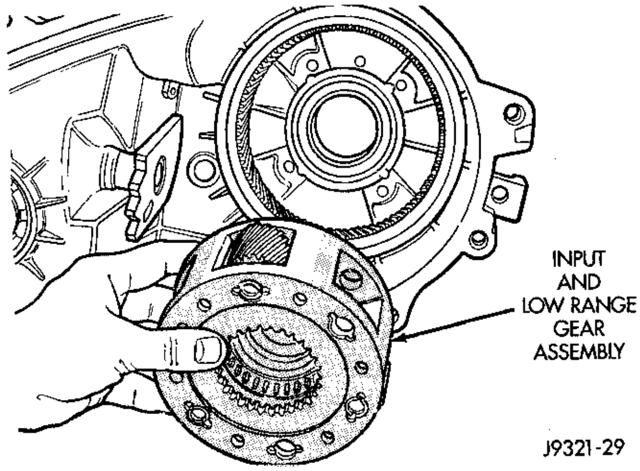

Fig. 45 Input Gear And Planetary Carrier Removal

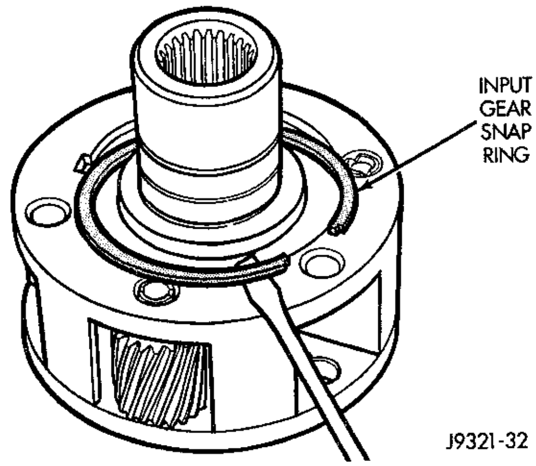

Fig. 46 Input Gear Snap-Ring Removal

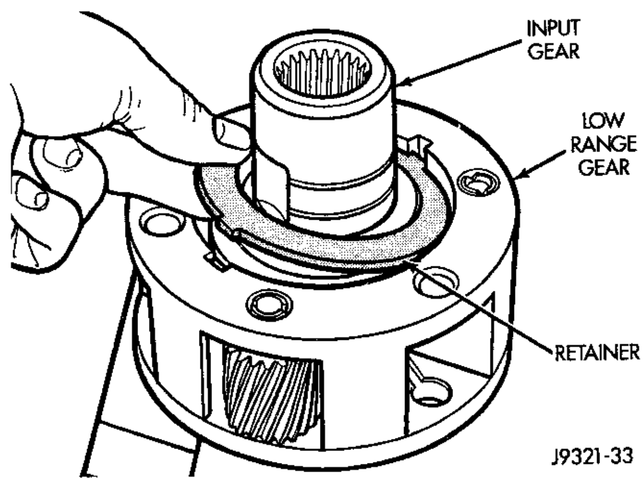

Fig. 47 Input Gear Retainer Removal

DISASSEMBLY AND ASSEMBLY (Continued)

(3) Remove front tabbed thrust washer (Fig. 48).

(4) Remove input gear (Fig. 49).

(5) Remove rear tabbed thrust washer from low range gear (Fig. 50).

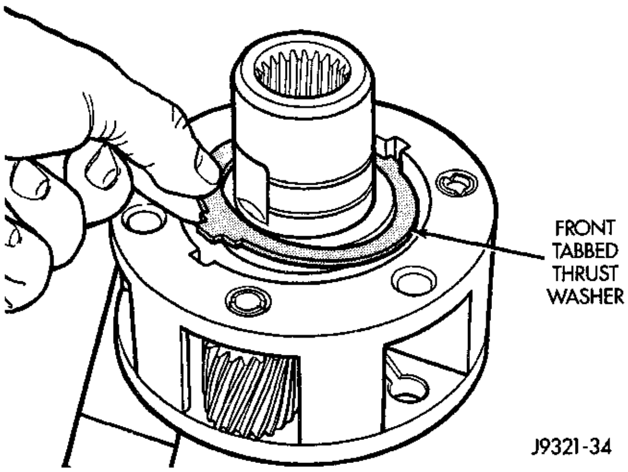

Fig. 48 Front Tabbed Thrust Washer Removal

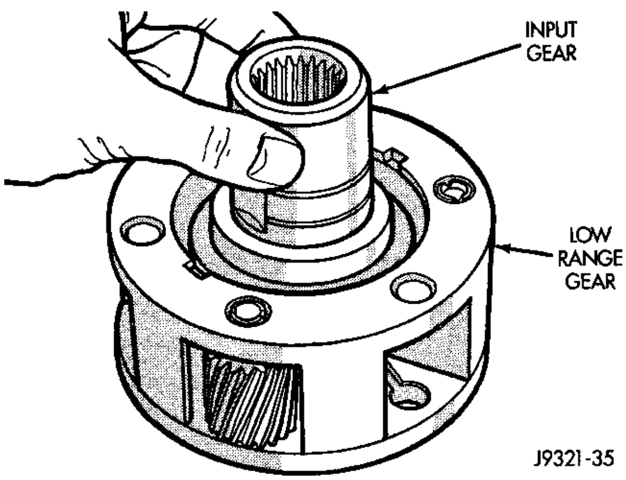

Fig. 49 Input Gear Removal

ASSEMBLY

BEARING AND SEAL REPLACEMENT

(1) Using Remover C-4210 and Handle C-4171, drive input shaft bearing from case from inside annulus gear opening (Fig. 51).

(2) Install locating ring on new bearing.

(3) Position case so that the forward end is facing upward.

(4) Using Remover C-4210 and Handle C-4171, drive input shaft bearing into case. The bearing locating ring must be fully seated on case (Fig. 52).

(5) Using Installer 6953, remove front output shaft bearing.

(6) Start front shaft output bearing in case (Fig. 53). Then seat bearing with Handle C-4171 and Installer 6953.

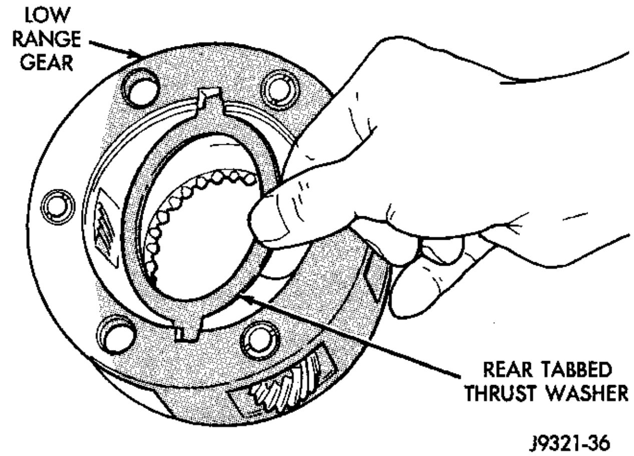

Fig. 50 Rear Tabbed Thrust Washer Removal

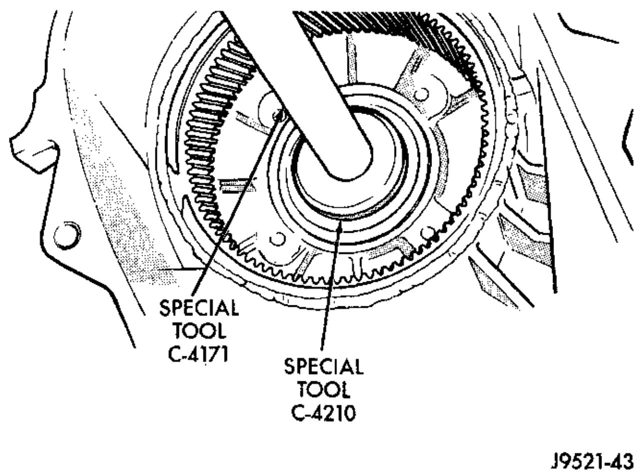

Fig. 51 Input Shaft Bearing Removal

(7) Install front output bearing retaining ring.

(8) Install new front output seal in NV241LD front case with Installer Tool 6888 and Tool Handle C-4171 as follows:

(a) Place new seal on tool. **Garter spring on seal goes toward interior of case.**

(b) Start seal in bore with light taps from hammer (Fig. 54). Once seal is started, continue tapping seal into bore until installer tool bottoms against case.

(c) Remove installer and verify that seal is recessed the proper amount (Fig. 55). Seal should be 2.03 to 2.5 mm (0.080 to 0.100 in.) below top edge of seal bore in front case. This is correct final seal position.

CAUTION: Be sure the front output seal is seated below the top edge of the case bore as shown. The seal could loosen, or become cocked if not seated to recommended depth.

DISASSEMBLY AND ASSEMBLY (Continued)

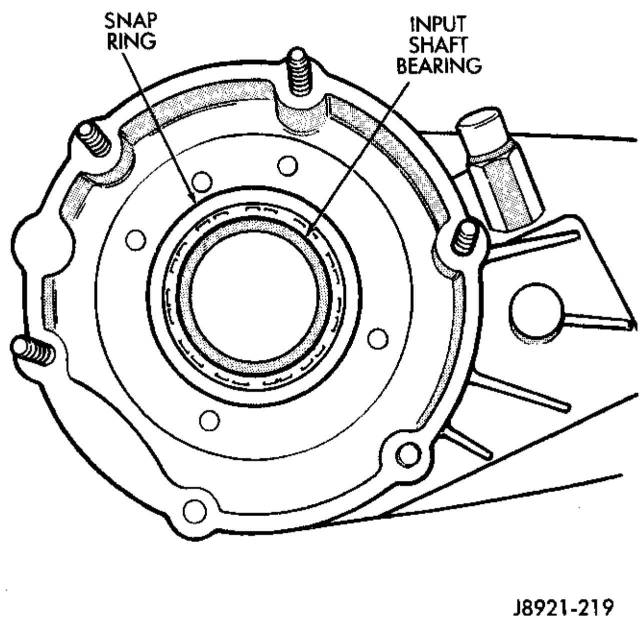

Fig. 52 Seating Input Shaft Bearing

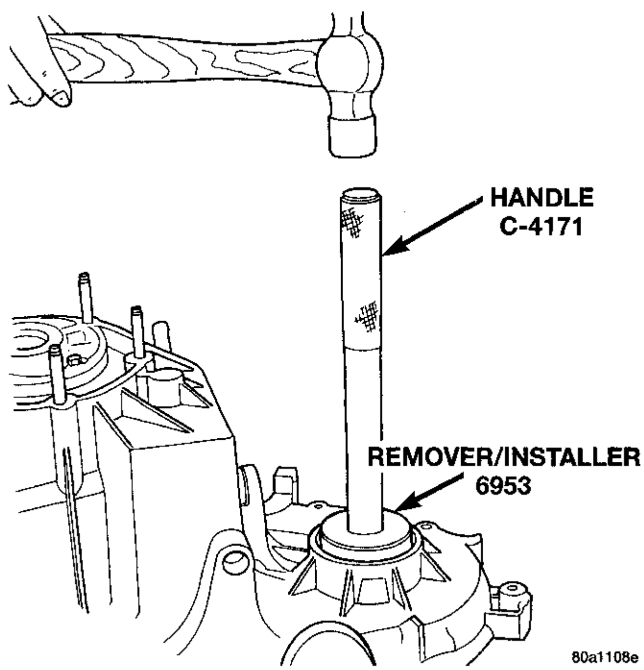

Fig. 53 Front Output Bearing Installation

(9) Install new front output seal in NV231HD front case with Installer Tool 8143 as follows:

(a) Place new seal on tool. Garter spring on seal goes toward interior of case.

(b) Start seal in bore with light taps from hammer (Fig. 56). Once seal is started, continue tapping seal into bore until installer tool seats against case.

(10) Remove seal from front bearing retainer with suitable pry tool.

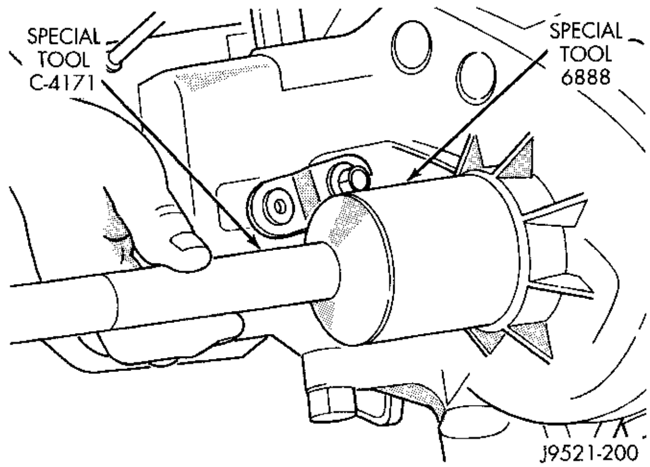

Fig. 54 Front Output Seal Installation

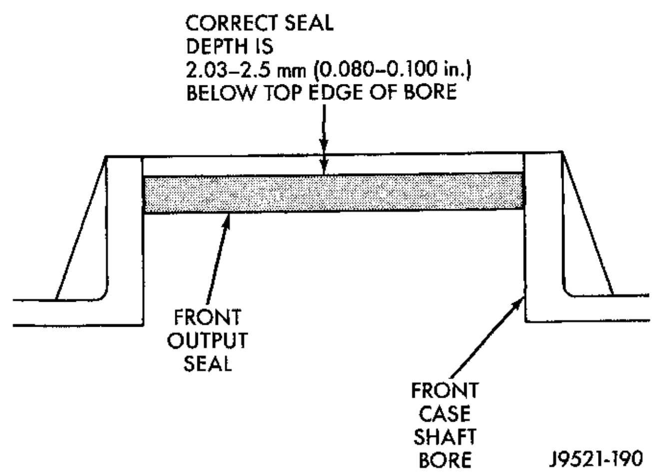

Fig. 55 Checking Front Output Seal Installation Depth

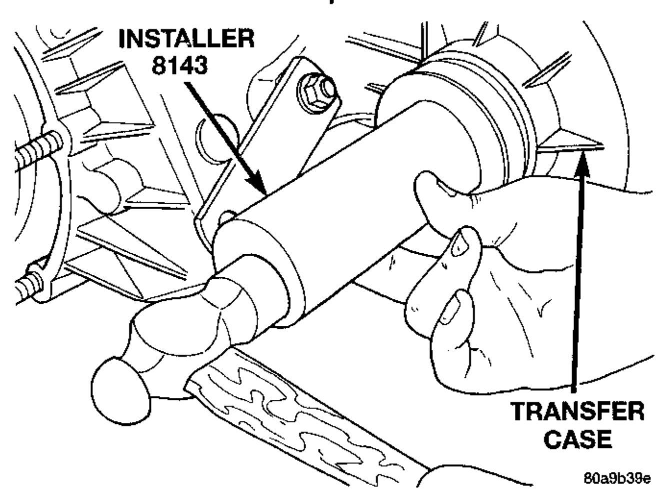

Fig. 56 Front Output Seal Installation

(11) Install new oil seal in front bearing retainer with Installer 7884 (Fig. 57).

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

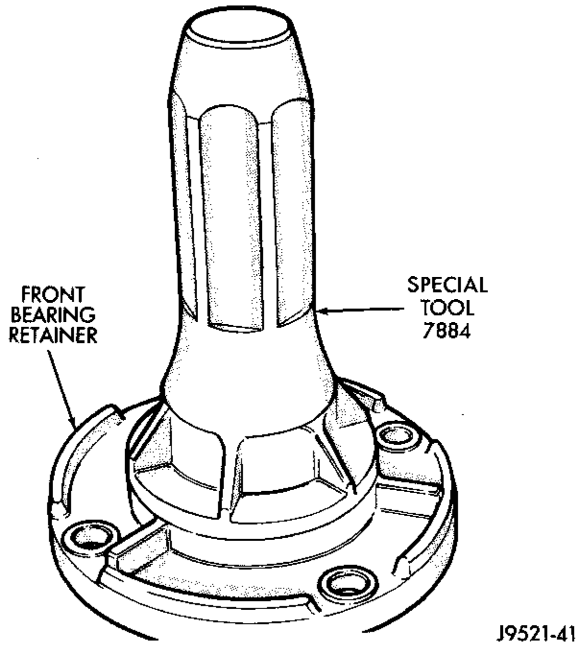

Fig. 57 Install Front Bearing Retainer Seal

(12) Remove seal from oil pump with suitable pry tool.

(13) Install new seal in oil pump with Installer 7888 (Fig. 58).

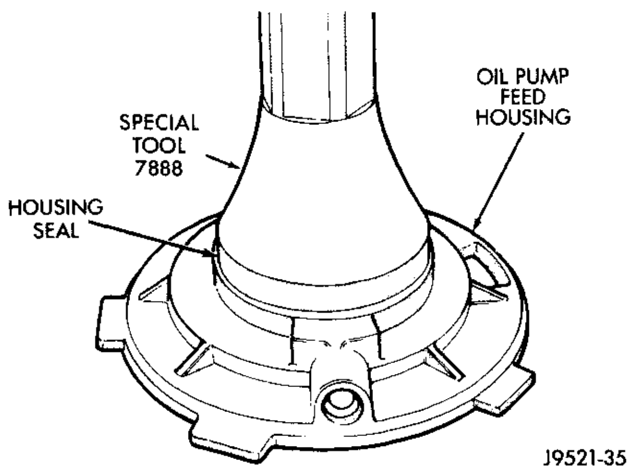

Fig. 58 Install Oil Pump Seal

(14) Remove input gear pilot bearing by inserting a suitably sized drift into the splined end of the input gear and driving the bearing out with the drift and a hammer (Fig. 59).

(15) Install new pilot bearing with Plug C-293-3.

(16) Remove the output shaft rear bearing with the screw and jaws from Remover L-4454 and Cup 8148 (Fig. 60).

(17) Install new bearing with Tool Handle C-4171 and Installer 5066 (Fig. 61). The bearing bore is

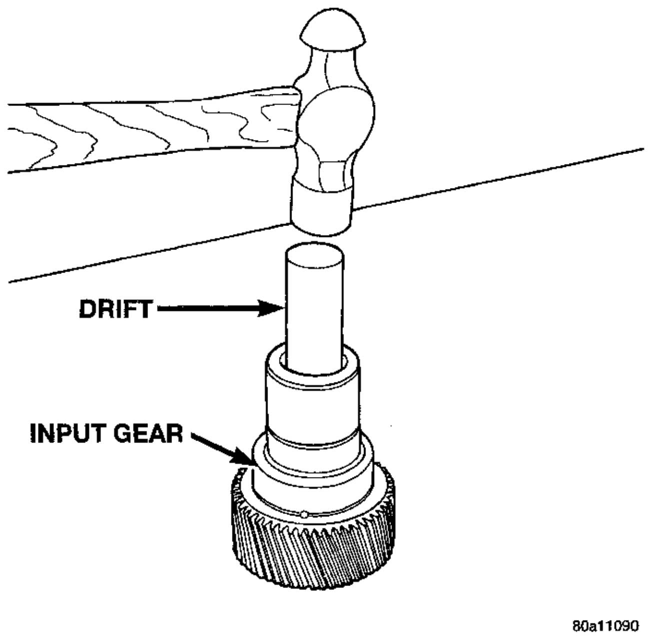

Fig. 59 Remove Input Gear Pilot Bearing

chamfered at the top. Install the bearing so it is flush with the lower edge of this chamfer (Fig. 62).

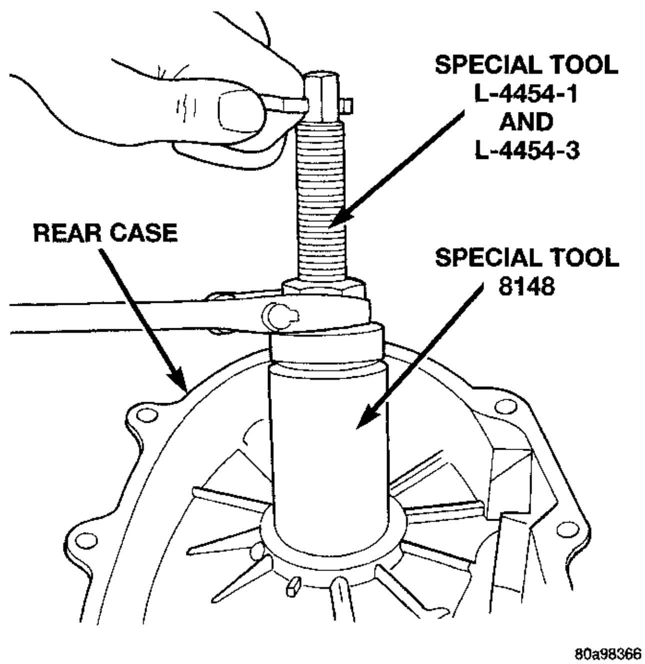

Fig. 60 Output Shaft Rear Bearing Removal

INPUT AND PLANETARY GEAR ASSEMBLY

(1) Lubricate gears and thrust washers (Fig. 63) with recommended transmission fluid.

(2) Install first thrust washer in low range gear (Fig. 63). Be sure washer tabs are properly aligned in gear notches.

DISASSEMBLY AND ASSEMBLY (Continued)

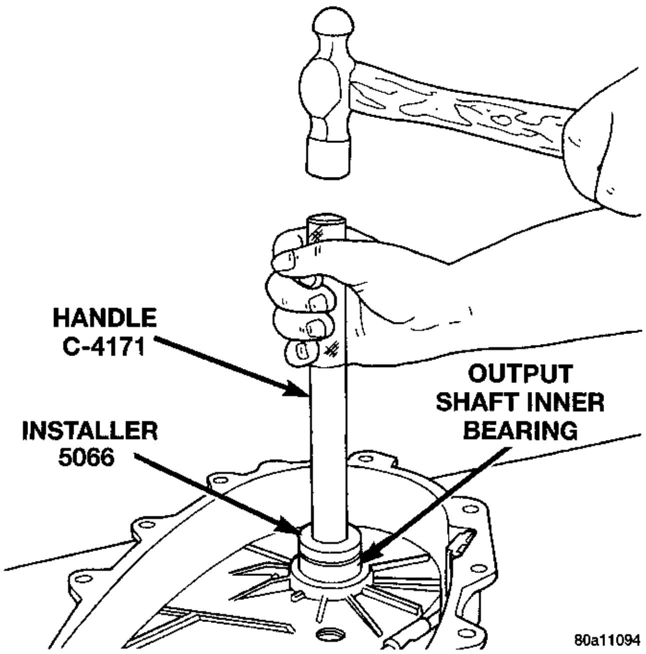

Fig. 61 Output Shaft Rear Bearing Installation

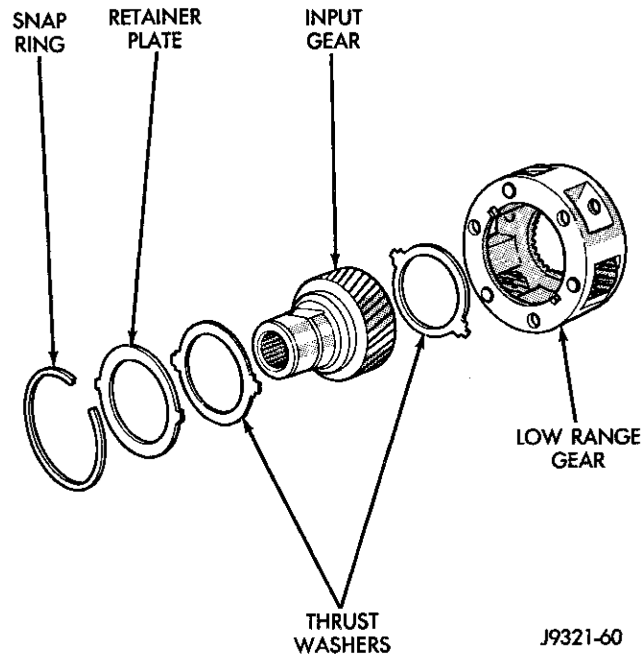

Fig. 63 Input/Low Range Gear Components

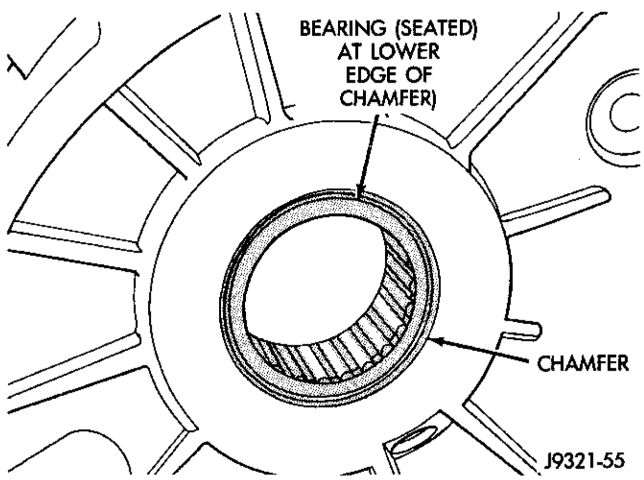

Fig. 62 Output Shaft Rear Bearing Installation Depth

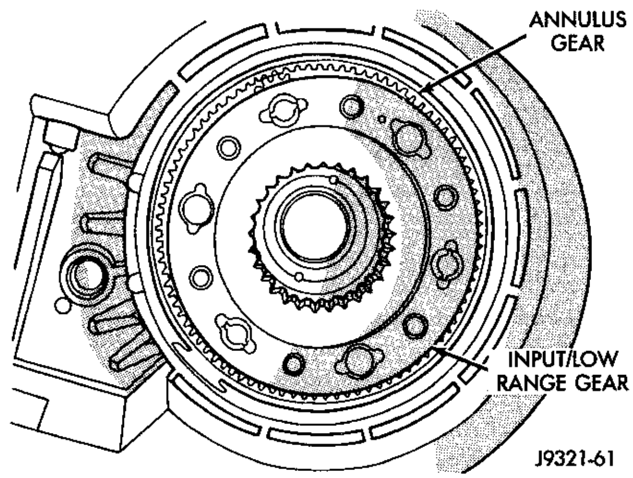

Fig. 64 Input/Low Range Gear Installation

(3) Install input gear in low range gear. Be sure input gear is fully seated.

(4) Install remaining thrust washer in low range gear and on top of input gear. Be sure washer tabs are properly aligned in gear notches.

(5) Install retainer on input gear and install snap-ring.

INPUT AND PLANETARY GEAR INSTALLATION

(1) Align and install low range/input gear assembly in front case (Fig. 64). Be sure low range gear pinions are engaged in annulus gear and that input gear shaft is fully seated in front bearing.

(2) Install snap-ring to hold input/low range gear into front bearing (Fig. 65).

(3) Clean gasket sealer residue from retainer and inspect retainer for cracks or other damage.

(4) Apply a 3 mm (1/8 in.) bead of Mopar® gasket maker or silicone adhesive to sealing surface of retainer.

(5) Align cavity in seal retainer with fluid return hole in front of case.

CAUTION: Do not block fluid return cavity on sealing surface of retainer when applying Mopar® gasket maker or silicone adhesive sealer. Seal failure and fluid leak can result.

(6) Install bolts to hold retainer to transfer case (Fig. 66). Tighten to 21 N·m (16 ft. lbs.) of torque.

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

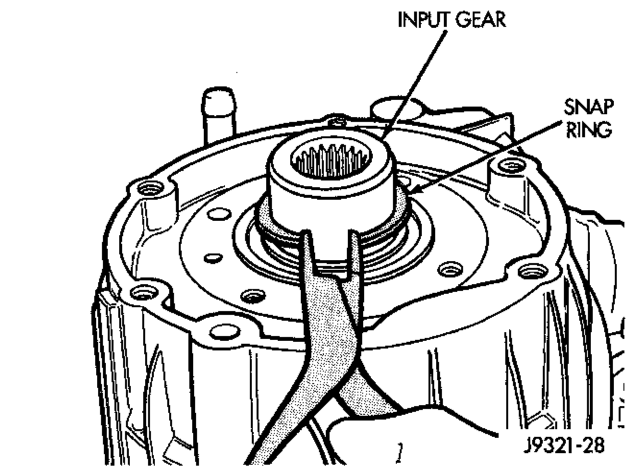

Fig. 65 Install Snap-Ring

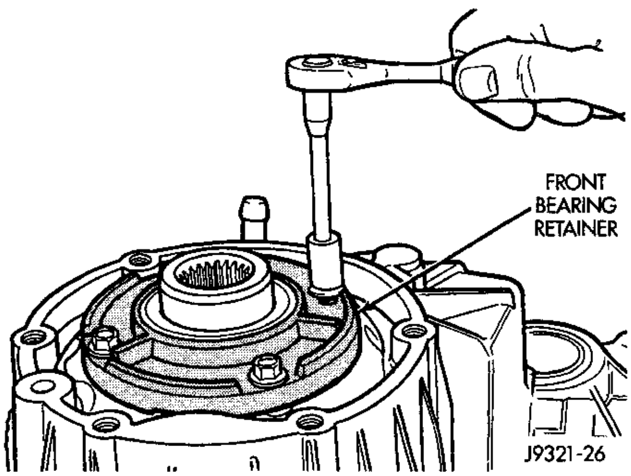

Fig. 66 Install Front Bearing Retainer

MAINSHAFT ASSEMBLY

(1) Lubricate mainshaft splines with recommended transmission fluid.

(2) Slide drive sprocket onto mainshaft.

(3) Slide mode hub onto mainshaft.

(4) Install mode hub retaining ring. Verify that the retaining ring is fully seated in mainshaft groove.

SHIFT FORKS AND MAINSHAFT INSTALLATION

(1) Support front case on wood blocks so case interior is facing up. Place blocks between mounting studs on forward surface of case. Be sure blocks will not interfere with input gear installation.

(2) Lubricate mainshaft components with Dexron II transmission fluid.

(3) Lubricate sector shaft with transmission fluid and install shift sector in case (Fig. 67). Position slot in sector so it will be aligned with shift fork pin when shift forks are installed.

(4) Assemble and install range fork and hub (Fig. 68). Be sure hub is properly seated in low range gear and engaged to the input gear.

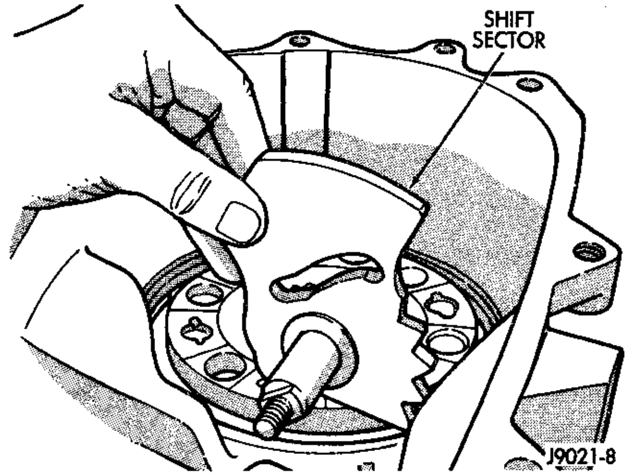

Fig. 67 Shift Sector Installation

(5) Align and insert range fork pin in shift sector slot.

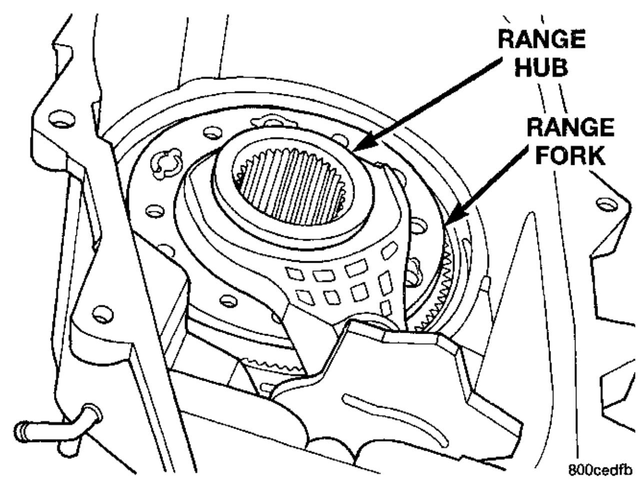

Fig. 68 Install Range Fork And Hub Assembly

(6) Install assembled mainshaft (Fig. 69). Be sure shaft is seated in pilot bearing and input gear.

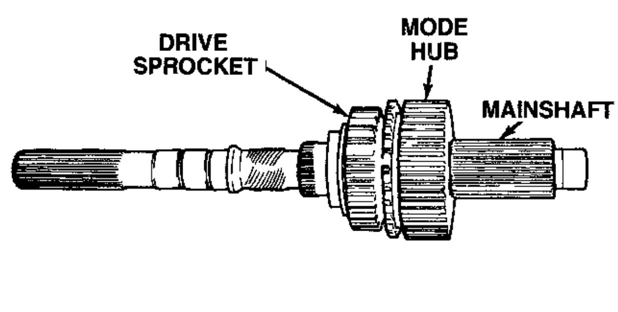

Fig. 69 Mainshaft Assembly Installation

(7) Install new pads on mode fork if necessary.

(8) Insert mode sleeve in mode fork mode fork. Be sure long side of sleeve is toward long end of shift rail (Fig. 70).

DISASSEMBLY AND ASSEMBLY (Continued)

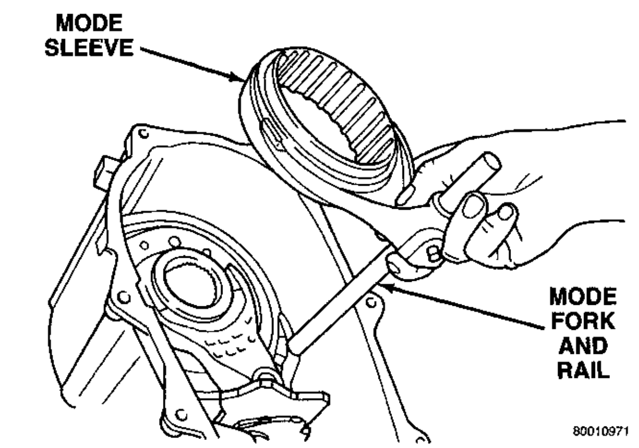

Fig. 70 Assembling Mode Fork And Sleeve

(9) Install assembled mode fork and sleeve (Fig. 71). Be sure fork rail goes through range fork and into case bore. Also be sure sleeve is aligned and seated on mainshaft hub.

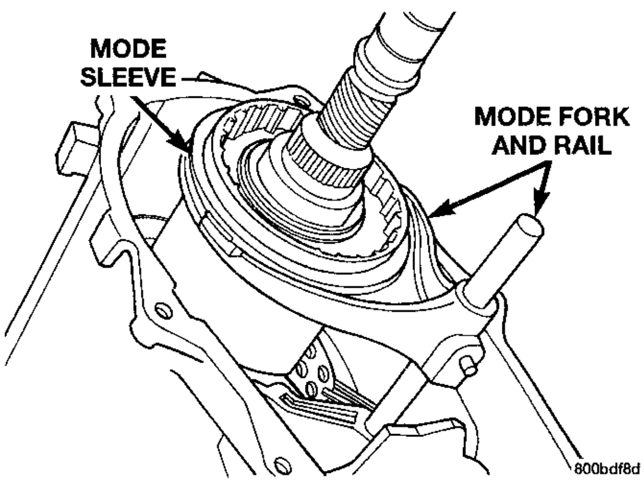

Fig. 71 Mode Fork And Sleeve Installation

(10) Install vacuum/indicator switch (Fig. 72). Tighten switch to 20-34 N·m (15-25 ft. lbs.) torque. Install new O-ring on switch beforehand, if necessary.

(11) Install new sector shaft O-ring and O-ring

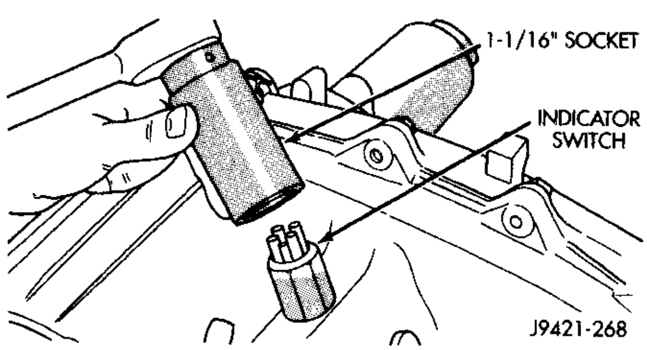

Fig. 72 Vacuum/Indicator Switch Installation

retainer in sector shaft bore (Fig. 73). Lubricate O-ring with transmission fluid or petroleum jelly after installation.

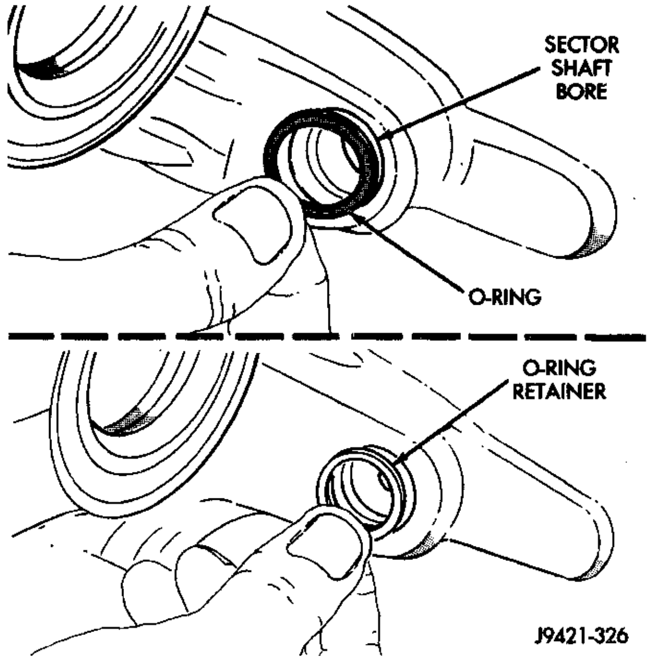

Fig. 73 Sector Shaft O-Ring And Retainer Installation

(12) Install shift lever on sector shaft (Fig. 74).

(13) Install washer and nut on sector shaft to secure shift lever. Apply 1-2 drops Mopar® Lock N' Seal, or equivalent, to nut threads before installation. Then tighten nut to 27-34 N·m (20-25 ft. lbs.) torque.

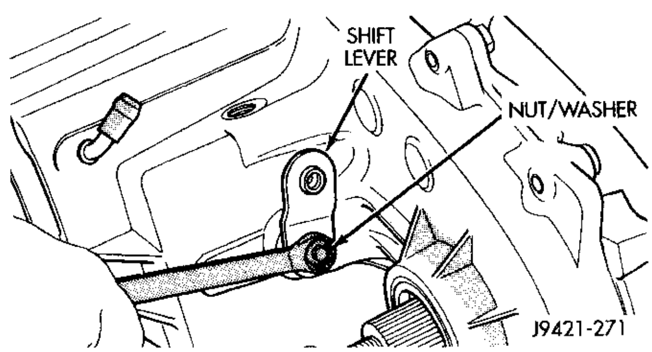

Fig. 74 Shift Lever Installation

(14) Install poppet plunger and spring (Fig. 75).

(15) Install new O-ring on poppet screw and install screw in front case (Fig. 76). Tighten screw to 16-24 N·m (12-18 ft. lbs.).

FRONT OUTPUT SHAFT AND DRIVE CHAIN INSTALLATION

(1) Install front output shaft in bearing (Fig. 77).

(2) Insert front sprocket in drive chain (Fig. 78).

(3) Install drive chain around mainshaft sprocket (Fig. 78). Then position front sprocket over front shaft.

DISASSEMBLY AND ASSEMBLY (Continued)

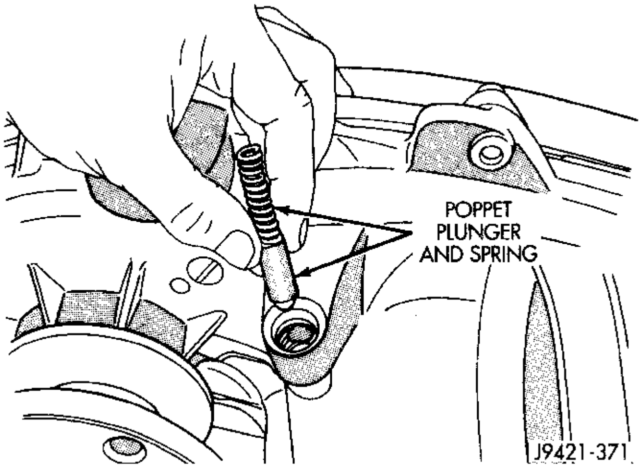

Fig. 75 Poppet Plunger And Spring Installation

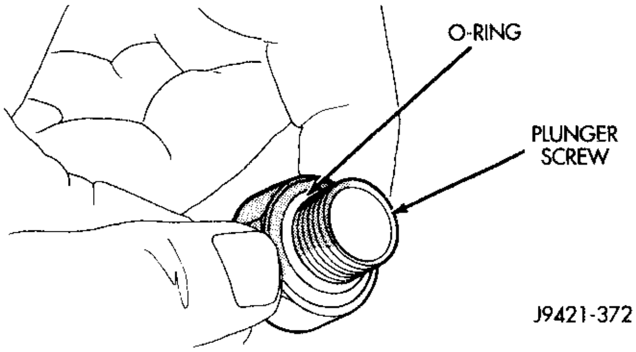

Fig. 76 O-Ring Installation On Poppet Plunger Screw

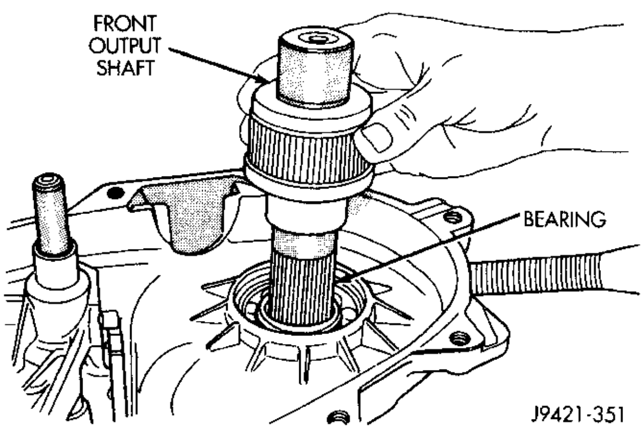

Fig. 77 Front Output Shaft Installation

(4) Raise mainshaft about 2.54 cm (one inch) and seat front sprocket on front output shaft.

(5) If mainshaft and mode sleeve were unseated during chain installation, align and reseat mainshaft in input gear and hub.

(6) Install front sprocket retaining ring (Fig. 79).

(7) Install spring and cup on shift rail (Fig. 80).

(8) Insert magnet in front case pocket (Fig. 81).

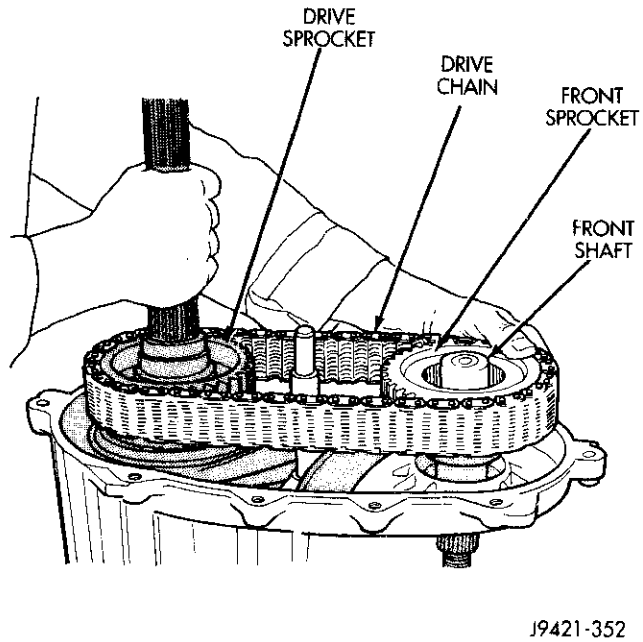

Fig. 78 Drive Chain And Front Sprocket Installation

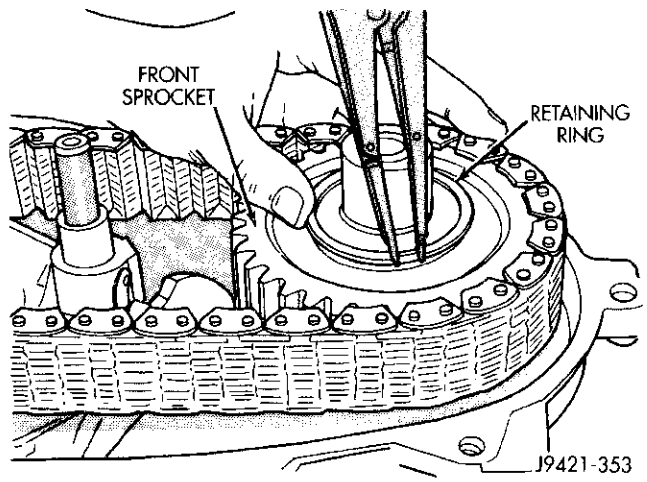

Fig. 79 Front Sprocket Retaining Ring Installation

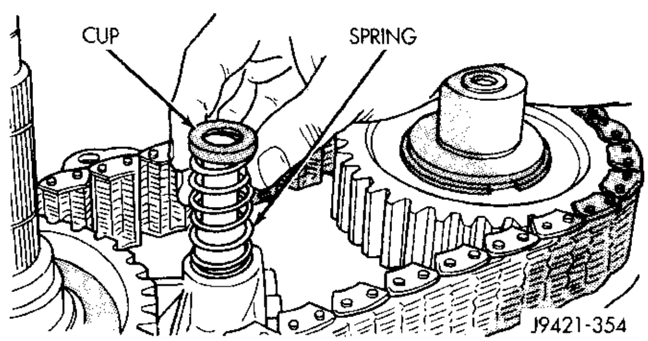

Fig. 80 Shift Rail Spring And Cup Installation

DISASSEMBLY AND ASSEMBLY (Continued)

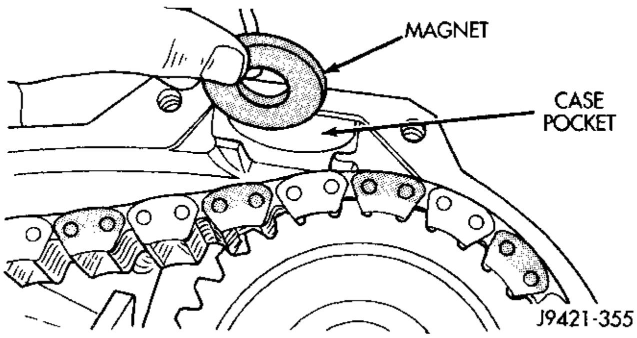

Fig. 81 Case Magnet Installation

OIL PUMP AND REAR CASE ASSEMBLY/INSTALLATION

Lubricate the oil pump components with Dexron II before installation. Prime the oil pickup tube by pouring a little oil into the tube before installation.

(1) Install new O-ring in pickup tube inlet of oil pump (Fig. 82).

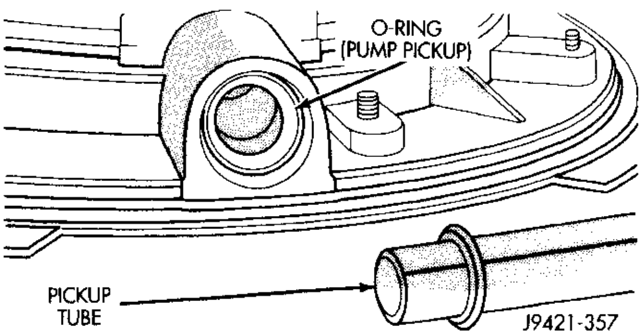

Fig. 82 Pickup Tube O-Ring Installation

(2) Position oil pickup tube and filter in rear case. Be sure pickup filter is seated in case pocket and that pickup tube is aligned in case notches (Fig. 83). Be sure hose that connects tube to filter is securely positioned.

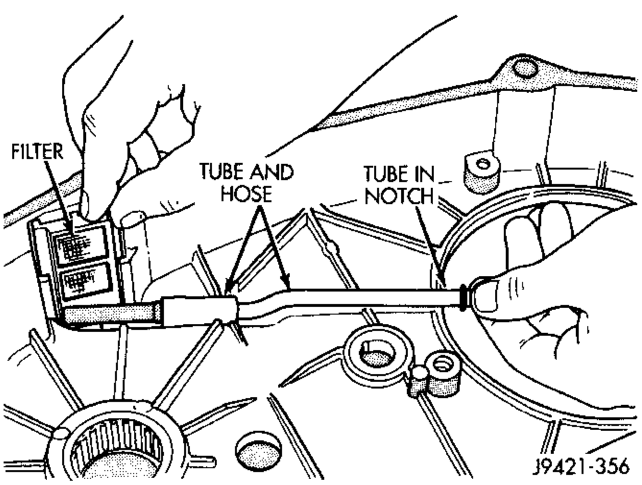

Fig. 83 Oil Pickup Tube And Filter Position In Rear Case

(3) Insert oil pickup tube in oil pump and position pump in rear case (Fig. 84).

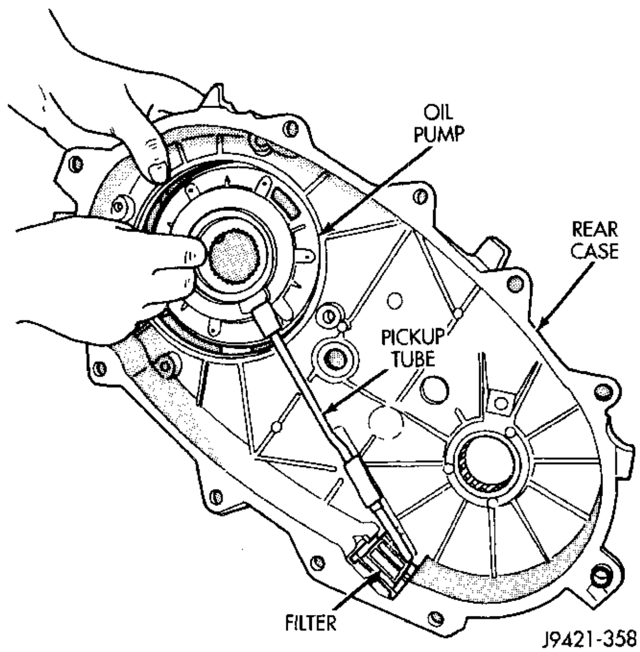

Fig. 84 Positioning Oil Pump In Rear Case

(4) Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of front case. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess will be displaced into case interior.

(5) Align oil pump with mainshaft and align shift rail with bore in rear case. Then install rear case and oil pump assembly (Fig. 85). Be sure oil pump and pickup tube remain in position during case installation.

(6) Install 4-5 rear case-to front case bolts to hold rear case in position. Tighten bolts snug but not to specified torque at this time.

CAUTION: Verify that shift rail (Fig. 86), and case alignment dowels are seated before installing any bolts. Case could be cracked if shaft rail or dowels are misaligned.

(7) Verify that oil pump is aligned and seated on rear case. Reposition pump if necessary.

(8) Check stud at end of case halves (Fig. 87). If stud was loosened or came out during disassembly, apply Loctite 242 to stud threads and reseat stud in case.

(9) Apply Loctite 242 to remainder of rear case-to-front case bolt threads and install bolts. Be sure lock washers are used on studs/bolts at case ends. Tighten bolts, or stud nuts as follows:

- flange head bolts to 47-61 N·m (35-45 ft. lbs.)
- all other bolts/nuts to 27-34 N·m (20-25 ft. lbs.)

DISASSEMBLY AND ASSEMBLY (Continued)

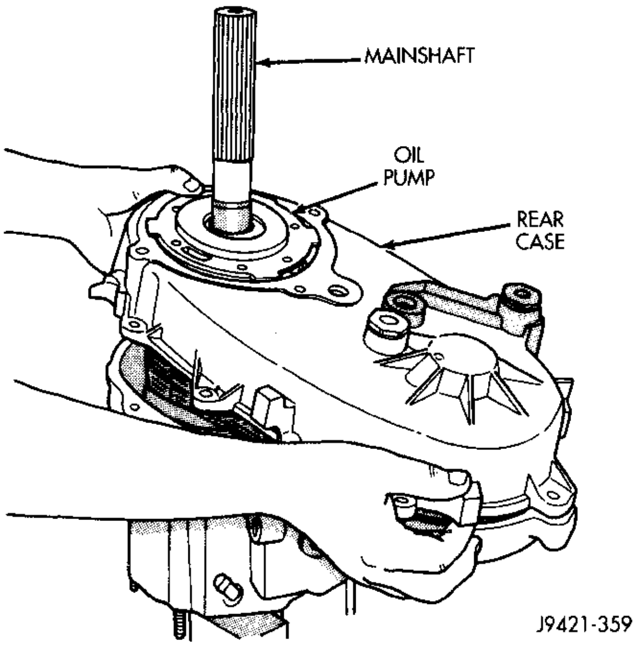

Fig. 85 Rear Case And Oil Pump Installation

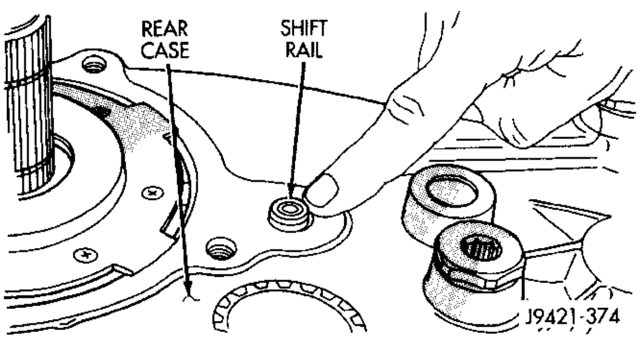

Fig. 86 Shift Rail Seated In Rear Case Bore

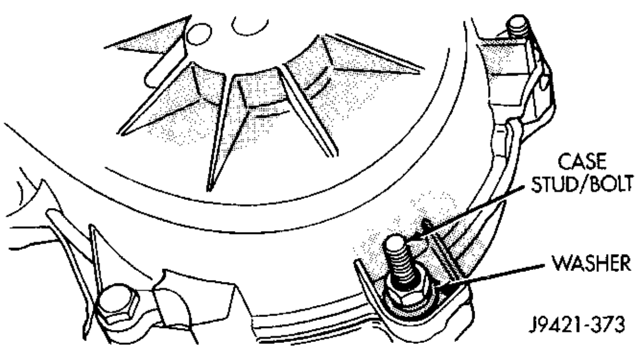

Fig. 87 Washer Installation On Case Stud And Dowel Bolts

(10) Install oil pump retaining ring on mainshaft (Fig. 88).

(11) Install rear output bearing and snap ring to output shaft.

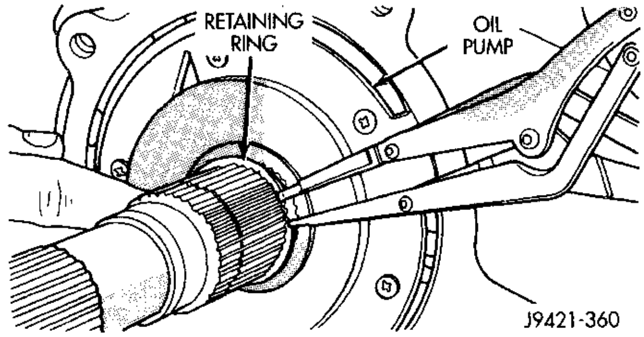

Fig. 88 Oil Pump Retaining Ring Installation

COMPANION FLANGE INSTALLATION

(1) Install companion flange seal on front shaft (Fig. 89).

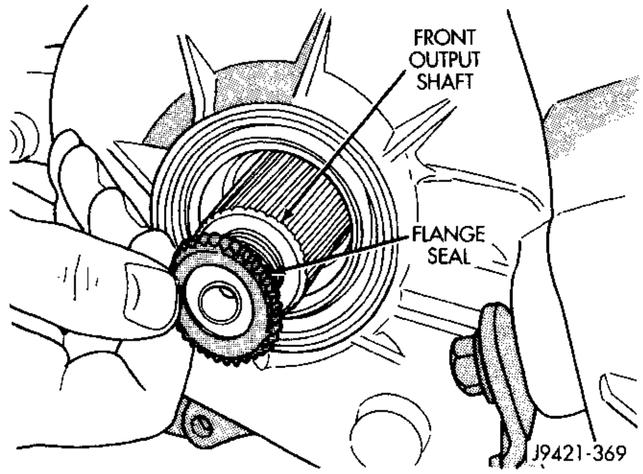

Fig. 89 Installing Flange Seal On Front Shaft

(2) Install companion flange on front shaft (Fig. 90). Then install and tighten flange nut to 176-271 N·m (130-200 ft. lbs.) torque.

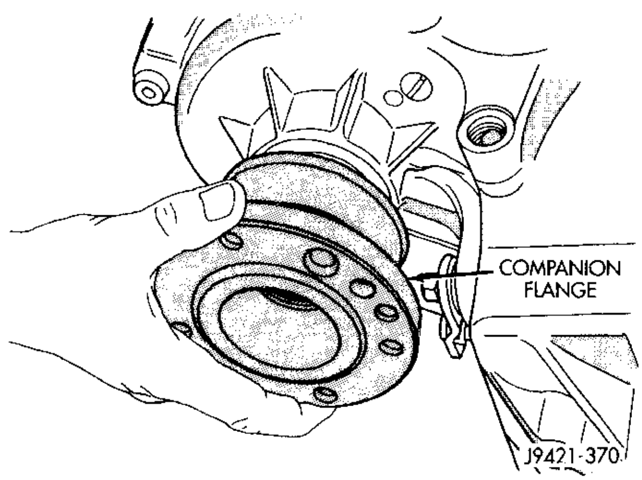

Fig. 90 Installing Companion Flange On Front Shaft

DISASSEMBLY AND ASSEMBLY (Continued)

REAR RETAINER AND EXTENSION INSTALLATION

(1) Clean mating surfaces of transfer case housing and the rear retainer of any original gasket material.

(2) Install new rear retainer gasket onto the transfer case housing or rear retainer.

(3) Align and install rear retainer on rear case (Fig. 91).

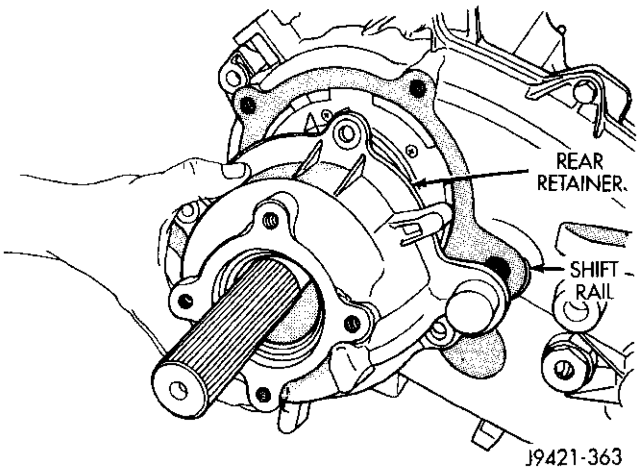

Fig. 91 Rear Retainer Installation

(4) Apply Mopar® silicone sealer to threads of rear retainer bolts. Then install retainer bolts finger tight.

(5) Install output bearing on mainshaft and seat it in rear retainer with suitable size pipe tool (Fig. 92).

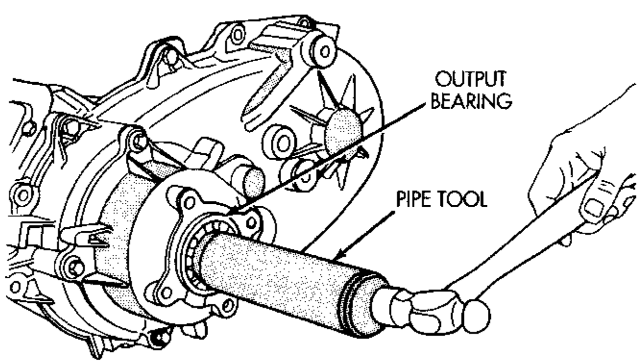

Fig. 92 Output Bearing Installation

(6) Install output bearing retaining ring (Fig. 93).

(7) Tighten rear retainer bolts to 27-34 N·m (20-25 ft. lbs.) torque.

(8) Install new seal in rear extension with suitable size installer tool.

(9) Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of rear extension. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess could be displaced into output bearing.

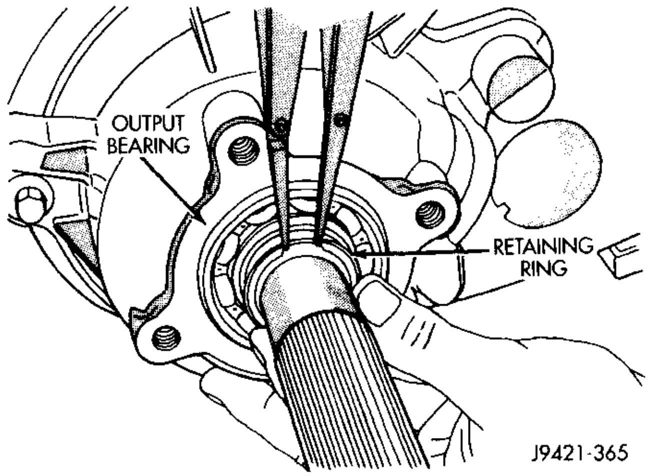

Fig. 93 Output Bearing Retaining Ring Installation

(10) Align and install rear extension on retainer (Fig. 94).

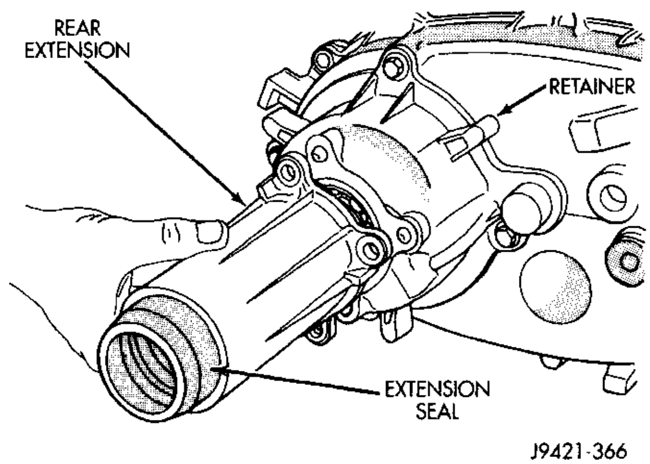

Fig. 94 Rear Extension Installation

(11) Apply Mopar® silicone sealer to threads of rear extension bolts. Then install and tighten bolts to 27-34 N·m (20-25 ft. lbs.) torque.

CLEANING AND INSPECTION

TRANSFER CASE CLEANING AND INSPECTION

Clean the transfer case parts with a standard parts cleaning solvent. Remove all traces of sealer from the cases and retainers with a scraper and 3M all purpose cleaner. Use compressed air to remove solvent residue from oil feed passages in the case halves, retainers, gears, and shafts.

The oil pickup screen can be cleaned with solvent. Shake excess solvent from the screen after cleaning and allow it to air dry. Do not use compressed air.

AUTHENTIC RESTORATION PRODUCT

CLEANING AND INSPECTION (Continued)

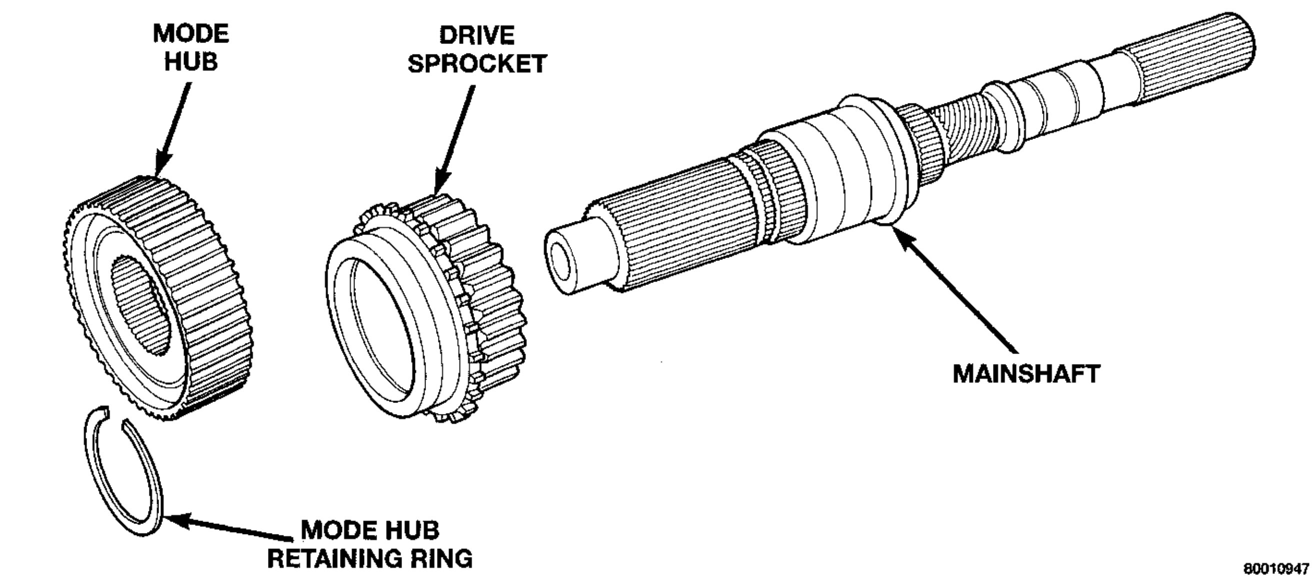

Fig. 95 Mainshaft, Mode Hub, And Drive Sprocket

MAINSHAFT/SPROCKET/HUB INSPECTION

Inspect the splines on the hub and shaft and the teeth on the sprocket (Fig. 95). Minor nicks and scratches can be smoothed with an oilstone, however, replace any part is damaged.

Check the contact surfaces in the sprocket bore and on the mainshaft. Minor nicks and scratches can be smoothed with 320–400 grit emery cloth but do not try to salvage the shaft if nicks or wear is severe.

INPUT GEAR AND PLANETARY CARRIER

Check the teeth on the gear (Fig. 96). Minor nicks can be dressed off with an oilstone but replace the gear if any teeth are broken, cracked, or chipped. The bearing surface on the gear can be smoothed with 300–400 grit emery cloth if necessary.

Examine the carrier body and pinion gears for wear or damage. The carrier will have to be replaced as an assembly if the body, pinion pins, or pinion gears are damaged.

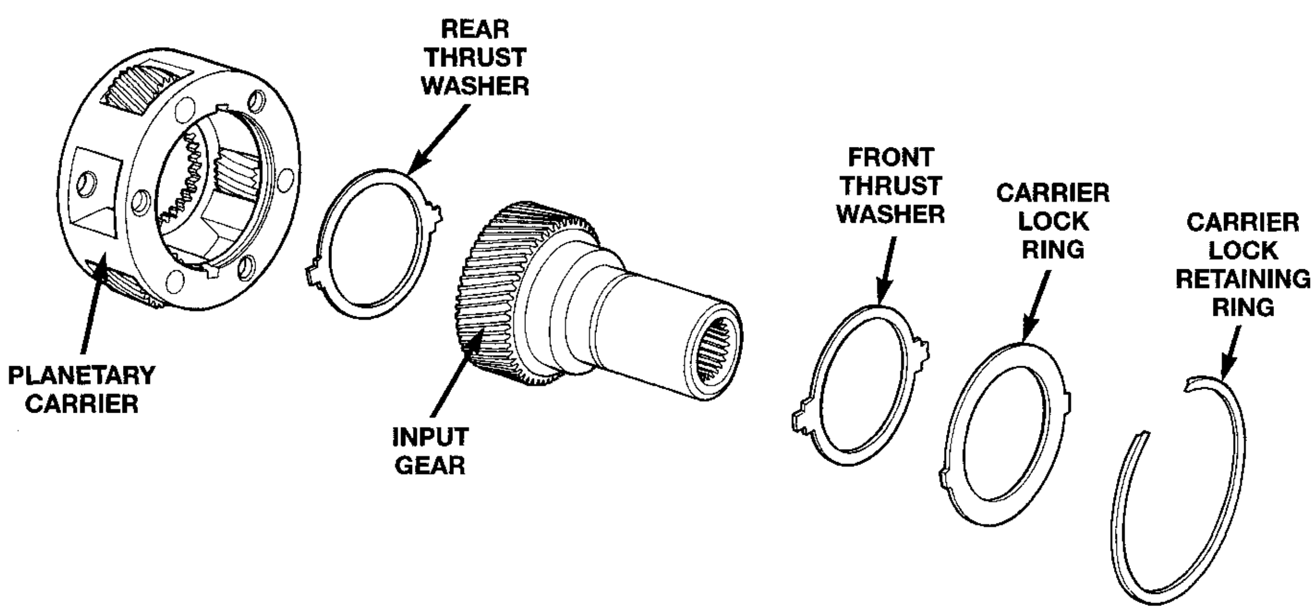

Fig. 96 Input Gear And Carrier Components

CLEANING AND INSPECTION (Continued)

Check the lock ring and both thrust washers for wear or cracks. Replace them if necessary. Also replace the lock retaining ring if bent, distorted, or broken.

SHIFT FORKS/HUBS/SLEEVES

Check condition of the shift forks and mode fork shift rail (Fig. 97). Minor nicks on the shift rail can be smoothed with 320–400 grit emery cloth.

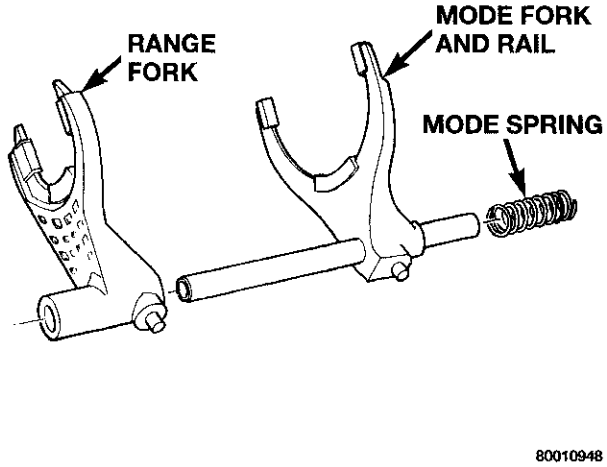

Fig. 97 Shift forks

Inspect the shift fork wear pads (Fig. 98). The mode fork pads are serviceable and can be replaced if necessary. The range fork pads are not serviceable. The fork must be replaced as an assembly if the pads are worn or damaged.

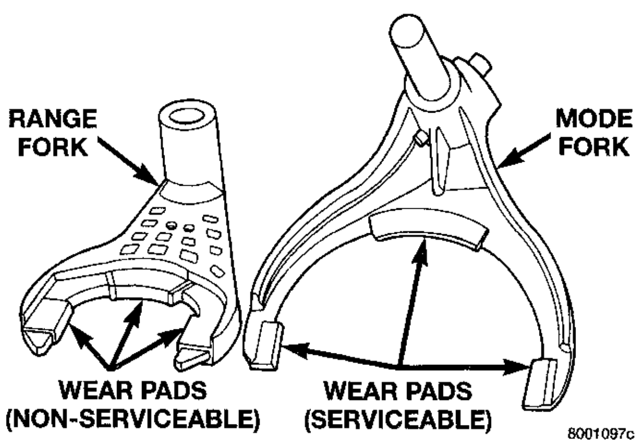

Fig. 98 Shift Fork And Wear Pad Locations

Check both of the sleeves for wear or damage, especially on the interior teeth. Replace the sleeves if wear or damage is evident.

REAR RETAINER COMPONENTS

Inspect the retainer components. Replace the bearing if rough or noisy. Check the retainer for cracks or wear in the bearing bore. Clean the retainer sealing surfaces with a scraper and 3M all purpose cleaner. This will ensure proper adhesion of the sealer during reassembly.

Inspect the retaining rings and washers. Replace any part if distorted, bent, or broken. Reuse is not recommended.

Inspect rear extension bushing. Replace if worn or scored.

DRIVE CHAIN

Examine the drive chain and shaft bearings. replace the chain if stretched, distorted, or if any of the links bind. Replace the bearings if rough, or noisy.

LOW RANGE ANNULUS GEAR

Inspect annulus gear condition carefully. The gear is only serviced as part of the front case. If the gear is damaged, it will be necessary to replace the gear and front case as an assembly. Do not attempt to remove the gear (Fig. 99)

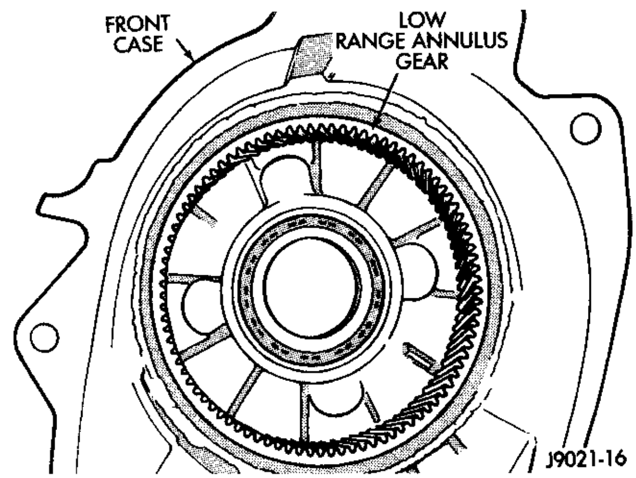

Fig. 99 Low Range Annulus Gear

FRONT-REAR CASES AND FRONT RETAINER

Inspect the cases and retainer for wear and damage. Clean the sealing surfaces with a scraper and 3M all purpose cleaner. This will ensure proper sealer adhesion at assembly. Replace the input retainer seal; do not reuse it.

Check case condition. If leaks were a problem, look for gouges and severe scoring of case sealing surfaces. Also make sure the front case mounting studs are in good condition.

Check the front case mounting studs and vent tube. The tube can be secured with Loctite 271 or 680 if loose. The stud threads can be cleaned up with a die if necessary. Also check condition of the fill/ drain plug threads in the rear case. The threads can be repaired with a thread chaser or tap if necessary.

Mopar AUTHENTIC RESTORATION PRODUCT

CLEANING AND INSPECTION (Continued)

Or the threads can be repaired with Helicoil stainless steel inserts if required.

OIL PUMP/OIL PICKUP

Examine the oil pump pickup parts. Replace the pump if any part appears to be worn or damaged. Do not disassemble the pump as individual parts are not available. The pump is only available as a complete assembly. The pickup screen, hose, and tube are the only serviceable parts and are available separately.

ADJUSTMENTS

SHIFT LINKAGE ADJUSTMENT

(1) Move shift lever into 2H position.
(2) Raise vehicle.
(3) Loosen shift rod lock bolt at trunnion (Fig. 100).

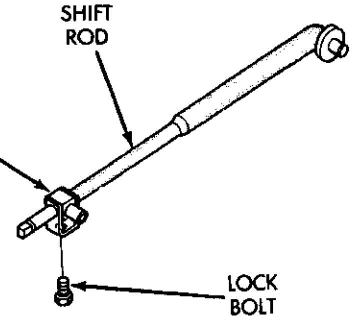

Fig. 100 Shift Rod Lock Bolt Location

(4) Check shift rod fit in trunnion. Be sure rod does not bind in trunnion.
(5) Verify that transfer case shift lever is in 2H position. The 2H position on the transfer case shift arm is the second position from full forward.
(6) Lower vehicle.
(7) Position the shift lever on the cab such that the distance from the instrument panel to the 2H position dot in the shift lever insert is 14.6 cm (5.75 in.). Ensure that the measurement is made parallel to the floor of the vehicle.
(8) Tighten shift rod lock bolt to 10 N·m (90 in. lbs.) torque.
(9) Check shift linkage operation. Be sure transfer case shifts into and operates properly in all ranges.

SPECIFICATIONS

TORQUE

DESCRIPTION	TORQUE
Plug, Detent	16–24 N·m (12–18 ft. lbs.)
Bolt, Diff. Case	17–27 N·m (15–24 ft. lbs.)
Plug, Drain/Fill	40–45 N·m (30–40 ft. lbs.)

NV241HD TRANSFER CASE

INDEX

GENERAL INFORMATION

NV241HD INTRODUCTION

The NV241HD is a part-time transfer case with a low-range gear system. The transfer case provides three operating ranges plus a Neutral position. The low range position provides a gear reduction ratio of 2.72:1 for increased low speed torque capability. Operating ranges are: 2-high, 4-high and 4-low.

The gear cases, retainer and extension are all of aluminum. Drive sprockets and an interconnecting drive chain are used to transmit engine torque to the front/rear propeller shafts. The mainshaft, input gear and front output shaft are supported by ball and needle bearings.

The synchro mechanism consists of a brass stop ring, synchro hub with 3 struts and 2 retaining springs and the sliding clutch (Fig. 1). The synchro components allow the transfer case to be shifted between 2H and 4H ranges while the vehicle is in motion. However, the vehicle must be stopped in order to shift into 4L range.

