(8) Route seat belt webbing through opening in B-pillar trim.

INSTALLATION

(1) Route seat belt webbing through opening in B-pillar trim.
(2) Position B-pillar trim at B-pillar.
(3) Starting at the top, engage clips attaching B-pillar trim to upper B-pillar.
(4) Install seat belt exit plug.

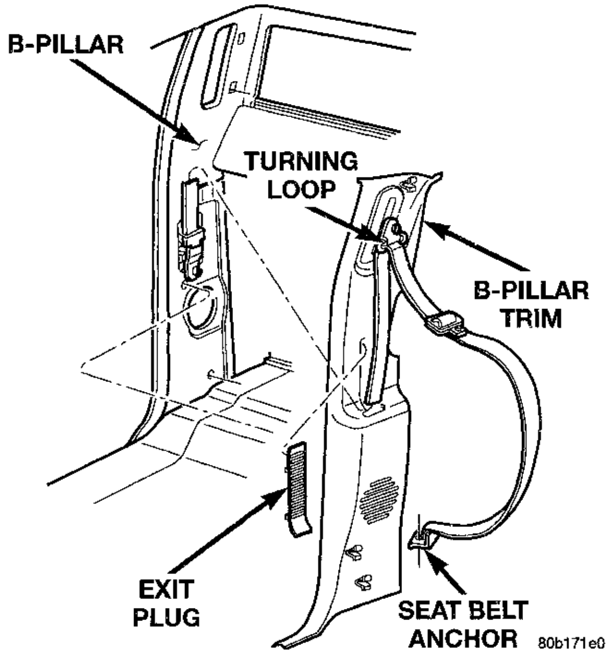

Fig. 100 B-Pillar Trim

(5) Install bolt attaching turning loop to B-pillar and install turning loop cover.
(6) Install bolt attaching seat belt anchor to floor.
(7) Install door sill cover.
(8) Install rear floor stowage tray.

C—PILLAR TRIM

REMOVAL

(1) Remove rear floor stowage tray.
(2) Remove door sill cover as necessary to clear C-pillar trim.
(3) Remove bolt attaching seat belt anchor to floor.
(4) Pull turning loop cover up and remove bolt attaching turning loop to C-pillar.
(5) Remove seat belt exit plug (Fig. 101).
(6) Disengage clips attaching C-pillar trim to upper C-pillar.
(7) Separate C-pillar trim from C-pillar.
(8) Route seat belt webbing through opening in C-pillar trim.

INSTALLATION

(1) Route seat belt webbing through opening in C-pillar trim.
(2) Position C-pillar trim at C-pillar.
(3) Starting at the top, engage clips attaching C-pillar trim to upper C-pillar.
(4) Install seat belt exit plug.
(5) Install bolt attaching turning loop to C-pillar and install turning loop cover.
(6) Install bolt attaching seat belt anchor to floor.
(7) Install door sill cover.
(8) Install rear floor stowage tray.

REMOVAL AND INSTALLATION (Continued)

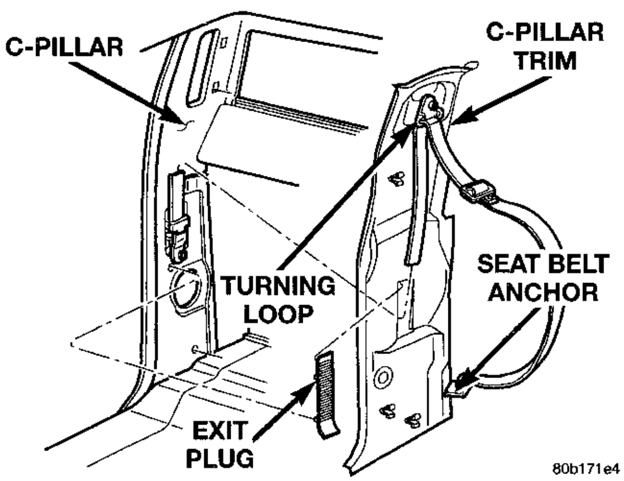

Fig. 101 C-pillar Trim

QUARTER TRIM PANEL—CLUB CAB

REMOVAL

(1) Remove rear seat. Refer to the removal procedure in this section, if necessary.

(2) Remove door sill cover as necessary to clear quarter trim.

(3) Remove lower seat belt anchor bolt (Fig. 102).

(4) Remove seat belt tuning loop anchor bolt.

(5) Disengage clips attaching quarter trim panel from quarter panel.

(6) Route seat belt webbing through opening in quarter trim panel and remove panel from vehicle.

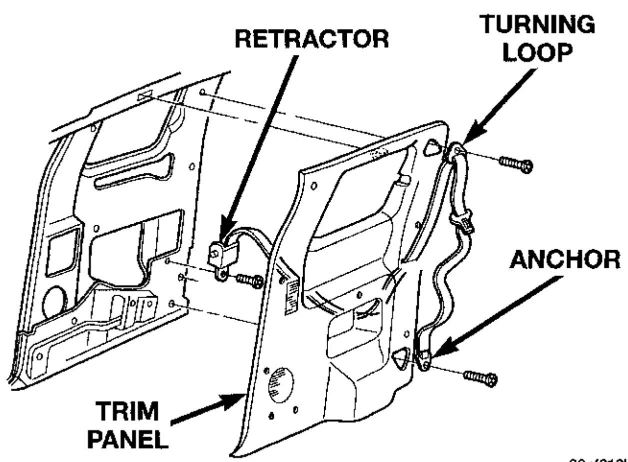

Fig. 102 Quarter Trim Panel—Club Cab

INSTALLATION

(1) Position trim panel in vehicle and route seat belt webbing through opening in quarter trim panel.

(2) Open quarter vent window.

(3) Position trim panel on quarter panel and engage clips on upper portion of panel.

(4) Engage clips attaching lower portion of quarter trim panel to quarter panel.

(5) Install lower seat belt anchor bolt.

(6) Install door sill cover as necessary.

(7) Install rear seat. Refer to the installation procedure in this section, if necessary.

REAR CLOSURE PANEL TRIM

REMOVAL

(1) Remove quarter trim panels.

(2) Remove rear floor stowage tray.

(3) Remove screws attaching bottom of rear closure panel trim to floor pan (Fig. 103).

(4) Remove screws attaching rear closure panel trim to cab back panel.

(5) Disengage clips attaching top of rear closure panel trim to cab back panel.

(6) Separate rear closure panel trim from vehicle.

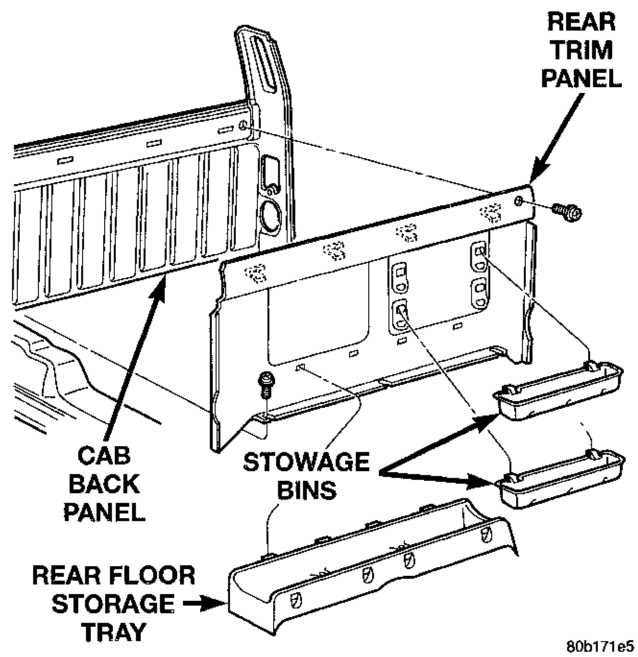

Fig. 103 Rear Closure Panel Trim

INSTALLATION

(1) Position rear closure panel trim in vehicle.

(2) Align and engage clips attaching top of rear closure panel trim to cab back panel.

(3) Install screws attaching rear closure panel trim to cab back panel.

(4) Install screws attaching bottom of rear closure panel trim to floor pan (Fig. 103).

(5) Install rear floor stowage tray.

(6) Install quarter trim panels.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

SEAT BELT RETRACTOR—CONVENTIONAL CAB

WARNING: Inspect the shoulder belt, retractor and buckle. Replace the belt or buckle that is either cut, frayed, torn or damaged. Replace the belt if the retractor is inoperative.

REMOVAL

(1) Remove bolt attaching shoulder belt lower anchor to floor at base of quarter trim panel (Fig. 104).

(2) Remove quarter trim panel.

(3) Remove bolt attaching seat belt turning loop to B-pillar (Fig. 105).

(4) Separate turning loop from B-pillar.

(5) Disengage body harness wire connector from seat belt retractor (drivers side only).

(6) Remove bolt attaching seat belt retractor to quarter panel.

(7) Separate seat belt retractor from vehicle.

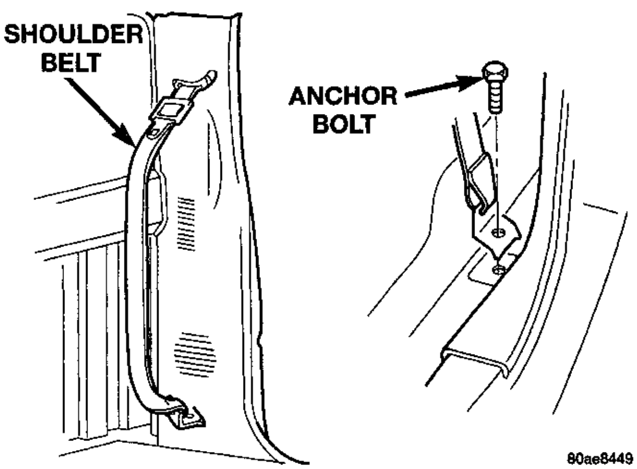

Fig. 104 Shoulder Belt Anchor

INSTALLATION

(1) Position seat belt retractor in vehicle.

(2) Install bolt attaching seat belt retractor to quarter panel. Tighten bolt to 39 N·m (28 ft. lbs.) torque.

(3) Engage body harness wire connector from seat belt retractor (drivers side only).

(4) Position turning loop on B-pillar.

(5) Install bolt attaching seat belt turning loop to B-pillar (Fig. 105). Tighten bolt to 39 N·m (28 ft. lbs.) torque.

(6) Install quarter trim panel.

(7) Install bolt attaching shoulder belt lower anchor to floor at base of quarter trim panel (Fig. 105). Tighten bolt to 39 N·m (28 ft. lbs.) torque.

FRONT SEAT BELT RETRACTOR—CLUB/QUAD CAB

The seat/shoulder belt and retractor is incorporated in each driver and passenger seat.

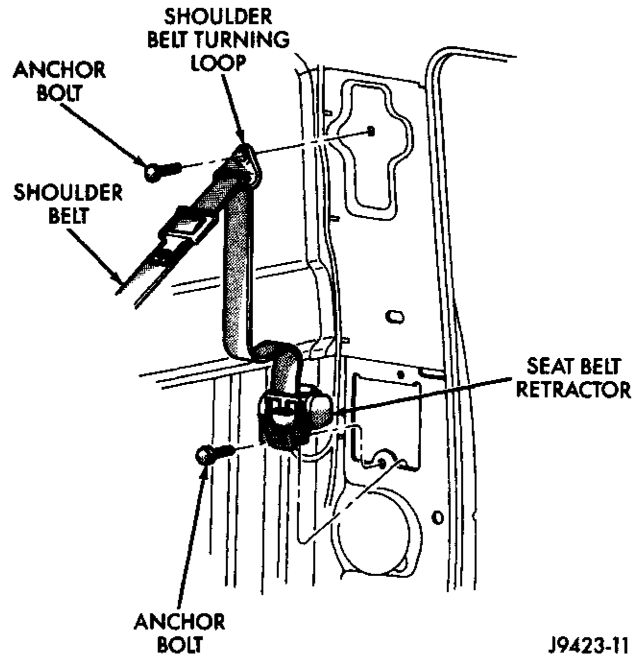

Fig. 105 Seat Belt Retractor

WARNING: Inspect the shoulder belt, retractor and buckle. Replace the belt or buckle that is either cut, frayed, torn or damaged. Replace the belt if the retractor is inoperative.

REMOVAL

(1) Remove the seat back cover.

(2) Remove the screws attaching the retractor cover to the seat back frame.

(3) Disengage the wire connectors from the retractor.

(4) Remove the bolts attaching the retractor to the seat back frame (Fig. 106).

(5) Separate the retractor from the seat back frame.

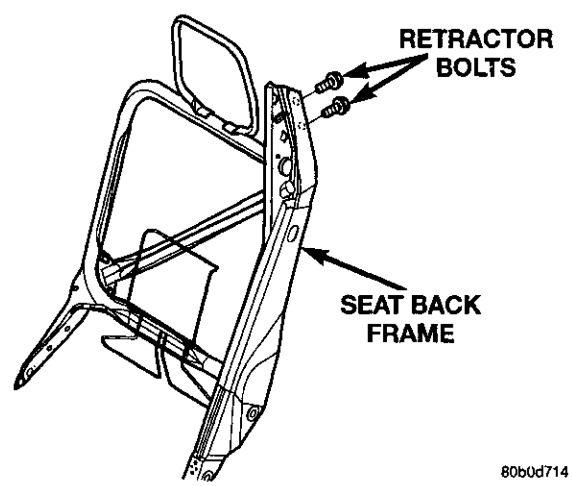

Fig. 106 Seat Belt Retractor

REMOVAL AND INSTALLATION (Continued)

INSTALLATION

(1) Position the retractor in the seat back frame.

(2) Install the bolts attaching the retractor to the seat back frame. Tighten the bolts to 16 N·m (11 ft. lbs.) torque.

(3) Engage the wire connectors to the retractor.

(4) Install screws attaching retractor cover to seat back frame.

(5) Install seat back cover.

SEAT BELT BUCKLE

REMOVAL

(1) Move seat to the forward position.

(2) Hinge seat backs forward.

(3) Remove bolt holding seat belt buckle to seat frame.

(4) Separate seat belt buckle from vehicle.

INSTALLATION

Reverse the preceding operation. Install the seat belt buckle anchor nuts. Tighten to 40 N·m (30 ft. lbs.) torque.

REAR SEAT BELT BUCKLE

REMOVAL

(1) Turn release handle on underside of rear seat to disengage seat cushion and move seat to the stowed position.

Access to rear seat belt buckle nuts can be obtained through an opening between the rear seat back and the floor.

(2) Remove seat belt buckle anchor nuts (Fig. 107).

(3) Separate seat belt buckle from vehicle.

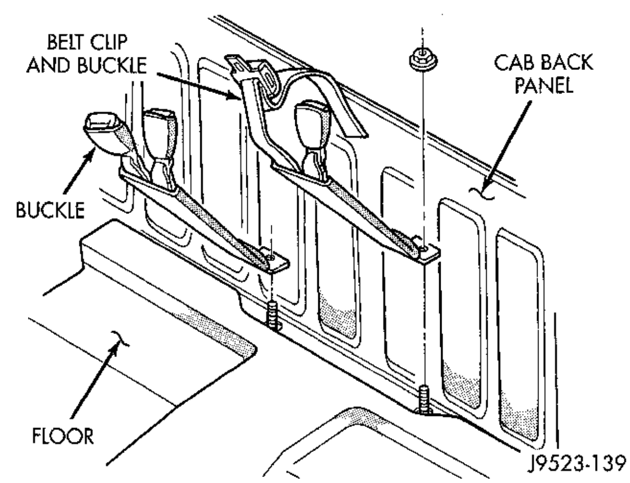

Fig. 107 Rear Seat Belt Buckle Removal

INSTALLATION

(1) Position the seat belt buckle on the anchoring studs.

(2) Install the seat belt buckle anchor nuts. Tighten to 40 N·m (30 ft. lbs.) torque.

(3) Route the belts and buckles between the seat back and seat cushion.

(4) Turn release handle to disengage seat from stowed position and push seat cushion downward to lock into place.

BENCH SEAT

REMOVAL

(1) Move seat track to forward position.

(2) Hinge seat backs forward.

(3) Remove nuts holding rear of seat tracks to floor (Fig. 108).

(4) Move seat track to rearward position.

(5) Remove bolts holding front of seat tracks to floor.

(6) Separate seat from vehicle.

INSTALLATION

Seat adjustment latch must be engaged prior to seat installation. Verify inboard and outboard seat latch operation.

Reverse the removal procedure.

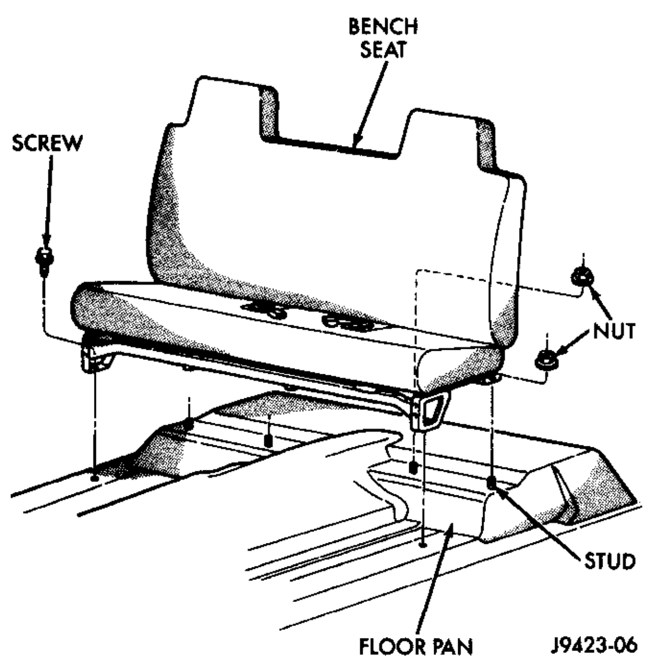

Fig. 108 Bench Seat

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

SPLIT BENCH SEAT—CONVENTIONAL CAB

REMOVAL

(1) Move seat track to forward position.
(2) Hinge seat back forward.
(3) Disengage power seat wire connector from body harness, if equipped (Fig. 109).
(4) Remove nuts holding outboard and inboard tracks to floor (Fig. 109).
(5) Move seat track to forward position.
(6) Remove bolt holding inboard seat track to bottom of center occupant seat.
(7) Remove bolts holding front of seat tracks to floor.
(8) Lift center occupant seat upward to clear rear attachment stud.
(9) Separate seat from vehicle.

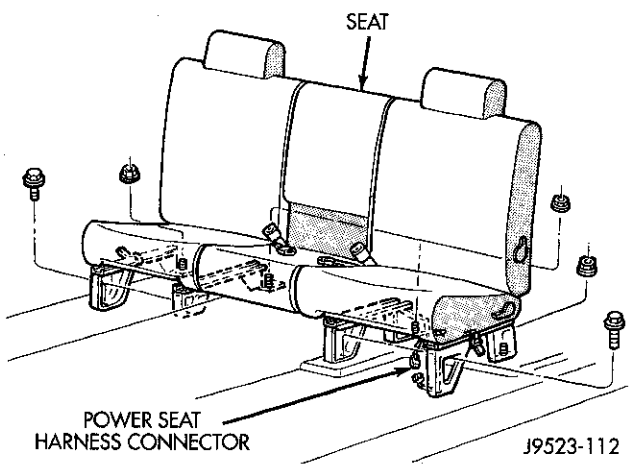

Fig. 109 Split Bench Seat

INSTALLATION

(1) Position seat in vehicle.
(2) Install bolts holding front of seat tracks to floor. Tighten the bolts with 28 N·m (250 in-lbs) torque.
(3) Install bolt holding inboard seat track to bottom of center occupant seat. Tighten the bolt with 28 N·m (250 in- lbs) torque.
(4) Install nuts holding outboard and inboard tracks to floor. Tighten the nuts with 40 N·m (30 ft. lbs.) torque.
(5) Connect power seat wire connector to body harness, if equipped.

SPLIT BENCH SEAT—CLUB/QUAD CAB

REMOVAL

(1) Clamp seat belt to prevent belt from retracting.
(2) Move seats to full rearward position.
(3) Remove bolts attaching front of seat tracks to floor.
(4) Move seats to full forward position.
(5) Remove bolts attaching rear of outboard seat tracks to floor (Fig. 110).
(6) Remove nuts attaching inboard seat tracks to floor.
(7) Disengage power seat wire connector from body harness, if equipped.
(8) Lift seats upward to clear rear studs.
(9) With the aid of a helper, separate seat from vehicle.

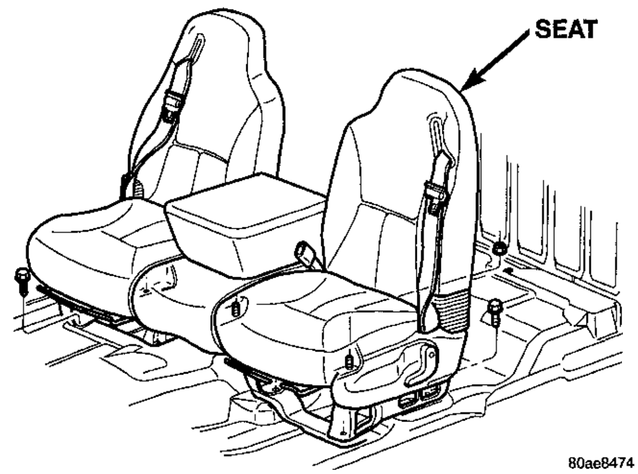

Fig. 110 Split Bench Seat—Club/Quad Cab

INSTALLATION

(1) Position seat in vehicle.
(2) Engage power seat wire connector to body harness, if equipped.
(3) Ensure seats are in full forward position.
(4) Install outboard bolts attaching rear of seat tracks to floor (Fig. 110). Tighten the bolts with 54 N·m (40 ft. lbs.) torque.
(5) Install nuts attaching inboard seat tracks to floor. Tighten the nuts with 40 N·m (30 ft. lbs.) torque.
(6) Move seats to full forward position.
(7) Install bolts attaching front of seat tracks to floor. Tighten the bolts with 54 N·m (40 ft. lbs.) torque.

REMOVAL AND INSTALLATION (Continued)

CENTER SEAT/CONSOLE

REMOVAL

(1) Remove bolts on driver and passenger seat inboard seat tracks.

(2) Separate center section.

INSTALLATION

(1) Position and align center section on driver and passenger seat inboard seat tracks.

(2) Install bolts. Tighten to 19.5 N·m (14 ft. lbs.) torque.

CONSOLE LID

REMOVAL

(1) Open console lid.

(2) Using a small flat blade screwdriver, disengage locking tabs located under the console lid trim bezel.

(3) Separate bezel from lid.

(4) Move driver and passenger seat to full forward position.

(5) Using a small drift and hammer, tap out console lid hinge pin.

(6) Separate lid from console.

INSTALLATION

(1) Align console lid with console. Verify lid tension spring is in position.

(2) Install hinge pin.

(3) Position trim bezel on lid and snap into place.

STANCHION COVER

REMOVAL

(1) Remove push-in fasteners attaching stanchion cover to seat stanchion (Fig. 111).

(2) Separate cover from seat stanchion.

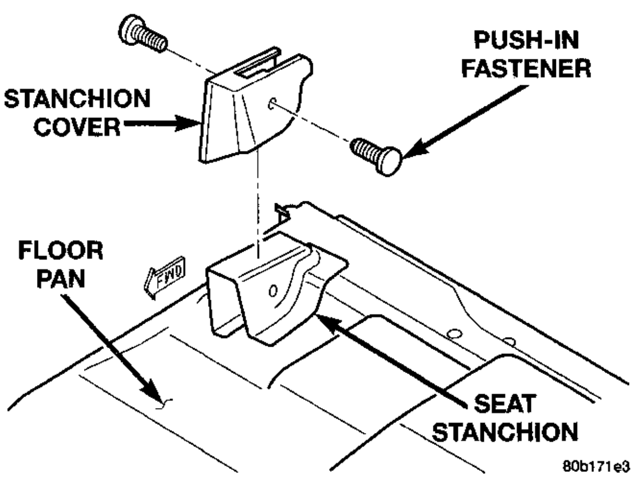

Fig. 111 Stanchion Cover

INSTALLATION

(1) Position cover on seat stanchion.

(2) Install push-in fasteners attaching stanchion cover to seat stanchion (Fig. 111).

REAR SEAT—CLUB CAB

REMOVAL

(1) Move front seat track to full forward position.

(2) Turn release handle on underside of rear seat (Fig. 112) to disengage seat cushion and move seat to the stowed position (Fig. 113).

(3) Remove side support bracket screws and lift seat to disengage from cab (Fig. 114).

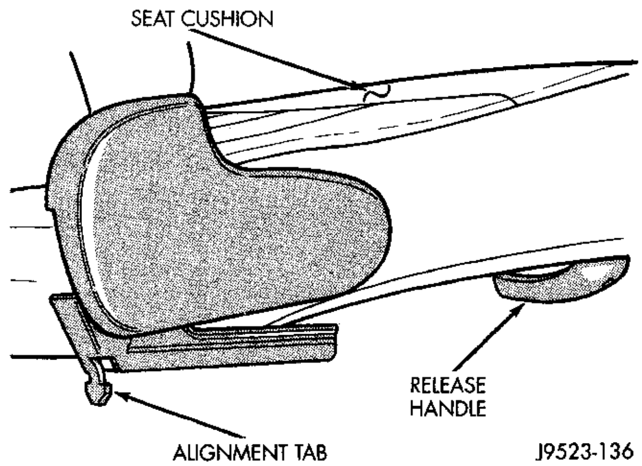

Fig. 112 Rear Seat Release Handle

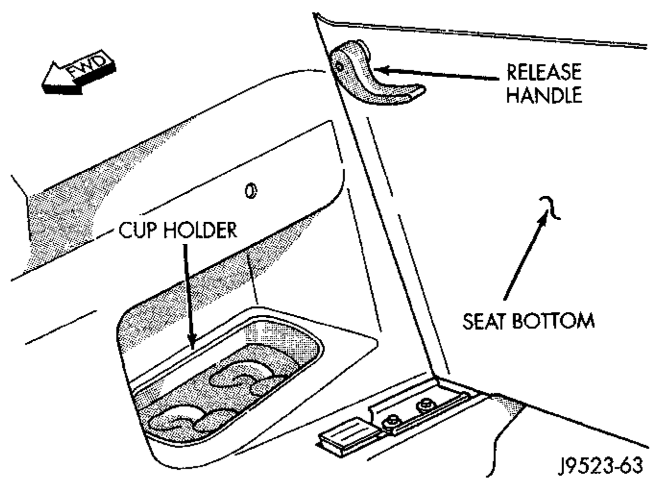

Fig. 113 Rear Seat Stowed

INSTALLATION

(1) Position seat in vehicle.

(2) Align seatback hooks with loops on cab rear panel (Fig. 114).

(3) Align side support alignment tabs, and lower seat into place.

Mopar AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

(4) Install side support bracket screws. Tighten the screws to 28 N·m (250 in-lbs) torque.

(5) Turn release handle to disengage seat from stowed position and push seat cushion downward to lock into place.

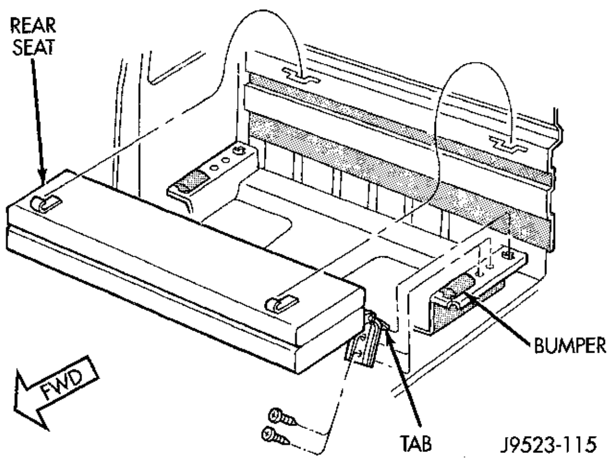

Fig. 114 Rear Seat Removal/Installation

FLOOR CONSOLE

REMOVAL

(1) Using a trim stick, pry the corner of the shift boot up and pull boot up to remove from console

(2) Remove the screws attaching the console to mounting brackets (Fig. 115).

(3) Lift the console upward.

(4) Disengage wire harness connector, if equipped.

(5) Route the shift boot(s) through the console.

(6) Separate console from vehicle.

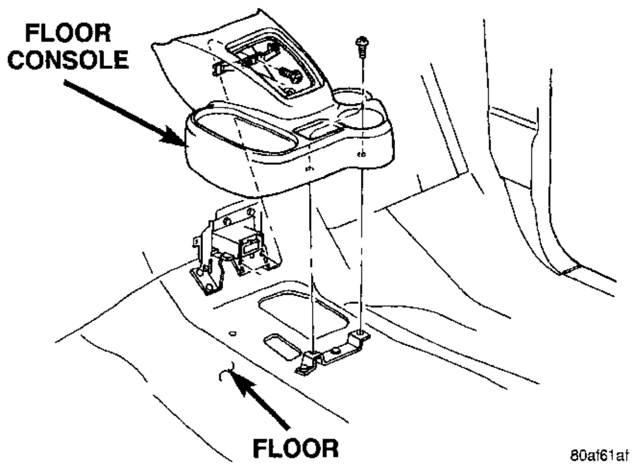

Fig. 115 Floor Console

INSTALLATION

(1) Position console in vehicle.

(2) Route the shift boot(s) through the console.

(3) Engage wire harness connector, if equipped.

(4) Position the console on the floor.

(5) Install shift boot on console

(6) Install the screws attaching the console to mounting brackets (Fig. 115).

FLOOR SHIFT BOOT—MANUAL TRANSMISSION

REMOVAL

(1) Pull edge of floor shift boot upward to expose fasteners (Fig. 116).

(2) Remove screws attaching floor shift boot to floor.

(3) Remove gear shift knob.

(4) Separate gear shift boot from floor.

(5) Lift floor shift boot off shifter.

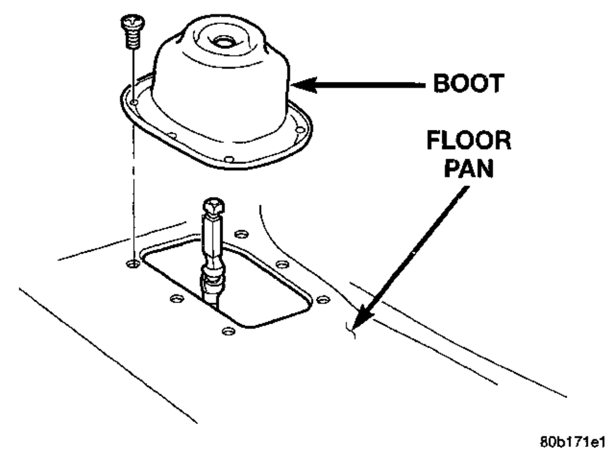

Fig. 116 Floor Shift Boot—Manual Transmission

INSTALLATION

(1) Position floor shift boot on shifter.

(2) Install gear shift knob.

(3) Install screws attaching floor shift boot to floor.

(4) Tuck edge of floor shift boot to secure.

4WD FLOOR SHIFT BOOT— MANUAL TRANSMISSION

REMOVAL

(1) Pull edge of floor shift boot upward to expose fasteners.