OPERATING RANGES

Transfer case operating ranges are:

- 4x2 (2-wheel drive)
- 4x4 (4-wheel drive)
- 4 Lo (4-wheel drive low range

The 4x2 range is for use on any road surface at any time.

The 4x4 and 4 Lo ranges are for off road use only. They are not for use on hard surface roads. The only exception being when the road surface is covered by ice and snow.

The low range reduction gear system is operative in 4 Lo range only. This range is for extra pulling power in off road situations. Low range reduction ratio is 2.72:1.

A front axle disconnect system is used to achieve two-wheel drive mode. The axle disconnect vacuum motor is actuated by a vacuum switch on the transfer case. The switch is operated by the transfer case range rod.

SHIFT MECHANISM

The transfer case is operated by an adjustable floor mounted shift linkage. The transfer case shift lever is directly attached to the shift sector. The sector operates the range and mode forks within the transfer case.

A straight line shift pattern is used with a neutral detent. Lever range positions are imprinted in the shift knob.

AUTHENTIC RESTORATION PRODUCT

GENERAL INFORMATION (Continued)

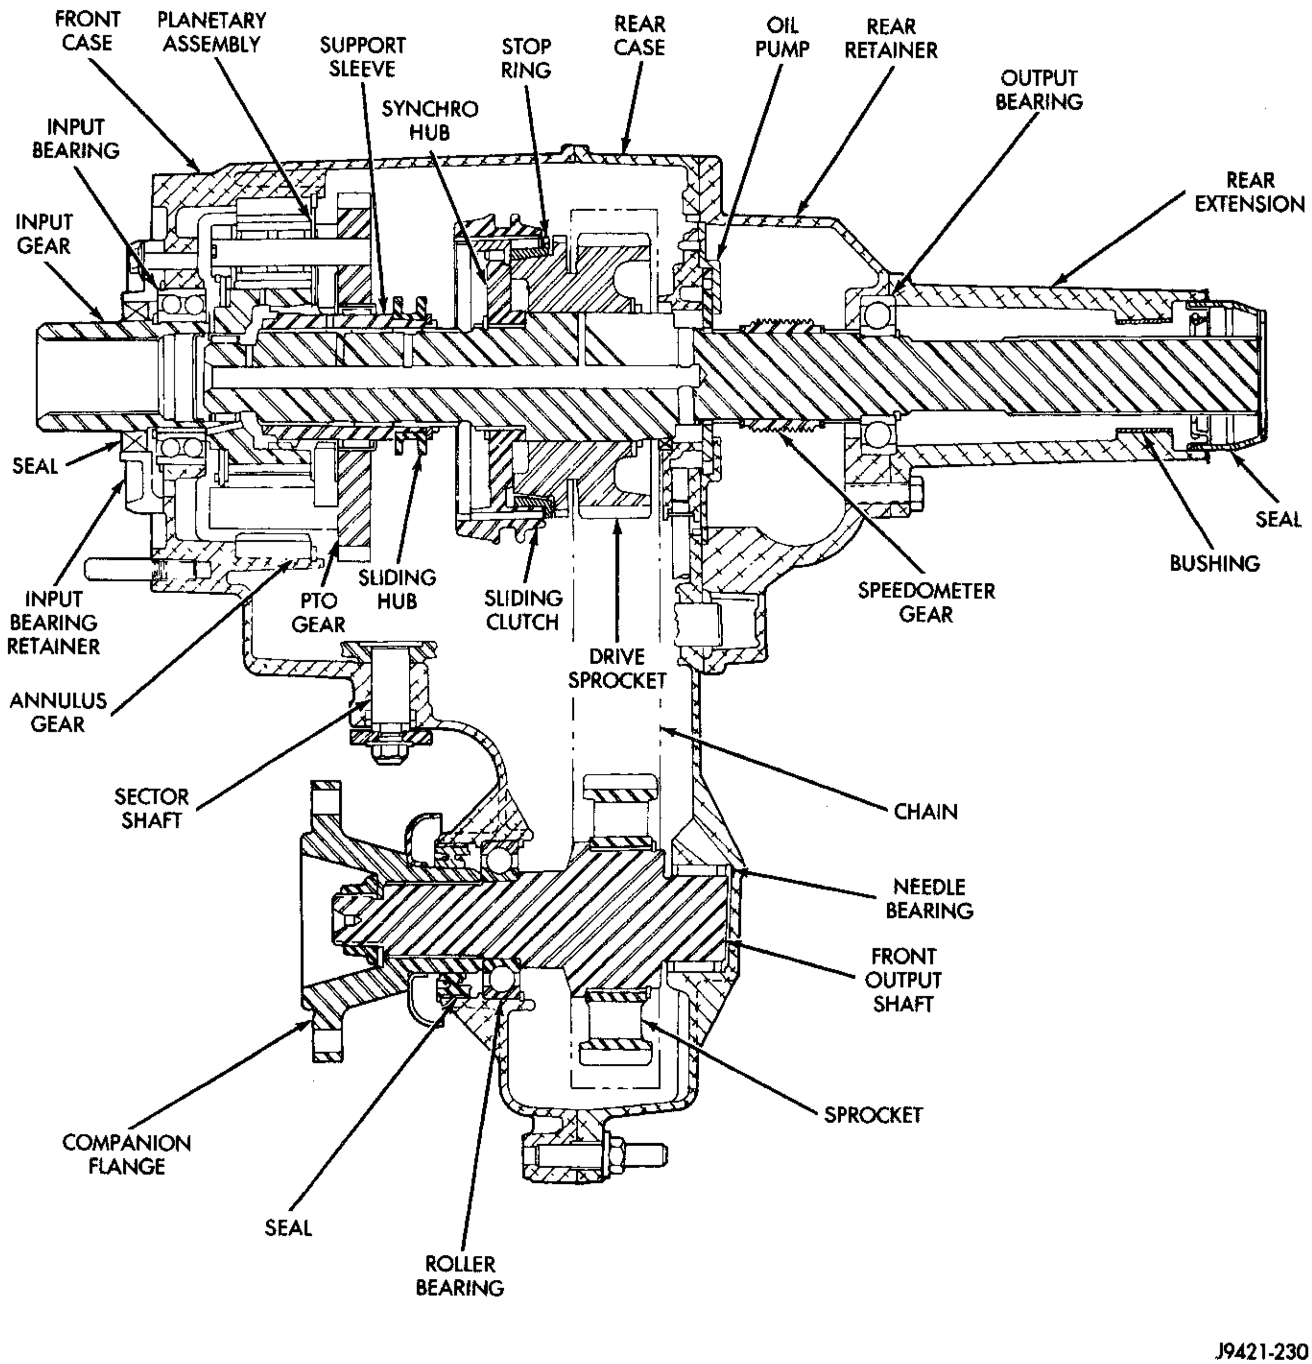

Fig. 1 NV241HD Transfer Case

Mopar AUTHENTIC RESTORATION PRODUCT

GENERAL INFORMATION (Continued)

PTO CAPABILITY

The NV241HD transfer case has power take-off capability. A PTO gear permanently attached to the planetary carrier, and a removable PTO cover are provided for this purpose.

TRANSFER CASE IDENTIFICATION

An identification tag (Fig. 2) is attached to the rear case of every transfer case. The tag provides the transfer case model number, assembly number, serial number, and low range ratio.

The transfer case serial number also represents the date of build.

RECOMMENDED LUBRICANT AND FILL LEVEL

Recommended lubricant for the NV241HD transfer case is Mopar® Dexron II, or ATF Plus. Use this fluid for topping off the level, refilling after service, or normal fluid changes.

Do not use anti-friction additives or similar products in the NV241HD transfer case. Use recommended lubricant only.

Approximate lubricant refill capacity is 3.1 liters (6.5 pints) for the NV241HD.

Correct fluid level for the transfer case is to the bottom edge of the fill plug hole. Be sure that the vehicle is level when checking the fill level.

DIAGNOSIS AND TESTING

SERVICE DIAGNOSIS

Before beginning repair on a suspected transfer case malfunction, check all other driveline components beforehand.

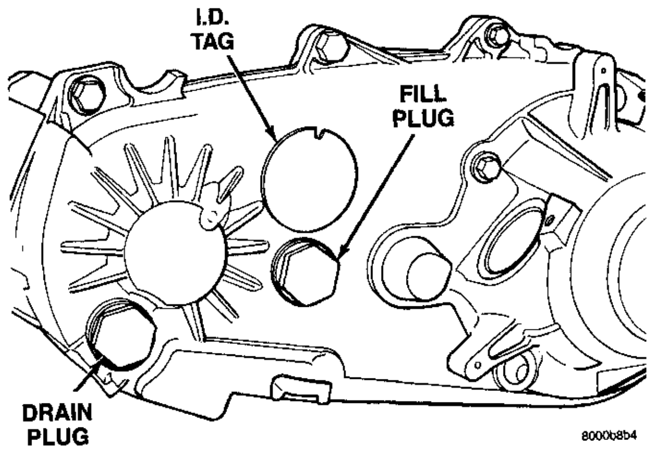

Fig. 2 Transfer Case Identification Tag—Typical

The actual cause of a problem may be related to such items as: front hubs, axles, propeller shafts, wheels and tires, transmission, or clutch instead. If all other driveline components are in good condition and operating properly, refer to the Service Diagnosis chart for further information.

Mopar AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING (Continued)

SERVICE DIAGNOSIS

Condition	Possible Cause	Correction
TRANSFER CASE DIFFICULT TO SHIFT OR WILL NOT SHIFT INTO DESIRED RANGE	(1) Vehicle speed too great to permit shifting.	(1) Stop vehicle and shift into desired range. Or reduce speed to 3-4 km/h (2-3 mph) before attempting to shift.
	(2) If vehicle was operated for extended period in 4H mode on dry paved surface, driveline torque load may cause difficulty.	(2) Stop vehicle, shift transmission to Neutral, shift transfer case to 2H mode and operate vehicle in 2H on dry paved surfaces.
	(3) Transfer case external shift linkage binding.	(3) Lubricate, repair or replace linkage bushings or tighten loose components as necessary.
	(4) Insufficient or incorrect lubricant.	(4) Drain and refill to edge of fill hole with DEXRON II® or MOPAR-MERCON® Automatic Transmission Fluid.
	(5) Internal components binding, worn or damaged.	(5) Disassemble unit and replace worn or damaged components as necessary.
TRANSFER CASE NOISY IN ALL DRIVE MODES	(1) Insufficient or incorrect lubricant.	(1) Drain and refill to edge of fill hole with DEXRON II® or MOPAR-MERCON® Automatic Transmission Fluid. Check for leaks and repair if necessary. **Note: If unit is still noisy after drain and refill, disassembly and inspection may be required to locate source of noise.**
NOISY IN – OR JUMPS OUT OF – FOUR WHEEL DRIVE LOW RANGE	(1) Transfer case not completely engaged in 4L position.	(1) Stop vehicle, shift transfer case to Neutral, then shift back into 4L position.
	(2) Shift linkage out of adjustment.	(2) Adjust linkage.
	(3) Shift linkage loose or binding.	(3) Tighten, lubricate or repair linkage as necessary.
	(4) Range fork damaged, inserts worn, or fork is binding on shift rail.	(4) Disassemble unit and repair as necessary.
	(5) Low range gear worn or damaged.	(5) Disassemble and repair as necessary.
LUBRICANT LEAKING FROM OUTPUT SHAFT SEALS OR FROM VENT	(1) Transfer case overfilled.	(1) Drain to correct level.
	(2) Vent closed or restricted.	(2) Clear or replace vent if necessary.
	(3) Output shaft seals damaged or installed incorrectly.	(3) Replace seals. Be sure seal lip faces interior of case when installed. Also be sure yoke seal surfaces are not scored or nicked. Remove scores and nicks with fine sandpaper or replace yoke(s) if necessary.
ABNORMAL TIRE WEAR	(1) Extended operation on dry hard surface (paved) roads in 4H range.	(1) Operate in 2H on hard surface (paved) roads.

J9021-118

SERVICE PROCEDURES

FLUID DRAIN/REFILL

(1) Raise vehicle.
(2) Position drain pan under transfer case.
(3) Remove drain and fill plugs and drain lubricant completely.
(4) Install drain plug. Tighten plug to 41-54 N·m (30-40 ft. lbs.).
(5) Remove drain pan.
(6) Fill transfer case to bottom edge of fill plug opening with Mopar® Dexron II.
(7) Install and tighten fill plug to 41-54 N·m (30-40 ft. lbs.).
(8) Lower vehicle.

REMOVAL AND INSTALLATION

TRANSFER CASE

REMOVAL

(1) Raise and support vehicle.
(2) Remove skid plate, if equipped.
(3) Position drain oil container under transfer case.
(4) Remove transfer case drain plug and drain lubricant into container.
(5) Disconnect vent hose and vacuum harness at transfer case switch.
(6) Disconnect shift rod from grommet in transfer case shift lever, or from floor shift arm whichever provides easy access. Use channel lock style pliers to press rod out of lever grommet.
(7) Support transmission with jack stand.
(8) Remove rear crossmember.
(9) Mark front and rear propeller shafts for assembly reference.
(10) Remove front and rear propeller shafts.
(11) Support transfer case with suitable jack. Secure transfer case to jack with safety chains.
(12) Remove nuts attaching transfer case to transmission.
(13) Move transfer case assembly rearward until free of transmission output shaft.
(14) Lower jack and move transfer case from under vehicle.

INSTALLATION

(1) Align and seat transfer case on transmission. Be sure transfer case input gear splines are aligned with transmission output shaft. Align splines by rotating transfer case rear output shaft yoke if necessary. Do not install any transfer case attaching nuts until the transfer case is completely seated against the transmission.
(2) Install and tighten transfer case attaching nuts. If case has 5/16 in. studs, tighten nuts to 30-41 N·m (22-30 ft.lbs.). If case has 3/8 studs, tighten nuts to 41-47 N·m (30-35 ft. lbs.).
(3) Install rear crossmember.
(4) Remove jack stand from under transmission.
(5) Align and connect propeller shafts.
(6) Connect vacuum harness and vent hose.
(7) Connect shift rod to transfer case lever or floor shift arm. Use channel lock style pliers to press rod back into lever grommet.
(8) Adjust shift linkage, if necessary.
(9) Fill transfer case with recommended transmission fluid and install fill plug.
(10) Install skid plate, if equipped.
(11) Lower vehicle

SHIFT LEVER

REMOVAL

(1) Shift transfer case into 4L.
(2) Remove transfer case shifter knob cap.
(3) Remove nut holding shifter knob to shift lever.
(4) Remove shifter knob.
(5) Raise and support vehicle.
(6) Loosen adjusting trunnion lock bolt and slide shift rod out of trunnion. If rod lacks enough travel to come out of trunnion, push trunnion out of shift lever.
(7) Remove bolts holding shift lever to the underside of the body.
(8) Separate shift lever from vehicle.

INSTALLATION

(1) Position shift lever on vehicle. Use care when passing the shift lever through the shifter boot to prevent damage to the shifter boot.
(2) Install bolts to hold shift lever to the underside of the body.
(3) Install trunnion to shift lever, if necessary.
(4) Install shift rod to trunnion, if necessary.
(5) Lower vehicle.
(6) Install shift knob on shift lever.
(7) Install nut to hold shifter knob to shift lever.
(8) Install shifter knob cap.
(9) Adjust the transfer case shift linkage.
(10) Verify transfer case operation.

FRONT OUTPUT SHAFT SEAL

REMOVAL

(1) Shift transfer case into neutral.
(2) Remove companion flange nut (Fig. 3). Discard nut after removal. It is not reusable.
(3) Remove companion flange from output shaft. Use a suitable puller if flange can not be removed by hand.

REMOVAL AND INSTALLATION (Continued)

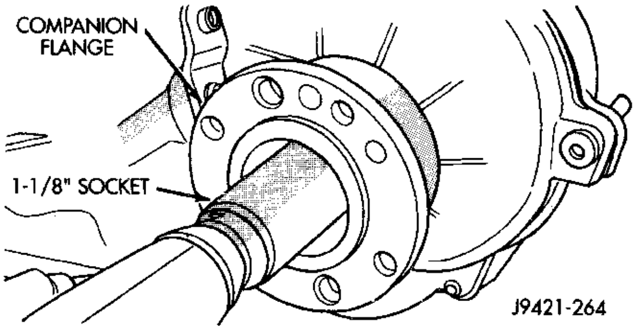

Fig. 3 Removing Companion Flange Nut

(4) Remove companion flange rubber seal from front output shaft (Fig. 4).

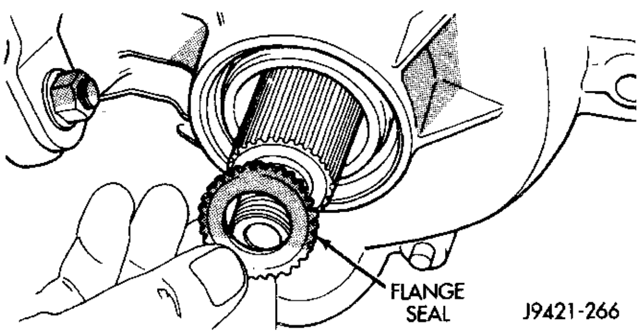

Fig. 4 Companion Flange Seal Removal

(5) Remove front output shaft seal with suitable pry tool, or a slide hammer mounted screw.

INSTALLATION

(1) Install new front output seal in front case with Installer Tool 6888 and Tool Handle C-4171 (Fig. 5) as follows:

(a) Place new seal on tool. Garter spring on seal goes toward interior of case.

(b) Start seal in bore. Once seal is started, continue tapping seal into bore until installer tool bottoms against case.

(c) Remove installer and verify that seal is recessed the proper amount. Seal should be 2.03 to 2.5 mm (0.080 to 0.100 in.) below top edge of seal bore in front case (Fig. 6). This is correct final seal position.

CAUTION: Be sure the front output seal is seated below the top edge of the case bore as shown. The seal could loosen, or become cocked if not seated to recommended depth.

(2) Install companion flange seal on front shaft (Fig. 7).

(3) Install companion flange on front shaft (Fig. 8). Then install and tighten flange nut to 176-271 N·m (130-200 ft. lbs.) torque.

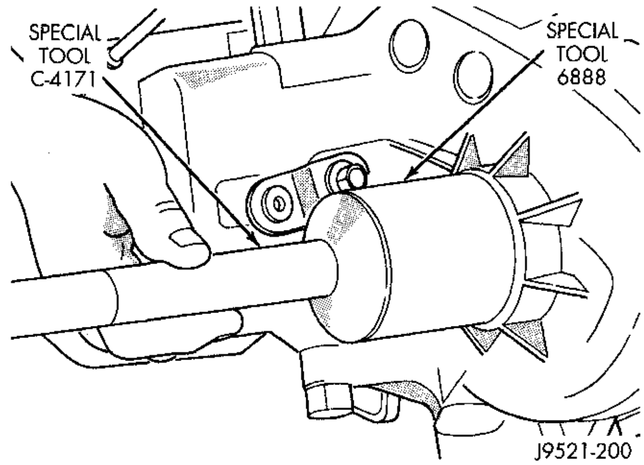

Fig. 5 Front Output Seal Installation

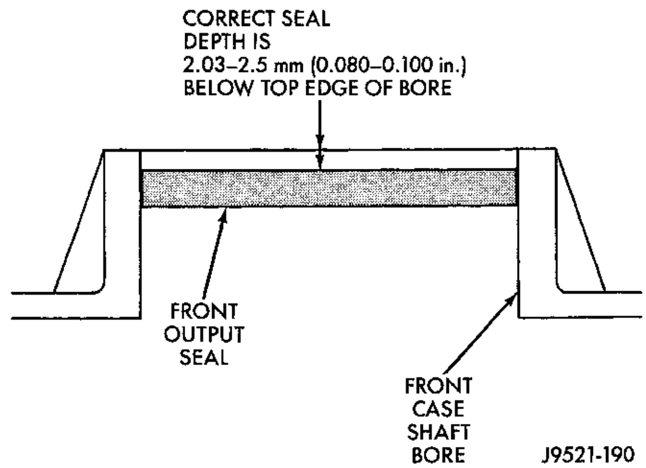

Fig. 6 Checking Front Output Seal Installation Depth

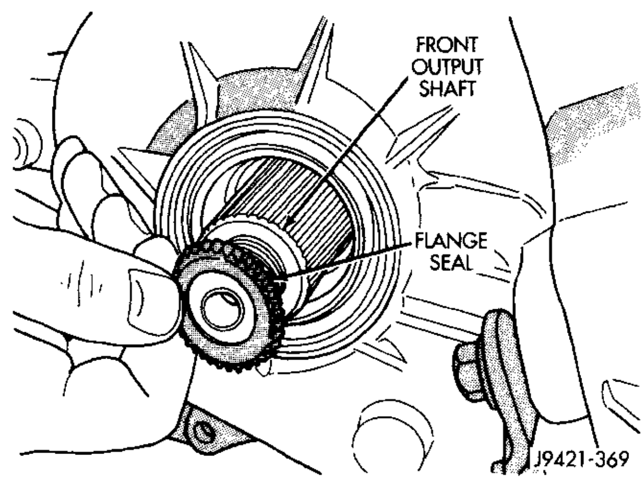

Fig. 7 Installing Flange Seal On Front Shaft

REMOVAL AND INSTALLATION (Continued)

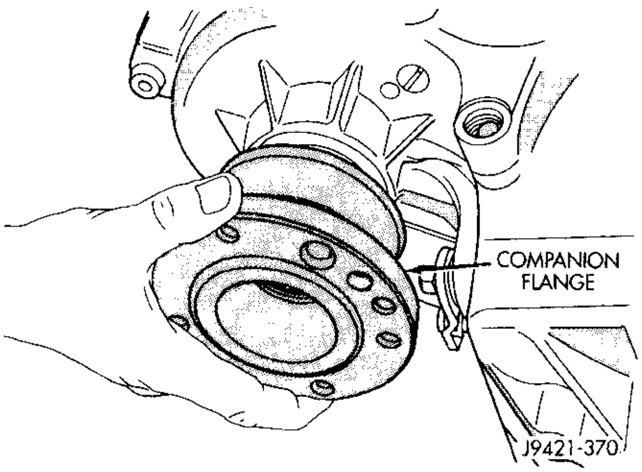

Fig. 8 Installing Companion Flange On Front Shaft

EXTENSION HOUSING BUSHING AND SEAL

REMOVAL

(1) Raise and support vehicle.

(2) Remove rear propeller shaft. Refer to Group 3, Differential and Driveline, for proper procedure.

(3) Using a suitable pry tool or slide-hammer mounted screw, remove the extension housing seal.

(4) Using Remover 8155, remove bushing from extension housing (Fig. 9).

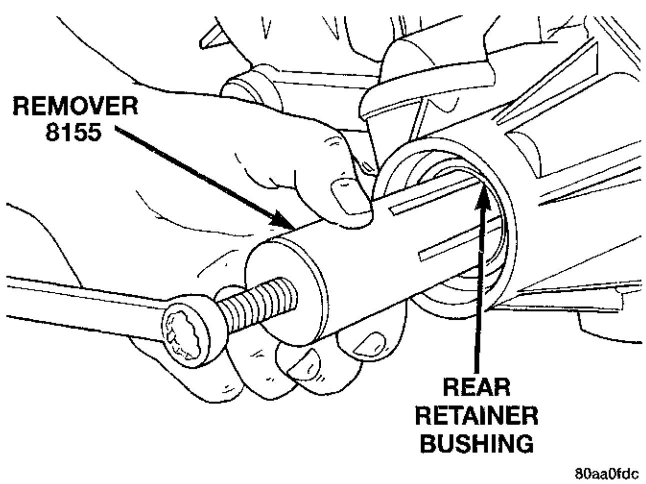

Fig. 9 Rear Retainer Bushing Removal

INSTALLATION

(1) Clean fluid residue from sealing surface and inspect for defects.

(2) Position replacement bushing in extension housing with fluid port in bushing aligned with slot in housing.

(3) Using Installer 8156, drive bushing into housing until installer seats against case (Fig. 10).

(4) Using Installer 8154, install seal in extension housing (Fig. 11).

(5) Install propeller shaft.

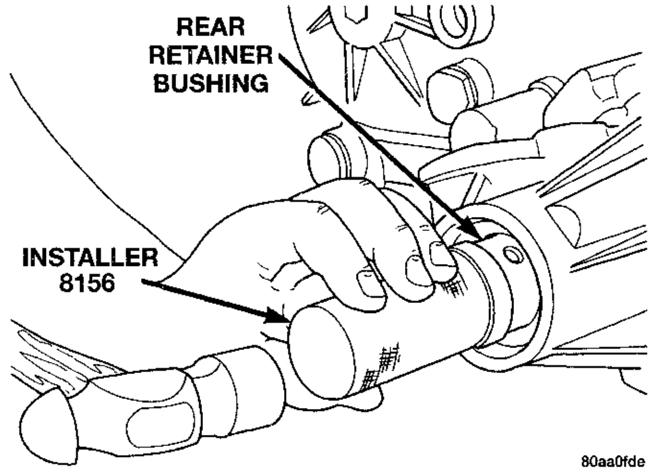

Fig. 10 Extension Housing Bushing Install

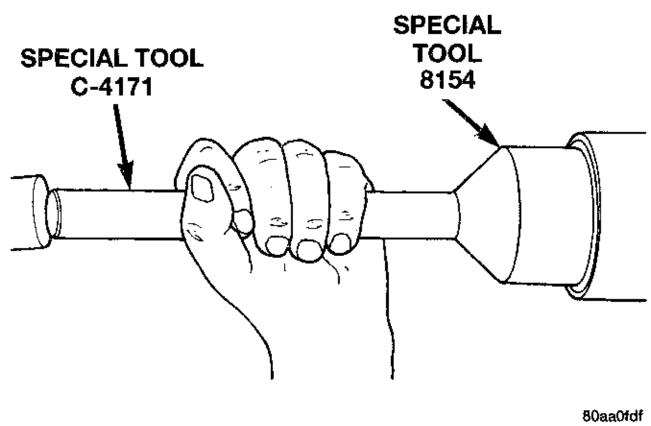

Fig. 11 Install Extension Housing Seal

(6) Verify proper fluid level.

(7) Lower vehicle.

DISASSEMBLY AND ASSEMBLY

TRANSFER CASE

DISASSEMBLY

Position transfer case in a shallow drain pan. Remove drain plug and drain any remaining lubricant remaining in case.

EXTENSION HOUSING REMOVAL

(1) Remove extension housing snap ring access cover.

(2) Remove bolts holding extension housing to rear case half.

(3) Tap extension housing with plastic or rawhide hammer to loosen sealant.

(4) Disengage extension housing snap ring from rear output shaft bearing.

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(5) Separate extension housing from transfer case.

COMPANION FLANGE AND SHIFT LEVER REMOVAL

(1) Shift transfer case into neutral.

(2) Remove companion flange nut (Fig. 12). Discard nut after removal. It is not reusable.

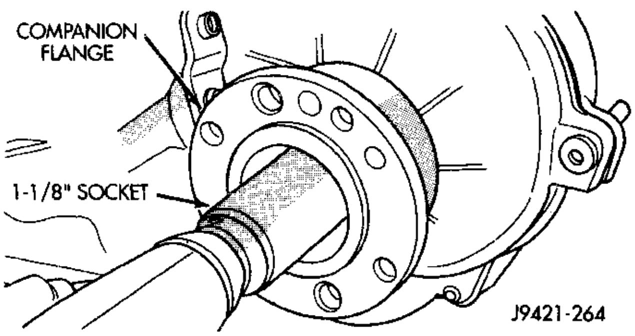

Fig. 12 Removing Companion Flange Nut

(3) Remove companion flange from front output shaft. Use a suitable puller if flange can not be removed by hand.

(4) Remove companion flange rubber seal from front output shaft (Fig. 13).

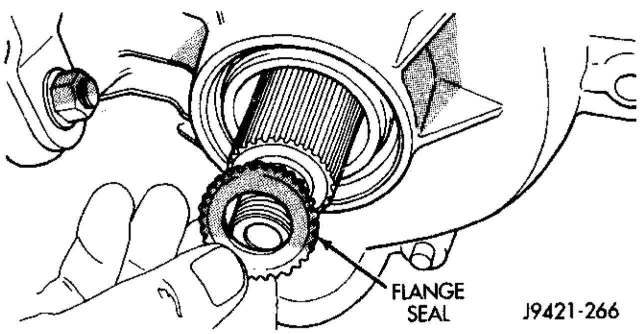

Fig. 13 Companion Flange Seal Removal

(5) Remove nut and washer that retain shift lever to sector shaft. Then remove shift lever from shaft (Fig. 14).

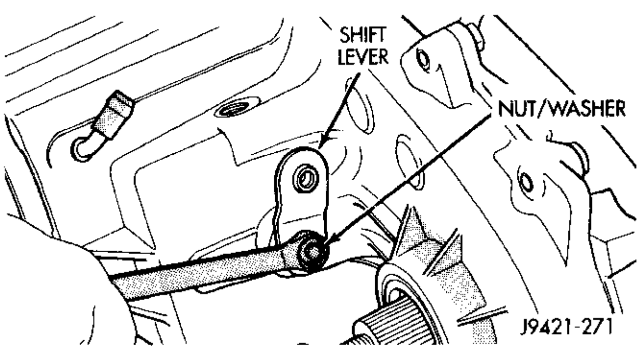

Fig. 14 Shift Lever Removal

FRONT OUTPUT SHAFT AND DRIVE CHAIN REMOVAL

(1) Remove output bearing retaining ring with heavy duty snap ring pliers.

(2) Remove output shaft bearing.

(3) Note position of bolts that attach rear case to front case (Fig. 15). Some bolts/studs at ends of case require flat washers. Mark position of these bolts with paint or scriber.

(4) Remove rear case-to-front case bolts.

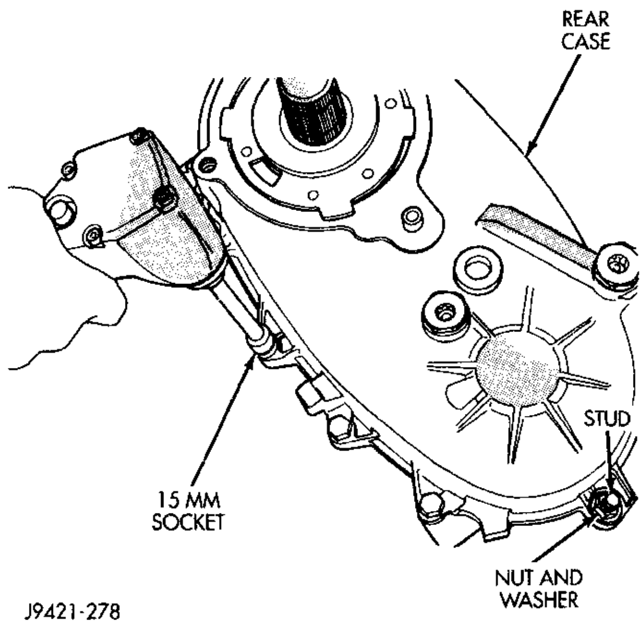

Fig. 15 Removing Case Attaching Bolts

(5) Loosen rear case with pry tool to break sealer bead. Insert tool in slot at each end of case (Fig. 16).

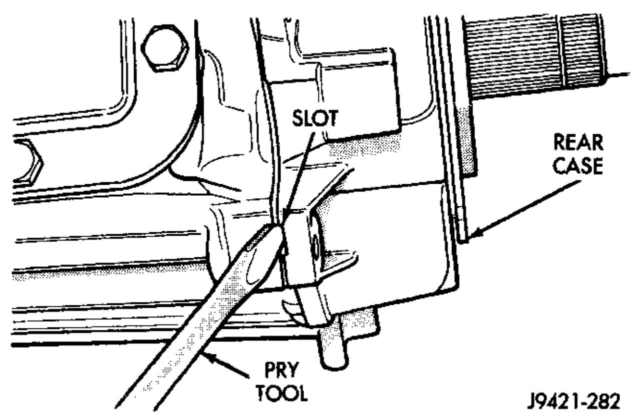

Fig. 16 Loosening Rear Case (Breaking Sealer Bead)

DISASSEMBLY AND ASSEMBLY (Continued)

(6) Unseat rear case from alignment dowels (Fig. 17).

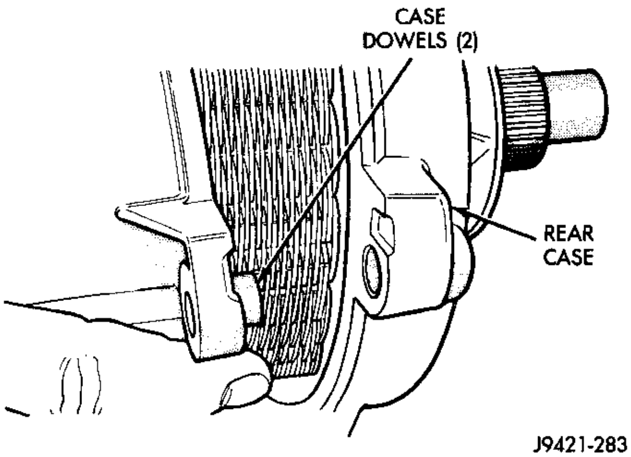

Fig. 17 Removing Rear Case From Alignment Dowels

(7) Remove rear case and oil pump assembly from front case.

(8) Remove shift rail cup and spring (Fig. 18).

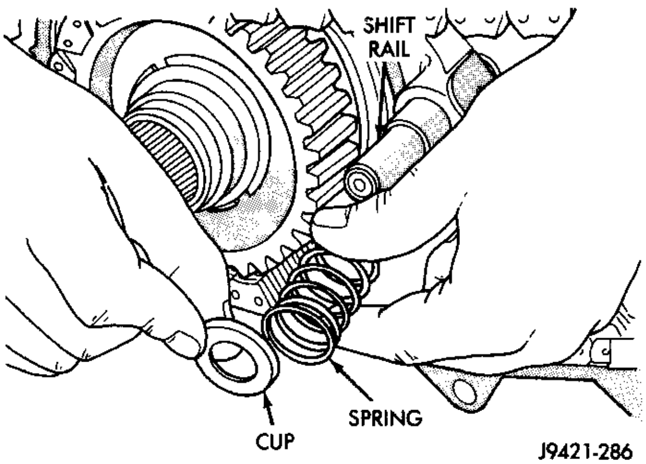

Fig. 18 Shift Rail Cup And Spring Removal

(9) Remove front sprocket retaining ring (Fig. 19).

(10) Pull mainshaft, front sprocket and chain outward about 25.4 mm (1–inch) simultaneously (Fig. 20).

(11) Remove chain from mainshaft drive sprocket and remove front sprocket and chain as assembly.

SHIFT FORK AND MAINSHAFT REMOVAL

(1) Remove vacuum/indicator switch (Fig. 21).

(2) Loosen poppet plunger screw (Fig. 22).

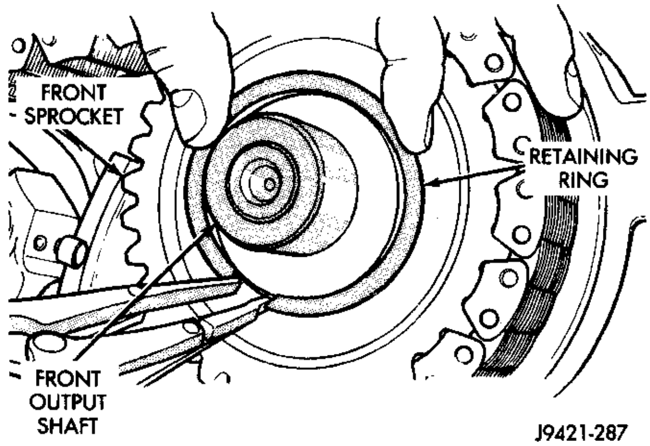

Fig. 19 Removing Front Sprocket Retaining Ring

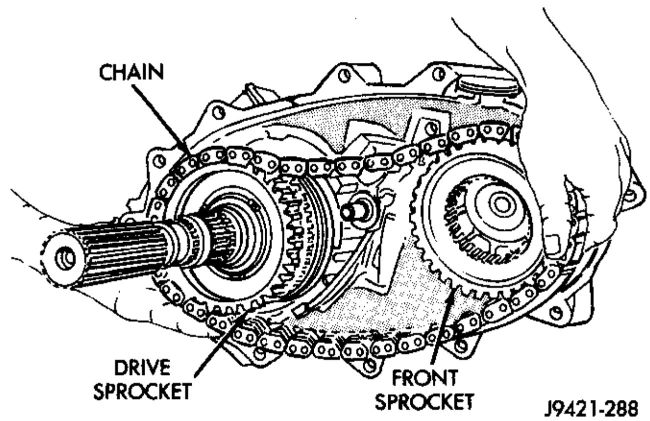

Fig. 20 Removing Drive Chain And Front Sprocket

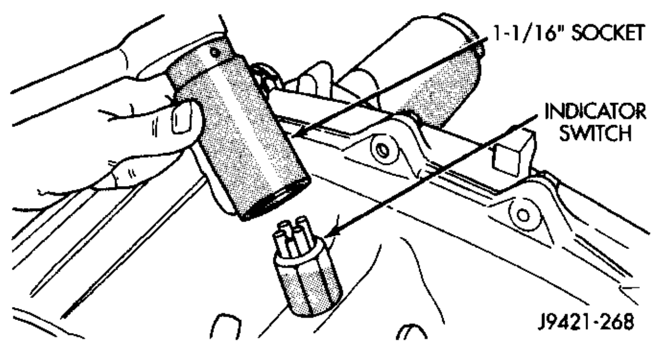

Fig. 21 Vacuum/Indicator Switch Removal

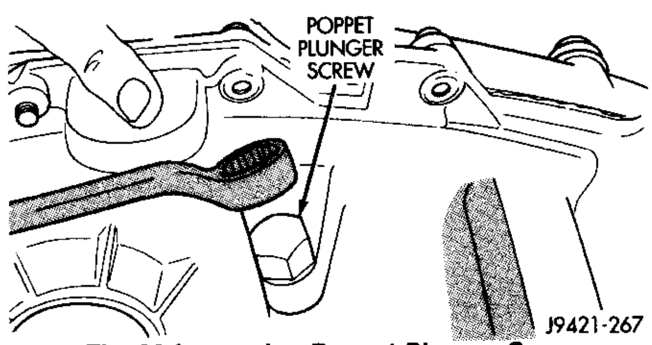

Fig. 22 Loosening Poppet Plunger Screw

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(3) Remove poppet plunger screw and spring (Fig. 23). Note that screw has O-ring seal. Remove and discard seal this seal.

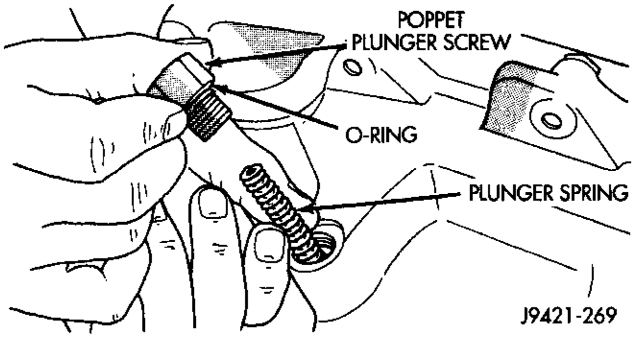

Fig. 23 Poppet Plunger Screw And Spring Removal

(4) Remove poppet plunger with magnet (Fig. 24).

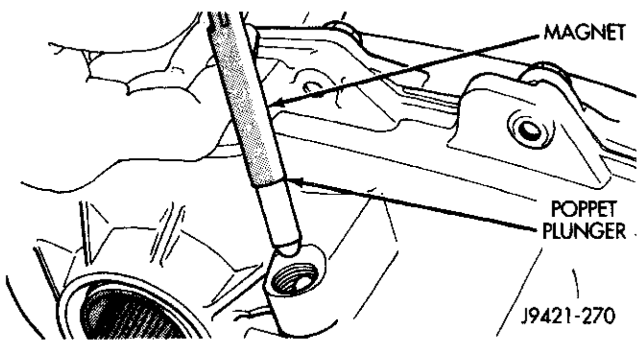

Fig. 24 Poppet Plunger Removal

(5) Remove front output shaft from bearing in case (Fig. 25).

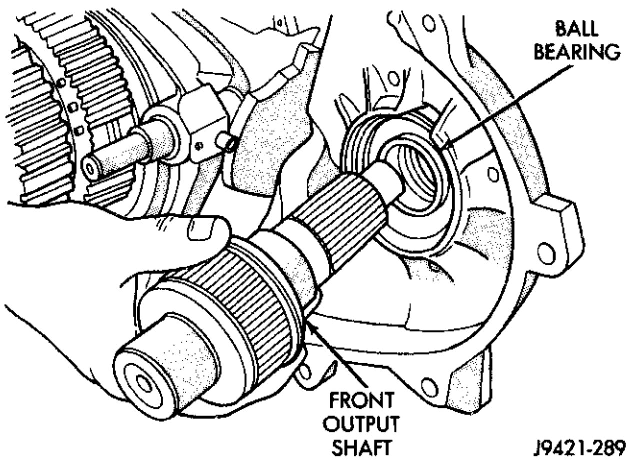

Fig. 25 Front Output Shaft Removal

(6) Pull mainshaft assembly out of input gear, sliding clutch and case (Fig. 26).

(7) Remove mode fork, sliding clutch and shift rail as assembly (Fig. 27). Note which way clutch fits in fork (long side of clutch goes to front).

(8) Remove range fork retaining ring (Fig. 28).

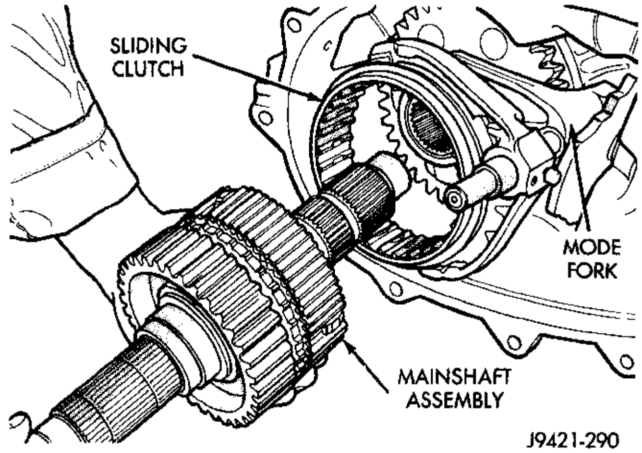

Fig. 26 Mainshaft Assembly Removal

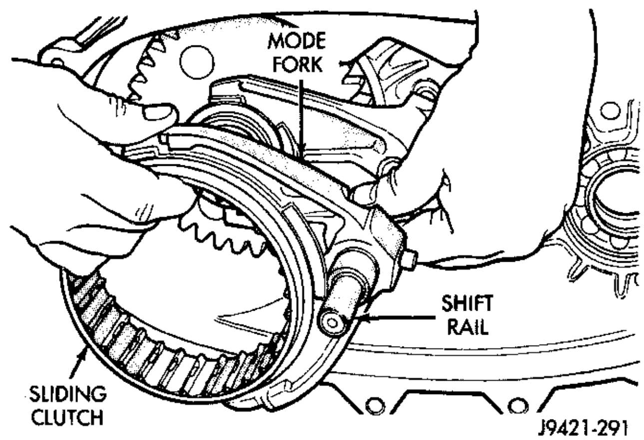

Fig. 27 Mode Fork, Shift Rail And Sliding Clutch Removal

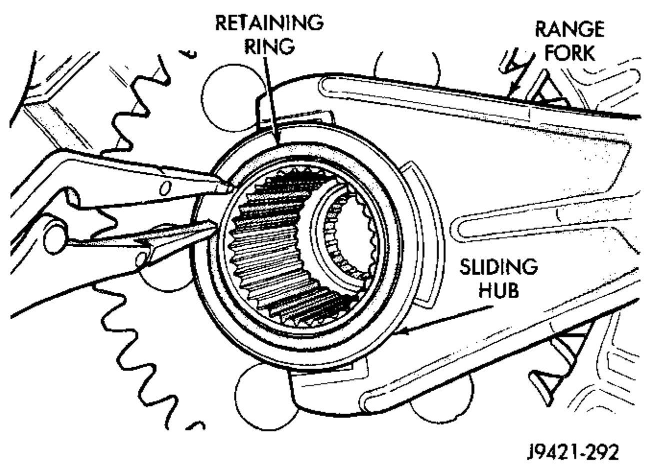

Fig. 28 Range Fork Retaining Ring Removal

DISASSEMBLY AND ASSEMBLY (Continued)

(9) Remove range fork and support sleeve as assembly (Fig. 29).

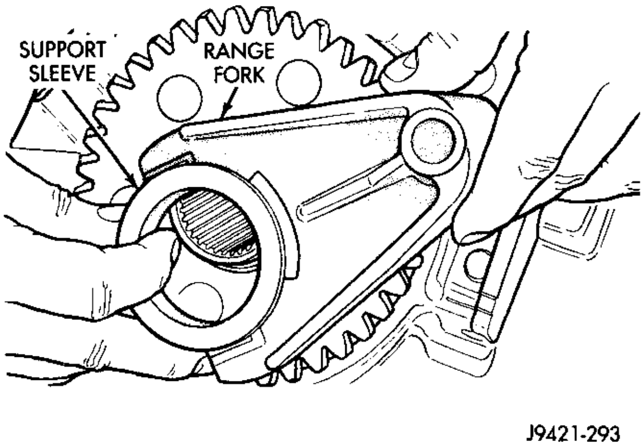

Fig. 29 Range Fork And Support Sleeve Removal

(10) Remove shift sector (Fig. 30).

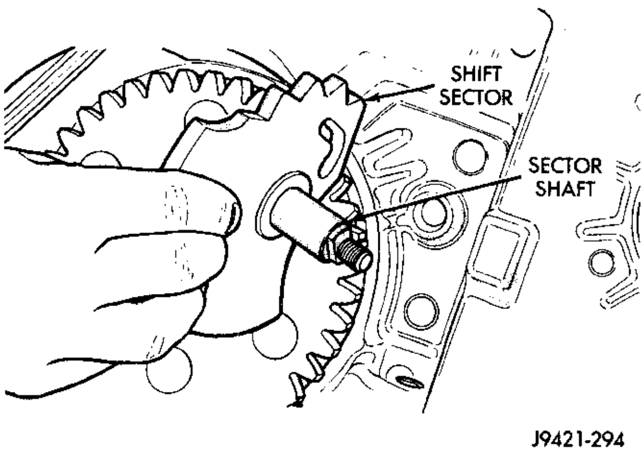

Fig. 30 Shift Sector Removal

(11) Remove shift sector shaft nylon retainer and O–ring from shaft bore in front case (Fig. 31).

MAINSHAFT DISASSEMBLY

(1) Remove retaining ring that secures synchro hub on mainshaft (Fig. 32). Use standard (instead of parallel jaw) snap ring pliers to remove this retaining ring.

(2) Remove synchro hub (Fig. 33).

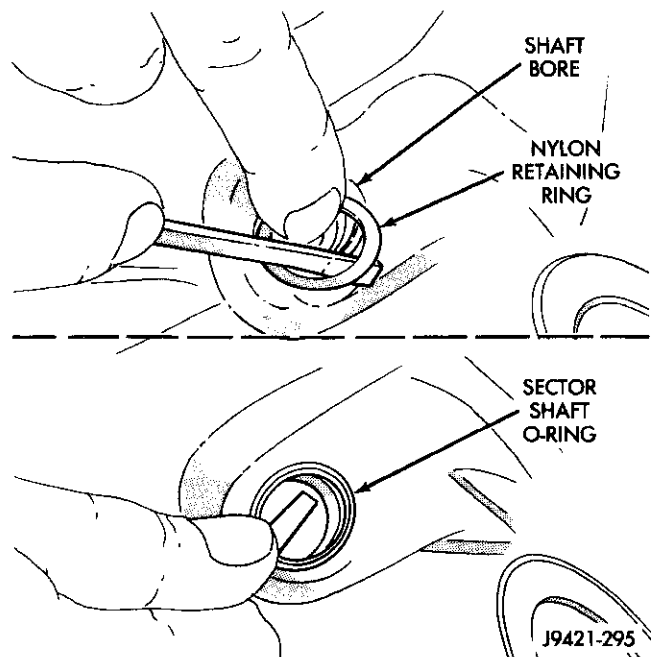

Fig. 31 Removing Sector Shaft O–Ring And Retainer

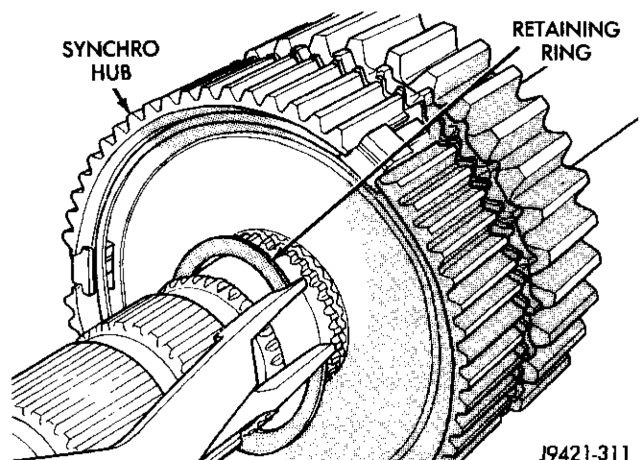

Fig. 32 Synchro Hub Retaining Ring Removal

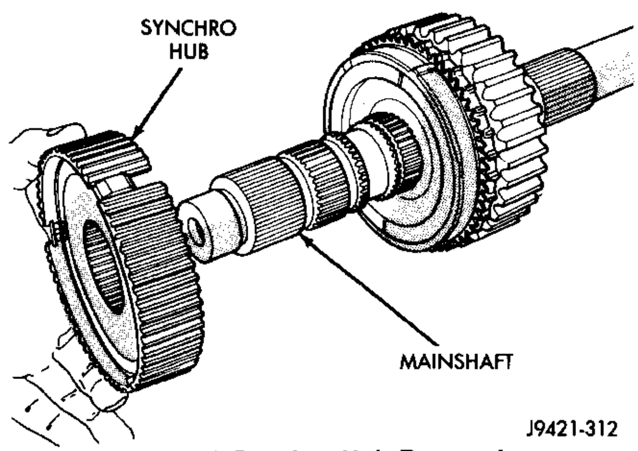

Fig. 33 Synchro Hub Removal

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(3) Inspect synchro hub struts and springs. If struts appear worn, remove struts and springs from hub. Note position of springs for installation reference (Fig. 34).

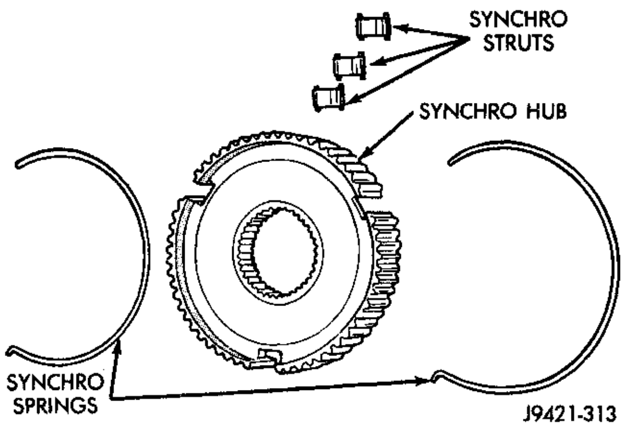

Fig. 34 Synchro Strut And Spring Removal

(4) Remove brass stop ring (Fig. 35). Discard stop ring if worn, cracked, or any teeth are missing.

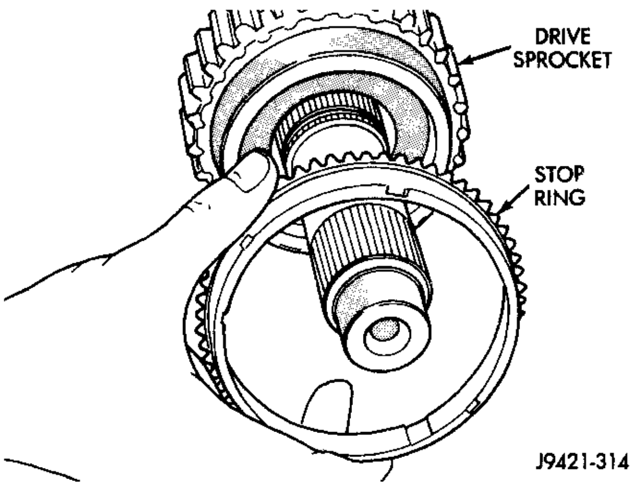

Fig. 35 Synchro Stop Ring Removal

(5) Remove drive sprocket (Fig. 36).

INPUT AND PLANETARY GEAR REMOVAL

(1) Remove input bearing retainer bolts (Fig. 37). A 10 mm socket is required.

(2) Loosen bearing retainer with pry tool. Insert tool in retainer slot as shown (Fig. 38). Then remove retainer.

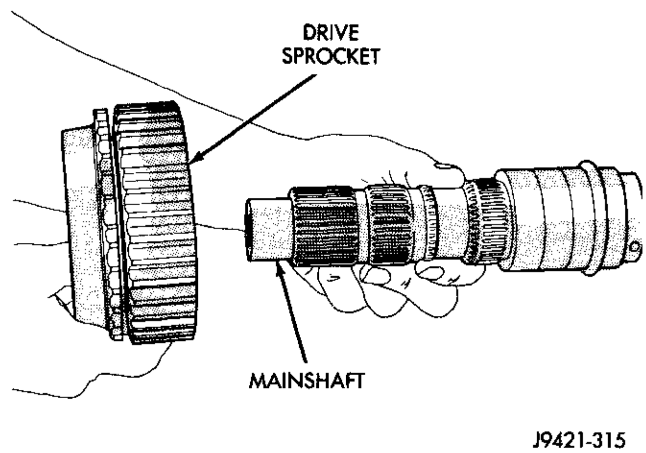

Fig. 36 Drive Sprocket Removal

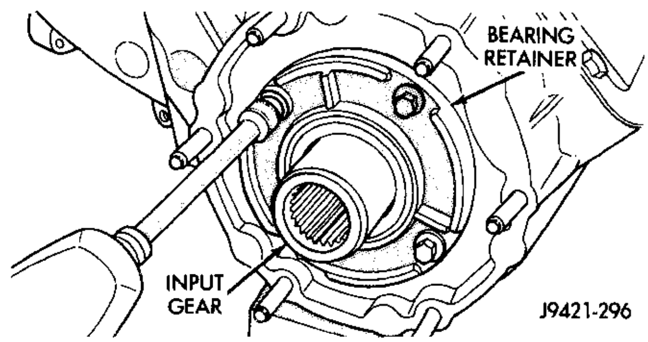

Fig. 37 Removing Input Bearing Retainer Bolts

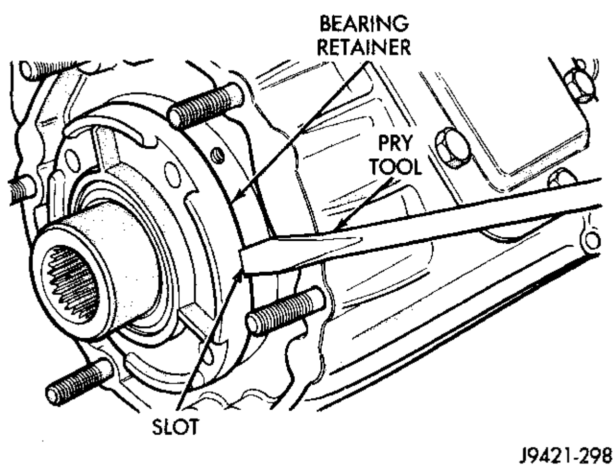

Fig. 38 Loosening/Removing Input Bearing Retainer

DISASSEMBLY AND ASSEMBLY (Continued)

(3) Remove input gear retaining ring with heavy duty parallel jaw snap ring pliers (Fig. 39).

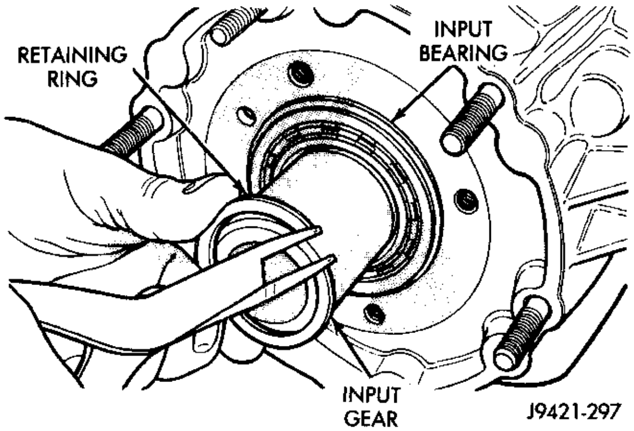

Fig. 39 Removing Input Gear Retaining Ring

(4) Tap input gear out of bearing with plastic mallet (Fig. 40).

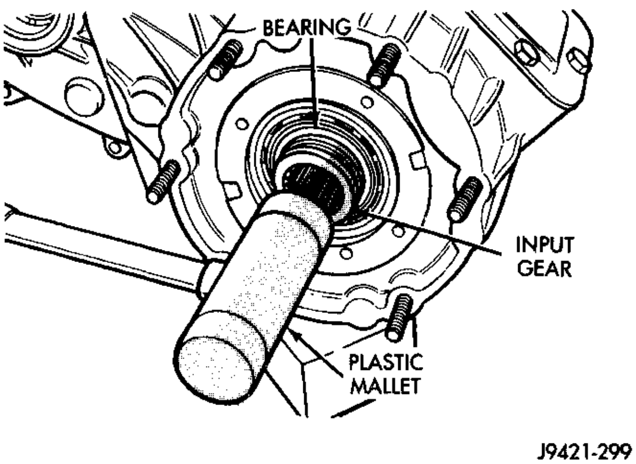

Fig. 40 Removing Input Gear Retaining Ring

(5) Remove input gear and planetary/PTO gear as assembly (Fig. 41).

INPUT AND PLANETARY GEAR DISASSEMBLY

The only removable parts in the planetary assembly are the snap rings, needle bearing, thrust washers, lock ring, input gear, and support sleeve. **The planetary carrier, PTO gear, planetary pinions, and remaining planetary components are fixed parts and are serviced as an assembly.**

(1) Position planetary assembly so PTO gear is on bench (Fig. 42).

(2) Remove retaining ring that secures input gear and lock ring in planetary assembly.

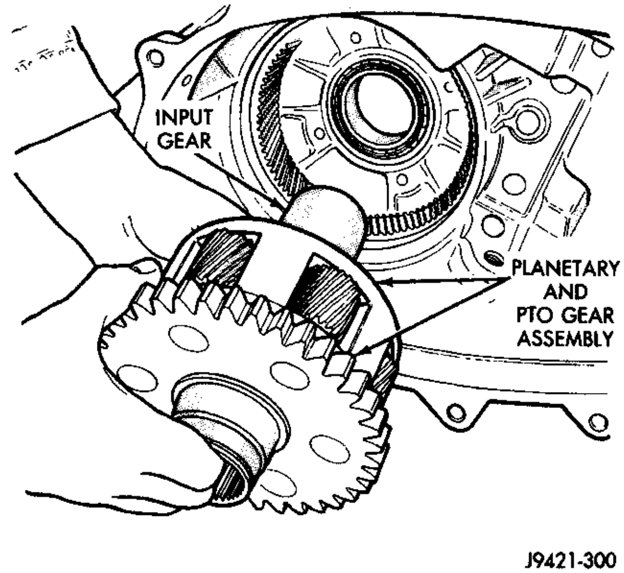

Fig. 41 Input Gear And Planetary Assembly Removal

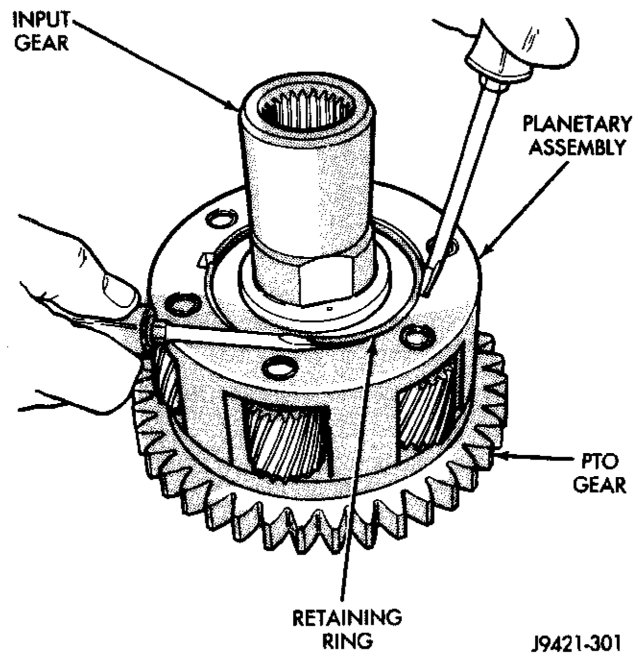

Fig. 42 Removing Lock Ring/Input Gear Retaining Ring

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(3) Remove lock ring and front thrust washer from carrier (Fig. 43). Note that lock ring and thrust washer are both tabbed.

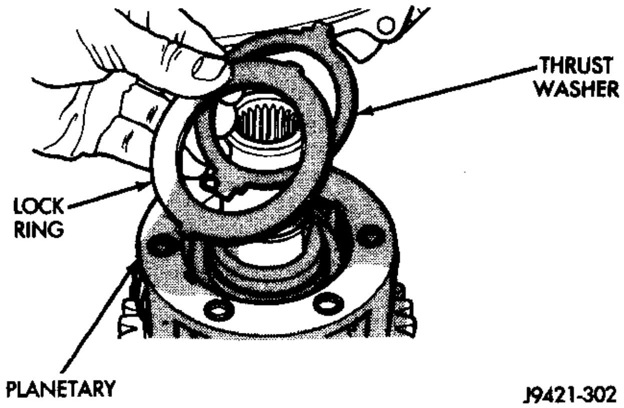

Fig. 43 Planetary Lock Ring And Front Thrust Washer Removal

(4) Remove input gear from planetary carrier (Fig. 44). Lift gear straight up and out of carrier.

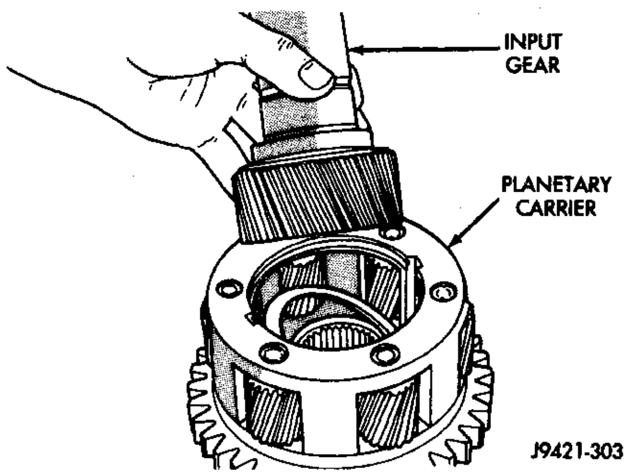

Fig. 44 Removing Input Gear From Planetary Carrier

(5) Remove support sleeve from carrier (Fig. 45).
(6) Remove rear thrust washer (Fig. 46).

ASSEMBLY

BEARING AND SEAL REPLACEMENT

(1) Using Remover C-4210 and Handle C-4171, drive input shaft bearing from case from inside annulus gear opening (Fig. 47).
(2) Install locating ring on new bearing.
(3) Position case so that the forward end is facing upward.
(4) Using Remover C-4210 and Handle C-4171, drive input shaft bearing into case. The bearing locating ring must be fully seated on case (Fig. 48).

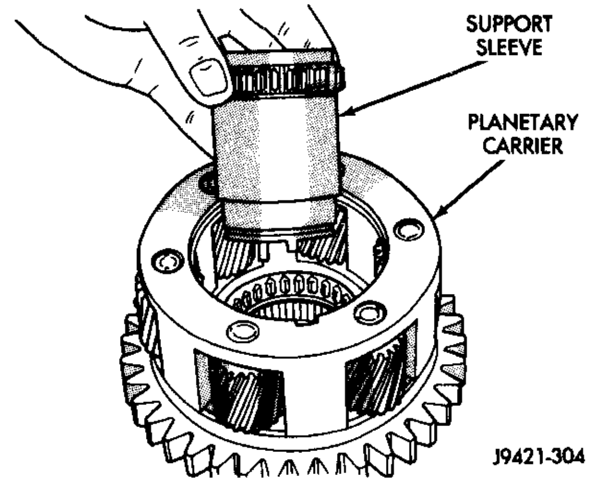

Fig. 45 Support Sleeve Removal

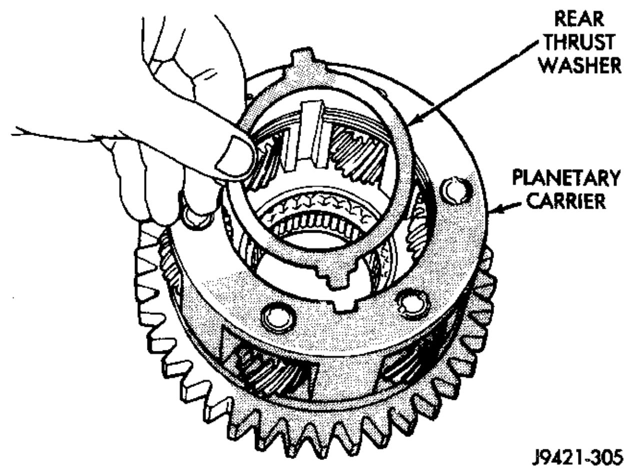

Fig. 46 Rear Thrust Washer Removal

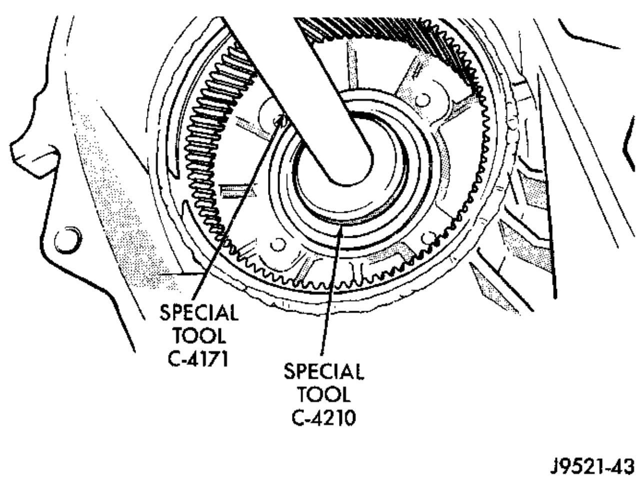

Fig. 47 Input Shaft Bearing Removal

(5) Using Installer 6953, remove front output shaft bearing.

DISASSEMBLY AND ASSEMBLY (Continued)

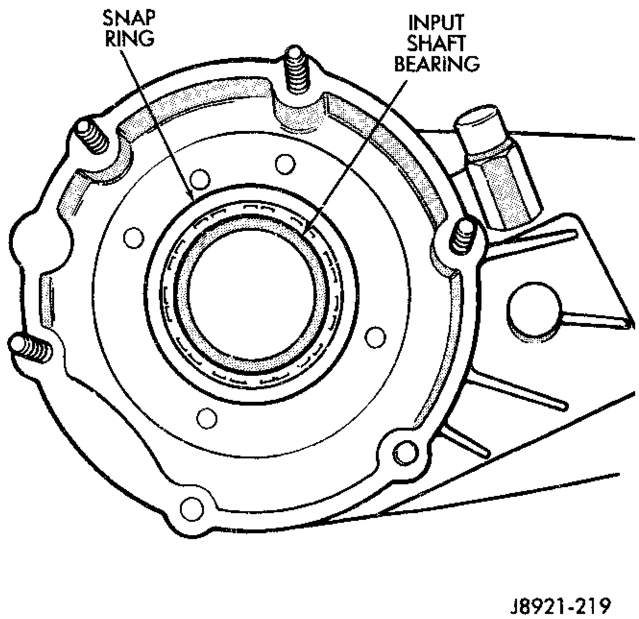

Fig. 48 Seating Input Shaft Bearing

5(6) Start front shaft output bearing in case (Fig. 49). Then seat bearing with Handle C-4171 and Installer 6953.

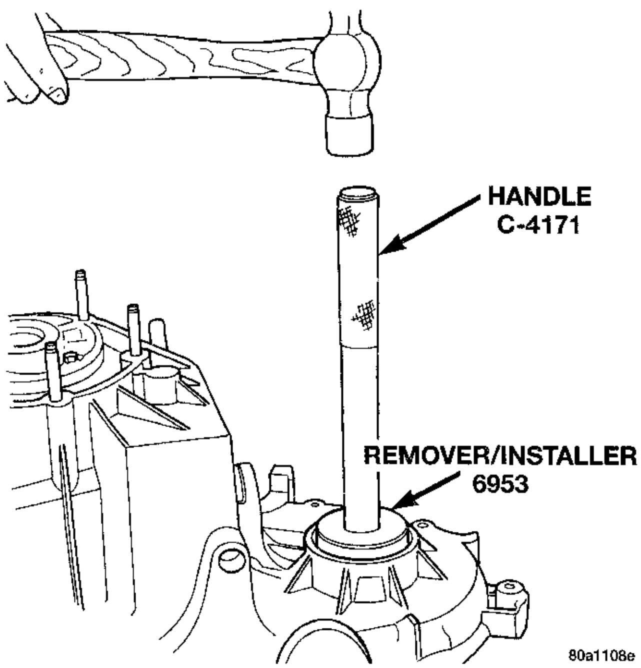

Fig. 49 Front Output Bearing Installation

(7) Install front output bearing retaining ring.

(8) Install new front output seal in front case with Installer Tool 6888 and Tool Handle C-4171 as follows:

(a) Place new seal on tool. **Garter spring on seal goes toward interior of case.**

(b) Start seal in bore with light taps from hammer (Fig. 51). Once seal is started, continue tapping seal into bore until installer tool bottoms against case.

(c) Remove installer and verify that seal is recessed the proper amount. Seal should be 2.03 to 2.5 mm (0.080 to 0.100 in.) below top edge of seal bore in front case (Fig. 64). This is correct final seal position.

CAUTION: Be sure the front output seal is seated below the top edge of the case bore as shown. The seal could loosen, or become cocked if not seated to recommended depth.

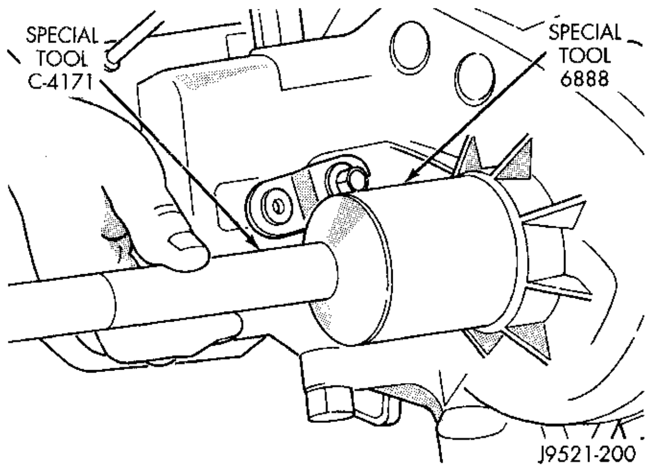

Fig. 50 Front Output Seal Installation

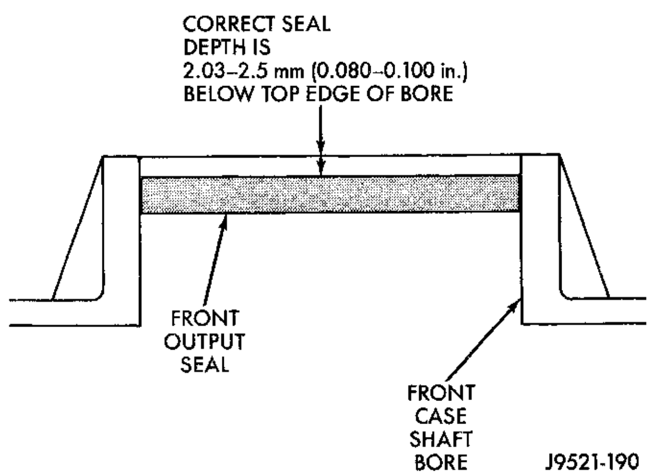

Fig. 51 Checking Front Output Seal Installation Depth

DISASSEMBLY AND ASSEMBLY (Continued)

(9) Remove seal from front bearing retainer with suitable pry tool.

(10) Install new oil seal in front bearing retainer with Installer 7884 (Fig. 52).

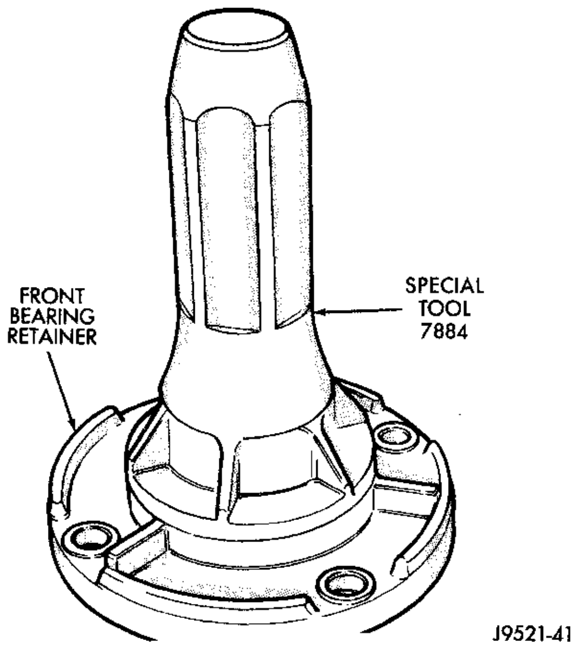

Fig. 52 Install Front Bearing Retainer Seal

(11) Remove seal from oil pump with suitable pry tool.

(12) Install new seal in oil pump with Installer 7888 (Fig. 53).

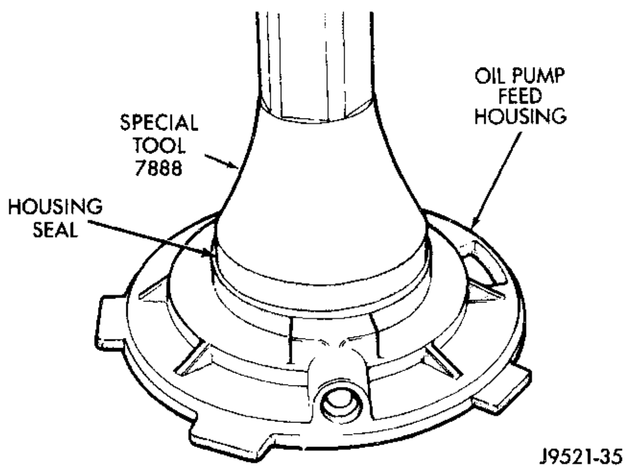

Fig. 53 Install Oil Pump Seal

(13) Inspect carrier needle bearing. If bearing is worn, rough, or damaged in any way, remove it with a brass punch and hammer (Fig. 54).

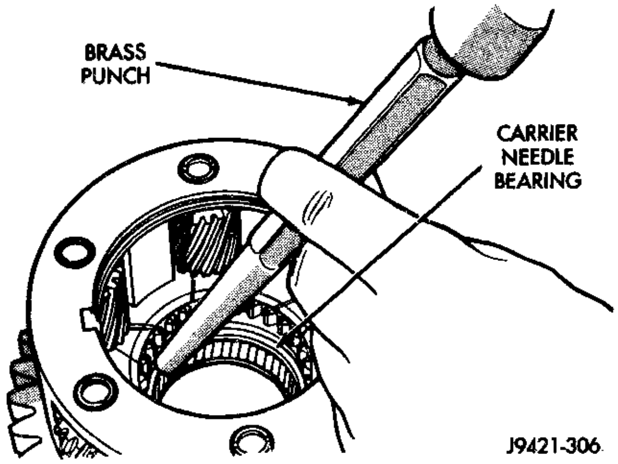

Fig. 54 Carrier Needle Bearing Removal

(14) Install new needle bearing in planetary carrier (Fig. 55). Use Handle C–4171 and Installer 5062 to install bearing.

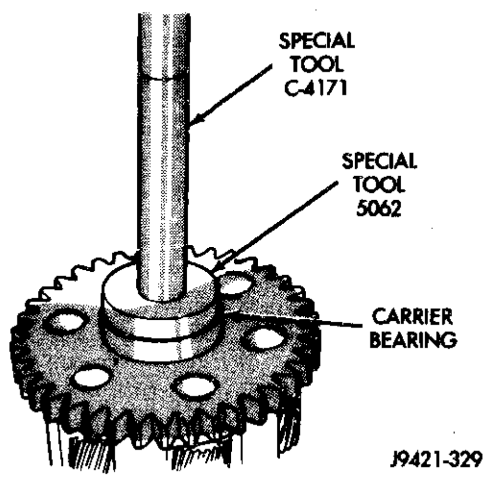

Fig. 55 Planetary Carrier Needle Bearing Installation

DISASSEMBLY AND ASSEMBLY (Continued)

(15) Remove input gear pilot bearing by inserting a suitably sized drift into the splined end of the input gear and driving the bearing out with the drift and a hammer (Fig. 56).

(16) Install new pilot bearing with Plug C-293-3.

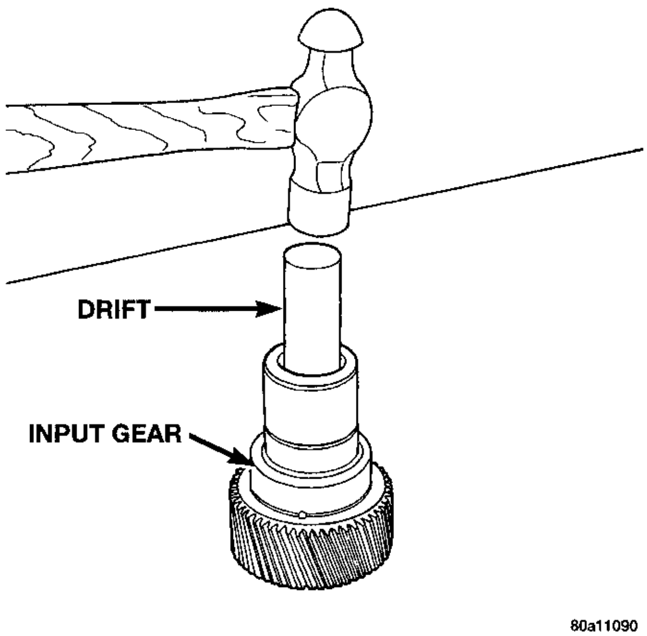

Fig. 56 Remove Input Gear Pilot Bearing

(17) Remove the output shaft rear bearing with the screw and jaws from Remover L-4454 and Cup 8148 (Fig. 57).

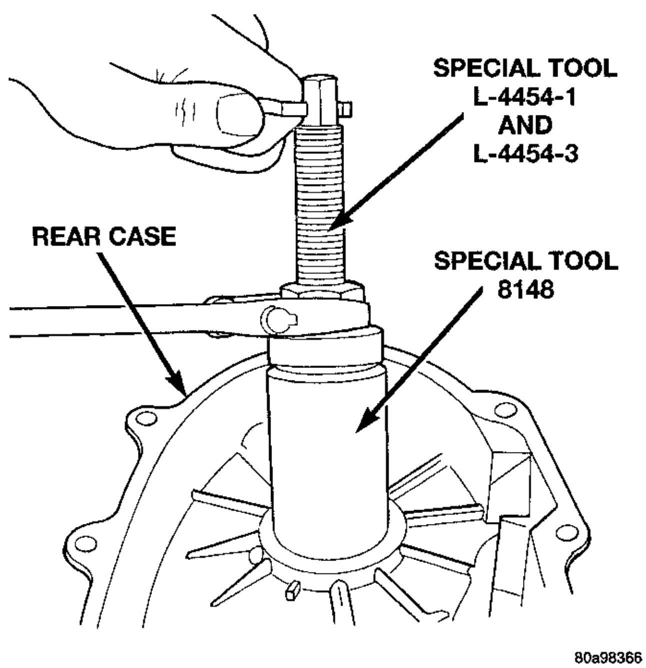

Fig. 57 Output Shaft Rear Bearing Removal

(18) Install new bearing with Tool Handle C-4171 and Installer 5066 (Fig. 58). The bearing bore is chamfered at the top. Install the bearing so it is flush with the lower edge of this chamfer (Fig. 59).

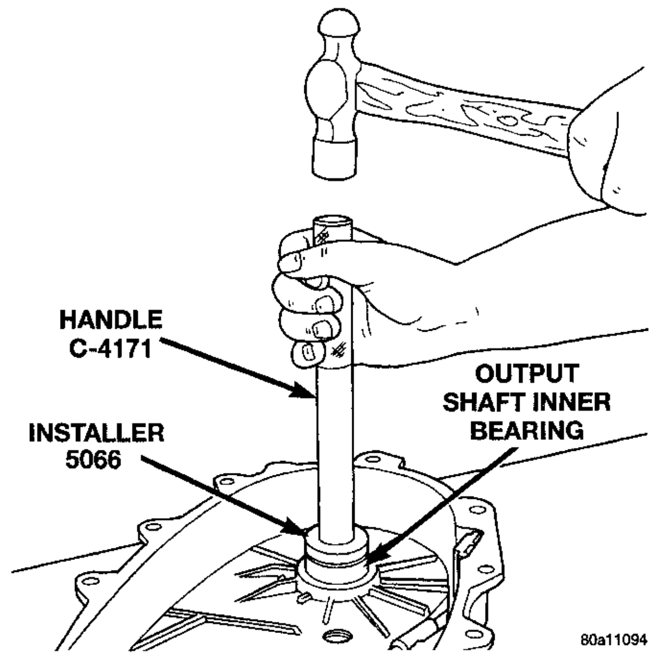

Fig. 58 Output Shaft Rear Bearing Installation

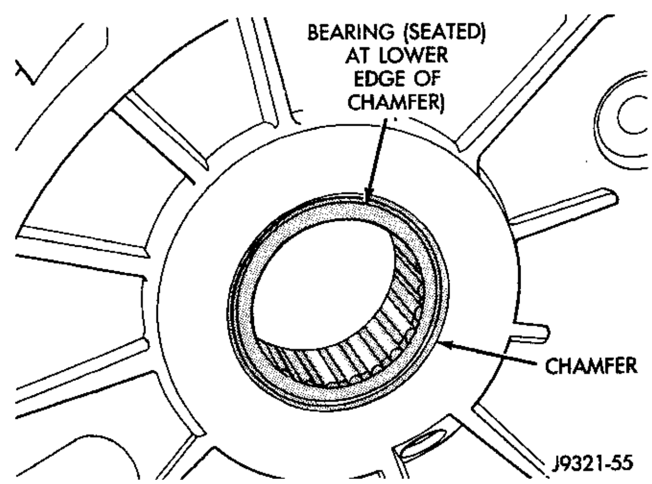

Fig. 59 Output Shaft Rear Bearing Installation Depth

mopar AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

INPUT AND PLANETARY GEAR ASSEMBLY

(1) Lubricate planetary components with transmission fluid.

(2) Install first thrust washer in carrier (Fig. 60). Lube washer with petroleum jelly before installation.

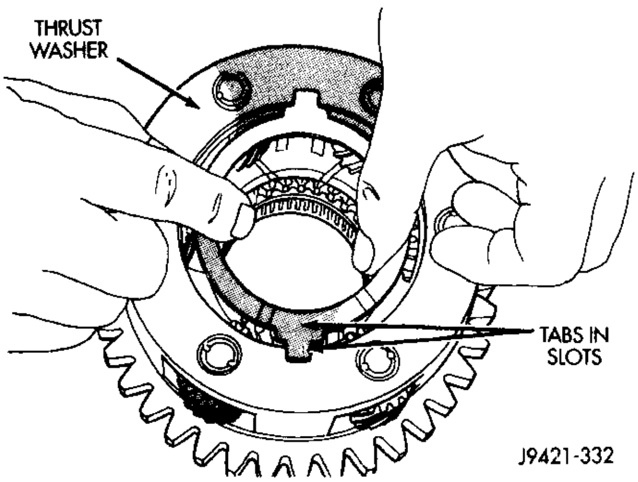

Fig. 60 Thrust Washer Installation

(3) Support carrier with wood blocks under PTO gear (Fig. 61).

(4) Install support sleeve in planetary carrier. Be sure sleeve is seated.

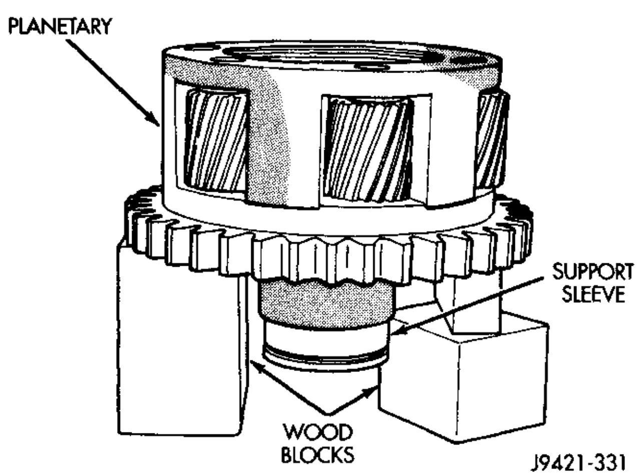

Fig. 61 Support Sleeve Installation

(5) Install input gear in planetary carrier (Fig. 62).

(6) Install second thrust washer in planetary carrier. Be sure washer tabs are seated in carrier slots.

(7) Install lock ring (Fig. 63).

(8) Install retaining ring (Fig. 64).

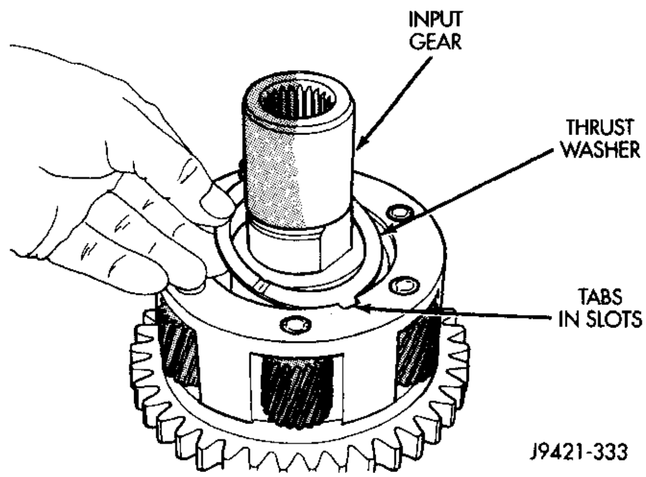

Fig. 62 Input Gear And Thrust Washer Installation

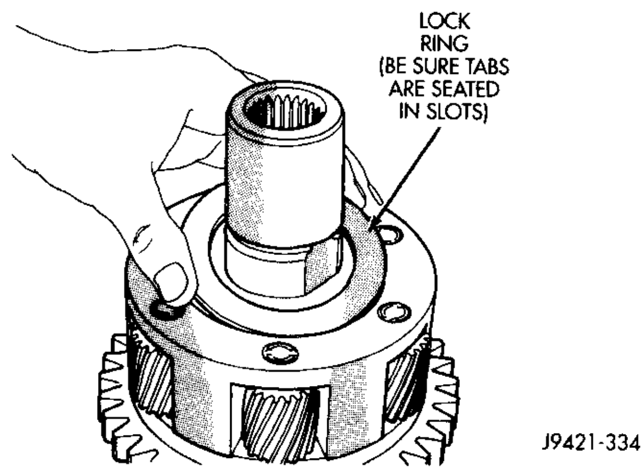

Fig. 63 Lock Ring Installation

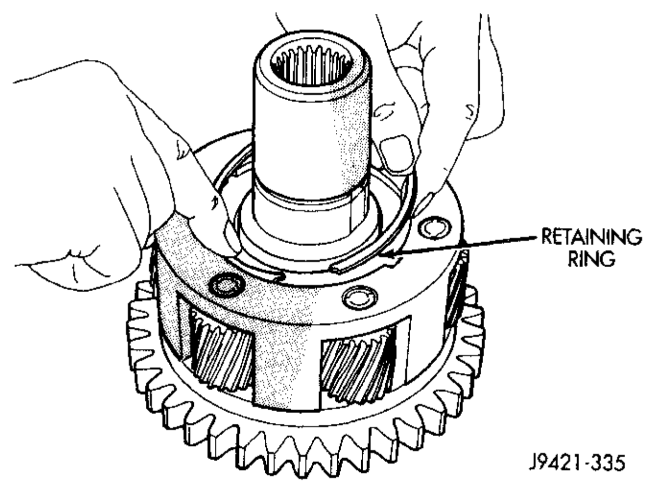

Fig. 64 Retaining Ring Installation

DISASSEMBLY AND ASSEMBLY (Continued)

INPUT AND PLANETARY GEAR INSTALLATION

(1) Lubricate planetary pinions and annulus gear with transmission fluid.

(2) Install planetary/input gear assembly in case (Fig. 65).

(3) Start planetary pinions in low range annulus gear. Then tap PTO gear, with hammer handle to seat planetary pinions in annulus gear.

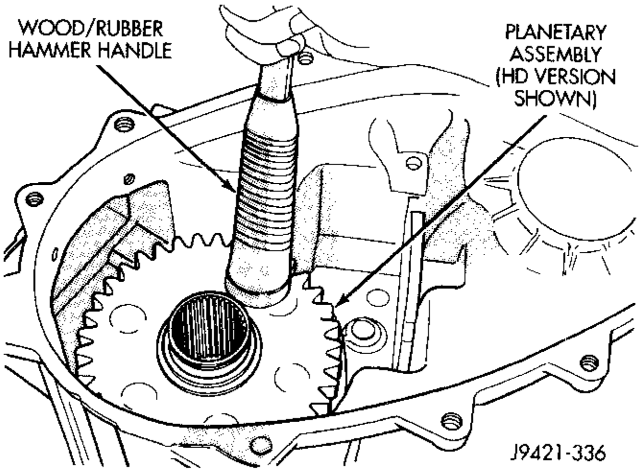

Fig. 65 Planetary/Input Gear Assembly Installation

(4) Install retaining ring on input gear (Fig. 66).

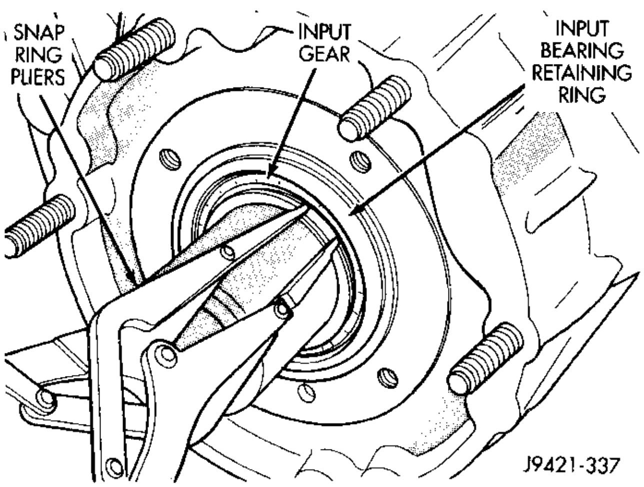

Fig. 66 Installing Input Gear Retaining Ring

(5) Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of input retainer. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess could be displaced into oil channel and feed hole in case.

(6) Align oil channel in retainer with oil feed hole in front case (Fig. 67).

(7) Install retainer on input gear shaft and front case (Fig. 68).

(8) Apply Mopar® silicone sealer to threads of input retainer bolts. Then install and tighten bolts to 27-34 N·m (20-25 ft. lbs.) torque.

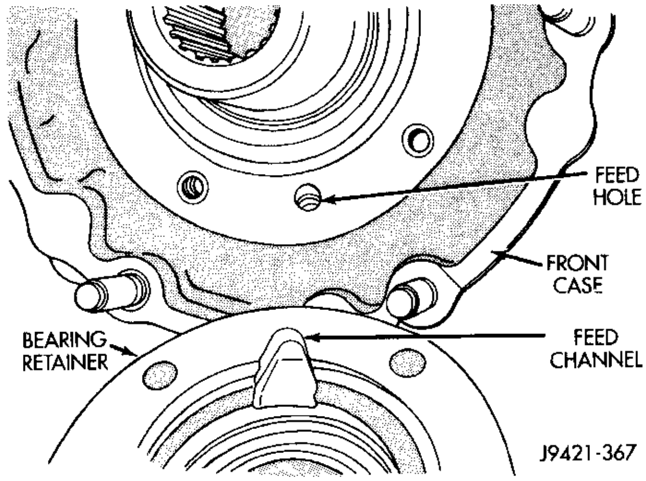

Fig. 67 Aligning Retainer Oil Channel and Case Feed Holes

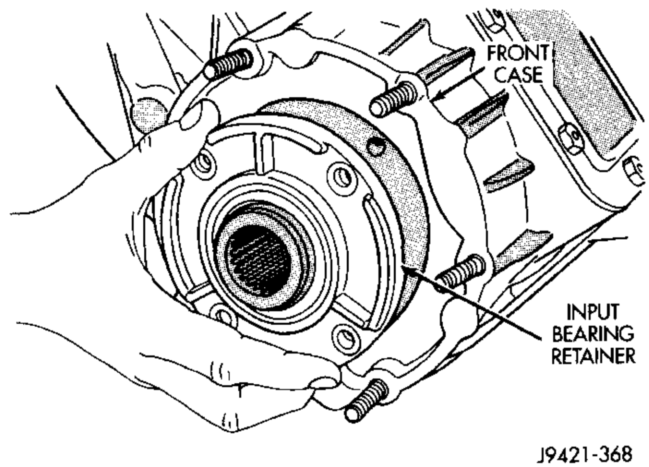

Fig. 68 Input Bearing Retainer Installation

MAINSHAFT ASSEMBLY

(1) Install drive sprocket on mainshaft (Fig. 69).

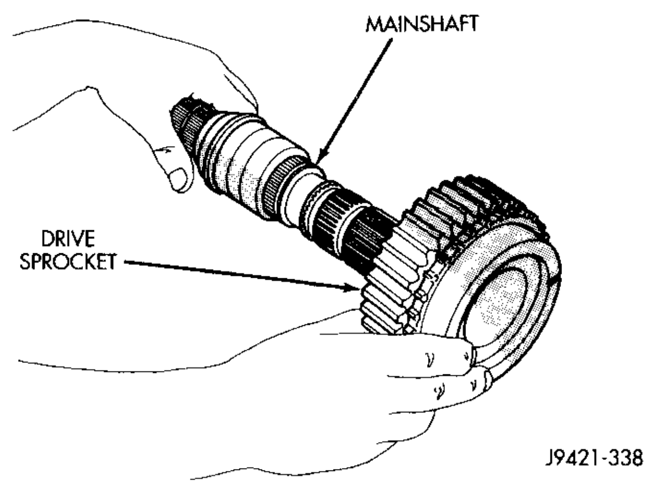

Fig. 69 Drive Sprocket Installation

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(2) Install brass stop ring on drive sprocket (Fig. 70).

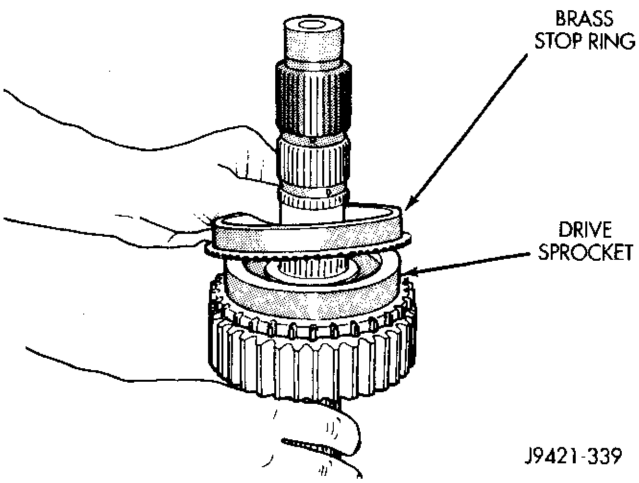

Fig. 70 Synchro Stop Ring Installation

(3) Install 3 synchro struts and 2 springs in hub as follows:

(a) Insert first strut in hub (Fig. 71). Strut shoulders rest (and slide) on sides hub slot as shown.

(b) Insert hooked end of first spring in center of strut to secure it. Then work spring into hub (Fig. 72).

(c) Press spring inward and insert last two struts in hub slots. Be sure spring is positioned under struts to properly secure them (Fig. 73).

(d) Turn hub over and install remaining spring in hub. Position hooked end of second spring 180° away from first spring end.

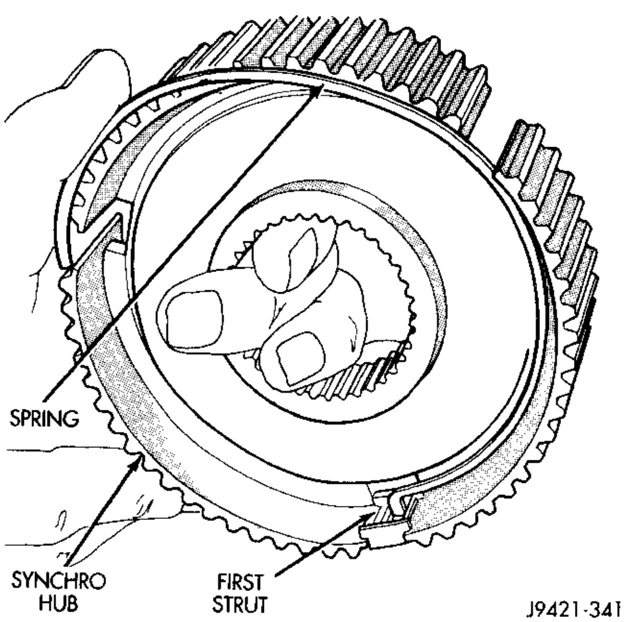

Fig. 71 Installing First Synchro Strut And Spring

(4) Install assembled synchro hub on mainshaft (Fig. 74). Hub has shoulder on one side which goes toward sprocket (rear of shaft). Flat side of hub faces front of shaft.

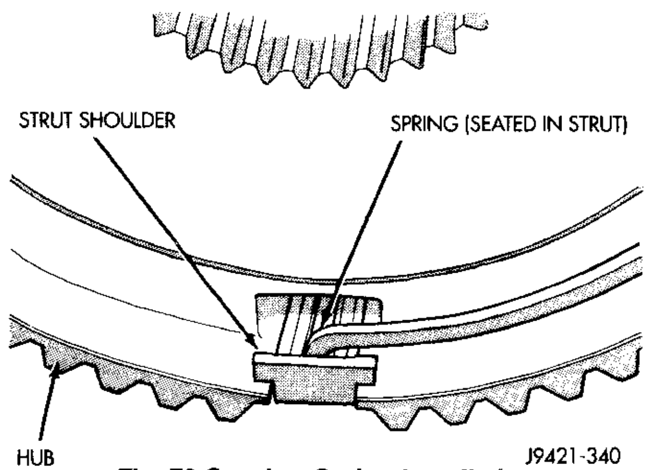

Fig. 72 Synchro Spring Installation

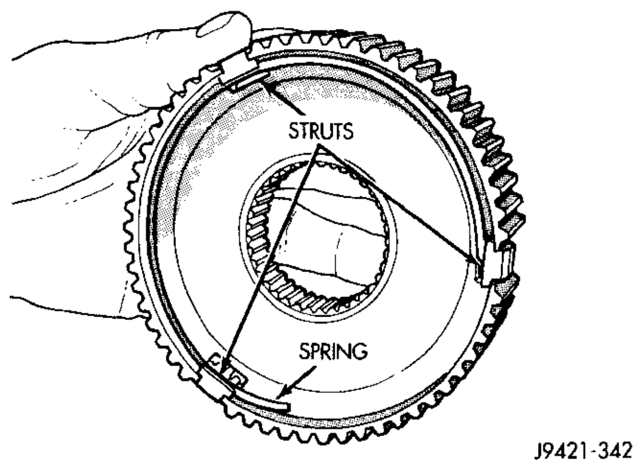

Fig. 73 Correct Position Of Struts And Springs

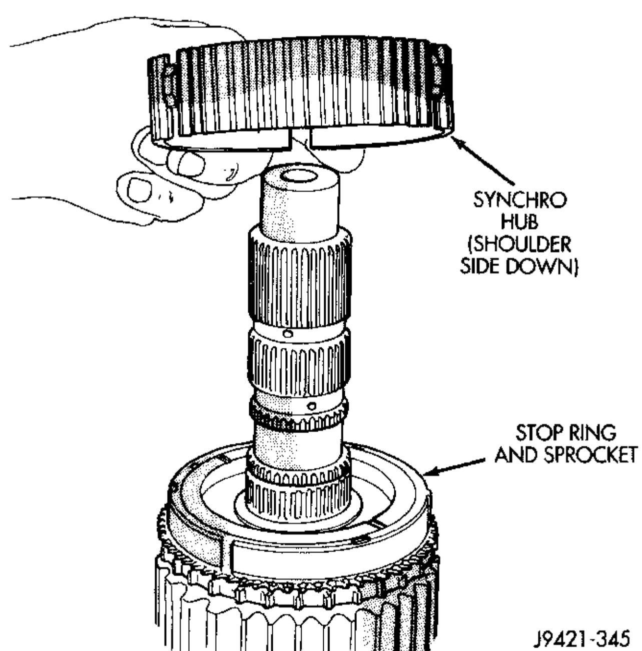

Fig. 74 Synchro Hub Installation

DISASSEMBLY AND ASSEMBLY (Continued)

(5) Install synchro hub retaining ring (Fig. 75). Be sure ring is fully seated before proceeding.

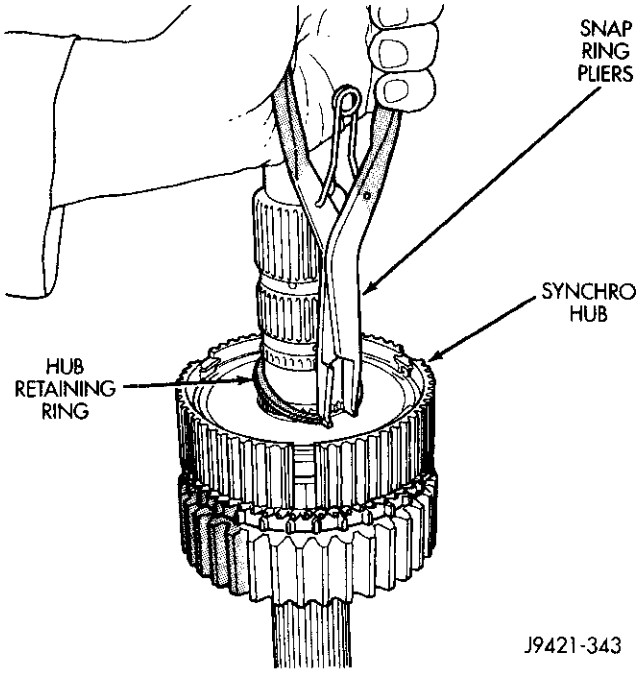

Fig. 75 Synchro Hub Retaining Ring Installation

(6) Install sliding clutch (sleeve) on synchro hub (Fig. 76).

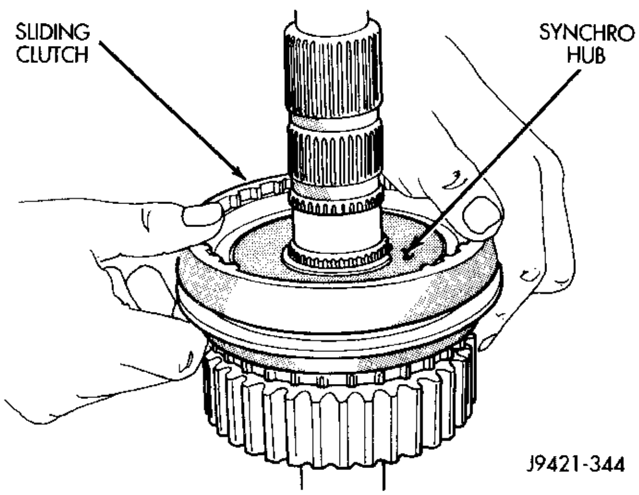

Fig. 76 Sliding Clutch Installation

CAUTION: The sliding clutch must be correctly positioned to ensure proper shifting. Position the clutch on the hub so a clutch spline is centered over each strut as shown (Fig. 77). If the clutch is installed so a gap between splines is aligned with one or more struts, gear clash will result.

SHIFT FORKS AND MAINSHAFT INSTALLATION

(1) Support front case on wood blocks so case interior is facing up. Place blocks between mounting studs on forward surface of case. Be sure blocks will not interfere with input gear installation.

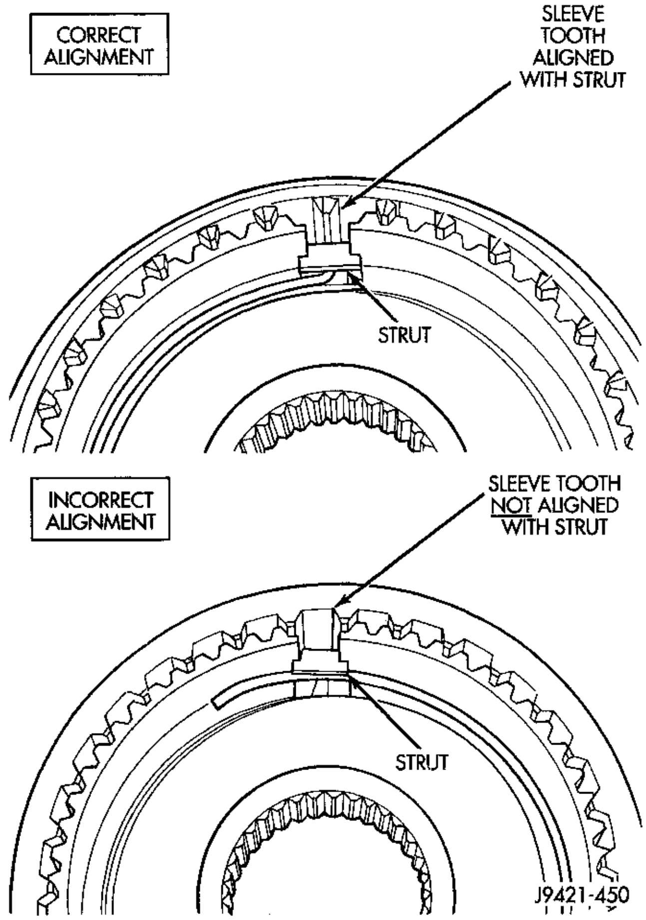

Fig. 77 Correct Alignment Of Struts And Sliding Clutch

(2) Lubricate mainshaft components with Dexron II transmission fluid.

(3) Lubricate sector shaft with transmission fluid and install shift sector in case (Fig. 78). Position slot in sector so it will be aligned with shift fork pin when shift forks are installed.

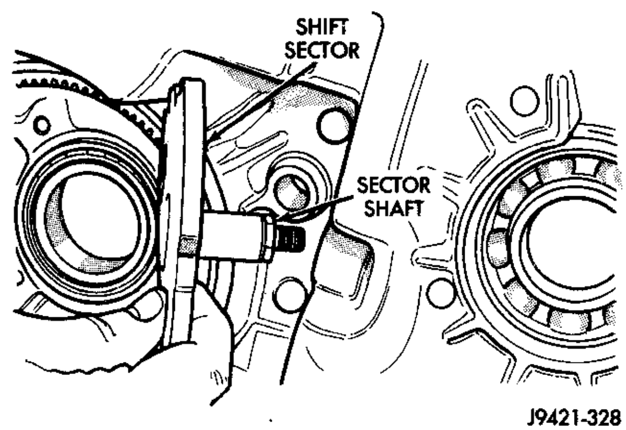

Fig. 78 Shift Sector Installation

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(4) Assemble range fork and synchro clutch and hub (Fig. 79). Then install fork and hub in case. Seat hub on support sleeve and seat range fork pin in shift sector slot (Fig. 80).

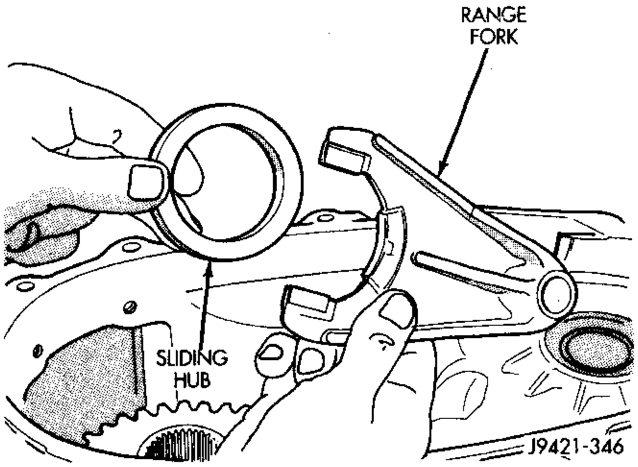

Fig. 79 Assembling Range Fork And Sliding Hub

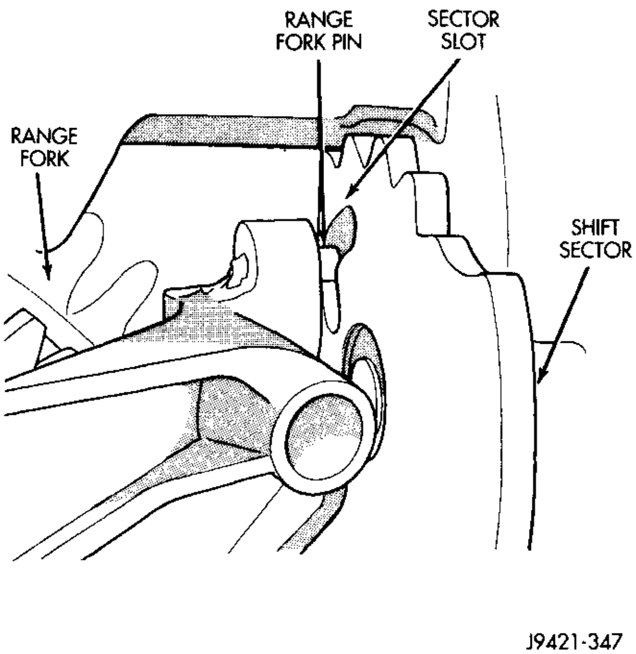

Fig. 80 Seating Range Fork And Hub

(5) Install sliding hub and retaining ring (Fig. 81). Be sure ring is fully seated before proceeding.

(6) Install mode fork and shift rail in sliding clutch (Fig. 82).

(7) Install mainshaft/mode fork assembly (Fig. 83). Guide mainshaft through hub and into input gear and shift rail through range fork and into case bore.

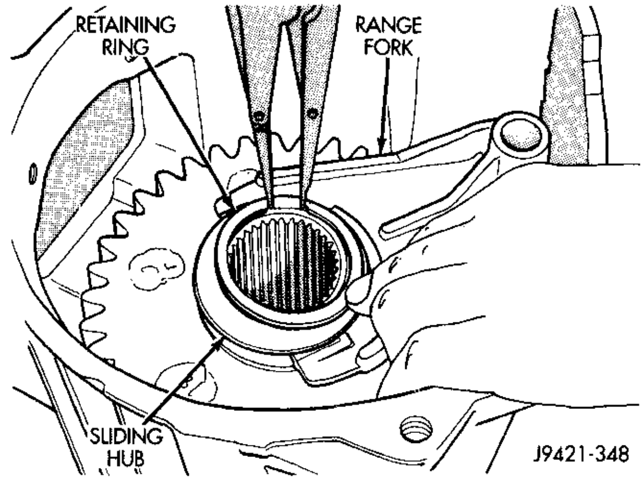

Fig. 81 Sliding Hub Retaining Ring Installation

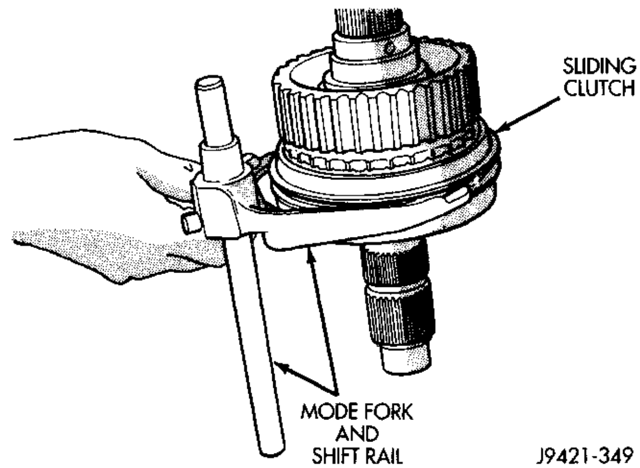

Fig. 82 Assembling Mode Fork And Mainshaft

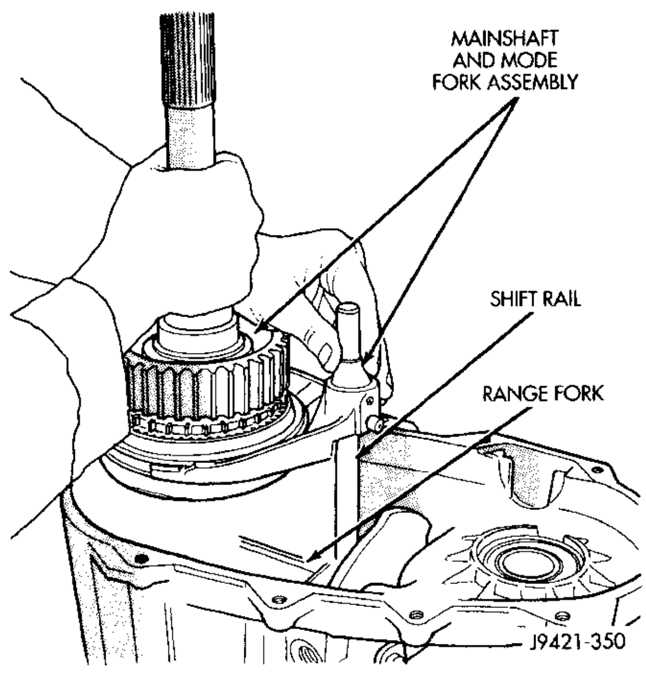

Fig. 83 Installing Mainshaft And Mode Fork Assembly

DISASSEMBLY AND ASSEMBLY (Continued)

(8) Install vacuum/indicator switch (Fig. 84). Tighten switch to 20-34 N·m (15-25 ft. lbs.) torque. Install new O-ring on switch beforehand, if necessary.

(9) Install new sector shaft O-ring and O-ring retainer in sector shaft bore (Fig. 85). Lubricate O-ring with transmission fluid or petroleum jelly after installation.

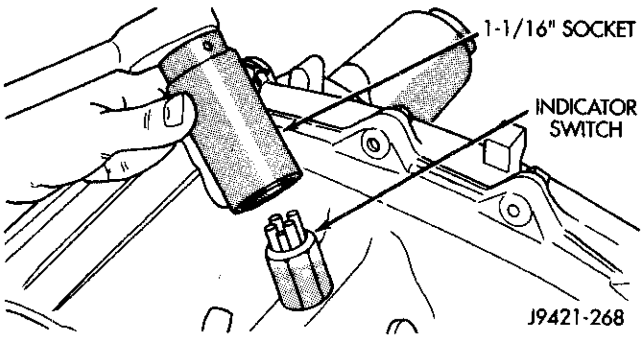

Fig. 84 Vacuum/Indicator Switch Installation

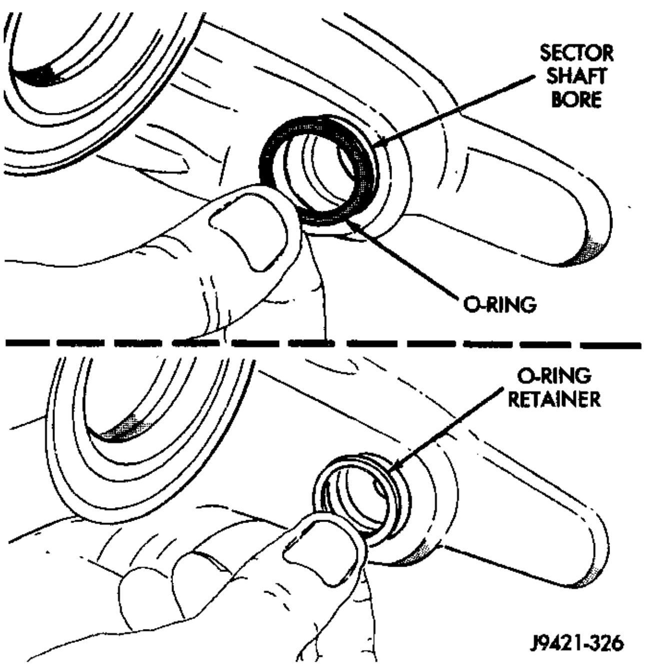

Fig. 85 Sector Shaft O-Ring And Retainer Installation

(10) Install shift lever on sector shaft (Fig. 86).

(11) Install washer and nut on sector shaft to secure shift lever. Apply 1-2 drops Mopar® Lock N' Seal, or equivalent, to nut threads before installation. Then tighten nut to 27-34 N·m (20-25 ft. lbs.) torque.

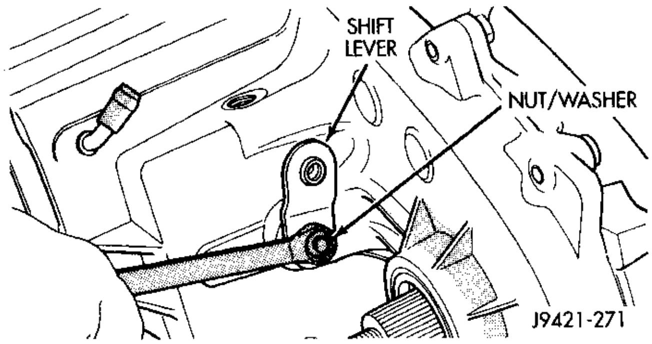

Fig. 86 Shift Lever Installation

(12) Install poppet plunger and spring (Fig. 87).

(13) Install new O-ring on poppet screw and install screw in front case (Fig. 88). Tighten screw to 16-24 N·m (12-18 ft. lbs.).

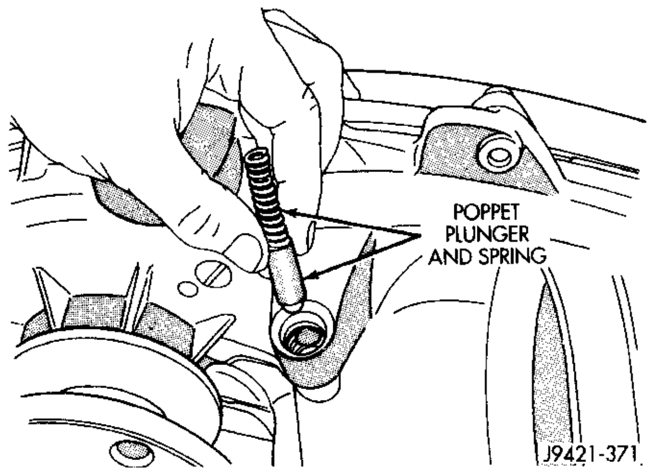

Fig. 87 Poppet Plunger And Spring Installation

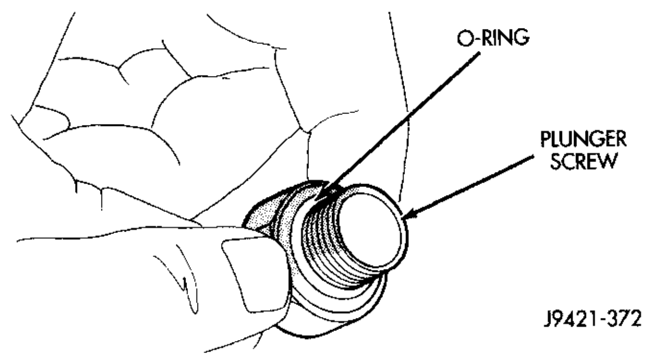

Fig. 88 O-Ring Installation On Poppet Plunger Screw

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

FRONT OUTPUT SHAFT AND DRIVE CHAIN INSTALLATION

(1) Install front output shaft in bearing (Fig. 89).

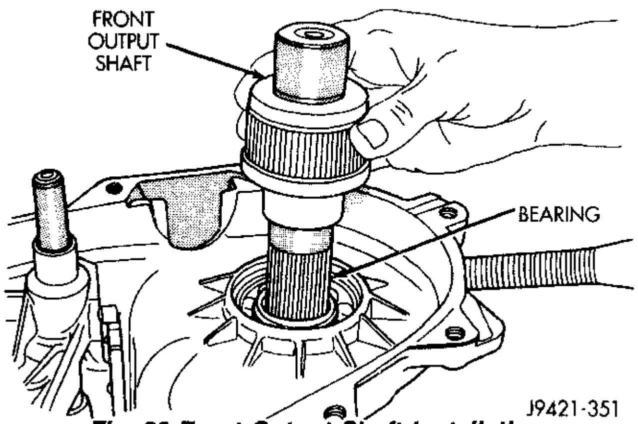

Fig. 89 Front Output Shaft Installation

(2) Insert front sprocket in drive chain (Fig. 90).

(3) Install drive chain around mainshaft sprocket (Fig. 90). Then position front sprocket over front shaft.

(4) Raise mainshaft about 2.54 cm (one inch) and seat front sprocket on front output shaft.

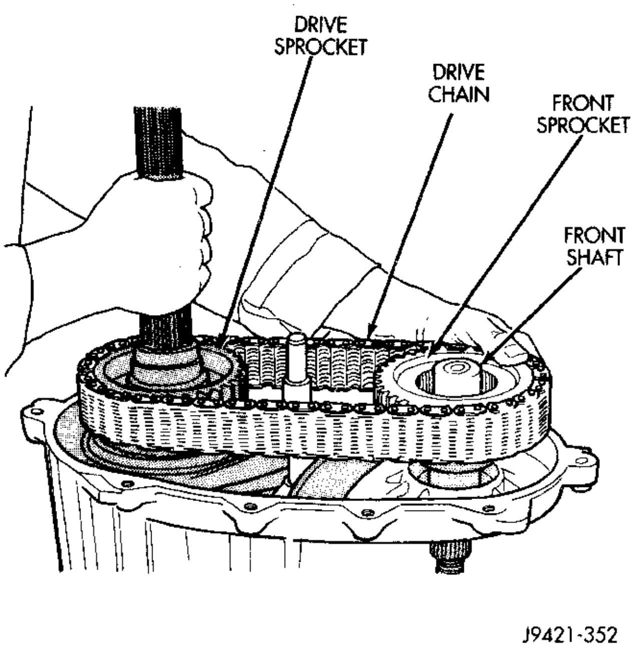

Fig. 90 Drive Chain And Front Sprocket Installation

(5) If mainshaft and sliding clutch were unseated during chain installation, align and reseat mainshaft in input gear and hub. Then reseat synchro hub in sliding clutch. Press synchro struts inward to ease clutch back onto hub.

(6) Install front sprocket retaining ring (Fig. 91).

(7) Realign sliding clutch on synchro hub if necessary. Press synchro struts inward to ease realignment. Be sure mainshaft is fully seated before proceeding.

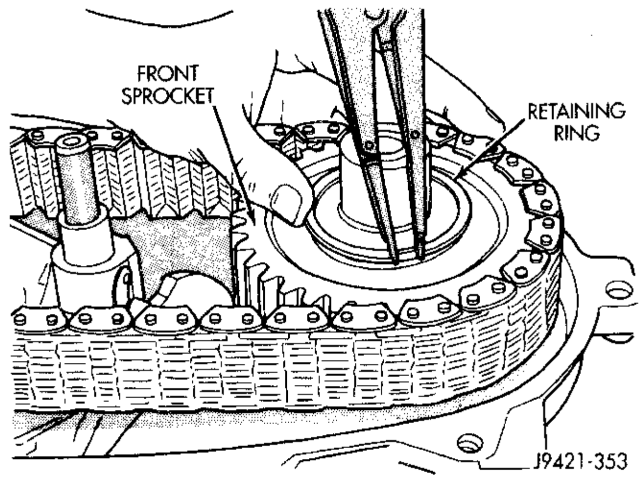

Fig. 91 Front Sprocket Retaining Ring Installation

(8) Install spring and cup on shift rail (Fig. 92).

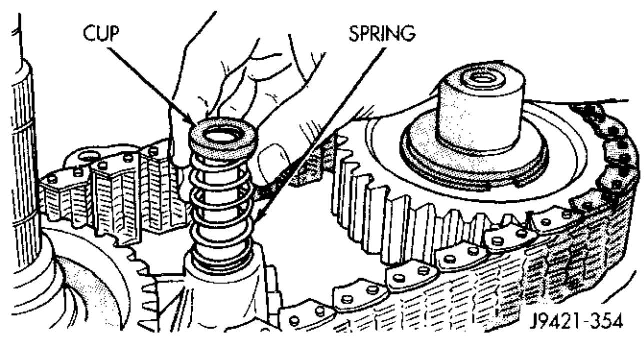

Fig. 92 Shift Rail Spring And Cup Installation

(9) Insert magnet in front case pocket (Fig. 93).

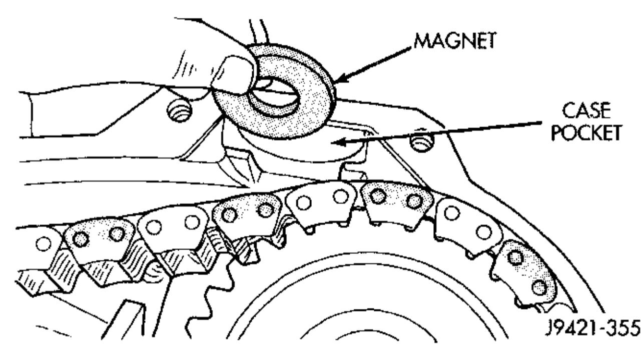

Fig. 93 Case Magnet Installation

OIL PUMP AND REAR CASE ASSEMBLY/INSTALLATION

Lubricate the oil pump components with Dexron II before installation. Prime the oil pickup tube by pouring a little oil into the tube before installation.

(1) Install new O-ring in pickup tube inlet of oil pump (Fig. 94).

(2) Position oil pickup tube and filter in rear case. Be sure pickup filter is seated in case pocket and

DISASSEMBLY AND ASSEMBLY (Continued)

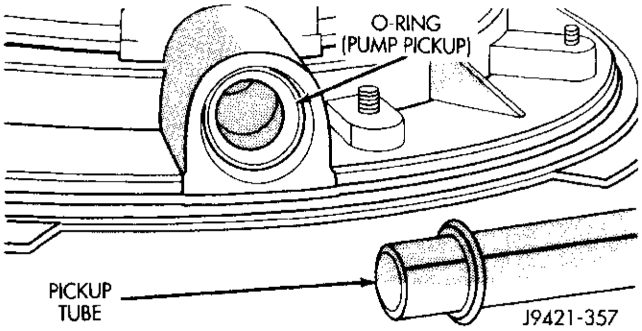

Fig. 94 Pickup Tube O-Ring Installation

that pickup tube is aligned in case notches (Fig. 95). Be sure hose that connects tube to filter is securely positioned.

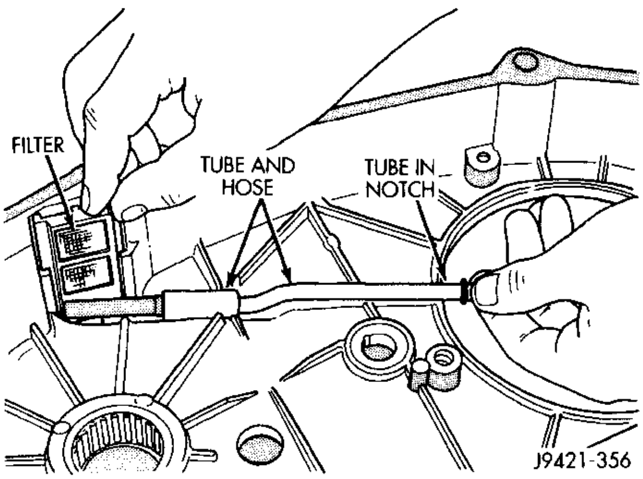

Fig. 95 Oil Pickup Tube And Filter Position In Rear Case

(3) Insert oil pickup tube in oil pump and position pump in rear case (Fig. 96).

(4) Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of front case. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess will be displaced into case interior.

(5) Align oil pump with mainshaft and align shift rail with bore in rear case. Then install rear case and oil pump assembly (Fig. 97). Be sure oil pump and pickup tube remain in position during case installation.

(6) Install 4-5 rear case-to front case bolts to hold rear case in position. Tighten bolts snug but not to specified torque at this time.

CAUTION: Verify that shift rail (Fig. 98), and case alignment dowels are seated before installing any bolts. Case could be cracked if shaft rail or dowels are misaligned.

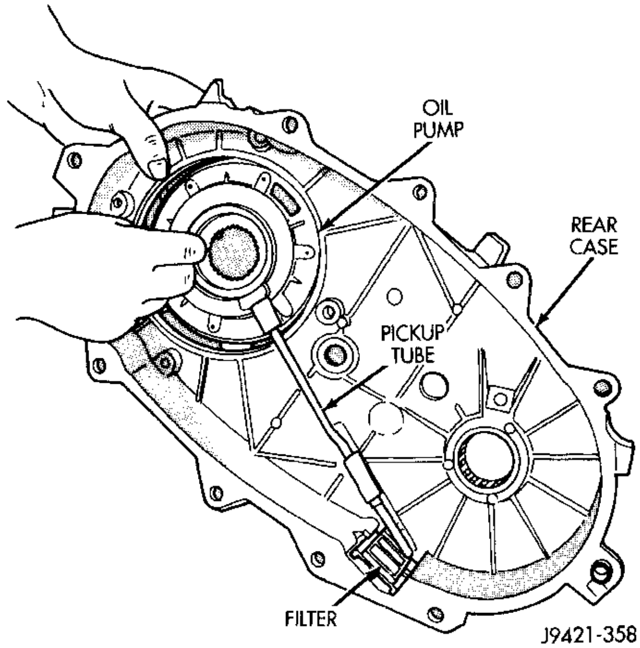

Fig. 96 Positioning Oil Pump In Rear Case

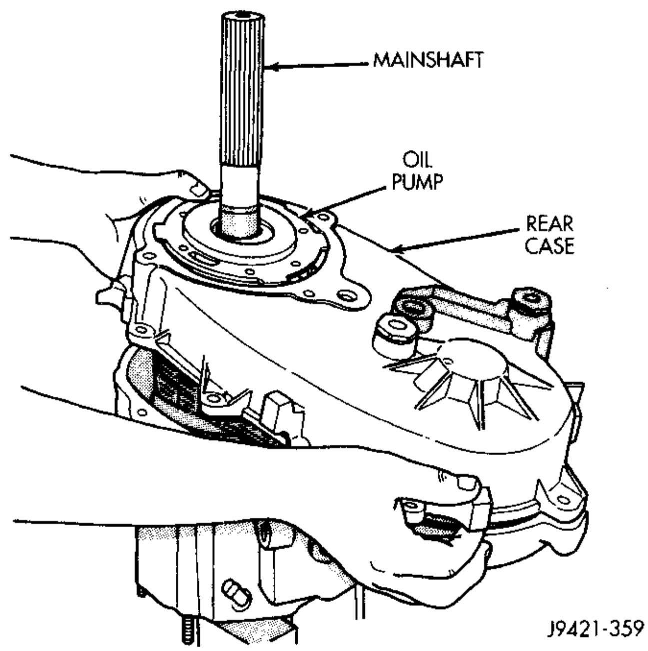

Fig. 97 Rear Case And Oil Pump Installation

(7) Verify that oil pump is aligned and seated on rear case. Reposition pump if necessary.

(8) Check stud at end of case halves (Fig. 99). If stud was loosened or came out during disassembly, apply Loctite 242 to stud threads and reseat stud in case.

(9) Apply Loctite 242 to remainder of rear case-to-front case bolt threads and install bolts. Be sure lock washers are used on studs/bolts at case ends. Tighten bolts, or stud nuts as follows:

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

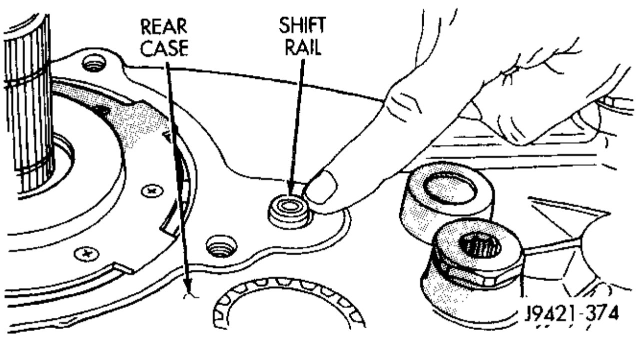

Fig. 98 Shift Rail Seated In Rear Case Bore

- flange head bolts to 47-61 N·m (35-45 ft. lbs.)
- all other bolts/nuts to 27-34 N·m (20-25 ft. lbs.)

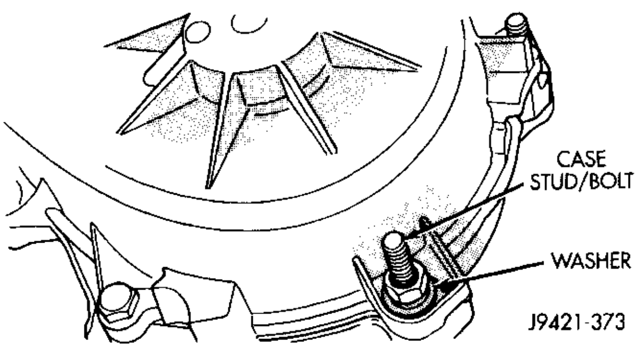

Fig. 99 Washer Installation On Case Stud And Dowel Bolts

(10) Install oil pump retaining ring on mainshaft (Fig. 100).

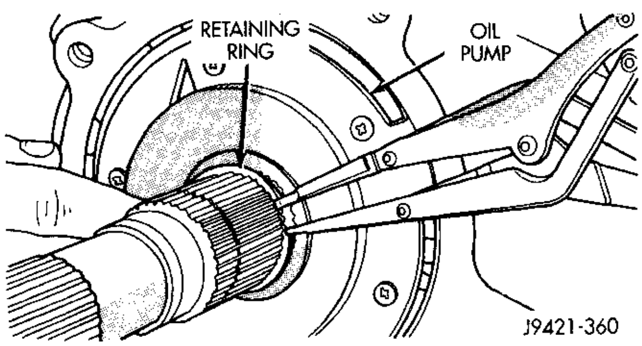

Fig. 100 Oil Pump Retaining Ring Installation

(11) Install rear output bearing and snap ring to output shaft.

COMPANION FLANGE INSTALLATION

(1) Install companion flange seal on front shaft (Fig. 101).

(2) Install companion flange on front shaft (Fig. 102). Then install and tighten flange nut to 176-271 N·m (130-200 ft. lbs.) torque.

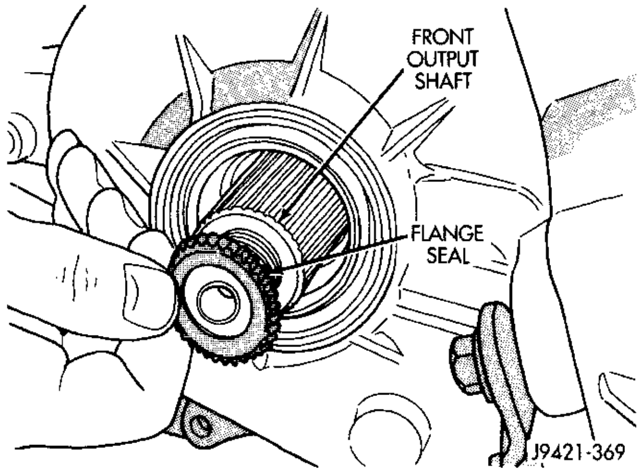

Fig. 101 Installing Flange Seal On Front Shaft

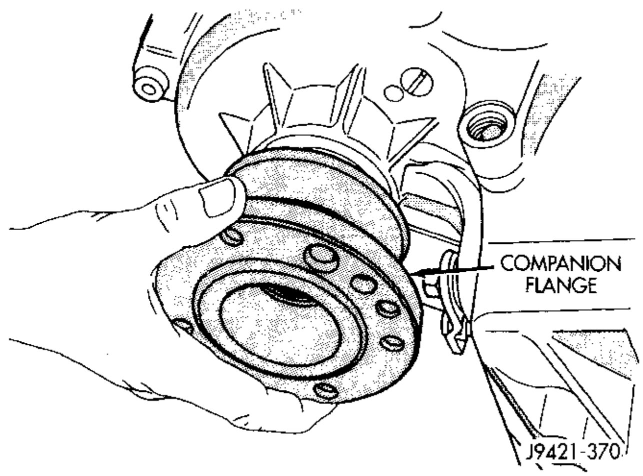

Fig. 102 Installing Companion Flange On Front Shaft

EXTENSION HOUSING AND PTO COVER

(1) Apply bead of Mopar® Gasket Maker, or equivalent, to mating surface of extension housing. Keep sealer bead width to maximum of 3/16 inch. Do not use excessive amount of sealer as excess could be displaced into oil pump.

(2) Position extension housing over output shaft.

(3) Spread extension housing retaining ring and seat extension housing on rear case. Verify that the retaining ring is seated in output shaft rear bearing.

(4) Install retaining ring access cover.

(5) Apply Mopar® silicone sealer, or equivalent, to threads of extension housing bolts. Then install bolts finger tight.

(6) Tighten extension housing bolts to 27-34 N·m (20-25 ft. lbs.) torque.

(7) Apply Mopar silicone adhesive/sealer to mating surface of PTO cover and to cover bolt shanks and underside of bolt heads. Then install and tighten bolts to 27-34 N·m (20-25 ft. lbs.) torque.

CLEANING AND INSPECTION

TRANSFER CASE CLEANING AND INSPECTION

Wash all parts thoroughly in clean solvent. Be sure all old lubricant, sealant, metal particles, dirt and foreign material are removed from the surfaces of every part.

Apply compressed air to each oil feed port and channel in both case halves to remove any foreign material or cleaning solvent residue.

If any pump component is worn, or damaged, the pump must be replaced as an assembly.

Inspect the spline teeth on the synchro hub (Fig. 103). If evidence of chipping or excessive wear is apparent, replace the hub. The hooked end of each synchro spring should be inserted in one of the struts. In addition, the springs should not interfere with the polished gear cone or inside diameters of the hub.

Inspect the stop ring for cracks and wear. Replace the ring if necessary or if doubt exists over condition. Check a replacement synchro ring for proper fit on the cone with a minimum of wobble. Also check the synchronizer struts for wear or damage.

Inspect all gear teeth and splines for wear or damage. Also check splines for burrs, or nicks. Remove minor nicks and scratches with an oil stone. Replace any part with damaged splines.

It is recommended that all retaining (snap) rings be replaced during overhaul. Most of the retaining rings can be distorted during removal and should not be reused.

Inspect the two case halves, for cracks, porosity, damaged mating surfaces, stripped bolt threads, or distortion. Replace either case half if necessary. However, stripped threads can be repaired with Heli–Coil stainless steel thread inserts. The case vent tube can be resecured with Loctite 680 if necessary.

Inspect the annulus gear. Be sure the gear teeth are in good condition. Replace the front case and annulus as an assembly if the gear is damaged.

Check condition of the shift fork pads (Fig. 104). The pads should be replaced if cracked, worn, or loose (won't stay on fork).

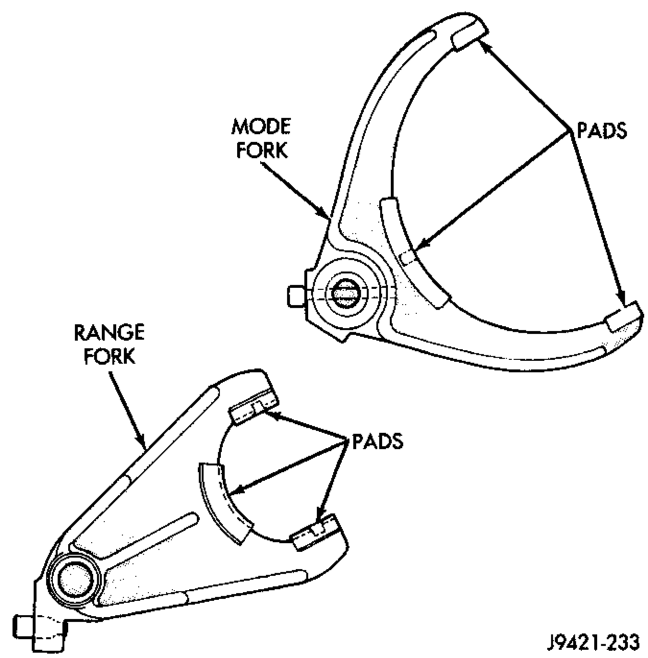

Fig. 104 Shift Fork Pads

The shift forks, clutch and sleeve should all be checked for wear, cracks, or any type of damage

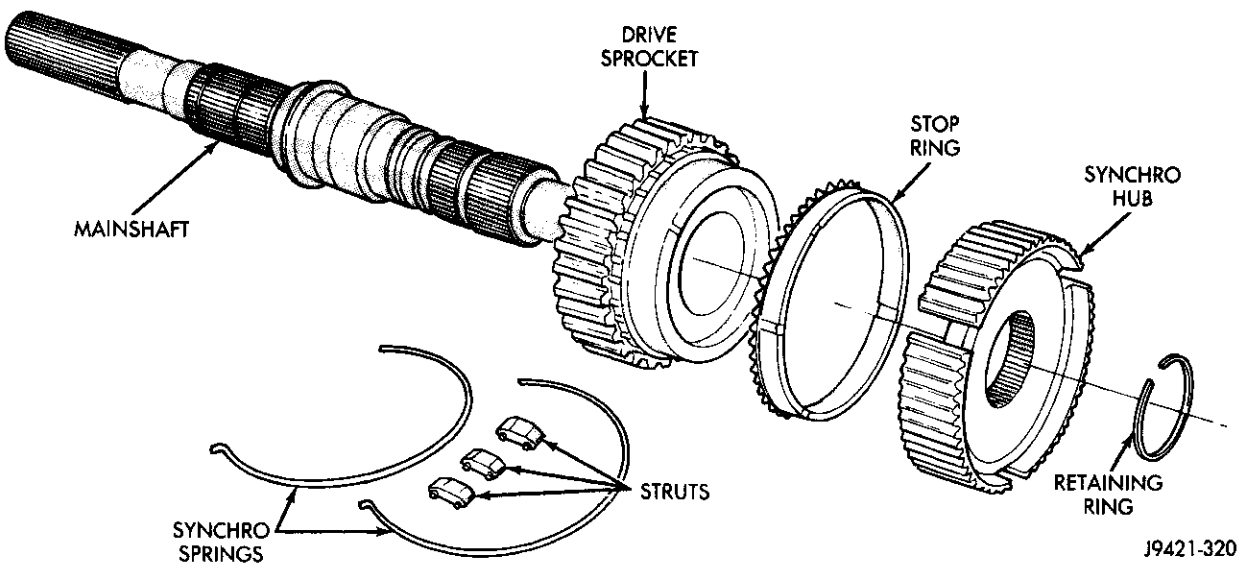

Fig. 103 Mainshaft Components

AUTHENTIC RESTORATION PRODUCT

CLEANING AND INSPECTION (Continued)

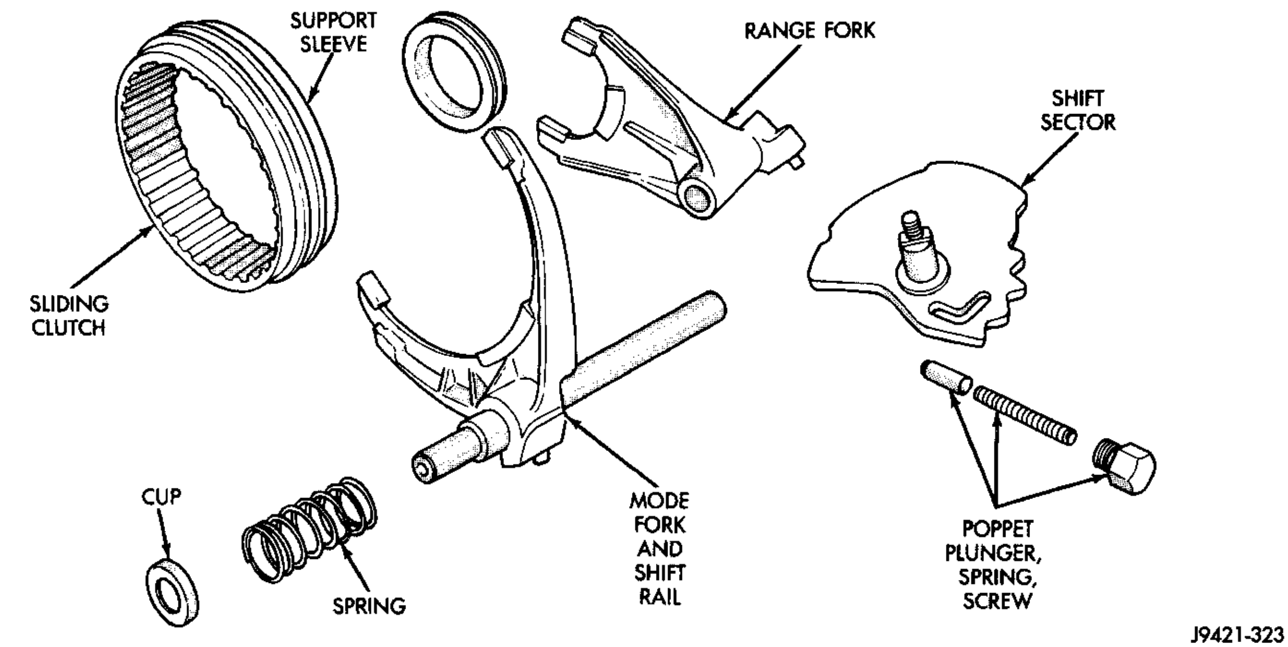

Fig. 105 Shift Fork Components

(Fig. 105). The shift sector shaft and detents should be inspected for wear. The mode fork and shift rail are a one–piece unit. If either part is damaged, replace the fork and rail as an assembly. Replace the shift rail cup and spring if they exhibit wear.

Inspect the planetary thrust washers (Fig. 106) carefully for wear or damage. Replace both washers if necessary.

The planetary carrier cannot be disassembled. It must be serviced as an assembly if damaged. Check condition of the pinion teeth and PTO gear teeth. If pinion tooth wear is evident, it will also be necessary to check condition of the annulus gear teeth.

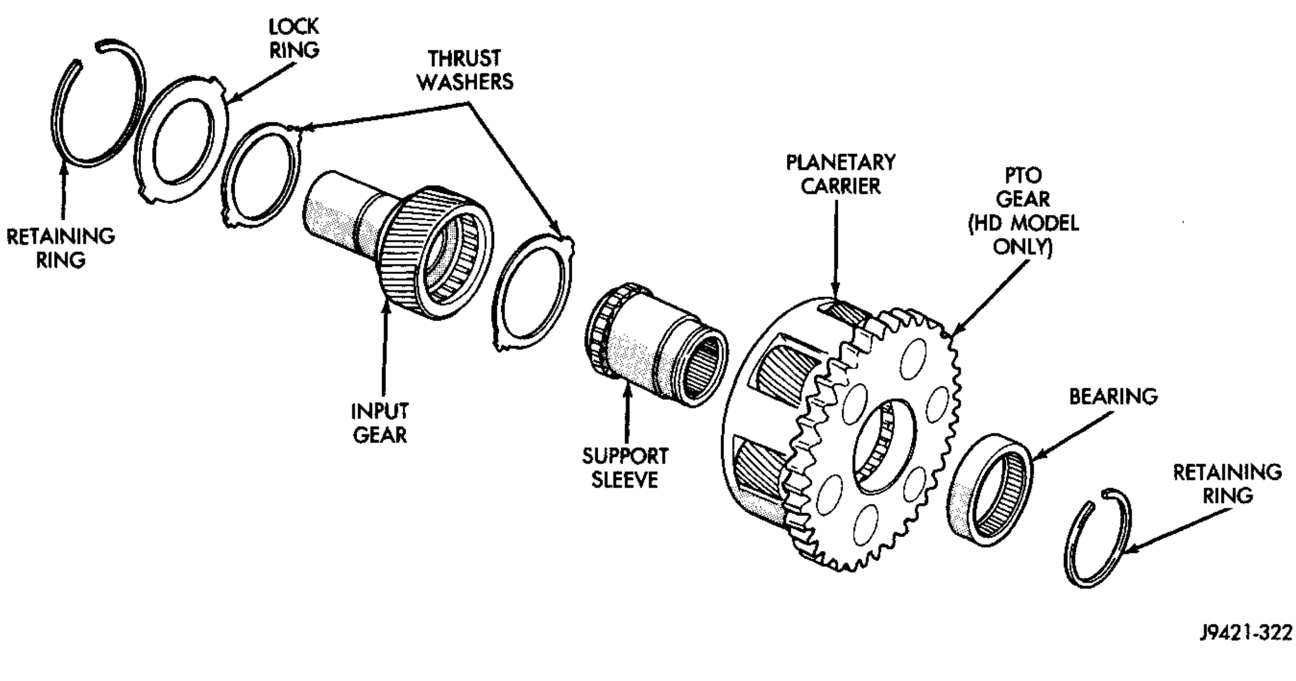

Fig. 106 Planetary And Input Gear Components

ADJUSTMENTS

SHIFT LINKAGE ADJUSTMENT

(1) Move shift lever into 2H position.
(2) Raise vehicle.
(3) Loosen shift rod lock bolt at trunnion (Fig. 107).

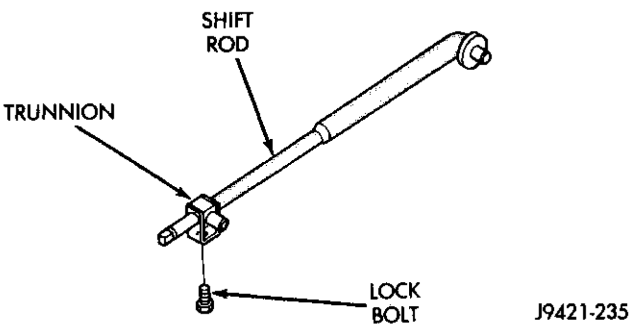

Fig. 107 Shift Rod Lock Bolt Location

(4) Check shift rod fit in trunnion. Be sure rod does not bind in trunnion.
(5) Verify that transfer case shift lever is in 2H position. The 2H position on the transfer case shift arm is the second position from full forward.
(6) Lower vehicle.
(7) Position the shift lever on the cab such that the distance from the instrument panel to the 2H position dot in the shift lever insert is 14.6 cm (5.75 in.). Ensure that the measurement is made parallel to the floor of the vehicle.
(8) Tighten shift rod lock bolt to 10 N·m (90 in. lbs.) torque.
(9) Check shift linkage operation. Be sure transfer case shifts into and operates properly in all ranges.

NV021 PTO ADAPTER

INDEX

GENERAL INFORMATION

GENERAL INFORMATION

The NV 021 PTO adapter provides power take–off capability for BR models with an automatic transmission. The adapter is available as an option on 2–wheel drive 2500 and 3500 models.

The NV 021 adapter is similar in appearance and mounting to a small transfer case (Fig. 1). A 4–wheel drive automatic transmission is used to simplify adapter mounting. The adapter has mounting studs in the front case for attachment to the overdrive unit gear case.

Basic components consist of the front case and rear extension, mainshaft, input gear, PTO gear, shift sector, and shift fork, shift rail and sleeve.

The mainshaft is supported in by a needle bearing in the input gear hub and by a ball bearing in the rear extension. The input gear is supported by a roller bearing in the front case. The PTO gear is splined to the input gear and is retained by a snap ring.

The input bearing is secured in the front case by a retainer. The output bearing is secured by a retaining ring on the mainshaft and by a second retaining ring in the rear extension.

The speedometer drive gear is located at the rear of the mainshaft. The gear is secured on the shaft with two snap rings.

SHIFT LEVER AND LINKAGE

A floor mounted shift lever assembly (Fig. 2), is used for selecting desired operating range. The lever is attached to the adapter shift lever by a single shift rod (Fig. 3). The floor linkage assembly is the same as used on 4–wheel drive models with a transfer case.