(2) Remove screws attaching floor shift boot to floor.

(3) Remove gear shift knob.

(4) Separate gear shift boot from floor.

(5) Lift floor shift boot off shifter.

INSTALLATION

(1) Position shift boot on shifter.

(2) Install gear shift knob.

(3) Install screws attaching floor shift boot to floor.

(4) Tuck edge of floor shift boot inward to cover fasteners.

REMOVAL AND INSTALLATION (Continued)

4WD FLOOR SHIFT BOOT— AUTOMATIC TRANSMISSION

REMOVAL

(1) Pull edge of floor shift boot upward to expose fasteners (Fig. 117).
(2) Remove screws holding floor shift boot to floor.
(3) Remove gear shift knob.
(4) Separate gear shift boot from floor.
(5) Lift floor shift boot off shifter.

INSTALLATION

Reverse the preceding operation.

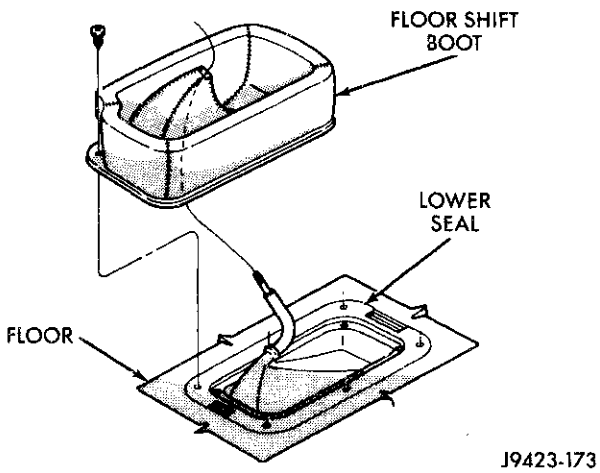

Fig. 117 4WD Floor Shift Boot—Automatic Transmission

REAR FLOOR STOWAGE TRAY

REMOVAL

(1) Move seat tracks to forward position.
(2) Remove screws holding rear floor stowage tray to floor (Fig. 118).
(3) Disengage hooks on stowage tray from slots in rear closure panel trim.
(4) Separate rear floor stowage tray from vehicle.

INSTALLATION

Reverse the preceding operation.

FLOOR CARPET OR MAT

REMOVAL

(1) Remove seat.
(2) Remove door sill and cowl trim covers.
(3) Remove bolts holding lower seat belt anchors to floor.
(4) Remove floor shift boot, if equipped.
(5) Remove rear stowage tray.
(6) Remove quarter trim panels.
(7) Remove rear closure panel trim.
(8) Fold carpet or mat toward center of cab.

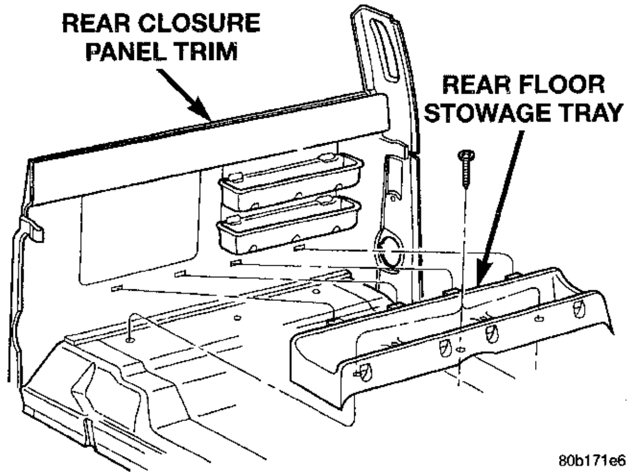

Fig. 118 Rear Floor Stowage Tray

(9) Remove carpet or mat through door opening (Fig. 119).

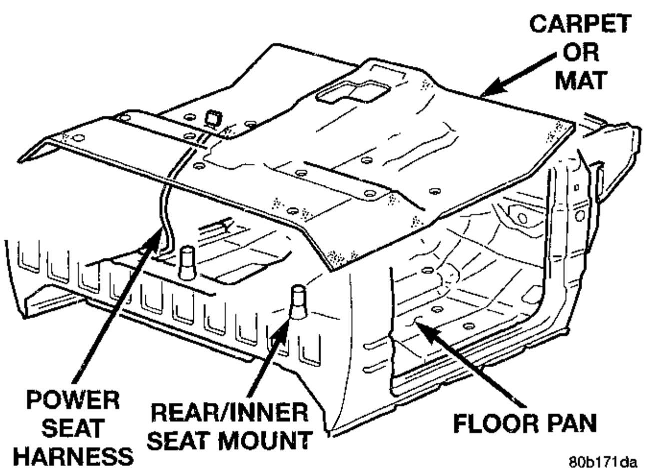

Fig. 119 Floor Carpet or Mat

INSTALLATION

(1) Position carpet or mat in vehicle and align all holes (Fig. 119).
(2) Install rear closure panel trim.
(3) Install rear stowage tray.
(4) Install floor shift boot, if equipped.
(5) Install bolts holding lower seat belt anchors to floor.
(6) Install cowl trim covers and door sill.
(7) Install seat.

FLOOR CARPET OR MAT—CLUB CAB

REMOVAL

(1) Remove front and rear seats.
(2) Remove door sill and cowl trim covers.
(3) Remove floor shift boot, if equipped.
(4) Remove emergency jack tool kit.
(5) Remove rear seat belt buckles.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

(6) Remove quarter trim panels.
(7) Fold carpet or mat toward center of cab.
(8) Remove carpet or mat through door opening.

INSTALLATION

Reverse the preceding operation.

REARVIEW MIRROR

REMOVAL

(1) Loosen the mirror base setscrew (Fig. 120).
(2) Slide the mirror base upward and off the bracket.

INSTALLATION

(1) Position the mirror base at the bracket and slide it downward onto the support bracket.
(2) Tighten the setscrew securely.

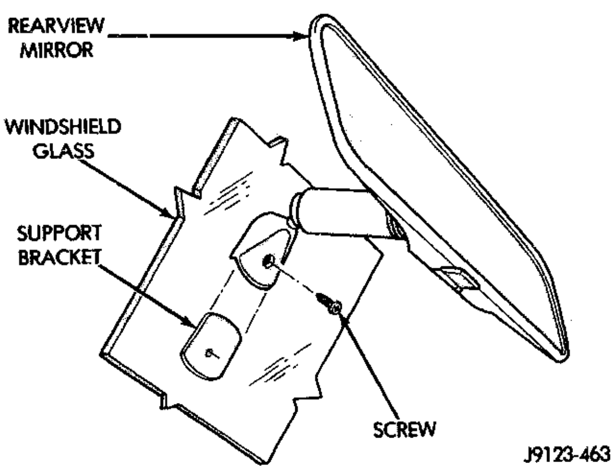

Fig. 120 Rearview Mirror

REARVIEW MIRROR SUPPORT BRACKET

INSTALLATION

(1) Mark the position for the mirror bracket on the outside of the windshield glass with a wax pencil.
(2) Clean the bracket contact area on the glass. Use a mild powdered cleanser on a cloth saturated with isopropyl (rubbing) alcohol. Finally, clean the glass with a paper towel dampened with alcohol.
(3) Sand the surface on the support bracket with fine grit-sandpaper. Wipe the bracket surface clean with a paper towel.
(4) Apply accelerator to the surface on the bracket according to the following instructions:
- Crush the vial to saturate the felt applicator.
- Remove the paper sleeve.
- Apply accelerator to the contact surface on the bracket.
- Allow the accelerator to dry for five minutes.
- Do not touch the bracket contact surface after the accelerator has been applied.

(5) Apply adhesive accelerator to the bracket contact surface on the windshield glass. Allow the accelerator to dry for one minute. Do not touch the glass contact surface after the accelerator has been applied.
(6) Install the bracket according to the following instructions:
- Apply one drop of adhesive at the center of the bracket contact-surface on the windshield glass.
- Apply an even coat of adhesive to the contact surface on the bracket.
- Align the bracket with the marked position on the windshield glass.
- Press and hold the bracket in place for at least one minute.

NOTE: Verify that the mirror support bracket is correctly aligned, because the adhesive will cure rapidly.

(7) Allow the adhesive to cure for 8-10 minutes. Remove any excess adhesive with an alcohol-dampened cloth.
(8) Allow the adhesive to cure for an additional 8-10 minutes before installing the mirror.

SUN VISOR

NOTE: All vehicles with driver and passenger side airbags must have a colored-coded, 5-bullet point airbag warning label applied to the sunvisor face surface (in the stored position). When replacing the sunvisor, verify label availability and ensure the label is installed.

REMOVAL

(1) Remove screws attaching sun visor to roof (Fig. 121).
(2) If equipped, disengage lighted vanity mirror connector.
(3) Separate sun visor from roof.
(4) Remove screw attaching sun visor hook to roof.
(5) Separate sun visor hook from roof.

INSTALLATION

(1) Position sun visor hook on roof.
(2) Install screw attaching sun visor hook to roof.
(3) Position sun visor on roof.
(4) If equipped, engage lighted vanity mirror connector.
(5) Install screws attaching sun visor to roof (Fig. 121).

REMOVAL AND INSTALLATION (Continued)

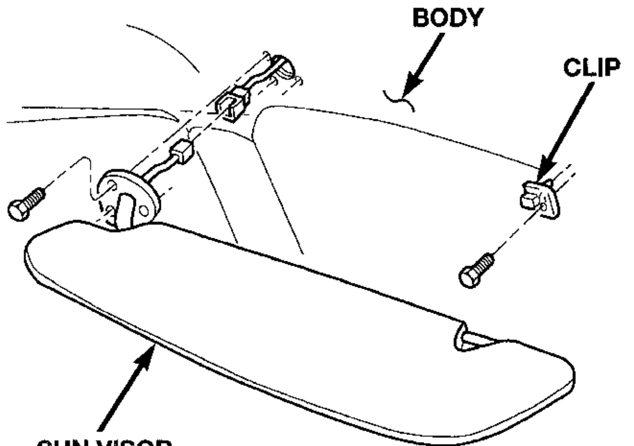

Fig. 121 Sun Visor

HEADLINER

REMOVAL

(1) Remove sun visors and visor hooks.
(2) Remove overhead assist handle.
(3) Remove coat hook(s).
(4) Remove overhead console, if equipped. Refer to Group 8V, Overhead Console for removal procedure.
(5) Remove A-pillar trim.
(6) Remove quarter trim panels.
(7) Remove dome lamp. Refer to Group 8L, Lamps for removal procedure.
(8) If equipped, disengage push-in fasteners attaching headliner to roof panel (Fig. 123).
(9) If equipped, remove upper latch striker cover.
(10) Separate headliner from roof panel (Fig. 122).
(11) Extract headliner through door opening.

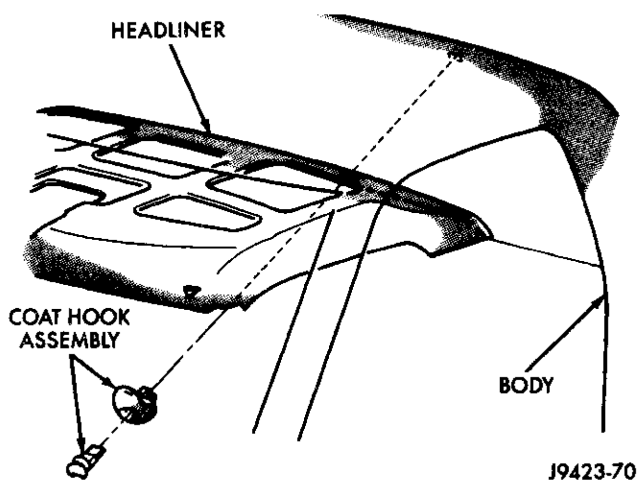

Fig. 122 Headliner

INSTALLATION

(1) Position headliner on roof panel (Fig. 122).
(2) Install passenger side sun visor hook.
(3) Install:
(a) Driver's side coat hook-BR vehicles.

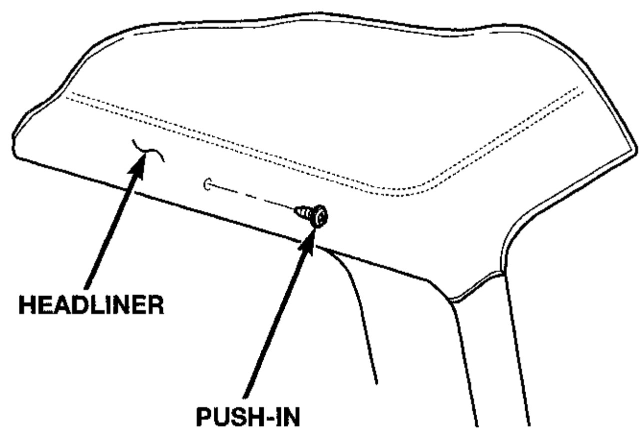

Fig. 123 Headliner Push-In Fasteners

(b) Driver's side rear push-in fasteners-BE vehicles.
(4) Install driver side sun visor hook.
(5) Install right rear push-in fastener-BE vehicles.
(6) Install left and right side coat hooks-BE vehicles.
(7) Install dome lamp.
(8) Install push-in fasteners on each side of dome lamp-BE vehicles.
(9) If equipped, install upper latch striker cover.
(10) Install quarter trim panels.
(11) Install A-pillar trim.
(12) Install overhead console, if equipped. Refer to Group 8V, Overhead Console for installation procedure.
(13) Install overhead assist handle.
(14) Install sun visors.

OVERHEAD ASSIST HANDLE

REMOVAL

(1) Disengage tabs attaching assist handle end covers to assist handle.
(2) Remove screws attaching overhead assist handle to roof rail (Fig. 124).
(3) Separate overhead assist handle from vehicle.

INSTALLATION

Reverse the preceding operation.
(1) Position assist handle on vehicle.
(2) Install screws attaching overhead assist handle to roof rail (Fig. 124).
(3) Install tabs attaching assist handle end covers to assist handle.

COAT HOOK

REMOVAL

(1) Grasp both sides of the coat hook base and firmly pull outward to disengage the coat hook cover from the base. (Fig. 125).

REMOVAL AND INSTALLATION (Continued)

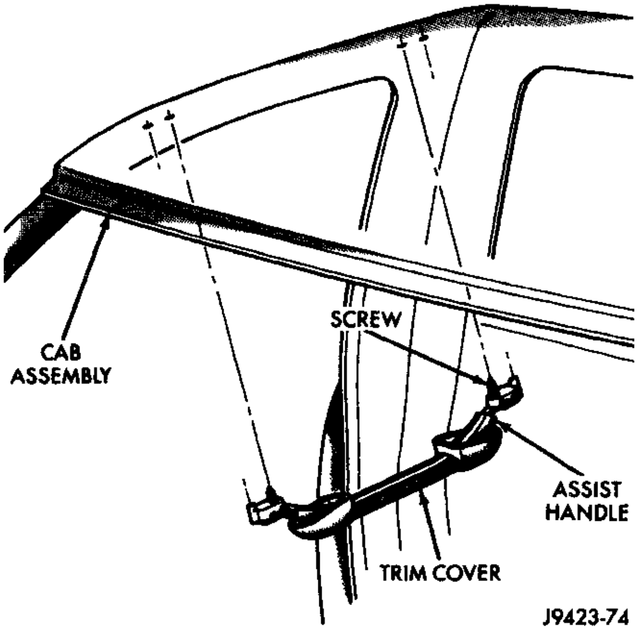

Fig. 124 Overhead Assist Handle

(2) Pull coat hook out of roof panel (Fig. 126).

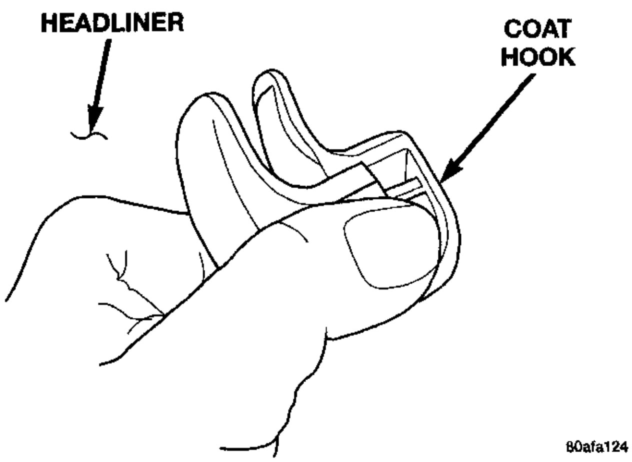

Fig. 125 Coat Hook Removal

INSTALLATION

(1) Position coat hook in roof panel.

(2) Push the coat hook cover inward and secure the coat hook to the roof panel.

ADJUSTMENTS

HOOD

(1) Loosen the hinge arm-to-hood panel bolts at each side of the vehicle.

(2) Loosen the hood latch screws.

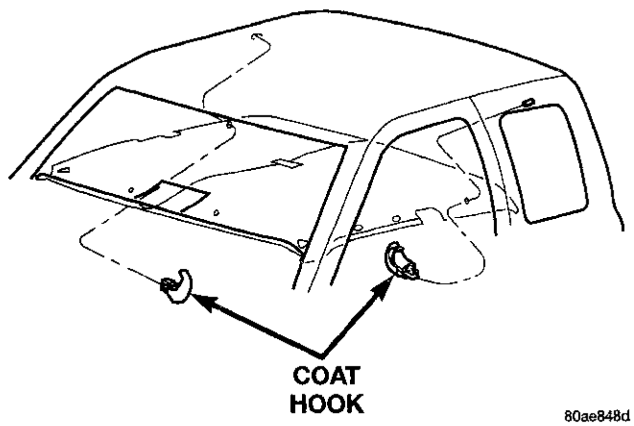

Fig. 126 Coat Hook—Club/Quad Cab

(3) Close the hood. Adjust the fore/aft position.

(4) Raise the hood. Tighten the hinge arm-to-hood panel bolts.

(5) Tighten the latch screws.

(6) Lower the hood. Inspect clearance between the hood and the cowl cover.

HOOD LATCH STRIKER

(1) Open the hood.

(2) Loosen the latch striker screws.

(3) Slowly close the hood and observe the latching operation.

(4) As necessary, re-adjust the striker position. Tighten the screws.

HOOD LATCH

(1) Open the hood.

(2) Loosen the hood latch screws.

(3) Move the latch to the correct location and lightly tighten the screws.

(4) Close the hood slowly and observe the latching operation.

(5) As necessary, re-adjust the latch position and tighten the screws.

FRONT DOOR LATCH

(1) Insert a hex-wrench through the elongated hole in the door end frame near the latch striker opening (Fig. 127).

(2) Loosen torx head screw on the side of the latch linkage.

(3) Lift upward on outside door handle and release it.

(4) Tighten torx head screw on latch.

(5) Verify latch operation.

ADJUSTMENTS (Continued)

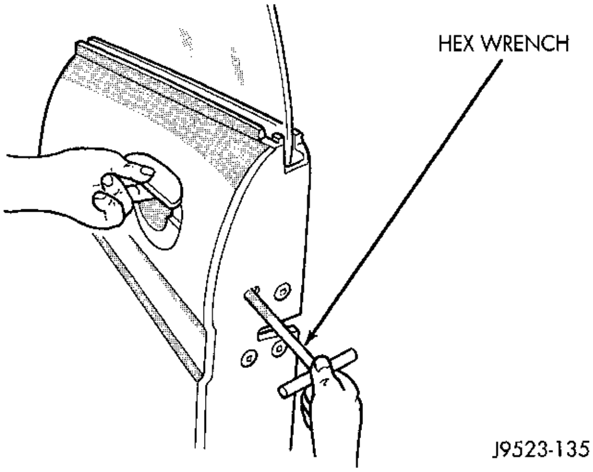

Fig. 127 Door Latch Adjustment

FRONT DOOR FORE/AFT

Fore/aft (lateral) door adjustment is done by loosening the hinge to cowl screws one hinge at a time. Then move the door to the correct position.

(1) Support the door with a padded floor jack.

(2) Loosen the hinge to cowl screws, if necessary, refer to the front door hinge removal/installation procedure for hinge fastener location. Move the door to the correct fore/aft position.

(3) Tighten the hinge to cowl screws.

(4) Remove the floor jack from the door.

FRONT DOOR IN/OUT

In/out door adjustment is done by loosening the hinge to door fasteners. Then move the door to the correct position.

(1) Support the door with a padded floor jack.

(2) Loosen the applicable hinge to door fasteners. Move the door to the correct in/out position.

(3) If necessary, loosen the other hinge to door fasteners and move the door to the correct in/out position.

(4) Tighten the hinge to door fasteners.

(5) Remove the floor jack from the door.

FRONT DOOR UP/DOWN

Up/down door adjustment is done by loosening the hinge to cowl fasteners at both hinges. Then move the door to the correct position.

(1) Support the door with a padded floor jack.

(2) Loosen hinge to cowl fasteners at both hinges. Move the door to the correct up/down position.

(3) Tighten the hinge to cowl fasteners.

(4) Remove the floor jack from the door.

CARGO DOOR

CARGO DOOR FORE/AFT AND UP/DOWN

(1) As applicable, remove the C-pillar trim to access the bolts attaching the cargo door to the C-pillar.

(2) Support the door with a padded floor jack.

(3) Loosen the applicable C-pillar to hinge bolts and move the door to the correct position.

If necessary, loosen the other C-pillar to hinge bolts and move the door to the correct position.

(4) Tighten the bolts to 28 N·m (21 ft. lbs.) torque.

(5) If necessary, loosen the bolts attaching the lower striker and move striker to the correct position.

If necessary, loosen the bolts attaching the upper latch to the cargo door and move to the correct position. (Fig. 128)

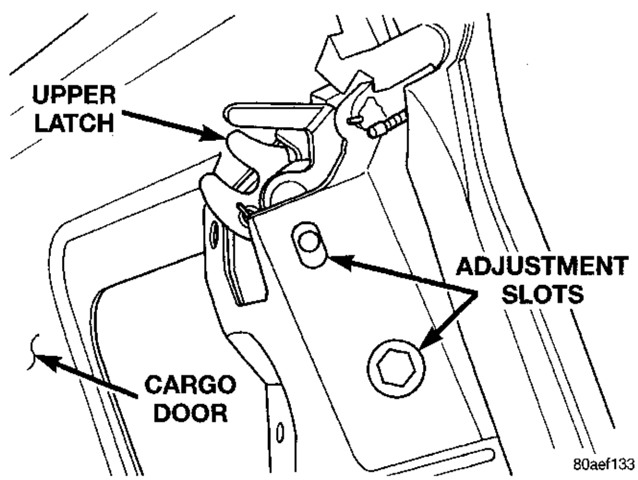

Fig. 128 Cargo Door Upper Latch

CARGO DOOR IN/OUT

(1) Loosen the applicable hinge to door fasteners and move the door to the correct position.

(2) Tighten the bolts to 28 N·m (21 ft. lbs.) torque.

Mopar AUTHENTIC RESTORATION™ PRODUCT

Mopar AUTHENTIC RESTORATION PRODUCT

HEATING AND AIR CONDITIONING

CONTENTS

GENERAL INFORMATION

HEATER AND AIR CONDITIONER

All vehicles are equipped with a common heater-A/C housing assembly (Fig. 1). The system combines air conditioning, heating, and ventilating capabilities in a single unit housing mounted under the instrument panel. On heater-only systems, the evaporator coil is omitted from the housing and replaced with an air restrictor plate.

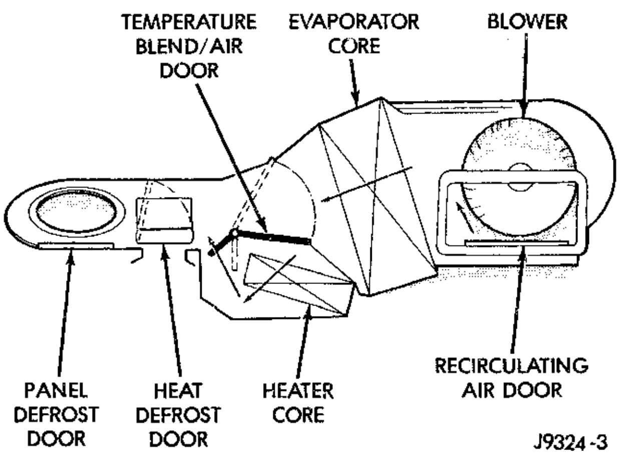

Fig. 1 Common Blend-Air Heater-Air Conditioner System

Outside fresh air enters the vehicle through the cowl top opening at the base of the windshield, and passes through a plenum chamber to the heater-A/C system blower housing (Fig. 2). Air flow velocity can then be adjusted with the blower motor speed selector switch on the heater-A/C control panel. The air intake openings must be kept free of snow, ice, leaves, and other obstructions for the heater-A/C system to receive a sufficient volume of outside air.

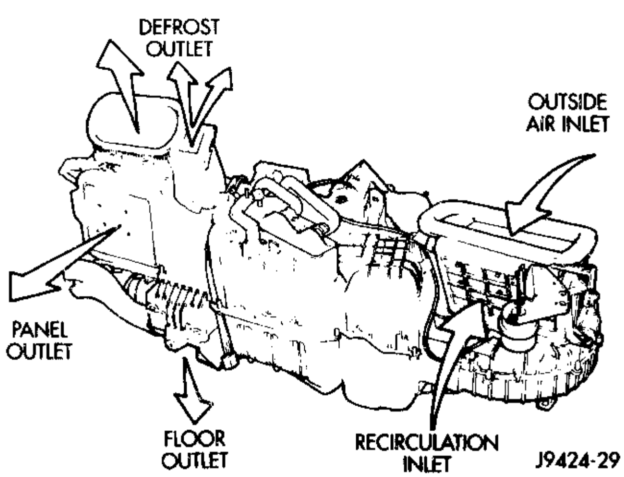

Fig. 2 Heater-A/C System Air Flow (Front View)

It is also important to keep the air intake openings clear of debris because leaf particles and other debris that is small enough to pass through the cowl plenum screen can accumulate within the heater-A/C housing. The closed, warm, damp and dark environment created within the heater-A/C housing is ideal for the growth of certain molds, mildews and other fungi. Any accumulation of decaying plant matter provides an additional food source for fungal spores, which enter the housing with the fresh air. Excess debris, as well as objectionable odors created by decaying plant matter and growing fungi can be discharged into the passenger compartment during heater-A/C system operation.

The heater and optional air conditioner are blend-air type systems. In a blend-air system, a blend-air door controls the amount of unconditioned air (or cooled air from the evaporator on models with air conditioning) that is allowed to flow through, or around, the heater core. A temperature control knob on the heater-A/C control panel determines the discharge air temperature by moving a cable, which operates the blend-air door. This allows an almost immediate manual control of the output air temperature of the system.

The mode control knob on the heater-only or heater-A/C control panel is used to direct the conditioned air to the selected system outlets. Both mode control switches use engine vacuum to control the mode doors, which are operated by vacuum actuator motors.

On air conditioned vehicles, the outside air intake can be shut off by selecting the recirculation mode (Max A/C) with the mode control knob. This will operate a vacuum actuated recirculating air door that closes off the outside fresh air intake and recirculates the air that is already inside the vehicle.

The optional air conditioner for all models is designed for the use of non-CFC, R-134a refrigerant. The air conditioning system has an evaporator to cool and dehumidify the incoming air prior to blending it with the heated air. This air conditioning system uses a fixed orifice tube in the liquid line between the condenser and the evaporator coil to meter refrigerant flow to the evaporator coil. To maintain minimum evaporator temperature and prevent evaporator freezing, a fixed pressure setting switch on the accumulator cycles the compressor clutch.

HEATER AND AIR CONDITIONER CONTROL

Both the heater-only and heater-A/C systems use a combination of mechanical, electrical, and vacuum controls. These controls provide the vehicle operator with a number of setting options to help control the climate and comfort within the vehicle. Refer to the owner's manual in the vehicle glove box for more

Mopar AUTHENTIC RESTORATION PRODUCT

GENERAL INFORMATION (Continued)

information on the features, use, and suggested operation of these controls.

The heater-only or heater-A/C control panel is located to the right of the instrument cluster on the instrument panel. The control panel contains a rotary-type temperature control knob, a rotary-type mode control switch knob, and a rotary-type blower motor speed switch knob. On models with the optional heated mirror system, a momentary push button switch and indicator lamp are located near the bottom of the heater-A/C control panel. Refer to Heated Mirror System in Group 8N - Electrically Heated Systems for more information on this feature.

The heater-only or heater-A/C control panel cannot be repaired. If faulty or damaged, the entire unit must be replaced. The control knobs and the illumination lamps are available for service replacement.

SERVICE WARNINGS AND PRECAUTIONS

WARNING:

- **THE AIR CONDITIONING SYSTEM CONTAINS REFRIGERANT UNDER HIGH PRESSURE. SEVERE PERSONAL INJURY MAY RESULT FROM IMPROPER SERVICE PROCEDURES. REPAIRS SHOULD ONLY BE PERFORMED BY QUALIFIED SERVICE PERSONNEL.**
- **AVOID BREATHING THE REFRIGERANT AND REFRIGERANT OIL VAPOR OR MIST. EXPOSURE MAY IRRITATE THE EYES, NOSE, AND/OR THROAT. WEAR EYE PROTECTION WHEN SERVICING THE AIR CONDITIONING REFRIGERANT SYSTEM. SERIOUS EYE INJURY CAN RESULT FROM DIRECT CONTACT WITH THE REFRIGERANT. IF EYE CONTACT OCCURS, SEEK MEDICAL ATTENTION IMMEDIATELY.**
- **DO NOT EXPOSE THE REFRIGERANT TO OPEN FLAME. POISONOUS GAS IS CREATED WHEN REFRIGERANT IS BURNED. AN ELECTRONIC LEAK DETECTOR IS RECOMMENDED.**
- **IF ACCIDENTAL SYSTEM DISCHARGE OCCURS, VENTILATE THE WORK AREA BEFORE RESUMING SERVICE. LARGE AMOUNTS OF REFRIGERANT RELEASED IN A CLOSED WORK AREA WILL DISPLACE THE OXYGEN AND CAUSE SUFFOCATION.**
- **THE EVAPORATION RATE OF R-134a REFRIGERANT AT AVERAGE TEMPERATURE AND ALTITUDE IS EXTREMELY HIGH. AS A RESULT, ANYTHING THAT COMES IN CONTACT WITH THE REFRIGERANT WILL FREEZE. ALWAYS PROTECT THE SKIN OR DELICATE OBJECTS FROM DIRECT CONTACT WITH THE REFRIGERANT.**
- **THE R-134a SERVICE EQUIPMENT OR THE VEHICLE REFRIGERANT SYSTEM SHOULD NOT BE PRESSURE TESTED OR LEAK TESTED WITH COMPRESSED AIR. SOME MIXTURES OF AIR AND R-134a HAVE BEEN SHOWN TO BE COMBUSTIBLE AT ELEVATED PRESSURES. THESE MIXTURES ARE POTENTIALLY DANGEROUS, AND MAY RESULT IN FIRE OR EXPLOSION CAUSING INJURY OR PROPERTY DAMAGE.**

CAUTION:

- **Liquid refrigerant is corrosive to metal surfaces. Follow the operating instructions supplied with the service equipment being used.**
- **Never add R-12 to a refrigerant system designed to use R-134a. Damage to the system will result.**
- **R-12 refrigerant oil must not be mixed with R-134a refrigerant oil. They are not compatible.**
- **Do not use R-12 equipment or parts on the R-134a system. Damage to the system will result.**
- **Do not overcharge the refrigerant system. This will cause excessive compressor head pressure and can cause noise and system failure.**
- **Recover the refrigerant before opening any fitting or connection. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.**
- **Do not remove the secondary retention clip from any spring-lock coupler connection while the refrigerant system is under pressure. Recover the refrigerant before removing the secondary retention clip. Open the fittings with caution, even after the system has been discharged. Never open or loosen a connection before recovering the refrigerant.**
- **The refrigerant system must always be evacuated before charging.**
- **Do not open the refrigerant system or uncap a replacement component until you are ready to service the system. This will prevent contamination in the system.**
- **Before disconnecting a component, clean the outside of the fittings thoroughly to prevent contamination from entering the refrigerant system.**
- **Immediately after disconnecting a component from the refrigerant system, seal the open fittings with a cap or plug.**
- **Before connecting an open refrigerant fitting, always install a new seal or gasket. Coat the fitting and seal with clean refrigerant oil before connecting.**

Mopar AUTHENTIC RESTORATION

GENERAL INFORMATION (Continued)

- **Do not remove the sealing caps from a replacement component until it is to be installed.**
- **When installing a refrigerant line, avoid sharp bends that may restrict refrigerant flow. Position the refrigerant lines away from exhaust system components or any sharp edges, which may damage the line.**
- **Tighten refrigerant fittings only to the specified torque. The aluminum fittings used in the refrigerant system will not tolerate overtightening.**
- **When disconnecting a refrigerant fitting, use a wrench on both halves of the fitting. This will prevent twisting of the refrigerant lines or tubes.**
- **Refrigerant oil will absorb moisture from the atmosphere if left uncapped. Do not open a container of refrigerant oil until you are ready to use it. Replace the cap on the oil container immediately after using. Store refrigerant oil only in a clean, airtight, and moisture-free container.**
- **Keep service tools and the work area clean. Contamination of the refrigerant system through careless work habits must be avoided.**

COOLING SYSTEM REQUIREMENTS

To maintain the performance level of the heating-air conditioning system, the engine cooling system must be properly maintained. The use of a bug screen is not recommended. Any obstructions in front of the radiator or condenser will reduce the performance of the air conditioning and engine cooling systems.