GENERAL INFORMATION (Continued)

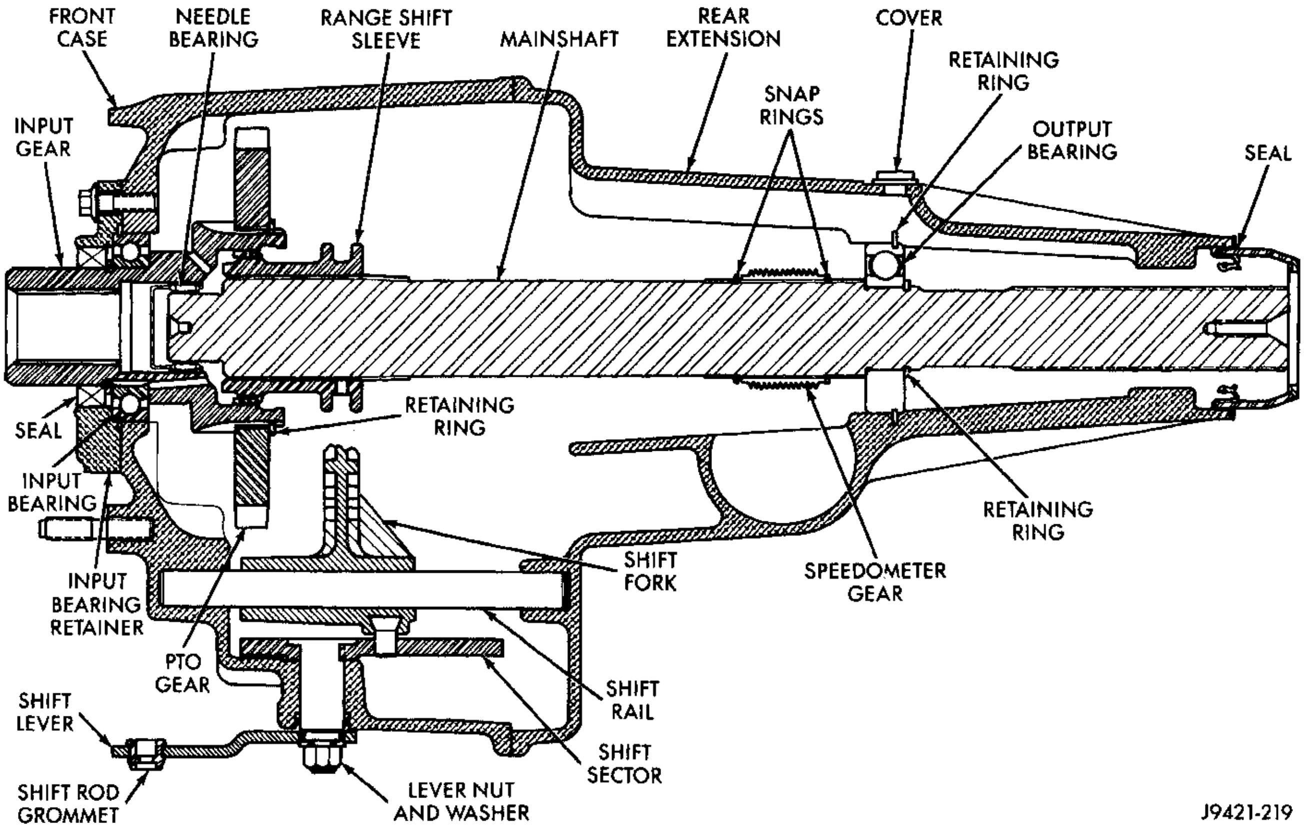

Fig. 1 NV 021 PTO Adapter

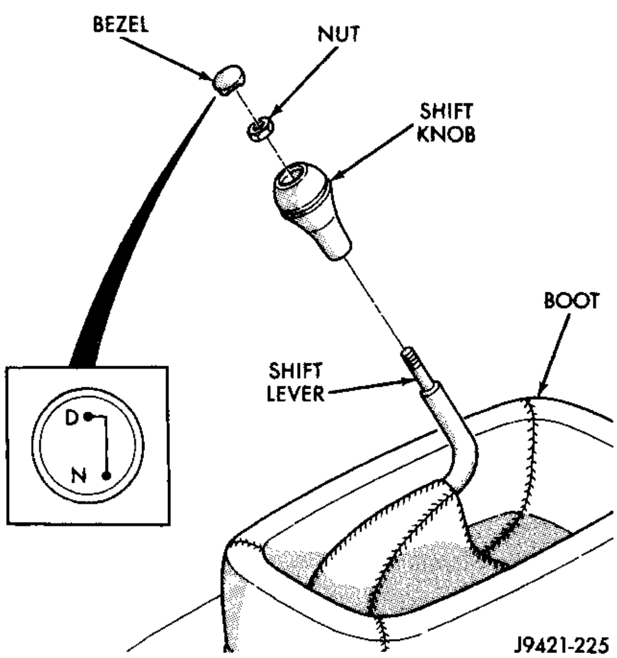

Fig. 2 Adapter Shift Lever And Shift Pattern

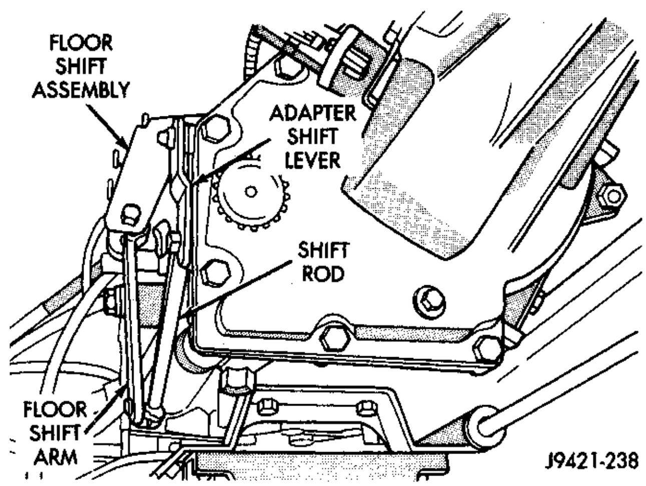

Fig. 3 Floor Shift Linkage

AUTHENTIC RESTORATION PRODUCT

GENERAL INFORMATION (Continued)

The adapter shift lever is attached directly to the shift sector shaft. Sector position is controlled by a detent poppet, spring and screw (Fig. 4). The poppet, under pressure from the spring, maintains sector detent position.

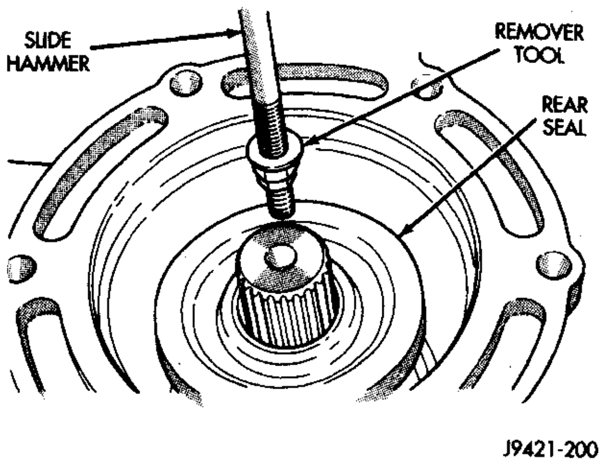

Fig. 4 Shift Sector Detent Controls

PTO ACCESSORY EQUIPMENT

Power take–off accessories such as pumps, gear drives, and towing equipment, are operated by a drive gear on the PTO adapter mainshaft.

The drive gear is accessible by removing the PTO access cover on the front case (Fig. 5). The auxiliary equipment to be operated is bolted directly to the adapter once the cover has been removed.

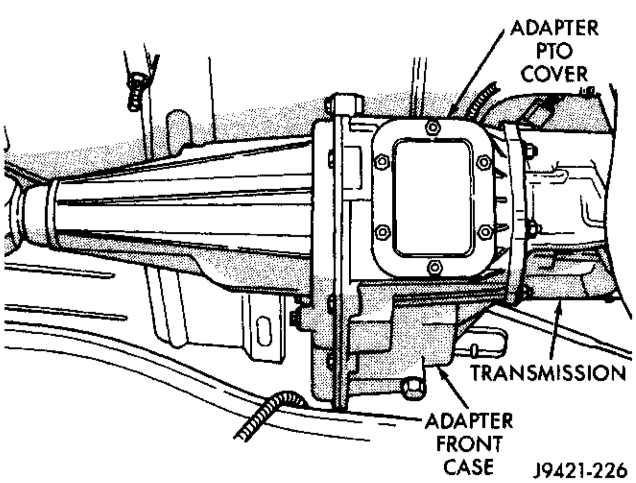

Fig. 5 PTO Access Cover Location

RECOMMENDED LUBRICANT AND FILL LEVEL

Recommended lubricant for the NV 021 is Mopar Dexron II, or ATF Plus transmission fluid.

Approximate fluid capacity is 2.17 liters (4.6 pints). The adapter fill and drain plugs are located in the rear extension (Fig. 6).

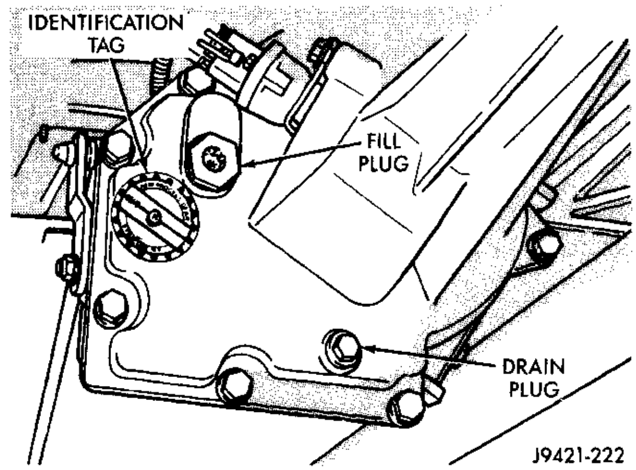

Fig. 6 Drain And Fill Plug Locations

The correct fill level is to the **bottom edge** of the fill plug hole.

ADAPTER IDENTIFICATION

A round, identification tag (Fig. 7) is attached to the rear extension. The tag provides the adapter model number, assembly number, serial number, and ratio.

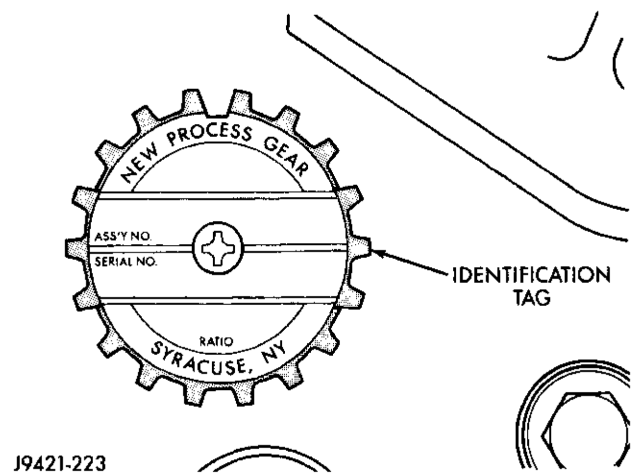

Fig. 7 Adapter I.D. Tag

The adapter serial number also represents the date of build. For example, a serial number of 9–10–93 would represent September 10, 1996.

DESCRIPTION AND OPERATION

PTO ADAPTER OPERATING RANGES AND SHIFTING

The NV 021 is a dual range unit. Operating ranges consist of drive (D) and neutral (N).

D range is used for normal driving and for PTO accessory operation while the vehicle is in motion.

DESCRIPTION AND OPERATION (Continued)

N range is used for PTO accessory operation when the vehicle is stopped.

N range is also used for breakdown towing with the front end raised. In this situation, the transmission must be shifted into Park and the PTO adapter into N range.

Operating/Shifting The PTO Adapter

To operate a PTO accessory while the vehicle is in motion:

- shift adapter into D range before engine start
- start engine
- shift transmission into D range and drive vehicle
- operate PTO accessory

To operate a PTO accessory while the vehicle is stopped:

- leave engine running
- shift transmission and adapter both into Neutral
- shift transmission back to Drive
- operate PTO accessory

To shift the adapter out of N and back to D range:

- leave engine running
- apply service brakes
- shift transmission into Reverse
- shift transmission back to Neutral and immediately shift adapter into D

To shift the adapter from D range into N:

- stop vehicle
- leave engine running
- shift transmission to Neutral
- shift adapter to N
- shift transmission back to D range
- operate accessory

DIAGNOSIS AND TESTING

ADAPTER SERVICE DIAGNOSIS

The PTO adapter should not be removed until diagnosis indicates a fault has actually occurred. Verify that the other driveline components (transmission, axle), are operating correctly before removing the adapter.

Begin diagnosis by checking fluid level and shift linkage adjustment. Have a helper observe linkage operation if necessary.

If auxiliary power take–off equipment is attached to the adapter, be sure the device is properly attached and in mesh with the PTO gear. Loose, misaligned, or incompatible auxiliary equipment will result in noise and unsatisfactory operation.

The following diagnosis information provides a listing of probable causes of an adapter malfunction. Use the lists as a guideline during diagnosis.

Inoperative

If the adapter will not drive a PTO accessory, the most probable causes are:

- PTO accessory not compatible with adapter (no gear mesh)
- PTO accessory loose, or misaligned
- PTO accessory damaged/inoperative
- adapter shift lever or shift rod disconnected
- transmission not in drive range

Noisy Operation

The most probable causes of noise are:

- low lubricant level
- PTO accessory loose, misaligned, or not compatible
- misadjusted shift rod
- engine/transmission mounts loose/damaged
- loose linkage or adapter assembly bolts
- output bearing snap ring not seated in bearing groove
- damaged input/output bearing
- worn/damaged shift fork, sleeve, or input gear
- loose/missing poppet, spring, or screw
- PTO gear teeth damaged

Hard Shifting

The most probable causes of a hard shift condition are:

- incorrect shift technique
- transmission and adapter shaft speeds not matched
- PTO accessory misaligned, or loose
- low lubricant level (leak or underfilled)
- shift rod loose or misadjusted
- shift lever nut loose or missing
- engine/transmission mounts loose/damaged
- adapter shift fork or sleeve damaged

Fluid Leaks

Fluid leaks from the adapter will generally be from the vent, front/rear seal, front case–to–rear case joint, poppet plunger screw, or adapter–to–transmission joint.

A leak at the front end of the adapter may not always be from the input bearing retainer seal. Check front leaks carefully as the actual leak source may be the transmission.

SERVICE PROCEDURES

PTO ADAPTER SERVICE

The adapter can be removed and disassembled for service when necessary. Removal/installation and overhaul procedures are provided in this section.

Gaskets are not used in the PTO adapter. All mating surfaces are to be coated with Mopar Gasket Maker, Mopar Silicone Adhesive Sealer, or Loctite 518.

SERVICE PROCEDURES (Continued)

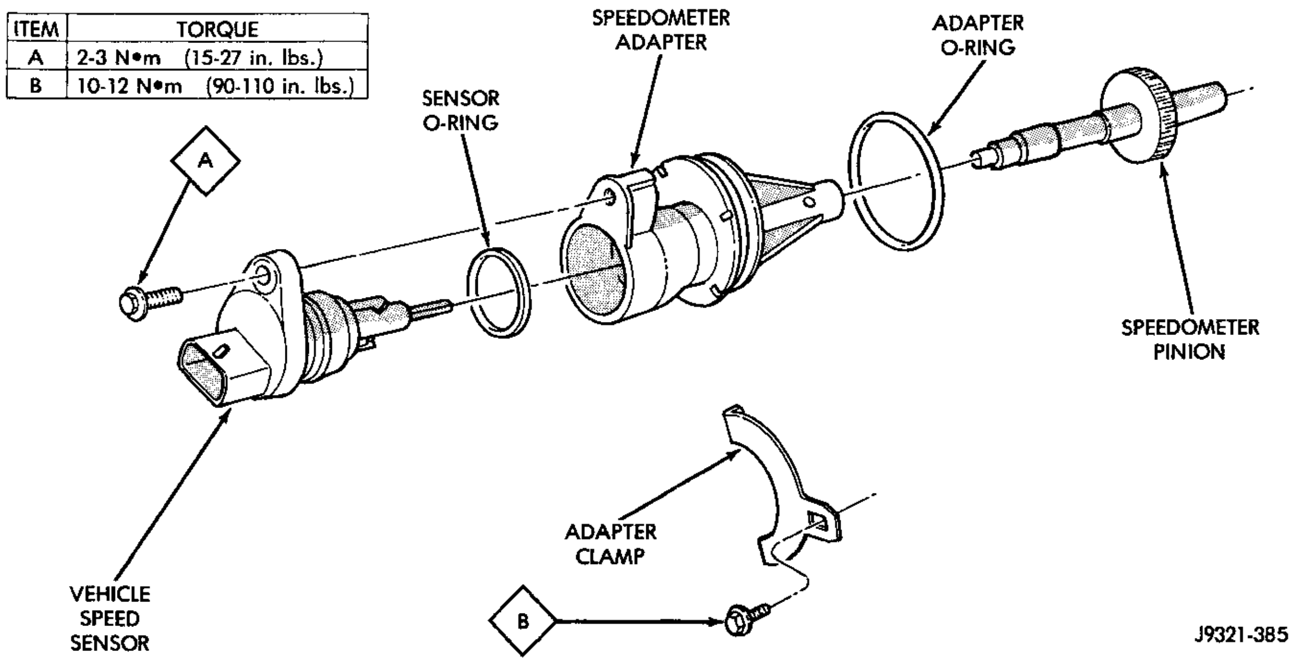

Fig. 8 Speedometer Components

SPEEDOMETER SERVICE

(1) Raise vehicle.
(2) Disconnect wires from vehicle speed sensor.
(3) Remove adapter clamp and screw (Fig. 8).
(4) Remove speed sensor and speedometer adapter as assembly.
(5) Remove speed sensor retaining screw and remove sensor from adapter.
(6) Remove speedometer pinion from adapter.
(7) Inspect sensor and adapter O–rings. Remove and discard O–rings if worn or damaged.
(8) Inspect terminal pins in speed sensor. Clean pins with Mopar electrical spray cleaner if dirty or oxidized. Replace sensor if faulty, or pins are loose, severely corroded, or damaged.

Speedometer Installation And Indexing

(1) Thoroughly clean adapter flange and adapter mounting surface in housing. Surfaces must be clean for proper adapter alignment and speedometer operation.
(2) Install new O–rings on speed sensor and speedometer adapter if necessary.
(3) Lubricate sensor and adapter O–rings with transmission fluid.
(4) Install vehicle speed sensor in speedometer adapter. Tighten sensor attaching screw to 2–3 N·m (15–27 in. lbs.) torque.
(5) Install speedometer pinion in adapter.
(6) Count number of teeth on speedometer pinion. Do this before installing assembly in housing. Then lubricate pinion teeth with transmission fluid.
(7) Note index numbers on adapter body (Fig. 9). These numbers will correspond to number of teeth on pinion.

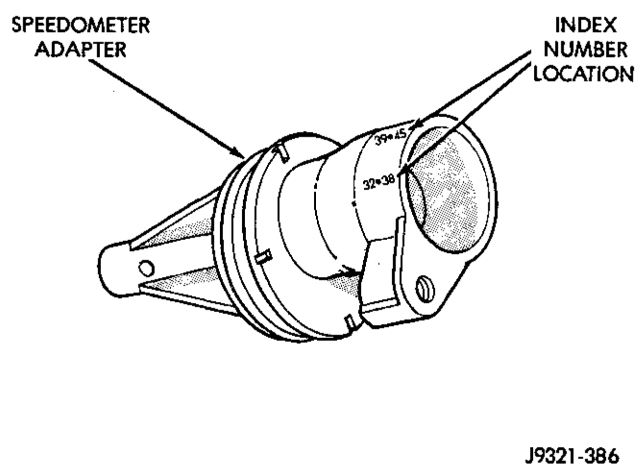

Fig. 9 Location Of Index Numbers On Speedometer Adapter

(8) Install speedometer assembly in housing.
(9) Rotate adapter until required range numbers are at 6 O'clock position. Be sure range index numbers correspond to number of teeth on pinion gear.
(10) Install speedometer adapter clamp and retaining screw. Tighten clamp screw to 10–12 N·m (90–110 in. lbs.) torque.
(11) Connect wires to vehicle speed sensor.
(12) Lower vehicle.

REMOVAL AND INSTALLATION

ADAPTER

REMOVAL

(1) Raise vehicle.

(2) If adapter is to be removed for disassembly and overhaul, remove drain plug and drain lubricant from adapter.

(3) Disconnect vehicle speed sensor wires at sensor (Fig. 10).

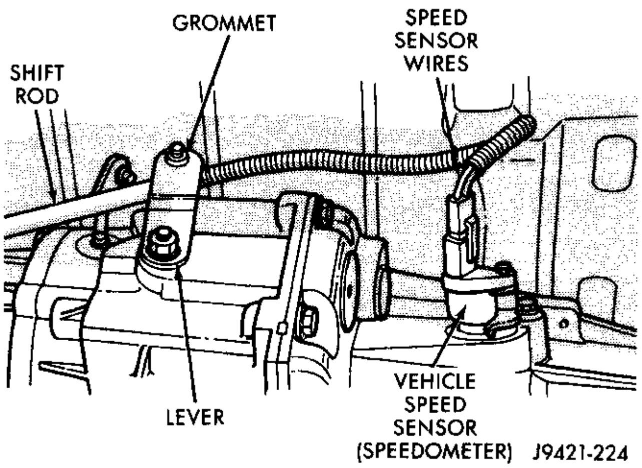

Fig. 10 Shift Rod And Speed Sensor Wire Attachment

(4) Disconnect shift rod from grommet in adapter shift lever. Use channel lock–style pliers to press rod out of grommet.

(5) Mark propeller shaft yoke for alignment reference. Then disconnect and remove propeller shaft.

(6) Remove nuts securing adapter mounting studs to transmission extension (Fig. 11).

(7) Slide adapter studs out of transmission extension and remove adapter from vehicle.

(8) If a gasket is used between adapter and transmission, retain gasket if in good condition.

INSTALLATION

(1) If adapter was overhauled, fill adapter to bottom edge of fill plug hole with Mopar Dexron II, or ATF Plus transmission fluid. Tighten fill plug to 41–54 N·m (30–40 ft. lbs.) torque.

(2) Clean mounting surfaces of adapter and transmission extension with solvent.

(3) Apply 2–3 drops of Mopar Lock N' Seal, or Loctite 242 to adapter mounting nuts.

(4) Install gasket on adapter (if equipped). Apply thin bead of sealer to transmission extension and to gasket, if used.

(5) Install adapter on transmission and install adapter mounting nuts. If adapter has 5/16 studs, tighten nuts to 30–41 N·m (22–30 ft. lbs.). If adapter has 3/8 studs, tighten nuts to 41–47 N·m (30–35 ft. lbs.).

(6) Lubricate propeller shaft slip yoke with transmission fluid or petroleum jelly.

(7) Align and install propeller shaft. Tighten shaft clamp bolts to 19 N·m (170 in. lbs.) torque.

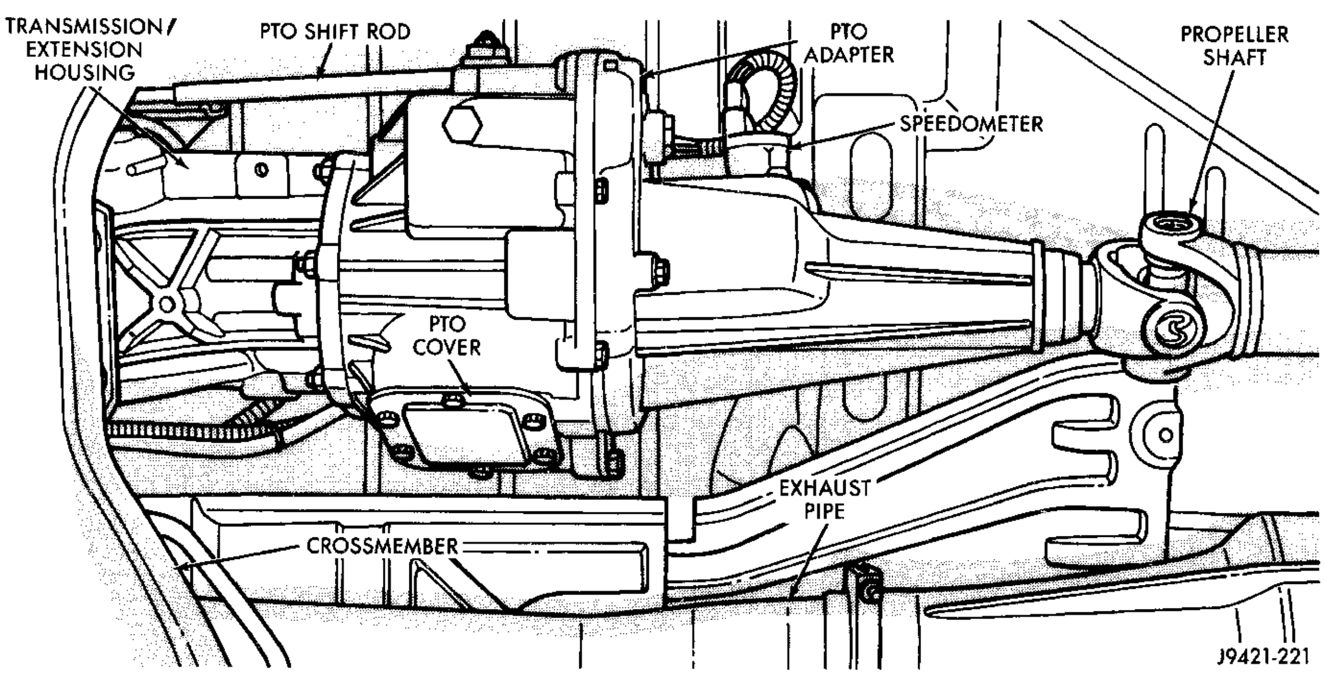

Fig. 11 PTO Adapter Mounting

REMOVAL AND INSTALLATION (Continued)

(8) Connect shift rod to adapter shift lever. Be sure rod is fully seated in plastic grommet.

(9) Adjust shift rod if necessary.

(10) Lower vehicle.

DISASSEMBLY AND ASSEMBLY

ADAPTER OVERHAUL

DISASSEMBLY

(1) If adapter was not drained during removal, remove drain bolt at bottom of front housing and drain lubricant into drain pan (Fig. 12).

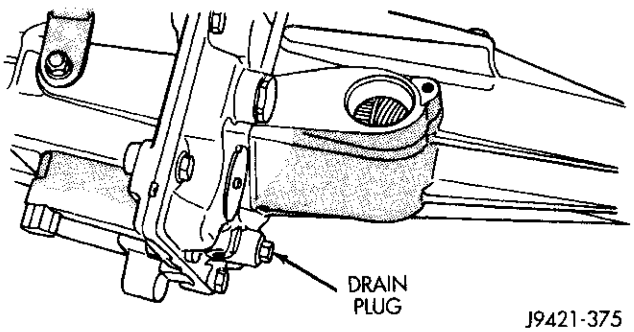

Fig. 12 Drain Bolt Location

(2) Remove mainshaft bearing retaining ring access cover and gasket (Fig. 13). Cover must be removed from extension for access to retaining ring. A torx head bit is required to remove cover screws.

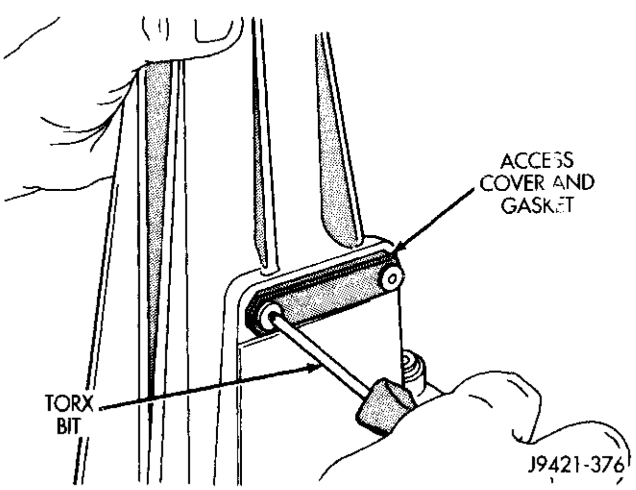

Fig. 13 Retaining Ring Access Cover Removal

(3) Remove input bearing retainer bolts (Fig. 14).

(4) Remove input bearing retainer as follows: Insert pry tool in retainer slot (Fig. 15). Then pry retainer outward to break sealer bead and remove retainer (Fig. 16).

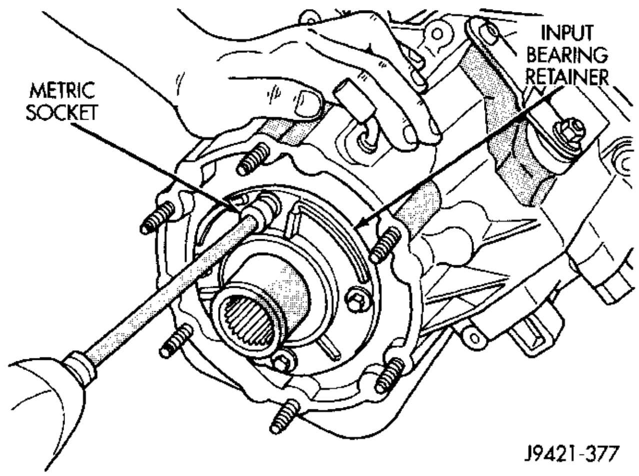

Fig. 14 Removing Input Bearing Retainer Bolts

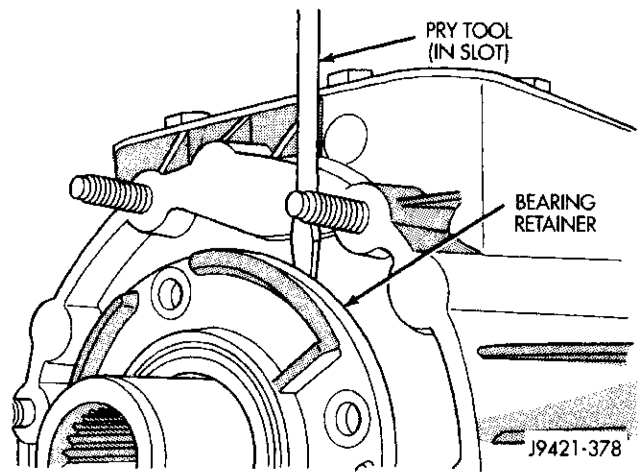

Fig. 15 Loosening Bearing Retainer (Breaking Sealer Bead)

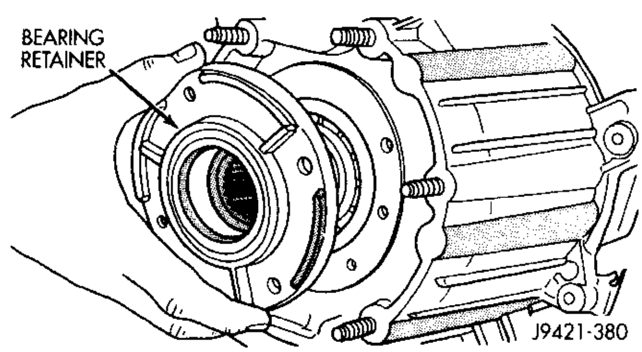

Fig. 16 Input Bearing Retainer Removal

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(5) Remove input gear retaining ring (Fig. 17).

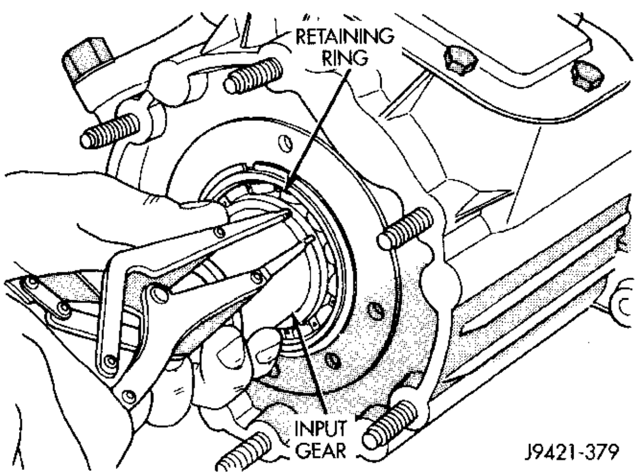

Fig. 17 Input Gear Retaining Ring Removal

(6) Support adapter on 3–4 small wood blocks (Fig. 18). Position blocks under transmission mounting surface of front case and between studs.

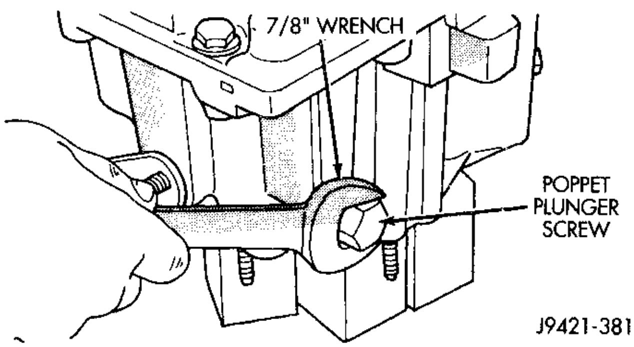

Fig. 18 Poppet Screw Removal

(7) Remove poppet plunger screw.
(8) Remove spring and poppet plunger (Fig. 19).

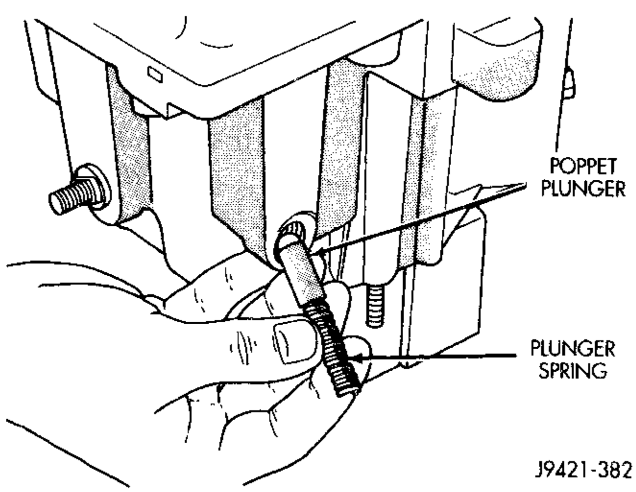

Fig. 19 Poppet And Spring Removal

(9) Loosen nut and washer that attach shift lever to sector shaft (Fig. 20). Then remove, nut, washer and lever from sector shaft (Fig. 21).

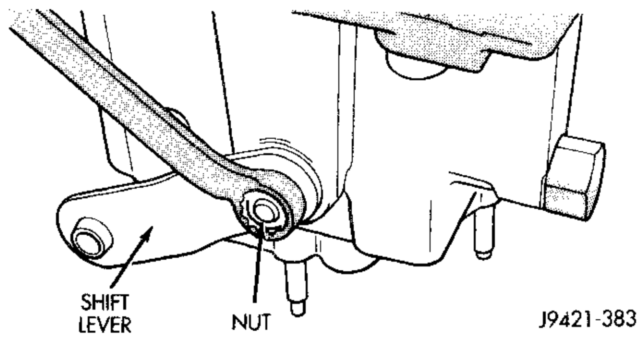

Fig. 20 Loosening Shift Lever Nut

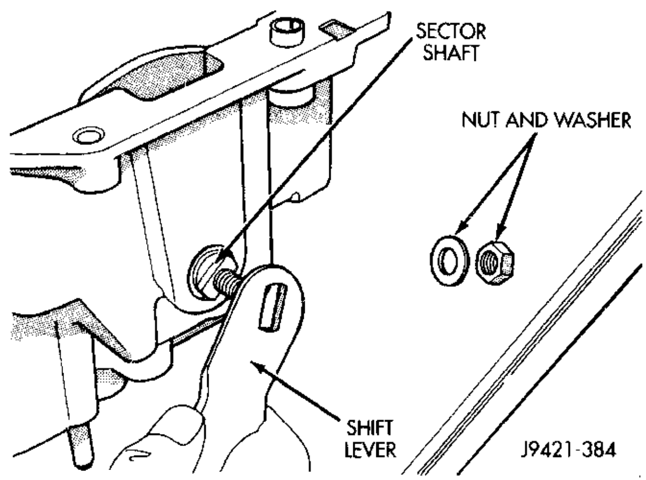

Fig. 21 Shift Lever, Nut And Washer Removal

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(10) Remove bolts attaching front case to rear extension (Fig. 22). **Two attaching bolts require a flat washer (Fig. 23). Note position of these bolts for assembly reference. Mark bolt position with scriber or with paint stripe.**

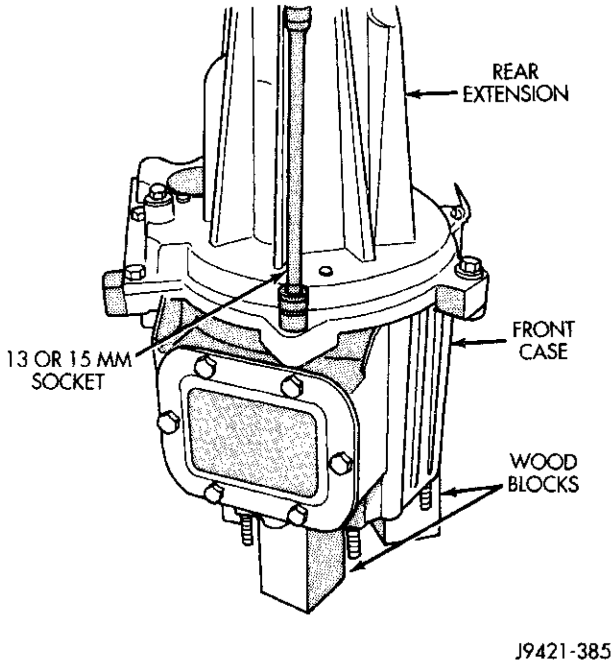

Fig. 22 Removing Rear Extension Attaching Bolts

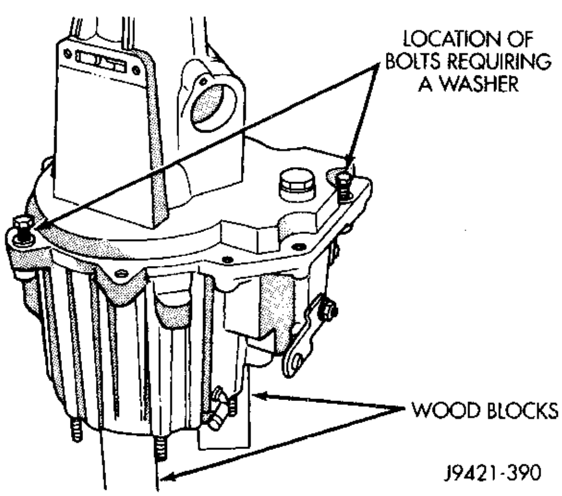

Fig. 23 Location Of Rear Extension Bolts Requiring Washers

(11) Pry extension away from front case with flat blade screwdriver. Position screwdriver in slots provided at each end of case and extension (Fig. 24).

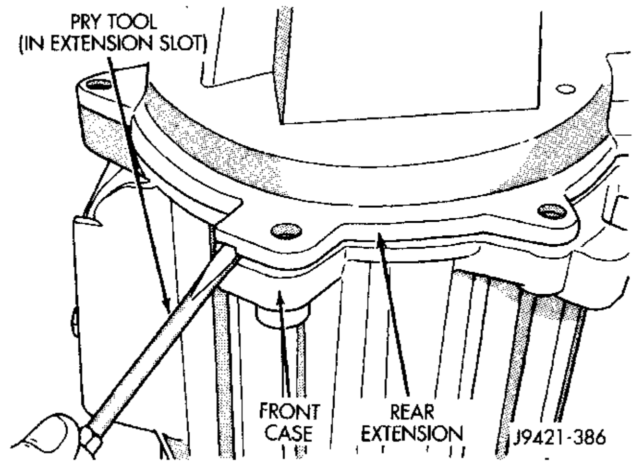

Fig. 24 Loosening Rear Extension (Breaking Sealer Bead)

(12) Remove rear extension as follows:

(a) Spread mainshaft bearing retaining ring with snap ring pliers (Fig. 25).

(b) Lift extension up and off mainshaft and front case (Fig. 26).

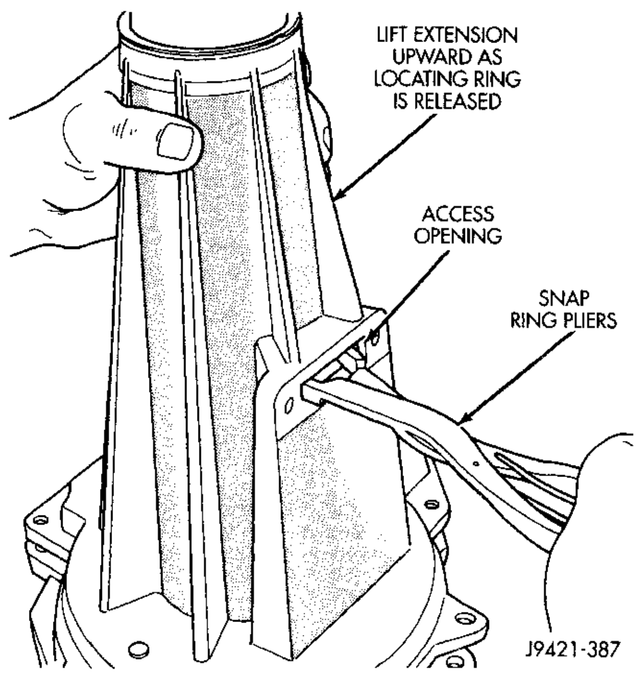

Fig. 25 Releasing Mainshaft Bearing Retaining Ring

DISASSEMBLY AND ASSEMBLY (Continued)

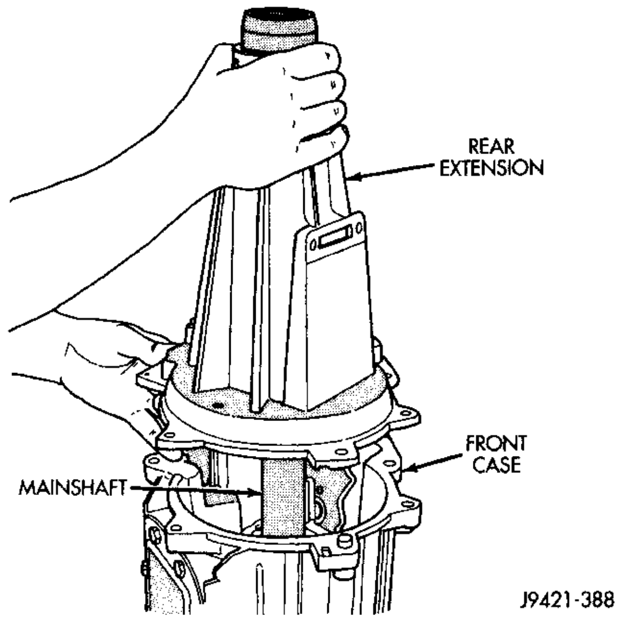

Fig. 26 Removing Rear Extension

(13) Remove mainshaft by lifting it straight up and out of input gear and shift sleeve (Fig. 27).

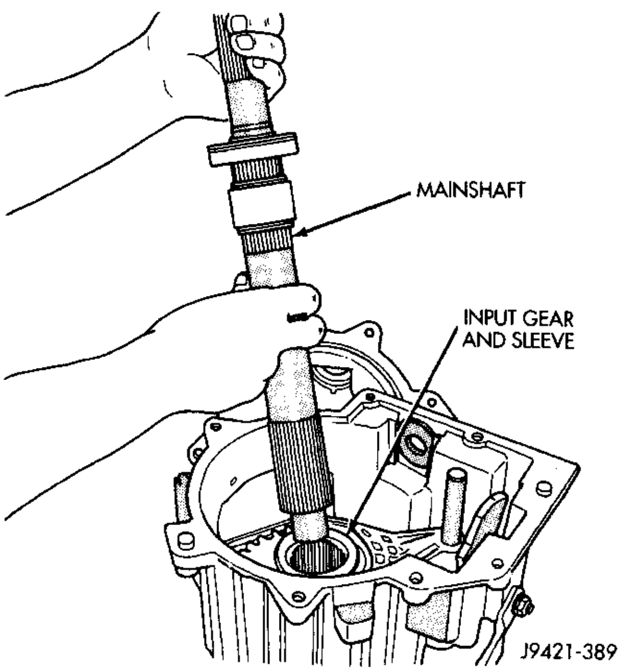

Fig. 27 Mainshaft Removal

(14) Remove rear output bearing retaining ring from mainshaft (Fig. 28).

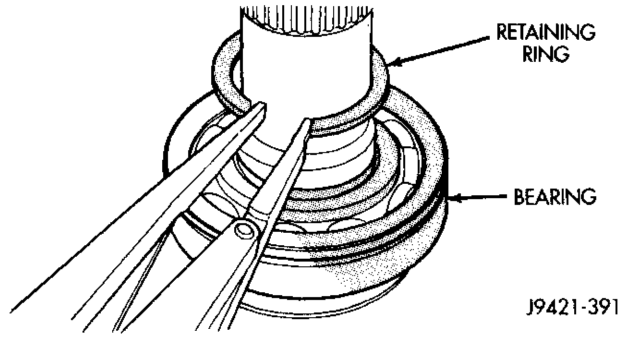

Fig. 28 Output Bearing Snap Ring Removal

(15) Remove output bearing from mainshaft. **Note position of snap ring groove in bearing for installation reference (Fig. 29).**

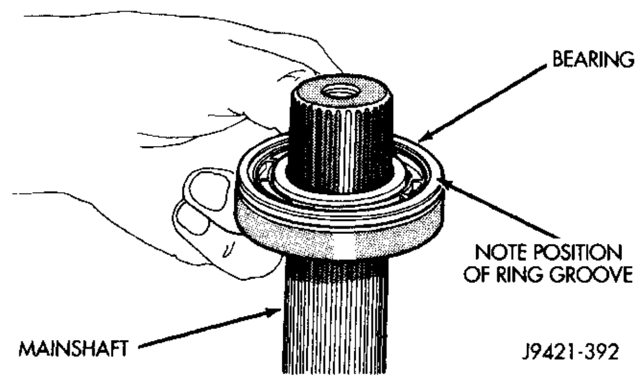

Fig. 29 Mainshaft Output Bearing Removal

(16) Remove speedometer gear rear retaining ring (Fig. 30).

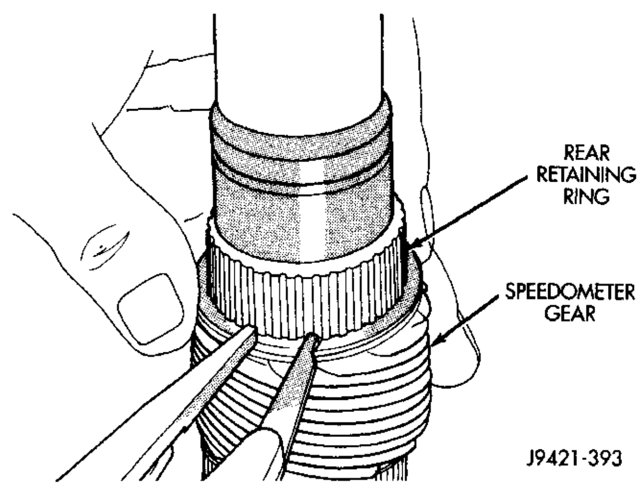

Fig. 30 Speedometer Gear Rear Snap Ring Removal

Mopar AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(17) Remove speedometer gear from mainshaft (Fig. 31).

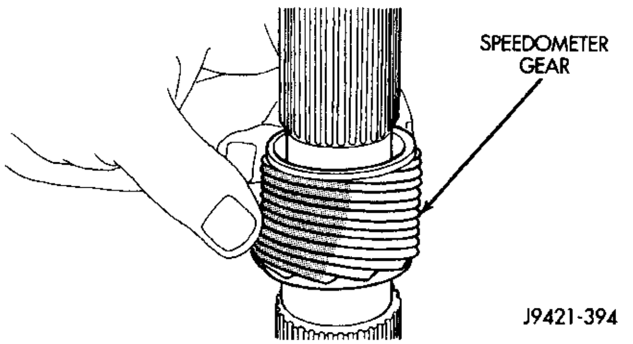

Fig. 31 Speedometer Gear Removal

(18) Remove speedometer gear front snap ring from mainshaft (Fig. 32).

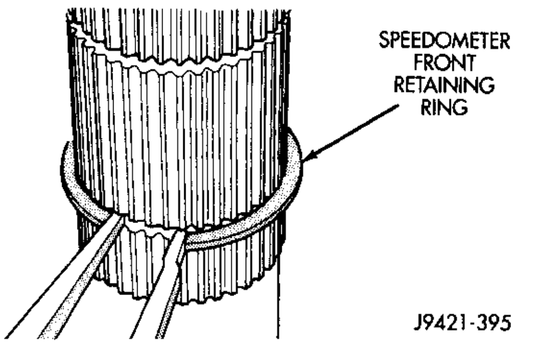

Fig. 32 Speedometer Gear Front Snap Ring Removal

(19) Remove shift rail by pulling it up and out of fork and case (Fig. 33).

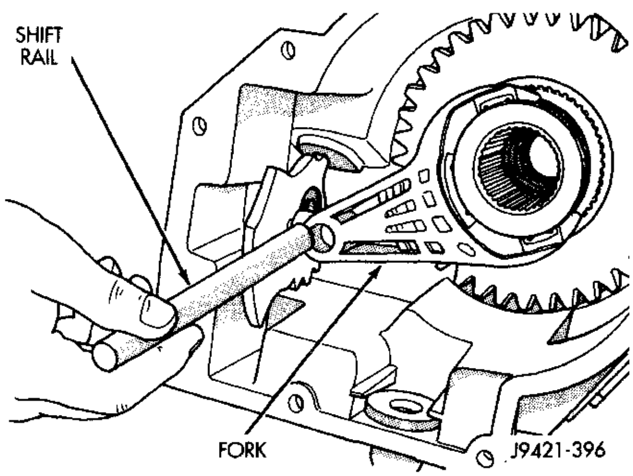

Fig. 33 Shift Rail Removal

(20) Remove shift fork and shift sleeve as assembly (Fig. 34).

(21) Separate shift fork and sleeve (Fig. 35). Note position of sleeve for installation reference.

(22) Roll case on side and off wood blocks.

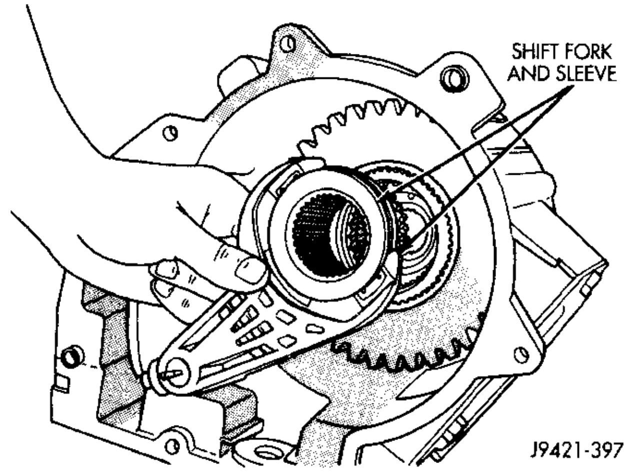

Fig. 34 Shift Fork And Sleeve Removal

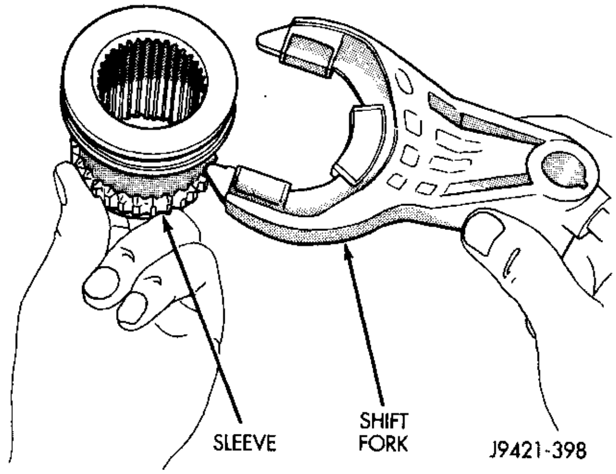

Fig. 35 Separating Shift Fork And Sleeve

(23) Tap input gear out of bearing with plastic mallet (Fig. 36).

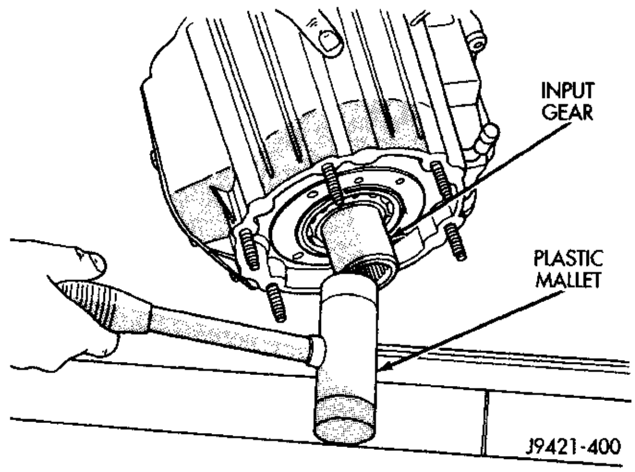

Fig. 36 Starting Input Gear Out of Bearing

DISASSEMBLY AND ASSEMBLY (Continued)

(24) Remove PTO and input gear assembly (Fig. 37). Lift assembly up and out of input bearing and case.

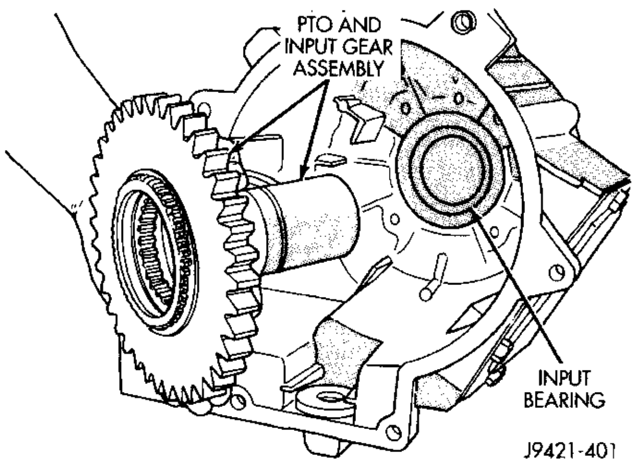

Fig. 37 Removing PTO/Input Gear Assembly

(25) Remove retaining ring that secures PTO gear on input gear (Fig. 38). Then slide PTO gear off input gear (Fig. 39).

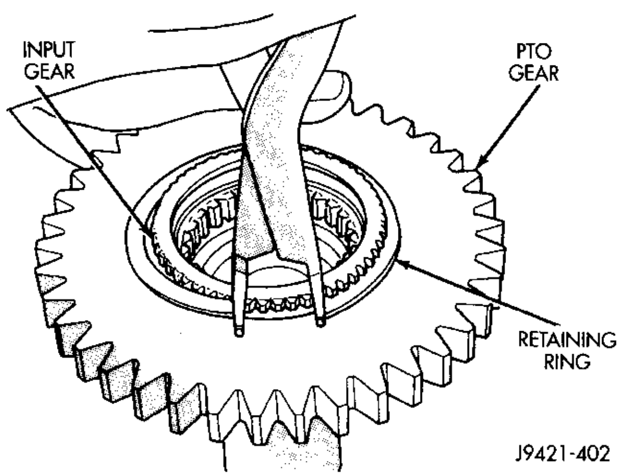

Fig. 38 Removing PTO Gear Retaining Ring

(26) Remove sector shaft O–ring retainer (Fig. 40), and O–ring (Fig. 41).

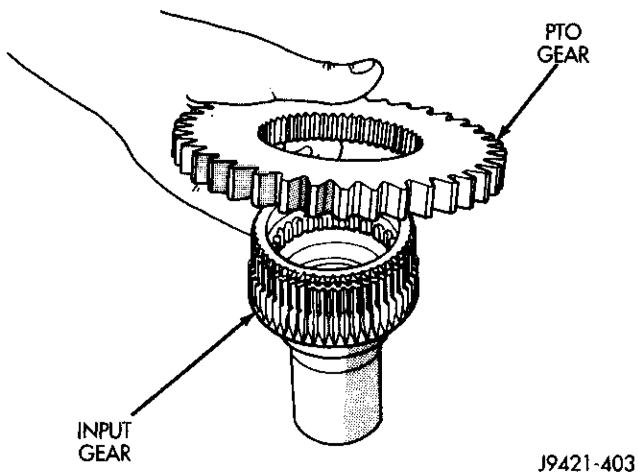

Fig. 39 Removing PTO Gear From Input Gear

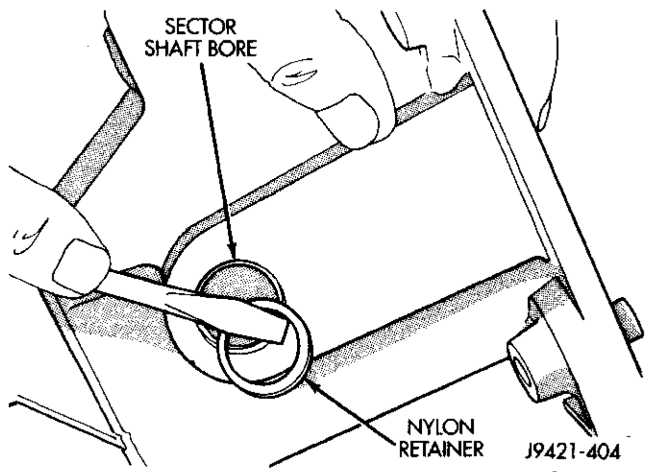

Fig. 40 Removing Shift Sector O–Ring Retainer

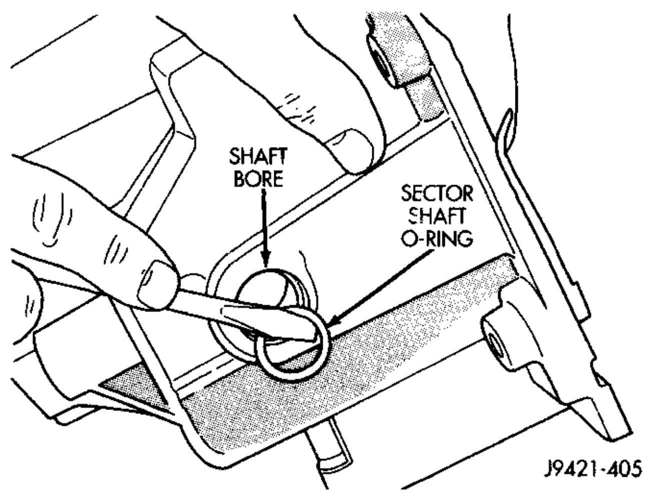

Fig. 41 Removing Shift Sector O–Ring

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(27) Remove input bearing from front case with Driver Handle C–4171 and Tool C–4210 or 7828, whichever fits best (Fig. 42). **Bearing can only be removed from case interior because of bearing locating ring.**

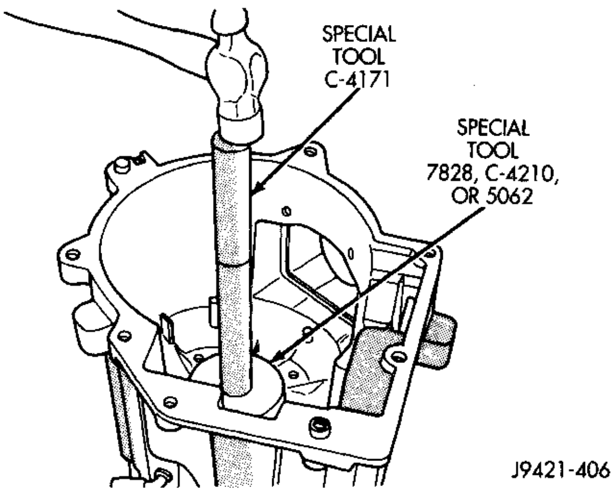

Fig. 42 Input Bearing Removal

(28) Inspect condition of needle bearing in input gear. If bearing is rough/noisy, worn, or brinnelled, remove bearing as follows:

(a) Turn bolt of Puller MD998346 to retract puller jaws. Then position puller jaws under bearing (Fig. 43).

(b) Tighten puller bolt to expand puller jaws and secure them under bearing.

(c) Grip puller bridge and turn puller nut clockwise to draw bearing out of gear (Fig. 44). **Note that bearing has built in cup plug (Fig. 45).**

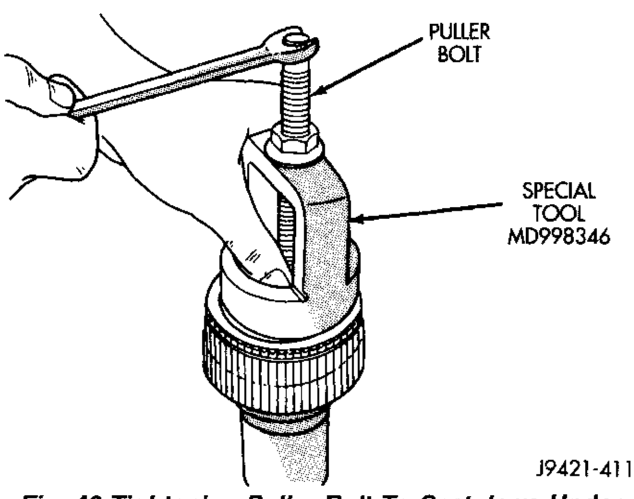

Fig. 43 Tightening Puller Bolt To Seat Jaws Under Bearing

ASSEMBLY

Lubricate the adapter components with Mopar Dexron II, or ATF Plus during assembly operations. In addition, since gaskets are not used in the adapter, sealing surfaces are to be coated with Mopar Gasket Maker, Loctite 518, or Mopar silicone adhesive/sealer. Therefore, it is important that all sealing surfaces be clean and free of grease and oil before applying sealers.

(1) Start input bearing in front case bore. Verify that locating ring is installed on bearing (Fig. 46). Note that bearing can only be installed from case exterior because of the ring which controls depth of installation.

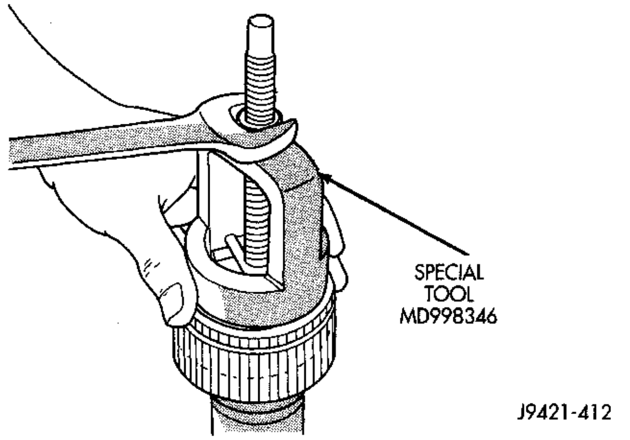

Fig. 44 Tightening Puller Nut To Pull Bearing From Gear

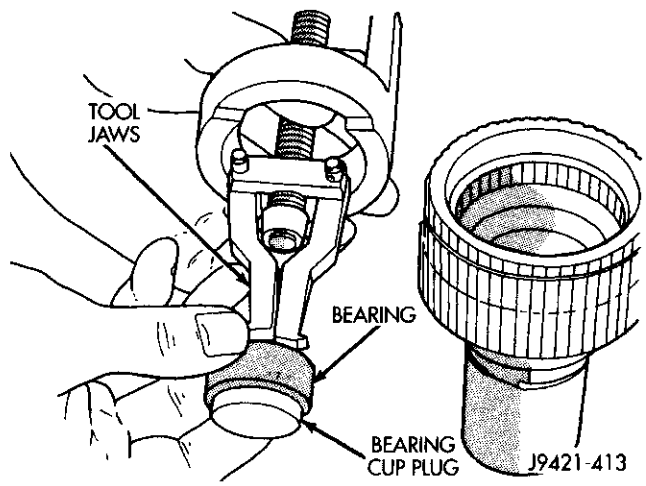

Fig. 45 Bearing Removed From Gear

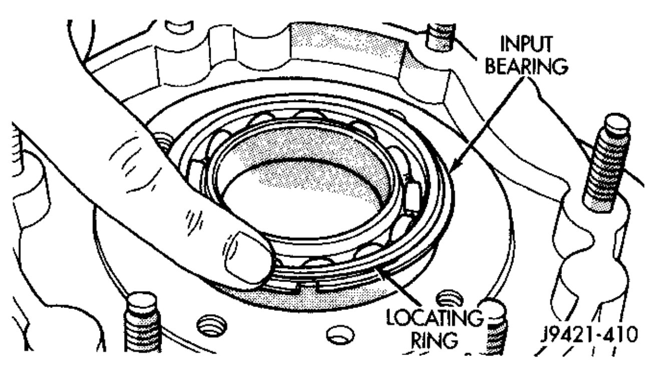

Fig. 46 Input Bearing Locating Ring Position

DISASSEMBLY AND ASSEMBLY (Continued)

(2) Seat input bearing in case (Fig. 47). Use driver Handle C– 4171 and Installer C–4210, 5062, or 7828 to install bearing. Seat bearing until locating ring is flush against case.

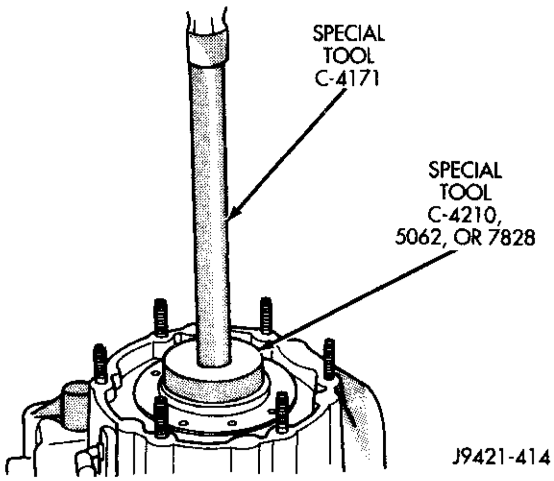

Fig. 47 Input Bearing Installation

(3) Install new needle bearing in input gear with Driver Handle C–4171 and Installer 5065 (Fig. 48).

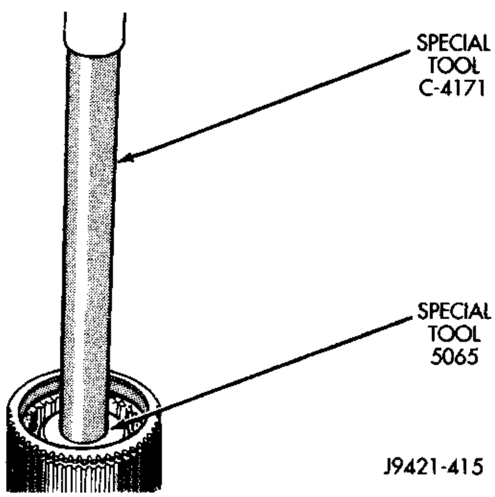

Fig. 48 Installing Needle Bearing In Input Gear

(4) Install new sector shaft O–ring (Fig. 49), and O–ring retainer (Fig. 50) in sector shaft bore.

(5) Install shift sector in front case (Fig. 51).

(6) Support front case on 3–4 small wood blocks so interior of case is facing up. Position blocks between studs on front case.

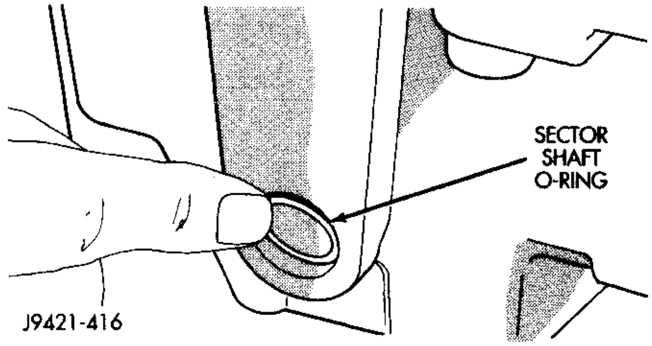

Fig. 49 Sector Shaft O–Ring Installation

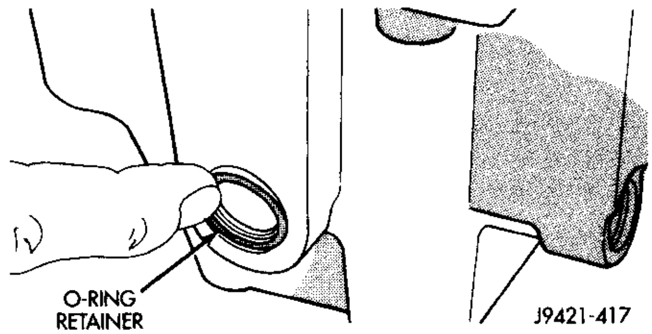

Fig. 50 Sector Shaft O–Ring Retainer Installation

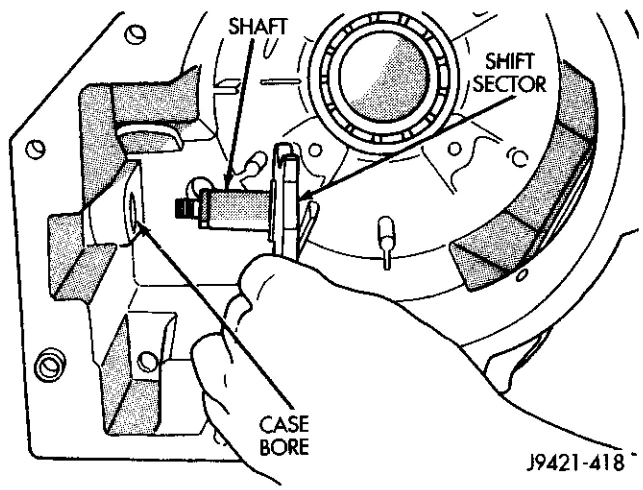

Fig. 51 Shift Sector Installation

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(7) Install PTO gear on input gear (Fig. 52).
(8) Install PTO gear retaining ring (Fig. 53).

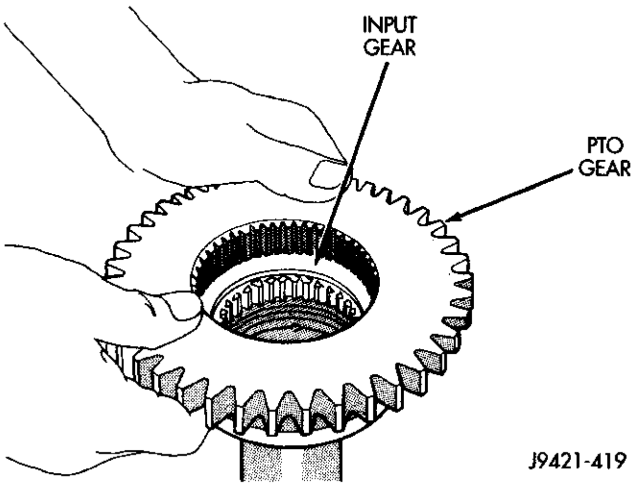

Fig. 52 Assembling Input And PTO Gears

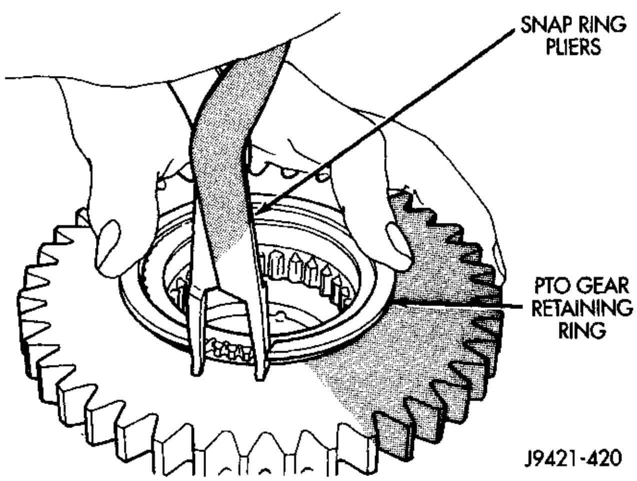

Fig. 53 Installing PTO Gear Retaining Ring

(9) Install input/PTO gear assembly in case (Fig. 54).

(10) **Tap PTO gear with wood hammer handle until snap ring groove in input gear is accessible.**

(11) Remove front case from wood blocks and position case so input gear is accessible.

(12) Install retaining ring on input gear (Fig. 55). **Be sure ring is fully seated in gear groove.**

(13) Remount front case on wood blocks.

(14) Assemble shift fork and sleeve (Fig. 56). Then install fork and sleeve (Fig. 57). Be sure sleeve is seated in input gear.

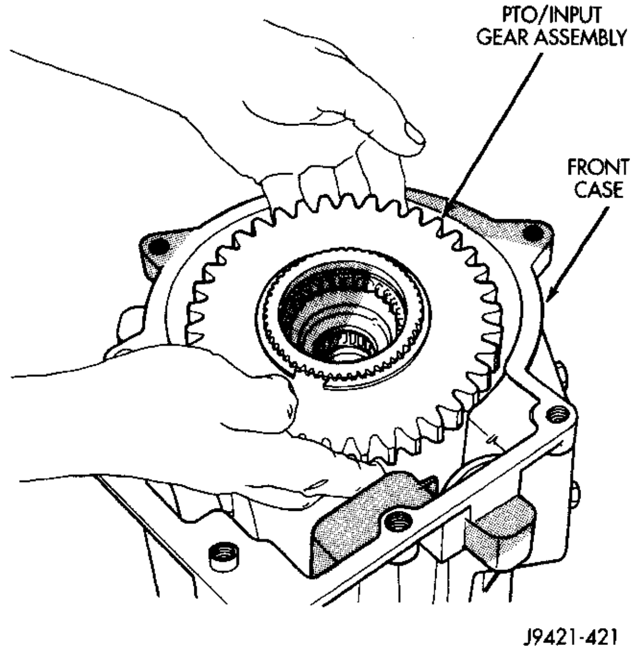

Fig. 54 Installing Input/PTO Gear Assembly In Case

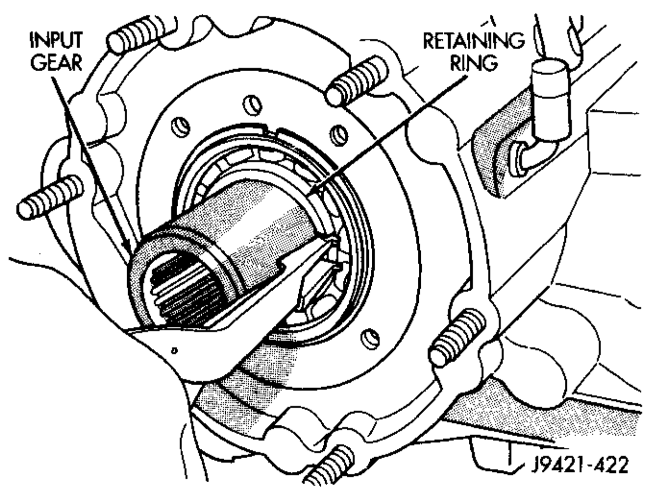

Fig. 55 Installing Input Gear Retaining Snap Ring

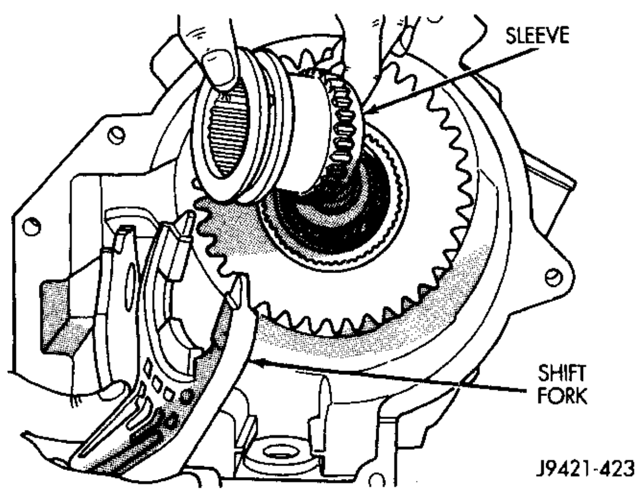

Fig. 56 Assembling Shift Fork And Sleeve

DISASSEMBLY AND ASSEMBLY (Continued)

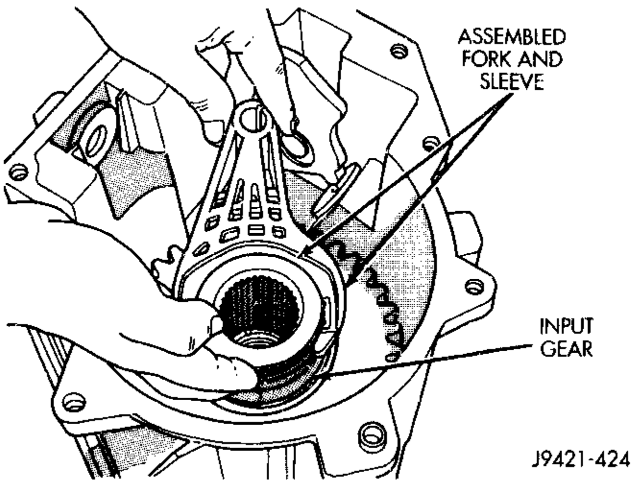

Fig. 57 Shift Fork And Sleeve Installation

(15) Align and install shift fork pin in sector slot (Fig. 58).

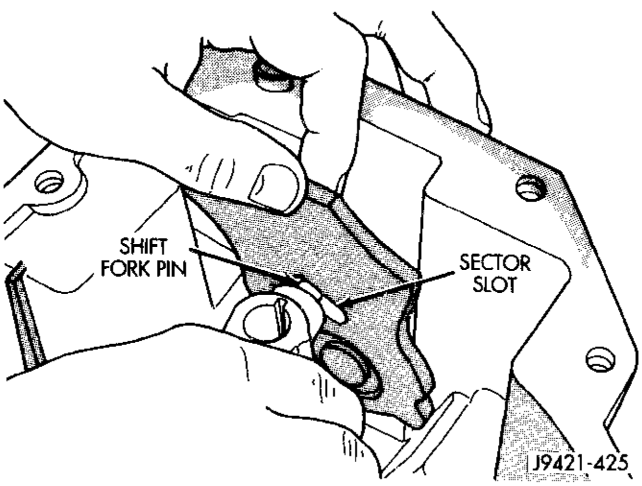

Fig. 58 Inserting Shift Fork Pin In Sector Slot

(16) Align shift sleeve in input gear and align shift fork with shift rail bore in case.