The engine cooling system includes the heater core and the heater hoses. Refer to Group 7 - Cooling System for more information before the opening of, or attempting any service to the engine cooling system.

REFRIGERANT HOSES/LINES/TUBES PRECAUTIONS

Kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire system. High pressures are produced in the system when it is operating. Extreme care must be exercised to make sure that all refrigerant system connections are pressure tight.

A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. Sharp bends will reduce the flow of refrigerant. The flexible hose lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold. It is a good practice to inspect all flexible refrigerant system hose lines at least once a year to make sure they are in good condition and properly routed.

There are two types of refrigerant fittings:

- All fittings with O-rings need to be coated with refrigerant oil before installation. Use only O-rings that are the correct size and approved for use with R-134a refrigerant. Failure to do so may result in a leak.
- Unified plumbing connections with gaskets cannot be serviced with O-rings. The gaskets are not reusable and new gaskets do not require lubrication before installing.

Using the proper tools when making a refrigerant plumbing connection is very important. Improper tools or improper use of the tools can damage the refrigerant fittings. Always use two wrenches when loosening or tightening tube fittings. Use one wrench to hold one side of the connection stationary, while loosening or tightening the other side of the connection with a second wrench.

The refrigerant must be recovered completely from the system before opening any fitting or connection. Open the fittings with caution, even after the refrigerant has been recovered. If any pressure is noticed as a fitting is loosened, tighten the fitting and recover the refrigerant from the system again.

Do not discharge refrigerant into the atmosphere. Use an R-134a refrigerant recovery/recycling device that meets SAE Standard J2210.

The refrigerant system will remain chemically stable as long as pure, moisture-free R-134a refrigerant and refrigerant oil is used. Dirt, moisture, or air can upset this chemical stability. Operational troubles or serious damage can occur if foreign material is present in the refrigerant system.

When it is necessary to open the refrigerant system, have everything needed to service the system ready. The refrigerant system should not be left open to the atmosphere any longer than necessary. Cap or plug all lines and fittings as soon as they are opened to prevent the entrance of dirt and moisture. All lines and components in parts stock should be capped or sealed until they are to be installed.

All tools, including the refrigerant recycling equipment, the manifold gauge set, and test hoses should be kept clean and dry. All tools and equipment must be designed for R-134a refrigerant.

DESCRIPTION AND OPERATION

ACCUMULATOR

The accumulator is mounted in the engine compartment between the evaporator coil outlet tube and the compressor inlet. Refrigerant enters the accumulator canister as a low pressure vapor through the inlet tube.

Any liquid, oil-laden refrigerant falls to the bottom of the canister, which acts as a separator. A desiccant bag is mounted inside the accumulator canister to absorb any moisture which may have entered and

DESCRIPTION AND OPERATION (Continued)

become trapped within the refrigerant system (Fig. 3)

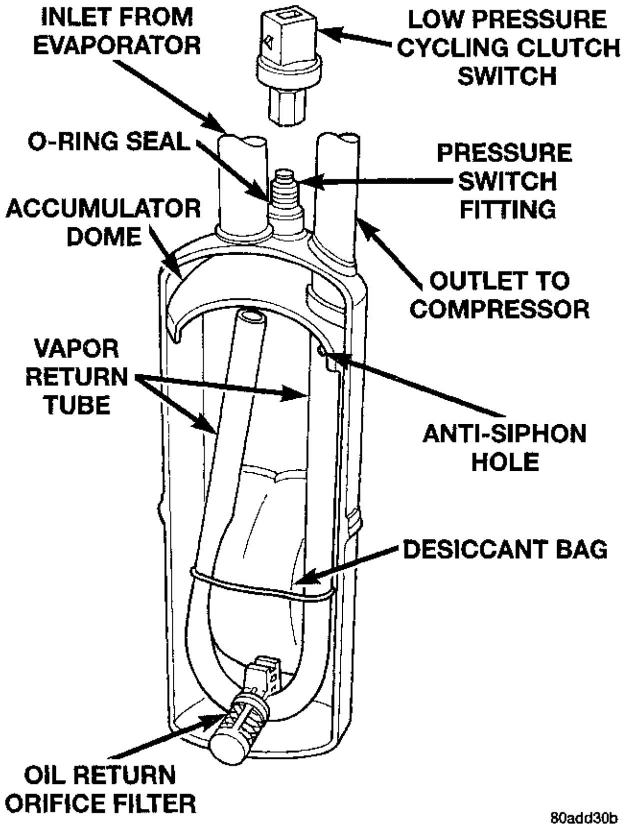

Fig. 3 Accumulator - Typical

BLOWER MOTOR

The blower motor and blower wheel are located in the passenger side end of the heater-A/C housing, below the glove box. The blower motor controls the velocity of the air flowing through the heater-A/C housing by spinning a squirrel cage-type blower wheel within the housing at the selected speed. The blower motor and blower wheel can be serviced from the passenger compartment side of the housing.

The blower motor will only operate when the ignition switch is in the On position, and the heater-A/C mode control switch knob is in any position, except Off. The blower motor receives a fused battery feed through the blower motor relay whenever the ignition switch is in the On position.

The blower motor battery feed circuit is protected by a fuse in the Power Distribution Center (PDC). The blower motor relay control circuit is protected by a fuse in the junction block. Blower motor speed is controlled by regulating the ground path through the heater-A/C mode control switch, the blower motor switch, and the blower motor resistor.

The blower motor and blower wheel cannot be repaired and, if faulty or damaged, they must be replaced. The blower motor and blower wheel are each serviced separately.

BLOWER MOTOR RELAY

The blower motor relay is a International Standards Organization (ISO)-type relay. The relay is a electromechanical device that switches battery current from a fuse in the Power Distribution Center (PDC) directly to the blower motor. The relay is energized when the relay coil is provided a voltage signal by the ignition switch. This arrangement reduces the amount of battery current that must flow through the ignition switch.

The blower motor relay control circuit is protected by a fuse located in the junction block. When the relay is de-energized, the blower motor receives no battery current. See Blower Motor Relay in the Diagnosis and Testing section of this group for more information.

The blower motor relay is located in the PDC in the engine compartment. Refer to the PDC label for blower motor relay identification and location.

The blower motor relay cannot be repaired and, if faulty or damaged, it must be replaced.

BLOWER MOTOR RESISTOR

The blower motor resistor is mounted to the bottom of the heater-A/C housing, under the instrument panel and just inboard of the blower motor. It can be accessed without removing any other components.

The resistor has multiple resistor wires, each of which will change the resistance in the blower motor ground path to change the blower motor speed. The blower motor switch directs the ground path through the correct resistor wire to obtain the selected blower motor speed.

With the blower motor switch in the lowest speed position, the ground path for the motor is applied through all of the resistor wires. Each higher speed selected with the blower motor switch applies the blower motor ground path through fewer of the resistor wires, increasing the blower motor speed. When the blower motor switch is in the highest speed position, the blower motor resistor is bypassed and the blower motor receives a direct path to ground.

The blower motor resistor cannot be repaired and, if faulty or damaged, it must be replaced.

BLOWER MOTOR SWITCH

The heater-only or heater-A/C blower motor is controlled by a four position rotary-type blower motor switch, mounted in the heater-A/C control panel. The switch allows the selection of one of four blower motor speeds, but can only be turned off by selecting the Off position with the heater-A/C mode control switch knob.

DESCRIPTION AND OPERATION (Continued)

The blower motor switch directs the blower motor ground path through the mode control switch to the blower motor resistor, or directly to ground, as required to achieve the selected blower motor speed.

The blower motor switch cannot be repaired and, if faulty or damaged, the entire heater-only or heater-A/C control unit must be replaced. The blower motor switch knob is serviced separately.

COMPRESSOR

The air conditioning system uses a Sanden SD7H15 seven cylinder, reciprocating wobble plate-type compressor on all models. This compressor has a fixed displacement of 150 cubic centimeters (9.375 cubic inches), and has both the suction and discharge ports located on the cylinder head. A label identifying the use of R-134a refrigerant is located on the compressor.

The compressor is driven by the engine through an electric clutch, drive pulley and belt arrangement. The compressor is lubricated by refrigerant oil that is circulated throughout the refrigerant system with the refrigerant.

The compressor draws in low-pressure refrigerant vapor from the evaporator through its suction port. It then compresses the refrigerant into a high-pressure, high-temperature refrigerant vapor, which is then pumped to the condenser through the compressor discharge port.

The compressor cannot be repaired. If faulty or damaged, the entire compressor assembly must be replaced. The compressor clutch, pulley and clutch coil are available for service.

COMPRESSOR CLUTCH

The compressor clutch assembly consists of a stationary electromagnetic coil, a hub bearing and pulley assembly, and a clutch plate (Fig. 4). The electromagnetic coil unit and the hub bearing and pulley assembly are each retained on the nose of the compressor front housing with snap rings. The clutch plate is mounted to the compressor shaft and secured with a nut.

These components provide the means to engage and disengage the compressor from the engine serpentine accessory drive belt. When the clutch coil is energized, it magnetically draws the clutch into contact with the pulley and drives the compressor shaft. When the coil is not energized, the pulley freewheels on the clutch hub bearing, which is part of the pulley. The compressor clutch and coil are the only serviced parts on the compressor.

The compressor clutch engagement is controlled by several components: the heater-A/C mode control switch, the low pressure cycling clutch switch, the high pressure cut-off switch, the compressor clutch

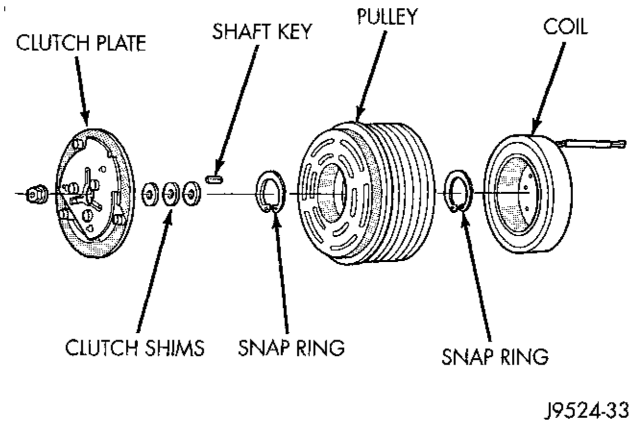

Fig. 4 Compressor Clutch - Typical

relay, and the Powertrain Control Module (PCM). The PCM may delay compressor clutch engagement for up to thirty seconds. Refer to Group 14 - Fuel System for more information on the PCM controls.

COMPRESSOR CLUTCH RELAY

The compressor clutch relay is a International Standards Organization (ISO) micro-relay. The terminal designations and functions are the same as a conventional ISO relay. However, the micro-relay terminal orientation (footprint) is different, the current capacity is lower, and the relay case dimensions are smaller than those of the conventional ISO relay.

The compressor clutch relay is a electromechanical device that switches battery current to the compressor clutch coil when the Powertrain Control Module (PCM) grounds the coil side of the relay. The PCM responds to inputs from the heater-A/C mode control switch, the low pressure cycling clutch switch, and the high pressure cut-off switch. See Compressor Clutch Relay in the Diagnosis and Testing section of this group for more information.

The compressor clutch relay is located in the Power Distribution Center (PDC) in the engine compartment. Refer to the PDC label for relay identification and location.

The compressor clutch relay cannot be repaired and, if faulty or damaged, it must be replaced.

CONDENSER

The condenser is located in the air flow in front of the engine cooling radiator. The condenser is a heat exchanger that allows the high-pressure refrigerant gas being discharged by the compressor to give up its heat to the air passing over the condenser fins. When the refrigerant gas gives up its heat, it condenses. When the refrigerant leaves the condenser, it has become a high-pressure liquid refrigerant.

The volume of air flowing over the condenser fins is critical to the proper cooling performance of the air

DESCRIPTION AND OPERATION (Continued)

conditioning system. Therefore, it is important that there are no objects placed in front of the radiator grille openings in the front of the vehicle or foreign material on the condenser fins that might obstruct proper air flow. Also, any factory-installed air seals or shrouds must be properly reinstalled following radiator or condenser service.

The condenser cannot be repaired and, if faulty or damaged, it must be replaced.

EVAPORATOR COIL

The evaporator coil is located in the heater-A/C housing, under the instrument panel. The evaporator coil is positioned in the heater-A/C housing so that all air that enters the housing must pass over the fins of the evaporator before it is distributed through the system ducts and outlets. However, air passing over the evaporator coil fins will only be conditioned when the compressor is engaged and circulating refrigerant through the evaporator coil tubes.

Refrigerant enters the evaporator from the fixed orifice tube as a low-temperature, low-pressure liquid. As air flows over the fins of the evaporator, the humidity in the air condenses on the fins, and the heat from the air is absorbed by the refrigerant. Heat absorption causes the refrigerant to boil and vaporize. The refrigerant becomes a low-pressure gas before it leaves the evaporator.

The evaporator coil cannot be repaired and, if faulty or damaged, it must be replaced.

FIXED ORIFICE TUBE

The fixed orifice tube is installed in the liquid line between the outlet of the condenser and the inlet of the evaporator. The fixed orifice tube is only serviced as an integral part of the liquid line.

The inlet end of the fixed orifice tube has a nylon mesh filter screen, which filters the refrigerant and helps to reduce the potential for blockage of the metering orifice by refrigerant system contaminants (Fig. 5). The outlet end of the tube has a nylon mesh diffuser screen. The O-rings on the plastic body of the fixed orifice tube seal the tube to the inside of the liquid line and prevent the refrigerant from bypassing the fixed metering orifice.

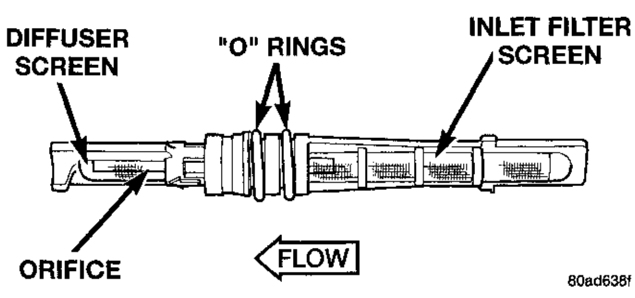

Fig. 5 Fixed Orifice Tube - Typical

The fixed orifice tube is used to meter the flow of liquid refrigerant into the evaporator coil. The high-pressure liquid refrigerant from the condenser expands into a low-pressure liquid as it passes through the metering orifice and diffuser screen of the fixed orifice tube.

The fixed orifice tube cannot be repaired and, if faulty or plugged, the liquid line assembly must be replaced.

HEATER CORE

The heater core is located in the heater-A/C housing, under the instrument panel. It is a heat exchanger made of rows of tubes and fins. Engine coolant is circulated through heater hoses to the heater core at all times. As the coolant flows through the heater core, heat removed from the engine is transferred to the heater core fins and tubes.

Air directed through the heater core picks up the heat from the heater core fins. The blend air door allows control of the heater output air temperature by controlling how much of the air flowing through the heater-A/C housing is directed through the heater core. The blower motor speed controls the volume of air flowing through the heater-A/C housing.

The heater core cannot be repaired and, if faulty or damaged, it must be replaced. Refer to Group 7 - Cooling System for more information on the engine cooling system, the engine coolant and the heater hoses.

HIGH PRESSURE CUT-OFF SWITCH

The high pressure cut-off switch is located on the discharge line near the compressor. The switch is screwed onto a fitting that contains a Schrader-type valve, which allows the switch to be serviced without discharging the refrigerant system. The discharge line fitting is equipped with an O-ring to seal the switch connection.

The high pressure cut-off switch is connected in series electrically with the low pressure cycling clutch switch between ground and the Powertrain Control Module (PCM). The switch contacts open and close causing the PCM to turn the compressor clutch on and off. This prevents compressor operation when the discharge line pressure approaches high levels.

The high pressure cut-off switch contacts are open when the discharge line pressure rises above about 3100 to 3375 kPa (450 to 490 psi). The switch contacts will close when the discharge line pressure drops to about 1860 to 2275 kPa (270 to 330 psi). When checking refrigerant system pressures with a manifold gauge set, keep in mind that the indicated pressures will be about 172 kpa (25 psi) below the actual switch pressure values due to the pressure

DESCRIPTION AND OPERATION (Continued)

drop that occurs in the refrigerant system between the switch and the high pressure service port.

The high pressure cut-off switch is a factory-calibrated unit. The switch cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

HIGH PRESSURE RELIEF VALVE

A high pressure relief valve is located on the compressor cylinder head, which is at the rear of the compressor. This mechanical valve is designed to vent refrigerant from the system to protect against damage to the compressor and other system components, caused by condenser air flow restriction or an overcharge of refrigerant.

The high pressure relief valve vents the system when a discharge pressure of 3445 to 4135 kPa (500 to 600 psi) or above is reached. The valve closes with a minimum discharge pressure of 2756 kPa (400 psi) is reached.

The high pressure relief valve vents only enough refrigerant to reduce the system pressure, and then re-seats itself. The majority of the refrigerant is conserved in the system. If the valve vents refrigerant, it does not mean the valve is faulty.

The high pressure relief valve is a factory-calibrated unit. The valve cannot be adjusted or repaired, and must not be removed or otherwise disturbed. The valve is only serviced as a part of the compressor assembly.

LOW PRESSURE CYCLING CLUTCH SWITCH

The low pressure cycling clutch switch is located on the top of the accumulator. The switch is screwed onto an accumulator fitting that contains a Schrader-type valve, which allows the switch to be serviced without discharging the refrigerant system. The accumulator fitting is equipped with an O-ring to seal the switch connection.

The low pressure cycling clutch switch is connected in series electrically with the high pressure cut-off switch and the heater-A/C controls, between ground and the Powertrain Control Module (PCM). The switch contacts open and close causing the PCM to turn the compressor clutch on and off. This regulates the refrigerant system pressure and controls evaporator temperature. Controlling evaporator temperature prevents condensate water on the evaporator fins from freezing and obstructing air conditioning system air flow.

The low pressure cycling clutch switch contacts are open when the suction pressure is about 172 kPa (25 psi) or lower. The switch contacts will close when the suction pressure rises to about 296 kPa (43 psi) or above. Lower ambient temperatures, below about -1° C (30° F), will also cause the switch contacts to open. This is due to the pressure/temperature relationship of the refrigerant in the system.

The low pressure cycling clutch switch is a factory-calibrated unit. It cannot be adjusted or repaired and, if faulty or damaged, it must be replaced.

REFRIGERANT

The refrigerant used in this air conditioning system is a HydroFluoroCarbon (HFC), type R-134a. Unlike R-12, which is a ChloroFluoroCarbon (CFC), R-134a refrigerant does not contain ozone-depleting chlorine. R-134a refrigerant is a non-toxic, non-flammable, clear, and colorless liquefied gas.

Even though R-134a does not contain chlorine, it must be reclaimed and recycled just like CFC-type refrigerants. This is because R-134a is a greenhouse gas and can contribute to global warming.

R-134a refrigerant is not compatible with R-12 refrigerant in an air conditioning system. Even a small amount of R-12 added to an R-134a refrigerant system will cause compressor failure, refrigerant oil sludge or poor air conditioning system performance. In addition, the PolyAlkylene Glycol (PAG) synthetic refrigerant oils used in an R-134a refrigerant system are not compatible with the mineral-based refrigerant oils used in an R-12 refrigerant system.

R-134a refrigerant system service ports, service tool couplers and refrigerant dispensing bottles have all been designed with unique fittings to ensure that an R-134a system is not accidentally contaminated with the wrong refrigerant (R-12). There are also labels posted in the engine compartment of the vehicle and on the compressor identifying to service technicians that the air conditioning system is equipped with R-134a.

REFRIGERANT LINE

The refrigerant lines and hoses are used to carry the refrigerant between the various air conditioning system components. A barrier hose design with a nylon tube inner hose liner is used for the R-134a air conditioning system on this vehicle. This nylon liner helps to further contain the R-134a refrigerant, which has a smaller molecular structure than R-12 refrigerant. The ends of the refrigerant hoses are made from lightweight aluminum, and use braze-less fittings.

Any kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire air conditioning system. Kinks and sharp bends reduce the flow of refrigerant in the system. A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. In addition, the flexible hose refrigerant lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold.

Mopar AUTHENTIC RESTORATION PRODUCT

DESCRIPTION AND OPERATION (Continued)

High pressures are produced in the refrigerant system when the air conditioning compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

The refrigerant lines and hoses cannot be repaired and, if faulty or damaged, they must be replaced.

REFRIGERANT LINE COUPLER

Spring-lock type refrigerant line couplers are used to connect many of the refrigerant lines and other components to the refrigerant system. These couplers require a special tool for disengaging the two coupler halves.

The spring-lock coupler is held together by a garter spring inside a circular cage on the male half of the fitting (Fig. 6). When the two coupler halves are connected, the flared end of the female fitting slips behind the garter spring inside the cage on the male fitting. The garter spring and cage prevent the flared end of the female fitting from pulling out of the cage

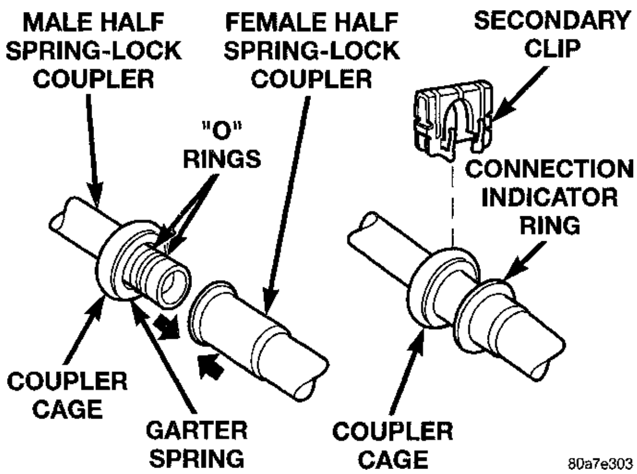

Fig. 6 Spring-Lock Coupler - Typical

Two O-rings on the male half of the fitting are used to seal the connection. These O-rings are compatible with R-134a refrigerant and must be replaced with O-rings made of the same material.

Secondary clips are installed over the two connected coupler halves at the factory for added blowoff protection. In addition, a plastic ring is used at the factory as a visual indicator to confirm that these couplers are connected. After the coupler is connected, the plastic indicator ring is no longer needed; however, it will remain on the refrigerant line near the coupler cage.

REFRIGERANT OIL

The refrigerant oil used in R-134a refrigerant systems is a synthetic-based, PolyAlkylene Glycol (PAG), wax-free lubricant. Mineral-based R-12 refrigerant oils are not compatible with PAG oils, and should never be introduced to an R-134a refrigerant system.

There are different PAG oils available, and each contains a different additive package. The SD7H15 compressor used in this vehicle is designed to use an SP-20 PAG refrigerant oil. Use only refrigerant oil of this same type to service the refrigerant system.

After performing any refrigerant recovery or recycling operation, always replenish the refrigerant system with the same amount of the recommended refrigerant oil as was removed. Too little refrigerant oil can cause compressor damage, and too much can reduce air conditioning system performance.

PAG refrigerant oil is much more hygroscopic than mineral oil, and will absorb any moisture it comes into contact with, even moisture in the air. The PAG oil container should always be kept tightly capped until it is ready to be used. After use, recap the oil container immediately to prevent moisture contamination.

REFRIGERANT SYSTEM SERVICE EQUIPMENT

WARNING: EYE PROTECTION MUST BE WORN WHEN SERVICING AN AIR CONDITIONING REFRIGERANT SYSTEM. TURN OFF (ROTATE CLOCKWISE) ALL VALVES ON THE EQUIPMENT BEING USED, BEFORE CONNECTING TO OR DISCONNECTING FROM THE REFRIGERANT SYSTEM. FAILURE TO OBSERVE THESE WARNINGS MAY RESULT IN PERSONAL INJURY.

When servicing the air conditioning system, a R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used. Contact an automotive service equipment supplier for refrigerant recovery/recycling/charging equipment. Refer to the operating instructions supplied by the equipment manufacturer for the proper care and use of this equipment.

A manifold gauge set may be needed with some recovery/recycling/charging equipment (Fig. 7). The service hoses on the gauge set being used should have manual (turn wheel), or automatic back-flow valves at the service port connector ends. This will prevent refrigerant from being released into the atmosphere.

MANIFOLD GAUGE SET CONNECTIONS

CAUTION: Do not use an R-12 manifold gauge set on an R-134a system. The refrigerants are not compatible and system damage will result.

DESCRIPTION AND OPERATION (Continued)

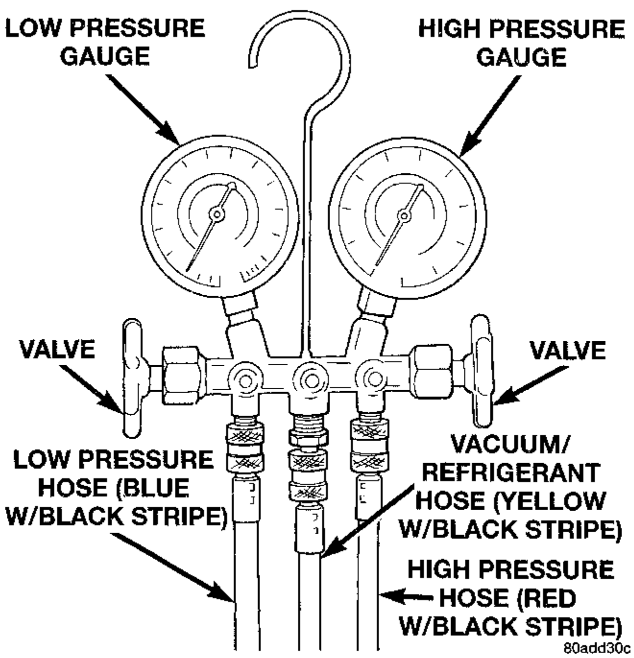

Fig. 7 Manifold Gauge Set - Typical

LOW PRESSURE GAUGE HOSE

The low pressure hose (Blue with Black stripe) attaches to the suction service port. This port is located on the suction line, near the accumulator outlet.

HIGH PRESSURE GAUGE HOSE

The high pressure hose (Red with Black stripe) attaches to the discharge service port. This port is located on the liquid line between the condenser and the evaporator, near the front of the engine compartment.

RECOVERY/RECYCLING/EVACUATION/CHARGING HOSE

The center manifold hose (Yellow, or White, with Black stripe) is used to recover, evacuate, and charge the refrigerant system. When the low or high pressure valves on the manifold gauge set are opened, the refrigerant in the system will escape through this hose.

REFRIGERANT SYSTEM SERVICE PORT

The two refrigerant system service ports are used to charge, recover/recycle, evacuate, and test the air conditioning refrigerant system. Unique service port coupler sizes are used on the R-134a system, to ensure that the refrigerant system is not accidentally contaminated by the use of the wrong refrigerant (R-12), or refrigerant system service equipment.

The high pressure service port is located on the liquid line between the condenser and the evaporator, near the front of the engine compartment. The low pressure service port is located on the suction line, near the accumulator outlet.

Each of the service ports has a threaded plastic protective cap installed over it from the factory. After servicing the refrigerant system, always reinstall both of the service port caps.

VACUUM CHECK VALVE

On models with a gasoline engine, a vacuum check valve is installed in the accessory vacuum supply line near the vacuum tap on the right side of the engine intake manifold. On models with a diesel engine, a vacuum check valve is installed on the engine vacuum pump. The vacuum check valve is designed to allow vacuum to flow in only one direction through the accessory vacuum supply circuits.

The use of a vacuum check valve helps to maintain the system vacuum needed to retain the selected heater-A/C mode and vehicle speed control settings. On gasoline engine models, it prevents the engine from bleeding down system vacuum through the intake manifold during extended heavy engine load (low engine vacuum) operation. On diesel engine models, it prevents oil from contaminating the vacuum supply system by maintaining vacuum in the pump after engine shut-off.

On gasoline engine models, a second vacuum check valve is installed in the accessory vacuum supply line at the tee fitting near the dash panel in the engine compartment. This check valve also helps to maintain the system vacuum needed to retain the selected heater-A/C mode settings, but isolates the heater-A/C vacuum circuit from the vehicle speed control vacuum circuit. It prevents the vehicle speed control servo from bleeding down the heater-A/C system vacuum during extended heavy engine load operation.

The vacuum check valve cannot be repaired and, if faulty or damaged, it must be replaced.

VACUUM RESERVOIR

Models equipped with a gasoline engine have a vacuum reservoir. The vacuum reservoir is mounted in the passenger side cowl plenum area, under the cowl plenum cover/grille panel. The cowl plenum cover/grille panel must be removed from the vehicle to access the vacuum reservoir for service.

Engine vacuum is stored in the vacuum reservoir. The stored vacuum is used to operate the vacuum-controlled vehicle accessories during periods of low engine vacuum such as when the vehicle is climbing a steep grade, or under other high engine load operating conditions.

The vacuum reservoir cannot be repaired and, if faulty or damaged, it must be replaced.