(17) Install shift rail through fork and into case bore (Fig. 59).

(18) Install shift lever on sector shaft (Fig. 60). Then install lever washer and nut on sector shaft (Fig. 61). Apply Loctite 242 to nut before installation and tighten nut to 27–34 N·m (20–25 ft. lbs.) torque.

(19) Install magnet in case pocket.

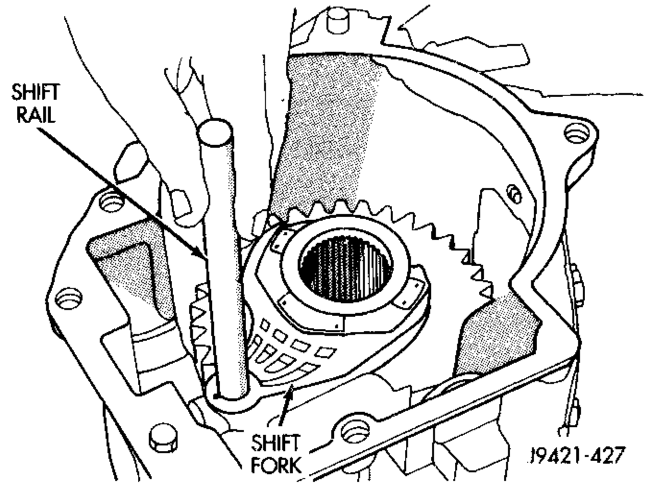

Fig. 59 Shift Rail Installation

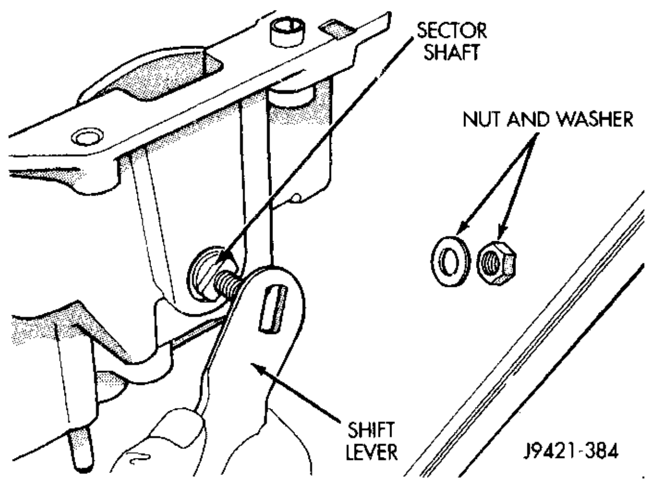

Fig. 60 Shift Lever Installation

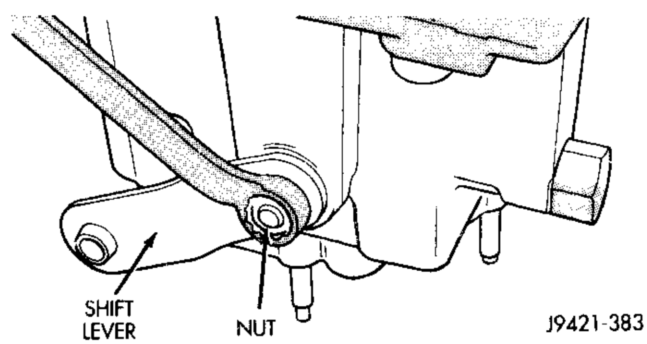

Fig. 61 Installing/Tightening Shift Lever Nut And Washer

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(20) Install mainshaft (Fig. 62). Guide shaft through sleeve and into input gear bearing.

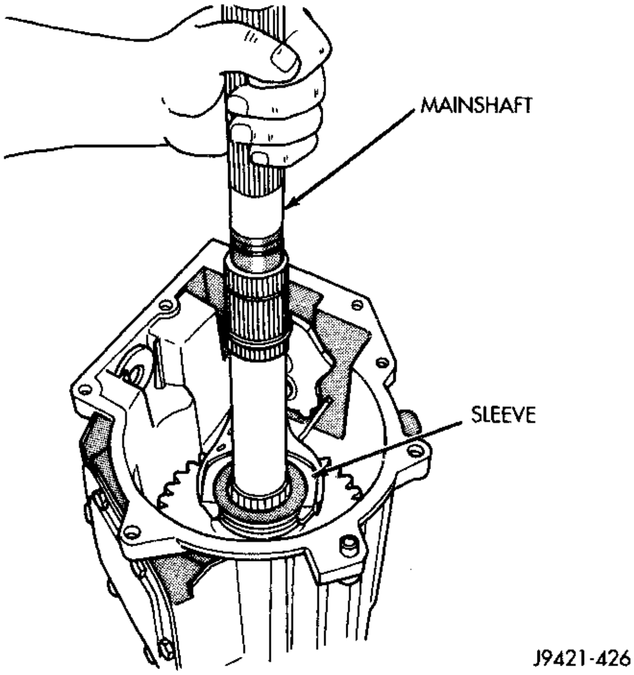

Fig. 62 Mainshaft Installation

(21) Install first speedometer snap ring on shaft (Fig. 63), followed by speedometer gear (Fig. 64). Then install second snap ring to secure gear on shaft (Fig. 65).

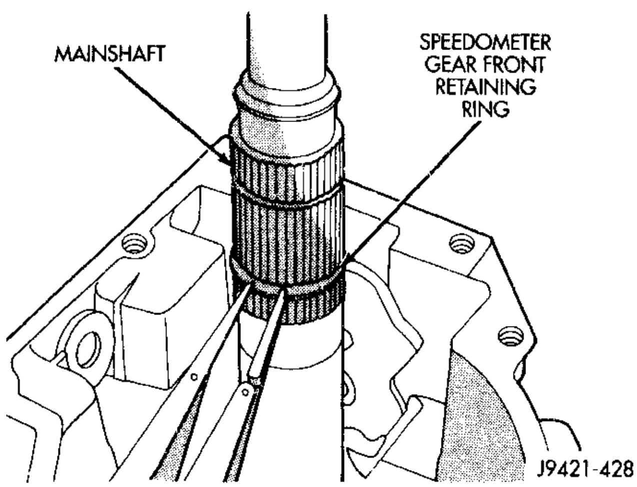

Fig. 63 Speedometer Front Ring installation

(22) Install output bearing on mainshaft (Fig. 66). **Be sure groove in outer race of bearing is toward rear of shaft. If bearing is reversed, retaining ring (in extension) will not align bearing.**

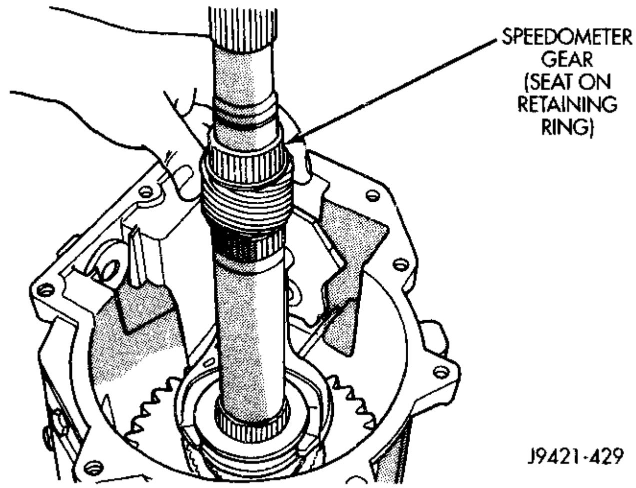

Fig. 64 Speedometer Gear installation

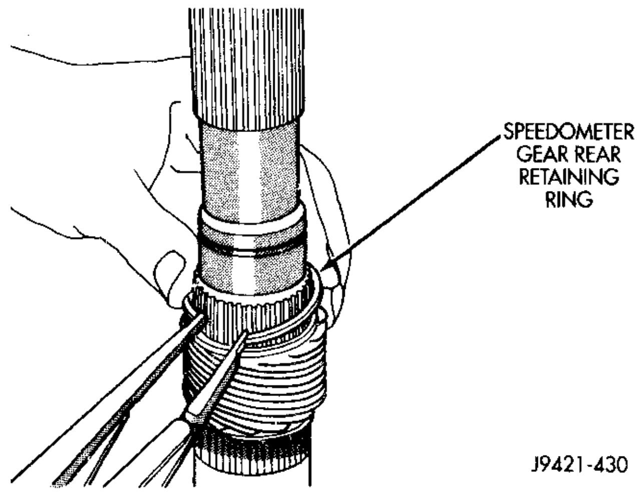

Fig. 65 Speedometer Front Ring installation

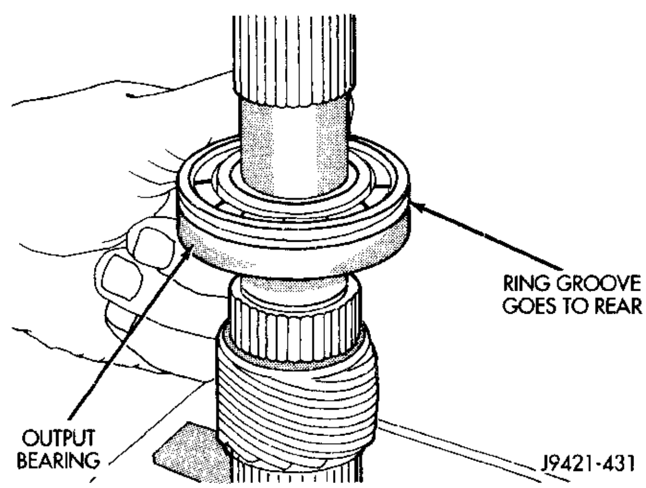

Fig. 66 Output Bearing Installation

DISASSEMBLY AND ASSEMBLY (Continued)

(23) Install output bearing retaining ring (Fig. 67). Use parallel jaw pliers to install ring.

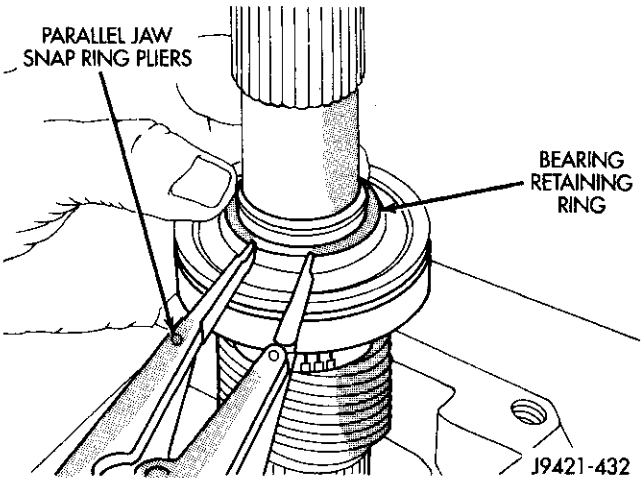

Fig. 67 Output Bearing Retaining Ring Installation

(24) Install new seal in rear extension if necessary. Use suitable size installer tool and be sure seal is fully seated.

(25) Apply bead of Mopar Gasket Maker, Loctite 518, or Mopar silicone adhesive sealer to mating surface of front case and rear extension. Sealer beads should be no more than 1/8 to 3/16 in. wide.

(26) Align and install rear extension on front case (Fig. 68).

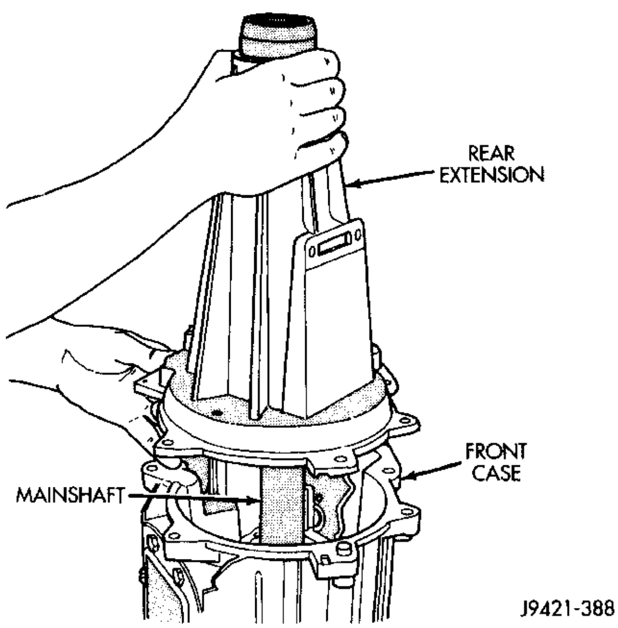

Fig. 68 Installing Rear Extension On Front Case

(27) Install one or two extension–to–front case bolts to hold assembly together. Be sure dowels are aligned in extension before hand tightening bolts.

(28) Remove adapter assembly from wood blocks and place assembly in horizontal position on workbench.

(29) Seat output bearing retaining ring as follows:

(a) Reach in access cover opening in rear extension with snap ring pliers (Fig. 69).

(b) Spread retaining ring with snap ring pliers and seat it in groove of output bearing. **If retaining ring is not aligned with bearing groove, tilt front case upward so mainshaft will move rearward for alignment.**

(c) Verify that retaining ring is fully seated in ring groove before proceeding (Fig. 70).

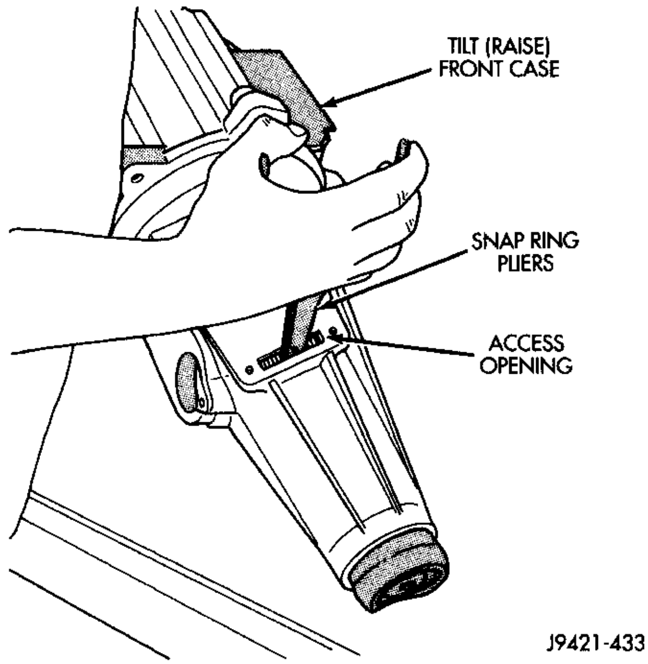

Fig. 69 Seating Output Bearing Retaining Ring

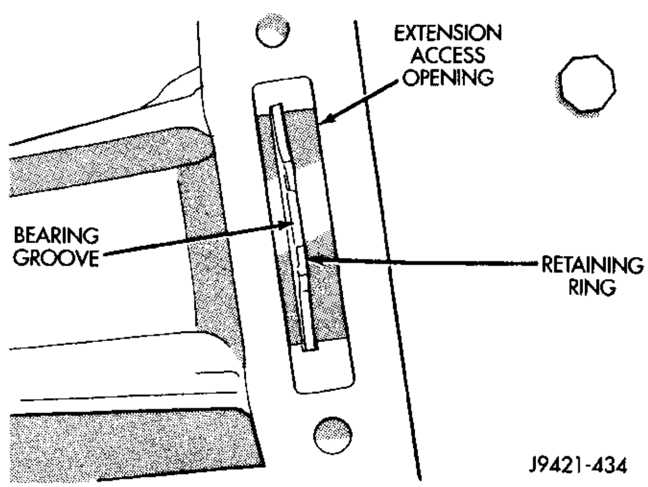

Fig. 70 Correct Seating Of Retaining Ring

AUTHENTIC RESTORATION PRODUCT

DISASSEMBLY AND ASSEMBLY (Continued)

(30) Install access cover and gasket in rear extension (Fig. 71). Then install and tighten torx screws to 8–11 N·m (75–95 in. lbs.) (Fig. 72).

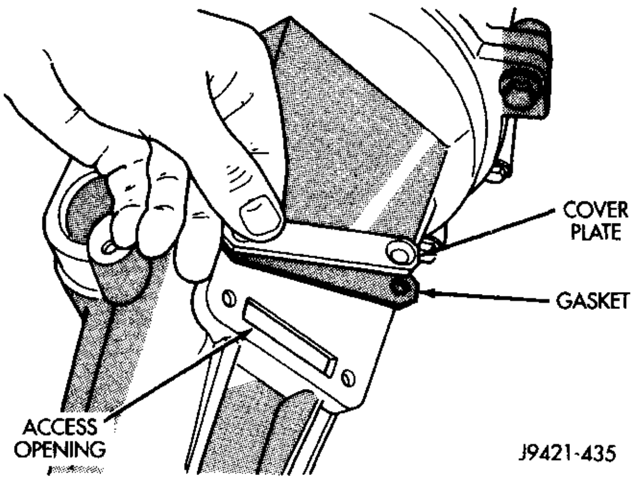

Fig. 71 Access Cover And Gasket Installation

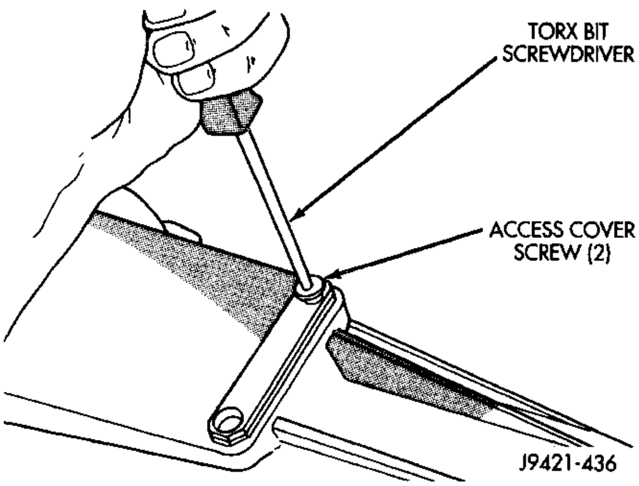

Fig. 72 Installing Access Cover Screws

(31) Install new seal in input bearing retainer with Handle C- 4171 and Installer 7828, C–4974, or similar size installer tool (Fig. 73).

(32) Install input bearing retainer as follows:

(a) Note position of oil channel in retainer and oil feed hole in front case (Fig. 74). Be sure retainer is installed so channel is aligned with feed hole.

(b) Apply bead of Mopar Gasket Maker, Loctite 518, or Mopar silicone adhesive sealer to seal surface of retainer. Sealer bead should be no more than 1/8 to 3/16 in. wide.

(c) Apply transmission fluid to input gear hub.

(d) Align retainer channel with feed hole in case and install retainer (Fig. 75).

(e) Apply sealer to retainer bolts. Then install and tighten bolts to 16–24 N·m (12–18 ft. lbs.) torque.

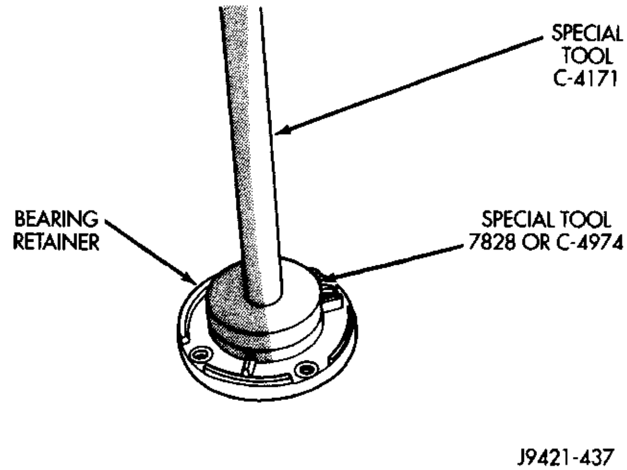

Fig. 73 Installing Input Bearing Retainer Seal

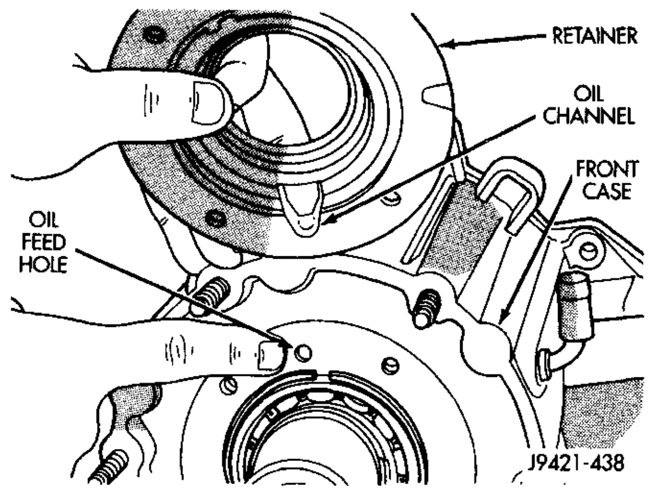

Fig. 74 Retainer Oil Channel And Case Oil Feed Hole Locations

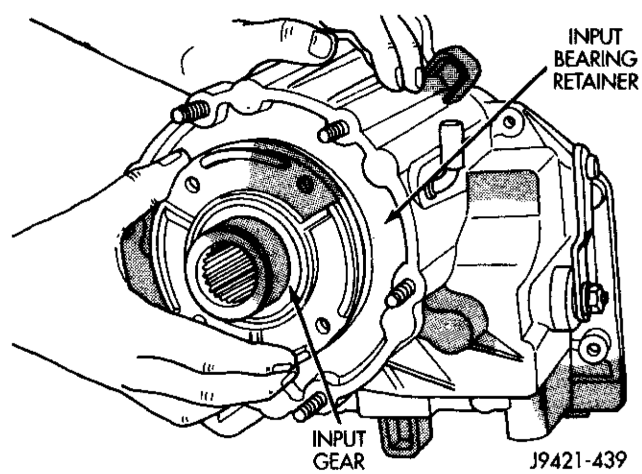

Fig. 75 Input Bearing Retainer Installation

DISASSEMBLY AND ASSEMBLY (Continued)

CAUTION: If a silicone sealer is used, do not use any more sealer than recommended. Excessive amounts of sealer will be displaced into the area between the retainer and case. This could result in partial or full blockage of the bearing oil feed hole in the front case.

(33) Install poppet plunger and spring in front case detent bore (Fig. 76).

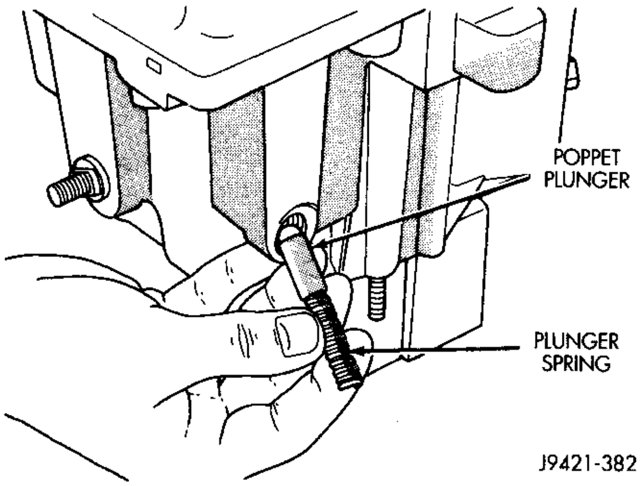

Fig. 76 Poppet Plunger And Spring Installation

(34) Install new O–ring on poppet plunger screw. Then install screw in front case (Fig. 77). Tighten screw to 16–24 N·m (12– 18 ft. lbs.) torque.

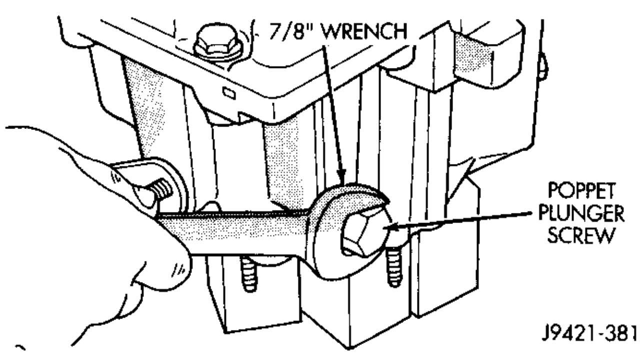

Fig. 77 Poppet Plunger Screw Installation

(35) Install indicator switch in front case. Tighten switch to 20–34 N·m (15–25 ft. lbs.) torque.

(36) Install and tighten drain plug to 41–54 N·m (30–40 ft. lbs.) torque.

(37) Fill adapter with 2.1 liters (4.6 pints) liters of Mopar Dexron II, or ATF Plus transmission fluid and install fill plug. Tighten fill plug to 41–54 N·m (30–40 ft. lbs.) torque.

(38) Apply Mopar silicone adhesive/sealer to PTO cover mating surface and to threads of cover bolts. Then install cover and tighten bolts to 27–34 N·m (20–25 ft. lbs.) torque.

CLEANING AND INSPECTION

ADAPTER

Clean the adapter components with solvent. Dry all the parts (except bearings) with compressed air. Allow bearings to air dry, or wipe them dry with clean shop towels.

Inspect the front case and rear extension (Fig. 78), for cracks, damaged threads, or scored mating surfaces. Minor scratches and nicks can be smoothed off with emery cloth. Damaged threads can be repaired with Heli–Coil, stainless steel thread inserts.

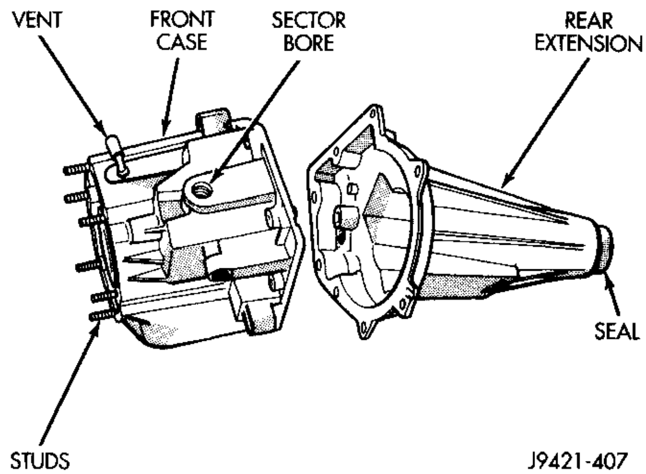

Fig. 78 Front Case And Extension

Be sure the front case sector bore, vent tube, and mounting studs are in good condition. Replace the extension oil seal if it is cut, or torn. Also check the retaining ring in the extension interior (Fig. 79). This ring secures the mainshaft output bearing to the extension.

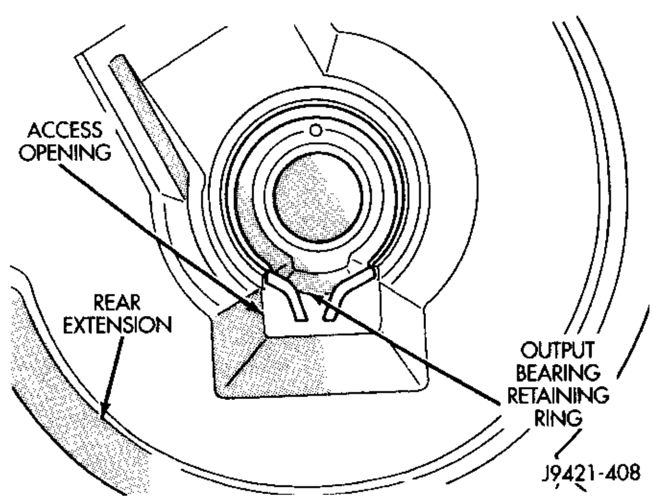

Fig. 79 Bearing Retaining Ring Location In Extension

AUTHENTIC RESTORATION PRODUCT

CLEANING AND INSPECTION (Continued)

The extension has a bushing at the rear. If the bushing is worn, remove the seal. Then remove the bushing by cutting and collapsing it with a cape chisel. A new bushing can be installed with any suitable size installer tool similar to 5065 or 5062.

Slide the PTO gear onto the input gear and check fit (Fig. 80). Replace either gear if any gear teeth, or splines are damaged. Also check the bearing/seal surface of the input gear. Small scratches on this surface can be smoothed with 320/400 grit emery cloth if necessary.

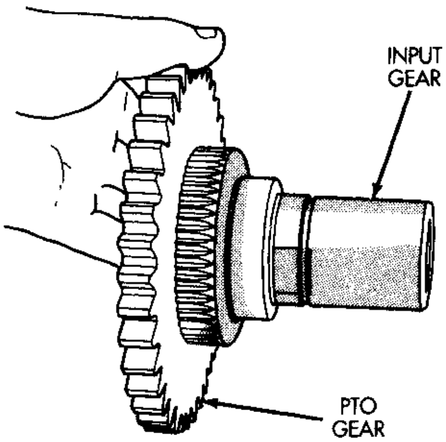

Fig. 80 Input And PTO Gears

The various snap rings used in the adapter should be replaced during overhaul. This is recommended as some of the snap rings can be distorted during removal. A distorted snap ring will not seat properly.

Inspect the bearings carefully. Rotate them by hand and check for noise or roughness. Replace any bearing exhibiting roughness, noise, or visible surface damage of the rollers or bearing balls.

Check the splines and gear teeth on the PTO gear, mainshaft, and shift sleeve. Replace any component exhibiting damage.

Install new O–rings on the poppet screw and in the sector shaft bore. Do not reuse the original O–rings.

Check condition of the plastic inserts on the shift fork. Be sure the inserts are not worn through, or otherwise damaged. Replace the fork if worn, or damaged in any way.

ADJUSTMENTS

SHIFT LINKAGE

(1) Place adapter floor shift lever in D position.
(2) Raise vehicle.
(3) Loosen locknut on shift rod.
(4) Verify that adapter shift lever is in D position.
(5) Tighten shift rod locknut and lower vehicle.

TIRES AND WHEELS

CONTENTS

TIRES

INDEX

DESCRIPTION AND OPERATION

TIRES

Tires are designed and engineered for each specific vehicle. They provide the best overall performance for normal operation. The ride and handling characteristics match the vehicle's requirements. With proper care they will give excellent reliability, traction, skid resistance, and tread life.

Driving habits have more effect on tire life than any other factor. Careful drivers will obtain in most cases, much greater mileage than severe use or careless drivers. A few of the driving habits which will shorten the life of any tire are:

- Rapid acceleration
- Severe brake applications
- High speed driving
- Excessive speeds on turns
- Striking curbs and other obstacles

Radial-ply tires are more prone to irregular tread wear. It is important to follow the tire rotation interval shown in the section on Tire Rotation. This will help to achieve a greater tread life.

TIRE IDENTIFICATION

Tire type, size, aspect ratio and speed rating are encoded in the letters and numbers imprinted on the side wall of the tire. Refer to the chart to decipher the tire identification code (Fig. 1).

Performance tires have a speed rating letter after the aspect ratio number. The speed rating is not always printed on the tire sidewall. These ratings are:

- **Q** up to 100 mph
- **S** up to 112 mph
- **T** up to 118 mph
- **U** up to 124 mph
- **H** up to 130 mph
- **V** up to 149 mph
- **Z** more than 149 mph (consult the tire manufacturer for the specific speed rating)

An All Season type tire will have either **M + S, M & S or M–S** (indicating mud and snow traction) imprinted on the side wall.

TIRE CHAINS

Tire snow chains may be used on **certain** models. Refer to the Owner's Manual for more information.

DESCRIPTION AND OPERATION (Continued)

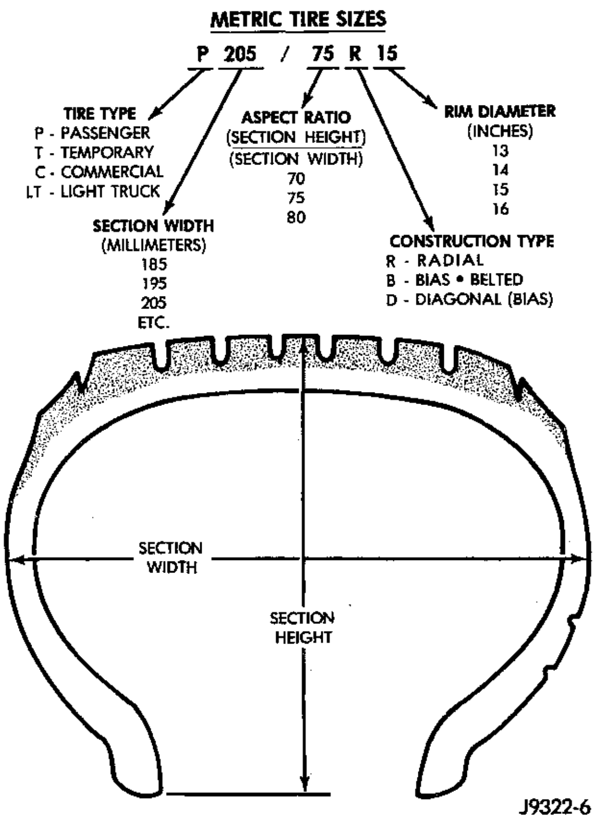

Fig. 1 Tire Identification

RADIAL-PLY TIRES

Radial-ply tires improve handling, tread life and ride quality, and decrease rolling resistance.

Radial-ply tires must always be used in sets of four. Under no circumstances should they be used on the front only. They may be mixed with temporary spare tires when necessary. A maximum speed of 50 MPH is recommended while a temporary spare is in use.

Radial-ply tires have the same load-carrying capacity as other types of tires of the same size. They also use the same recommended inflation pressures.

The use of oversized tires, either in the front or rear of the vehicle, can cause vehicle drive train failure. This could also cause inaccurate wheel speed signals when the vehicle is equipped with Anti-Lock Brakes.

The use of tires from different manufactures on the same vehicle is NOT recommended. The proper tire pressure should be maintained on all four tires. For proper tire pressure refer to the Tire Inflation Pressure Chart provided with the vehicle.

SPARE TIRE–TEMPORARY

The temporary spare tire is designed for emergency use only. The original tire should be repaired or replaced at the first opportunity and reinstall. Do not exceed speeds of 50 MPH. Refer to Owner's Manual for complete details.

TIRE INFLATION PRESSURES

CAUTION: Models 2500 and 3500 now use a high pressure snap-in tire valve. Do not substitute with other tire valves. The Tire and Rim industry designations are TR413 for low pressure and 600HP for high pressure.

Under inflation (Fig. 2) causes rapid shoulder wear and tire flexing.

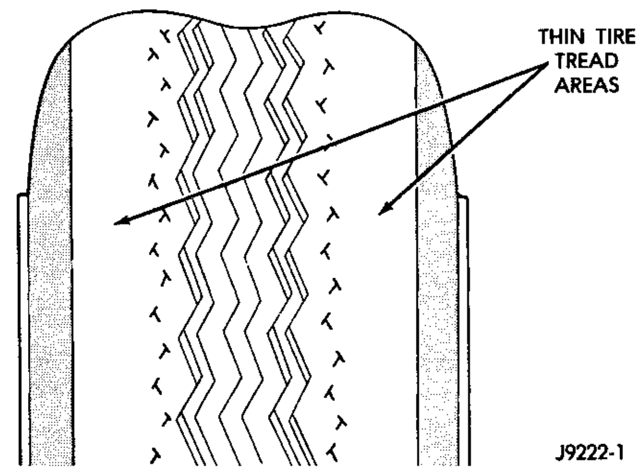

Fig. 2 Under Inflation Wear

Over inflation (Fig. 3) causes rapid center wear and loss of the tire's ability to cushion shocks.

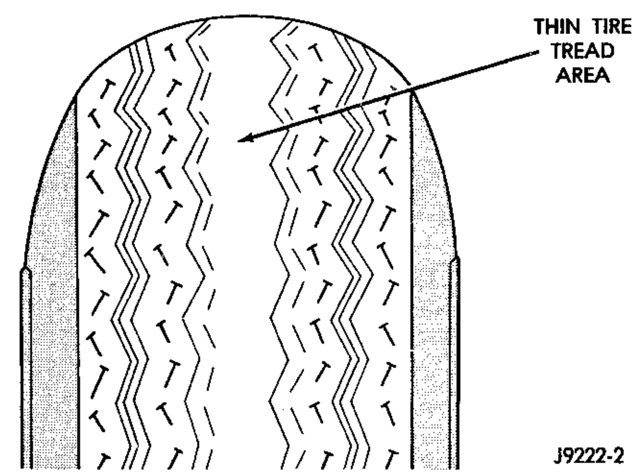

Fig. 3 Over Inflation Wear

Improper inflation can cause;

- Uneven wear patterns
- Reduced tread life
- Reduced fuel economy
- Unsatisfactory ride
- Cause the vehicle to drift

AUTHENTIC RESTORATION PRODUCT

DESCRIPTION AND OPERATION (Continued)

Refer to the Tire Inflation Pressure brochure for information regarding proper tire inflation. This information is provided with the Owner's Manual.

This pressure has been carefully selected to provide for safe vehicle operation. Tire pressure should be checked **cold** once a month. Tire pressure decreases when the outside temperature drops.

Inflation pressures specified on the placards are always **cold inflation pressure**. Cold inflation pressure is obtained after the vehicle has not been operated for at least 3 hours. Tire inflation pressures may increase from 2 to 6 pounds per square inch (psi) during operation. **Do not** reduce this normal pressure build-up.

Vehicles loaded to the maximum capacity should not be driven at continuous speeds above 75 mph (120 km/h).

WARNING: OVER OR UNDER INFLATED TIRES CAN AFFECT VEHICLE HANDLING AND MAY RESULT IN LOSS OF VEHICLE CONTROL.

TIRE PRESSURE FOR HIGH SPEED OPERATION

Chrysler Corporation advocates driving at safe speeds within posted speed limits. Where speed limits allow the vehicle to be driven at high speeds, correct tire inflation pressure is very important. For speeds up to and including 120 km/h (75 mph), tires must be inflated to the pressures shown on the tire placard. For continuous speeds in excess of 120 km/h (75 mph), tires must be inflated to the maximum pressure specified on the tire sidewall.

Vehicles loaded to the maximum capacity should not be driven at continuous speeds above 75 mph (120 km/h).

For emergency vehicles that are driven at speeds over 90 mph (144 km/h), special high speed tires must be used. Consult tire manufacturer for correct inflation pressure recommendations.

REPLACEMENT TIRES

The original equipment tires provide a proper balance of many characteristics such as:

- Ride
- Noise
- Handling
- Durability
- Tread life
- Traction
- Rolling resistance
- Speed capability

It is recommend that tires equivalent to the original equipment tires be used when replacement is needed.

Failure to use equivalent replacement tires may adversely affect the safety and handling of the vehicle.

The use of oversize tires not listed in the specification charts may cause interference with vehicle components. Under extremes of suspension and steering travel, interference with vehicle components may cause tire damage.

WARNING: FAILURE TO EQUIP THE VEHICLE WITH TIRES HAVING ADEQUATE SPEED CAPABILITY CAN RESULT IN SUDDEN TIRE FAILURE.

DIAGNOSIS AND TESTING

PRESSURE GAUGES

A quality air pressure gauge is recommended to check tire pressure. After checking the air pressure, replace valve cap finger tight.

TREAD WEAR INDICATORS

Tread wear indicators are molded into the bottom of the tread grooves. When tread depth is 1.6 mm (1/16 in.), the tread wear indicators will appear as a 13 mm (1/2 in.) band (Fig. 4).

Tire replacement is necessary when indicators appear in two or more grooves or if localized balding occurs.

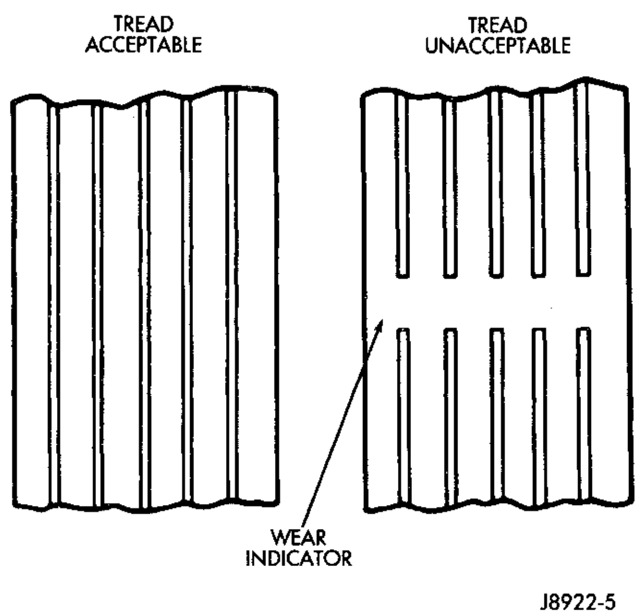

Fig. 4 Tread Wear Indicators

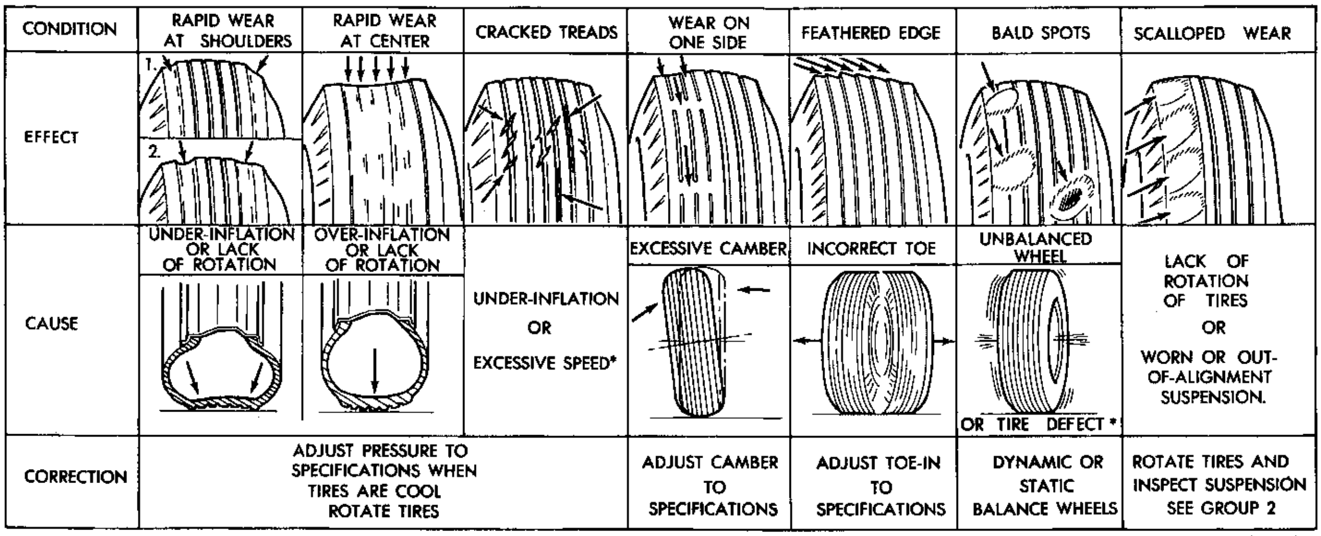
TIRE WEAR PATTERNS

Under inflation will cause wear on the shoulders of tire. Over inflation will cause wear at the center of tire.

DIAGNOSIS AND TESTING (Continued)



CONDITION	RAPID WEAR AT SHOULDERS	RAPID WEAR AT CENTER	CRACKED TREADS	WEAR ON ONE SIDE	FEATHERED EDGE	BALD SPOTS	SCALLOPED WEAR

*HAVE TIRE INSPECTED FOR FURTHER USE.

RN797

Fig. 5 Tire Wear Patterns

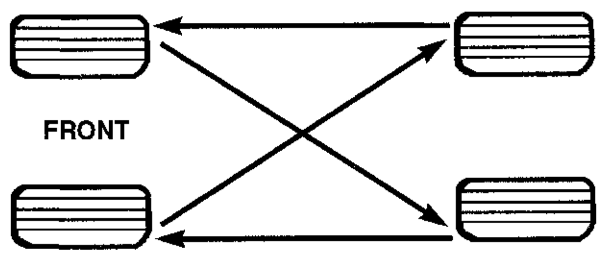
Excessive camber causes the tire to run at an angle to the road. One side of tread is then worn more than the other (Fig. 5).

Excessive toe-in or toe-out causes wear on the tread edges and a feathered effect across the tread (Fig. 5).

TIRE NOISE OR VIBRATION

Radial-ply tires are sensitive to force impulses caused by improper mounting, vibration, wheel defects, or possibly tire imbalance.

To find out if tires are causing the noise or vibration, drive the vehicle over a smooth road at varying speeds. Note the noise level during acceleration and deceleration. The engine, differential and exhaust noises will change as speed varies, while the tire noise will usually remain constant.



8031e864

Fig. 6 Tire Rotation Pattern

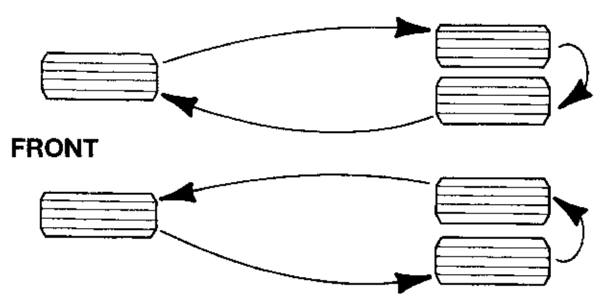
SERVICE PROCEDURES

ROTATION

Tires on the front and rear axles operate at different loads and perform different steering, driving, and braking functions. For these reasons, the tires wear at unequal rates. They may also develop irregular wear patterns. These effects can be reduced by rotating the tires according to the maintenance schedule in the Owners Manual. This will improve tread life, traction and maintain a smooth quiet ride.

The recommended method of tire rotation is (Fig. 6). Other methods can be used, but may not provide the same tire longevity benefits.

Dual wheel vehicles require a different tire rotation pattern. Refer to (Fig. 7) for the proper tire rotation with dual wheels.



803f5899

Fig. 7 Dual Wheel Tire Rotation Pattern

SERVICE PROCEDURES (Continued)

MATCH MOUNTING

Wheels and tires are match mounted at the factory. This means that the high spot of the tire is matched to the low spot on the wheel rim. Each are marked with a bright colored temporary label on the outboard surface for alignment. The wheel is also marked permanently on the inside of the rim in the tire well. This permanent mark may be a paint dot or line, a permanent label or a stamped impression such as an X. An optional location mark is a small spherical indentation on the vertical face of the outboard flange on some non styled base steel wheels. The tire must be removed to locate the permanent mark on the inside of the wheel.

Before dismounting a tire from its wheel, a reference mark should be placed on the tire at the valve stem location. This reference will ensure that it is remounted in the original position on the wheel.

(1) Remove the tire and wheel assembly from the vehicle and mount on a service dynamic balance machine.

(2) Measure the total runout on the center of the tire tread rib with a dial indicator. Record the indicator reading. Mark the tire to indicate the high spot. Place a mark on the tire at the valve stem location (Fig. 8).

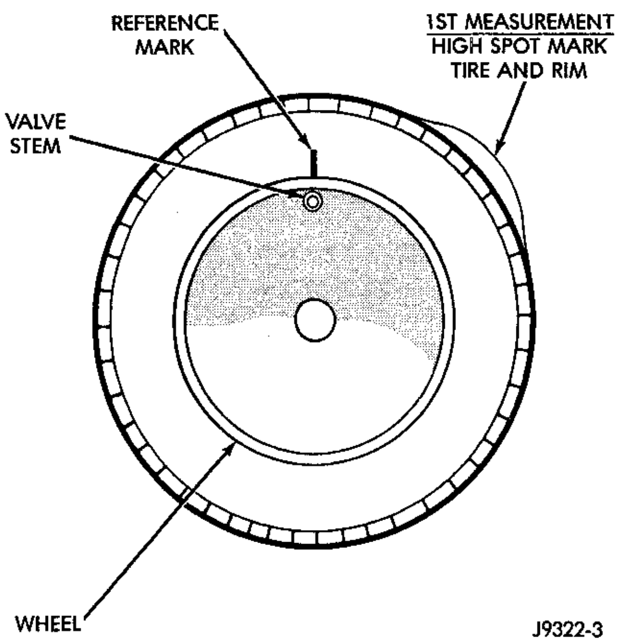


Fig. 8 First Measurement On Tire

(3) Break down the tire and remount it 180 degrees on the rim (Fig. 9).

(4) Measure the total indicator runout again. Mark the tire to indicate the high spot.

(5) If runout is still excessive, the following procedures must be done.

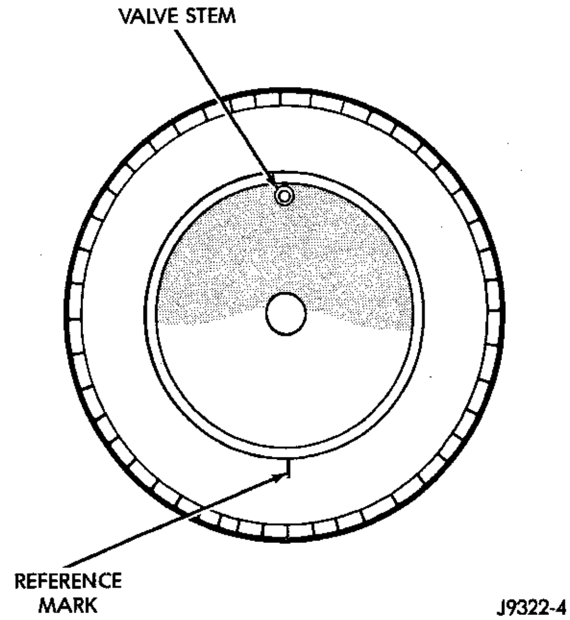

Fig. 9 Remount Tire 180 Degrees

- If the high spot is within 101.6 mm (4.0 in.) of the first spot and is still excessive, replace the tire.
- If the high spot is within 101.6 mm (4.0 in.) of the first spot on the wheel, the wheel may be out of specifications. Refer to Wheel and Tire Runout.
- If the high spot is NOT within 101.6 mm (4.0 in.) of either high spot, draw an arrow on the tread from second high spot to first. Break down the tire and remount it 90 degrees on rim in that direction (Fig. 10). This procedure will normally reduce the runout to an acceptable amount.

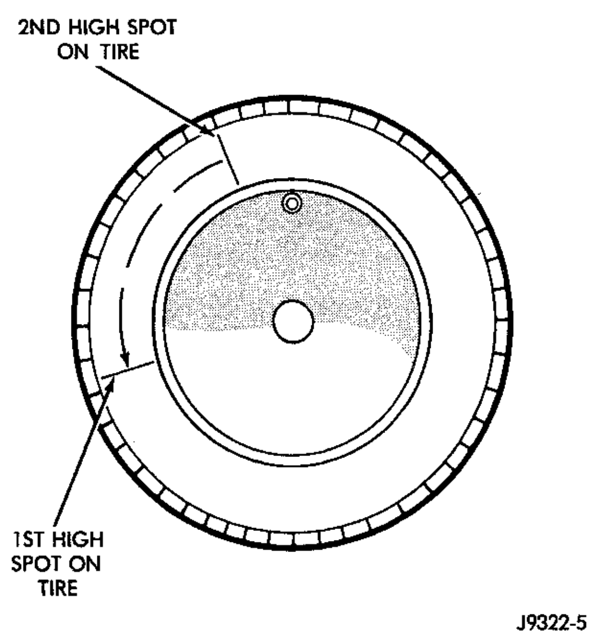

Fig. 10 Remount Tire 90 Degrees In Direction of Arrow

SERVICE PROCEDURES (Continued)

REPAIRING LEAKS

For proper repairing, a radial tire must be removed from the wheel. Repairs should only be made if the defect, or puncture, is in the tread area (Fig. 11). The tire should be replaced if the puncture is located in the sidewall.

Deflate tire completely before removing the tire from the wheel. Use lubrication such as a mild soap solution when dismounting or mounting tire. Use tools free of burrs or sharp edges which could damage the tire or wheel rim.

Before mounting tire on wheel, make sure all rust is removed from the rim bead and repaint if necessary.

Install wheel on vehicle, and tighten to proper torque specification.

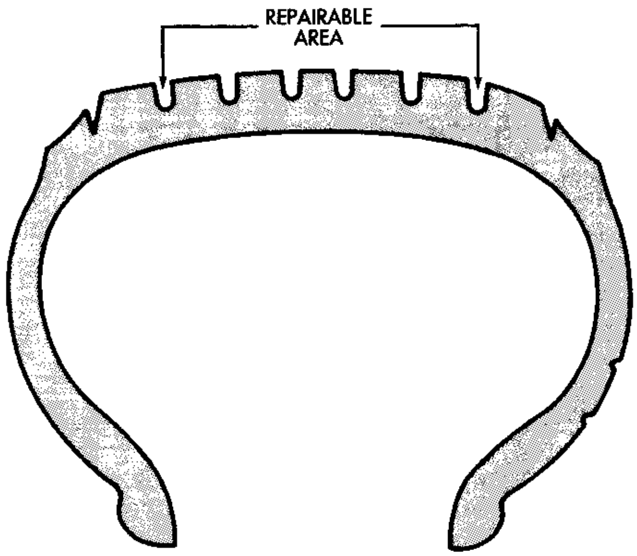

Fig. 11 Tire Repair Area

CLEANING AND INSPECTION

CLEANING TIRES

Remove protective coating on tires before delivery of vehicle. This coating may cause deterioration of tires.

To remove the protective coating applying warm water and let it soak for a few minutes. Then scrub the coating away with a soft bristle brush. Steam cleaning may also be used to remove the coating.

NOTE: DO NOT use gasoline, mineral oil, oil-based solvent or wire brush for cleaning.

WHEELS

INDEX

DESCRIPTION AND OPERATION

WHEELS INFORMATION

Original equipment wheels are designed for the specified Maximum Vehicle Capacity.

All models use steel or cast aluminum drop center wheels. The safety rim wheel (Fig. 1) has raised sections between the rim flanges and the rim well.

Initial inflation of the tire forces the bead over these raised sections. In case of tire failure, the raised sections hold the tire in position on the wheel until the vehicle can be brought to a safe stop.

Cast aluminum wheels require special balance weights and alignment equipment.

Ram Truck Models equipped with dual rear wheels have eight-stud hole rear wheels. The wheels have a flat mounting surface (Fig. 2). The slots in the wheel must be aligned to provide access to the valve stem (Fig. 3).

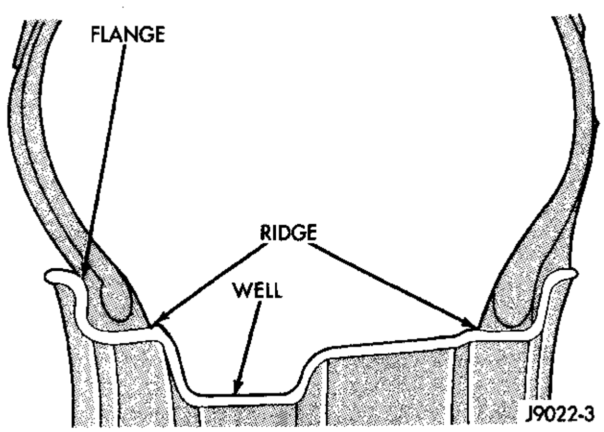

Fig. 1 Safety Rim

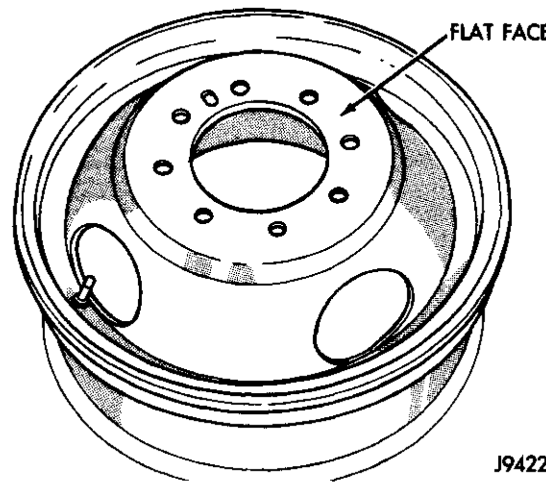

Fig. 2 Flat Face Wheel

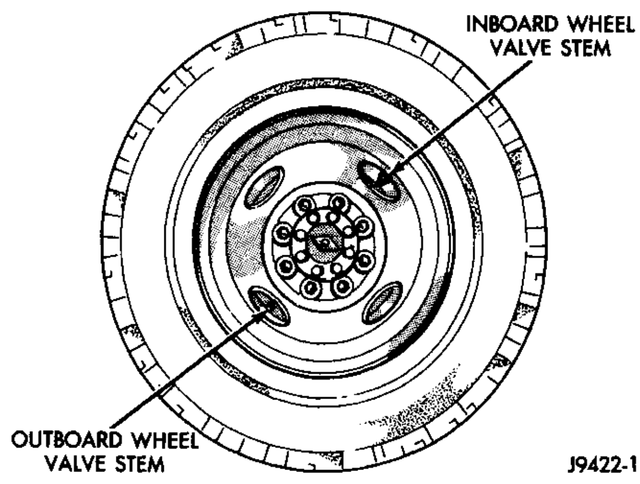

Fig. 3 Dual Rear Wheels

DIAGNOSIS AND TESTING

WHEEL INSPECTION

Inspect wheels for:

- Excessive run out
- Dents or cracks
- Damaged wheel lug nut holes
- Air Leaks from any area or surface of the rim

NOTE: Do not attempt to repair a wheel by hammering, heating or welding.

If a wheel is damaged an original equipment replacement wheel should be used. When obtaining replacement wheels, they should be equivalent in load carrying capacity. The diameter, width, offset, pilot hole and bolt circle of the wheel should be the same as the original wheel.

WARNING: FAILURE TO USE EQUIVALENT REPLACEMENT WHEELS MAY ADVERSELY AFFECT THE SAFETY AND HANDLING OF THE VEHICLE. USED WHEELS ARE NOT RECOMMENDED. THE SERVICE HISTORY OF THE WHEEL MAY HAVE INCLUDED SEVERE TREATMENT OR VERY HIGH MILEAGE. THE RIM COULD FAIL WITHOUT WARNING.

TIRE AND WHEEL RUNOUT

Radial runout is the difference between the high and low points on the tire or wheel (Fig. 4).

Lateral runout is the **wobble** of the tire or wheel.

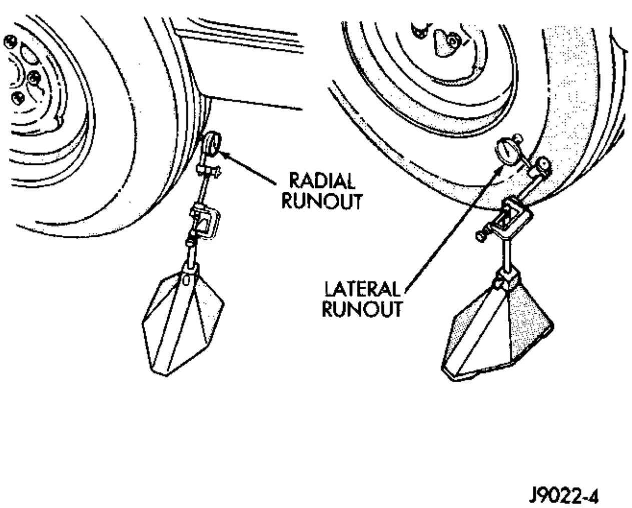

Fig. 4 Checking Tire/Wheel/Hub Runout

Radial runout of more than 1.5 mm (.060 inch) measured at the center line of the tread may cause the vehicle to shake.

Lateral runout of more than 2.0 mm (.080 inch) measured near the shoulder of the tire may cause the vehicle to shake.

Sometimes radial runout can be reduced. Relocate the wheel and tire assembly on the mounting studs (See Method 1). If this does not reduce runout to an acceptable level, the tire can be rotated on the wheel. (See Method 2).

METHOD 1 (RELOCATE WHEEL ON HUB)

(1) Drive vehicle a short distance to eliminate tire flat spotting from a parked position.

(2) Check wheel bearings and adjust if adjustable or replace if necessary.

(3) Check the wheel mounting surface.

(4) Relocate wheel on the mounting, two studs over from the original position.

(5) Tighten wheel nuts until all are properly torqued, to eliminate brake distortion.

(6) Check radial runout. If still excessive, mark tire sidewall, wheel, and stud at point of maximum runout and proceed to Method 2.

METHOD 2 (RELOCATE TIRE ON WHEEL)

NOTE: Rotating the tire on wheel is particularly effective when there is runout in both tire and wheel.

(1) Remove tire from wheel and mount wheel on service dynamic balance machine.

(2) Check wheel radial runout (Fig. 5) and lateral runout (Fig. 6).

- STEEL WHEELS: Radial runout 0.040 in., Lateral runout 0.045 in. (maximum)
- ALUMINUM WHEELS: Radial runout 0.030 in., Lateral runout 0.035 in. (maximum)

(3) If point of greatest wheel lateral runout is near original chalk mark, remount tire 180 degrees. Recheck runout, Refer to match mounting procedure.

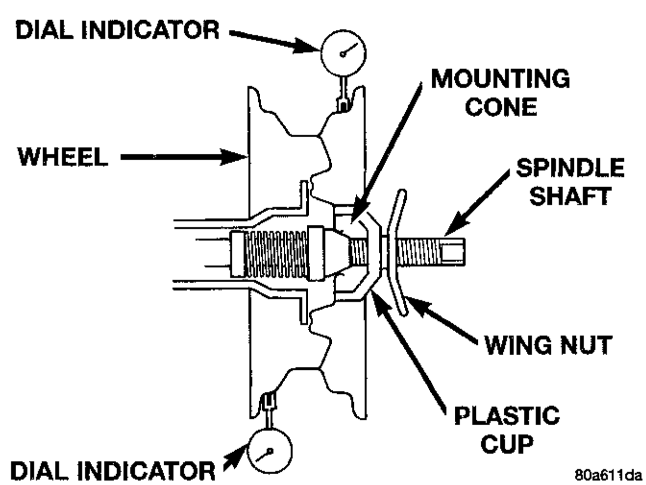

Fig. 5 Radial Runout

AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING (Continued)

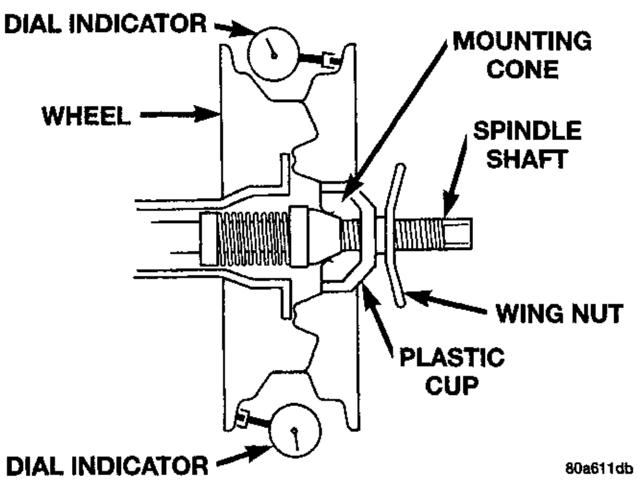

Fig. 6 Lateral Runout

SERVICE PROCEDURES

WHEEL INSTALLATION

CAUTION: Models equipped with chrome plated wheels are not supplied with chrome plated lug nuts. Under no circumstances are chrome plated lug nuts to be used, use only the factory specified lug nuts.

CAUTION: All 8800 GVW 4x4 vehicles have a factory install spacer behind the right front wheel.

The wheel studs and nuts are designed for specific applications. Do not use replacement parts of lesser quality or a substitute design.

The 3500 use a two piece flat face nut (Fig. 7).

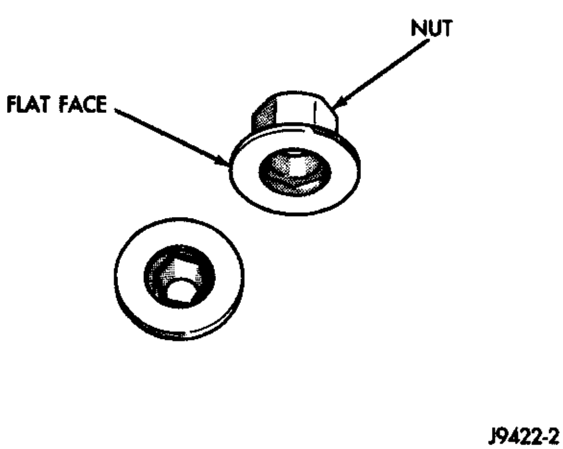

Fig. 7 Two Piece Lug Nut

All aluminum and some steel wheels have wheel stud nuts which feature an enlarged nose. This enlarged nose is necessary to ensure proper retention of the aluminum wheels.

Before installing the wheel, be sure to remove any build up of corrosion on the wheel mounting surfaces. Ensure wheels are installed with good metal-to-metal contact. Improper installation could cause loosening of wheel nuts. This could affect the safety and handling of your vehicle.

To install the 5 stud wheel, first position it properly on the mounting surface. All wheel nuts should then be tightened just snug. Gradually tighten them in sequence to specified torque (Fig. 8). **Never use oil or grease on studs.**

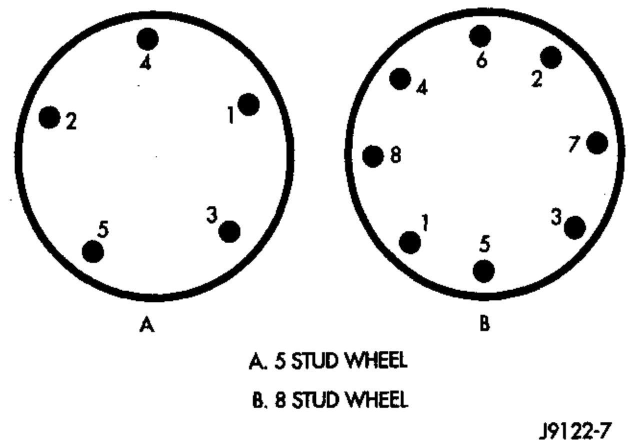

Fig. 8 Lug Nut Tightening Pattern

DUAL REAR WHEEL INSTALLATION

Dual rear wheels use a special heavy duty lug nut wrench. It is recommended to remove and install dual rear wheels only when the proper wrench is available. The wrench is also use to remove wheel center caps for more information refer to Owner's Manual.

The tires on both wheels must be completely raised off the ground when tightening the lug nuts. This will ensure correct wheel centering and maximum wheel clamping.

A two piece flat face lug nut with right-hand threads is used for retaining the wheels on the hubs (Fig. 7).

The dual rear wheel lug nuts should be tightened according to the following procedure:

- Place two drops of oil to the interface of the nut/washer (Fig. 9) before installing on the wheel stud.

NOTE: Do not use more then two drops of oil on the nut/washer, since the center caps attach in this area.

AUTHENTIC RESTORATION PRODUCT

SERVICE PROCEDURES (Continued)

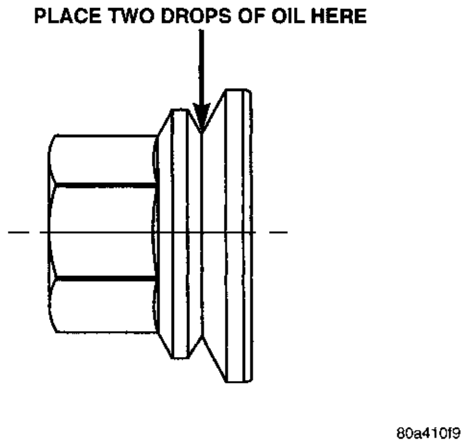

Fig. 9 Oil Location

• Tighten the wheel lug nuts in the numbered sequential pattern until they are snug tight. Then tighten lug nut to specified torque following same number sequence (Fig. 8).

• Tighten lug nuts in same numbered sequence a second time to the specified torque. This will ensure that the wheels are thoroughly mated.

• Check lug nut specified torque after 100 miles (160 kilometers). Also after 500 miles (800 kilometers) of vehicle operation.

NOTE: Wheel lug nuts should be tightened to specified torque at every maintenance interval thereafter.

TIRE AND WHEEL BALANCE

It is recommended that a two plane service dynamic balancer be used when a tire and wheel assembly require balancing. Refer to balancer operation instructions for proper cone mounting procedures. Typically use front cone mounting method for steel wheels. For aluminum wheel use back cone mounting method without cone spring.

NOTE: Static should be used only when a two plane balancer is not available.

NOTE: Cast aluminum and forged aluminum wheels require coated balance weights and special alignment equipment.

Wheel balancing can be accomplished with either on or off vehicle equipment. When using on-vehicle balancing equipment, remove the opposite wheel/tire. Off-vehicle balancing is recommended.

For static balancing, find location of heavy spot causing the imbalance. Counter balance wheel directly opposite the heavy spot. Determine weight required to counter balance the area of imbalance. Place half of this weight on the **inner** rim flange and the other half on the **outer** rim flange (Fig. 10).

For dynamic balancing, the balancing equipment is designed to locate the amount of weight to be applied to both the inner and outer rim flange (Fig. 11).

GENERAL SERVICE INFORMATION

GENERAL INFORMATION

SAFETY PRECAUTIONS AND WARNINGS

WARNING: EYE PROTECTION SHOULD BE USED WHEN SERVICING GLASS COMPONENTS. PERSONAL INJURY CAN RESULT.

USE A OSHA APPROVED BREATHING FILTER WHEN SPRAYING PAINT OR SOLVENTS IN A CONFINED AREA. PERSONAL INJURY CAN RESULT.

AVOID PROLONGED SKIN CONTACT WITH PETROLEUM OR ALCOHOL– BASED CLEANING SOLVENTS. PERSONAL INJURY CAN RESULT.

DO NOT STAND UNDER A HOISTED VEHICLE THAT IS NOT PROPERLY SUPPORTED ON SAFETY STANDS. PERSONAL INJURY CAN RESULT.

CAUTION: When holes must be drilled or punched in an inner body panel, verify depth of space to the outer body panel, electrical wiring, or other components. Damage to vehicle can result.

Do not weld exterior panels unless combustible material on the interior of vehicle is removed from the repair area. Fire or hazardous conditions, can result.

Always have a fire extinguisher ready for use when welding.

Disconnect the negative (-) cable clamp from the battery when servicing electrical components that are live when the ignition is OFF. Damage to electrical system can result.

Do not use abrasive chemicals or compounds on painted surfaces. Damage to finish can result.

Do not use harsh alkaline based cleaning solvents on painted or upholstered surfaces. Damage to finish or color can result.

Do not hammer or pound on plastic trim panel when servicing interior trim. Plastic panels can break.

Chrysler Corporation uses many different types of push-in fasteners to secure the interior and exterior trim to the body. Most of these fasteners can be reused to assemble the trim during various repair procedures. At times, a push-in fastener cannot be removed without damaging the fastener or the component it is holding. If it is not possible to remove a fastener without damaging a component or body, cut or break the fastener and use a new one when installing the component. Never pry or pound on a plastic or pressed-board trim component. Using a suitable fork-type prying device, pry the fastener from the retaining hole behind the component being removed. When installing, verify fastener alignment with the retaining hole by hand. Push directly on or over the fastener until it seats. Apply a low-force pull to the panel to verify that it is secure.

When it is necessary to remove components to service another, it should not be necessary to apply excessive force or bend a component to remove it. Before damaging a trim component, verify hidden fasteners or captured edges holding the component in place.

Mopar AUTHENTIC RESTORATION PRODUCT

BODY DIAGNOSTIC PROCEDURES

INDEX

DESCRIPTION AND OPERATION

WATER LEAKS

Water leaks can be caused by poor sealing, improper body component alignment, body seam porosity, missing plugs, or blocked drain holes. Centrifugal and gravitational force can cause water to drip from a location away from the actual leak point, making leak detection difficult. All body sealing points should be water tight in normal wet-driving conditions. Water flowing downward from the front of the vehicle should not enter the passenger or luggage compartment. Moving sealing surfaces will not always seal water tight under all conditions. At times, side glass or door seals will allow water to enter the passenger compartment during high pressure washing or hard driving rain (severe) conditions. Overcompensating on door or glass adjustments to stop a water leak that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After completing a repair, water-test vehicle to verify leak has stopped before returning vehicle to use.

VISUAL INSPECTION BEFORE WATER LEAK TESTS

Verify that floor and body plugs are in place, body drains are clear, and body components are properly aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

WATER LEAK TESTS

WARNING: DO NOT USE ELECTRIC SHOP LIGHTS OR TOOLS IN WATER TEST AREA. PERSONAL INJURY CAN RESULT.

When the conditions causing a water leak have been determined, simulate the conditions as closely as possible.

• If a leak occurs with the vehicle parked in a steady light rain, flood the leak area with an open-ended garden hose.

• If a leak occurs while driving at highway speeds in a steady rain, test the leak area with a reasonable velocity stream or fan spray of water. Direct the spray in a direction comparable to actual conditions.

• If a leak occurs when the vehicle is parked on an incline, hoist the end or side of the vehicle to simulate this condition. This method can be used when the leak occurs when the vehicle accelerates, stops or turns. If the leak occurs on acceleration, hoist the front of the vehicle. If the leak occurs when braking, hoist the back of the vehicle. If the leak occurs on left turns, hoist the left side of the vehicle. If the leak occurs on right turns, hoist the right side of the vehicle. For hoisting recommendations refer to Group 0, Lubrication and Maintenance, General Information section.

WATER LEAK DETECTION

To detect a water leak point-of-entry, do a water test and watch for water tracks or droplets forming on the inside of the vehicle. If necessary, remove interior trim covers or panels to gain visual access to the leak area. If the hose cannot be positioned without being held, have someone help do the water test.

Some water leaks must be tested for a considerable length of time to become apparent. When a leak appears, find the highest point of the water track or drop. The highest point usually will show the point of entry. After leak point has been found, repair the leak and water test to verify that the leak has stopped.

Locating the entry point of water that is leaking into a cavity between panels can be difficult. The trapped water may splash or run from the cavity, often at a distance from the entry point. Most water leaks of this type become apparent after accelerating, stopping, turning, or when on an incline.

MIRROR INSPECTION METHOD

When a leak point area is visually obstructed, use a suitable mirror to gain visual access. A mirror can also be used to deflect light to a limited-access area to assist in locating a leak point.

BRIGHT LIGHT LEAK TEST METHOD

Some water leaks in the luggage compartment can be detected without water testing. Position the vehicle in a brightly lit area. From inside the darkened

AUTHENTIC RESTORATION PRODUCT

DESCRIPTION AND OPERATION (Continued)

luggage compartment inspect around seals and body seams. If necessary, have a helper direct a drop light over the suspected leak areas around the luggage compartment. If light is visible through a normally sealed location, water could enter through the opening.

PRESSURIZED LEAK TEST METHOD

When a water leak into the passenger compartment cannot be detected by water testing, pressurize the passenger compartment and soap test exterior of the vehicle. To pressurize the passenger compartment, close all doors and windows, start engine, and set heater control to high blower in HEAT position. If engine can not be started, connect a charger to the battery to ensure adequate voltage to the blower. With interior pressurized, apply dish detergent solution to suspected leak area on the exterior of the vehicle. Apply detergent solution with spray device or soft bristle brush. If soap bubbles occur at a body seam, joint, seal or gasket, the leak entry point could be at that location.

WIND NOISE

Wind noise is the result of most air leaks. Air leaks can be caused by poor sealing, improper body component alignment, body seam porosity, or missing plugs in the engine compartment or door hinge pillar areas. All body sealing points should be airtight in normal driving conditions. Moving sealing surfaces will not always seal airtight under all conditions. At times, side glass or door seals will allow wind noise to be noticed in the passenger compartment during high crosswinds. Over compensating on door or glass adjustments to stop wind noise that occurs under severe conditions can cause premature seal wear and excessive closing or latching effort. After a repair procedure has been performed, test vehicle to verify noise has stopped before returning vehicle to use.

Wind noise can also be caused by improperly fitted exterior moldings or body ornamentation. Loose moldings can flutter, creating a buzzing or chattering noise. An open cavity or protruding edge can create a whistling or howling noise. Inspect the exterior of the vehicle to verify that these conditions do not exist.

VISUAL INSPECTION BEFORE TESTS

Verify that floor and body plugs are in place and body components are aligned and sealed. If component alignment or sealing is necessary, refer to the appropriate section of this group for proper procedures.

ROAD TESTING WIND NOISE

(1) Drive the vehicle to verify the general location of the wind noise.

(2) Apply 50 mm (2 in.) masking tape in 150 mm (6 in.) lengths along weatherstrips, weld seams or moldings. After each length is applied, drive the vehicle. If noise goes away after a piece of tape is applied, remove tape, locate, and repair defect.

POSSIBLE CAUSE OF WIND NOISE

- Moldings standing away from body surface can catch wind and whistle.
- Gaps in sealed areas behind overhanging body flanges can cause wind-rushing sounds.
- Misaligned movable components.
- Missing or improperly installed plugs in pillars.
- Weld burn through holes.

mopar AUTHENTIC RESTORATION PRODUCT

PAINT

INDEX

GENERAL INFORMATION

PAINT CODE

Exterior vehicle body colors are identified on the Body Code plate. The plate is located on the floor pan under the passenger seat or attached to the front face of the radiator closure panel. Refer to the Introduction section at the front of this manual for body code plate description. The paint code is also identified on the Vehicle Safety Certification Label which is located on the drivers door shut face. The color names provided in the Paint and Trim Code Description chart are the color names used on most repair product containers.

BASE COAT/CLEAR COAT FINISH

On most vehicles a two-part paint application (base coat/clear coat) is used. Color paint that is applied to primer is called base coat. The clear coat protects the base coat from ultraviolet light and provides a durable high-gloss finish.

WET SANDING, BUFFING, AND POLISHING

Minor acid etching, orange peel, or smudging in clear coat or single-stage finishes can be reduced with light wet sanding, hand buffing, and polishing. **If the finish has been wet sanded in the past, it cannot be repeated. Wet sanding operation should be performed by a trained automotive paint technician.**

CAUTION: Do not remove clear coat finish, if equipped. Base coat paint must retain clear coat for durability.

PAINTED SURFACE TOUCH-UP

When a painted metal surface has been scratched or chipped, it should be touched-up as soon as possible to avoid corrosion. For best results, use Mopar® Scratch Filler/Primer, Touch-Up Paints and Clear Top Coat. Refer to Introduction group of this manual for Body Code Plate information.

TOUCH-UP PROCEDURE

(1) Scrape loose paint and corrosion from inside scratch or chip.

(2) Clean affected area with Mopar® Tar/Road Oil Remover, and allow to dry.

(3) Fill the inside of the scratch or chip with a coat of filler/primer. Do not overlap primer onto good surface finish. The applicator brush should be wet enough to puddle-fill the defect without running. Do not stroke brush applicator on body surface. Allow the filler/primer to dry hard.

(4) Cover the filler/primer with color touch-up paint. Do not overlap touch-up color onto the original color coat around the scratch or chip. Butt the new color to the original color, if possible. Do not stroke applicator brush on body surface. Allow touch-up paint to dry hard.

(5) On vehicles without clear coat, the touch-up color can be lightly wet sanded (1500 grit) and polished with rubbing compound.

(6) On vehicles with clear coat, apply clear top coat to touch-up paint with the same technique as described in Step 4. Allow clear top coat to dry hard. If desired, Step 5 can be performed on clear top coat.

STATIONARY GLASS

INDEX

DESCRIPTION AND OPERATION

SAFETY PRECAUTIONS

WARNING: DO NOT OPERATE THE VEHICLE WITHIN 24 HOURS OF WINDSHIELD INSTALLATION. IT TAKES AT LEAST 24 HOURS FOR URETHANE ADHESIVE TO CURE. IF IT IS NOT CURED, THE WINDSHIELD MAY NOT PERFORM PROPERLY IN AN ACCIDENT.

URETHANE ADHESIVES ARE APPLIED AS A SYSTEM. USE GLASS CLEANER, GLASS PREP SOLVENT, GLASS PRIMER, PVC (VINYL) PRIMER AND PINCHWELD (FENCE) PRIMER PROVIDED BY THE ADHESIVE MANUFACTURER. IF NOT, STRUCTURAL INTEGRITY COULD BE COMPROMISED.

CHRYSLER DOES NOT RECOMMEND GLASS ADHESIVE BY BRAND. TECHNICIANS SHOULD REVIEW PRODUCT LABELS AND TECHNICAL DATA SHEETS, AND USE ONLY ADHESIVES THAT THEIR MANUFACTURES WARRANT WILL RESTORE A VEHICLE TO THE REQUIREMENTS OF FMVSS 212. TECHNICIANS SHOULD ALSO INSURE THAT PRIMERS AND CLEANERS ARE COMPATIBLE WITH THE PARTICULAR ADHESIVE USED.

BE SURE TO REFER TO THE URETHANE MANUFACTURER'S DIRECTIONS FOR CURING TIME SPECIFICATIONS, AND DO NOT USE ADHESIVE AFTER ITS EXPIRATION DATE.

VAPORS THAT ARE EMITTED FROM THE URETHANE ADHESIVE OR PRIMER COULD CAUSE PERSONAL INJURY. USE THEM IN A WELL-VENTILATED AREA.

SKIN CONTACT WITH URETHANE ADHESIVE SHOULD BE AVOIDED. PERSONAL INJURY MAY RESULT.

ALWAYS WEAR EYE AND HAND PROTECTION WHEN WORKING WITH GLASS.

CAUTION: Protect all painted and trimmed surfaces from coming in contact with urethane or primers.

Be careful not to damage painted surfaces when removing moldings or cutting urethane around windshield.

It is difficult to salvage a windshield during the removal operation. The windshield is part of the structural support for the roof. The urethane bonding used to secure the windshield to the fence is difficult to cut or clean from any surface. If the moldings are set in urethane, it would also be unlikely they could be salvaged. Before removing the windshield, check the availability of the windshield and moldings from the parts supplier.

REMOVAL AND INSTALLATION

WINDSHIELD

REMOVAL

(1) Remove inside rear view mirror (Fig. 1).

(2) Remove cowl cover. Refer to Cowl Cover Removal paragraph in this group.

(3) With doors open, remove windshield molding (Fig. 2). Pull outward on molding beginning at the bottom of A-pillars using pliers.

(4) Cut urethane bonding from around windshield using a suitable sharp cold knife (C-4849). A pneumatic cutting device can be used but is not recommended (Fig. 3).

(5) Separate windshield from vehicle.

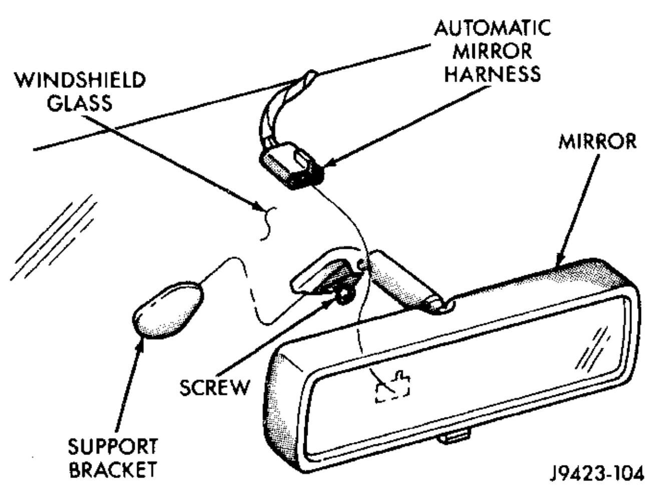

Fig. 1 Rear View Mirror

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

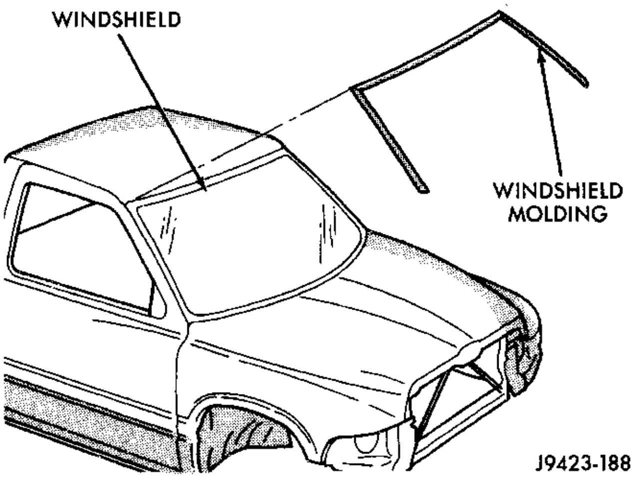

Fig. 2 Windshield Moldings

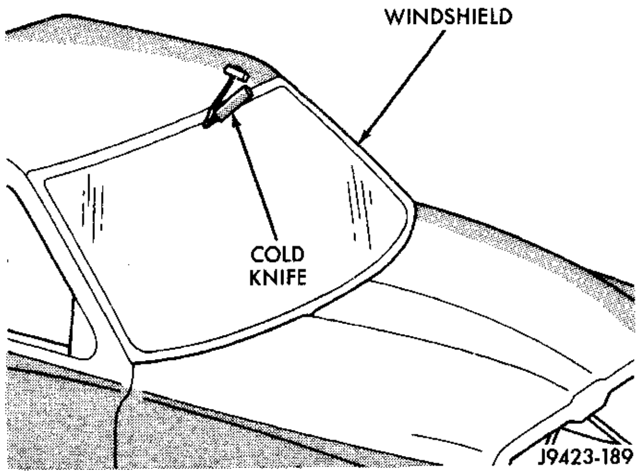

Fig. 3 Cut Urethane Around Windshield

INSTALLATION

WARNING: Allow the urethane at least 24 hours to cure before returning the vehicle to use.

CAUTION: Roll down the left and right front door glass and open the rear glass slider (if available) before installing windshield to avoid pressurizing the passenger compartment if a door is slammed before urethane is cured. Water leaks can result.

The windshield fence should be cleaned of most of its old urethane bonding material. A small amount of old urethane, approximately 1-2 mm in height, should remain on the fence. Do not grind off or completely remove all old urethane from the fence, the paint finish and bonding strength will be adversely affected. Support spacers should be cleaned and properly installed on weld studs or repair screws at bottom of windshield opening.

(1) Place replacement windshield into windshield opening and position glass in the center of the opening against the support spacers. Mark the glass at the support spacers with a grease pencil or pieces of masking tape and ink pen to use as a reference for installation. Remove replacement windshield from windshield opening (Fig. 4).

(2) Position the windshield inside up on a suitable work surface with two padded, wood 10 cm by 10 cm by 50 cm (4 in. by 4 in. by 20 in.) blocks, placed parallel 75 cm (2.5 ft.) apart (Fig. 5).

(3) Clean inside of windshield with MOPAR Glass Cleaner and lint-free cloth.

(4) Apply clear glass primer 25 mm (1 in.) wide around perimeter of windshield and wipe with a new clean and dry lint- free cloth.

(5) Apply the molding to the windshield:

- Press the upper corners of the molding onto the windshield.
- Press the header section onto the windshield.
- Press the A-Pillar sections onto the windshield.

(6) Apply black-out primer onto the glass using the windshield molding as a guide. The primer should be 15 mm (5/8 in.) wide on the top and sides of the glass and 25 mm (1 in.) on the bottom of windshield. Allow at least three minutes drying time.

(7) Position one 5 mm (3/16 in.) soft spacer (p/n 55028214) at the bottom of the windshield fence (Fig. 6).

(8) Apply a 13mm (1/2 in.) high and 10mm (3/8 in.) wide bead of urethane around the perimeter of windshield. At the bottom, apply the bead 7 mm (1/4 in.) inboard from the glass edge. On the three sides where the molding is on the glass, follow the edge of molding. The urethane bead should be shaped in a triangular cross-section, this can be achieved by notching the tip of the applicator (Fig. 7).

(9) With the aid of a helper, position the windshield over the windshield opening. Align the reference marks at the bottom of the windshield to the support spacers.

(10) Slowly lower windshield glass to the fence opening guiding the lower corners into proper position. Beginning at the bottom and continuing to the top, push glass onto fence along the A-Pillars. Push windshield inward to the fence at the bottom corners (Fig. 8).

(11) Clean excess urethane from exterior with MOPAR Super Clean or equivalent.

(12) Apply 150 mm (6 in.) lengths of 50 mm (2 in.) masking tape spaced 250 mm (10 in.) apart to hold molding in place until urethane cures.

(13) Install cowl cover and wipers.

(14) Install inside rear view mirror.

(15) After urethane has cured, remove tape strips and water test windshield to verify repair.

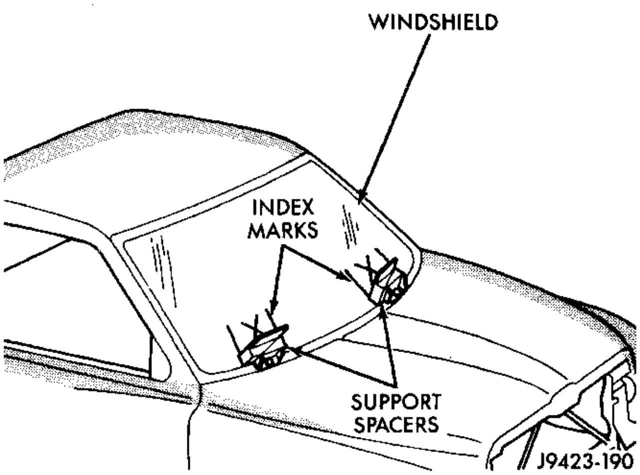

Fig. 4 Center Windshield and Mark at Support Spacers

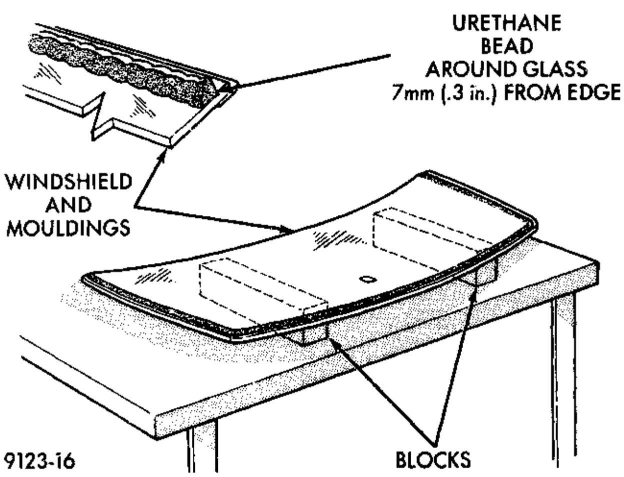

Fig. 5 Work Surface Set up and Molding Installation

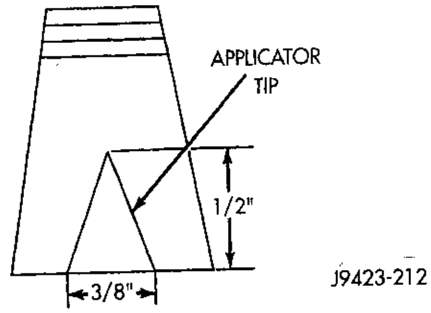

Fig. 7 Applicator Tip

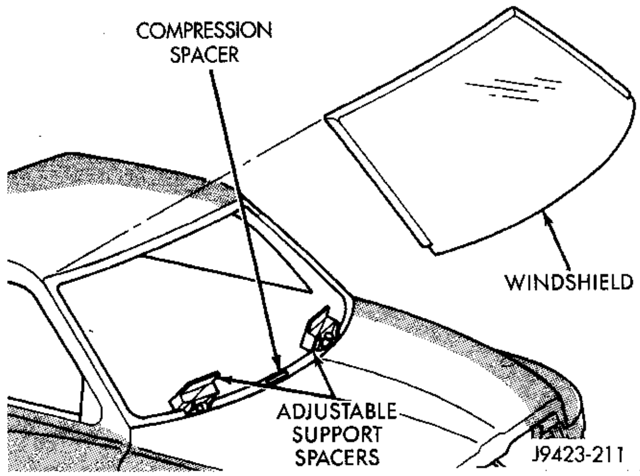

Fig. 8 Lower Windshield Into Position

BACKLITE

REMOVAL

It is difficult to salvage the backlite during the removal operation. The backlite is part of the structural support for the roof. The urethane bonding used to secure the glass to the fence is difficult to cut or clean from any surface. Since the molding is set in urethane, it is unlikely it would be salvaged. Before removing the backlite, check the availability from the parts supplier.

The backlite is attached to the window frame with urethane adhesive. The urethane adhesive is applied cold and seals the surface area between the window opening and the glass. The primer adheres the urethane adhesive to the backlite.

(1) Roll down door glass.
(2) If necessary, remove quarter trim panels.
(3) Remove headliner.
(4) Remove cab back panel trim.
(5) Bend rear window retaining tabs inward against glass.
(6) Using a suitable pneumatic knife from inside the vehicle, cut urethane holding rear glass frame to opening fence.
(7) Separate glass from vehicle.

REMOVAL AND INSTALLATION (Continued)

INSTALLATION

(1) Clean urethane adhesive from around rear glass opening fence.
(2) Apply black-out primer to outer edge of replacement rear glass frame.
(3) Apply black-out primer to rear glass opening fence.
(4) Apply a 13 mm (0.5 in.) bead of urethane around the perimeter of the window frame bonding surface (Fig. 9).
(5) Set glass on lower fence and move glass forward into opening (Fig. 10).
(6) Firmly push glass against rear window glass opening fence.
(7) Bend tabs around edges of rear window opening fence to retain glass.
(8) Clean excess urethane from exterior with MOPAR, Super Clean or equivalent.
(9) Allow urethane to cure at least 24 hours (full cure is 72 hours).
(10) Water test to verify repair before returning vehicle to service.
(11) Install interior trim.

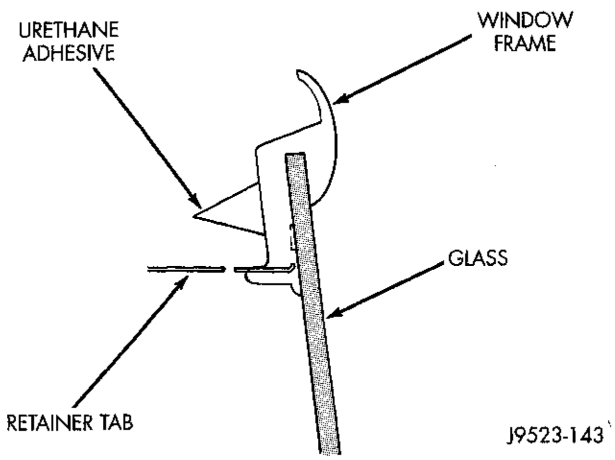

Fig. 9 Urethane Adhesive Application

SLIDING BACKLITE

If complete removal of the sliding backlite is required, refer to the backlite removal/installation procedures in this group.

SLIDING VENT GLASS

REMOVAL

(1) Slide the upper left and upper right run channels out of window frame (Fig. 11).
(2) Slide left and right glass panels upward, remove and separate latch and keeper (Fig. 12).

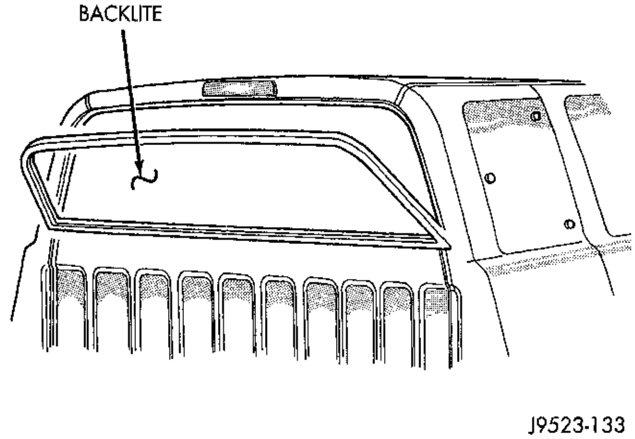

Fig. 10 Backlite Installation

(3) If necessary, remove lower glass channel and replace (Fig. 13).

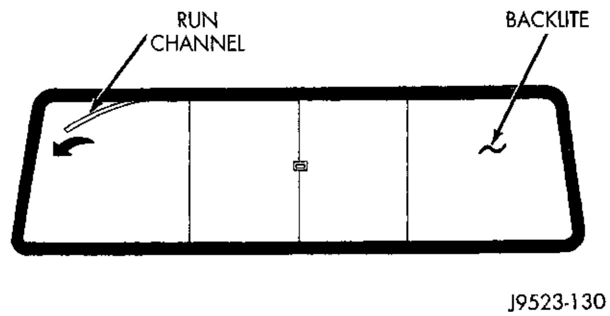

Fig. 11 Run Channel Removal

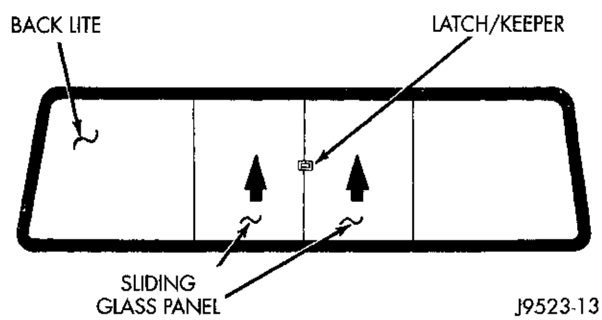

Fig. 12 Glass Panel Removal

INSTALLATION

(1) If necessary, install lower run channel.
(2) Position left and right glass panels at window opening and lower into the lower run channel. The glass panels must be in the closed position (Fig. 14).
(3) Slide the upper left and upper right run channels into the window frame.
(4) Verify window and latch/keeper operation.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

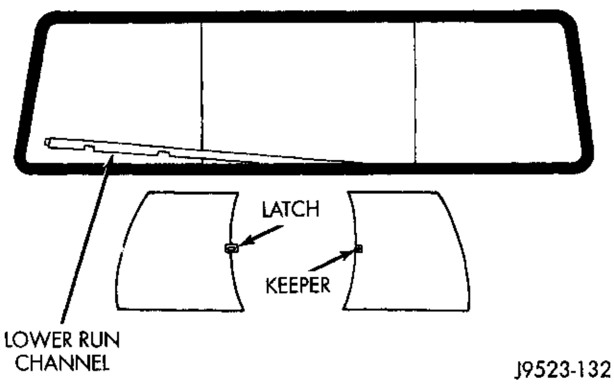

Fig. 13 Lower Run Channel Removal

SLIDING BACKLITE LATCH AND KEEPER

REMOVAL

(1) Disengage latch and keeper.
(2) Remove latch/keeper screws.
(3) Separate Latch/keeper from glass panel.

INSTALLATION

(1) Position Latch/keeper on glass panel.
(2) Install screws. Tighten the screws with 1.5 N·m (15 in. lbs.) torque.
(3) Engage latch and keeper to verify operation.

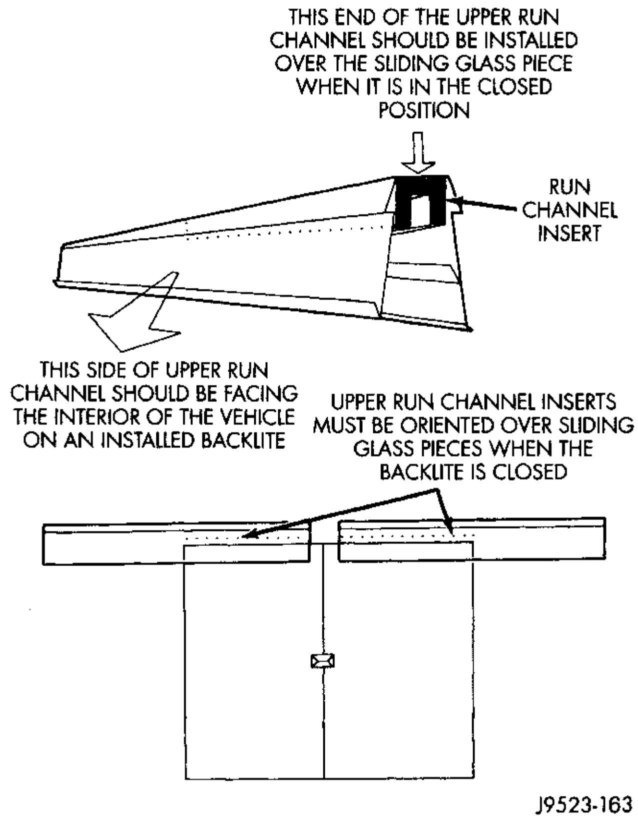

Fig. 14 Glass Panel Installation

Mopar AUTHENTIC RESTORATION PRODUCT

SEATS

INDEX

REMOVAL AND INSTALLATION

BENCH SEAT TRACK

REMOVAL

(1) Remove seat from vehicle.
(2) Remove inboard seat belt buckles.
(3) Remove bolts attaching seat track to seat cushion frame (Fig. 1).
(4) Separate seat track from seat cushion frame.

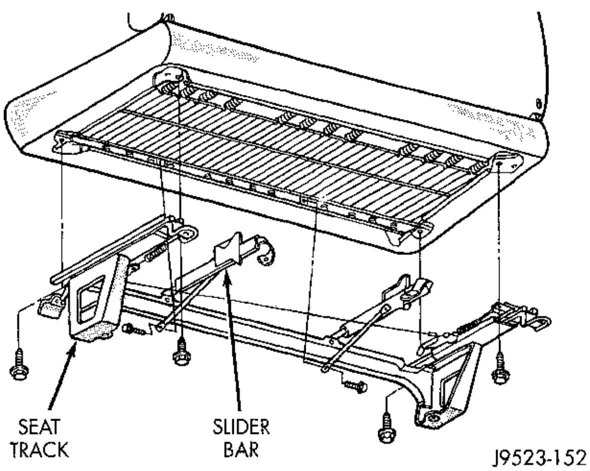

Fig. 1 Seat Track Removal

INSTALLATION

(1) Position seat track on seat cushion frame.
(2) Ensure seat track and slider bar are aligned.
(3) Install rear seat track bolts. Tighten seat track bolts to 25 N·m (18 ft.lbs.) torque.
(4) Install inboard seat belt buckles. Tighten bolts to 40 N·m (30 ft.lbs.) torque.
(5) Pull seat release and move track rearward.
(6) Install front seat track bolts. Tighten seat track bolts to 25 N·m (18 ft.lbs.) torque.
(7) Align slider bars and install bolts. Tighten slider bar bolts to 10.0 N·m (7 ft.lbs.) torque.
(8) Install seat.

BENCH SEAT BACK

REMOVAL

(1) Move seat to the full forward position.
(2) Release J-Strap and peel back side of cover (corner flap) (Fig. 3).
(3) Remove bolts attaching seat back to seat cushion and separate seat back from seat cushion (Fig. 2).

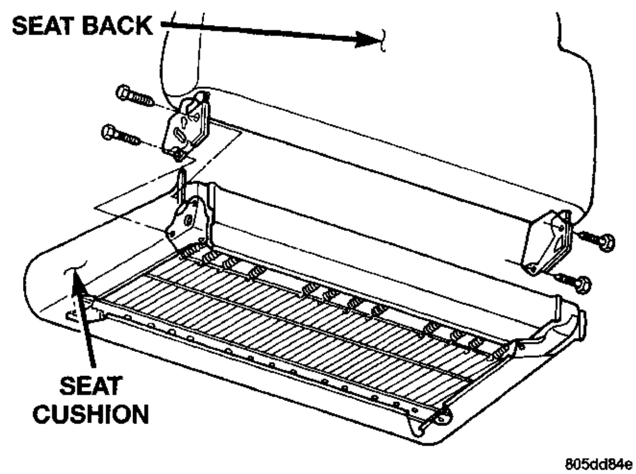

Fig. 2 Seat Back Removal/Installation

INSTALLATION

(1) Align seat cushion with seat back.
(2) Install bolts through seat back latch into seat cushion frame. Tighten bolts to 25 N·m (18 ft.lbs.) torque.
(3) Pull side of cover (corner flap) facing rear of the cushion over and secure J-Strap (Fig. 3).
(4) Plastic cover on side cover (corner flap) at rear of cushion must be over the pin on the inertia latches.

REMOVAL AND INSTALLATION (Continued)

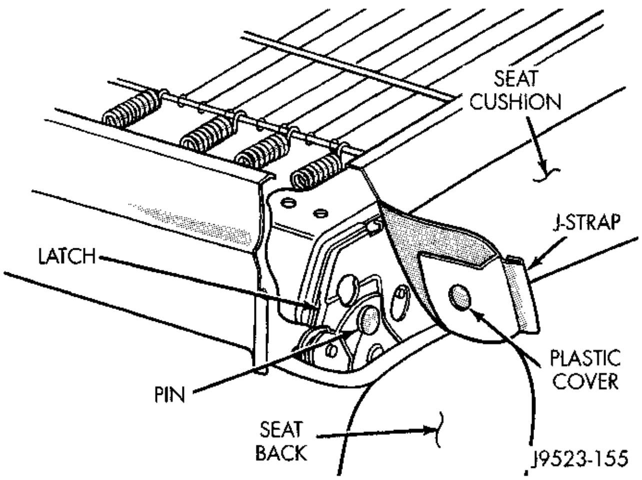

Fig. 3 J-Strap Corner Removal/Installation

BENCH SEAT BACK COVER

REMOVAL

(1) Remove seat back from vehicle.
(2) Disengage J-Straps from base of seat back.
(3) Remove hogrings, if equipped.
(4) With seat back in a normal vertical position, roll cover upwards and remove.

INSTALLATION

(1) With seat back in a normal vertical position, roll cover downwards over seat back.
(2) Install hogrings, if equipped.
(3) Secure J-Straps at base of seat back.
(4) Install seat back.

BENCH SEAT CUSHION COVER

REMOVAL

(1) Remove seat from vehicle.
(2) Remove seat back.
(3) Position seat cushion on a suitable work surface with frame side up.
(4) Remove seat track.
(5) Remove left and right side J-Straps.
(6) Remove rear J-Strap.
(7) Remove front J-Strap.
(8) Roll trim cover off of front and rear corners and separate from foam cushion.

INSTALLATION

(1) Position cushion cover on cushion and roll cover over front and rear corners.
(2) Secure front J-Strap (Fig. 4).
(3) Install seat back.
(4) Secure rear J-Strap.
(5) Secure left and right side J-Straps.
(6) Verify stitching lines are straight, correct as necessary.
(7) Install seat track.
(8) Install seat.

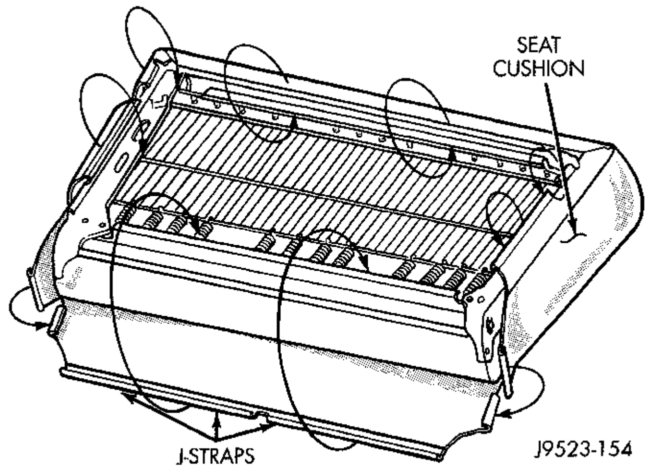

Fig. 4 J-Strap Installation

SPLIT BENCH SEAT TRACK-STD CAB

REMOVAL

(1) Disconnect power seat switch connector, if equipped.
(2) Remove seat from vehicle.
(3) Remove bolts attaching center seat to seat frame and remove center seat.
(4) Remove bolts attaching seat track to seat frame (Fig. 5) and (Fig. 6).

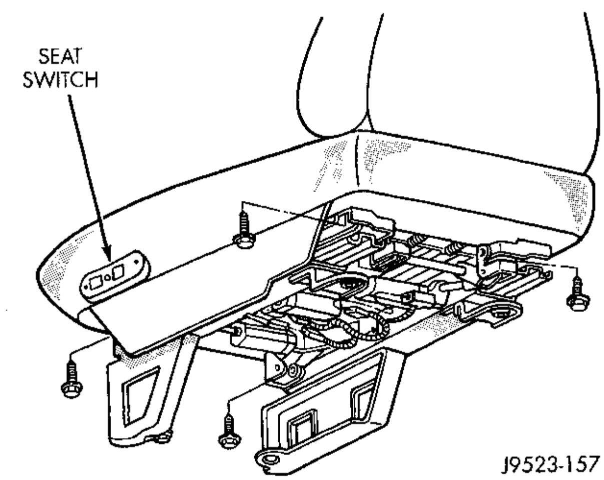

Fig. 5 Power Seat Track Removal/Installation

INSTALLATION

(1) Install bolts attaching seat track to seat frame. Tighten bolts to 25 N·m (18 ft. lbs.) torque.
(2) Install bolts attaching center seat to seat frame. Tighten bolts to 25 N·m (18 ft. lbs.) torque.
(3) Install seat.
(4) Connect power seat switch connector, if equipped.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

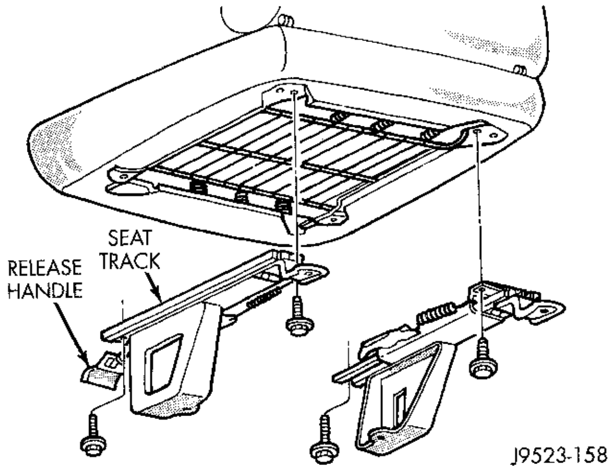

Fig. 6 Seat Track Removal/Installation

(5) Power adjuster on power seat must be cycled in all 6 functions to ensure the adjuster if working properly.

SPLIT BENCH SEAT BACK—STD CAB

REMOVAL

(1) Disconnect power seat switch connector, if equipped.

(2) Remove center seat/console armrest.

(3) Disconnect rear end flap J-Straps and peel back rear J-Strap.

(4) Remove bolts attaching seat back to seat cushion frame.

(5) Separate seat back from seat cushion (Fig. 7).

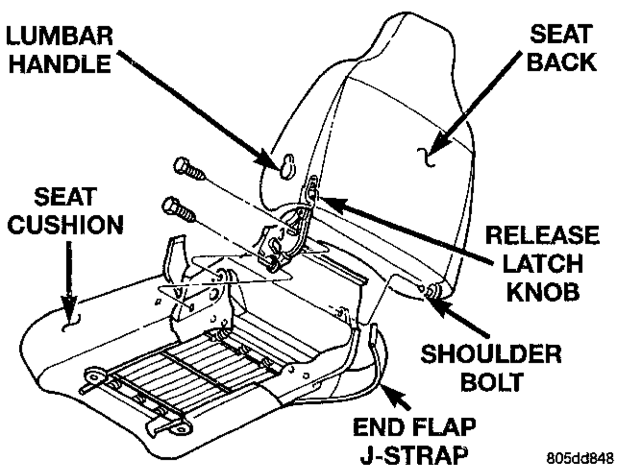

Fig. 7 Seat Back Removal

INSTALLATION

(1) Align seat cushion with seat back and install shoulder bolt through seat back into seat cushion frame on inboard side. Tighten bolt to 49 N·m (36 ft.lbs.) torque.

(2) Install bolts through seat back latch into seat cushion frame. Tighten bolts to 25 N·m (18 ft.lbs.) torque.

(3) Connect rear end flap J-Straps and pull rear J-Strap up and secure to frame.

(4) Install seat in vehicle.

(5) Connect power seat switch connector, if equipped.

SPLIT BENCH SEAT BACK COVER—STD CAB

REMOVAL

(1) Using a trim stick or equivalent tool, pry off lumbar handle, if equipped (Fig. 8). (Damage to lumbar handle may occur during removal, verify availability of replacement handle before removing.)

(2) Remove latch release knob (Fig. 8).

(3) Remove latch release bezel.

(4) Disengage J-Straps from base of seat back.

(5) Remove hogrings, if equipped.

(6) With seat back in a normal vertical position, roll cover upwards and remove.

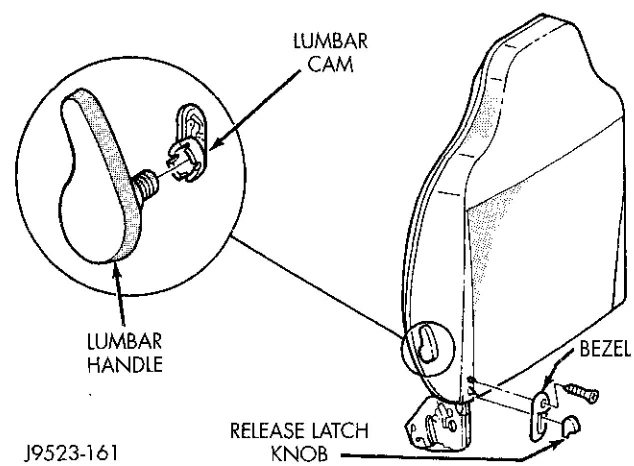

Fig. 8 Lumbar Handle Removal

INSTALLATION

(1) With seat back in a normal vertical position, roll cover downwards over seat back.

(2) Install hogrings, if equipped.

(3) Engage J-Straps at base of seat back.

(4) Align lumbar handle with lumbar cam and tap on with rubber mallet until seated.

(5) Install latch release bezel.

(6) Install latch release knob.

(7) Install seat back on seat cushion.

(8) Install seat.

REMOVAL AND INSTALLATION (Continued)

SPLIT BENCH SEAT CUSHION COVER—STD CAB

REMOVAL

(1) Remove seat from vehicle.
(2) Remove center seat/console armrest.
(3) Remove seat tracks.
(4) Remove left and right J-straps.
(5) Remove seat back.
(6) Position seat cushion on a suitable work surface with frame side up.
(7) Remove rear J-strap.
(8) Remove front J-strap.
(9) Roll cushion cover off of foam cushion.

INSTALLATION

(1) Position cushion cover on cushion and roll cover over front and rear corners. Verify stitching lines are straight, correct as necessary.
(2) Pull front J-strap up, align cover to foam notches and secure front J-strap to frame (Fig. 9).
(3) Install seat back.
(4) Pull the left J-strap up and secure to frame. Verify cover is straight.
(5) Pull the right side J-strap up and secure to frame.
(6) Install seat tracks.
(7) Install seat.

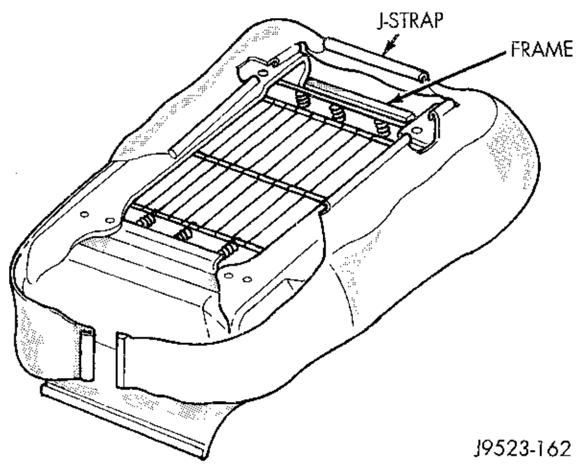

Fig. 9 J-Strap Installation

FRONT SEAT RISER—QUAD CAB

REMOVAL

(1) Disconnect seat harness connector.
(2) Remove the seat from the vehicle.
(3) Remove the bolts attaching the seat track adjuster to the seat riser (Fig. 10).
(4) Separate the seat track adjuster from the riser.

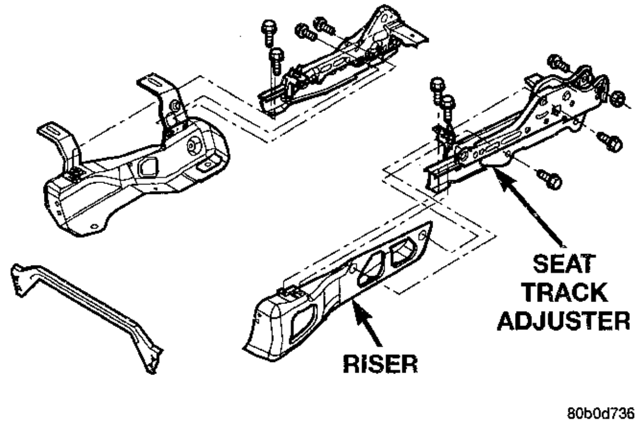

Fig. 10 Seat Riser

INSTALLATION

(1) Position the seat track adjuster on the riser.
(2) Install the bolts attaching the seat track adjuster to the seat riser. Tighten front bolts to 17 N·m (12 ft. lbs.) torque. Tighten rear inboard bolt to 22 N·m (16 ft. lbs.) torque. Tighten rear outboard bolt to 45 N·m (33 ft. lbs.) torque.
(3) Install the seat in the vehicle.
(4) Connect seat harness connector.

FRONT SEAT TRACK ADJUSTER—QUAD CAB

REMOVAL

(1) Disconnect seat harness connector.
(2) Remove seat from vehicle.
(3) Remove bolts attaching center seat to seat frame and remove center seat.
(4) Disconnect seat belt control timer module harness connector (SCTM).
(5) Remove bolts attaching seat track adjuster to riser (Fig. 10).
(6) Remove bolts attaching seat track adjuster to seat frame.

INSTALLATION

(1) Install bolts attaching seat track adjuster to seat frame. Tighten recliner bolt to seat track adjuster to 45 N·m (33 ft. lbs.) torque. Tighten inboard and outboard pivot bolts to 51 N·m (37 ft. lbs.) torque.
(2) Install bolts attaching seat track adjuster to riser.
(3) Install center seat to seat frame.
(4) Connect seat belt control timer module harness connector (SCTM).
(5) Install seat in vehicle.
(6) Connect seat harness connector.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

EZ ENTRY SEAT TRACK—CLUB CAB

REMOVAL

(1) Remove front passenger seat.
(2) Remove recliner handle.
(3) Remove side shield.
(4) Disengage seat track latch release cables.
(5) Remove bolts attaching seat track/riser to EZ entry seat track (Fig. 11).
(6) Remove screws attaching EZ entry track to seat cushion frame.
(7) Remove nut attaching inboard seat belt buckle to EZ entry seat track.
(8) Remove nut attaching seat/shoulder belt to EZ entry seat track.
(9) Remove bolts attaching recliner/seat back to EZ entry seat track.
(10) Remove inboard seat back pivot bolt.
(11) Disengage latch release cable from pulley.
(12) Separate EZ entry seat track from seat back.

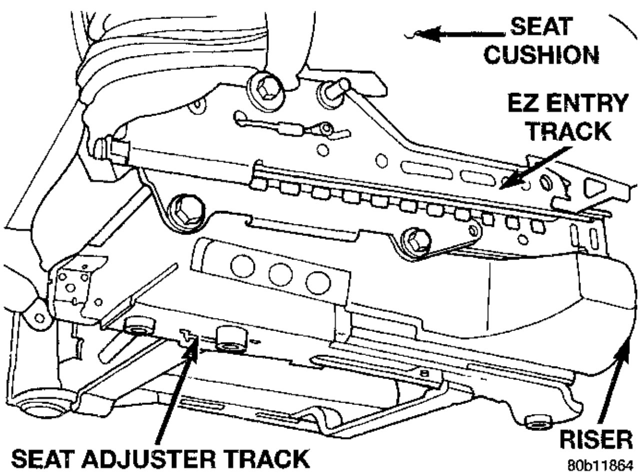

Fig. 11 EZ Entry Seat Track

INSTALLATION

(1) Position inboard EZ entry seat track at seat back.
(2) Engage latch release cable around pulley.
(3) Install bolts attaching recliner/seat back to EZ entry seat track. Tighten bolts to 45 N·m (33 ft. lbs.) torque.
(4) Install inboard seat back pivot bolt. Tighten bolt to 50 N·m (36 ft. lbs.) torque.
(5) Install nut attaching inboard seat belt buckle to EZ entry seat track. Tighten nut to 45 N·m (33 ft. lbs.) torque.
(6) Install screws attaching EZ entry track to seat cushion frame. Tighten screws to 25 N·m (18 ft. lbs.) torque.
(7) Install bolts attaching seat track/riser to EZ entry seat track. Tighten front bolts to 17 N·m (12 ft. lbs.) torque. Tighten rear inboard bolts to 21 N·m (16 ft. lbs.) torque. Tighten rear outboard bolts to 45 N·m (33 ft. lbs.) torque.
(8) Engage seat track latch release cables.
(9) Install front passenger seat.
(10) Install nut attaching seat/shoulder belt to EZ entry seat track. Tighten nut to 45 N·m (33 ft. lbs.) torque.
(11) Install side shield.
(12) Install recliner handle.

FRONT SEAT BACK—QUAD CAB

REMOVAL

(1) Remove screw attaching recliner handle and pull handle to remove.
(2) Remove seat dump handle, 2–door "BE" vehicles only.
(3) Remove screws attaching side shield to seat track adjuster.
(4) Remove seat dump handle.
(5) Pull shoulder belt out completely and clamp shoulder belt to prevent shoulder belt from retracting (Fig. 12).
(6) Remove shoulder belt anchor bolt.
(7) From the underside of the seat, remove the inboard pivot bolt (Fig. 13).
(8) From the underside of the seat, disengage the seat/shoulder belt harness connector

WARNING: DO NOT REMOVE UPPER RECLINER HANDLE, PULL ON UPPER RECLINER HANDLE OR RECLINER CABLE END. THE RECLINER LEAD SCREW IS SPRING LOADED AND WILL EJECT IF EITHER THE HANDLE OR CABLE IS PULLED BEFORE THE LEAD SCREW IS REMOVED.

(9) Remove clip attaching recliner cable (Fig. 14) to seat track adjuster and separate the cable from the seat track adjuster.
(10) Remove the inboard and outboard pivot bolts attaching the frame to the seat track adjuster (Fig. 15).
(11) Remove recliner lower bolt.
(12) Separate seat back from seat track adjuster.

INSTALLATION

(1) Position seat back on seat track adjuster.
(2) Install the inboard and outboard pivot bolts attaching the frame to the seat track adjuster (Fig. 15).
(3) Install the bolt attaching the lower recliner to the seat track adjuster.
(4) Position the recliner cable on seat track adjuster and install **new** clip.
(5) From the underside of the seat, engage the seat/shoulder belt harness connector.

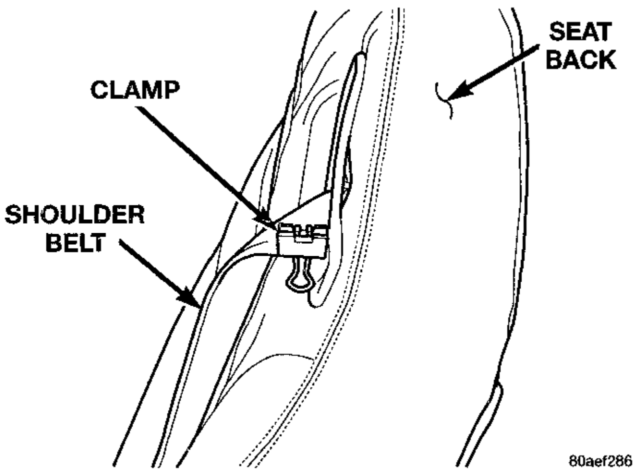

Fig. 12 Shoulder Belt Clamp

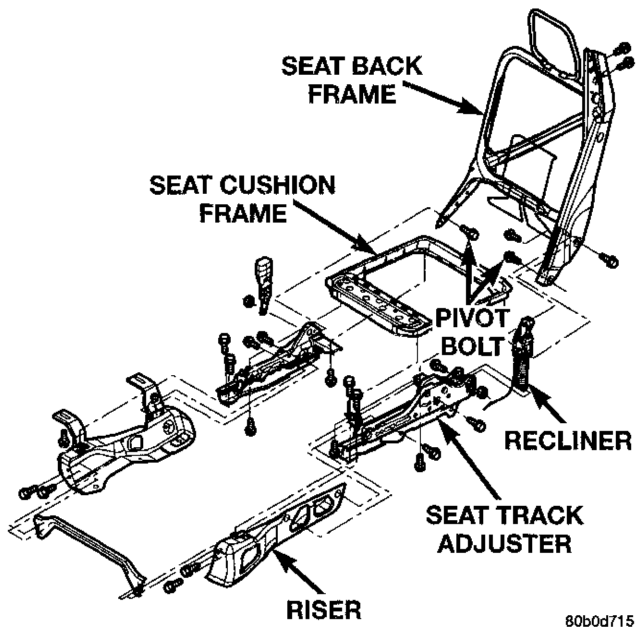

Fig. 13 Pivot Bolt

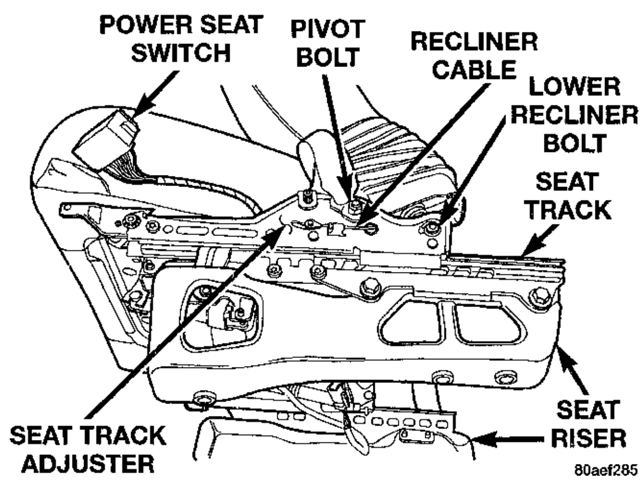

Fig. 14 Recliner Cable

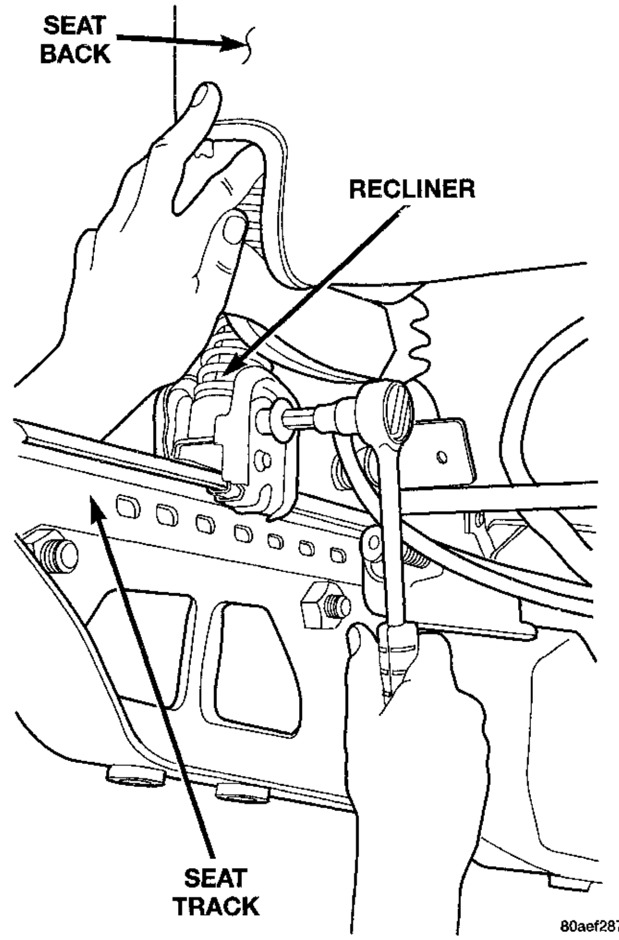

Fig. 15 Recliner

(6) Install shoulder belt anchor bolt. Tighten bolt to 45 N·m (33 ft. lbs.) torque.
(7) Remove clamp (Fig. 12).
(8) Install side shield.
(9) Install recliner handle.
(10) Install seat dump handle, if removed.

FRONT SEAT RECLINER—QUAD CLUB

REMOVAL

(1) Remove seat back.
(2) Disengage J-straps at base of seat back and roll seat back cover upward to access rubber bellows push-in fasteners.

NOTE: Notice the routing of the recliner cable for installation.

(3) Remove the push-in fasteners attaching upper rubber bellows to the seat back frame.
(4) Remove rubber bellows.
(5) Remove seat dump handle, 2–door "BE" vehicles only.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

WARNING: Do not pull on upper recliner handle or recliner cable end. The recliner lead screw is spring loaded and will eject if either the handle or cable is pulled before the lead screw is removed.

(6) Remove the bolts attaching upper recliner to seat back frame (Fig. 16).

Separate the recliner from the seat back.

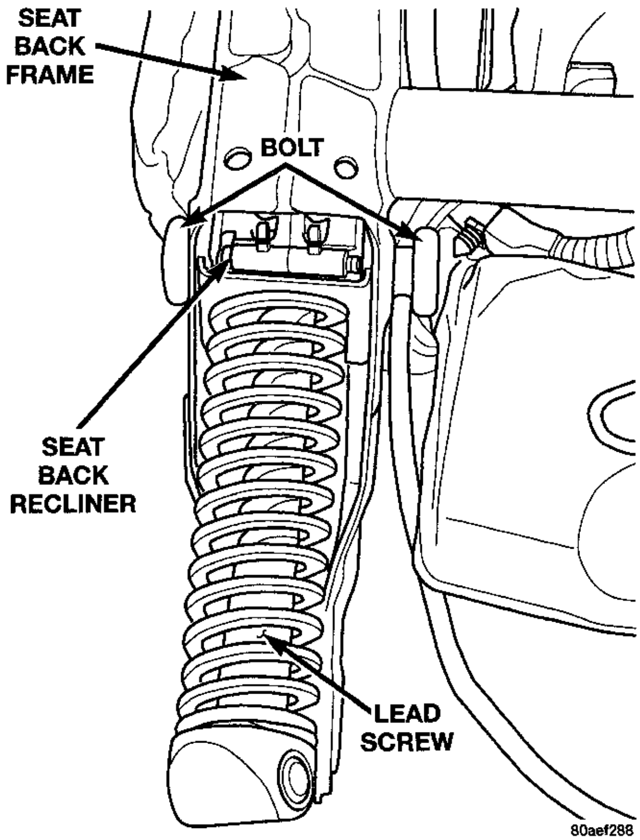

Fig. 16 Seat Back Recliner

INSTALLATION

(1) Install seat dump handle, if removed.

Position the recliner in the seat back.

(2) Install the bolts attaching upper recliner to seat back frame (Fig. 16).

(3) Install rubber bellows.

(4) Roll seat back cover upward and engage J-straps at base of seat back.

(5) Ensure recliner cable is correctly routed.

(6) Install seat back.

FRONT SEAT CUSHION—QUAD CAB

REMOVAL

The seat cushion can be removed with the seat in the vehicle.

(1) From the underside of the seat, remove the bolts attaching the cushion frame to the mounting brackets.

(2) Remove the cushion from the seat tracks.

INSTALLATION

(1) Position the cushion frame on the seat tracks.

(2) Ensure that the cushion frame is aligned with the mounting brackets (Fig. 17).

(3) Install the bolts attaching the seat cushion frame to the mounting brackets. Tighten bolts to 25 N·m (18 ft. lbs.) torque.

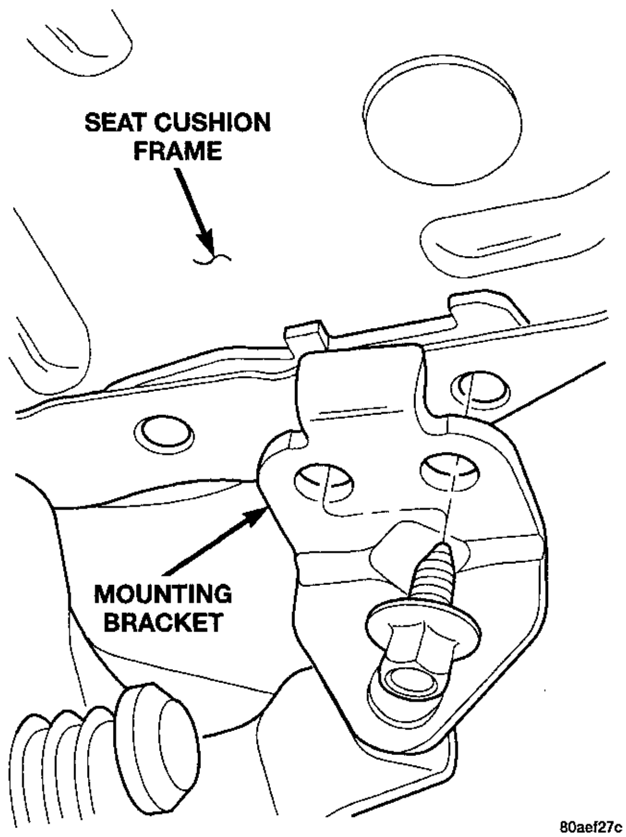

Fig. 17 Seat Cushion Mounting Frame

FRONT SEAT BACK COVER—QUAD CAB

REMOVAL

(1) Remove recliner handle.

(2) Remove dump handle, if equipped.

(3) Remove side shield.

(4) Clamp belt to prevent from retracting.

(5) Remove the bolt attaching the seat belt anchor to the seat track adjuster.

(6) Remove the assist handle on the backside of the seat, if equipped.

(7) Disengage the J-strap at the base of the seat back (Fig. 18).

(8) Roll cover upward.

(9) Disengage hog rings attaching the cover to the seat back frame (Fig. 19).

(10) Using a trim stick, carefully pry shoulder belt guide bezel from seat back.

(11) Route the shoulder belt and guide bezel through the seat back cover.

REMOVAL AND INSTALLATION (Continued)

(12) Roll the cover upward and separate from the seat back.

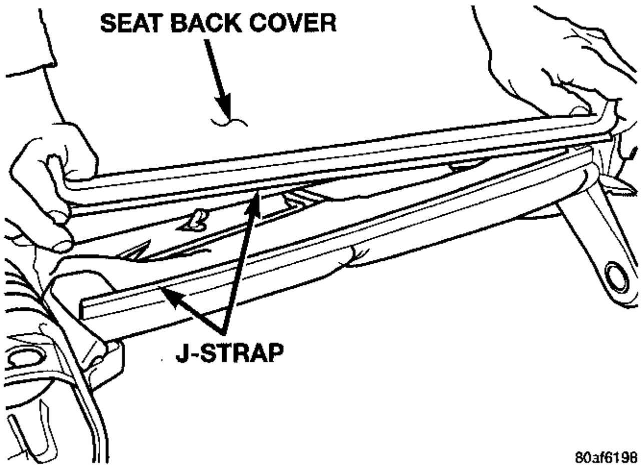

Fig. 18 Seat Back J-Strap

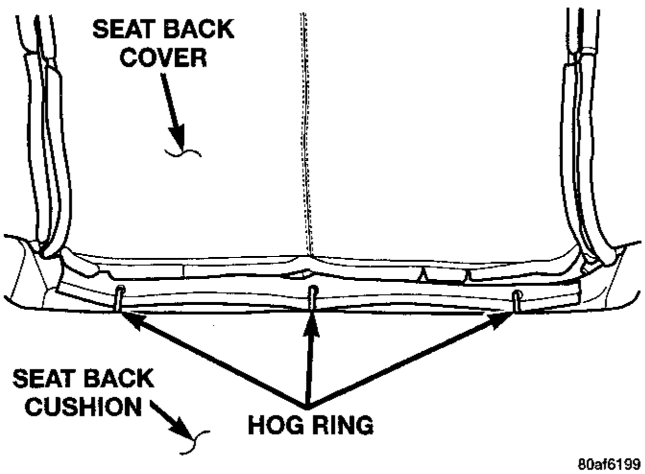

Fig. 19 Seat Back Hog Rings

INSTALLATION

(1) Position the seat back cover on the seat back and roll the cover downward.
(2) Route the shoulder belt and guide bezel through the seat back cover.
(3) Engage hog rings attaching the cover to the seat back frame.
(4) Align the shoulder belt guide bezel and press into place.
(5) Roll cover downward.
(6) Engage the J-strap at the base of the seat back.
(7) Install the assist handle on the backside of the seat, if equipped.
(8) Install the bolt attaching the seat belt anchor to the seat track adjuster.
(9) Install side shield.
(10) Install dump handle, if equipped.
(11) Install recliner handle.

FRONT SEAT CUSHION COVER—QUAD CAB

REMOVAL

(1) Remove seat cushion.
(2) Disengage the J-straps attaching the cushion cover to the cushion frame (Fig. 20).
(3) Peel the cushion cover and disengage the hook and loop fasteners (Fig. 21).
(4) Disengage the hog rings attaching the cushion cover to the cushion frame (Fig. 22).
(5) Separate the cover from the cushion.

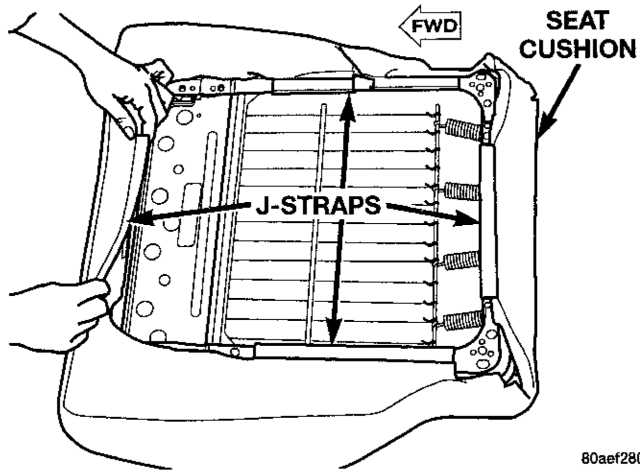

Fig. 20 Seat Cushion J-Straps

GENERAL INFORMATION

INTERIOR TRIM PANELS

CAUTION: Do not attempt to remove interior trim panels/mouldings without first removing the necessary adjacent panels.

To avoid damaging the panels, ensure that all the screws and clips are removed before attempting to remove an interior trim panel/moulding. **Trim panels are somewhat flexible but can be damaged if handled improperly.**

REMOVAL AND INSTALLATION

GRILLE

REMOVAL

(1) Release primary hood latch.
(2) Release hood safety catch and open hood.
(3) Remove bolt holding bottom of grille to frame.
(4) Remove bolts holding sides of grille to frame.
(5) Remove nuts holding grille to hood (Fig. 1).
(6) Separate grille from vehicle.

INSTALLATION

Reverse the preceding operation.

GRILLE FRAME

REMOVAL

(1) Release primary hood latch.
(2) Release hood safety catch and open hood.
(3) Remove bolts holding guide loop for hood safety catch release rod to grille frame.
(4) Remove grille.
(5) Remove screws holding grille frame to hood (Fig. 2).

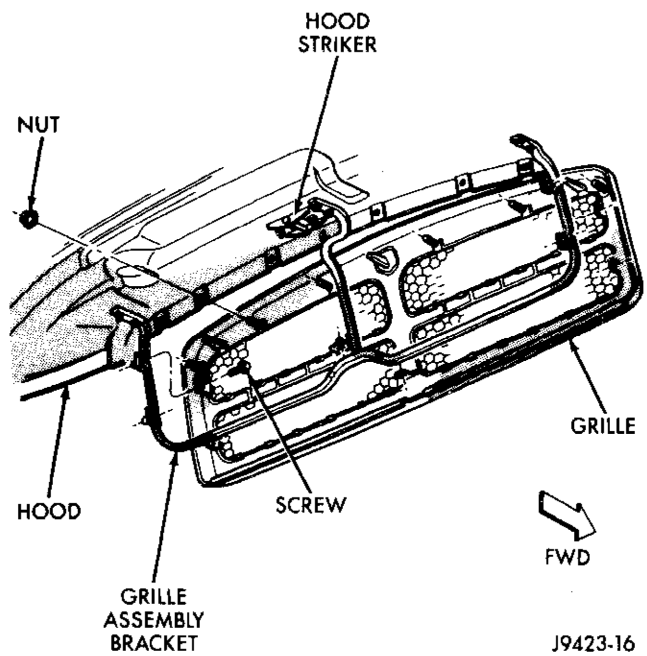

Fig. 1 Grille

(6) Separate grille frame from vehicle.

INSTALLATION

Reverse the preceding operation.

HOOD

REMOVAL

(1) Release primary hood latch.
(2) Release hood safety catch and open hood.
(3) Disconnect the under hood lamp wire connector.
(4) Mark all bolt and hinge attachment locations with a grease pencil or other suitable device to provide reference marks for installation.

REMOVAL AND INSTALLATION (Continued)

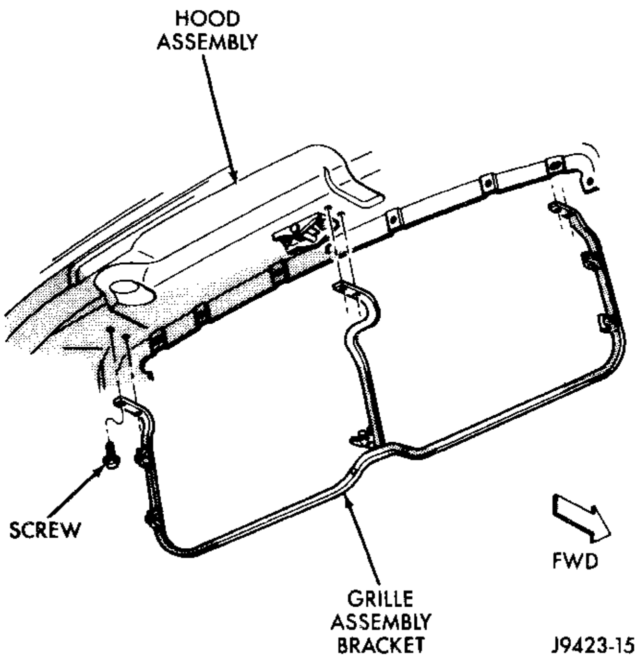

Fig. 2 Grille Mounting Frame

(5) Remove the top hood to hinge attaching bolts and loosen the bottom bolts until they can be removed by hand (Fig. 3).

(6) With assistance of a helper at the opposite side of the vehicle to support the hood, remove the bottom hood to hinge attaching bolts. Separate the hood from the vehicle.

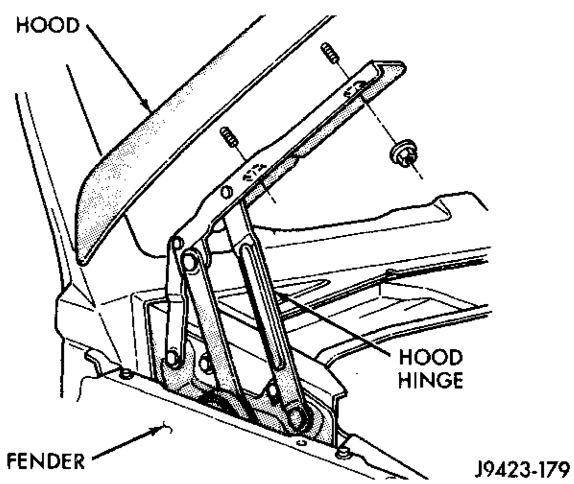

Fig. 3 Hood

INSTALLATION

Align all marks and secure bolts. The hood should be aligned to 5 mm (0.2 in.) gap to the front fenders and flush across the top surfaces along fenders.

Reverse the preceding operation.

HOOD SILENCER

REMOVAL

(1) Release primary hood latch.

(2) Release hood safety catch and open hood.

(3) Remove push-in fasteners holding silencer to hood (Fig. 4).

(4) Separate hood silencer from vehicle.

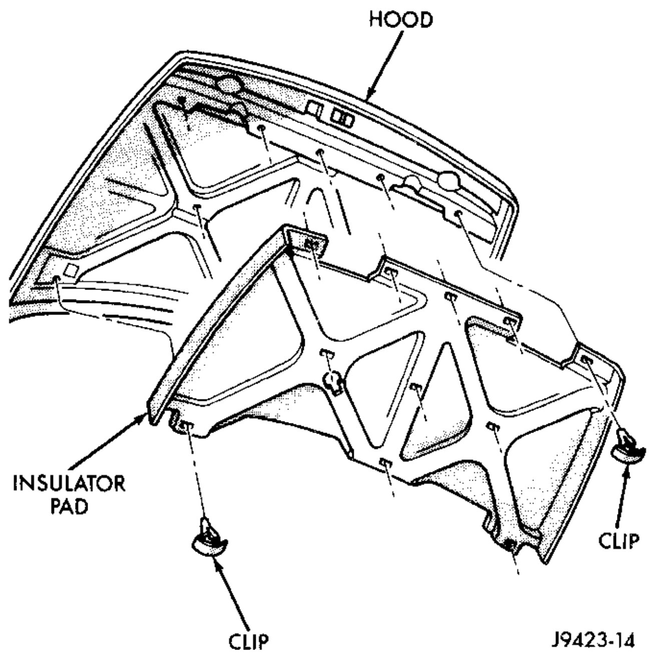

Fig. 4 Hood Silencer

INSTALLATION

Reverse the preceding operation.

HOOD HINGE

REMOVAL

(1) Open hood and support the side that requires hinge replacement.

(2) Mark all bolt and hinge attachment locations with a grease pencil or other suitable device to provide reference marks for installation. When installing hood hinge, align all marks and secure bolts. The hood should be aligned to 5 mm (0.2 in.) gap to the front fenders and flush across the top surfaces along fenders. Shims can be added or removed under hood hinge to achieve proper hood height.

(3) Remove hood to hinge attaching bolts (Fig. 5).

(4) Remove hood hinge to cowl panel attaching bolts and separate hinge from vehicle.

INSTALLATION

Reverse the preceding operation. If necessary, paint new hinge before installation.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

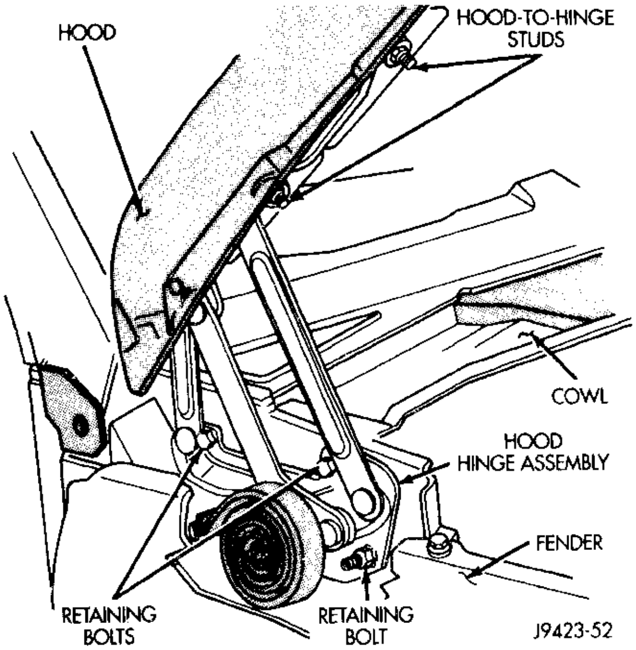

Fig. 5 Hood Hinge

HOOD SAFETY CATCH

REMOVAL

(1) Release primary hood latch.
(2) Release hood safety catch and open hood.
(3) Remove bolts holding hood safety catch to hood (Fig. 6).
(4) Separate safety catch from vehicle.

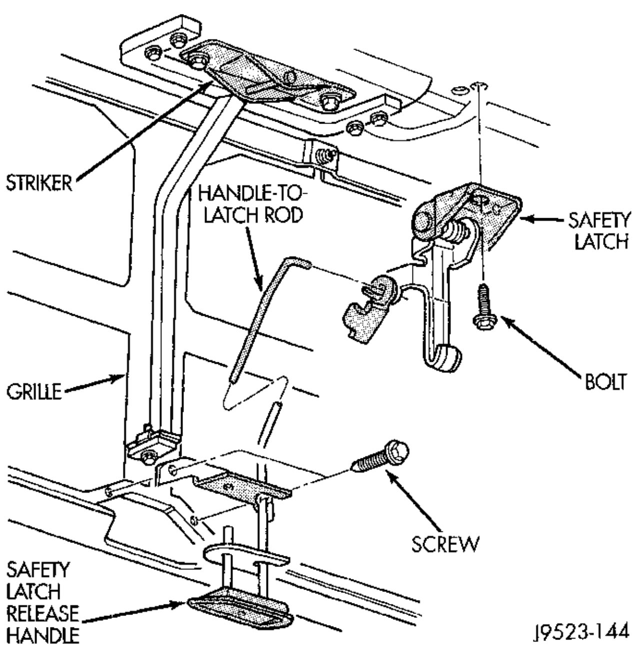

Fig. 6 Hood Safety Catch and Latch Striker

INSTALLATION

Reverse the preceding operation.

HOOD LATCH STRIKER

REMOVAL

(1) Release primary hood latch.
(2) Release hood safety catch and open hood.
(3) Remove bolts holding hood latch striker to hood (Fig. 6).
(4) Separate hood latch striker from vehicle.

INSTALLATION

Reverse the preceding operation.

HOOD LATCH

REMOVAL

(1) Release primary hood latch.
(2) Release hood safety catch and open hood.
(3) Remove bolts holding hood latch to radiator closure panel crossmember (Fig. 7).
(4) Separate hood latch from crossmember.
(5) Disconnect release cable from hood latch.

INSTALLATION

Reverse the preceding operation.

HOOD RELEASE CABLE

REMOVAL

(1) Release primary hood latch.
(2) Release hood safety catch and open hood.
(3) Remove hood latch.
(4) Disconnect release cable from hood latch.
(5) Detach the release cable from the retainer clips in the engine compartment.
(6) Separate the release cable grommet from the dash panel hole.
(7) From the inside of the vehicle, remove the screws attaching the hood release handle to the bottom of the instrument panel.
(8) Pull/route the hood release cable through the dash panel hole and remove it via the inside of the vehicle.

INSTALLATION

NOTE: If replacement hood latch is also being installed, ensure that it is thoroughly lubricated.

(1) From inside the vehicle, pull/route the hood release cable through the dash panel hole and into the engine compartment.
(2) Install the hood release handle.
(3) Install the cable grommet in the dash panel hole.
(4) Attach the release cable to the retainer clips in the engine compartment.
(5) Attach release cable to hood latch.
(6) Install hood latch.

mopar AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

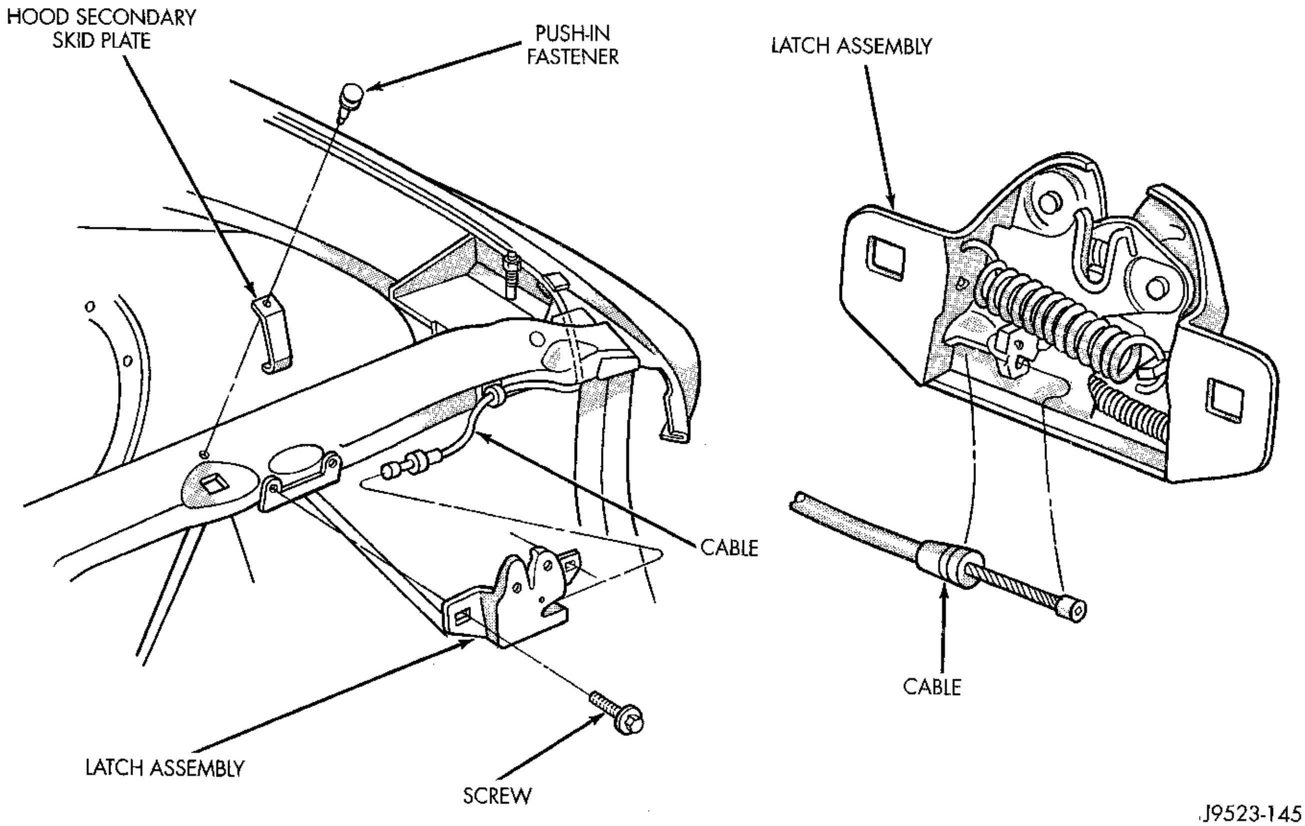

Fig. 7 Hood Latch

(7) Test the hood latch release cable for proper operation.