Mopar AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING

A/C PERFORMANCE

The air conditioning system is designed to provide the passenger compartment with low temperature and low humidity air. The evaporator, located in the heater-A/C housing on the dash panel below the instrument panel, is cooled to temperatures near the freezing point. As warm damp air passes through the cooled evaporator, the air transfers its heat to the refrigerant in the evaporator tubes and the moisture in the air condenses on the evaporator fins. During periods of high heat and humidity, an air conditioning system will be more effective in the recirculation mode (Max-A/C). With the system in the recirculation mode, only air from the passenger compartment passes through the evaporator. As the passenger compartment air dehumidifies, the air conditioning system performance levels improve.

Humidity has an important bearing on the temperature of the air delivered to the interior of the vehicle. It is important to understand the effect that humidity has on the performance of the air conditioning system. When humidity is high, the evaporator has to perform a double duty. It must lower the air temperature, and it must lower the temperature of the moisture in the air that condenses on the evaporator fins. Condensing the moisture in the air transfers heat energy into the evaporator fins and tubing. This reduces the amount of heat the evaporator can absorb from the air. High humidity greatly reduces the ability of the evaporator to lower the temperature of the air.

However, evaporator capacity used to reduce the amount of moisture in the air is not wasted. Wringing some of the moisture out of the air entering the vehicle adds to the comfort of the passengers. Although, an owner may expect too much from their air conditioning system on humid days. A performance test is the best way to determine whether the system is performing up to standard. This test also provides valuable clues as to the possible cause of trouble with the air conditioning system.

Review the Service Warnings and Precautions in the General Information section near the front of this group before performing this procedure. The air temperature in the test room and in the vehicle must be a minimum of 21° C (70° F) for this test.

(1) Connect a tachometer and a manifold gauge set.

(2) Set the heater-A/C mode control switch knob in the recirculation mode (Max-A/C) position, the temperature control knob in the full cool position, and the blower motor switch in the highest speed position.

(3) Start the engine and hold the idle speed at 1,000 rpm with the compressor clutch engaged. If the compressor clutch does not engage, see the A/C Diagnosis chart in the Diagnosis and Testing section of this group.

(4) The engine should be at operating temperature. The doors and windows must be open and the hood must be mostly closed.

(5) Insert a thermometer in the driver side center A/C (panel) outlet. Operate the engine for five minutes.

(6) The compressor clutch may cycle, depending upon the ambient temperature and humidity. If the clutch cycles, unplug the low pressure cycling clutch switch wire harness connector from the switch located on the accumulator (Fig. 8). Place a jumper wire between the two cavities of the low pressure cycling clutch switch wire harness connector.

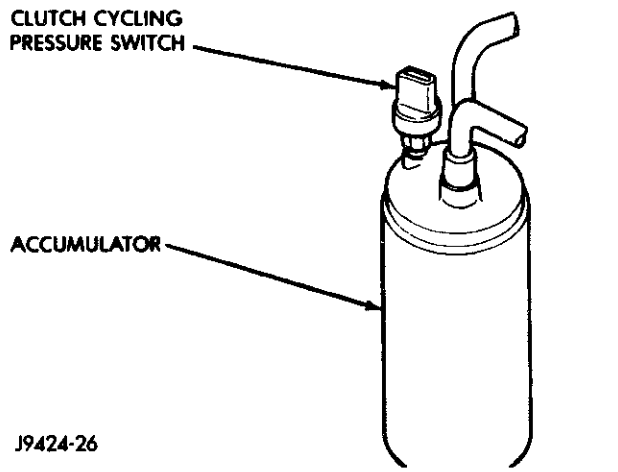

Fig. 8 Low Pressure Cycling Clutch Switch - Typical

(7) With the compressor clutch engaged, record the panel outlet discharge air temperature, the discharge pressure (high side), and the suction pressure (low side).

(8) Compare the panel outlet discharge air temperature reading to the Performance Temperature and Pressure chart. If the temperature reading is high, clamp off both heater hoses (inlet and outlet), wait five minutes and record the temperature again. Compare the second reading to the Performance Temperature and Pressure chart. If the temperature reading is now OK, see Temperature Control Cable in the Removal and Installation section and in the Adjustments section of this group. If the temperature reading is still too high, see Refrigerant System Leaks in the Diagnosis and Testing section of this group, and Refrigerant System Charge in the Service Procedures section of this group .

(9) Compare the discharge (high side) and suction (low side) pressure readings to the Performance Temperature and Pressure chart. If the pressures are abnormal, see the A/C Diagnosis chart in the Diagnosis and Testing section of this group.

Mopar AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING (Continued)

Performance Temperature and Pressure						
Ambient Temperature	**21° C (70° F)**	**27° C (80° F)**	**32° C (90° F)**	**38° C (100° F)**	**43° C (110° F)**	**49° C (120° F)**
Center Panel OutletDischarge Air Temperature	5 to 7° C (40 to 45° F)	13 to 16° C (55 to 60° F)	16 to 21° C (60 to 70° F)	21 to 24° C (70 to 75° F)	27 to 29° C (80 to 85° F)	29 to 32° C (85 to 90° F)
*Suction Pressure (Low Side)	241 to 276 kPa (35 to 40 psi)	276 to 345 kPa (40 to 50 psi)	345 to 414 kPa (50 to 60 psi)	414 to 483 kPa (60 to 70 psi)	483 to 552 kPa (70 to 80 psi)	552 to 586 kPa (85 to 90 psi)
*Discharge Pressure (High Side)	931 to 1000 kPa (135 to 145 psi)	1207 to 1482 kPa (175 to 215 psi)	1482 to 1862 kPa (215 to 270 psi)	1862 to 2275 kPa (270 to 330 psi)	2344 to 2551 kPa (340 to 370 psi)	2758 to 2965 kPa (400 to 430 psi)
*Note: If pressures are lower than shown, but center panel outlet discharge air temperatures are OK, then the A/C system is OK.						

A/C Diagnosis		
Condition	**Possible Causes**	**Correction**
RAPID COMPRESSOR CLUTCH CYCLING (TEN OR MORE CYCLES PER MINUTE).	1. Low refrigerant system charge. 2. Faulty low pressure cycling clutch switch. 3. Faulty Powertrain Control Module (PCM).	1. See Refrigerant System Leaks in the Diagnosis and Testing section of this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required. 2. See Low Pressure Cycling Clutch Switch in the Diagnosis and Testing section of this group. Test the low pressure cycling clutch switch and replace, if required. 3. Refer to the proper Diagnostic Procedures manual for testing of the PCM. Test the PCM and replace, if required.
EQUAL PRESSURES, BUT THE COMPRESSOR CLUTCH DOES NOT ENGAGE.	1. No refrigerant in the refrigerant system. 2. Faulty fuse. 3. Faulty compressor clutch coil. 4. Faulty compressor clutch relay. 5. Improperly installed or faulty low pressure cycling clutch switch. 6. Faulty high pressure cut-off switch. 7. Faulty Powertrain Control Module (PCM). 8. Faulty heater-A/C control.	1. See Refrigerant System Leaks in the Diagnosis and Testing section of this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required. 2. Check the fuses in the Power Distribution Center and the junction block. Repair the shorted circuit or component and replace the fuses, if required. 3. See Compressor Clutch Coil in the Diagnosis and Testing section of this group. Test the compressor clutch coil and replace, if required. 4. See Compressor Clutch Relay in the Diagnosis and Testing section of this group. Test the compressor clutch relay and relay circuits. Repair the circuits or replace the relay, if required. 5. See Low Pressure Cycling Clutch Switch in the Diagnosis and Testing section of this group. Test the low pressure cycling clutch switch and tighten or replace, if required. 6. See High Pressure Cut-Off Switch in the Diagnosis and Testing section of this group. Test the high pressure cut-off switch and replace, if required. 7. Refer to the proper Diagnostic Procedures manual for testing of the PCM. Test the PCM and replace, if required. 8. See Heater-A/C Control in the Diagnosis and Testing section of this group. Test the heater-A/C control and replace, if required.

Mopar AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING (Continued)

A/C Diagnosis		
Condition	**Possible Causes**	**Correction**
NORMAL PRESSURES, BUT A/C PERFORMANCE TEST AIR TEMPERATURES AT CENTER PANEL OUTLET ARE TOO HIGH.	1. Excessive refrigerant oil in system. 2. Temperature control cable improperly installed or faulty. 3. Blend-air door inoperative, obstructed or sealing improperly.	1. See Refrigerant Oil Level in the Service Procedures section of this group. Recover the refrigerant from the refrigerant system and inspect the refrigerant oil content. Restore the refrigerant oil to the proper level, if required. 2. See Temperature Control Cable in the Removal and Installation and Adjustments sections of this group. Inspect the temperature control cable for proper routing, operation and adjustment. Repair as required. 3. See Heater-A/C Housing Door in the Removal and Installation section of this group. Inspect the blend-air door for proper operation and sealing and correct, if required.
LOW SIDE PRESSURE IS NORMAL OR SLIGHTLY LOW, AND HIGH SIDE PRESSURE IS TOO LOW.	1. Low refrigerant system charge. 2. Refrigerant flow through the accumulator is restricted. 3. Refrigerant flow through the evaporator coil is restricted. 4. Faulty compressor.	1. See Refrigerant System Leaks in the Diagnosis and Testing section of this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required. 2. See Accumulator in the Removal and Installation section of this group. Replace the restricted accumulator, if required. 3. See Evaporator Coil in the Removal and Installation section of this group. Replace the restricted evaporator coil, if required. 4. See Compressor in the Diagnosis and Testing section of this group. Replace the compressor, if required.
LOW SIDE PRESSURE IS NORMAL OR SLIGHTLY HIGH, AND HIGH SIDE PRESSURE IS TOO HIGH.	1. Condenser air flow restricted. 2. Inoperative cooling fan. 3. Refrigerant system overcharged. 4. Air in the refrigerant system. 5. Engine overheating.	1. Check the condenser for damaged fins, foreign objects obstructing air flow through the condenser fins, and missing or improperly installed air seals. Refer to Group 7 - Cooling System for more information on air seals. Clean, repair, or replace components as required. 2. Refer to Group 7 - Cooling System for more information. Test the cooling fan and replace, if required. 3. See Refrigerant System Charge in the Service Procedures section of this group. Recover the refrigerant from the refrigerant system. Charge the refrigerant system to the proper level, if required. 4. See Refrigerant System Leaks in the Diagnosis and Testing section of this group. Test the refrigerant system for leaks. Repair, evacuate and charge the refrigerant system, if required. 5. Refer to Group 7 - Cooling System for more information. Test the cooling system and repair, if required.
LOW SIDE PRESSURE IS TOO HIGH, AND HIGH SIDE PRESSURE IS TOO LOW.	1. Accessory drive belt slipping. 2. Fixed orifice tube not installed. 3. Faulty compressor.	1. Refer to Group 7 - Cooling System for more information. Inspect the accessory drive belt condition and tension. Tighten or replace the accessory drive belt, if required. 2. See Fixed Orifice Tube in the Diagnosis and Testing section of this group. Install the missing fixed orifice tube, if required. 3. See Compressor in the Diagnosis and Testing section of this group. Replace the compressor, if required.

AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING (Continued)

A/C Diagnosis		
Condition	**Possible Causes**	**Correction**
LOW SIDE PRESSURE IS TOO LOW, AND HIGH SIDE PRESSURE IS TOO HIGH.	1. Restricted refrigerant flow through the refrigerant lines. 2. Restricted refrigerant flow through the fixed orifice tube. 3. Restricted refrigerant flow through the condenser.	1. See Liquid Line and Suction and Discharge Line in the Removal and Installation section of this group. Inspect the refrigerant lines for kinks, tight bends or improper routing. Correct the routing or replace the refrigerant line, if required. 2. See Fixed Orifice Tube in the Diagnosis and Testing section of this group. Replace the restricted fixed orifice tube, if required. 3. See Condenser in the Removal and Installation section of this group. Replace the restricted condenser, if required.

HEATER PERFORMANCE

Before performing the following tests, refer to Group 7 - Cooling System for the procedures to check the engine coolant level and flow, engine coolant reserve/recovery system operation, accessory drive belt condition and tension, radiator air flow and the fan drive operation. Also be certain that the accessory vacuum supply line is connected at the engine vacuum source.

MAXIMUM HEATER OUTPUT

Engine coolant is delivered to the heater core through two heater hoses. With the engine idling at normal operating temperature, set the temperature control knob in the full hot position, the mode control switch knob in the floor position, and the blower motor switch knob in the highest speed position. Using a test thermometer, check the temperature of the air being discharged at the heater-A/C housing floor outlets. Compare the test thermometer reading to the Temperature Reference chart.

If the floor outlet air temperature is too low, refer to Group 7 - Cooling System to check the engine coolant temperature specifications. Both of the heater hoses should be hot to the touch. The coolant return heater hose should be slightly cooler than the coolant supply heater hose. If the return hose is much cooler than the supply hose, locate and repair the engine coolant flow obstruction in the cooling system. Refer to Group 7 - Cooling System for the procedures.

An alternate method of checking heater performance is to use a DRB scan tool to monitor the engine coolant temperature. The floor outlet air temperature reading should be no more than 4.5° C (40° F) lower than the engine coolant temperature reading.

OBSTRUCTED COOLANT FLOW

Possible locations or causes of obstructed coolant flow:

- Faulty water pump.
- Faulty thermostat.
- Pinched or kinked heater hoses.
- Improper heater hose routing.
- Plugged heater hoses or supply and return ports at the cooling system connections.
- A plugged heater core.

If proper coolant flow through the cooling system is verified, and heater outlet air temperature is still low, a mechanical problem may exist.

MECHANICAL PROBLEMS

Possible locations or causes of insufficient heat:

- An obstructed cowl air intake.
- Obstructed heater system outlets.
- A faulty, obstructed or improperly installed blend-air door.
- The temperature control cable is not connected, or is not routed or adjusted properly.
- A faulty blower system.
- A faulty heater-A/C control.

Temperature Reference				
Ambient Air Temperature	15.5° C (60° F)	21.1° C (70° F)	26.6° C (80° F)	32.2° C (90° F)
Minimum Air Temperature at Floor Outlet	62.2° C (144° F)	63.8° C (147° F)	65.5° C (150° F)	67.2° C (153° F)

mopar AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING (Continued)

TEMPERATURE CONTROL

If the heater outlet air temperature cannot be adjusted with the temperature control knob on the heater-A/C control panel, the following could require service:

- A faulty heater-A/C control.
- The temperature control cable is not connected, or is not routed or adjusted properly.
- A faulty, obstructed or improperly installed blend-air door.
- An obstructed cowl air intake.
- The engine cooling system.

HEATER-A/C CONTROL

Satisfactory heater and air conditioner performance depends upon proper operation and adjustment of all operating controls and refrigeration system components. For circuit descriptions and diagrams, refer to 8W-42 - Air Conditioning/Heater in Group 8W - Wiring Diagrams. These inspections, tests, and adjustments should be used to locate the cause of a malfunction.

Operation must be tested as described in the following sequence:

(1) Move the temperature control knob quickly to the full hot and the full cold positions. There should be a distinct sound of the blend-air door hitting its stops within the heater-A/C housing at the end of knob travel in each direction, with no spring-back of the knob. If not OK, inspect the condition, routing, installation and adjustment of the temperature control cable. See Temperature Control Cable in the Removal and Installation section and in the Adjustments section of this group for more information.

(2) Inspect and adjust the serpentine drive belt. Refer to Group 7 - Cooling System for the procedures.

(3) Start the engine and hold the idle speed at 1,300 rpm.

(4) On vehicles with air conditioning, turn the temperature control knob to the extreme counterclockwise (Cool) position, and set the mode control switch knob in the Bi-Level (A/C) position. The outside (recirculation) air door should be open to outside air. If not OK, see Vacuum System in the Diagnosis and Testing section of this group.

(5) Open the vehicle windows. Test the blower motor operation in all speeds. If not OK, see Blower Motor in the Diagnosis and Testing section of this group. Leave the blower motor switch knob in the highest speed position.

(6) On vehicles with air conditioning, the compressor should be running and the air conditioning system in operation unless the ambient air temperature is below about -1° C (30° F). If not OK, see A/C Performance in the Diagnosis and Testing section of this group.

(7) Check the mode control switch operation. The heater and air conditioner systems should respond as

Heater Diagnosis		
Condition	**Possible Cause**	**Correction**
INSUFFICIENT HEATER OUTPUT.	1. Incorrect engine coolant level. 2. Air trapped in engine cooling system. 3. Incorrect engine coolant temperature. 4. Temperature control cable improperly installed or not adjusted. 5. Blend-air door not operating properly. 6. Insufficient air flow through heater housing. 7. Improper blower motor operation.	1. Check the engine coolant level. Refer to Group 7 - Cooling System for the procedures. 2. Check the operation of the coolant reserve/recovery system. Refer to Group 7 - Cooling System for the procedures. 3. Check the performance and operation of the engine cooling system including: thermostat, water pump, fan drive, accessory drive belt, coolant flow (plugged radiator or heater core, plugged or kinked coolant hoses), air flow (missing or improperly installed radiator air seals or fan shroud). Refer to Group 7 - Cooling System for the procedures. 4. See Temperature Control Cable in the Removal and Installation and in the Adjustments sections of this group. 5. Check for a damaged, obstructed or improperly installed blend-air door or seals. See Heater-A/C Housing Door in the Removal and Installation section of this group. 6. Remove foreign material or obstructions from cowl air intake. 7. See Blower Motor in the Diagnosis and Testing section of this group.

DIAGNOSIS AND TESTING (Continued)

described in the owner's manual in the vehicle glove box to each mode selected. Reduce the engine speed to normal idle. The vacuum will be high at low idle and the vacuum actuators should respond quickly. If not OK, see Vacuum System in the Diagnosis and Testing section of this group.

(8) If the vacuum tests, and the electrical component and circuit tests reveal no problems, disassemble the heater-A/C housing to inspect for mechanical misalignment or binding of the mode doors.

VACUUM SYSTEM

Vacuum control is used to operate the mode doors in the heater-only and heater-A/C housings. Testing of the heater-only and heater-A/C mode control switch operation will determine if the vacuum, electrical, and mechanical controls are functioning. However, it is possible that a vacuum control system that operates perfectly at engine idle (high engine vacuum) may not function properly at high engine speeds or loads (low engine vacuum). This can be caused by leaks in the vacuum system, or by a faulty or improperly installed vacuum check valve.

A vacuum system test will help to identify the source of poor vacuum system performance or vacuum system leaks. Before starting this test, stop the engine and make certain that the problem is not a disconnected vacuum supply tube at the engine vacuum source or the vacuum reservoir.

Use an adjustable vacuum test set (Special Tool C-3707) and a suitable vacuum pump to test the heater-A/C vacuum control system. With a finger placed over the end of the vacuum test hose probe (Fig. 9), adjust the bleed valve on the test set gauge to obtain a vacuum of exactly 27 kPa (8 in. Hg.). Release and block the end of the probe several times to verify that the vacuum reading returns to the exact 27 kPa (8 in. Hg.) setting. Otherwise, a false reading will be obtained during testing.

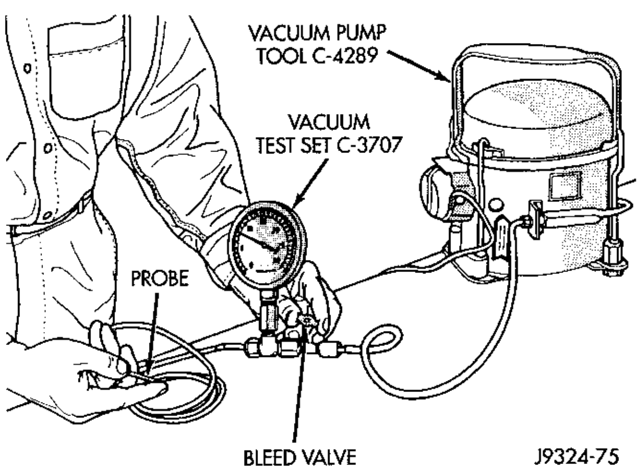

Fig. 9 Adjust Vacuum Test Bleed Valve

VACUUM CHECK VALVE

(1) Remove the vacuum check valve. On gasoline engines, one valve is located in the vacuum supply tube (black) at the intake manifold tap on the right side of the engine. A second check valve is located next to the tee fitting in the vacuum supply tube (black) near the dash panel in the engine compartment. On diesel engines, the vacuum check valve is integral to the engine vacuum pump nipple and is threaded into the vacuum pump. The vacuum check valve must be removed in order to perform the following tests. See Vacuum Check Valve in the Removal and Installation section of this group for the procedures.

(2) Connect the test set vacuum supply hose to the heater-A/C control side of the valve. When connected to this side of the check valve, no vacuum should pass and the test set gauge should return to the 27 kPa (8 in. Hg.) setting. If OK, go to step Step 3. If not OK, replace the faulty valve.

(3) Connect the test set vacuum supply hose to the engine vacuum side of the valve. When connected to this side of the check valve, vacuum should flow through the valve without restriction. If not OK, replace the faulty valve.

HEATER-A/C CONTROLS

(1) Connect the test set vacuum probe to the heater-A/C vacuum supply (black) tube in the engine compartment. Position the test set gauge so that it can be viewed from the passenger compartment.

(2) Place the heater-A/C mode control switch knob in each mode position, one position at a time, and pause after each selection. The test set gauge should return to the 27 kPa (8 in. Hg.) setting shortly after each selection is made. If not OK, a component or vacuum line in the vacuum circuit of the selected mode has a leak. See Locating Vacuum Leaks in the Diagnosis and Testing section of this group.

CAUTION: Do not use lubricant on the switch ports or in the holes in the plug, as lubricant will ruin the vacuum valve in the switch. A drop of clean water in the connector plug holes will help the connector slide onto the switch ports.

DIAGNOSIS AND TESTING (Continued)

LOCATING VACUUM LEAKS

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO GROUP 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect the vacuum harness connector located between the heater-A/C control and the heater-A/C housing under the instrument panel.

(2) Connect the test set vacuum hose probe to each port in the heater-A/C housing half of the vacuum harness connector, one port at a time, and pause after each connection (Fig. 10). The test set gauge should return to the 27 kPa (8 in. Hg.) setting shortly after each connection is made. If OK, replace the faulty heater-A/C control. If not OK, go to step Step 3.

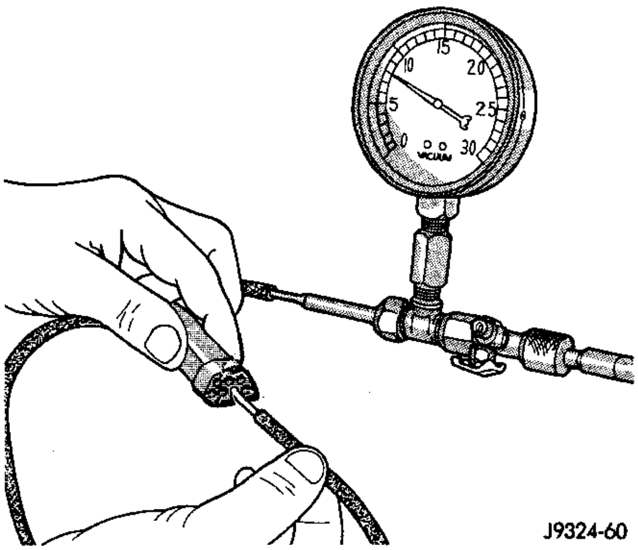

Fig. 10 Vacuum Circuit Test

(3) Determine the vacuum line color of the vacuum circuit that is leaking. To determine the vacuum line colors, see the Vacuum Circuits chart (Fig. 11).

(4) Disconnect and plug the vacuum line from the component (fitting, actuator, valve, switch, or reservoir) on the other end of the leaking circuit. Instrument panel disassembly or removal may be necessary to gain access to some components. See the Removal and Installation section of this group for more information.

(5) Connect the test set hose or probe to the open end of the leaking circuit. The test set gauge should return to the 27 kPa (8 in. Hg.) setting shortly after each connection is made. If OK, replace the faulty disconnected component. If not OK, go to Step 6.

(6) To locate a leak in a vacuum line, leave one end of the line plugged and connect the test set hose or probe to the other end of the line. Run your fingers slowly along the line while watching the test set gauge. The vacuum reading will fluctuate when your fingers contact the source of the leak. To repair the vacuum line, cut out the leaking section of the line. Then, insert the loose ends of the line into a suitable length of 3 millimeter (0.125 inch) inside diameter rubber hose.

BLOWER MOTOR

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO GROUP 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

For circuit descriptions and diagrams, refer to 8W-42 - Air Conditioning/Heater in Group 8W - Wiring Diagrams. Possible causes of an inoperative blower motor include:

- Faulty fuse
- Faulty blower motor circuit wiring or wire harness connectors
- Faulty blower motor resistor
- Faulty blower motor relay
- Faulty blower motor switch
- Faulty heater-A/C mode control switch
- Faulty blower motor.

Possible causes of the blower motor not operating in all speeds include:

- Faulty fuse
- Faulty blower motor switch
- Faulty blower motor resistor
- Faulty blower motor relay
- Faulty blower motor circuit wiring or wire harness connectors.

VIBRATION

Possible causes of blower motor vibration include:

- Improper blower motor mounting
- Improper blower wheel mounting
- Blower wheel out of balance or deformed
- Blower motor faulty.

NOISE

To verify that the blower is the source of the noise, unplug the blower motor wire harness connector and

DIAGNOSIS AND TESTING (Continued)

operate the heater-A/C system. If the noise goes away, possible causes include:

- Foreign material in the heater-A/C housing
- Improper blower motor mounting
- Improper blower wheel mounting
- Blower motor faulty.

BLOWER MOTOR RELAY

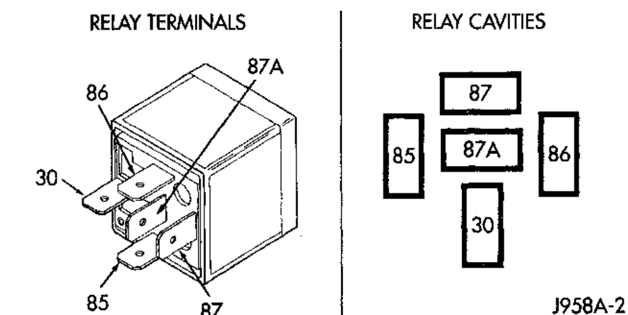
RELAY TEST

The blower motor relay (Fig. 12) is located in the Power Distribution Center (PDC). Remove the blower motor relay from the PDC as described in this group to perform the following tests:

(1) A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 2. If not OK, replace the faulty relay.

(2) Resistance between terminals 85 and 86 (electromagnet) should be 75 ± 5 ohms. If OK, go to Step 3. If not OK, replace the faulty relay.

(3) Connect a battery to terminals 85 and 86. There should now be continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, see Relay Circuit Test in the Diagnosis and Testing section of this group. If not OK, replace the faulty relay.



TERMINAL LEGEND	
NUMBER	IDENTIFICATION
30	COMMON FEED
85	COIL GROUND
86	COIL BATTERY
87	NORMALLY OPEN
87A	NORMALLY CLOSED

Fig. 12 Blower Motor Relay

RELAY CIRCUIT TEST

For circuit descriptions and diagrams, refer to 8W-42 - Air Conditioning/Heater in Group 8W - Wiring Diagrams.

(1) The relay common feed terminal cavity (30) is connected to fused battery feed directly from a fuse in the Power Distribution Center (PDC), and should be hot at all times. Check for battery voltage at the PDC cavity for relay terminal 30. If OK, go to Step 2. If not OK, repair the open circuit to the PDC fuse as required.

(2) The relay normally closed terminal cavity (87A) is not used for this application. Go to Step 3.

(3) The relay normally open terminal cavity (87) is connected to the blower motor. When the relay is energized, terminal 87 is connected to terminal 30 and provides full battery current to the blower motor feed circuit. There should be continuity between the PDC cavity for terminal 87 and the blower motor relay output circuit cavity of the blower motor wire harness connector at all times. If OK, go to Step 4. If not OK, repair the open circuit to the blower motor as required.

(4) The coil battery terminal cavity (86) is connected to the ignition switch. When the ignition switch is placed in the On position, fused ignition switch output is directed from a fuse in the junction block to the relay electromagnetic coil to energize the relay. There should be battery voltage at the PDC cavity for relay terminal 86 with the ignition switch in the On position. If OK, go to Step 5. If not OK, repair the open circuit to the junction block fuse as required.

(5) The coil ground terminal cavity (85) is connected to ground. This terminal supplies the ground for the relay electromagnetic coil. There should be continuity between the PDC cavity for relay terminal 85 and a good ground at all times. If not OK, repair the open circuit as required.

BLOWER MOTOR RESISTOR

For circuit descriptions and diagrams, refer to 8W-42 - Air Conditioning/Heater in Group 8W - Wiring Diagrams.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO GROUP 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Disconnect and isolate the battery negative cable.

(2) Unplug the wire harness connector from the blower motor resistor.

(3) Check for continuity between each of the blower motor switch input terminals of the resistor and the resistor output terminal. In each case there should be continuity. If OK, repair the wire harness circuits between the blower motor switch and the blower motor resistor or blower motor as required. If not OK, replace the faulty blower motor resistor.

DIAGNOSIS AND TESTING (Continued)

BLOWER MOTOR SWITCH

For circuit descriptions and diagrams, refer to 8W-42 - Air Conditioning/Heater in Group 8W - Wiring Diagrams.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO GROUP 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

(1) Check for battery voltage at the fuse in the Power Distribution Center (PDC). If OK, go to Step 2. If not OK, repair the shorted circuit or component as required and replace the faulty fuse.

(2) Turn the ignition switch to the Off position. Disconnect and isolate the battery negative cable. Remove the heater-A/C control from the instrument panel. Check for continuity between the ground circuit cavity of the heater-A/C control wire harness connector and a good ground. There should be continuity. If OK, go to Step 3. If not OK, repair the open circuit to ground as required.

(3) With the heater-A/C control wire harness connector unplugged, place the heater-A/C mode control switch knob in any position except the Off position. Check for continuity between the ground circuit terminal and each of the blower motor driver circuit terminals of the heater-A/C control as you move the blower motor switch knob to each of the four speed positions. There should be continuity at each driver circuit terminal in only one blower motor switch speed position. If OK, test and repair the blower driver circuits between the heater-A/C control connector and the blower motor resistor as required. If not OK, replace the faulty heater-A/C control unit.

COMPRESSOR

When investigating an air conditioning related noise, you must first know the conditions under which the noise occurs. These conditions include: weather, vehicle speed, transmission in gear or neutral, engine speed, engine temperature, and any other special conditions. Noises that develop during air conditioning operation can often be misleading. For example: What sounds like a failed front bearing or connecting rod, may be caused by loose bolts, nuts, mounting brackets, or a loose compressor clutch assembly.

Drive belts are speed sensitive. At different engine speeds and depending upon belt tension, belts can develop noises that are mistaken for a compressor noise. Improper belt tension can cause a misleading noise when the compressor clutch is engaged, which may not occur when the compressor clutch is disengaged. Check the serpentine drive belt condition and tension as described in Group 7 - Cooling System before beginning this procedure.