COWL COVER

REMOVAL

(1) Release primary hood latch.
(2) Release hood safety catch and open hood.
(3) Remove wiper arms, refer to Group 8K, Windshield Wipers and Washers.
(4) Disconnect windshield washer tubing from coupling near left hood hinge.
(5) Remove retainers holding cowl cover to cowl box (Fig. 8).
(6) Pull cowl seal from pinch flange a front of cowl.
(7) Separate cowl cover from vehicle.

INSTALLATION

Reverse the preceding operation.

FRONT WHEELHOUSE LINER

REMOVAL

(1) Hoist and support vehicle on safety stands.
(2) Remove front wheel.
(3) Remove plastic rivets holding wheelhouse liner to fender at the edge of wheel opening.

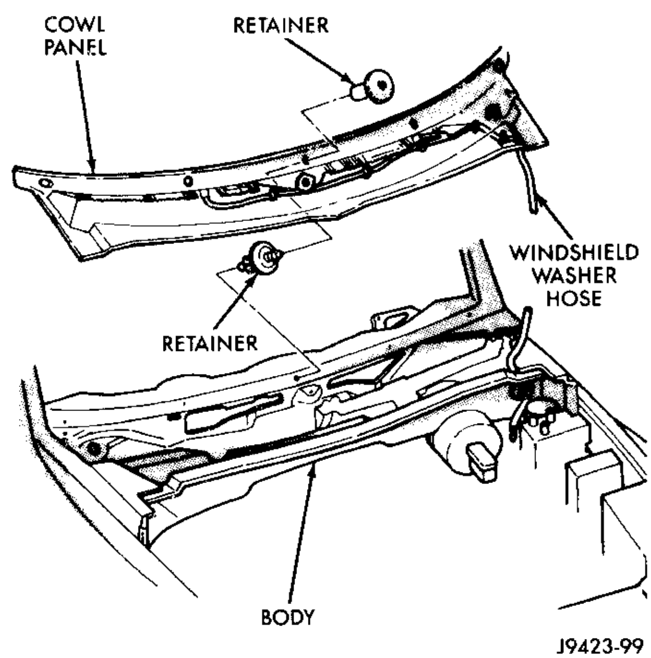

Fig. 8 Cowl Cover

(4) Remove plastic rivets holding liner to the wheelhouse (Fig. 9).
(5) Separate front wheelhouse liner from vehicle.

REMOVAL AND INSTALLATION (Continued)

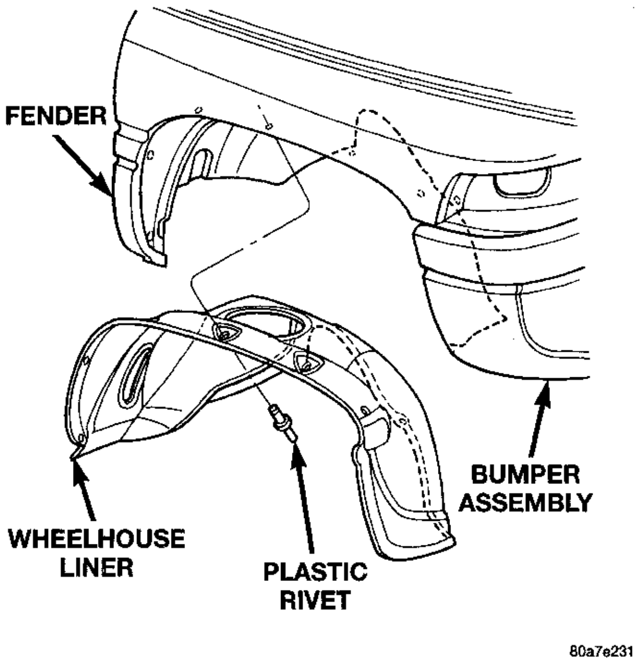

Fig. 9 Front Wheelhouse Liner

INSTALLATION

Reverse the preceding operation.

LEFT FRONT FENDER

REMOVAL

(1) Release primary hood latch.
(2) Release hood safety catch and open hood.
(3) Remove front bumper, refer to Group 13, Bumpers and Frame for procedures.
(4) Remove air cleaner from wheelhouse (DIESEL ONLY).
(5) Remove coolant overflow bottle (V-10 ONLY).
(6) Remove battery and tray, refer to Group 8B, Battery/Starter/Generator Service for procedures.
(7) Remove screws holding power distribution center to left wheelhouse (Fig. 10).
(8) Disengage wire harness tie-downs from wheelhouse.
(9) Disconnect wiring harness to headlamp connector.
(10) Disconnect wiring harness to airbag sensor and remove airbag sensor from wheelhouse.
(11) Remove bolts holding anti-lock brake controller to wheelhouse (Fig. 10), if equipped. Refer to Group 5, Brakes for procedures.
(12) Disengage windshield washer tubing tie-downs from wheelhouse (Fig. 10).
(13) Remove bolts holding front fender to cowl reinforcement (Fig. 11).
(14) Remove bolts holding front fender to radiator closure panel (Fig. 12).
(15) Remove bolts holding bottom of front fender to rocker panel lower flange (Fig. 13).
(16) Open left door.
(17) Remove bolt holding front fender to hinge pillar mounting bracket (Fig. 13).
(18) Remove bolts holding top of fender to radiator closure panel (Fig. 13).
(19) Separate left front fender from vehicle.

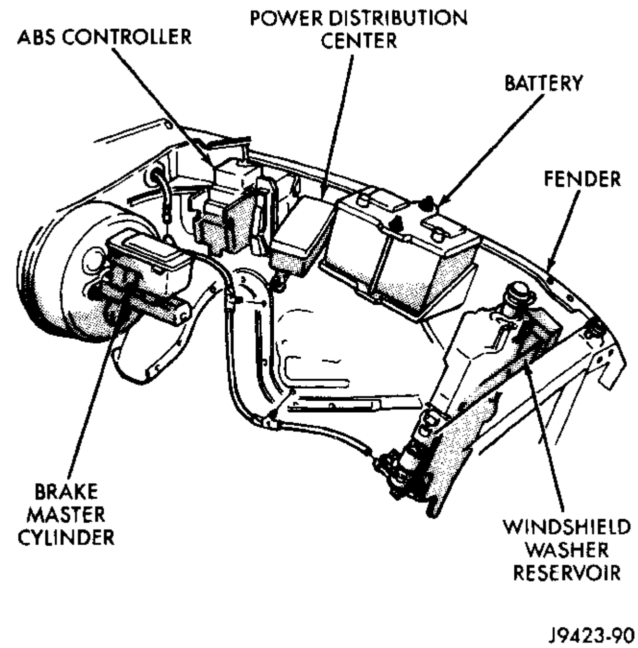

Fig. 10 Left Front Fender Access Components

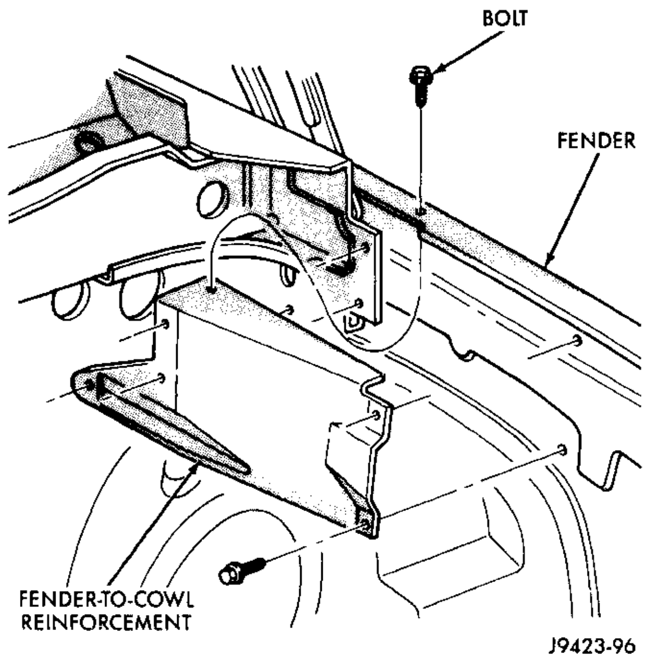

Fig. 11 Fender to Cowl Reinforcement—Typical

REMOVAL AND INSTALLATION (Continued)

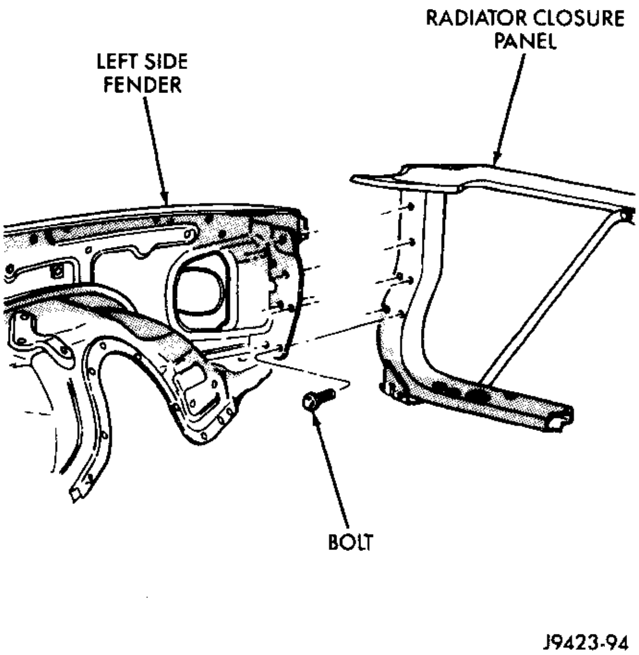

Fig. 12 Left Fender to Radiator Closure Panel Fasteners

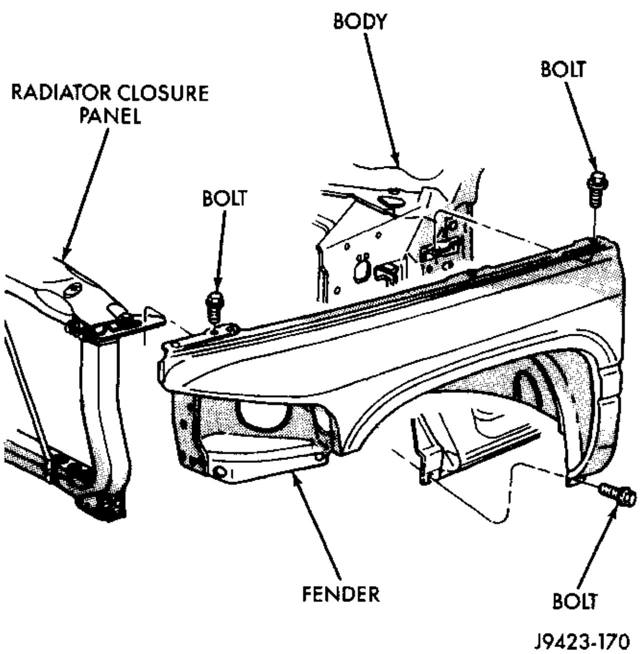

Fig. 13 Left Front Fender

INSTALLATION

Reverse the preceding operation.

RIGHT FRONT FENDER

REMOVAL

engage

(1) Remove front bumper, refer to Group 13, Bumpers and Frame for procedures.

(2) Remove auxiliary battery and tray on right side, if equipped. Refer to Group 8B, Battery/Starter/Generator Service for procedures.

(3) Disengage wire harness tie-downs from wheelhouse.

(4) Disconnect wiring harness to headlamp connector.

(5) Disconnect wiring harness to airbag sensor and remove airbag sensor from wheelhouse.

(6) Remove front wheelhouse liner (Fig. 9).

(7) Disengage air conditioning tubing from inner fender clips.

(8) Remove bolts holding front fender to cowl reinforcement (Fig. 11).

(9) Remove bolts holding front fender to radiator closure panel (Fig. 14).

(10) Remove bolts holding bottom of front fender to rocker panel lower flange (Fig. 15).

(11) Open right door.

(12) Remove bolt holding front fender to hinge pillar mounting bracket (Fig. 15).

(13) Remove bolts holding top of fender to radiator closure panel (Fig. 15).

(14) Separate right front fender from vehicle.

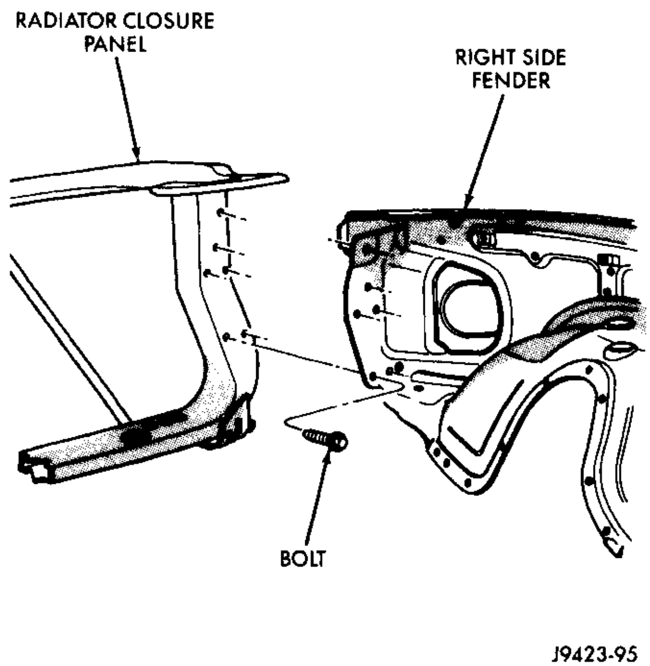

Fig. 14 Right Fender to Radiator Closure Panel Fasteners

INSTALLATION

Reverse the preceding operation.

EXTERIOR NAMEPLATES

REMOVAL

(1) Insert a plastic trim stick or a hard wood wedge behind the emblem to separate the adhesive

Mopar AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

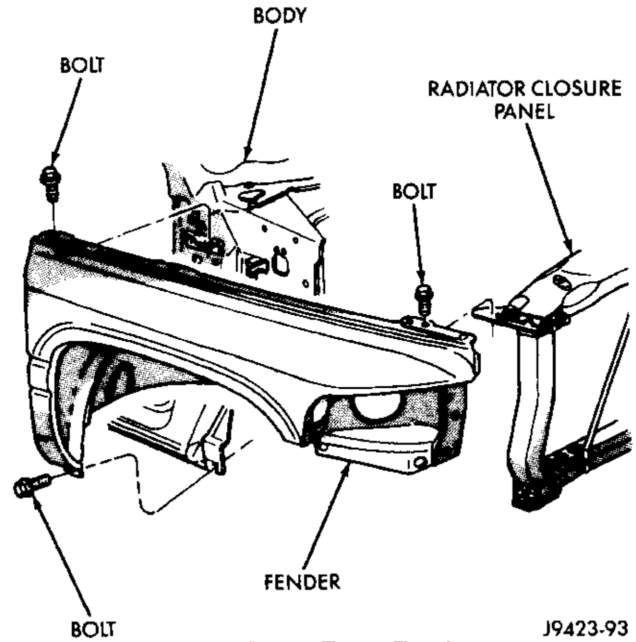

Fig. 15 Right Front Fender

backing from the body (Fig. 16) and (Fig. 17).

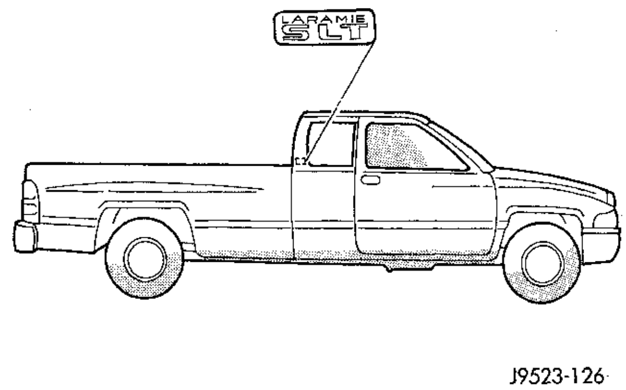

Fig. 17 Exterior Nameplates—Club Cab

(2) Clean adhesive residue from body with MOPAR Super Clean solvent or equivalent.

INSTALLATION

(1) Remove protective cover from adhesive tape on back of emblem.

(2) Position emblem properly on body.

(3) Press emblem firmly to body with palm of hand.

(4) If temperature is below 21°C (70°F) warm emblem with a heat lamp or gun to assure adhesion. Do not exceed 52°C (120°F) when heating emblem.

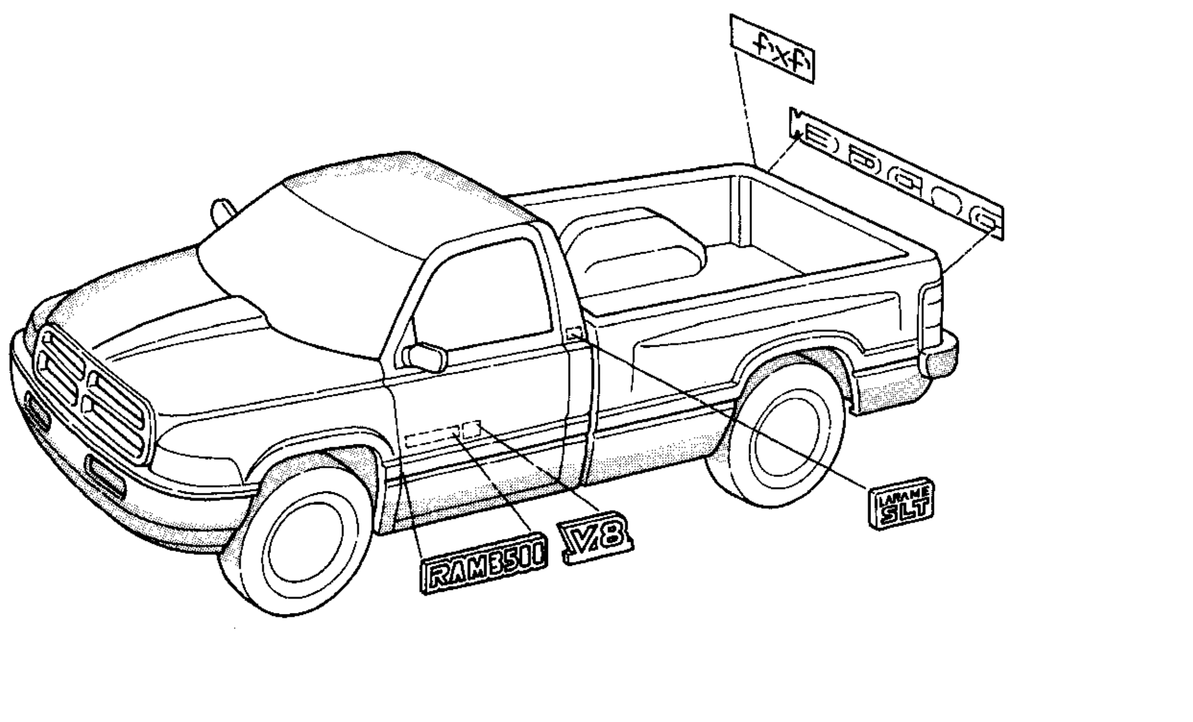

Fig. 16 Exterior Nameplates

REMOVAL AND INSTALLATION (Continued)

B-PILLAR APPLIQUE

REMOVAL

(1) Using a heat lamp, warm B-pillar to 38° C (100° F).

(2) Remove B-pillar secondary seal, BE vehicles only.

(3) Remove inner and outer belt weatherstrip.

(4) Remove glass run weatherstrip.

(5) Using an even pressure pull, peel B-pillar applique away from the B-pillar.

INSTALLATION

Installation equipment needed:

- Lint free applicator cloth
- six inch applicator squeegee
- Piercing pin

(1) Clean B-pillar using Mopar Super Kleen or equivalent.

(2) Wipe surface with a lint free cloth.

(3) Using a heat gun, warm surface to 22°C (70° F).

(4) Fold down, up/down locator tab (1a or 1b) (Fig. 18) along crease.

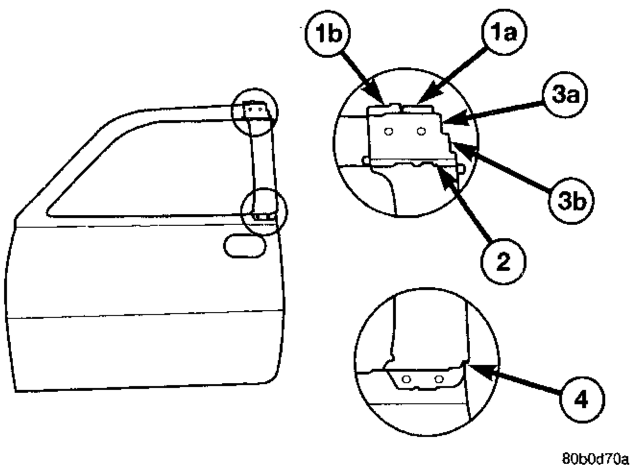

Fig. 18 B-Pillar Applique

1A = Club Cab - Up/Down
1B = Quad Cab - Up/Down
2 = Adhesion Strip
3A = Club Cab - For/Aft
3B= Quad Cab - For/Aft
4 = Rear Edge Locator

(5) Remove carrier from adhesion strip (2).

(6) Using up/down locator tab (1a or 1b) and fore/aft locator tab (3a or 3b), position the applique on the upper portion of the B-pillar.

(7) Using the lower edge locator (4), position the applique on the lower portion of the B-pillar.

(8) Verify the applique is positioned correctly and press the adhesion strip (2) to the door to temporarily secure it in place.

(9) Remove the carrier for the applique.

(10) Holding the applique from the surface, apply firm downward pressure with a six inch applicator squeegee. Ensure the lower rear edge (4) is aligned correctly.

(11) Wrap edges around door to at least a 90° angle.

(12) Remove premask by pulling in a firm continuous manner from top down at 180°.

(13) Complete wrapping applique around the door edges.

(14) Inspect for air bubbles. Small bubbles can be pierced with a sharp pin and smoothed out.

(15) Install glass run weatherstrip.

(16) Install inner and outer belt weatherstrip.

(17) Install B-pillar secondary seal, BE vehicles only.

SIDEVIEW MIRROR

REMOVAL

(1) Remove door trim panel.

(2) Remove mirror flag door seal (Fig. 19).

(3) Disengage power mirror wire connector from door harness, if equipped (Fig. 20).

(4) Remove nuts attaching sideview mirror to door frame (Fig. 21).

(5) Separate harness grommet form door frame, if equipped.

(6) Separate sideview mirror from vehicle.

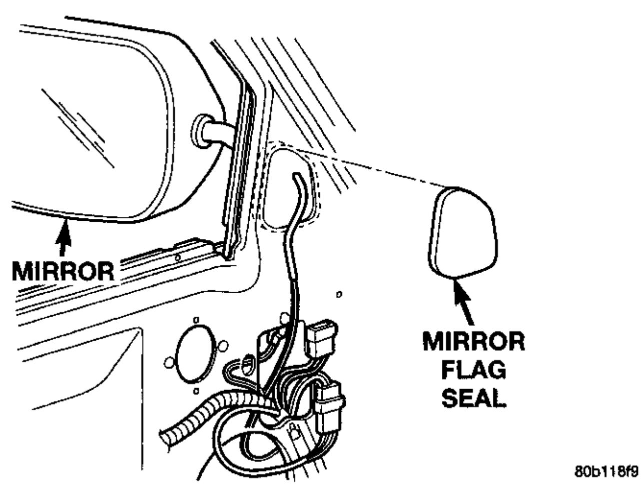

Fig. 19 Mirror Flag Door Seal

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

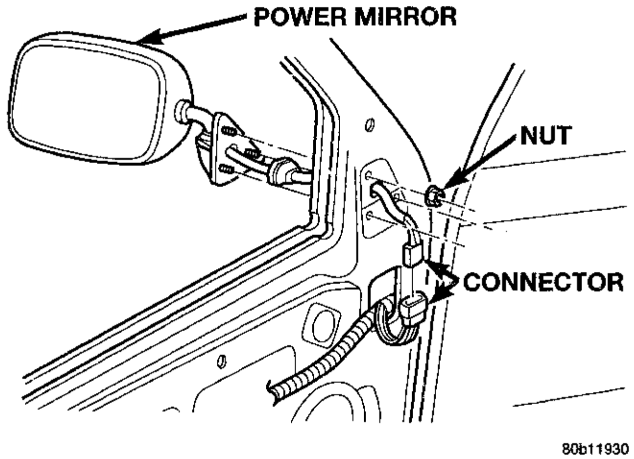

Fig. 20 Sideview Mirror—Power

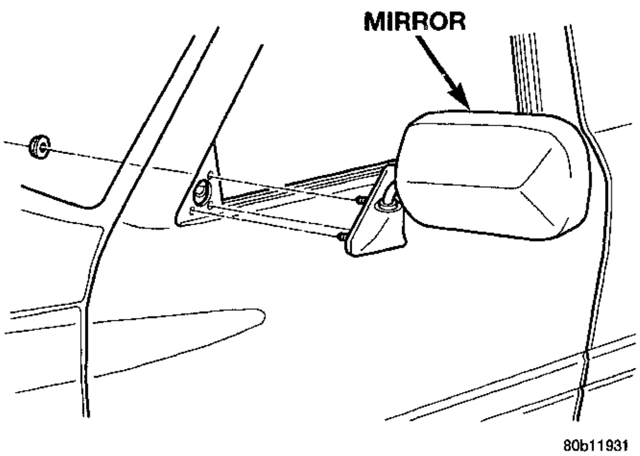

Fig. 21 Sideview Mirror

INSTALLATION

(1) Position sideview mirror on door.
(2) Install harness grommet in door frame, if equipped.
(3) Install nuts attaching sideview mirror to door (Fig. 21).
(4) Engage power mirror wire connector to harness, if equipped (Fig. 20).
(5) Install mirror flag door seal (Fig. 19).
(6) Install door trim panel.

MIRROR FLAG COVER

REMOVAL

(1) Remove door trim panel.
(2) Remove flag door seal.
(3) Remove nuts holding door flag cover to door frame (Fig. 22).
(4) Separate flag cover from vehicle.

INSTALLATION

Reverse the preceding operation.

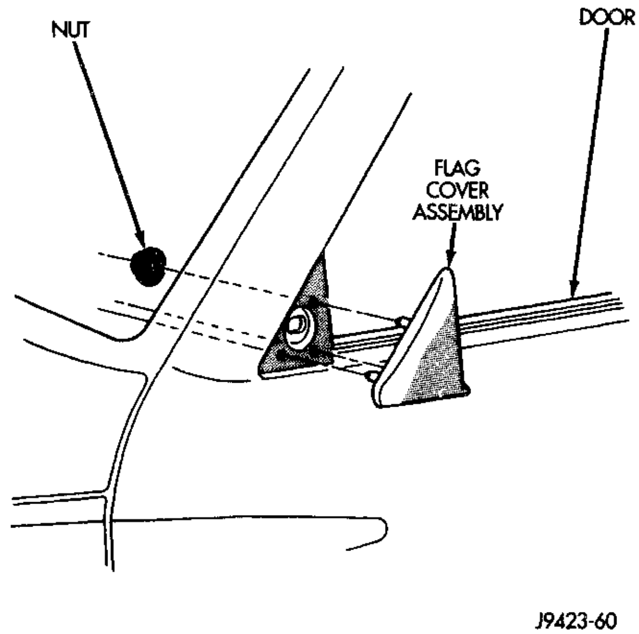

Fig. 22 Mirror Flag Cover

LOW MOUNTED SIDE VIEW MIRROR

REMOVAL

(1) Remove bolts holding lower support legs to outer door panel.
(2) Remove bolts holding upper support arms to outer door panel (Fig. 23).
(3) Separate mirror from vehicle.

INSTALLATION

Place insulation washers between support frame and painted door panel and reverse the preceding operation.

FRONT DOOR TRIM PANEL

REMOVAL

(1) Release door latch and open door.
(2) Roll window down.
(3) Remove window crank (Fig. 24), if equipped.
(4) Remove screws holding door trim panel to door from inside arm rest pull cup (Fig. 25).
(5) Disengage clips holding power window/lock switch panel to door trim panel (Fig. 26). Disengage wire connectors from switch panel, if equipped.
(6) Remove screw holding door trim to outside mirror frame.
(7) Using a trim panel removal tool, disengage clips holding door trim to door around perimeter of trim panel.
(8) Disengage power mirror wire connector, if equipped.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

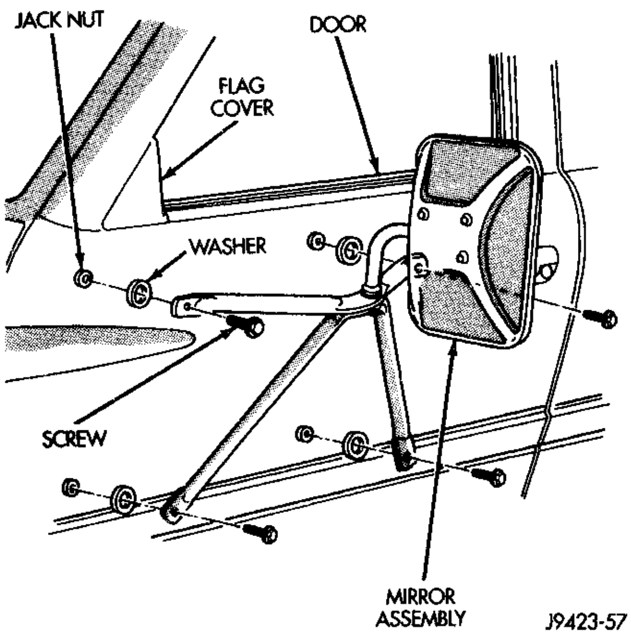

Fig. 23 Low Mounted Side View Mirror

(9) While holding bottom of trim panel away from door, simultaneously lift upward and forward.

(10) Separate door trim panel from inner belt weatherstrip.

(11) Disengage power outside mirror wire connector from control switch.

(12) Separate door trim panel from vehicle.

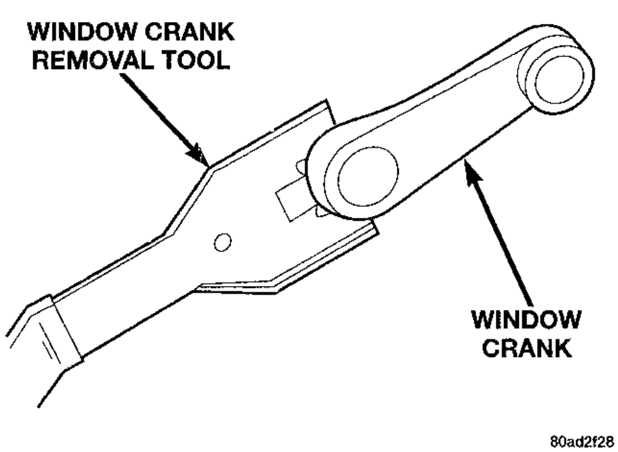

Fig. 24 Window Crank—Typical

INSTALLATION

Reverse the preceding operation.

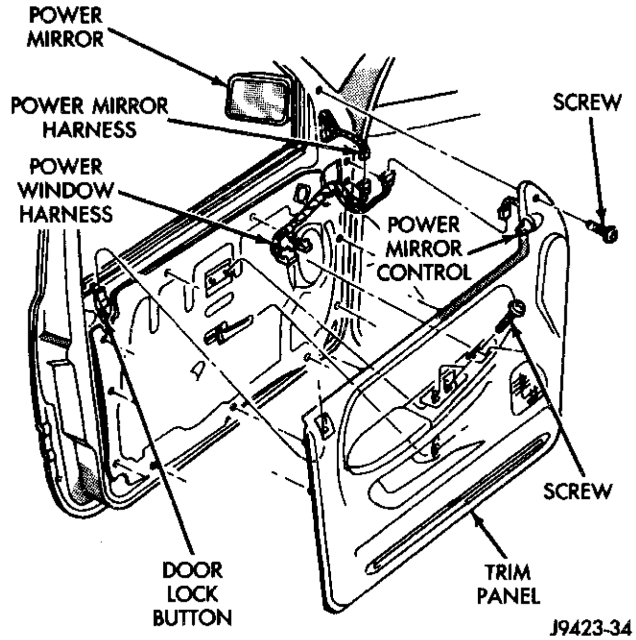

Fig. 25 Door Trim Panel

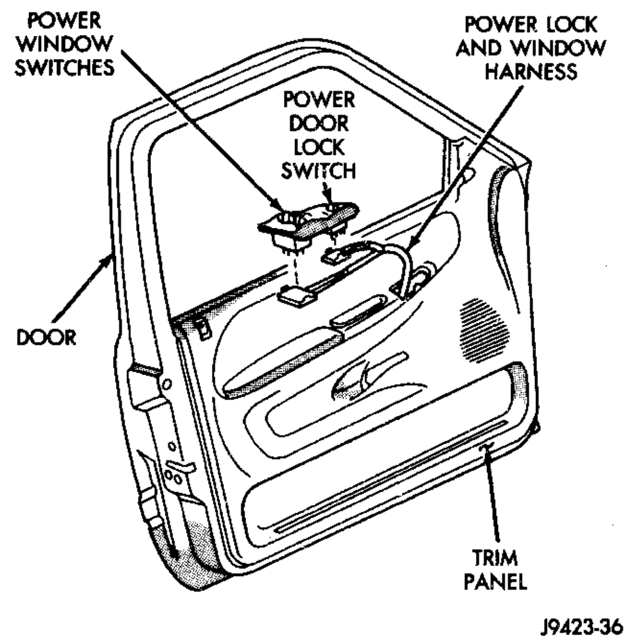

Fig. 26 Power Window/Lock Switch Panel

FRONT DOOR WATER DAM

REMOVAL

(1) Remove door trim panel.

(2) Peel water dam away from adhesive around perimeter of inner door panel (Fig. 27).

mopar AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

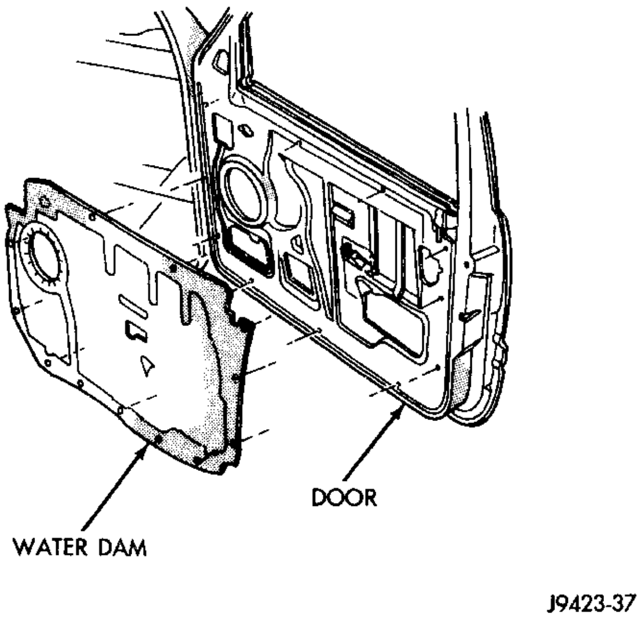

Fig. 27 Door Water Dam

INSTALLATION

Reverse the preceding operation.

FRONT DOOR

REMOVAL

(1) Release door latch and open door.
(2) Remove cowl trim panel.
(3) Disengage door wire harness connector of instrument panel harness and push door harness through access hole in pillar.
(4) Remove hidden bolts attaching door hinge to hinge pillar from behind cowl panel (Fig. 28).
(5) Using a suitable marker, mark the outline of the door hinges on the hinge pillar to aid installation.
(6) Support door on a suitable lifting device.
(7) Remove bolts attaching lower door hinge to hinge pillar (Fig. 29).
(8) While attaching the door steady on lift, remove bolts attaching upper door hinge to hinge pillar.
(9) Separate door from vehicle.

INSTALLATION

(1) While holding door steady on lift, position door at A-pillar.
(2) Align hinges using reference marks.
(3) Install bolts attaching upper door hinge to hinge pillar.
(4) Install bolts attaching lower door hinge to hinge pillar (Fig. 29).
(5) Install hidden bolts attaching door hinge to hinge pillar from behind cowl panel (Fig. 28).

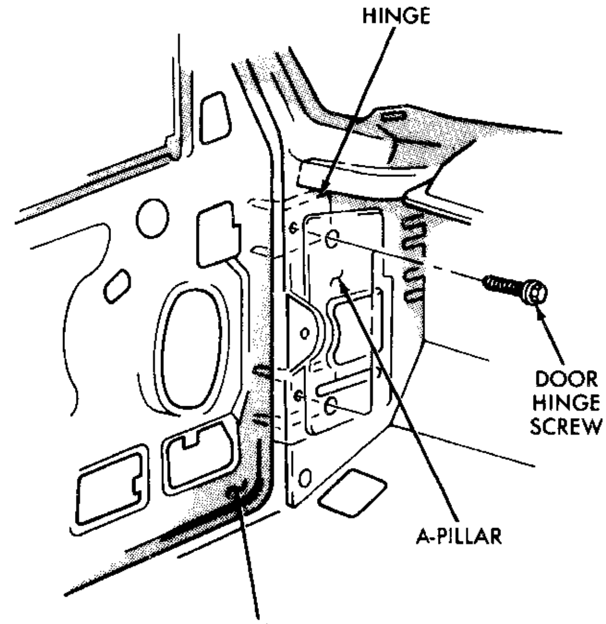

Fig. 28 Door Hinge Hidden Bolt

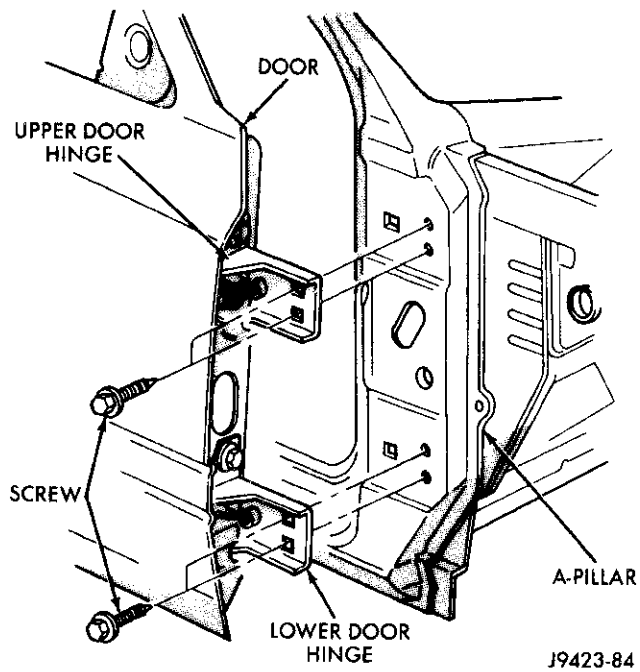

Fig. 29 Door

(6) Align door to achieve equal spacing on all sides and flush across the gaps.
(7) Tighten hinge bolts to 28 N·m (21 ft. lbs.) torque.
(8) Route harness through door and engage door wire harness connector.
(9) Install cowl trim panel.

REMOVAL AND INSTALLATION (Continued)

FRONT DOOR HINGE

REMOVAL

(1) Release door latch and open door.
(2) Remove cowl trim panel.
(3) Remove hidden bolt attaching door hinge to hinge pillar (Fig. 28).
(4) Support door on a suitable lifting device.
(5) Using a suitable marker, mark the outline of the door hinge on the hinge pillar to aid installation.
(6) Remove bolts attaching door hinge to hinge pillar (Fig. 29).
(7) Remove bolts attaching door hinge to door end frame (Fig. 30).
(8) Separate door hinge from vehicle.

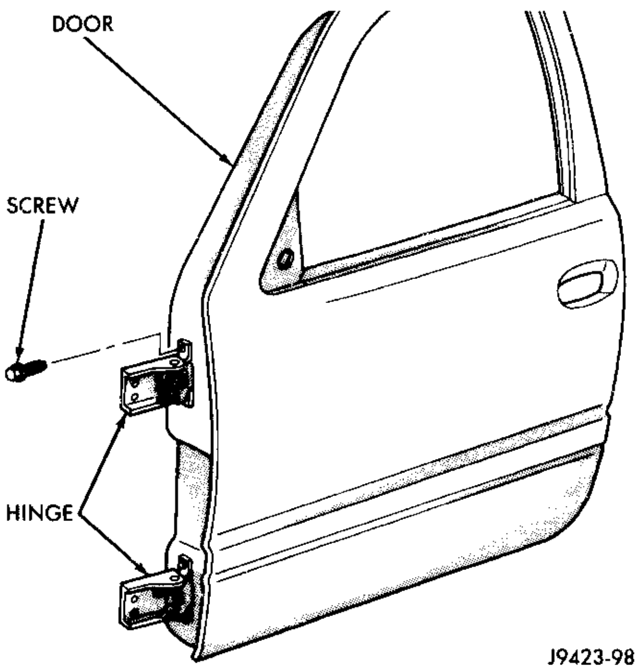

Fig. 30 Door Hinge

INSTALLATION

(1) If necessary, paint replacement door hinge before installation.
(2) Position hinge on door end frame.
(3) Align hinge using reference marks.
(4) Install bolts attaching door hinge to door end frame (Fig. 30).
(5) Install bolts attaching door hinge to hinge pillar (Fig. 29).
(6) Install hidden bolt attaching door hinge to hinge pillar (Fig. 28).
(7) Tighten hinge bolts to 28 N·m (21 ft. lbs.) torque.
(8) Remove support.
(9) Install cowl trim panel.

FRONT DOOR OUTSIDE HANDLE

REMOVAL

(1) Remove door trim panel.
(2) Remove water dam as necessary to gain access to door handle.
(3) Roll glass up.
(4) Remove fastener access plug from door end panel.
(5) Disengage clips holding latch and lock rods to door latch.
(6) Separate latch and lock rods from door latch.
(7) Remove nuts holding outside door handle retaining bracket to door handle (Fig. 31).
(8) Separate retaining bracket from door.
(9) Separate outside door handle from vehicle.

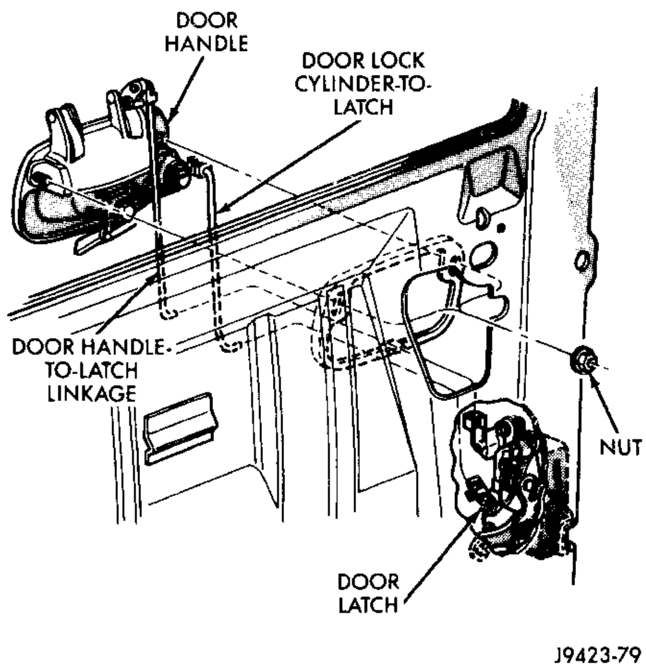

Fig. 31 Outside Door Handle

INSTALLATION

Reverse the preceding operation.

FRONT DOOR LOCK CYLINDER

REMOVAL

(1) Remove outside door handle.
(2) Remove clip holding lock cylinder to outside door handle (Fig. 32).
(3) Pull door lock from door handle.

INSTALLATION

Reverse the preceding operation.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

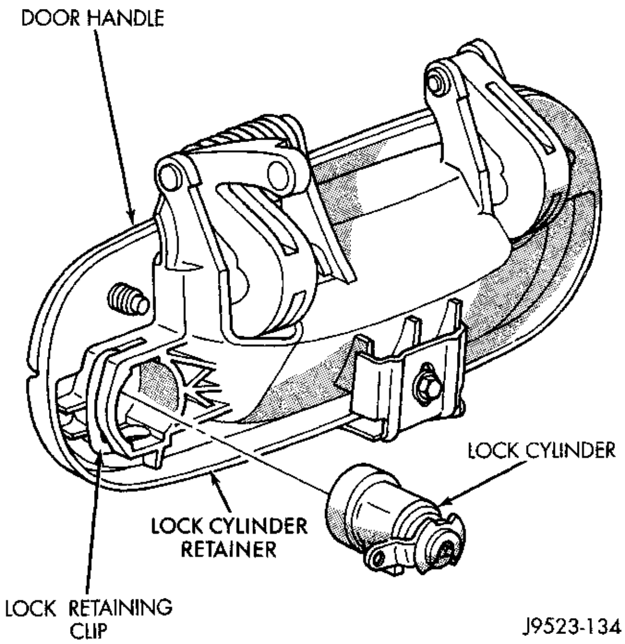

Fig. 32 Door Lock Cylinder

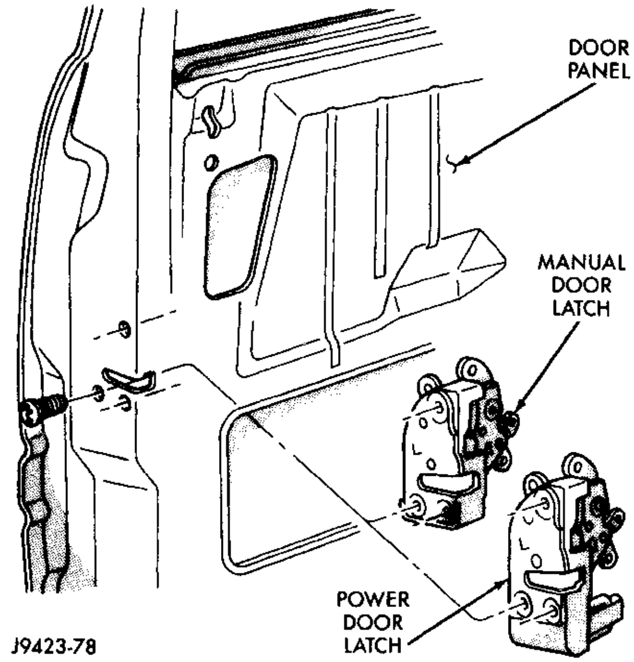

Fig. 33 Door Latch/Lock

FRONT DOOR LATCH

REMOVAL

(1) Remove door trim panel.
(2) Remove water dam.
(3) Disengage clips attaching lock and latch rods to door latch.
(4) Remove screws attaching door latch to door end panel (Fig. 33).
(5) Separate door latch/lock from vehicle.

INSTALLATION

(1) Position door latch/lock in door.
(2) Install screws attaching door latch to door end panel (Fig. 33). Tighten screws to 11 N·m (8 ft. lbs.) torque.
(3) Engage clips attaching lock and latch rods to door latch.
(4) Install water dam.
(5) Install door trim panel.

FRONT DOOR LATCH STRIKER

REMOVAL

(1) Release door latch and open door.
(2) Mark outline of striker base on B-pillar to aid installation.
(3) Remove screws attaching striker to B-pillar (Fig. 34).
(4) Separate striker from vehicle.

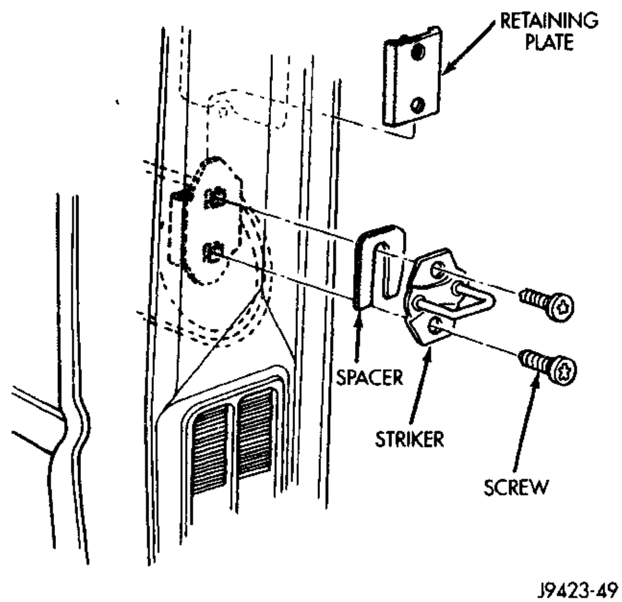

Fig. 34 Front Door Latch Striker

INSTALLATION

(1) Position striker on vehicle and align with reference marks.
(2) Install screws attaching striker to B-pillar. Tighten screws to 28 N·m (21 ft. lbs.) torque. (Fig. 34).

REMOVAL AND INSTALLATION (Continued)

FRONT DOOR INSIDE HANDLE ACTUATOR

REMOVAL

(1) Raise the window to the closed position.
(2) Remove the door trim panel and water dam.
(3) Remove the screws attaching the actuator to the door.

INSTALLATION

(1) Install the screws attaching the actuator to the door.
(2) Test handle for proper operation.
(3) Install the door water dam and trim panel.

FRONT DOOR INNER BELT WEATHERSTRIP

REMOVAL

(1) Remove door trim panel.
(2) Lift inner door belt weatherstrip upward (Fig. 35).
(3) Separate inner door belt weatherstrip from door.

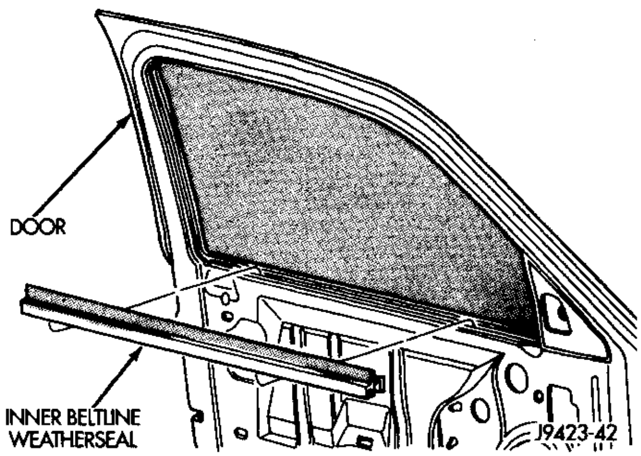

Fig. 35 Inner Door Belt Weatherstrip

INSTALLATION

Reverse the preceding operation.

FRONT DOOR OUTER BELT WEATHERSTRIP

REMOVAL

(1) Roll door glass down.
(2) Remove mirror.
(3) Using a hook tool inserted into the end of the belt weatherstrip, lift upward.
(4) Separate outer door belt weatherstrip from vehicle (Fig. 36).

INSTALLATION

Reverse the preceding operation.

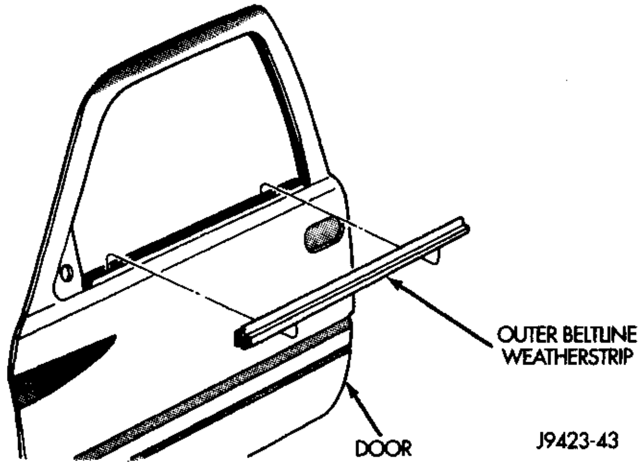

Fig. 36 Outer Door Belt Weatherstrip

FRONT DOOR GLASS

REMOVAL

(1) Remove door trim panel.
(2) Remove water dam as necessary to gain access to door glass lift plate.
(3) Remove inner door belt weatherstrip.
(4) Align door glass lift plate to access holes in inner door panel.
(5) Loosen bolts attaching front lower run channel to inner door panel.
(6) Remove nuts attaching door glass to lift plate (Fig. 37).
(7) Separate glass from lift plate.
(8) Lift glass upward and out of opening at top of door.

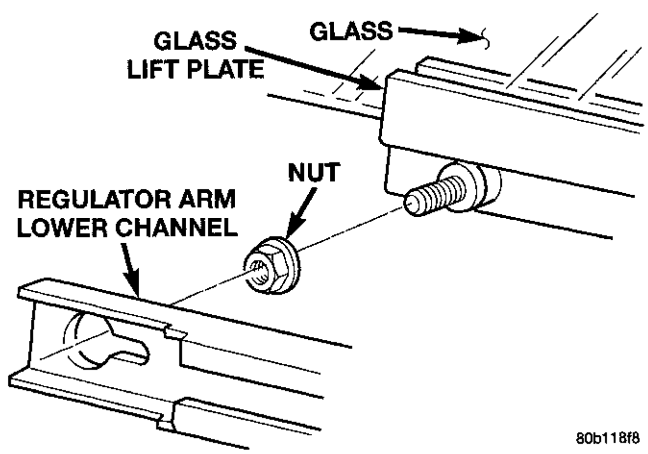

Fig. 37 Door Glass

INSTALLATION

(1) Position in door.
(2) Insert glass in lift plate.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

CAUTION: Do not exceed 11 N·m (8 ft. lbs.) torque when tightening the nuts that attach the glass to the lift plate.

(3) Install nuts attaching glass to lift plate (Fig. 37). Tighten nuts to 9 N·m (7 ft. lbs.) torque.
(4) Tighten bolts attaching front lower run channel to inner door panel.
(5) Install inner door belt weatherstrip.
(6) Install water dam.
(7) Install door trim panel.

FRONT DOOR WINDOW REGULATOR

REMOVAL

(1) Remove door trim panel.
(2) Remove water dam.
(3) Remove nuts attaching door glass to window regulator.
(4) Remove glass from door or move glass to full up position and secure glass to door with tape.
(5) Disengage power window motor wire connector from door harness, if equipped.
(6) Remove bolts attaching window regulator to inner door panel.
(7) Separate window regulator from door panel (Fig. 38).
(8) Extract window regulator through access hole in inner door panel.

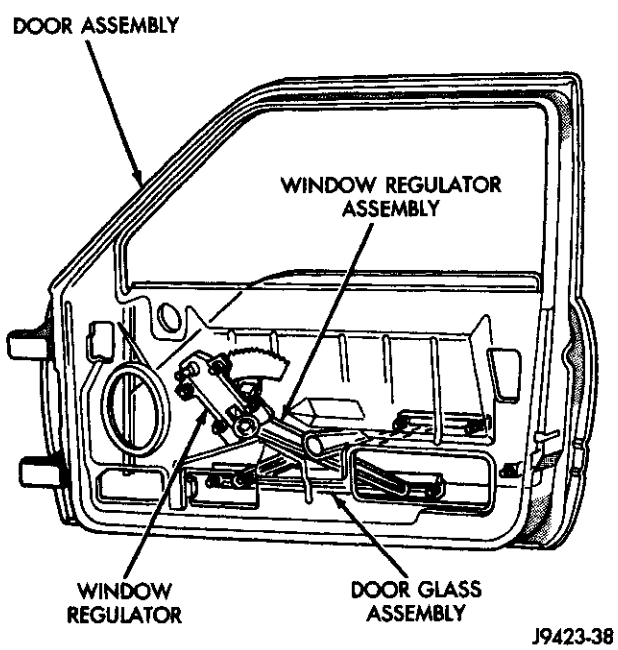

Fig. 38 Door Glass Window Regulator

INSTALLATION

(1) Position window regulator in door through access hole.
(2) Install bolts attaching window regulator to inner door panel.
(3) Engage power window motor wire connector to door harness, if equipped.
(4) Install glass in lift plate.
(5) Install water dam.
(6) Install door trim panel.

FRONT DOOR GLASS RUN LOWER CHANNELS

REMOVAL

(1) Remove door trim panel and waterdam.
(2) Roll door glass up.
(3) Remove bolts holding run channel to inner door panel (Fig. 39) and (Fig. 40).
(4) Slide channel downward to disengage it from the upper glass frame.
(5) Separate door glass run channel from door.

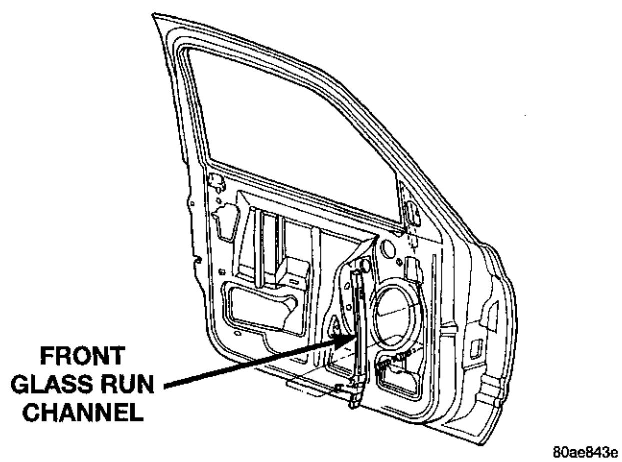

Fig. 39 Front Glass Run Lower Channel

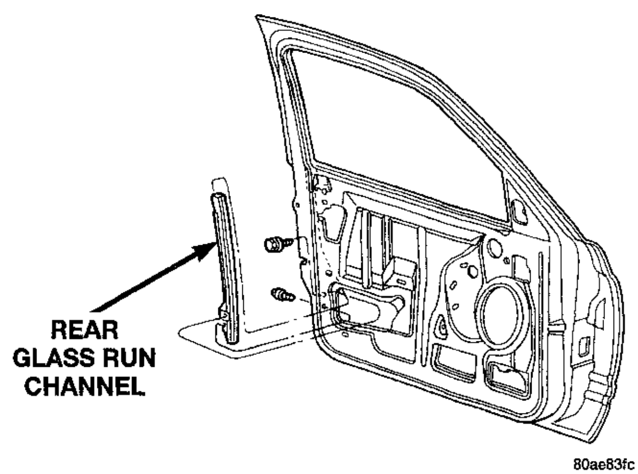

Fig. 40 Rear Glass Run Lower Channel

INSTALLATION

(1) Position door glass run channels on inner door panel.

REMOVAL AND INSTALLATION (Continued)

(2) Slide channel upward to engage it in the upper glass frame.
(3) Install bolts attaching run channels to inner door panel (Fig. 39) and (Fig. 40).
(4) Install door trim panel and waterdam.

FRONT DOOR GLASS RUN WEATHERSTRIP

REMOVAL

(1) Remove door trim panel.
(2) Remove inner door belt weatherstrip.
(3) Pull door glass run weatherstrip from channel around window opening (Fig. 41).

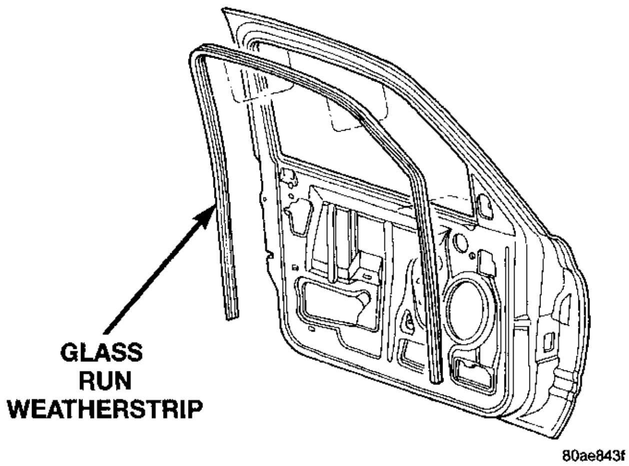

Fig. 41 Door Glass Run Weatherstrip

INSTALLATION

(1) Press door glass run weatherstrip into channel around window opening (Fig. 41).
(2) Install inner door belt weatherstrip.
(3) Install door trim panel.

DOOR OPENING SEAL

REMOVAL

(1) Remove A-pillar molding.
(2) Remove cowl panel and sill cover.
(3) Remove quarter trim panel, if equipped.
(4) Pull seal from pinch flange around door opening (Fig. 42) and (Fig. 43).

INSTALLATION

(1) Press seal onto pinch flange around door opening (Fig. 42).
(2) Connect the seal ends, if equipped.
(3) Install quarter trim panel, if equipped.
(4) Install cowl panel and sill cover.
(5) Install A-pillar molding.

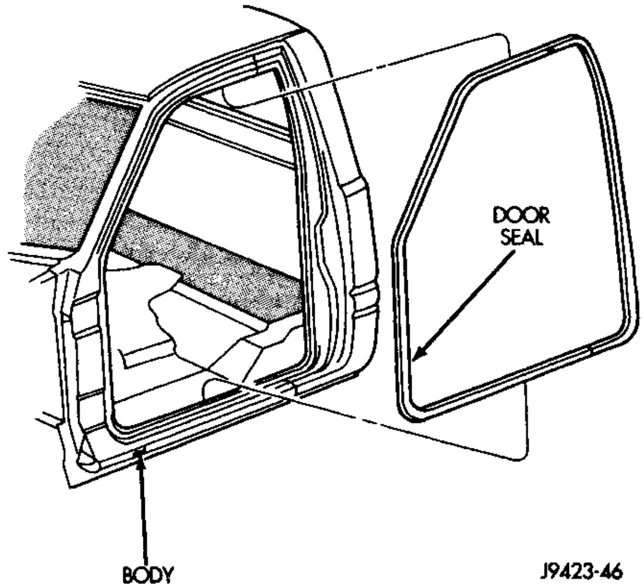

Fig. 42 Door Opening Seal—Club Cab

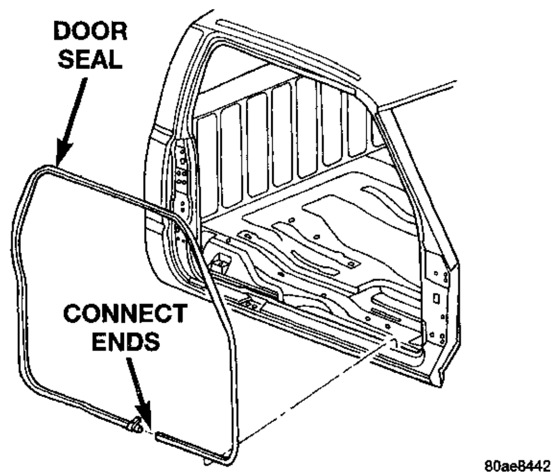

Fig. 43 Door Opening Seal—Quad Cab

B-PILLAR SECONDARY SEAL

REMOVAL

(1) Warm the seal and body metal to approximately 38°C (100°F) using a suitable heat lamp or heat gun.
(2) Pull seal from painted surface (Fig. 44).

INSTALLATION

(1) Remove adhesive tape residue from painted surface of vehicle.
(2) If seal is to be reused, remove tape residue from seal. Clean back of seal with MOPAR, Super

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

Kleen solvent or equivalent. Wipe seal dry with lint free cloth. Apply new body side moulding (two sided adhesive) tape to back of seal.

(3) Clean body surface with MOPAR, Super Kleen solvent or equivalent. Wipe surface dry with lint free cloth.

(4) Remove protective cover from tape on back of seal and apply seal to body.

(5) Heat body and seal, see step one. Firmly press seal to body surface to assure adhesion.

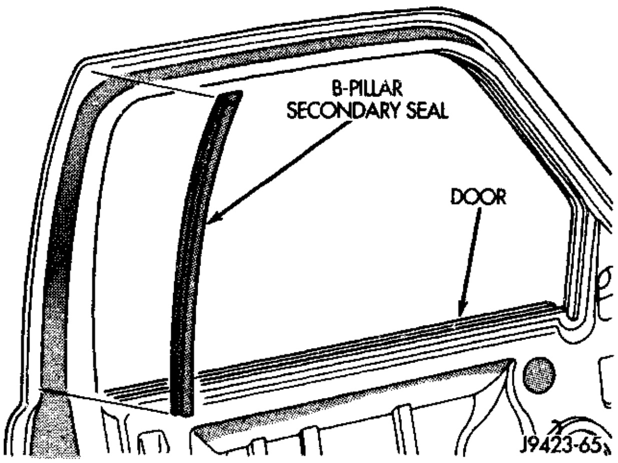

Fig. 44 B-Pillar Secondary Seal

FRONT DOOR SECONDARY SEAL

REMOVAL

(1) Remove the push-in fasteners attaching the secondary seal to the inner door panel.

(2) Separate the secondary seal from the inner door panel (Fig. 45).

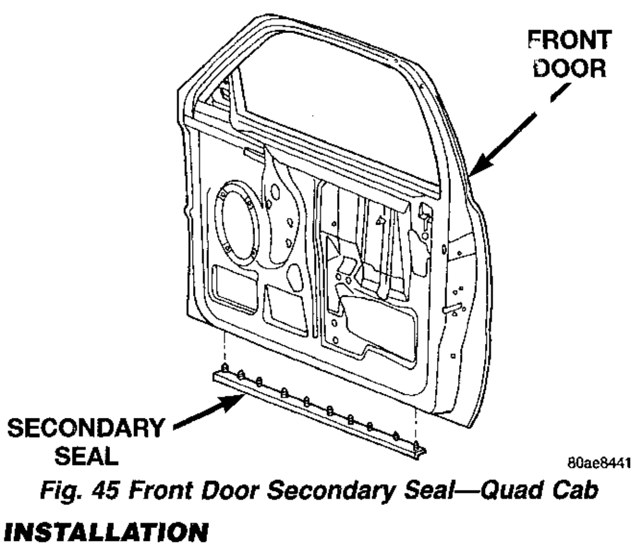

Fig. 45 Front Door Secondary Seal—Quad Cab

INSTALLATION

(1) Position the secondary seal on the inner door panel.

(2) Install the push-in fasteners attaching the secondary seal to the inner door panel.

FRONT DOOR UPPER CORNER SEAL

REMOVAL

(1) Remove the push-in fasteners attaching the upper corner seal to the front door (Fig. 46).

(2) Separate the upper corner seal from the door.

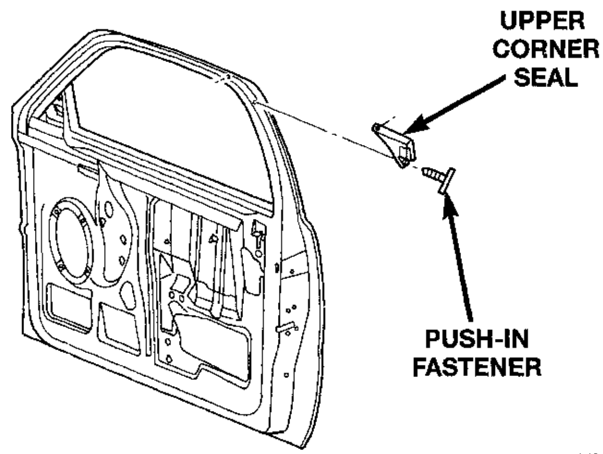

Fig. 46 Upper Corner Seal—Quad Cab

INSTALLATION

(1) Position the upper corner seal on the door.

(2) Install the push-in fasteners attaching the upper corner seal to the front door (Fig. 46).

CARGO DOOR TRIM PANEL

REMOVAL

(1) Remove the screws attaching the cargo door pull cup to the cargo door (Fig. 47).

(2) Remove the screw attaching the inside release handle to the cargo door.

NOTE: The cargo door trim panel is secured to the cargo door with spring clips and push-in fasteners (Fig. 48).

(3) Using a trim panel removal tool, remove the push-in fasteners attaching the trim panel to the cargo door.

(4) Pull the trim panel outward to disengage the spring clips.

(5) Separate the trim panel from the cargo door.

(6) Disengage the cargo door release cable from the inside release handle (Fig. 49).

INSTALLATION

(1) Engage the cargo door release cable to the inside release handle (Fig. 49).

(2) Position the trim panel on the cargo door.

(3) Align all fasteners and starting at the top of the panel, push into place to secure.

(4) Install the screw attaching the inside release handle to the cargo door.

REMOVAL AND INSTALLATION (Continued)

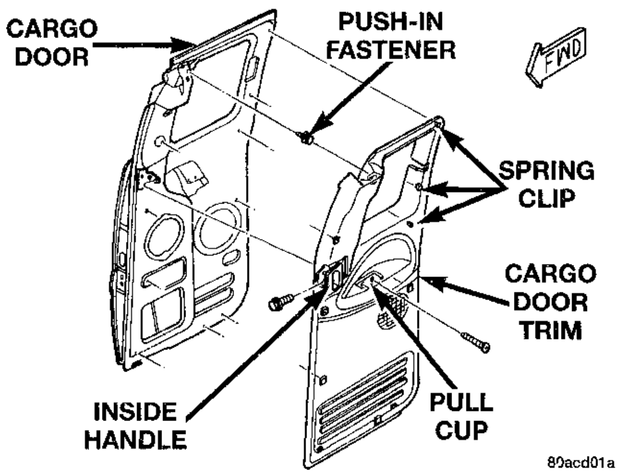

Fig. 47 Cargo Door Trim Panel

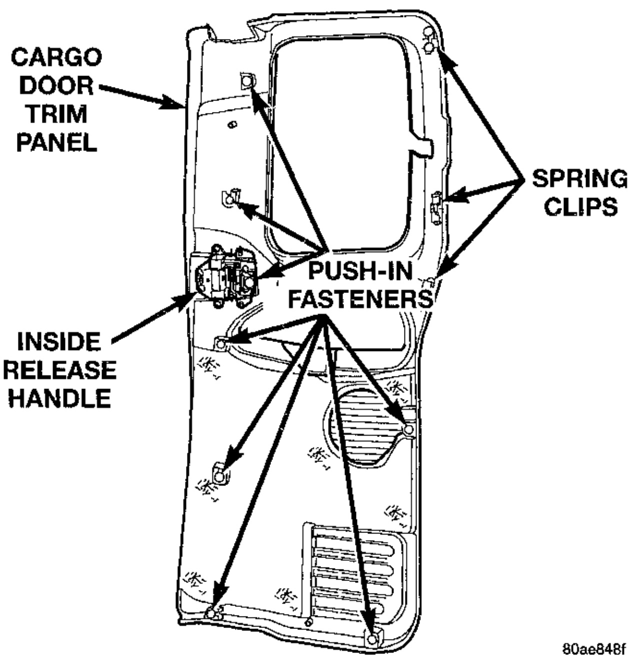

Fig. 48 Cargo Door Trim Panel Fasteners

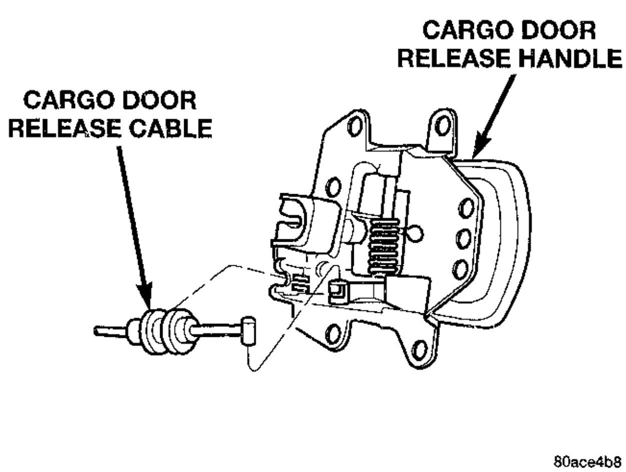

Fig. 49 Cargo Door Release Cable

(5) Install the screws attaching the cargo door pull cup to the cargo door (Fig. 47).

CARGO DOOR WATERDAM

REMOVAL

(1) Remove cargo door trim panel.
(2) Carefully peel waterdam from door (Fig. 50).

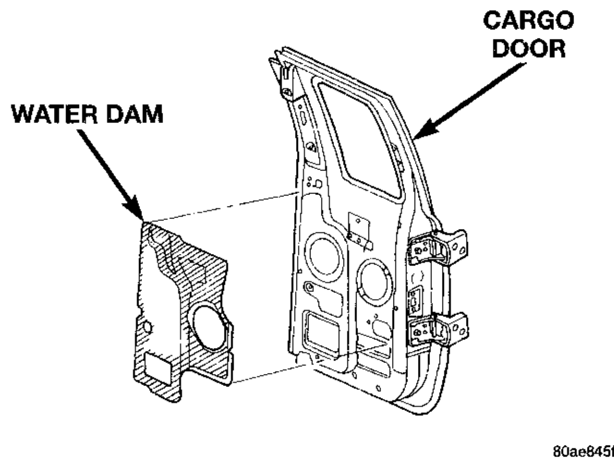

Fig. 50 Cargo Door Waterdam

INSTALLATION

If a replacement waterdam is being applied, clean cargo door inner panel with Mopar Super Clean or equivalent.

(1) Position waterdam on cargo door and press into place.
(2) install cargo door trim panel.

CARGO DOOR AIR EXHAUSTER

REMOVAL

(1) Remove cargo door trim panel.
(2) Peel back waterdam.
(3) Remove push-in fastener attaching air exhauster to cargo door inner panel (Fig. 51).
(4) Separate air exhauster from cargo door.

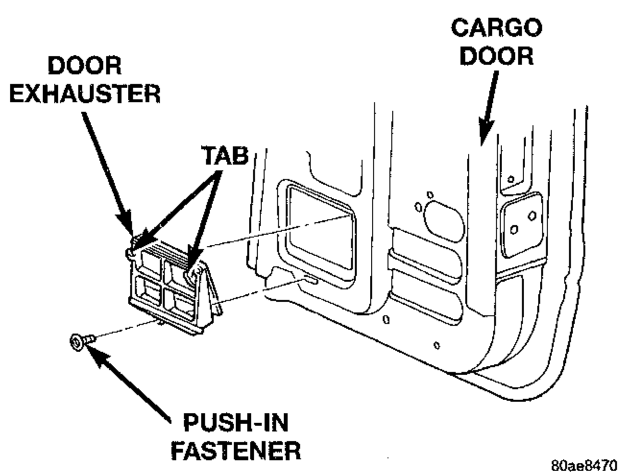

Fig. 51 Cargo Door Air Exhauster

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

INSTALLATION

(1) Position air exhauster in cargo door.
(2) Engage air exhauster upper tabs with cargo door inner panel.
(3) Install push-in fastener attaching air exhauster to cargo door inner panel (Fig. 51).
(4) Install waterdam.
(5) Install cargo door trim panel.

CARGO DOOR EXHAUST VENT

REMOVAL

(1) Using a trim stick, carefully pry bottom of vent to disengage from door (Fig. 52).
(2) Separate vent from door.

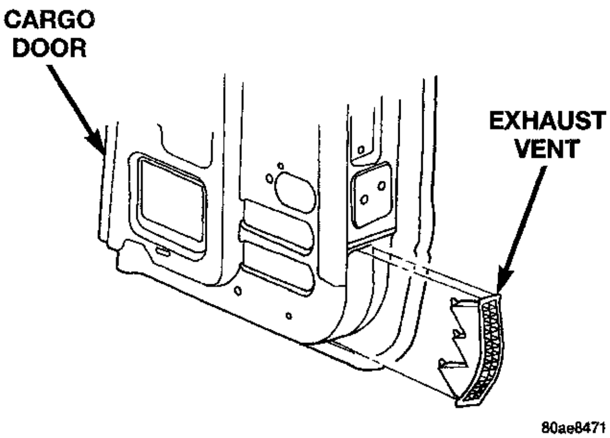

Fig. 52 Cargo Door Exhaust Vent

INSTALLATION

(1) Position upper side of vent in door opening.
(2) Slide upward until tabs on top edge are in place.
(3) Push the lower side of the vent towards the door until the tabs snap into place.
(4) Ensure vent is fully seated.

CARGO DOOR

REMOVAL

(1) Using a grease pencil or equivalent, mark the position of the hinge on the door.
(2) Remove the cargo door trim panel.
(3) Remove the cargo door check strap from the cab C-pillar.
(4) Using the access hole in the cargo door inner panel, disengage the speaker wire from the speaker and route the wire through the door.
(5) Support the cargo door on a suitable device.
(6) Remove the bolts attaching the hinges to the cargo door (Fig. 53).

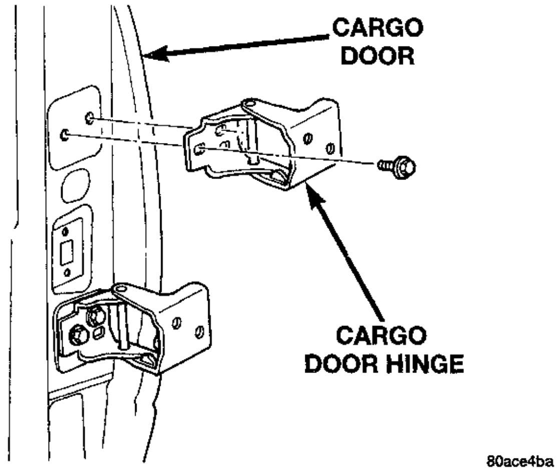

Fig. 53 Cargo Door

INSTALLATION

(1) Support the cargo door on a suitable device.
(2) Using the alignment marks, position the door at the hinge.
(3) Install the bolts attaching the hinges to the cargo door (Fig. 53). Tighten the bolts to 28 N·m (21 ft. lbs.) torque.
(4) Route the speaker wire through the door and using the access hole in the cargo door inner panel, engage the speaker wire at the speaker.
(5) Install the cargo door check strap at the cab C-pillar.
(6) Install the cargo door trim panel.