(1) Select a quiet area for testing. Duplicate the complaint conditions as much as possible. Switch the compressor on and off several times to clearly identify the compressor noise. Listen to the compressor while the clutch is engaged and disengaged. Probe the compressor with an engine stethoscope or a long screwdriver with the handle held to your ear to better localize the source of the noise.

(2) Loosen all of the compressor mounting hardware and retighten. Tighten the compressor clutch mounting nut. Be certain that the clutch coil is mounted securely to the compressor, and that the clutch plate and pulley are properly aligned and have the correct air gap. See Compressor and Compressor Clutch in the Removal and Installation section of this group for the procedures.

(3) To duplicate a high-ambient temperature condition (high head pressure), restrict the air flow through the condenser. Install a manifold gauge set to be certain that the discharge pressure does not exceed 2760 kPa (400 psi).

(4) Check the refrigerant system plumbing for incorrect routing, rubbing or interference, which can cause unusual noises. Also check the refrigerant lines for kinks or sharp bends that will restrict refrigerant flow, which can cause noises. See Suction and Discharge Line in the Removal and Installation section of this group for more information.

(5) If the noise is from opening and closing of the high pressure relief valve, evacuate and recharge the refrigerant system. See Refrigerant System Evacuate and Refrigerant System Charge in the Service Procedures section of this group. If the high pressure relief valve still does not seat properly, replace the compressor.

(6) If the noise is from liquid slugging on the suction line, replace the accumulator. See Accumulator in the Removal and Installation section of this group for the procedures. Check the refrigerant oil level and the refrigerant system charge. See Refrigerant Oil Level and Refrigerant System Charge in the Service Procedures section of this group. If the liquid slugging condition continues following accumulator replacement, replace the compressor.

(7) If the noise continues, replace the compressor and repeat Step 1.

COMPRESSOR CLUTCH COIL

For circuit descriptions and diagrams, refer to 8W-42 - Air Conditioning/Heater in Group 8W - Wiring Diagrams. The battery must be fully-charged

DIAGNOSIS AND TESTING (Continued)

before performing the following tests. Refer to Group 8A - Battery for more information.

(1) Connect an ammeter (0 to 10 ampere scale) in series with the clutch coil terminal. Use a voltmeter (0 to 20 volt scale) with clip-type leads for measuring the voltage across the battery and the compressor clutch coil.

(2) With the heater-A/C mode control switch in any A/C mode, and the blower motor switch in the lowest speed position, start the engine and run it at normal idle.

(3) The compressor clutch coil voltage should read within two volts of the battery voltage. If there is voltage at the clutch coil, but the reading is not within two volts of the battery voltage, test the clutch coil feed circuit for excessive voltage drop and repair as required. If there is no voltage reading at the clutch coil, use a DRB scan tool and the proper Diagnostic Procedures manual for testing of the compressor clutch circuit. The following components must be checked and repaired as required before you can complete testing of the clutch coil:

- Fuses in the junction block and the Power Distribution Center (PDC)
- Heater-A/C mode control switch
- Compressor clutch relay
- High pressure cut-off switch
- Low pressure cycling clutch switch
- Powertrain Control Module (PCM).

(4) The compressor clutch coil is acceptable if the current draw measured at the clutch coil is 2.0 to 3.9 amperes with the electrical system voltage at 11.5 to 12.5 volts. This should only be checked with the work area temperature at 21° C (70° F). If system voltage is more than 12.5 volts, add electrical loads by turning on electrical accessories until the system voltage drops below 12.5 volts.

(a) If the clutch coil current reading is four amperes or more, the coil is shorted and should be replaced.

(b) If the clutch coil current reading is zero, the coil is open and should be replaced.

COMPRESSOR CLUTCH RELAY

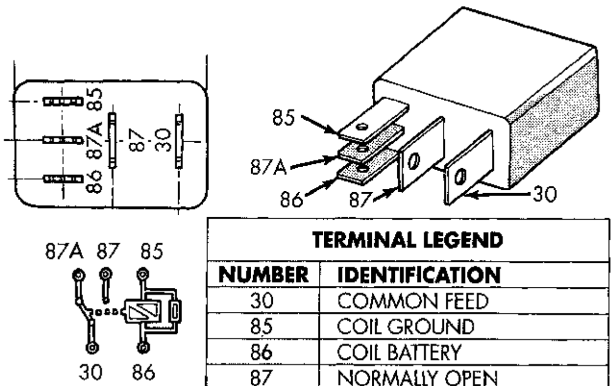
RELAY TEST

The compressor clutch relay (Fig. 13) is located in the Power Distribution Center (PDC). Refer to the PDC label for relay identification and location. Remove the relay from the PDC to perform the following tests:

(1) A relay in the de-energized position should have continuity between terminals 87A and 30, and no continuity between terminals 87 and 30. If OK, go to Step 2. If not OK, replace the faulty relay.

(2) Resistance between terminals 85 and 86 (electromagnet) should be 75 ± 5 ohms. If OK, go to Step 3. If not OK, replace the faulty relay.

(3) Connect a battery to terminals 85 and 86. There should now be continuity between terminals 30 and 87, and no continuity between terminals 87A and 30. If OK, see Relay Circuit Test in the Diagnosis and Testing section of this group. If not OK, replace the faulty relay.



TERMINAL LEGEND	
NUMBER	IDENTIFICATION
30	COMMON FEED
85	COIL GROUND
86	COIL BATTERY
87	NORMALLY OPEN
87A	NORMALLY CLOSED

9514-16

Fig. 13 Compressor Clutch Relay

RELAY CIRCUIT TEST

For circuit descriptions and diagrams, refer to 8W-42 - Air Conditioning/Heater in Group 8W - Wiring Diagrams.

(1) The relay common feed terminal cavity (30) is connected to fused battery feed. There should be battery voltage at the cavity for relay terminal 30 at all times. If OK, go to Step 2. If not OK, repair the open circuit to the fuse in the PDC as required.

(2) The relay normally closed terminal (87A) is not used in this application. Go to Step 3.

(3) The relay normally open terminal cavity (87) is connected to the compressor clutch coil. There should be continuity between this cavity and the A/C compressor clutch relay output circuit cavity of the compressor clutch coil wire harness connector. If OK, go to Step 4. If not OK, repair the open circuit as required.

(4) The relay coil battery terminal (86) is connected to the fused ignition switch output (run/start) circuit. There should be battery voltage at the cavity for relay terminal 86 with the ignition switch in the On position. If OK, go to Step 5. If not OK, repair the open circuit to the fuse in the junction block as required.

(5) The coil ground terminal cavity (85) is switched to ground through the Powertrain Control Module (PCM). There should be continuity between this cavity and the A/C compressor clutch relay control circuit cavity of the PCM wire harness connector C

AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING (Continued)

(gray) at all times. If not OK, repair the open circuit as required.

FIXED ORIFICE TUBE

The fixed orifice tube can be checked for proper operation using the following procedure. However, the fixed orifice tube is only serviced as a part of the liquid line unit. If the results of this test indicate that the fixed orifice tube is obstructed or missing, the entire liquid line unit must be replaced.

WARNING: THE LIQUID LINE BETWEEN THE CONDENSER OUTLET AND THE FIXED ORIFICE TUBE CAN BECOME HOT ENOUGH TO BURN THE SKIN. USE EXTREME CAUTION WHEN PERFORMING THE FOLLOWING TEST.

(1) Confirm that the refrigerant system is properly charged. See Refrigerant System Charge in the Service Procedures section of this group.

(2) Start the engine. Turn on the air conditioning system and confirm that the compressor clutch is engaged.

(3) Allow the air conditioning system to operate for five minutes.

(4) Lightly and cautiously touch the liquid line near the condenser outlet at the front of the engine compartment. The liquid line should be hot to the touch.

(5) Touch the liquid line near the evaporator inlet at the rear of the engine compartment. The liquid line should be cold to the touch.

(6) If there is a distinct temperature differential between the two ends of the liquid line, the orifice tube is in good condition. If there is little or no detectable temperature differential between the two ends of the liquid line, the orifice tube is obstructed or missing and the liquid line must be replaced.

HIGH PRESSURE CUT-OFF SWITCH

Before performing diagnosis of the high pressure cut-off switch, verify that the refrigerant system has the correct refrigerant charge. See Refrigerant System Charge in the Service Procedures section of this group for more information.

For circuit descriptions and diagrams, refer to 8W-42 - Air Conditioning/Heater in Group 8W - Wiring Diagrams.

(1) Disconnect and isolate the battery negative cable.

(2) Unplug the high pressure cut-off switch wire harness connector from the switch on the refrigerant system fitting.

(3) Check for continuity between the two terminals of the high pressure cut-off switch. There should be continuity. If OK, test and repair the A/C switch sense circuit as required. If not OK, replace the faulty switch.

LOW PRESSURE CYCLING CLUTCH SWITCH

Before performing diagnosis of the low pressure cycling clutch switch, be certain that the switch is properly installed on the accumulator fitting. If the switch is too loose it may not open the Schrader-type valve in the accumulator fitting, which will prevent the switch from correctly monitoring the refrigerant system pressure. Also verify that the refrigerant system has the correct refrigerant charge. See Refrigerant System Charge in the Service Procedures section of this group for more information.

Remember that lower ambient temperatures, below about -1° C (30° F), during cold weather will open the switch contacts and prevent compressor operation due to the pressure/temperature relationship of the refrigerant. For circuit descriptions and diagrams, refer to 8W-42 - Air Conditioning/Heater in Group 8W - Wiring Diagrams.

(1) Disconnect and isolate the battery negative cable.

(2) Unplug the low pressure cycling clutch switch wire harness connector from the switch on the accumulator fitting.

(3) Install a jumper wire between the two cavities of the low pressure cycling clutch switch wire harness connector.

(4) Connect a manifold gauge set to the refrigerant system service ports. See Refrigerant System Service Equipment and Refrigerant System Service Ports in the Description and Operation section of this group for more information.

(5) Connect the battery negative cable.

(6) Place the heater-A/C mode control switch knob in any A/C position and start the engine.

(7) Check for continuity between the two terminals of the low pressure cycling clutch switch. There should be continuity with a suction pressure reading of 296 kPa (43 psi) or above, and no continuity with a suction pressure reading of 172 kPa (25 psi) or below. If OK, test and repair the A/C switch sense circuit as required. If not OK, replace the faulty switch.

REFRIGERANT SYSTEM LEAKS

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE GENERAL INFORMATION SECTION NEAR THE FRONT OF THIS GROUP BEFORE LEAK TESTING THE SYSTEM.

If the air conditioning system does not cool properly, the A/C system performance should be tested. See A/C Performance in the Diagnosis and Testing section of this group for the procedures. If the A/C system refrigerant fill is found to be low or if the sys-

AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING (Continued)

tem is empty; a leak at a refrigerant line, connector fitting, component, or component seal is likely.

An electronic leak detector designed for R-134a refrigerant, or a fluorescent R-134a leak detection dye and a black light are recommended for locating and confirming refrigerant system leaks. Refer to the operating instructions supplied by the equipment manufacturer for the proper care and use of this equipment.

An oily residue on or near refrigerant system lines, connector fittings, components, or component seals can indicate the general location of a possible refrigerant leak. However, the exact leak location should be confirmed with an electronic leak detector prior to component repair or replacement.

To detect a leak in the refrigerant system with an electronic leak detector, perform one of the following procedures:

SYSTEM EMPTY

(1) Evacuate the refrigerant system. See Refrigerant System Evacuate in the Service Procedures section of this group.

(2) Connect and dispense 0.283 kilograms (0.625 pounds or 10 ounces) of R-134a refrigerant into the evacuated refrigerant system. See Refrigerant System Charge in the Service Procedures section of this group.

(3) Position the vehicle in a wind-free work area. This will aid in detecting small leaks.

(4) With the engine not running, use a electronic R-134a leak detector and search for leaks. Because R-134a refrigerant is heavier than air, the leak detector probe should be moved slowly along the bottom side of all refrigerant lines, connector fittings and components.

(5) To inspect the evaporator coil for leaks, insert the electronic leak detector probe into the center instrument panel outlet and the floor duct outlet. Set the blower motor switch to the lowest speed position, and the mode control switch in the recirculation mode (Max-A/C).

SYSTEM LOW

(1) Position the vehicle in a wind-free work area. This will aid in detecting small leaks.

(2) Bring the refrigerant system up to operating temperature and pressure. This is done by allowing the engine to run with the air conditioning system turned on for five minutes.

(3) With the engine not running, use a electronic R-134a leak detector and search for leaks. Because R-134a refrigerant is heavier than air, the leak detector probe should be moved slowly along the bottom side of all refrigerant lines, connector fittings and components.

(4) To inspect the evaporator coil for leaks, insert the electronic leak detector probe into the center instrument panel outlet and the floor duct outlet. Set the blower motor switch to the lowest speed position, and the mode control switch in the recirculation mode (Max-A/C).

SERVICE PROCEDURES

REFRIGERANT RECOVERY

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE GENERAL INFORMATION SECTION NEAR THE FRONT OF THIS GROUP BEFORE RECOVERING REFRIGERANT.

A R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used to recover the refrigerant from an R-134a refrigerant system. Refer to the operating instructions supplied by the equipment manufacturer for the proper care and use of this equipment.

REFRIGERANT SYSTEM EVACUATE

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE GENERAL INFORMATION SECTION NEAR THE FRONT OF THIS GROUP BEFORE EVACUATING THE SYSTEM.

If the refrigerant system has been open to the atmosphere, it must be evacuated before the system can be charged. If moisture and air enters the system and becomes mixed with the refrigerant, the compressor head pressure will rise above acceptable operating levels. This will reduce the performance of the air conditioner and damage the compressor. Evacuating the refrigerant system will remove the air and boil the moisture out of the system at near room temperature. To evacuate the refrigerant system, use the following procedure:

(1) Connect a R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 and a manifold gauge set to the refrigerant system of the vehicle.

(2) Open the low and high side valves and start the charging station vacuum pump. When the suction gauge reads 88 kPa (26 in. Hg.) vacuum or greater, close all of the valves and turn off the vacuum pump.

(a) If the refrigerant system fails to reach the specified vacuum, the system has a leak that must be corrected. See Refrigerant System Leaks in the Diagnosis and Testing section of this group for the procedures.

SERVICE PROCEDURES (Continued)

(b) If the refrigerant system maintains the specified vacuum for five minutes, restart the vacuum pump, open the suction and discharge valves and evacuate the system for an additional ten minutes.

(3) Close all of the valves, and turn off the charging station vacuum pump.

(4) The refrigerant system is now ready to be charged with R-134a refrigerant. See Refrigerant System Charge in the Service Procedures section of this group.

REFRIGERANT SYSTEM CHARGE

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE GENERAL INFORMATION SECTION NEAR THE FRONT OF THIS GROUP BEFORE CHARGING THE REFRIGERANT SYSTEM.

After the refrigerant system has been tested for leaks and evacuated, a refrigerant charge can be injected into the system. See Refrigerant Charge Capacity in the Service Procedures section of this group for the proper amount of the refrigerant charge.

A R-134a refrigerant recovery/recycling/charging station that meets SAE Standard J2210 must be used to charge the refrigerant system with R-134a refrigerant. Refer to the operating instructions supplied by the equipment manufacturer for the proper care and use of this equipment.

REFRIGERANT CHARGE CAPACITY

The R-134a refrigerant system charge capacity for this vehicle is 0.907 kilograms (32 ounces).

REFRIGERANT OIL LEVEL

When an air conditioning system is assembled at the factory, all components except the compressor are refrigerant oil free. After the refrigerant system has been charged and operated, the refrigerant oil in the compressor is dispersed throughout the refrigerant system. The accumulator, evaporator, condenser, and compressor will each retain a significant amount of the needed refrigerant oil.

It is important to have the correct amount of oil in the refrigerant system. This ensures proper lubrication of the compressor. Too little oil will result in damage to the compressor. Too much oil will reduce the cooling capacity of the air conditioning system.

It will not be necessary to check the oil level in the compressor or to add oil, unless there has been an oil loss. An oil loss may occur due to a rupture or leak from a refrigerant line, a connector fitting, a component, or a component seal. If a leak occurs, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system after the repair has been made. Refrigerant oil loss will be evident at the leak point by the presence of a wet, shiny surface around the leak.

Refrigerant oil must be added when a accumulator, evaporator coil, or condenser are replaced. See the Refrigerant Oil Capacities chart. When a compressor is replaced, the refrigerant oil must be drained from the old compressor and measured. Drain all of the refrigerant oil from the new compressor, then fill the new compressor with the same amount of refrigerant oil that was drained out of the old compressor.

Refrigerant Oil Capacities		
Component	**ml**	**fl oz**
A/C System	240	8.1
Accumulator	60	2
Condenser	30	1
Evaporator	60	2
Compressor	drain and measure the oil from the old compressor - see text.	

REMOVAL AND INSTALLATION

REFRIGERANT LINE COUPLER

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE GENERAL INFORMATION SECTION NEAR THE FRONT OF THIS GROUP BEFORE PERFORMING THE FOLLOWING OPERATION.

REMOVAL

(1) Recover the refrigerant from the refrigerant system. See Refrigerant Recovery in the Service Procedures section of this group.

(2) Remove the secondary clip from the spring-lock coupler.

(3) Fit the proper size A/C line disconnect tool (Special Tool Kit 7193) over the spring-lock coupler cage (Fig. 14).

(4) Close the two halves of the A/C line disconnect tool around the spring-lock coupler.

(5) Push the A/C line disconnect tool into the open side of the coupler cage to expand the garter spring. Once the garter spring is expanded and while still pushing the disconnect tool into the open side of the coupler cage, pull on the refrigerant line attached to the female half of the coupler fitting until the flange on the female fitting is separated from the garter spring and cage on the male fitting within the disconnect tool.

NOTE: The garter spring may not release if the A/C line disconnect tool is cocked while pushing it into the coupler cage opening.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

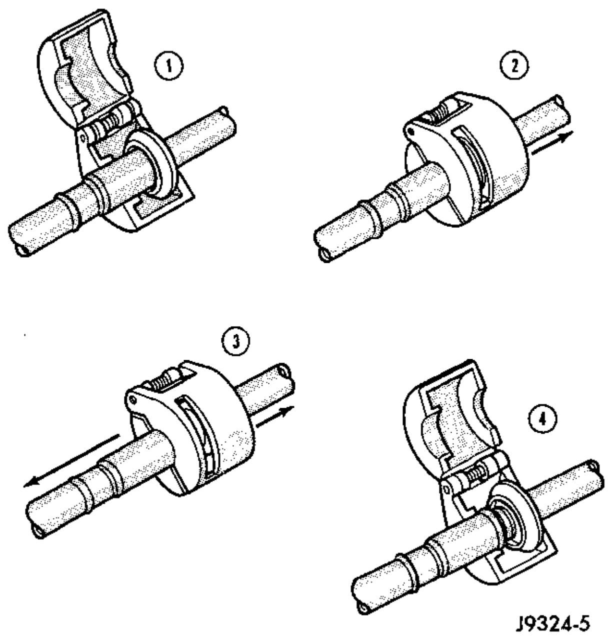


Fig. 14 Refrigerant Line Spring-Lock Coupler Disconnect

(6) Open and remove the A/C line disconnect tool from the disconnected spring-lock coupler.

(7) Complete the separation of the two halves of the coupler fitting.

INSTALLATION

(1) Check to ensure that the garter spring is located within the cage of the male coupler fitting, and that the garter spring is not damaged.

(a) If the garter spring is missing, install a new spring by pushing it into the coupler cage opening.

(b) If the garter spring is damaged, remove it from the coupler cage with a small wire hook (DO NOT use a screwdriver) and install a new garter spring.

(2) Clean any dirt or foreign material from both halves of the coupler fitting.

(3) Install new O-rings on the male half of the coupler fitting.

CAUTION: Use only the specified O-rings as they are made of a special material for the R-134a system. The use of any other O-rings may allow the connection to leak intermittently during vehicle operation.

(4) Lubricate the male fitting and O-rings, and the inside of the female fitting with clean R-134a refrigerant oil. Use only refrigerant oil of the type recommended for the compressor in the vehicle.

(5) Fit the female half of the coupler fitting over the male half of the fitting.

(6) Push together firmly on the two halves of the coupler fitting until the garter spring in the cage on the male half of the fitting snaps over the flanged end on the female half of the fitting.

(7) Ensure that the spring-lock coupler is fully engaged by trying to separate the two coupler halves. This is done by pulling the refrigerant lines on either side of the coupler away from each other.

(8) Reinstall the secondary clip over the spring-lock coupler cage.

HIGH PRESSURE CUT-OFF SWITCH

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Unplug the wire harness connector from the high pressure cut-off switch, which is mounted to a fitting on the discharge line between the compressor and the condenser inlet (Fig. 15).

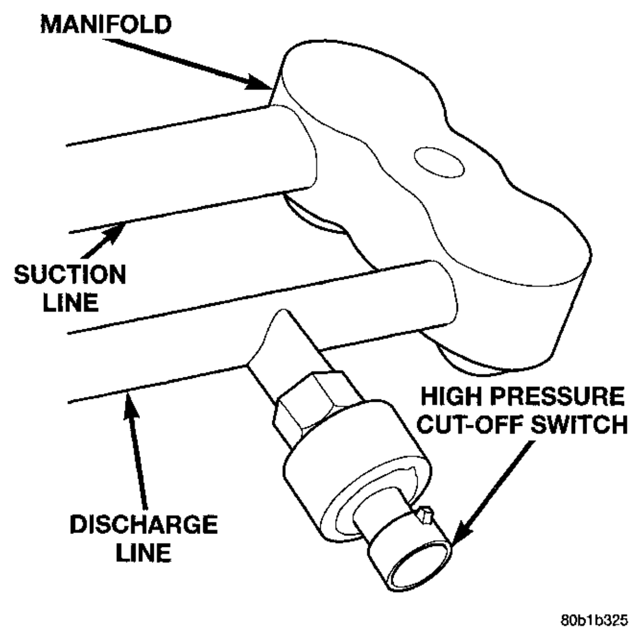

Fig. 15 High Pressure Cut-Off Switch Remove/Install

(3) Unscrew the high pressure cut-off switch from the discharge line fitting.

(4) Remove the high pressure cut-off switch from the vehicle.

(5) Remove the O-ring seal from the discharge line fitting and discard.

INSTALLATION

(1) Lubricate a new O-ring seal with clean refrigerant oil and install it on the discharge line fitting. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only

REMOVAL AND INSTALLATION (Continued)

refrigerant oil of the type recommended for the compressor in the vehicle.

(2) Install and tighten the high pressure cut-off switch on the discharge line fitting.

(3) Plug the wire harness connector into the high pressure cut-off switch.

(4) Connect the battery negative cable.

SUCTION AND DISCHARGE LINE

Any kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire air conditioning system. Kinks and sharp bends reduce the flow of refrigerant in the system. A good rule for the flexible hose refrigerant lines is to keep the radius of all bends at least ten times the diameter of the hose. In addition, the flexible hose refrigerant lines should be routed so they are at least 80 millimeters (3 inches) from the exhaust manifold.

High pressures are produced in the refrigerant system when the air conditioning compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free. It is a good practice to inspect all flexible hose refrigerant lines at least once a year to make sure they are in good condition and properly routed.

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE GENERAL INFORMATION SECTION NEAR THE FRONT OF THIS GROUP BEFORE PERFORMING THE FOLLOWING OPERATION.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Recover the refrigerant from the refrigerant system. See Refrigerant Recovery in the Service Procedures section of this group.

(3) Unplug the wire harness connector from the high pressure cut-off switch.

(4) Disconnect the suction line refrigerant line coupler at the accumulator. See Refrigerant Line Coupler in the Removal and Installation section of this group for the procedures. Install plugs in, or tape over all of the opened refrigerant line fittings.

(5) Remove the nut that secures the block fitting to the stud on the condenser inlet and disconnect the discharge line from the condenser. Install plugs in, or tape over all of the opened refrigerant line fittings.

(6) On models with a gasoline engine, remove the nut that secures the refrigerant line support bracket to the stud on the compressor mounting bracket.

(7) Remove the screw that secures the refrigerant line manifold to the compressor (Fig. 16) or (Fig. 17). Install plugs in, or tape over all of the opened refrigerant line fittings.

(8) Remove the suction and discharge line assembly from the vehicle.

INSTALLATION

(1) Remove the tape or plugs from all of the refrigerant line fittings. Connect the suction line refrigerant line coupler to the accumulator. See Refrigerant Line Coupler in the Removal and Installation section of this group for the procedures.

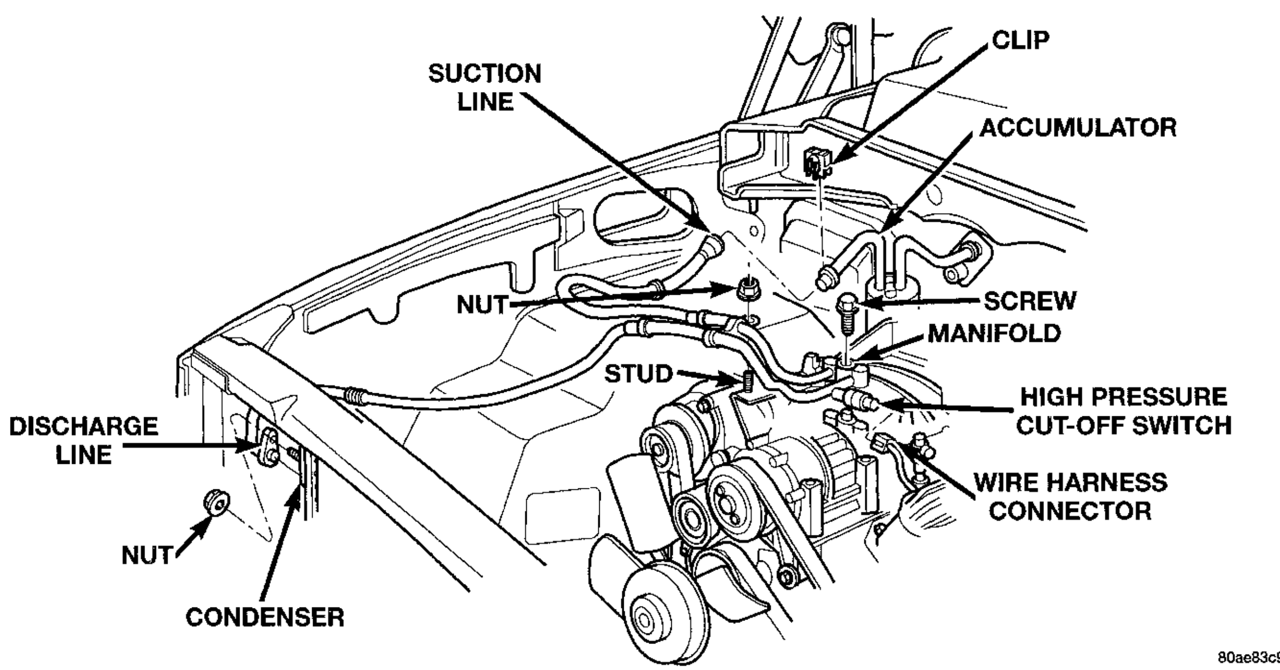

Fig. 16 Suction and Discharge Line Remove/Install - Gasoline Engine

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

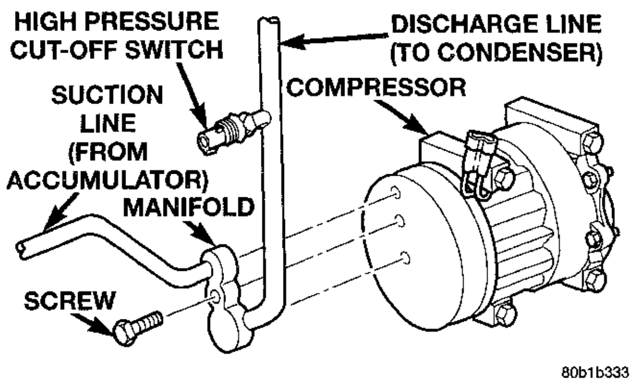

Fig. 17 Suction and Discharge Line Remove/Install - Diesel Engine

(2) Install a new gasket and the discharge line block fitting over the stud on the condenser inlet. Tighten the mounting nut to 20 N·m (180 in. lbs.).

(3) Install the refrigerant line manifold to the compressor. Tighten the mounting screw to 22 N·m (200 in. lbs.).

(4) On models with a gasoline engine, install the nut that secures the refrigerant line support bracket to the stud on the compressor mounting bracket. Tighten the mounting nut to 22 N·m (200 in. lbs.).

(5) Plug in the wire harness connector to the high pressure cut-off switch.

(6) Connect the battery negative cable.

(7) Evacuate the refrigerant system. See Refrigerant System Evacuate in the Service Procedures section of this group.

(8) Charge the refrigerant system. See Refrigerant System Charge in the Service Procedures section of this group.

COMPRESSOR

The compressor may be removed and repositioned without disconnecting the refrigerant lines or discharging the refrigerant system. Discharging is not necessary if servicing the compressor clutch or clutch coil, the engine, the cylinder head, or the generator.

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE GENERAL INFORMATION SECTION NEAR THE FRONT OF THIS GROUP BEFORE PERFORMING THE FOLLOWING OPERATION.

REMOVAL

(1) Recover the refrigerant from the refrigerant system. See Refrigerant Recovery in the Service Procedures section of this group.

(2) Disconnect and isolate the battery negative cable.

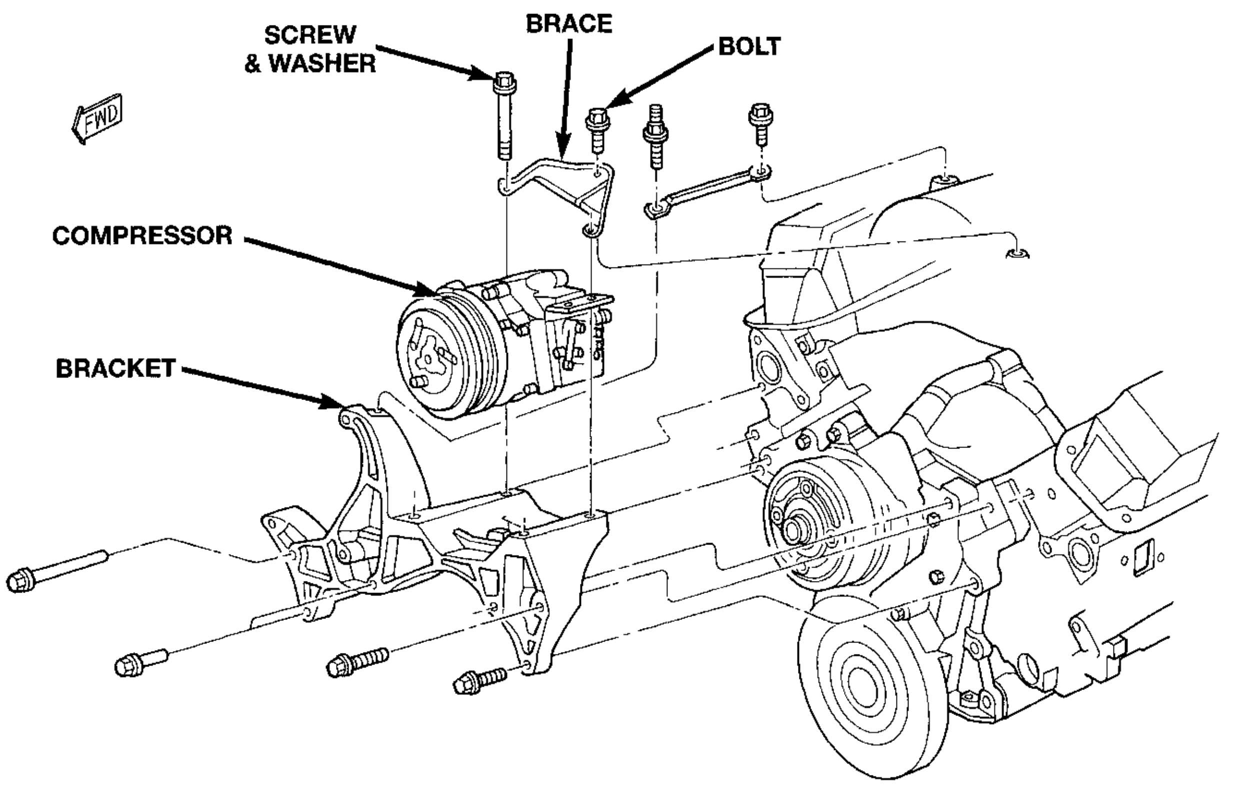

Fig. 18 Compressor Remove/Install - Gasoline Engine

REMOVAL AND INSTALLATION (Continued)

(3) Remove the serpentine drive belt. Refer to Group 7 - Cooling System for the procedures.

(4) Unplug the compressor clutch coil wire harness connector.

(5) Remove the suction and discharge refrigerant line manifold from the compressor. See Suction and Discharge Line in the Removal and Installation section of this group for the procedures. Install plugs in, or tape over all of the opened refrigerant line fittings.

(6) Remove the four screws that secure the compressor to the mounting bracket (Fig. 18) or (Fig. 19) .

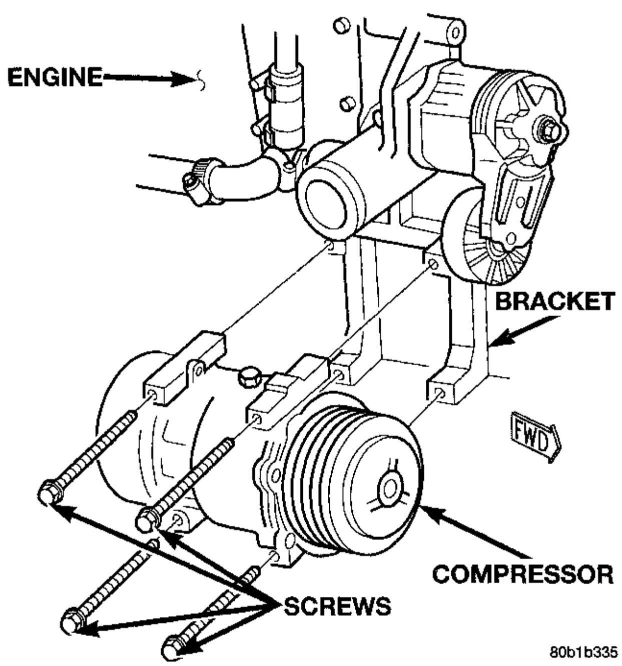

Fig. 19 Compressor Remove/Install - Diesel Engine

(7) Remove the compressor from the mounting bracket.

INSTALLATION

NOTE: If a replacement compressor is being installed, be certain to check the refrigerant oil level. See Refrigerant Oil Level in the Service Procedures section of this group. Use only refrigerant oil of the type recommended for the compressor in the vehicle.

(1) Install the compressor to the mounting bracket. Tighten the four mounting screws to 24 N·m (210 in. lbs.).

(2) Remove the tape or plugs from all of the opened refrigerant line fittings. Install the suction and discharge line manifold to the compressor. See Suction and Discharge Line in the Removal and Installation section of this group for the procedures.

(3) Install the serpentine drive belt. Refer to Group 7 - Cooling System for the procedures.

(4) Plug in the compressor clutch coil wire harness connector.

(5) Connect the battery negative cable.

(6) Evacuate the refrigerant system. See Refrigerant System Evacuate in the Service Procedures section of this group.

(7) Charge the refrigerant system. See Refrigerant System Charge in the Service Procedures section of this group.

COMPRESSOR CLUTCH

The refrigerant system can remain fully-charged during compressor clutch, pulley, or coil replacement. The compressor clutch can be serviced in the vehicle.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) On models with the diesel engine option, remove the compressor from the engine. Do not remove the refrigerant lines or fittings. See Compressor in the Removal and Installation section of this group for the procedures.

(3) Unplug the compressor clutch coil wire harness connector.

(4) Insert the two pins of the spanner wrench (Special Tool 6462 in Kit 6460) into the holes of the clutch plate. Hold the clutch plate stationary and remove the hex nut (Fig. 20).

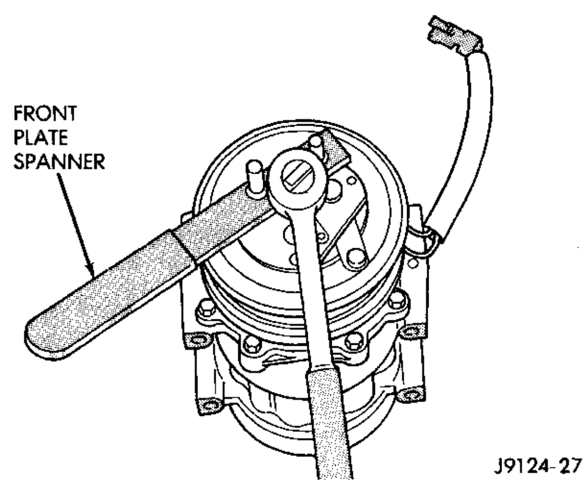

Fig. 20 Clutch Nut Remove

Mopar AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

(5) Remove the clutch plate and clutch shims. On models with the diesel engine option, a puller (Special Tool 6461 in Kit 6460) is used to remove the clutch plate (Fig. 21). This compressor also uses a shaft key, which must be removed.

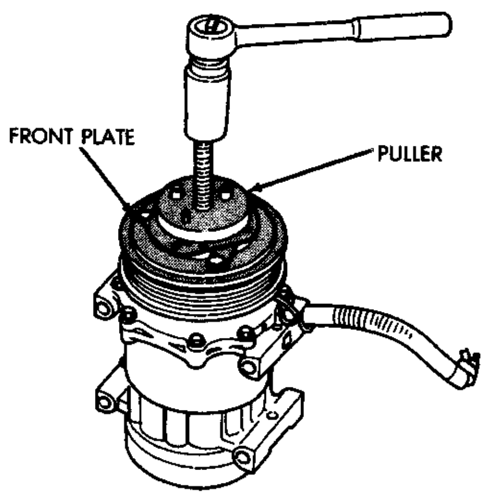

Fig. 21 Clutch Puller - Diesel Models

(6) Remove the external front housing snap ring with snap ring pliers (Fig. 22).

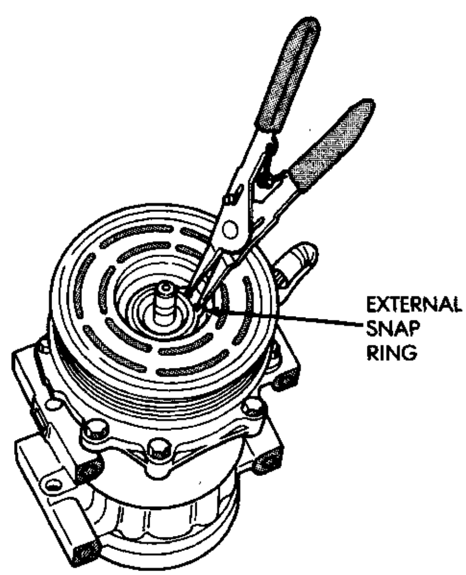

Fig. 22 External Snap Ring Remove

(7) Install the lip of the rotor puller (Special Tool C-6141-1 in Kit 6460) into the snap ring groove exposed in Step 6, and install the shaft protector (Special Tool C-6141-2 in Kit 6460) (Fig. 23).

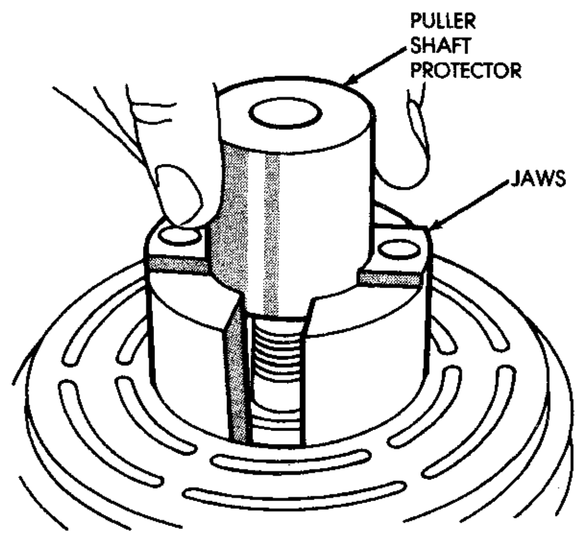

Fig. 23 Shaft Protector and Puller

(8) Install the puller through-bolts (Special Tool C-6461) through the puller flange and into the jaws of the rotor puller and tighten (Fig. 24). Turn the puller center bolt clockwise until the rotor pulley is free.

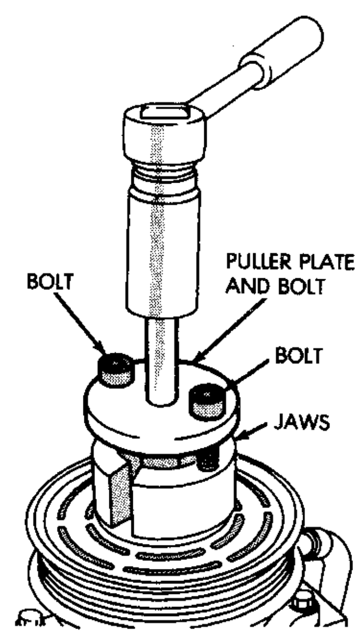

Fig. 24 Install Puller Plate

(9) Remove the screw and retainer from the clutch coil lead wire harness on the compressor front housing (Fig. 25).

REMOVAL AND INSTALLATION (Continued)

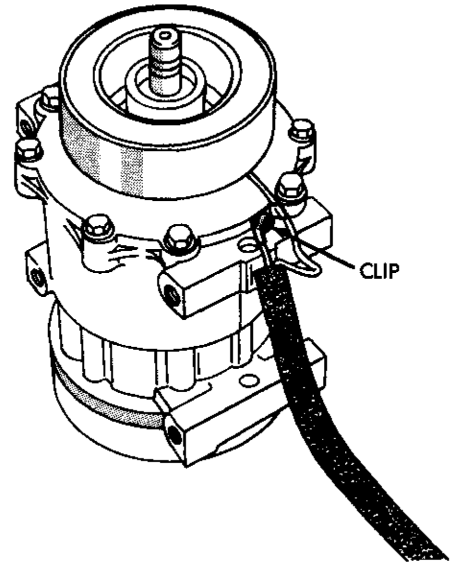

Fig. 25 Clutch Coil Lead Wire Harness

(10) Remove the snap ring from the compressor hub and remove the clutch field coil (Fig. 26). Slide the clutch field coil off of the compressor hub.

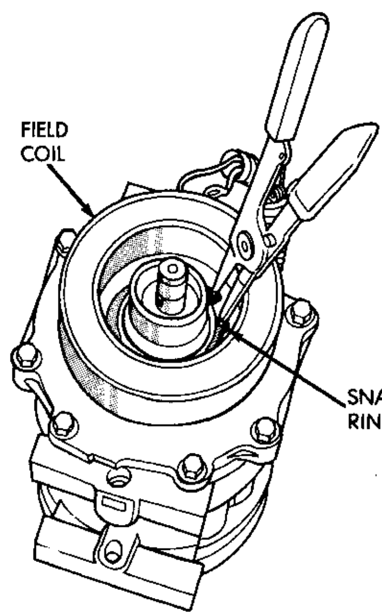

Fig. 26 Clutch Field Coil Snap Ring Remove

INSPECTION

Examine the friction surfaces of the clutch pulley and the front plate for wear. The pulley and front plate should be replaced if there is excessive wear or scoring.

If the friction surfaces are oily, inspect the shaft and nose area of the compressor for oil. Remove the felt from the front cover. If the felt is saturated with oil, the shaft seal is leaking and the compressor must be replaced.

Check the clutch pulley bearing for roughness or excessive leakage of grease. Replace the bearing, if required.

INSTALLATION

(1) Install the clutch field coil and snap ring.

(2) Install the clutch coil lead wire harness retaining clip on the compressor front housing and tighten the retaining screw.

(3) Align the rotor assembly squarely on the front compressor housing hub.

(4) Thread the handle (Special Tool 6464 in Kit 6460) into the driver (Special Tool 6143 in Kit 6460) (Fig. 27).

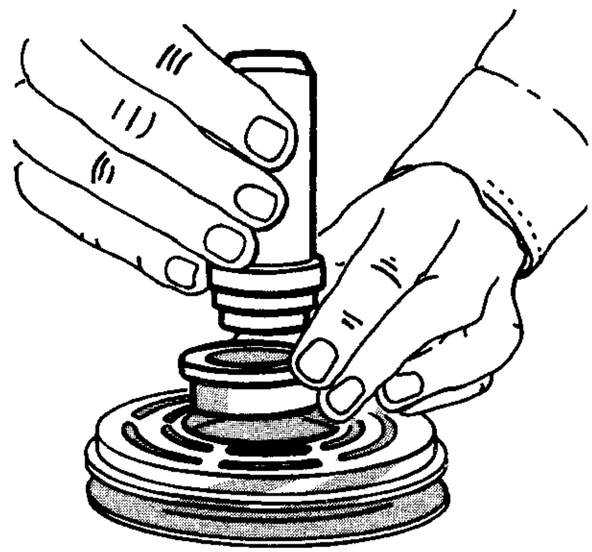

Fig. 27 Rotor Installer Set

(5) Place the driver tool assembly into the bearing cavity on the rotor. Make certain the outer edge of the tool rests firmly on the rotor bearing inner race (Fig. 28).

(6) Tap the end of the driver while guiding the rotor to prevent binding. Tap until the rotor bottoms against the compressor front housing hub. Listen for a distinct change of sound during the tapping process, to indicate the bottoming of the rotor.

(7) Install the external front rotor snap ring with snap ring pliers. The bevel side of the snap ring must be facing outward. Press the snap ring to make sure it is properly seated in the groove.

Mopar AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

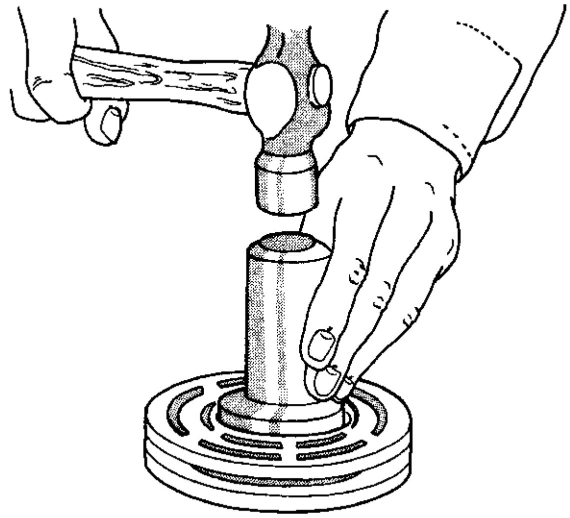

Fig. 28 Rotor Install

CAUTION: If the snap ring is not fully seated in the groove it will vibrate out, resulting in a clutch failure and severe damage to the front housing of the compressor.

(8) Install the original clutch shims on the compressor shaft.

(9) Install the clutch plate. On models with the diesel engine option, install the shaft key. Use the shaft protector (Special Tool 6141-2 in Kit 6460) to install the clutch plate on the compressor shaft (Fig. 29). Tap the clutch plate over the compressor shaft until it has bottomed against the clutch shims. Listen for a distinct change of sound during the tapping process, to indicate the bottoming of the clutch plate.

(10) Replace the compressor shaft hex nut. Tighten the nut to 14.4 N·m (10.5 ft. lbs.).

(11) Check the clutch air gap with a feeler gauge (Fig. 30). If the air gap does not meet the specification, add or subtract shims as required. The air gap specification is 0.41 to 0.79 millimeter (0.016 to 0.031 inch). If the air gap is not consistent around the circumference of the clutch, lightly pry up at the minimum variations. Lightly tap down at the points of maximum variation.

NOTE: The air gap is determined by the spacer shims. When installing an original, or a new clutch assembly, try the original shims first. When installing a new clutch onto a compressor that previously did not have a clutch, use 1.0, 0.50, and 0.13 millimeter (0.040, 0.020, and 0.005 inch) shims from the clutch hardware package that is provided with the new clutch.

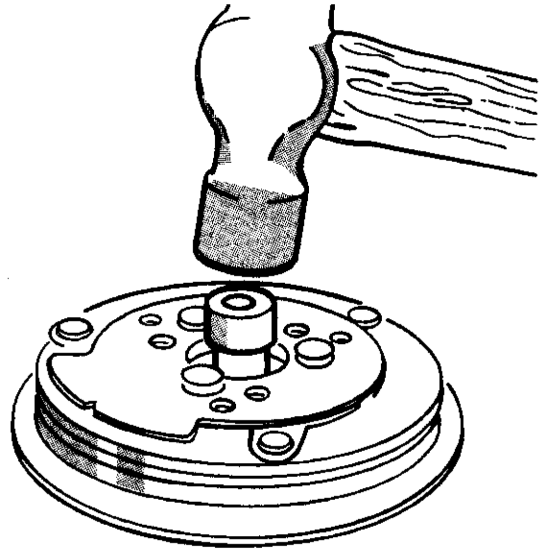

Fig. 29 Clutch Plate Install

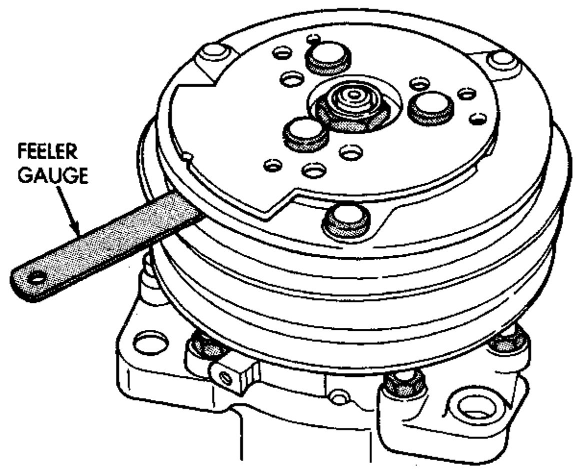

Fig. 30 Check Clutch Air Gap

(12) Reverse the remaining removal procedures to complete the installation.

CLUTCH BREAK-IN

After a new compressor clutch has been installed, cycle the compressor clutch approximately twenty times (five seconds on, then five seconds off). During this procedure, set the heater-A/C control to the recirculation mode (Max-A/C), the blower motor switch in the highest speed position, and the engine speed at 1500 to 2000 rpm. This procedure (burnishing) will seat the opposing friction surfaces and provide a higher compressor clutch torque capability.

REMOVAL AND INSTALLATION (Continued)

COMPRESSOR CLUTCH RELAY

(1) Disconnect and isolate the battery negative cable.

(2) Remove the cover from the Power Distribution Center (PDC) (Fig. 31).

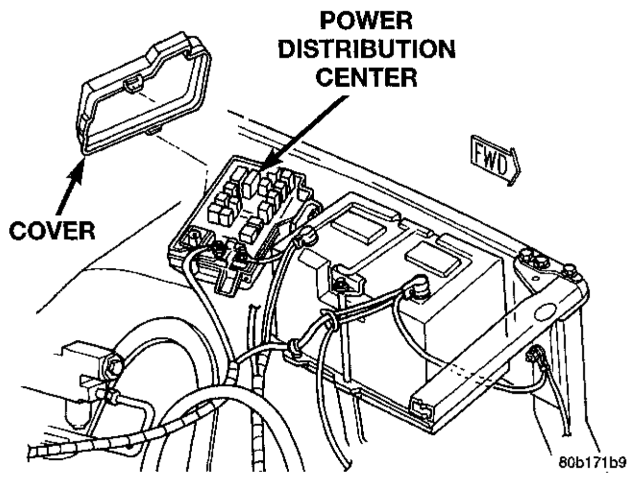

Fig. 31 Power Distribution Center

(3) Refer to the label on the PDC for compressor clutch relay identification and location.

(4) Unplug the compressor clutch relay from the PDC.

(5) Install the compressor clutch relay by aligning the relay terminals with the cavities in the PDC and pushing the relay firmly into place.

(6) Install the PDC cover.

(7) Connect the battery negative cable.

(8) Test the relay operation.

LIQUID LINE

Any kinks or sharp bends in the refrigerant plumbing will reduce the capacity of the entire air conditioning system. Kinks and sharp bends reduce the flow of refrigerant in the system. High pressures are produced in the refrigerant system when the air conditioning compressor is operating. Extreme care must be exercised to make sure that each of the refrigerant system connections is pressure-tight and leak free.

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE GENERAL INFORMATION SECTION NEAR THE FRONT OF THIS GROUP BEFORE PERFORMING THE FOLLOWING OPERATION.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Recover the refrigerant from the refrigerant system. See Refrigerant Recovery in the Service Procedures section of this group.

(3) Disconnect the liquid line refrigerant line couplers at the condenser outlet and the evaporator inlet. See Refrigerant Line Coupler in the Removal and Installation section of this group for the procedures. Install plugs in, or tape over all of the opened refrigerant line fittings.

(4) Disengage any clips that secure the liquid line to the inner fender shield and the dash panel (Fig. 32).

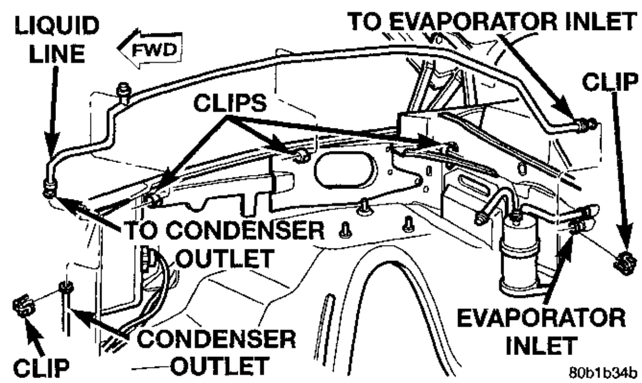

Fig. 32 Liquid Line Remove/Install

(5) Remove the liquid line from the vehicle.

INSTALLATION

(1) Install the liquid line into any clips on the inner fender shield and the dash panel.

(2) Remove the tape or plugs from the refrigerant line fittings on the liquid line, the condenser outlet, and the evaporator inlet. Connect the liquid line to the condenser and the evaporator. See Refrigerant Line Coupler in the Removal and Installation section of this group for the procedures.

(3) Connect the battery negative cable.

(4) Evacuate the refrigerant system. See Refrigerant System Evacuate in the Service Procedures section of this group.

(5) Charge the refrigerant system. See Refrigerant System Charge in the Service Procedures section of this group.

FIXED ORIFICE TUBE

The fixed orifice tube is located in the liquid line, between the condenser and the evaporator coil. The orifice has filter screens on the inlet and outlet ends of the tube body. If the fixed orifice tube is faulty or plugged, the liquid line assembly must be replaced. See Liquid Line in the Removal and Installation section of this group for the service procedures.

LOW PRESSURE CYCLING CLUTCH SWITCH

REMOVAL

(1) Disconnect and isolate the battery negative cable.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

(2) Unplug the wire harness connector from the low pressure cycling clutch switch on the top of the accumulator (Fig. 33).

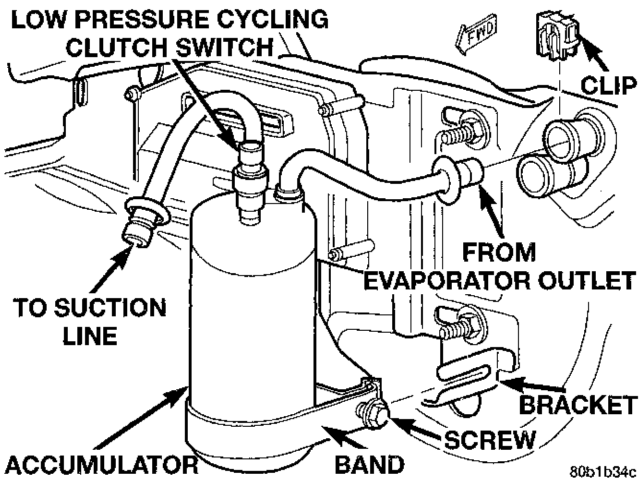

Fig. 33 Low Pressure Cycling Clutch Switch Remove/Install

(3) Unscrew the low pressure cycling clutch switch from the fitting on the top of the accumulator.

(4) Remove the O-ring seal from the accumulator fitting and discard.

INSTALLATION

(1) Lubricate a new O-ring seal with clean refrigerant oil and install it on the accumulator fitting. Use only the specified O-rings as they are made of a special material for the R-134a system. Use only refrigerant oil of the type recommended for the compressor in the vehicle.

(2) Install and tighten the low pressure cycling clutch switch on the accumulator fitting. The switch should be hand-tightened onto the accumulator fitting.

(3) Plug the wire harness connector into the low pressure cycling clutch switch.

(4) Connect the battery negative cable.

ACCUMULATOR

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE GENERAL INFORMATION SECTION NEAR THE FRONT OF THIS GROUP BEFORE PERFORMING THE FOLLOWING OPERATION.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Recover the refrigerant from the refrigerant system. See Refrigerant Recovery in the Service Procedures section of this group.

(3) Remove the low pressure cycling clutch switch from the accumulator. See Low Pressure Cycling Clutch Switch in the Removal and Installation section of this group for the procedures.

(4) Loosen the screw that secures the accumulator retaining band to the support bracket on the dash panel (Fig. 34).

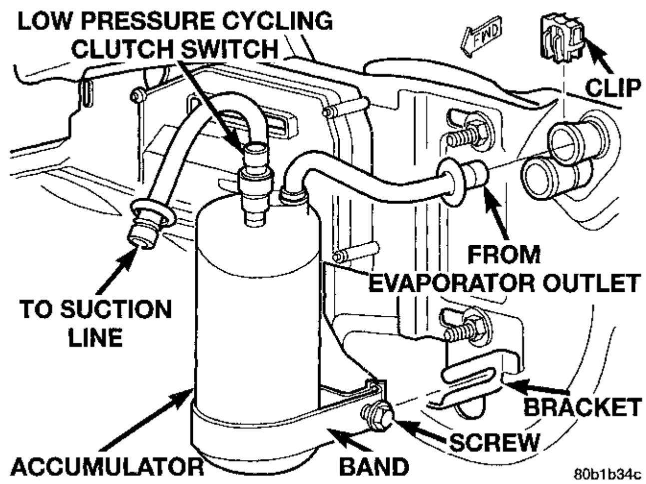

Fig. 34 Accumulator Remove/Install

(5) Disconnect the suction line refrigerant line fitting from the accumulator outlet. See Refrigerant Line Coupler in the Removal and Installation section of this group for the procedures. Install plugs in, or tape over all of the opened refrigerant line fittings.

(6) Disconnect the accumulator inlet refrigerant line fitting from the evaporator outlet. See Refrigerant Line Coupler in the Removal and Installation section of this group for the procedures. Install plugs in, or tape over all of the opened refrigerant line fittings.

(7) Pull the accumulator and retaining band unit forward until the screw in the band is clear of the slotted hole in the support bracket on the dash panel.

(8) Remove the accumulator from the engine compartment.

INSTALLATION

(1) Install the accumulator and retaining band as a unit by sliding the screw in the band into the slotted hole in the support bracket on the dash panel.

(2) Remove the tape or plugs from the refrigerant line fittings on the accumulator inlet and the evaporator outlet. Connect the accumulator inlet refrigerant line coupler to the evaporator outlet. See Refrigerant Line Coupler in the Removal and Installation section of this group for the procedures.

(3) Tighten the accumulator retaining band screw to 4.5 N·m (40 in. lbs.).

(4) Remove the tape or plugs from the refrigerant line fittings on the suction line and the accumulator

REMOVAL AND INSTALLATION (Continued)

outlet. Connect the suction line refrigerant line coupler to the accumulator outlet. See Refrigerant Line Coupler in the Removal and Installation section of this group for the procedures.

(5) Reinstall the low pressure cycling clutch switch on the accumulator. See Low Pressure Cycling Clutch Switch in the Removal and Installation section of this group for the procedures.

(6) Connect the battery negative cable.

(7) Evacuate the refrigerant system. See Refrigerant System Evacuate in the Service Procedures section of this group.

(8) Charge the refrigerant system. See Refrigerant System Charge in the Service Procedures section of this group.

NOTE: If the accumulator is replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the compressor in the vehicle.

CONDENSER

WARNING: REVIEW THE WARNINGS AND CAUTIONS IN THE GENERAL INFORMATION SECTION NEAR THE FRONT OF THIS GROUP BEFORE PERFORMING THE FOLLOWING OPERATION.

CAUTION: Before removing the condenser, note the location of each of the radiator and condenser air seals. These seals are used to direct air through the condenser and radiator. The air seals must be reinstalled in their proper locations in order for the air conditioning and engine cooling systems to perform as designed.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Recover the refrigerant from the refrigerant system. See Refrigerant Recovery in the Service Procedures section of this group.

(3) Remove the nut that secures the block fitting to the stud on the condenser inlet and disconnect the discharge line from the condenser. Install plugs in, or tape over all of the opened refrigerant line fittings.

(4) Disconnect the refrigerant line fitting that secures the liquid line to the condenser outlet. See Refrigerant Line Coupler in the Removal and Installation section of this group for the procedures. Install plugs in, or tape over all of the opened refrigerant line fittings.

(5) On gasoline engine models:

(a) Remove the two screws that secure the condenser upper mounting brackets to the outside of the upper radiator crossmember (Fig. 35).

(b) Tilt the condenser away from the engine compartment far enough to grasp the top of the condenser with both hands.

(c) Lift the condenser far enough to remove the two lower condenser locators from the isolators in the holes of the lower crossmember.

(d) Remove the condenser from the vehicle.

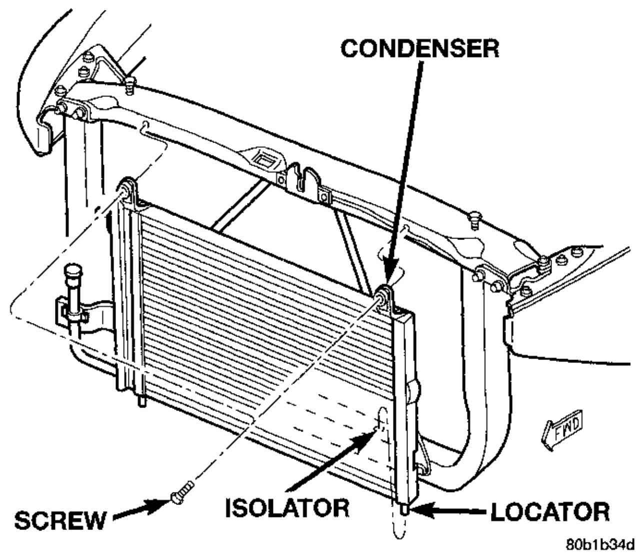

Fig. 35 Condenser Remove/Install - Gasoline Engine

(6) On diesel engine models:

(a) Remove the two screws that secure the brackets on the passenger side end of the condenser to the charge air cooler (Fig. 36).