CARGO DOOR HINGE

REMOVAL

(1) Remove cargo door.
(2) Remove rear seat.
(3) Remove quarter trim panel.
(4) Remove bolts attaching hinge to C-pillar (Fig. 54).
(5) Separate hinge from vehicle.

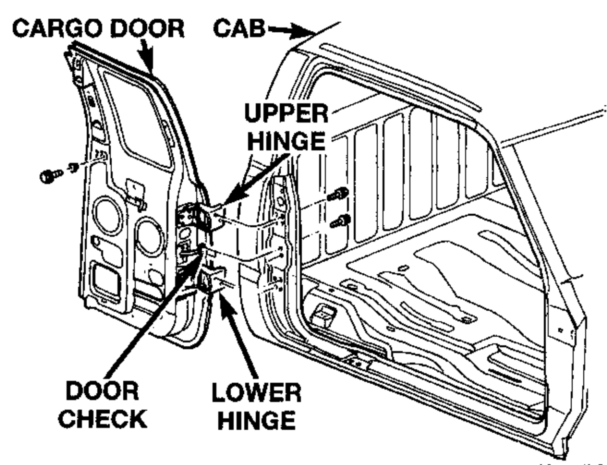

Fig. 54 Cargo Door Hinge

REMOVAL AND INSTALLATION (Continued)

INSTALLATION

(1) Position hinge on vehicle.

(2) Install bolts attaching hinge to C-pillar (Fig. 54). Tighten bolts to 28 N·m (21 ft. lbs.) torque.

(3) Install quarter trim panel.

(4) Install rear seat.

(5) Install cargo door.

CARGO DOOR DOOR CHECK

REMOVAL

(1) Remove cargo door trim panel.

(2) Remove the bolts attaching the door check to the cab C-pillar.

(3) Remove the nuts attaching the door check to the cargo door (Fig. 55).

(4) Remove the door check through the access hole in the cargo door.

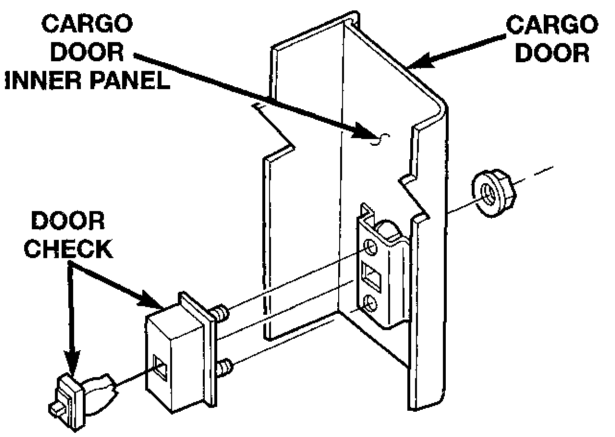

Fig. 55 Door Check

INSTALLATION

(1) Position the door check in the cargo door through the access hole.

(2) Install the nuts attaching the door check to the cargo door (Fig. 55).

(3) Install the bolts attaching the door check to the cab C-pillar.

(4) Install cargo door trim panel.

CARGO DOOR RELEASE CABLE

REMOVAL

(1) Remove cargo door trim panel.

(2) Disengage release cable from inside release handle (Fig. 56).

(3) Peel back waterdam

(4) Disengage release cable from shutface door handle (Fig. 57).

(5) Separate release cable from cargo door.

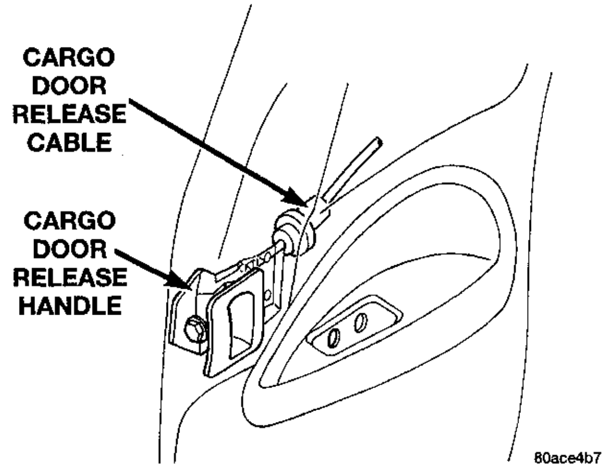

Fig. 56 Cargo Door Release Handle

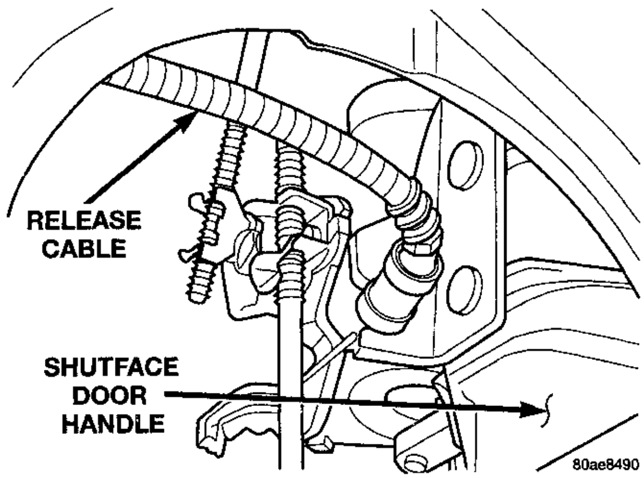

Fig. 57 Shutface Door Handle

INSTALLATION

(1) Position release cable in cargo door.

(2) Engage release cable to shutface door handle.

(3) Install waterdam

(4) Engage release cable to inside release handle.

(5) Install cargo door trim panel.

CARGO DOOR SHUTFACE HANDLE

REMOVAL

(1) Remove cargo door trim panel.

(2) Peel back waterdam.

(3) Disengage upper and lower latch release rods from shutface handle (Fig. 58).

(4) Disengage cargo door release cable.

(5) Remove screws attaching shutface handle to cargo door (Fig. 59).

(6) Separate handle from cargo door.

Mopar AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

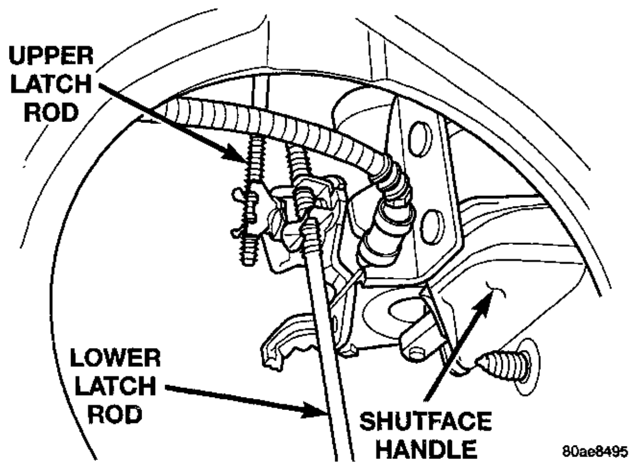

Fig. 58 Cargo Door Latch Rods

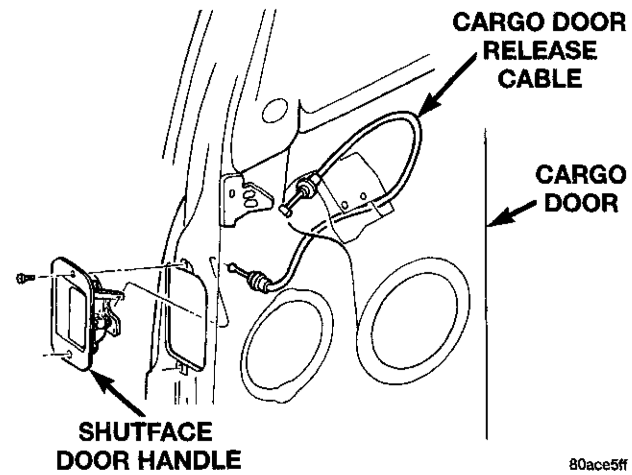

Fig. 59 Shutface Handle

INSTALLATION

(1) Position handle in cargo door.

(2) Install screws attaching shutface handle to cargo door (Fig. 59).

(3) Engage cargo door release cable.

CAUTION: When engaging upper and lower latch release rods to shutface handle, ensure the upper latch rod is pushed all the way up and the lower latch rod is pushed all the way down before engaging into the shutface handle.

(4) Engage upper and lower latch release rods to shutface handle.

(5) Cycle the shutface handle and verify operation.

(6) Install waterdam.

(7) Install cargo door trim panel.

CARGO DOOR UPPER LATCH

REMOVAL

(1) Remove cargo door trim panel.

(2) Using a grease pencil or equivalent, mark the position of the bolts.

(3) Disengage upper latch release rod from shutface handle.

(4) Remove the bolts attaching upper latch to cargo door (Fig. 60).

(5) Separate upper latch and latch rod from cargo door.

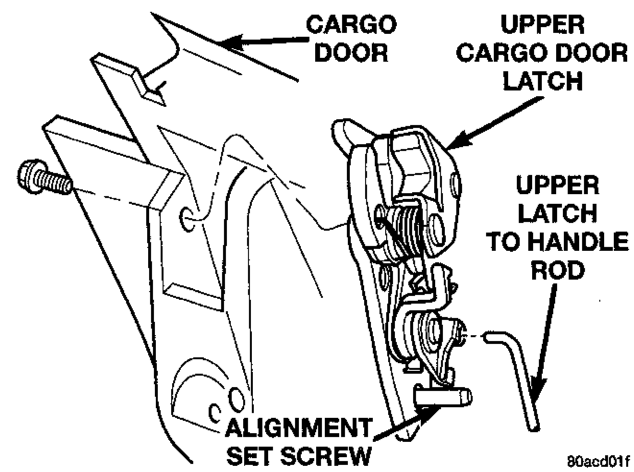

Fig. 60 Cargo Door Upper Latch

INSTALLATION

(1) The new replacement latch is supplied with an alignment set screw located in the lower mounting hole of the upper cargo door latch. If a new is latch is being installed, use the following procedure:

(a) Verify alignment set screw is fully seated in latch.

(b) Engage latch rod to latch.

(c) Position latch in cargo door with alignment set screw located in the lower hole.

(d) Align bolt with reference mark.

(e) Install upper bolt. Tighten bolt to 23 N·m (17 ft. lbs.) torque.

(f) Engage latch rod to shutface handle.

(g) Remove alignment set screw from lower hole.

(h) Align lower bolt with reference mark.

(i) Install bolt in lower hole. Tighten bolt to 23 N·m (17 ft. lbs.) torque.

CAUTION: When engaging upper latch release rod to shutface handle, ensure the latch rod is pushed all the way up before engaging into the shutface handle.

REMOVAL AND INSTALLATION (Continued)

(2) If the latch was not replaced and the existing latch is to be installed:

(a) Engage latch rod to latch.

(b) Position upper latch and latch rod in cargo door.

(c) Align bolts with reference marks.

(d) Install the bolts attaching upper latch to cargo door (Fig. 60). Tighten the bolts to 23 N·m (17 ft. lbs.) torque.

(e) Engage upper latch release rod to shutface handle.

(3) Cycle the shutface handle and verify latch operation.

(4) Install cargo door trim panel.

CARGO DOOR LOWER LATCH

REMOVAL

(1) Remove cargo door trim panel.

(2) Peel back waterdam to access air exhauster.

(3) Remove cargo door air exhauster.

(4) Disengage lower latch to shutface handle rod at shutface handle (Fig. 61).

(5) Remove nuts attaching lower latch to cargo door.

(6) Separate lower latch and latch rod from cargo door.

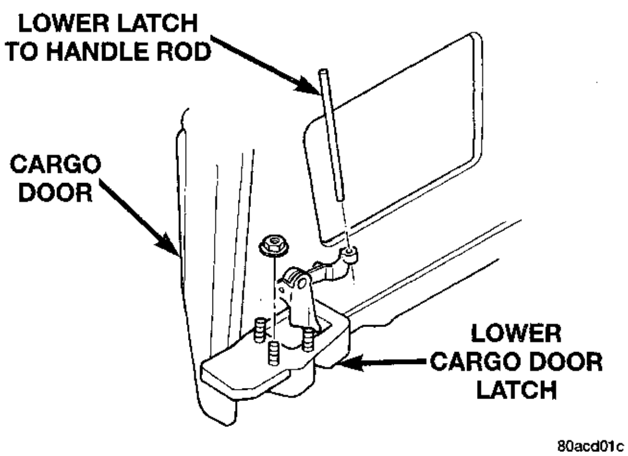

Fig. 61 Cargo Door Lower Latch

INSTALLATION

(1) If installing a new replacement latch:

(a) Engage latch rod to latch rod retaining clip in lower latch. Ensure "white" latch installation pin is in the position closest to the latch release lever (Fig. 62).

(2) If the latch was not replaced and the existing latch is to be installed:

(a) Slide "white" latch installation pin to the position closest to the latch release lever.

(3) Position lower latch and latch rod in cargo door.

(4) Install nuts attaching lower latch to cargo door. Tighten nuts to 12 N·m (9 ft. lbs.) torque (Fig. 61).

(5) Engage latch rod to latch rod retaining clip in lower latch.

CAUTION: When engaging lower latch release rod to shutface handle, ensure lower latch rod is pushed all the way down before engaging to the handle.

(6) Engage lower latch rod to shutface handle

(7) Cycle the shutface handle and verify latch operation.

(8) Install cargo door air exhauster.

(9) Install waterdam.

(10) Install cargo door trim panel.

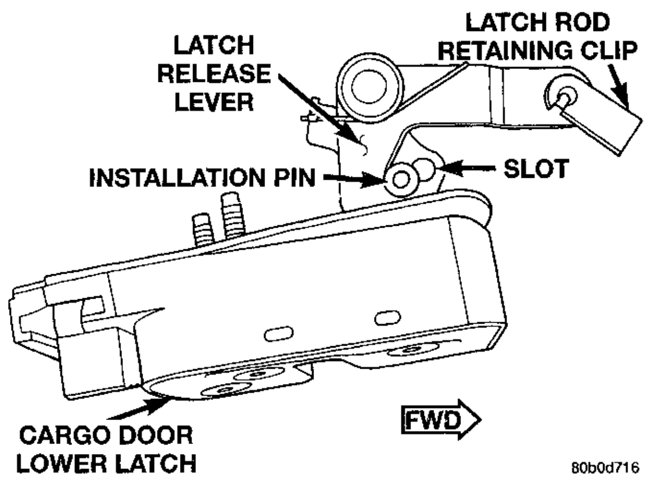

Fig. 62 Cargo Door Lower Latch Installation Pin

CARGO DOOR UPPER STRIKER

REMOVAL

(1) Remove screws attaching striker trim cover to roof.

(2) Remove bolts attaching striker to roof (Fig. 63).

(3) Separate upper striker from roof.

INSTALLATION

(1) Position upper striker on roof.

(2) Install bolts attaching striker to roof (Fig. 63). Tighten bolts to 23 N·m (17 ft. lbs.) torque.

(3) Install the screws attaching striker trim cover to roof.

CARGO DOOR LOWER STRIKER

REMOVAL

(1) Using a grease pencil or equivalent, mark the position of the lower striker on the sill.

(2) Remove the torx screws attaching the striker to the sill (Fig. 63).

(3) Separate striker from sill.

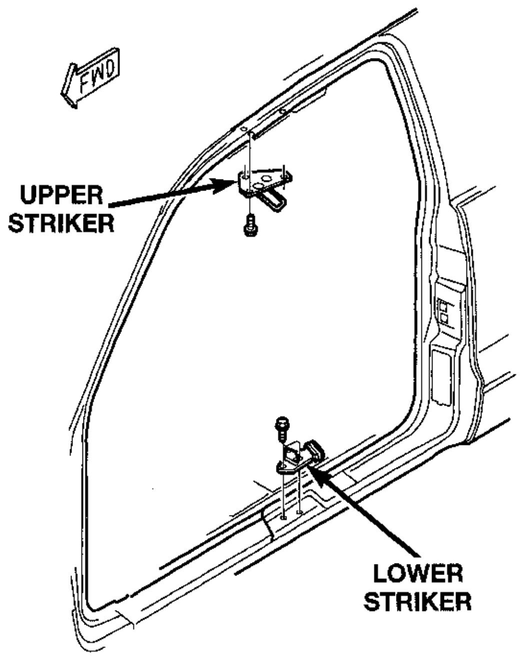

Fig. 63 Cargo Door Strikers

INSTALLATION

(1) Using the alignment marks, position striker on sill.

(2) Install the torx screws attaching the striker to the sill (Fig. 63). Tighten screws to 28 N·m (21 ft. lbs.) torque.

CARGO DOOR INSIDE HANDLE ACTUATOR

REMOVAL

NOTE: The cargo door inside handle actuator is heat staked to the trim panel (Fig. 64).

(1) Remove trim panel from cargo door.

(2) Disengage release cable from inside handle.

(3) Using a small file, drummel tool or die grinder, remove the melted material securing the handle to the trim panel.

(4) Separate the handle from the trim panel.

INSTALLATION

(1) Position the handle in the trim panel.

(2) Using a soldering gun, and using the additional studs, heat stake the handle to the trim panel.

(3) Engage release cable to inside handle.

(4) Install cargo door trim panel.

CARGO DOOR VENT WINDOW

REMOVAL

(1) Remove cargo door trim panel.

(2) Remove the screws attaching the latch to the cargo door (Fig. 65).

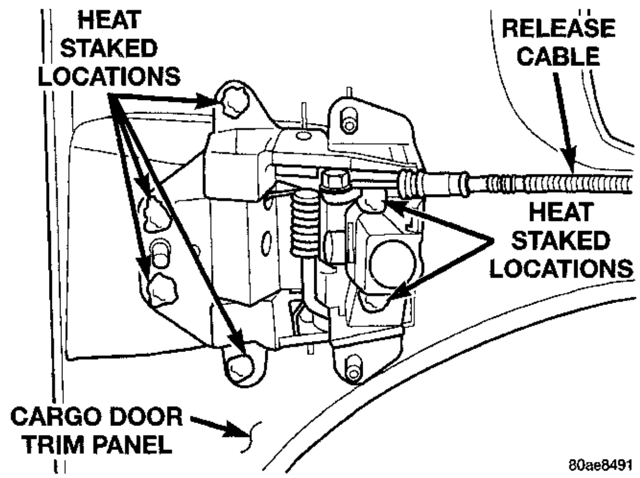

Fig. 64 Heat Staked Locations

(3) Remove the bolts attaching the vent glass to the cargo door (Fig. 66).

(4) Remove the glass from the door.

(5) If necessary, remove the latch from the glass.

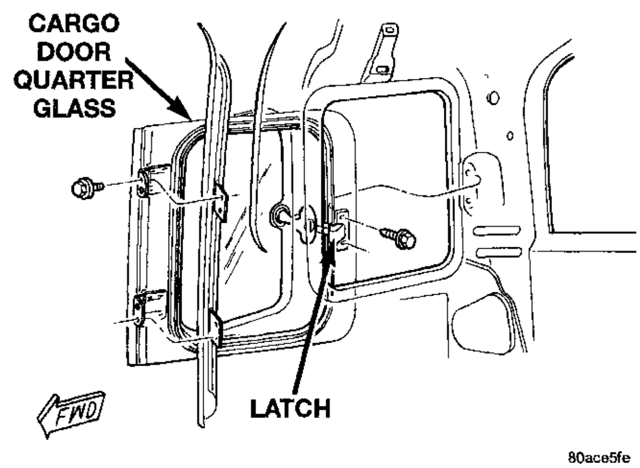

Fig. 65 Cargo Door Quarter Glass Vent Window Latch

INSTALLATION

(1) If removed, install the latch to the glass. Tighten the screw with 5 N·m (45 in. lbs.) torque.

(2) Center the glass in the cargo door opening.

(3) Install the bolts attaching the vent glass to the cargo door.

(4) Install the screws attaching the latch to the cargo door.

(5) Install cargo door trim panel.

CARGO DOOR VENT WINDOW WEATHERSTRIP

REMOVAL

(1) Remove the vent window.

(2) Peel the weatherstrip from the glass.

(3) Separate the weatherstrip from the cargo door.

AUTHENTIC RESTORATION PRODUCTS

REMOVAL AND INSTALLATION (Continued)

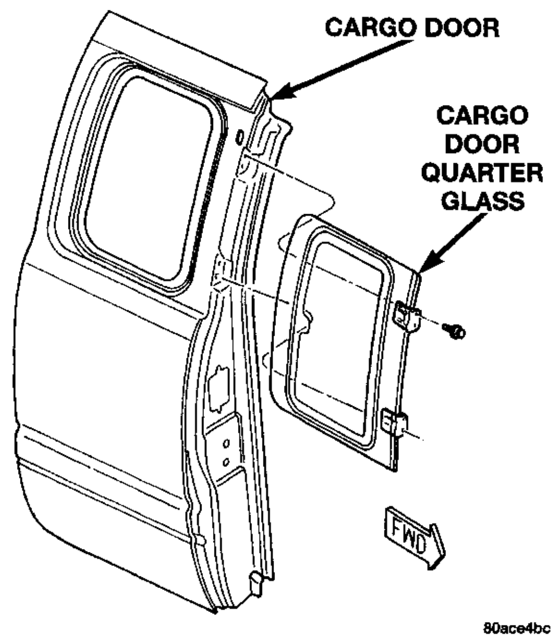

Fig. 66 Cargo Door Quarter Glass Vent Window

INSTALLATION

(1) Position the weatherstrip on the glass.
(2) Press the weatherstrip to seat.
(3) Install the vent window.

CARGO DOOR PRIMARY SEAL

REMOVAL

(1) Remove the push-in fasteners attaching the primary seal to the cargo door. (Fig. 67)
(2) Separate the seal from the door.

INSTALLATION

(1) Position the seal on the door.
(2) Install the push-in fasteners attaching the primary seal to the cargo door. (Fig. 67)

CARGO DOOR SECONDARY SEAL

REMOVAL

(1) Remove the push-in fasteners attaching the secondary seal to the inner cargo door panel.
(2) Separate the secondary seal from the inner cargo door panel (Fig. 68).

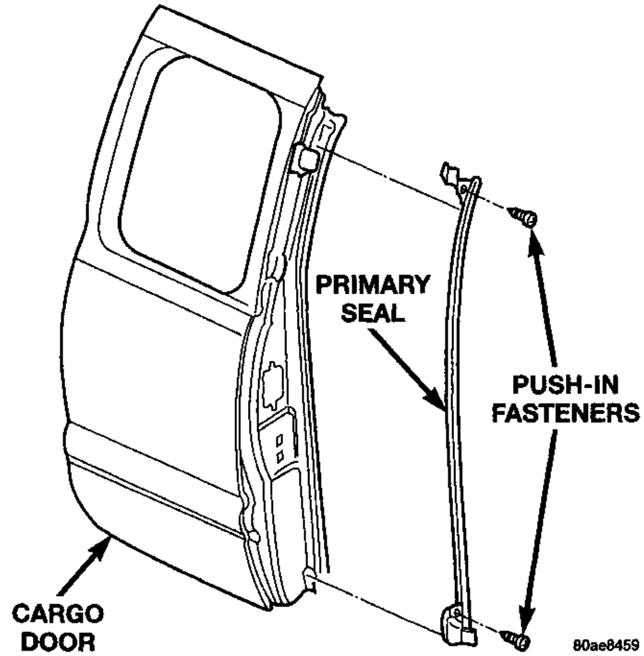

Fig. 67 Cargo Door Primary Seal

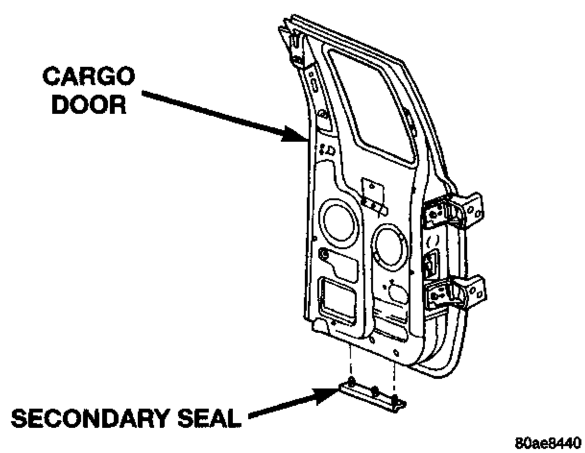

Fig. 68 Cargo Door Secondary Seal

INSTALATION

(1) Position the secondary seal on the inner cargo door panel.
(2) Install the push-in fasteners attaching the secondary seal to the inner cargo door panel.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

ROOF RAIL WEATHERSTRIP AND RETAINER

REMOVAL

(1) Release door latch and open door(s).

(2) Starting from rearward end of weatherstrip, slide weatherstrip out of retainer (Fig. 69).

(3) Remove screws attaching retainer to roof rail (Fig. 70).

(4) Separate retainer from vehicle.

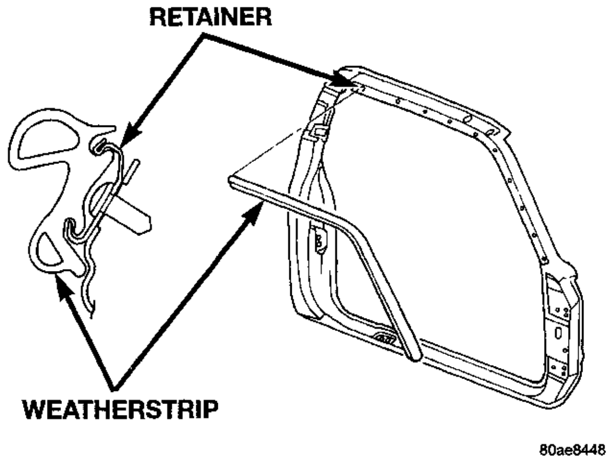

Fig. 69 Roof Rail Weatherstrip—Quad Cab

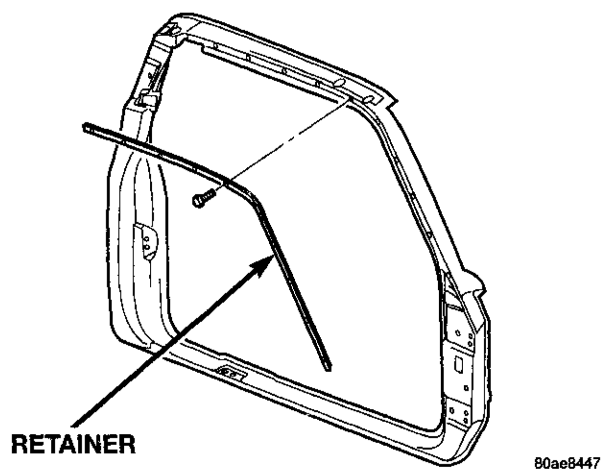

Fig. 70 Roof Rail Weatherstrip Retainer—Quad Cab

INSTALLATION

(1) If removed, install screws attaching retainer to roof rail (Fig. 70).

(2) Starting at the forward end of retainer and working rearward, slide weatherstrip into the retainer (Fig. 69).

(3) Peel the carrier from forward end of the weatherstrip and press to secure.

ROOF JOINT MOLDING

REMOVAL

(1) Warm the roof joint molding and roof panel to approximately 38°C (100°F) using a suitable heat lamp or heat gun.

(2) Pull molding from roof joint (Fig. 71), (Fig. 72) and (Fig. 73).

INSTALLATION

(1) Remove adhesive tape residue from roof joint.

(2) If molding is to be reused, remove tape residue from back of molding. Clean molding with MOPAR, Super Kleen solvent or equivalent. Wipe molding dry with lint free cloth. Apply new body side molding (two sided adhesive) tape to back of molding.

(3) Clean roof joint with MOPAR, Super Kleen solvent or equivalent. Wipe dry with lint free cloth.

(4) Remove protective cover from tape on back of molding and apply molding to roof joint.

(5) Heat roof and molding, see step one. Firmly press molding into roof joint to assure adhesion.

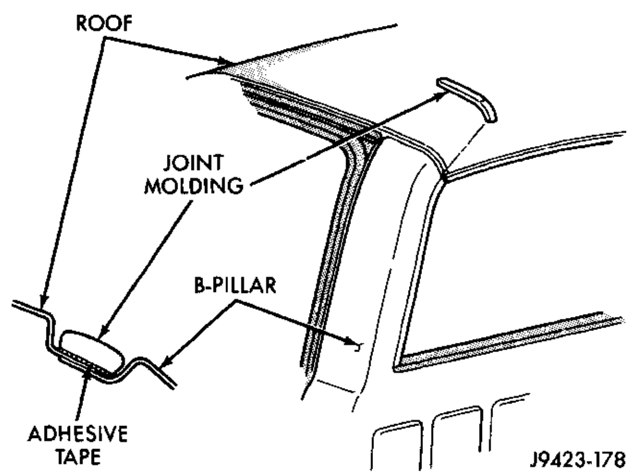

Fig. 71 Roof Joint Molding—Conventional Cab

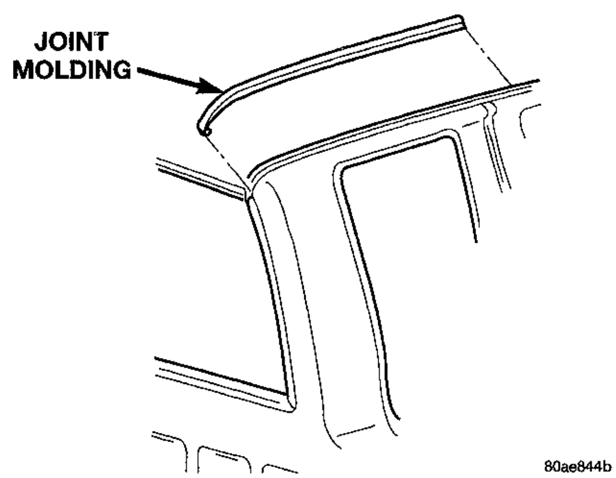

Fig. 72 Roof Joint Molding—Club Cab

AUTHENTIC RESTORATION

REMOVAL AND INSTALLATION (Continued)

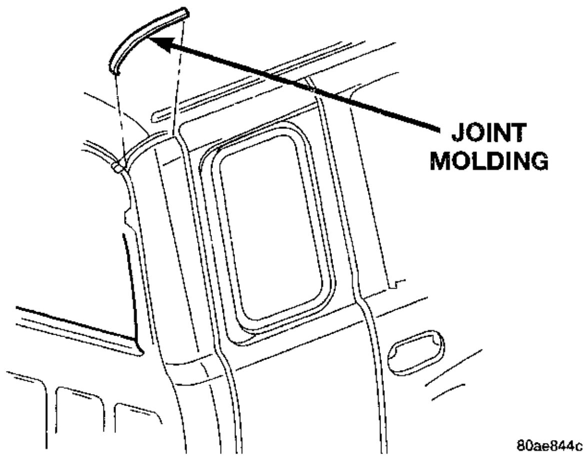

Fig. 73 Roof Joint Molding—Quad Cab

QUARTER VENT WINDOW—CLUB CAB

REMOVAL

(1) Remove quarter trim panel.
(2) Remove the latch retaining screws from the cab rear side panel (Fig. 74).
(3) Remove the frame/hinge retaining nuts from the B-pillar.
(4) Remove the window glass from the cab.
(5) If necessary, remove the latch from the glass.

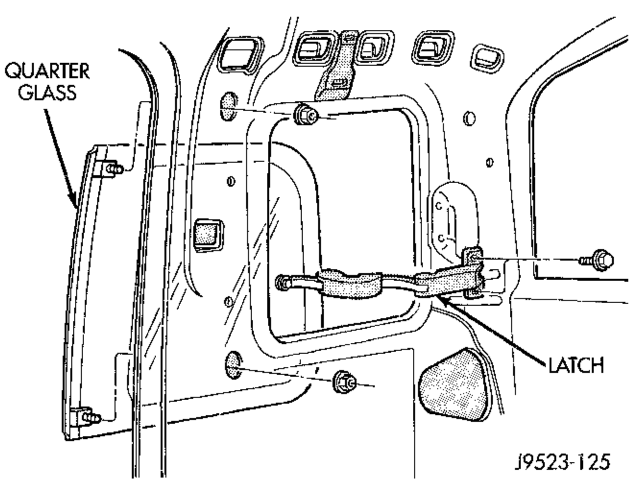

Fig. 74 Vent Window—Club Cab

INSTALLATION

(1) If removed, install the latch to the glass. Tighten the screw with 6 N·m (60 in. lbs.) torque.
(2) Center the window glass at the opening, insert the hinge studs in the B-pillar holes, and install the retaining nuts. Tighten the nuts with 11 N·m (95 in. lbs.) torque.
(3) Attach the latch to the rear side panel with the screws. Tighten the screws with the latch in the lock position and pushing rearward on the latch. Tighten the screws with 11 N·m (95 in. lbs.) torque.
(4) Test the vent window for water leaks.
(5) Install quarter trim panel.

QUARTER VENT WINDOW WEATHERSTRIP

REMOVAL

(1) Remove the window. If necessary, refer to the removal procedure.
(2) Pull the seal away from the flange around the perimeter of the window opening (Fig. 75).
(3) Clean the flange as necessary.

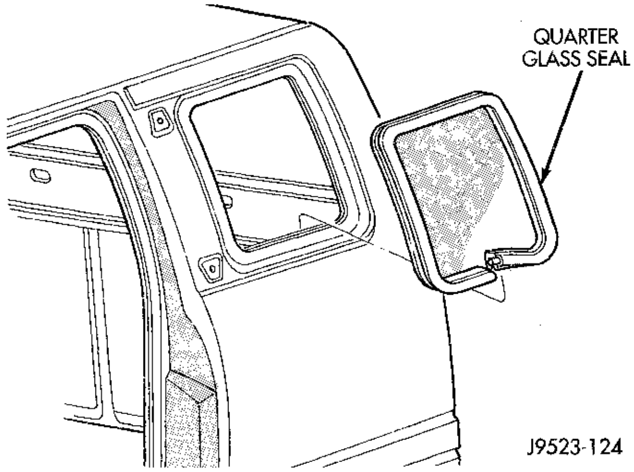

Fig. 75 Weatherstrip Seal Removal/Installation

INSTALLATION

(1) Center and butt the seal ends together at the bottom, centerline of the opening.
(2) Mate the seal with the bottom flange.
(3) Mate the seal with the front, vertical flange.
(4) Move upward and mate the seal with the top flange.
(5) Mate the seal with the rear, vertical flange.

BODY VENT

REMOVAL

(1) Release door latch and open door.
(2) Pull outward at top of vent to disengage clips holding vent to door jamb (Fig. 76).
(3) Separate vent from vehicle.

INSTALLATION

Reverse the preceding operation.

TAPE STRIPE

REMOVAL

(1) If the panel that is being serviced is not going to be refinished, apply a length of masking tape parallel to the edge of the original tape stripe to aid installation.
(2) Warm the panel to approximately 38°C (100°F) using a suitable heat lamp or heat gun.
(3) Peel tape stripe (Fig. 77) from body panel using an even pressure pull.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

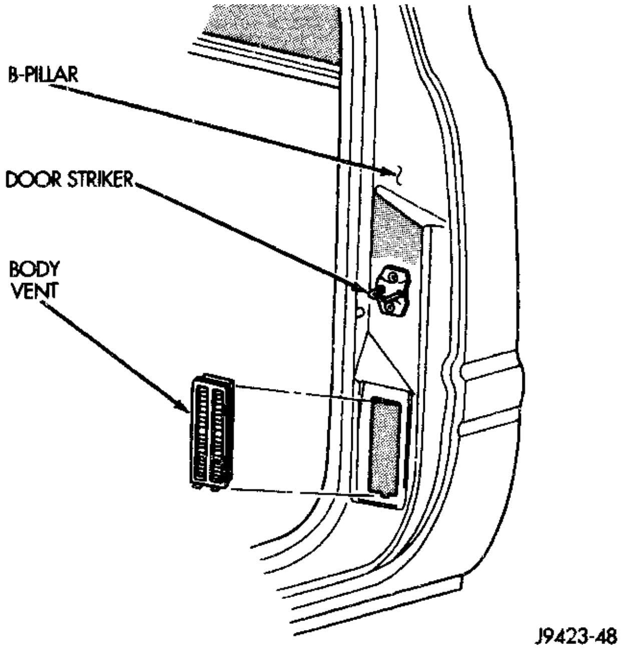

Fig. 76 Body Vent

(4) Remove adhesive residue from body panel using a suitable adhesive removing solvent.

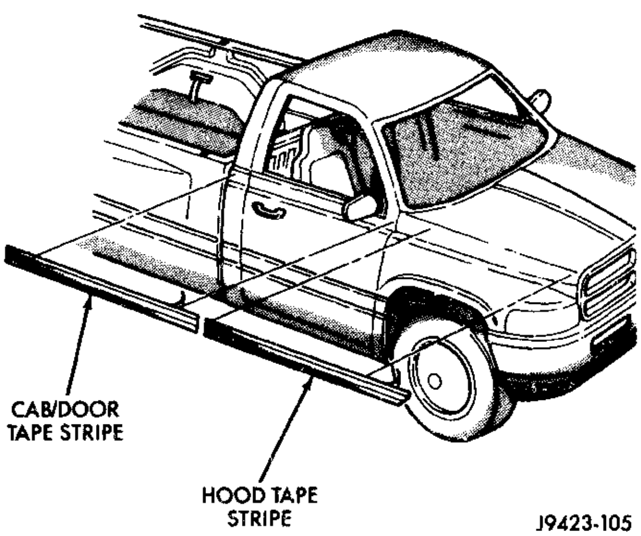

Fig. 77 Tape Stripe Overlay

INSTALLATION

The painted surface of the body panel to be covered by a tape stripe overlay must be smooth and completely cured before overlay can be applied. If painted surface is not smooth, wet sand with 600 grit wet/dry sand paper until surface is smooth. Ripples and feather edging will read through overlay if surface is not properly prepared. Clean all residue from surface.

Installation equipment:

- Pail filled with mild dish soap solution.
- Lint free applicator cloth or sponge.
- Body putty applicator squeegee.
- Heat gun or sun lamp.
- Razor knife.

(1) Spread replacement tape stripe overlay across a smooth flat work surface, finish side down.

(2) Peel paper backing away from overlay exposing adhesive back of overlay.

(3) Apply soap solution liberally to adhesive back of overlay.

(4) Apply soap solution liberally to body panel surface.

(5) Place overlay into position on body panel. Smooth out wrinkles by pulling lightly on edges of overlay until it lays flat on painted surface.

(6) Push air pockets from under overlay to the perimeter of the panel from the center of the overlay out.

(7) Squeegee soap solution and air bubbles from behind overlay from the center of the panel out using a body putty applicator squeegee (Fig. 78).

CAUTION: Do not cut into painted surface of body panel when trimming overlay to size.

(8) Trim overlay to size using a razor knife. Leave at least 13 mm (0.5 in.) for edges of doors and openings.

CAUTION: Do not overheat overlay when performing step 9.

(9) Apply heat to overlay to evaporate residual moisture from edges of overlay and to allow overlay to be stretched into concave surfaces.

(10) Edge turn overlay around doors or fenders.

(11) Install exterior trim if necessary.

(12) Small air or water bubbles under overlay can be pierced with a pin and smoothed out.

BODY SIDE MOLDINGS

REMOVAL

(1) Warm the effected stick-on molding and body metal to approximately 38°C (100°F) using a suitable heat lamp or heat gun.

(2) Pull stick-on molding from painted surface (Fig. 79), (Fig. 80) and (Fig. 81).

INSTALLATION

(1) Clean body surface with MOPAR Super Kleen solvent or equivalent. Wipe surface dry with lint free cloth.

REMOVAL AND INSTALLATION (Continued)

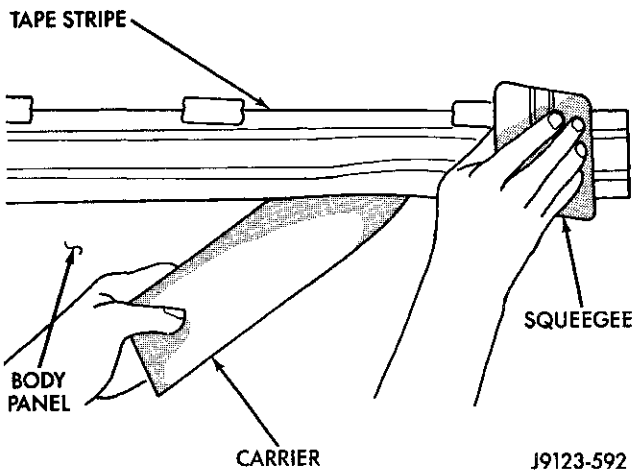

Fig. 78 Tape Stripe Application

(2) Apply a length of masking tape on the body, parallel to the top edge of the molding to use as a guide, if necessary.

(3) Remove protective cover from tape on back of molding. Apply molding to body below the masking tape guide.

(4) Remove masking tape guide and heat body and molding, see step one. Firmly press molding to body surface to assure adhesion.

FUEL FILL DOOR

REMOVAL

(1) Open fuel fill door.

(2) Remove bolts holding fuel fill door to cargo box quarter panel (Fig. 82).

(3) Separate fuel fill door from vehicle.

INSTALLATION

Reverse the preceding operation.

REAR SPLASH SHIELDS

REMOVAL

(1) Remove plastic rivets holding rear splash shield to rear wheel opening lip (Fig. 83).

(2) Remove plastic rivets holding rear splash shield to rear wheelhouse.

(3) Separate splash shield from vehicle.

INSTALLATION

(1) Position splash shield in wheelhouse opening.

(2) Install plastic rivets holding rear splash shield to rear wheelhouse.

(3) Install plastic rivets holding rear splash shield to rear wheel opening lip.

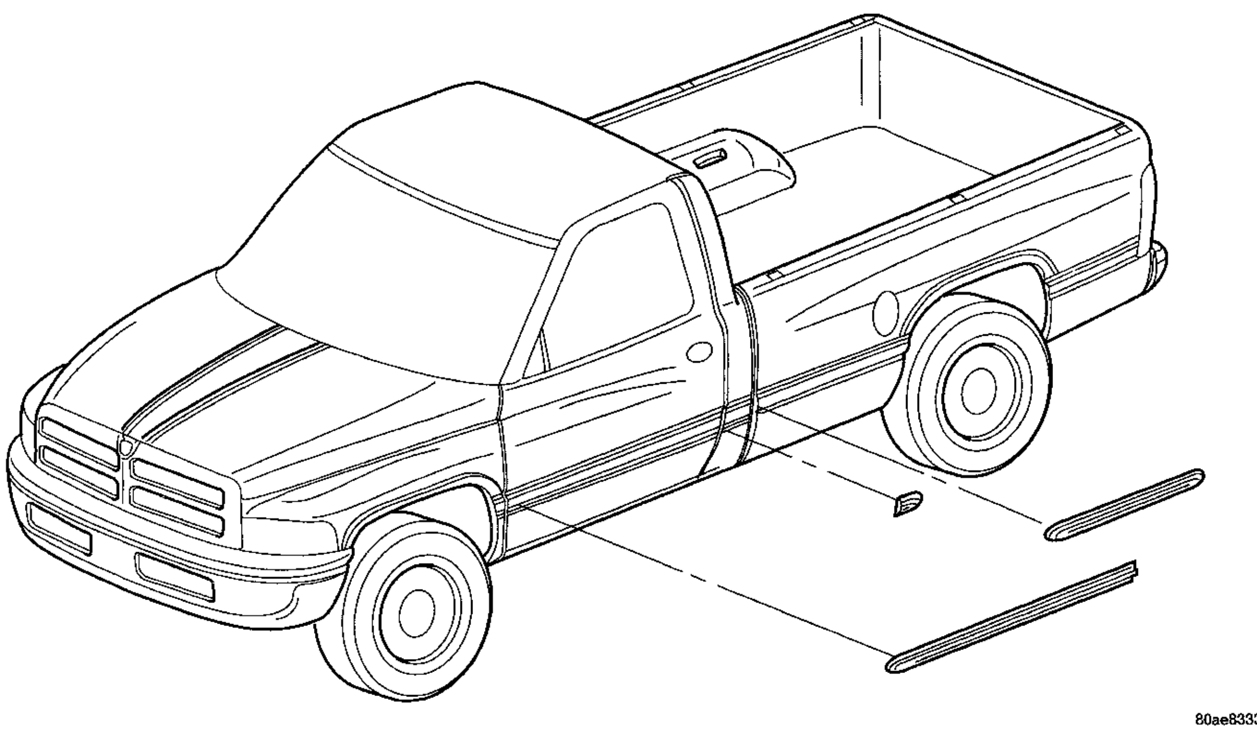

Fig. 79 Body Side Moldings—Conventional Cab

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

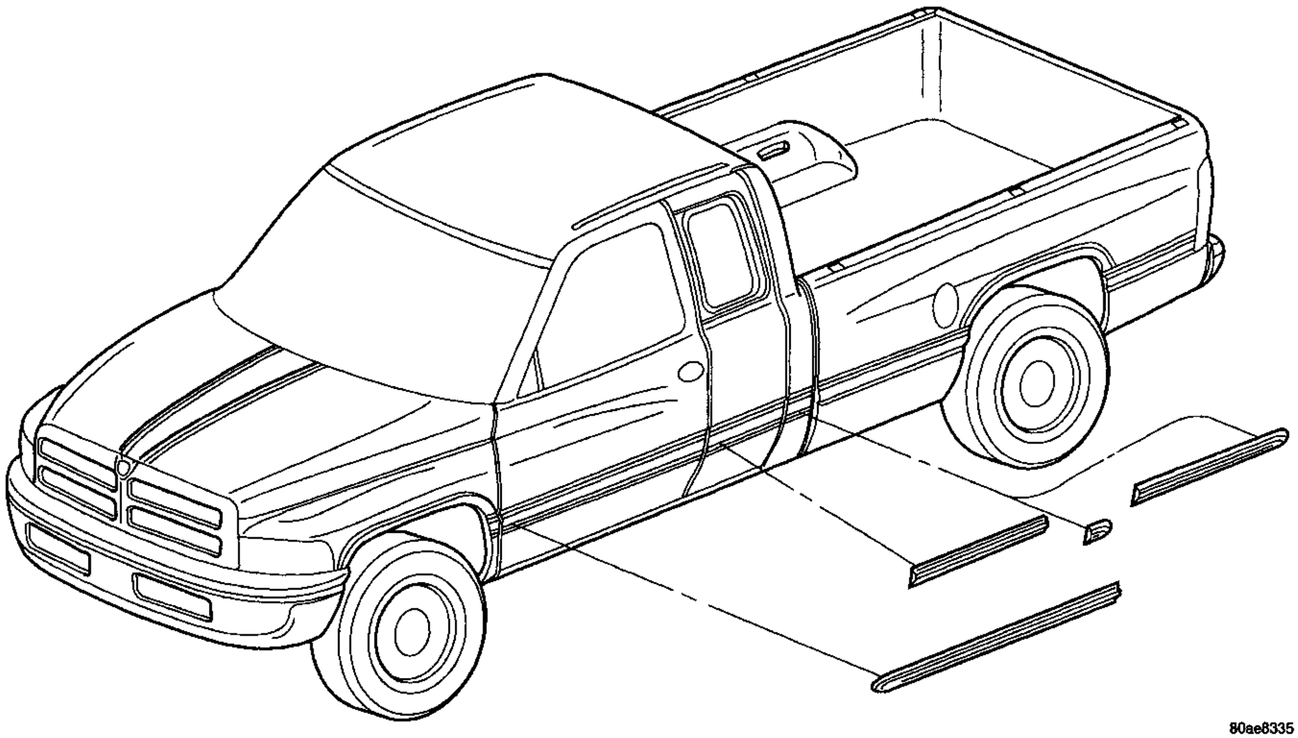

Fig. 80 Body Side Moldings—Club/Quad Cab

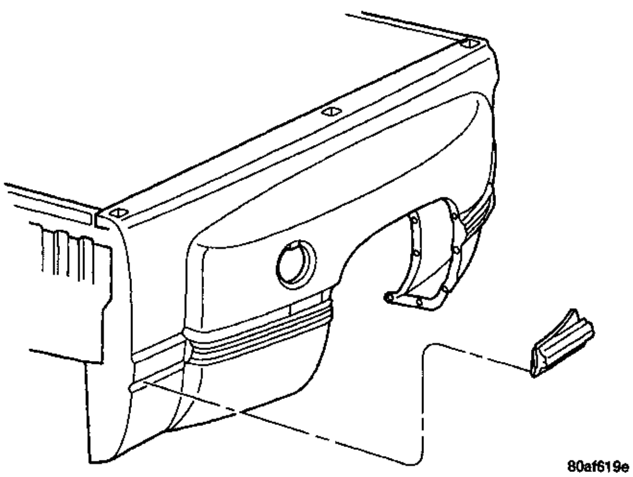

Fig. 81 Body Side Moldings—Dual Wheel

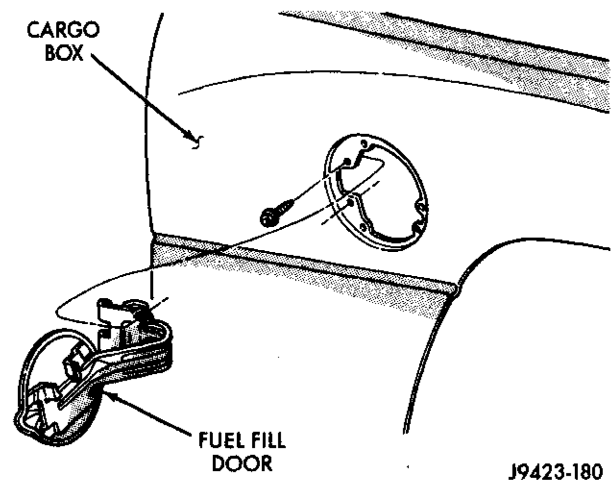

Fig. 82 Fuel Fill Door

REAR WHEELHOUSE LINER

REMOVAL

(1) Remove plastic rivets holding rear wheelhouse liner to rear wheel opening lip (Fig. 84).

(2) Remove plastic rivets holding rear wheelhouse liner to rear wheelhouse.

(3) Separate rear wheelhouse liner form vehicle.

INSTALLATION

(1) Position rear wheelhouse liner in wheelhouse opening.

(2) Install plastic rivets holding rear wheelhouse liner to rear wheelhouse.

(3) Install plastic rivets holding rear wheelhouse liner to rear wheel opening lip.

REMOVAL AND INSTALLATION (Continued)

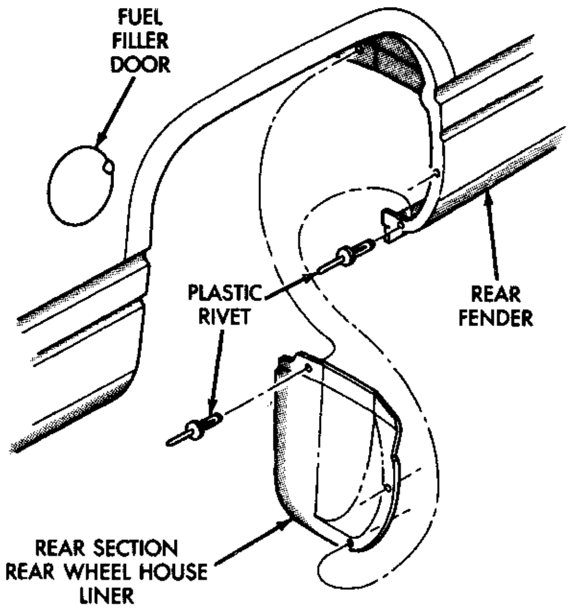

Fig. 83 Rear Splash Shields

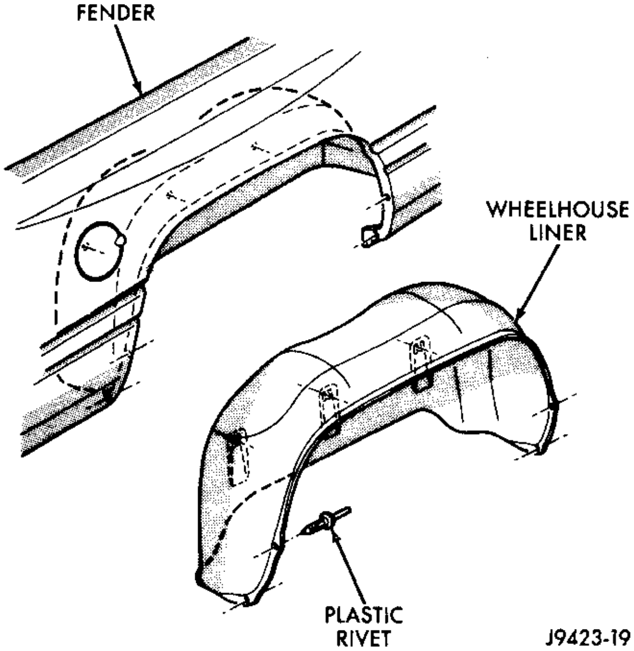

Fig. 84 Rear Wheelhouse Liner

REAR FENDER (DUAL REAR WHEELS)

REMOVAL

(1) Open fuel fill door, left side only.

(2) Remove screws holding fuel fill neck to rear fender opening.

(3) Remove tail lamp, refer to Group 8L, Lamps for proper procedures.

(4) Remove nuts holding rear fender to cargo box side panel through tail lamp opening.

(5) Remove clearance lamps, refer to Group 8L, Lamps for proper procedures.

(6) Remove sockets from clearance lamps.

(7) Remove bolts holding bottom of fender to cargo box forward of rear wheel.

(8) Remove bolts holding bottom of fender to cargo box rearward of rear wheel.

(9) Remove rear wheelhouse splash shields and liner

(10) Remove nuts holding front of rear fender to cargo box from behind side panel forward of wheelhouse.

(11) Remove screws holding access panel to top of wheelhouse.

(12) Remove nuts holding rear fender to cargo box through access hole in to of wheelhouse.

(13) Separate rear fender from cargo box side panel (Fig. 85).

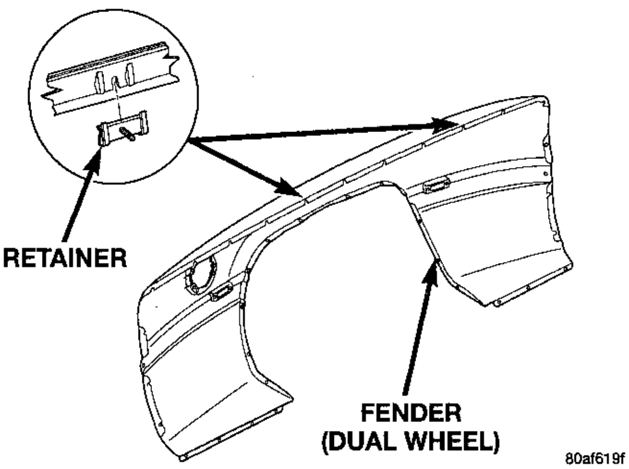

Fig. 85 Rear Fender—Dual Wheels

INSTALLATION

Ensure the retainers are in good condition.

Reverse the preceding operation.

TAILGATE CHECK CABLE

REMOVAL

(1) Release tailgate latch and open tailgate.

(2) Pry lock tab outward to clear stud head on cargo box (Fig. 86).

(3) Push cable end forward until stud head is in clearance hole portion of cable end.

(4) Separate cable end from stud.

(5) Remove screw holding cable to tailgate.

(6) Separate check cable from tailgate.

INSTALLATION

Reverse the preceding operation.

REMOVAL AND INSTALLATION (Continued)

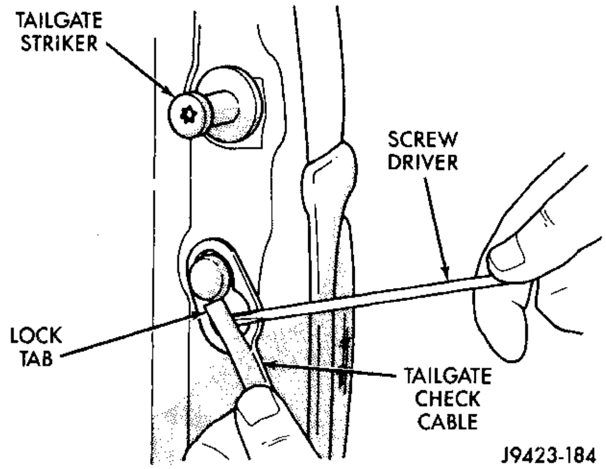

Fig. 86 Tailgate Check Cable

TAILGATE

REMOVAL

(1) Release tailgate latch and open tailgate.

(2) Disconnect tailgate marker light harness, if equipped.

(3) Disconnect tailgate check cable.

(4) Close tailgate until the notch in the right hand collar aligns with the pivot pin.

(5) Slip tailgate hinge collar from hinge pins.

(6) Slide tailgate to the right and separate left hand collar from the pivot pin.

(7) Separate tailgate from vehicle.

INSTALLATION

Reverse the preceding operation.

TAILGATE HANDLE ESCUTCHEON

REMOVAL

(1) Lift and hold tailgate latch release handle.

(2) Using a trim stick (C–4755), pry bottom of escutcheon outward to disengage clips.

(3) Rotate escutcheon upward to disengage clip above release handle.

(4) Lift escutcheon upward from behind release handle.

(5) Separate escutcheon from vehicle (Fig. 87).

INSTALLATION

Reverse the preceding operation.

TAILGATE LATCH HANDLE

REMOVAL

(1) Remove tailgate latch handle escutcheon.

(2) Disengage clips holding linkage rods to latch handle.

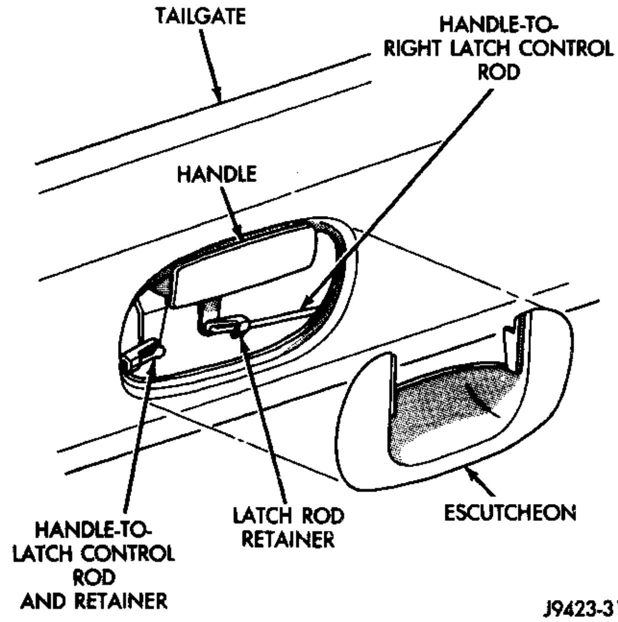

Fig. 87 Tailgate Handle Escutcheon

(3) Separate linkage rods from handle.

(4) Remove screws holding latch handle to tailgate (Fig. 88).

(5) Separate latch handle from vehicle.

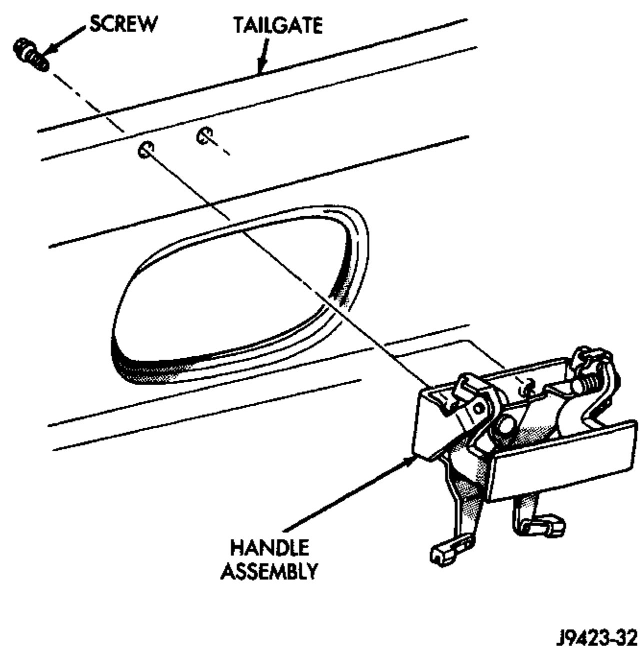

Fig. 88 Tailgate Latch Handle

INSTALLATION

Reverse the preceding operation.

REMOVAL AND INSTALLATION (Continued)

TAILGATE LATCH

REMOVAL

(1) Remove tailgate latch handle escutcheon.
(2) Release tailgate latch and open tailgate.
(3) Disengage linkage rod from latch handle (Fig. 89).
(4) Remove screws holding latch to tailgate.
(5) Separate latch from tailgate.
(6) Pull latch and linkage rod from tailgate.

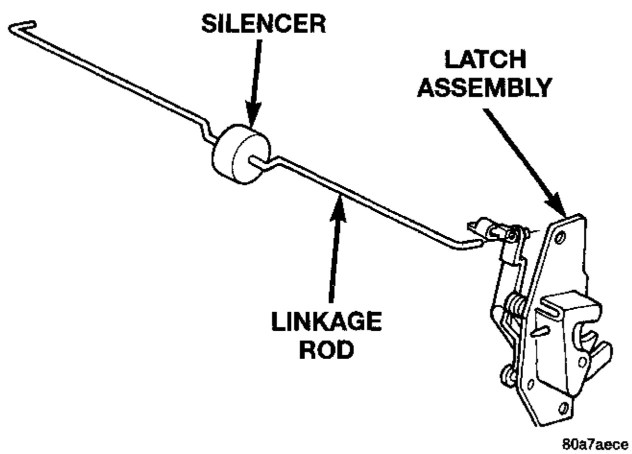

Fig. 89 Tailgate Latch

INSTALLATION

Reverse the preceding operation.

TAILGATE LATCH STRIKER

REMOVAL

(1) Open tailgate.
(2) Mark outline of striker on cargo box jamb to aid installation.
(3) Using a Torx drive wrench, remove striker from cargo box (Fig. 90).

INSTALLATION

Reverse the preceding operation.

TAILGATE SLAM BUMPER

REMOVAL

(1) Release tailgate latch and open tailgate.
(2) Remove screw holding slam bumper to cargo box (Fig. 91).
(3) Separate slam bumper from vehicle.

INSTALLATION

(1) Position slam bumper on vehicle.
(2) Install screw holding slam bumper to cargo box.
(3) Close tailgate and verify operation.

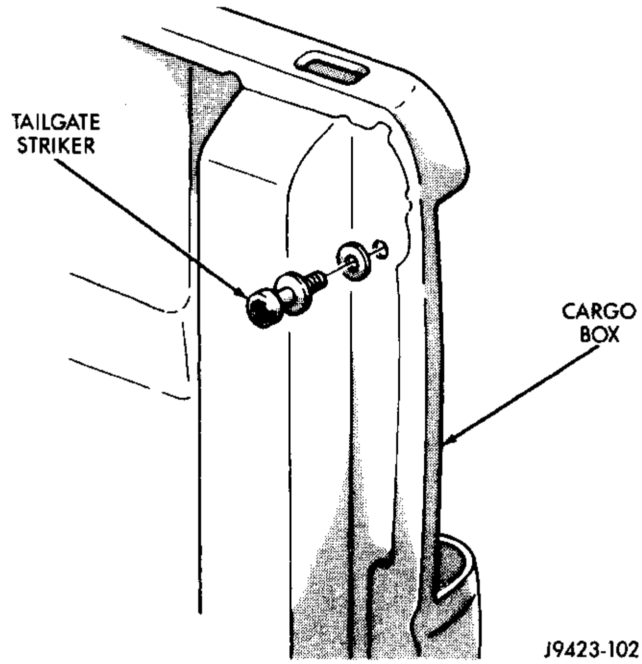

Fig. 90 Tailgate Latch

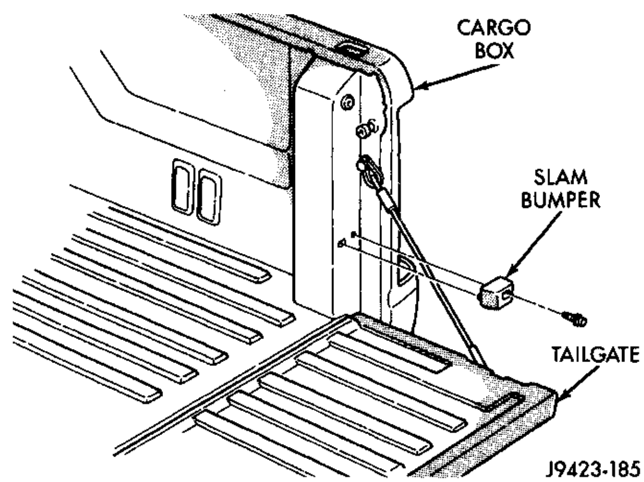

Fig. 91 Tailgate Slam Bumper

TAILGATE DECALS

REMOVAL

(1) Warm the panel to approximately 38°C (100°F) using a suitable heat lamp or heat gun.
(2) Peel tape stripe from body panel using an even pressure pull.
(3) Remove adhesive residue from body panel using a suitable adhesive removing solvent.

INSTALLATION

(1) Clean painted body surface with Mopar Super Clean solvent or equivalent and a lint free cloth.
(2) Remove protective cover from back side of decal.

Mopar AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

(3) Position decal properly on body.
(4) Press decal firmly to body with palm of hand.
(5) If temperature is below 21°C (70°F) warm decal with a heat lamp or gun to assure adhesion. Do not exceed 65°C (150°F) when heating emblem.

TAILGATE APPLIQUE

REMOVAL

(1) Apply a length of masking tape on the body, parallel to the top edge of the applique to use as a guide, if necessary.
(2) Warm the tailgate applique and tailgate metal to approximately 38°C (100°F) using a suitable heat lamp or heat gun.
(3) Pull applique from tailgate (Fig. 92).

INSTALLATION

(1) Remove adhesive tape residue from painted surface of tailgate.
(2) If applique is to be reused, remove tape residue from applique. Clean back of applique with MOPAR, Super Kleen solvent or equivalent. Wipe molding dry with lint free cloth. Apply new body side molding (two sided adhesive) tape to back of applique.
(3) Clean tailgate surface with MOPAR, Super Kleen solvent or equivalent. Wipe surface dry with lint free cloth. An adhesion promoter must be applied to ensure proper applique adhesion.
(4) Remove protective cover from tape on back of applique. Apply applique to body below the masking tape guide.
(5) Remove masking tape guide and heat tailgate and applique, see step one. Firmly press applique to tailgate to assure adhesion.

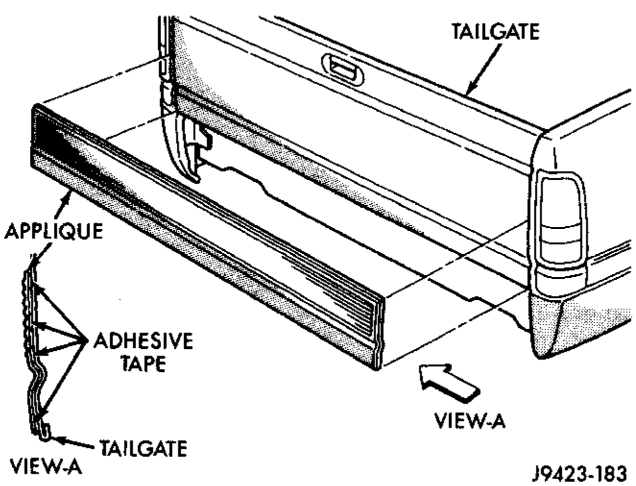

Fig. 92 Tailgate Applique

CARGO BOX

REMOVAL

(1) Open fuel fill door.
(2) Remove screws holding fuel fill neck adaptor to cargo box side wall.
(3) Separate fuel fill neck from cargo box.
(4) Disengage tail lamp wire connector from main body harness at left rear frame rail.
(5) Remove bolts holding cargo box to frame rails (Fig. 93).
(6) Using a suitable lifting device, separate cargo box from vehicle.

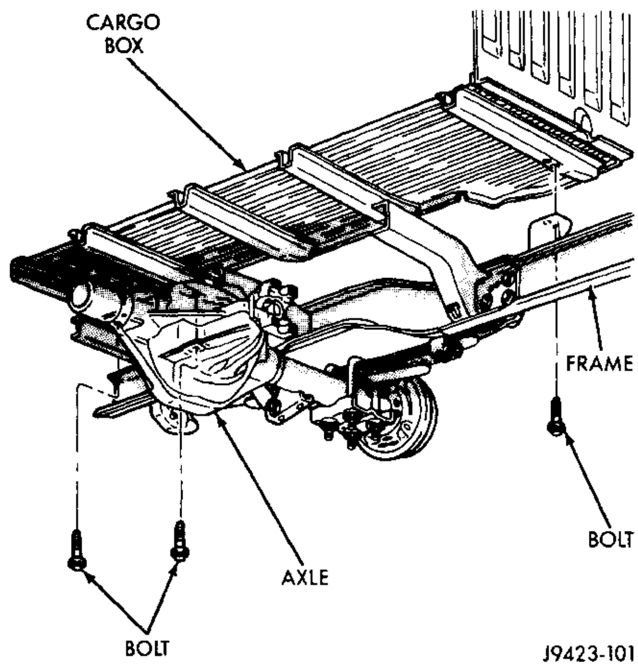

Fig. 93 Cargo Box

INSTALLATION

Reverse the preceding operation.

DOOR SILL TRIM COVER

REMOVAL

(1) Remove screws attaching door sill trim cover to door sill (Fig. 94) and (Fig. 95).
(2) Separate door sill trim cover from door sill.

INSTALLATION

(1) Position door sill trim cover on door sill.
(2) install screws attaching door sill trim cover to door sill.

REMOVAL AND INSTALLATION (Continued)

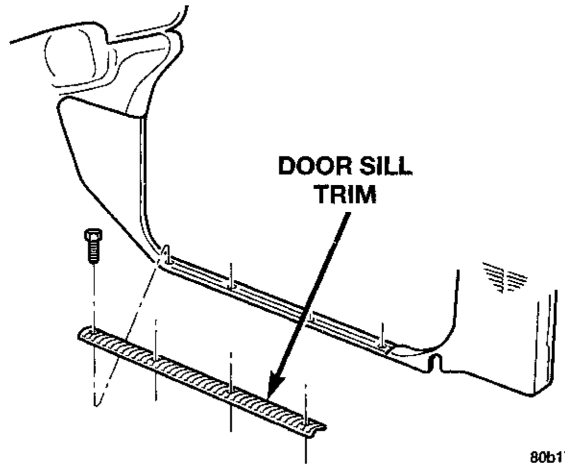

Fig. 94 Door Sill Trim Cover

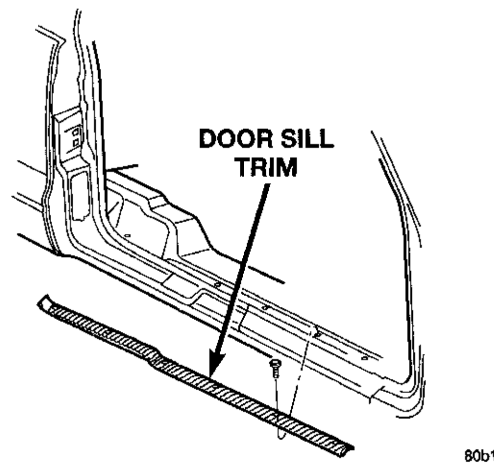

Fig. 95 Door Sill Trim Cover—Quad Cab

COWL TRIM COVER

REMOVAL

(1) Remove front door sill trim cover.

(2) Grasp center upper edge of cowl trim cover (Fig. 96) and pull outward allowing cowl trim cover to bow in the center releasing trim cover retaining tab (Fig. 97).

(3) Separate cowl trim cover from lower cowl.

INSTALLATION

(1) Position cowl trim cover on lower cowl.

(2) Press into place.

(3) Install front door sill trim cover.

A-PILLAR GRAB HANDLE

REMOVAL

(1) Using a small flat blade screw driver, pry trim plugs from A-pillar grab handle.

(2) Remove screws attaching grab handle to A-pillar (Fig. 98).

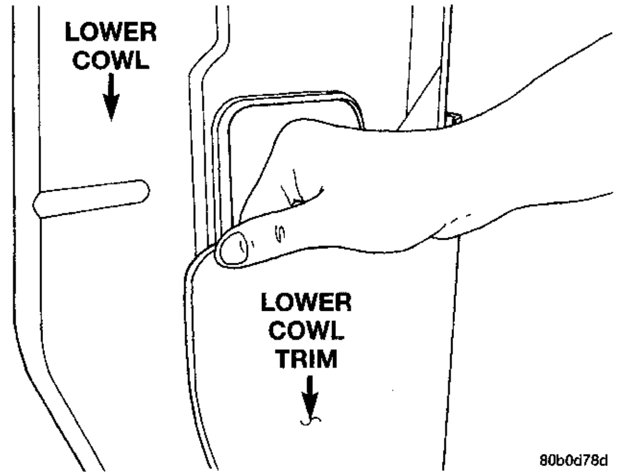

Fig. 96 Lower Cowl Trim Cover

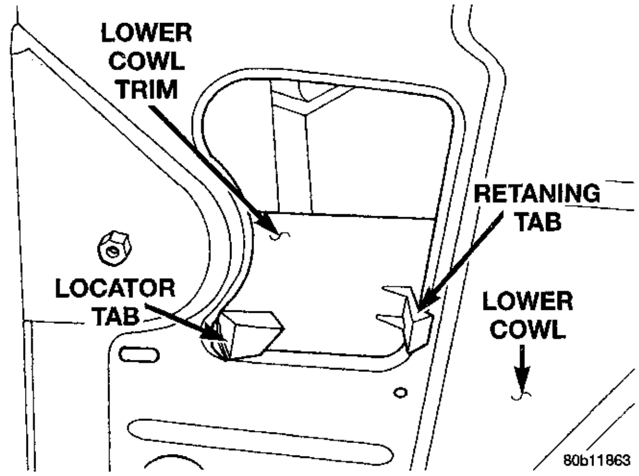

Fig. 97 Lower Cowl Trim Cover Retaining Tab

(3) Separate A-pillar grab handle from vehicle.

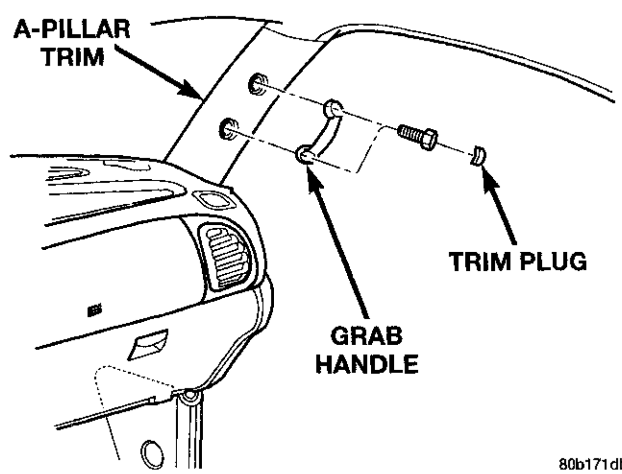

Fig. 98 A-pillar Grab Handle (4X4)

INSTALLATION

(1) Position grab handle on A-pillar.

(2) Install screws attaching grab handle to A-pillar (Fig. 98).

(3) Install trim plugs in A-pillar grab handle.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

A-PILLAR TRIM

REMOVAL

(1) Remove A-pillar grab handle, if equipped.
(2) Grasp A-pillar trim at top and pull outward/downward to disengage upper spring clip (Fig. 99).
(3) Carefully pull bottom of A-pillar trim outward to disengage lower spring clip.
(4) Disengage speaker harness connector, if equipped.
(5) Separate A-pillar trim from vehicle.

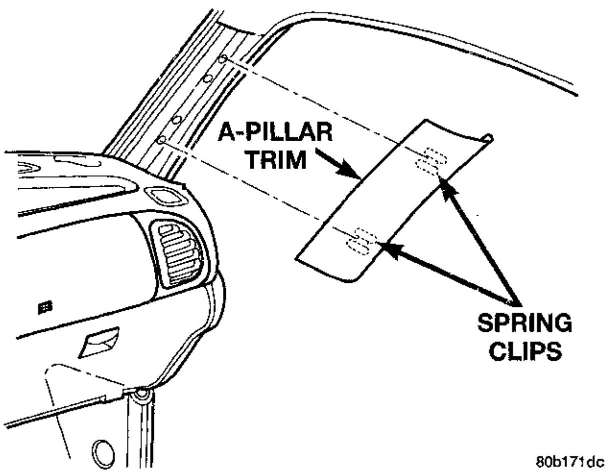

Fig. 99 A-pillar Trim

INSTALLATION

(1) Position A-pillar trim in vehicle.
(2) Engage speaker harness connector, if equipped.
(3) Align spring clips and press into place.
(4) Install A-pillar grab handle, if equipped.

B—PILLAR TRIM

REMOVAL

(1) Remove rear floor stowage tray.
(2) Remove door sill cover as necessary to clear B-pillar trim.
(3) Remove bolt attaching seat belt anchor to floor.
(4) Pull turning loop cover up and remove bolt attaching turning loop to B-pillar.
(5) Remove seat belt exit plug (Fig. 100).
(6) Disengage clips attaching B-pillar trim to upper B-pillar.
(7) Separate B-pillar trim from B-pillar.