(b) Remove the two nuts that secure the driver side end of the condenser to the studs on the charge air cooler.

(c) Remove the condenser from the vehicle.

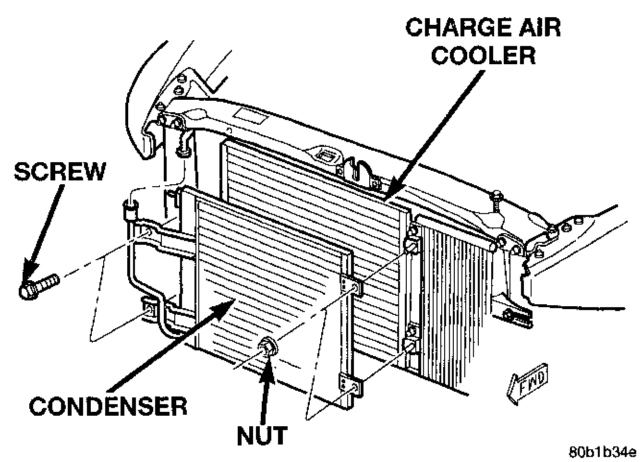

Fig. 36 Condenser Remove/Install - Diesel Engine

REMOVAL AND INSTALLATION (Continued)

INSTALLATION

(1) On gasoline engine models:

(a) Insert the two lower condenser locators into the isolators in the holes of the lower crossmember.

(b) Tilt the condenser up towards the engine compartment far enough to align the upper mounting bracket holes with the holes in the upper radiator crossmember.

(c) Install the two screws that secure the condenser upper mounting brackets to the outside of the upper radiator crossmember. Tighten the mounting screws to 10.5 N·m (95 in. lbs.).

(2) On diesel engine models:

(a) Install the driver side condenser mounting brackets over the two studs on the charge air cooler.

(b) Install the two screws that secure the brackets on the passenger side end of the condenser to the charge air cooler. Tighten the mounting screws to 10.5 N·m (95 in. lbs.).

(c) Install the two nuts that secure the driver side end of the condenser to the studs on the charge air cooler. Tighten the mounting nuts to 10.5 N·m (95 in. lbs.).

(3) Remove the plugs or tape from the refrigerant line fittings on the liquid line and the condenser outlet. Connect the liquid line to the condenser outlet. See Refrigerant Line Coupler in the Removal and Installation section of this group for the procedures.

(4) Install a new gasket and the discharge line block fitting over the stud on the condenser inlet. Tighten the mounting nut to 20 N·m (180 in. lbs.).

(5) Check that all of the condenser and radiator air seals are in their proper locations.

(6) Connect the battery negative cable.

(7) Evacuate the refrigerant system. See Refrigerant System Evacuate in the Service Procedures section of this group.

(8) Charge the refrigerant system. See Refrigerant System Charge in the Service Procedures section of this group.

NOTE: If the condenser is replaced, add 30 milliliters (1 fluid ounce) of refrigerant oil to the refrigerant system. Use only refrigerant oil of the type recommended for the compressor in the vehicle.

VACUUM CHECK VALVE

(1) On models with a gasoline engine, unplug the vacuum supply line connector at the vacuum check valve (Fig. 37). On models with a diesel engine, remove the clamp from the vacuum supply line connector and unplug the connector from the vacuum check valve (Fig. 38).

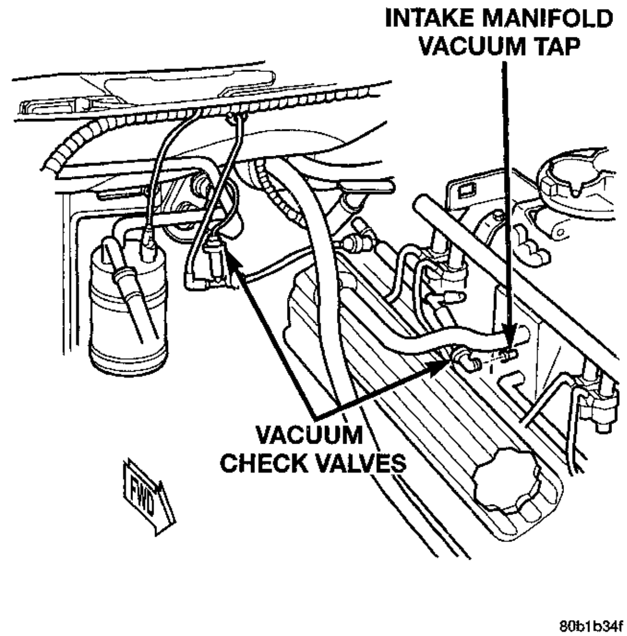

Fig. 37 Vacuum Check Valves - Gasoline Engine

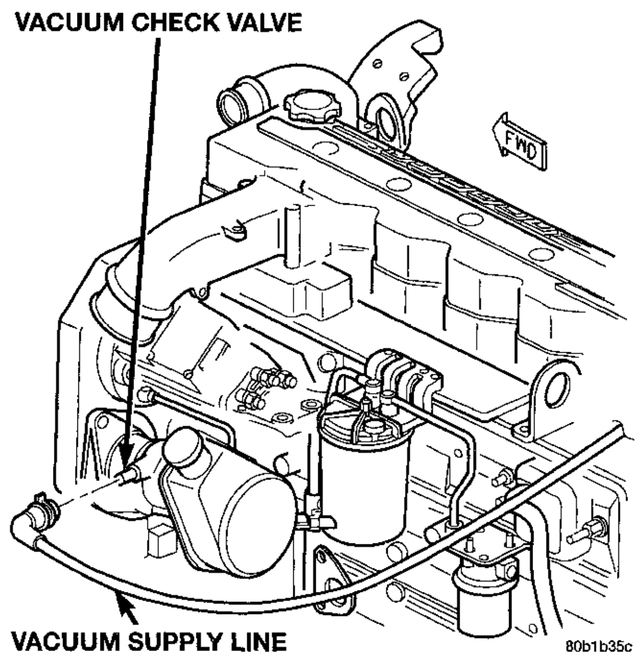

Fig. 38 Vacuum Check Valve - Diesel Engine

(2) On models with a gasoline engine, note the orientation of the check valve in the vacuum supply line for correct reinstallation.

(3) On models with a gasoline engine, unplug the vacuum check valve from the vacuum supply line fitting. On models with a diesel engine, unscrew the check valve and nipple unit from the engine vacuum pump.

REMOVAL AND INSTALLATION (Continued)

(4) Reverse the removal procedures to install. On models with a diesel engine, tighten the check valve and nipple unit to 24 N·m (18 ft. lbs.).

VACUUM RESERVOIR

(1) Disconnect and isolate the battery negative cable.

(2) Remove the wiper arms from the wiper pivots. Refer to Wiper Arm in the Removal and Installation section of Group 8K - Wiper and Washer Systems for the procedures.

(3) Remove the weatherstrip along the front edge of the cowl plenum cover/grille panel and the cowl plenum panel (Fig. 39).

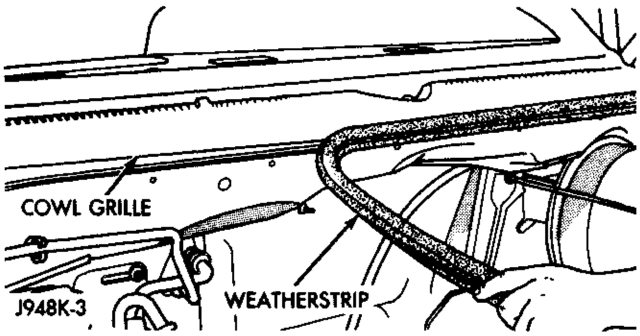

Fig. 39 Cowl Plenum Cover/Grille Panel Weatherstrip

(4) Remove the plastic screws that secure the cowl plenum cover/grille panel to the studs on the cowl top panel near the base of the windshield (Fig. 40).

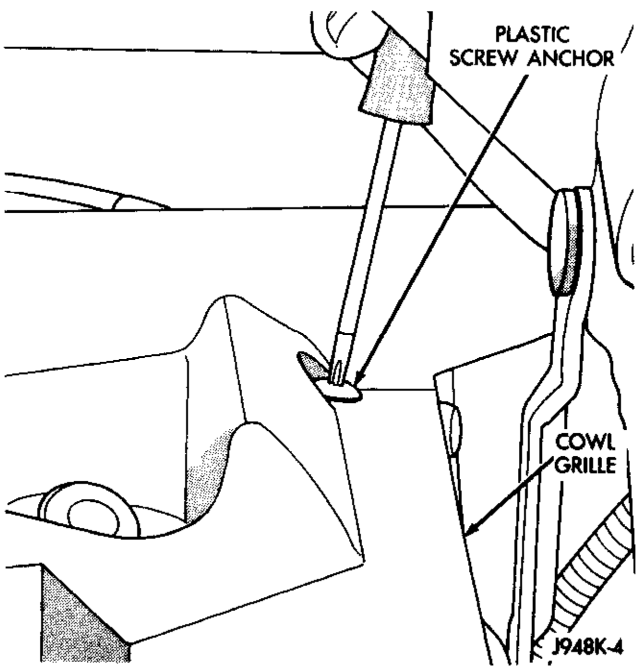

Fig. 40 Cowl Plenum Plastic Screws Remove/Install

(5) Lift the cowl plenum cover/grille panel from the cowl top far enough to access the vacuum reservoir near the right end of the cowl plenum.

(6) Disconnect the vacuum supply hose from the vacuum reservoir, which is secured to the dash panel near the right end of the cowl plenum (Fig. 41).

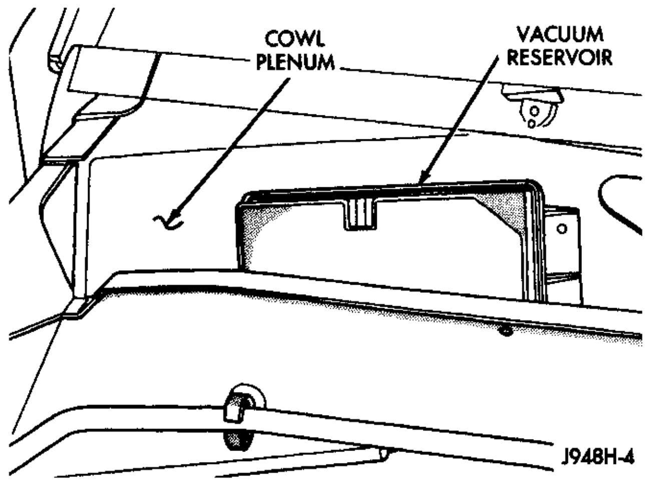

Fig. 41 Vacuum Reservoir

(7) Remove the two nuts that secure the reservoir to the studs on the dash panel near the right end of the cowl plenum.

(8) Remove the vacuum reservoir from the dash panel studs.

(9) Reverse the removal procedures to install. Tighten the mounting nuts to 2.8 N·m (25 in. lbs.).

HEATER-A/C CONTROL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO GROUP 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Reach under the instrument panel near the driver side of the floor panel transmission tunnel and unplug the heater-A/C control to heater-A/C housing vacuum harness connector.

(3) While still reaching under the instrument panel, disengage the retainer on the heater-A/C control half of the vacuum harness from the hole in the center distribution duct (Fig. 42).

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

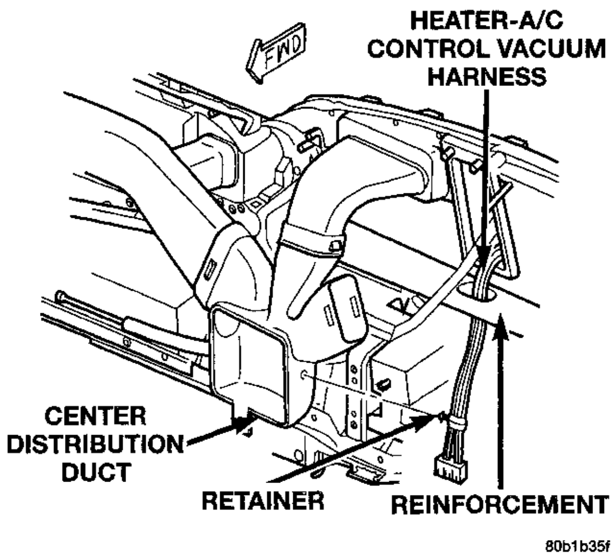

Fig. 42 Heater-A/C Control Vacuum Harness Routing

(4) Remove the cluster bezel from the instrument panel. Refer to Cluster Bezel in the Removal and Installation section of Group 8E - Instrument Panel Systems for the procedures.

(5) Remove the four screws that secure the heater-A/C control to the instrument panel (Fig. 43).

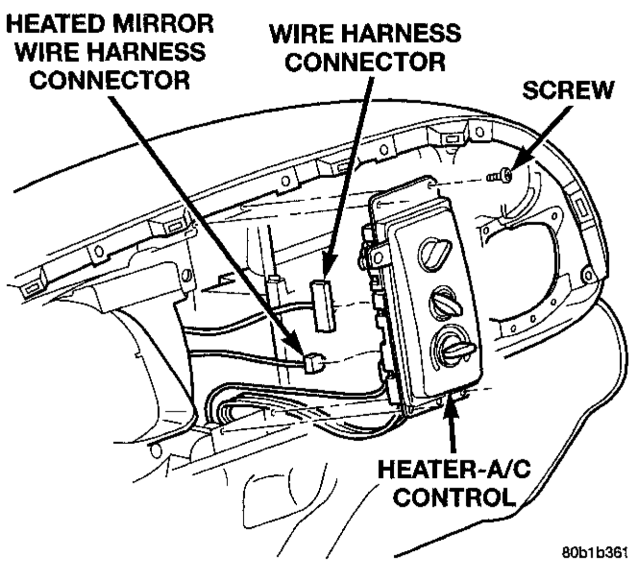

Fig. 43 Heater-A/C Control Remove/Install

(6) Pull the heater-A/C control assembly away from the instrument panel far enough to access the connections on the back of the control.

(7) Unplug the wire harness connector from the back of the heater-A/C control.

(8) On vehicles with heated mirrors, unplug the heated mirror wire harness connector from the back of the heater-A/C control.

(9) Release the temperature control cable housing flag retainer latch in the receptacle on the back of the heater-A/C control and disengage the flag retainer from the receptacle (Fig. 44).

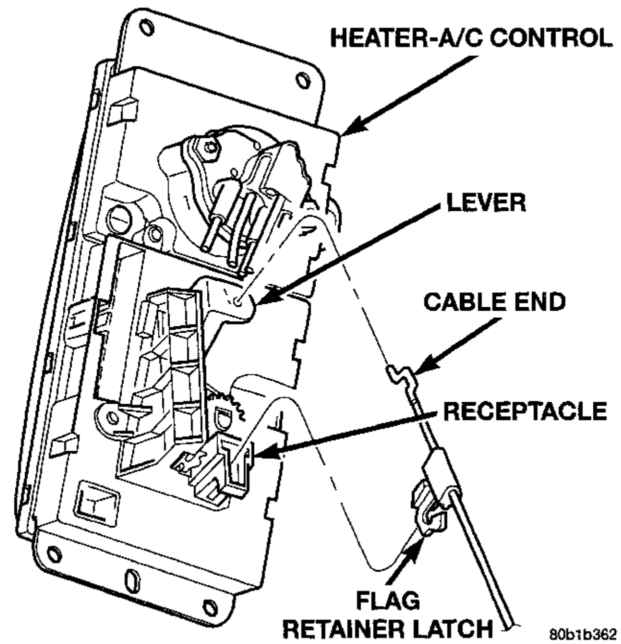

Fig. 44 Heater-A/C Control Temperature Control Cable Remove/Install

(10) Rotate the heater-A/C control assembly as needed to disengage the cable end from the hole on the end of the temperature control lever.

(11) Remove the heater-A/C control from the instrument panel.

INSTALLATION

(1) Connect the temperature control cable core end to the temperature control lever on the back of the heater-A/C control.

(2) Connect the temperature control cable housing flag retainer to the receptacle on the back of the heater-A/C control.

(3) Plug the wire harness connector(s) into the receptacle(s) on the back of the heater-A/C control.

(4) Route the heater-A/C vacuum harness through the hole in the reinforcement below the heater-A/C control opening of the instrument panel.

(5) Position the heater-A/C control in the instrument panel and secure it with four screws. Tighten the screws to 2.2 N·m (20 in. lbs.).

(6) Reinstall the cluster bezel to the instrument panel. Refer to Cluster Bezel in the Removal and Installation section of Group 8E - Instrument Panel Systems for the procedures.

(7) Reach under the instrument panel to reinstall the heater-A/C control vacuum harness retainer to the side of the center distribution duct.

mopar AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

(8) Plug in the two halves of the heater-A/C control to heater-A/C housing vacuum harness connector.
(9) Connect the battery negative cable.
(10) Adjust the temperature control cable. See Temperature Control Cable in the Adjustments section of this group for the procedures.

HEATER-A/C CONTROL KNOB

Each of the three heater-only or heater-A/C control knobs can be removed for service replacement.
(1) Rotate the control knob to its full clockwise position.
(2) Grasp the knob firmly and pull it straight out from the control.
(3) Reverse the removal procedures to install.

BLOWER MOTOR

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO GROUP 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

REMOVAL

(1) Disconnect and isolate the battery negative cable.
(2) Disconnect the blower motor cooling tube from the nipple on the blower motor housing (Fig. 45).
(3) Disengage the blower motor wire harness from the wire harness retainer.
(4) Unplug the blower motor wire harness connector from the heater-A/C housing wire harness.
(5) Remove the three screws that secure the blower motor and blower wheel assembly to the heater-A/C housing.
(6) Lower the blower motor and wheel from the heater-A/C housing.
(7) Remove the blower wheel retainer clip and remove the wheel from the blower motor shaft (Fig. 46).

INSTALLATION

(1) Press the blower wheel hub onto the blower motor shaft. Be sure the flat on the blower motor shaft is indexed to the flat on the inside of the blower wheel hub.
(2) Install the retainer clip over the blower wheel hub. The ears of the retainer clip must be indexed over the flats on the blower motor shaft and blower wheel hub.

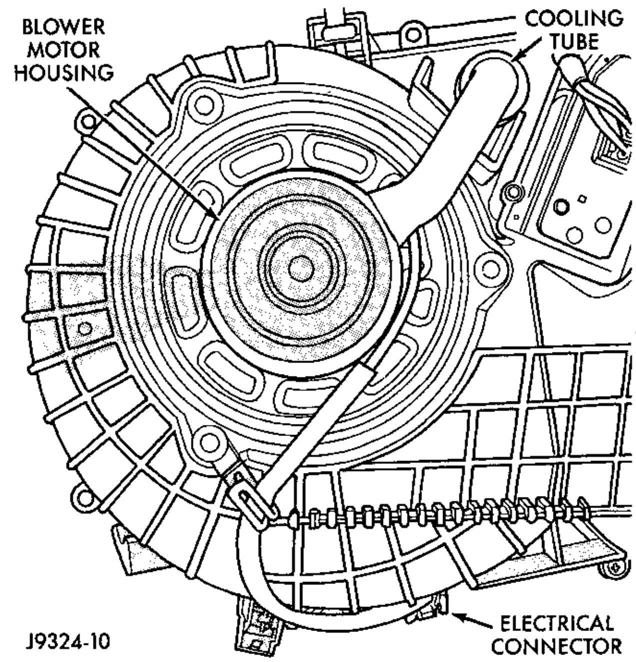

Fig. 45 Blower Motor Remove/Install

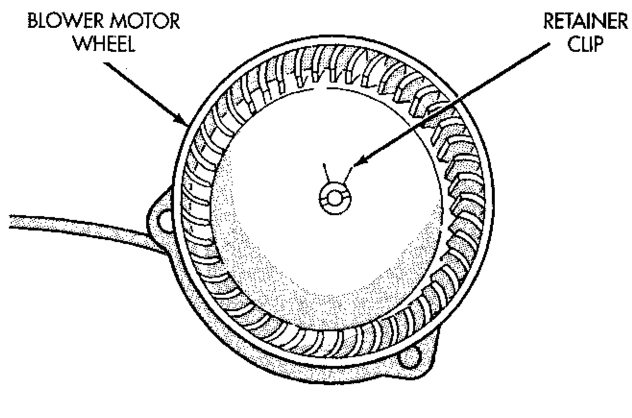

Fig. 46 Blower Motor Wheel Remove/Install

(3) Be certain that the blower motor seal is installed on the blower motor housing (Fig. 47).
(4) Install the blower motor in the heater-A/C housing with three mounting screws. Tighten the mounting screws to 2.2 N·m (20 in. lbs.).
(5) Plug the blower motor wire harness connector into the heater-A/C housing wire harness.
(6) Install the blower motor wire harness into the wire harness retainer.
(7) Connect the blower motor cooling tube to the nipple on the blower motor housing.
(8) Connect the battery negative cable.

Mopar AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

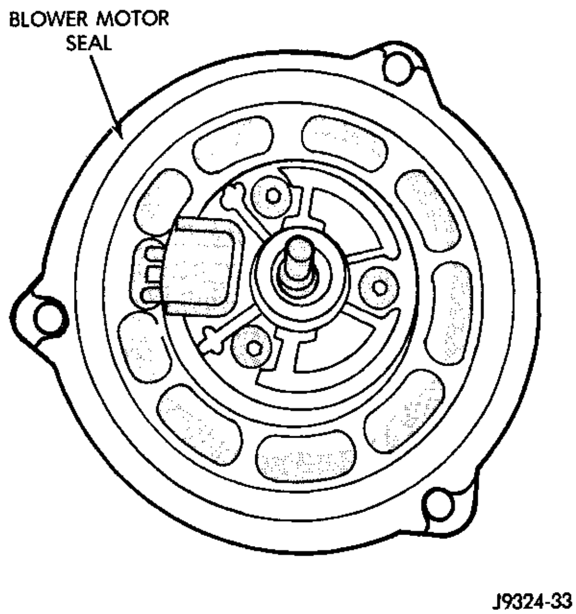

Fig. 47 Blower Motor Seal

BLOWER MOTOR RELAY

(1) Disconnect and isolate the battery negative cable.

(2) Remove the cover from the Power Distribution Center (PDC) (Fig. 48).

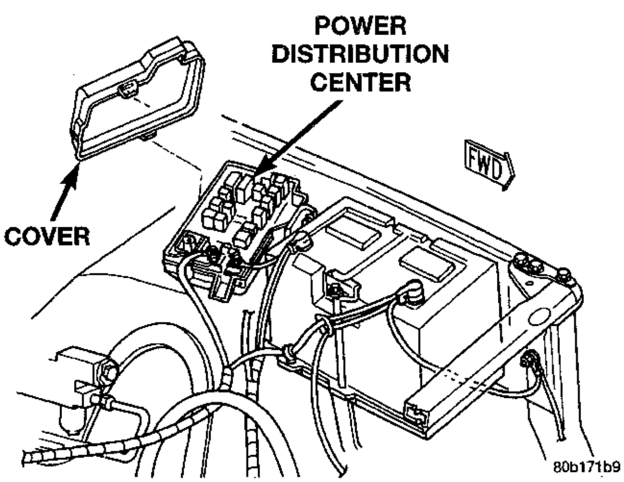

Fig. 48 Power Distribution Center

(3) Refer to the label on the PDC for blower motor relay identification and location.

(4) Unplug the blower motor relay from the PDC.

(5) Install the blower motor relay by aligning the relay terminals with the cavities in the PDC and pushing the relay firmly into place.

(6) Install the PDC cover.

(7) Connect the battery negative cable.

(8) Test the relay operation.

BLOWER MOTOR RESISTOR

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO GROUP 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Reach under the passenger side end of the heater-A/C housing and unplug the wire harness connector from the blower motor resistor.

(3) Remove the screws that secure the blower motor resistor to the heater-A/C housing.

(4) Remove the blower motor resistor from the heater-A/C housing (Fig. 49).

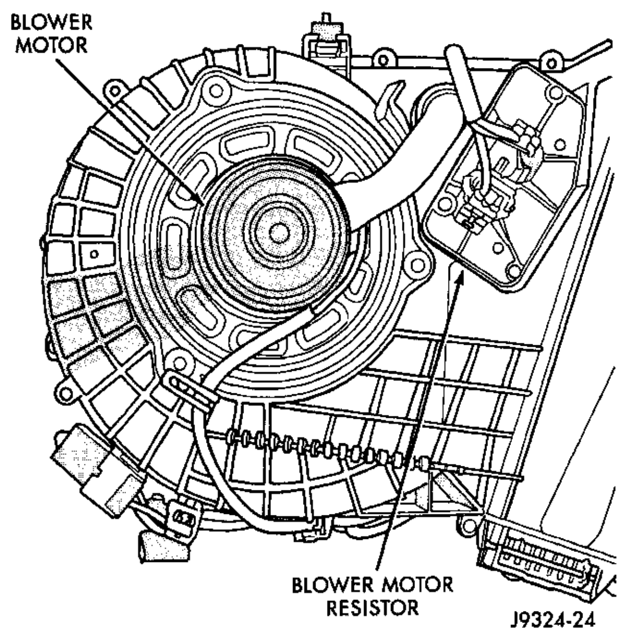

Fig. 49 Blower Motor Resistor - Typical

INSTALLATION

(1) Install the blower motor resistor into the heater-A/C housing and secure it with the mounting screws. Tighten the mounting screws to 2.2 N·m (20 in. lbs.).

(2) Plug the wire harness connector into the blower motor resistor.

(3) Connect the battery negative cable.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

TEMPERATURE CONTROL CABLE

The temperature control cable self-adjuster clip can be accessed and repositioned on the cable core without removal of the temperature control cable from the heater-A/C housing by reaching through the glove box opening as described in the Removal procedures that follow. Reposition the self-adjuster clip as shown in (Fig. 51), then see Temperature Control Cable in the Adjustments section of this group for the procedures to complete the cable adjustment.

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO GROUP 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the glove box from the instrument panel. Refer to Glove Box in the Removal and Installation section of Group 8E - Instrument Panel Systems for the procedures.

(3) Disconnect the temperature control cable from the heater-A/C control. See Heater-A/C Control in the Removal and Installation section of this group for the procedures.

(4) Reach through the instrument panel glove box opening to disconnect the temperature control cable housing flag retainer from the receptacle on the top of the heater-A/C housing (Fig. 50).

(5) Pull the temperature control cable core self-adjuster clip off of the pin on the end of the blend-air door lever.

(6) Remove the temperature control cable from the vehicle.

INSTALLATION

Before installing the temperature control cable, be certain that the self-adjuster clip is properly positioned (Fig. 51). This measurement is made between the self-adjuster clip and the cable end on the heater-A/C housing end of the cable. If the self-adjuster clip is not properly positioned, slide the clip up or down the cable core as required to achieve the specified dimension.

(1) Push the temperature control cable core self-adjuster clip onto the pin on the end of the blend-air door lever.

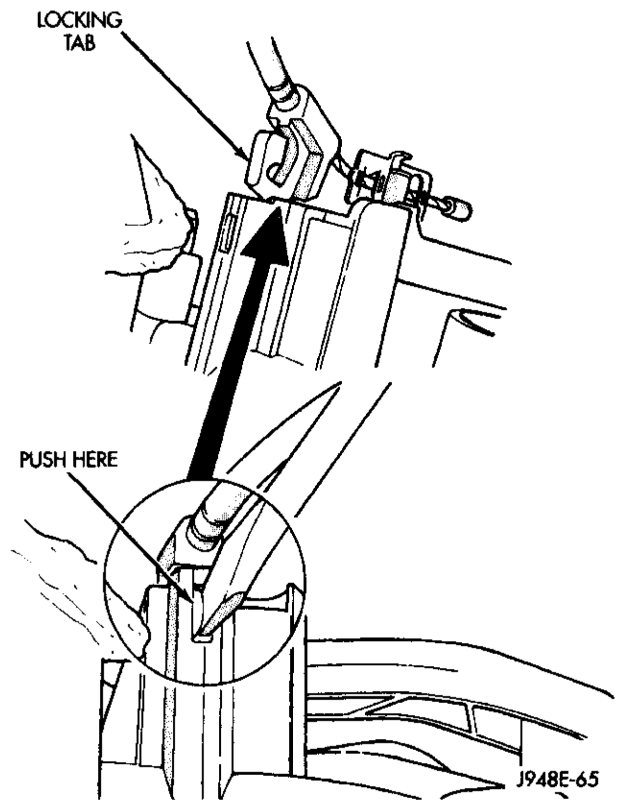

Fig. 50 Temperature Control Cable Remove/Install

(2) Snap the temperature control cable housing flag retainer into the receiver on the top of the heater-A/C housing.

(3) Reinstall the glove box in the instrument panel. Refer to Glove Box in the Removal and Installation section of Group 8E - Instrument Panel Systems for the procedures.

(4) Connect the temperature control cable to the heater-A/C control. See Heater-A/C Control in the Removal and Installation section of this group for the procedures.

(5) Connect the battery negative cable.

(6) Adjust the temperature control cable. See Temperature Control Cable in the Adjustments section of this group for the procedures.

HEATER-A/C HOUSING

The heater-A/C housing assembly must be removed from the vehicle and disassembled for service access of the heater core, evaporator coil, and each of the various mode control doors.

Mopar AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

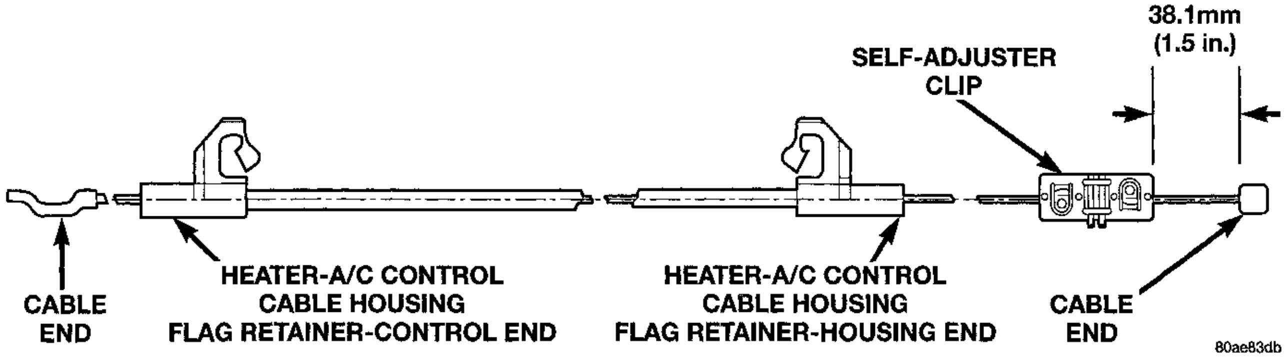

Fig. 51 Temperature Control Cable Self-Adjuster Clip

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO GROUP 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

REMOVAL

(1) Disconnect and isolate the battery negative cable.

(2) Remove the instrument panel from the vehicle. Refer to Instrument Panel Assembly in the Removal and Installation section of Group 8E - Instrument Panel Systems for the procedures.

(3) If the vehicle is not equipped with air conditioning, go to Step 6. If the vehicle is equipped with air conditioning, recover the refrigerant from the refrigerant system. See Refrigerant Recovery in the Service Procedures section of this group.

(4) Disconnect the liquid line refrigerant line fitting from the evaporator inlet tube. See Refrigerant Line Coupler in the Removal and Installation section of this group for the procedures. Install plugs in, or tape over all of the opened refrigerant line fittings.

(5) Disconnect the accumulator inlet tube refrigerant line fitting from the evaporator outlet tube. See Refrigerant Line Coupler in the Removal and Installation section of this group for the procedures. Install plugs in, or tape over all of the opened refrigerant line fittings.

(6) Drain the engine cooling system. Refer to Group 7 - Cooling System for the procedures.

(7) Disconnect the heater hoses from the heater core tubes. Refer to Group 7 - Cooling System for the procedures. Install plugs in, or tape over the opened heater core tubes.

(8) Remove the Powertrain Control Module (PCM) from the dash panel and set it aside, but do not unplug the PCM wire harness connectors. Refer to Group 14 - Fuel Systems for the procedures.

(9) Remove the nuts from the heater-A/C housing mounting studs on the engine compartment side of the dash panel.

(10) Remove the nuts that secure the heater-A/C housing to the mounting studs on the passenger compartment side of the dash panel (Fig. 52).

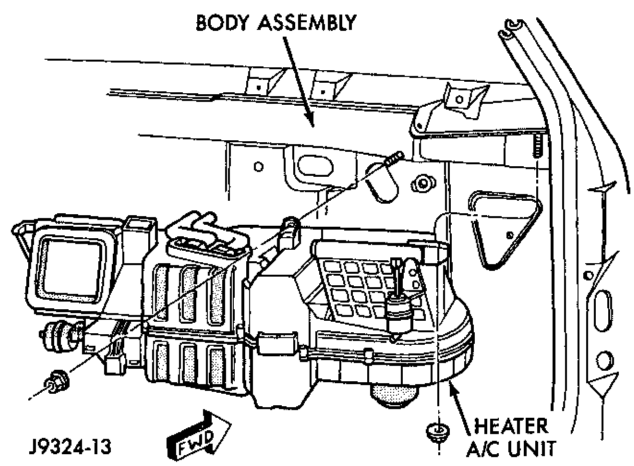

Fig. 52 Heater-A/C Housing Remove/Install

(11) Pull the heater-A/C housing rearward far enough for the mounting studs and the evaporator condensate drain tube to clear the dash panel holes.

(12) Remove the heater-A/C housing from the vehicle.

DISASSEMBLY

(1) Place the heater-A/C housing upside down on a work bench.

(2) Remove the screw that secures the floor duct to the bottom of the heater-A/C housing and slide the floor duct off of the center heat duct adaptor.

(3) Unsnap the center heat duct adaptor from the bottom of the heater-A/C housing and remove the screw that was hidden by the adaptor.

REMOVAL AND INSTALLATION (Continued)

(4) Remove the remaining screws on the bottom of the heater-A/C housing that secure the two housing halves together.

(5) Place the heater-A/C housing right side up on the work bench.

(6) Separate the top half of the heater-A/C housing from the bottom half and set it aside.

ASSEMBLY

(1) Position the top half of the heater-A/C housing over the bottom half. Be certain that the mode door pivot pins are properly inserted in their pivot holes.

(2) Place the heater-A/C housing upside down on the work bench.

(3) Install and tighten the screws on the bottom of the heater-A/C housing that secure the two housing halves together. Tighten the screws to 2.2 N·m (20 in. lbs.).

(4) Snap the center heat duct adaptor onto the bottom of the heater-A/C housing.

(5) Slide the floor duct onto the center heat duct adaptor and secure it with a screw to the bottom of the heater-A/C housing. Tighten the mounting screw to 2.2 N·m (20 in. lbs.).

(6) Reinstall the heater-A/C housing in the vehicle.

INSTALLATION

(1) Position the heater-A/C housing to the dash panel. Be certain that the evaporator condensate drain tube and the housing mounting studs are inserted into their correct mounting holes.

(2) Install the nuts that secure the heater-A/C housing to the mounting studs on the passenger compartment side of the dash panel. Tighten the nuts to 4.5 N·m (40 in. lbs.).

(3) Install and tighten the nuts onto the heater-A/C housing mounting studs on the engine compartment side of the dash panel. Tighten the nuts to 7 N·m (60 in. lbs.).

(4) Unplug or remove the tape from the heater core tubes. Connect the heater hoses to the heater core tubes and fill the engine cooling system. Refer to Group 7 - Cooling System for the procedures.

(5) If the vehicle is not equipped with air conditioning, go to Step 10. If the vehicle is equipped with air conditioning, unplug or remove the tape from the accumulator inlet tube and the evaporator outlet tube fittings. Connect the accumulator inlet tube coupler to the evaporator outlet tube. See Refrigerant Line Coupler in the Removal and Installation section of this group for the procedures.

(6) Unplug or remove the tape from the liquid line and the evaporator inlet tube fittings. Connect the liquid line coupler to the evaporator inlet tube. See Refrigerant Line Coupler in the Removal and Installation section of this group for the procedures.

(7) Evacuate the refrigerant system. See Refrigerant System Evacuate in the Service Procedures section of this group.

(8) Charge the refrigerant system. See Refrigerant System Charge in the Service Procedures section of this group.

(9) Reinstall the PCM to the dash panel. Refer to Group 14 - Fuel Systems for the procedures.

(10) Reinstall the instrument panel in the vehicle. Refer to Instrument Panel Assembly in the Removal and Installation section of Group 8E - Instrument Panel Systems for the procedures.

(11) Connect the battery negative cable.

(12) Start the engine and check for proper operation of the heating and air conditioning systems.

MODE DOOR VACUUM ACTUATOR

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO GROUP 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

HEAT-DEFROST DOOR ACTUATOR

(1) Disconnect and isolate the battery negative cable.

(2) Remove the heater-A/C housing from the vehicle and place it on a work bench. See Heater-A/C Housing in the Removal and Installation section of this group for the procedures.

(3) Unplug the two vacuum harness connectors from the heat-defrost door actuator (Fig. 53).

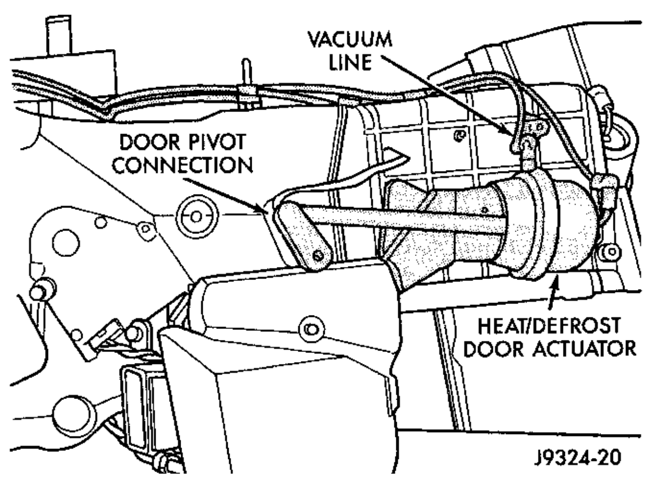

Fig. 53 Heat-Defrost Door Actuator

mopar AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

(4) Using a trim stick or another suitable wide flat-bladed tool, gently pry the heat-defrost door crank arm off of the heat-defrost door pivot.

(5) Remove the two screws that secure the heat-defrost door actuator to the heater-A/C housing.

(6) Remove the heat-defrost door actuator from the heater-A/C housing.

(7) Reverse the removal procedures to install. Tighten the heat-defrost door actuator mounting screws to 2.2 N·m (20 in. lbs.).

PANEL-DEFROST DOOR ACTUATOR

(1) Disconnect and isolate the battery negative cable.

(2) Remove the instrument panel assembly from the vehicle. Refer to Instrument Panel Assembly in the Removal and Installation section of Group 8E - Instrument Panel Systems for the procedures.

(3) Unplug the vacuum harness connector from the panel-defrost door actuator (Fig. 54).

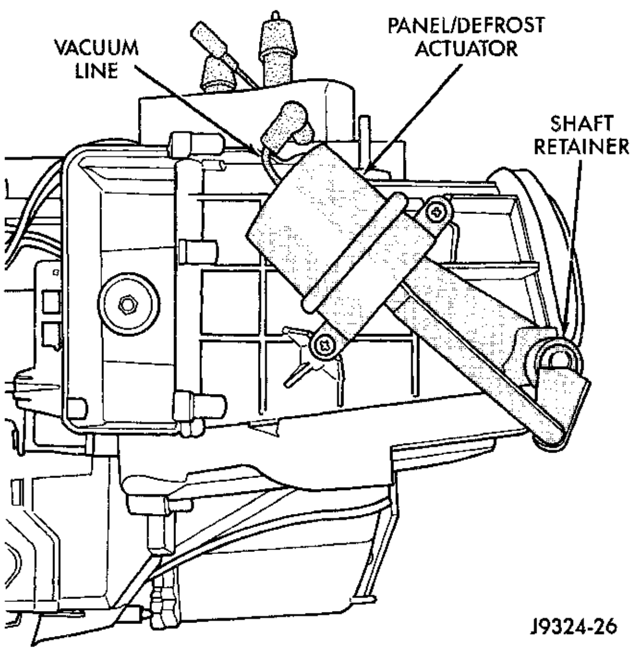

Fig. 54 Panel-Defrost Door Actuator

(4) Using a trim stick or another suitable wide flat-bladed tool, gently pry the panel-defrost door crank arm off of the panel-defrost door pivot.

(5) Remove the two screws that secure the panel-defrost door actuator to the heater-A/C housing.

(6) Remove the panel-defrost door actuator from the heater-A/C housing.

(7) Reverse the removal procedures to install. Tighten the panel-defrost door actuator mounting screws to 2.2 N·m (20 in. lbs.).

RECIRCULATION AIR DOOR ACTUATOR

(1) Disconnect and isolate the battery negative cable.

(2) Remove the glove box from the instrument panel. Refer to Glove Box in the Removal and Installation section of Group 8E - Instrument Panel Systems for the procedures.

(3) Reach through the glove box opening to access and unplug the vacuum harness connector from the recirculation air door actuator (Fig. 55).

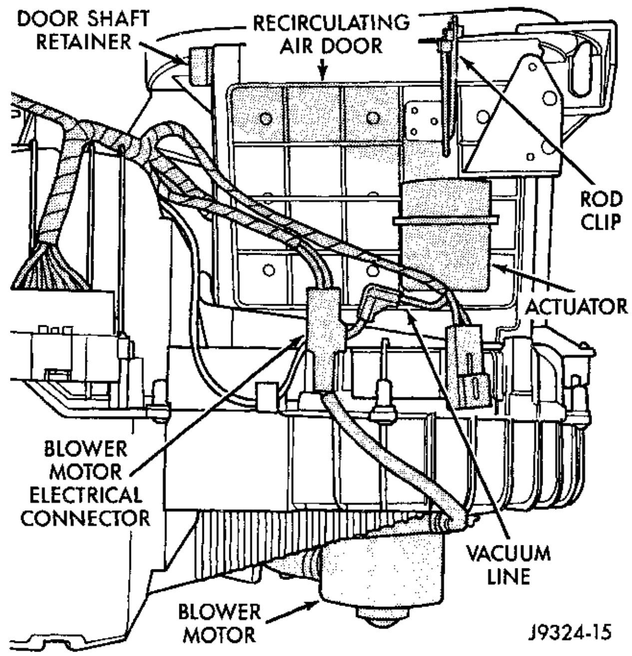

Fig. 55 Recirculation Air Door Actuator

(4) Loosen the two nuts on the studs that secure the recirculation air door actuator to the mounting bracket on the heater-A/C housing.

(5) Slide the two actuator mounting studs out of the slots in the actuator mounting bracket.

(6) Pull the recirculation actuator downward far enough to access the clip that retains the actuator link to the recirculation air door lever.

(7) Unsnap the clip from the recirculation actuator link and disengage the link from the recirculation air door lever.

(8) Remove the recirculation actuator from the heater-A/C housing.

(9) When reinstalling the recirculation actuator, insert a screwdriver or another suitable tool through the recirculation air intake grille to prop the recirculation air door up in the open position far enough to access the recirculation air door lever through the instrument panel glove box opening.

(10) Reverse the remaining removal procedures to install. Tighten the mounting nuts until the recirculation air door actuator is seated to the mounting bracket on the heater-A/C housing.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

HEATER-A/C HOUSING DOOR

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO GROUP 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

BLEND-AIR DOOR

(1) Remove the heater-A/C housing from the vehicle, and disassemble the housing halves. See Heater-A/C Housing in the Removal and Installation section of this group for the procedures.

(2) Lift the blend-air door pivot shaft out of the pivot hole in the bottom of the heater-A/C housing (Fig. 56).

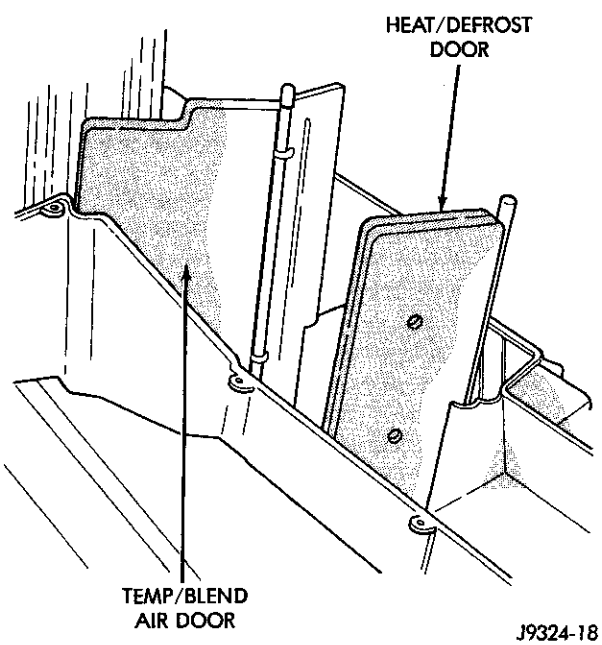

Fig. 56 Blend-Air Door

(3) Reverse the removal procedures to install.

HEAT-DEFROST DOOR

(1) Remove the heat-defrost door actuator from the heater-A/C housing. See Mode Door Vacuum Actuator in the Removal and Installation section of this group for the procedures.

(2) Disassemble the heater-A/C housing halves. See Heater-A/C Housing in the Removal and Installation section of this group for the procedures.

(3) Remove the heat-defrost door from the heater-A/C housing.

(4) Reverse the removal procedures to install.

PANEL-DEFROST DOOR

(1) Remove the panel-defrost door actuator from the heater-A/C housing. See Mode Door Vacuum Actuator in the Removal and Installation section of this group for the procedures.

(2) Remove the defroster and demister duct adapter from the heater-A/C housing. See Ducts and Outlets in the Removal and Installation section of this group for the procedures.

(3) Lift the panel-defrost door out of the top opening of the heater-A/C housing.

(4) Reverse the removal procedures to install.

RECIRCULATION AIR DOOR

(1) Remove the heater-A/C housing from the vehicle. See Heater-A/C Housing in the Removal and Installation section of this group for the procedures.

(2) Unsnap the recirculation air door vacuum actuator link clip and disengage the link from the recirculation air door lever. See Mode Door Vacuum Actuators in the Removal and Installation section of this group for the procedures.

(3) Using a trim stick or another suitable wide flat-bladed tool, gently pry the retainer off of the recirculation air door pivot shaft.

(4) Remove the recirculation air door through the outside air intake opening on the top of the heater-A/C housing.

(5) Reverse the removal procedures to install.

EVAPORATOR COIL

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO GROUP 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

REMOVAL

(1) Remove the heater-A/C housing from the vehicle, and disassemble the housing halves. See Heater-A/C Housing in the Removal and Installation section of this group for the procedures.

(2) Lift the evaporator coil out of the heater-A/C housing (Fig. 57).

INSTALLATION

(1) Insert the evaporator coil into the bottom of the heater-A/C housing.

Mopar AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

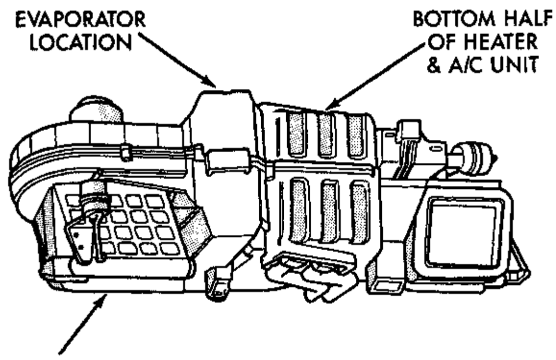

Fig. 57 Evaporator Coil Location in Heater-A/C Housing (Upside Down)

(2) Reassemble and reinstall the heater-A/C housing in the vehicle. See Heater-A/C Housing in the Removal and Installation section of this group for the procedures.

NOTE: If the evaporator is replaced, add 60 milliliters (2 fluid ounces) of refrigerant oil to the refrigerant system.

HEATER CORE

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO GROUP 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

REMOVAL

(1) Remove the heater-A/C housing from the vehicle. See Heater-A/C Housing in the Removal and Installation section of this group for the procedures.

(2) Remove the screws and retainers that secure the heater core to the heater-A/C housing.

(3) Lift the heater core straight up and out of the heater-A/C housing (Fig. 58).

INSTALLATION

(1) Lower the heater core into the heater-A/C housing.

(2) Position the retainers over the heater core tubes. Install and tighten the screws that secure the heater core and retainers to the heater-A/C housing. Tighten the screws to 2.2 N·m (20 in. lbs.).

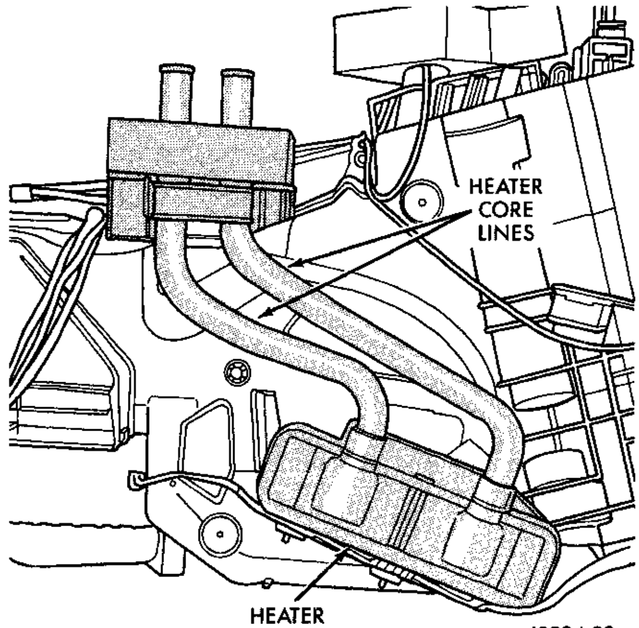

Fig. 58 Heater Core Remove/Install

(3) Reinstall the heater-A/C housing in the vehicle. See Heater-A/C Housing in the Removal and Installation section of this group for the procedures.

DUCTS AND OUTLETS

WARNING: ON VEHICLES EQUIPPED WITH AIRBAGS, REFER TO GROUP 8M - PASSIVE RESTRAINT SYSTEMS BEFORE ATTEMPTING ANY STEERING WHEEL, STEERING COLUMN, OR INSTRUMENT PANEL COMPONENT DIAGNOSIS OR SERVICE. FAILURE TO TAKE THE PROPER PRECAUTIONS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE PERSONAL INJURY.

PANEL AND CENTER DISTRIBUTION DUCTS

The panel and center distribution ducts (Fig. 59) are only serviced as part of the instrument panel assembly. Refer to Instrument Panel Assembly in the Removal and Installation section of Group 8E - Instrument Panel Systems for the service procedures.

REMOVAL AND INSTALLATION (Continued)

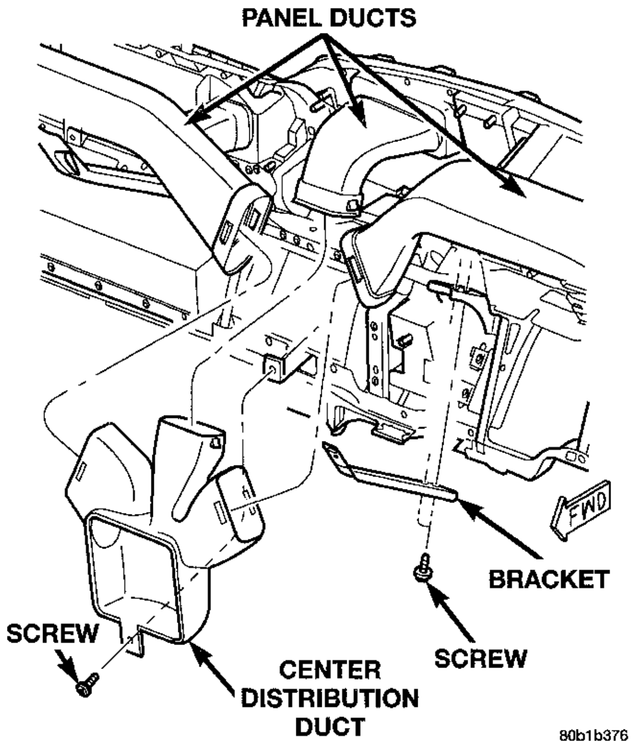

Fig. 59 Panel and Center Distribution Ducts

PANEL OUTLET BARRELS

WARNING: THE PANEL OUTLET BARRELS INSTALLED IN THE PASSENGER SIDE AIRBAG DOOR PANEL OUTLET HOUSINGS MUST NEVER BE REINSTALLED FOLLOWING REMOVAL FOR ANY REASON. THEY MUST BE REPLACED WITH NEW BARRELS. FAILURE TO OBSERVE THIS WARNING COULD RESULT IN OCCUPANT INJURIES UPON AIRBAG DEPLOYMENT.

(1) Using a trim stick or another suitable wide flat-bladed tool, gently pry near the center of either side of the panel outlet barrel to release the snap-fit pivots on the barrel from the pivot pins in the outlet housing of the passenger side airbag module or the instrument cluster bezel (Fig. 60).

(2) Remove the barrel from the panel outlet housing.

(3) To install a new panel outlet barrel, position the barrel in the outlet housing and press inwards firmly and evenly near the center of both sides of the panel outlet barrel until the pivots snap into place.

DEMISTER OUTLET GRILLES

(1) Using a trim stick or another suitable wide flat-bladed tool, gently pry at the perimeter edges of the demister grille to release the snap features from the instrument panel top cover.

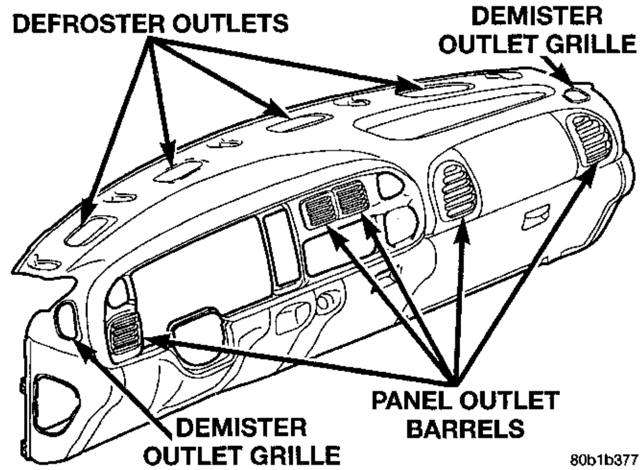

Fig. 60 Panel Outlet Barrels

(2) Remove the demister grille from the instrument panel.

(3) To install the demister grille, position the grille in the opening of the instrument panel top cover and press inwards firmly and evenly near the center of both sides of the grille until it snaps into place.

DEFROSTER AND DEMISTER DUCTS

The defroster duct and the main demister duct are a single molded plastic unit. The defroster outlet grilles are heat-staked to the defroster outlets and cannot be serviced separately. The demister tubes on each end of the main demister duct are only serviced in the instrument panel assembly.

(1) Remove the instrument panel top cover from the instrument panel. Refer to Instrument Panel Top Cover in the Removal and Installation section of Group 8E - Instrument Panel Systems for the procedures.

(2) Remove the screws that secure the defroster and demister ducts to the instrument panel brackets (Fig. 61).

(3) Disengage the demister tubes from each end of the main demister duct.

(4) Remove the defroster and demister duct unit from the instrument panel.

(5) Reverse the removal procedures to install. Tighten the mounting screws to 2.2 N·m (20 in. lbs.).

DEFROSTER AND DEMISTER DUCT ADAPTER

(1) Roll the instrument panel assembly down, but do not remove it from the vehicle. Refer to Instrument Panel Assembly in the Removal and Installation section of Group 8E - Instrument Panel Systems for the procedures.

(2) Using a trim stick or another suitable wide flat-bladed tool, gently pry at the perimeter edges of the defroster and demister duct adapter to release

REMOVAL AND INSTALLATION (Continued)

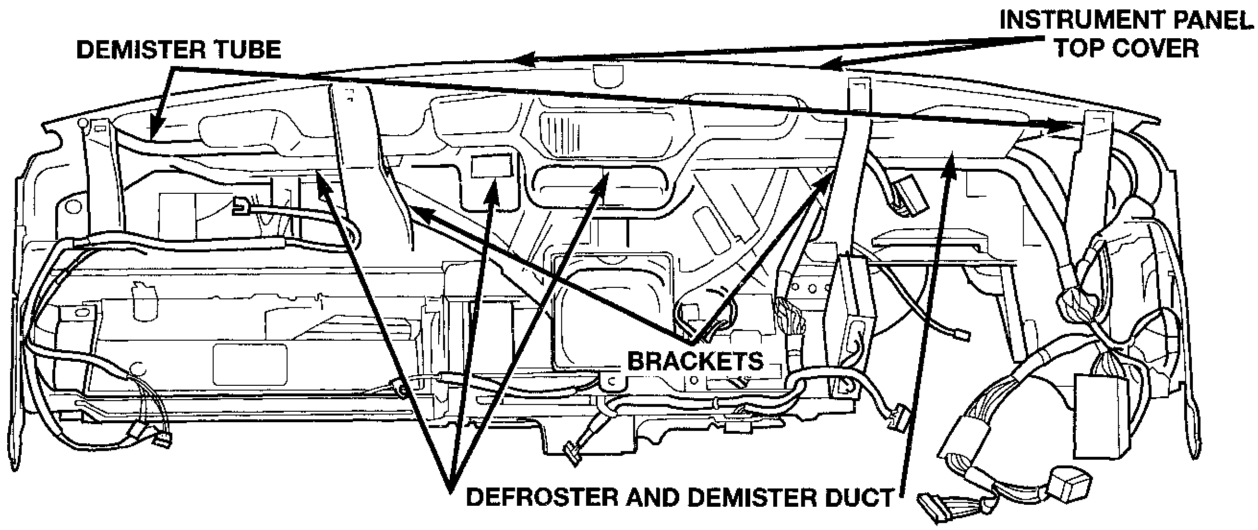

Fig. 61 Defroster and Demister Duct Remove/Install

the snap features from the top of the heater-A/C housing (Fig. 62).

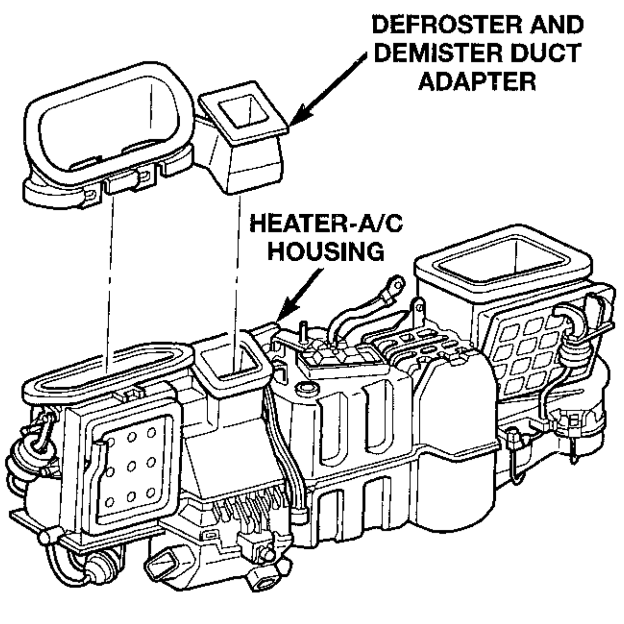

Fig. 62 Defroster and Demister Duct Adapter Remove/Install

(3) Remove the defroster and demister duct adapter from the top of the heater-A/C housing.

(4) Reverse the removal procedures to install.

HEATER-A/C HOUSING INLET BAFFLE

(1) Remove the heater-A/C housing from the vehicle. See Heater-A/C Housing in the Removal and Installation section of this group for the procedures.

(2) Slide the heater-A/C housing inlet baffle (Fig. 63) all the way to one side of the cowl plenum opening.

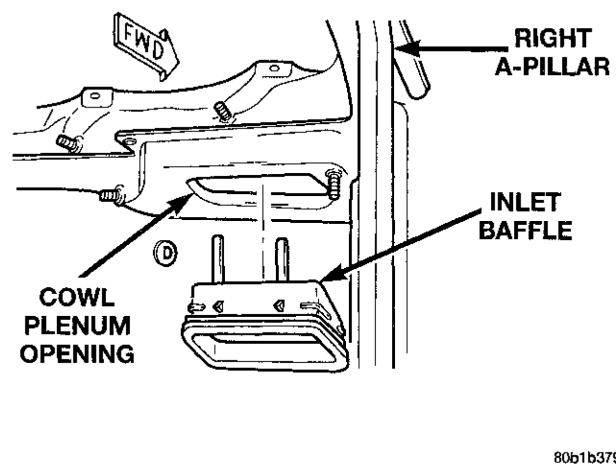

Fig. 63 Heater-A/C Housing Inlet Baffle Remove/Install

(3) Pull downwards sharply and firmly on the opposite side of the heater-A/C housing inlet baffle to disengage the snap features from the cowl plenum opening.

(4) Remove the heater-A/C housing inlet baffle from the cowl plenum panel.

(5) When reinstalling the heater-A/C housing inlet baffle to the cowl plenum panel opening, be certain that the snap features on each side of the adapter are fully engaged with the sides of the plenum panel opening. This must be a water tight connection to prevent leaks.

(6) Reverse the remaining removal procedures to complete the installation.

mopar AUTHENTIC RESTORATION PRODUCT

ADJUSTMENTS

TEMPERATURE CONTROL CABLE

Any time the heater-A/C control or the temperature control cable are removed and/or replaced, the following procedure must be performed.

(1) The temperature control cable housing and core must be installed at both the heater-A/C control and the heater-A/C housing ends, and the heater-A/C control must be installed in the instrument panel. See Heater-A/C Control and Temperature Control Cable in the Removal and Installation section of this group for the procedures.

(2) Rotate the temperature control knob on the heater-A/C control so that the knob pointer is in the 3 o'clock position.

(3) Pull the temperature control knob straight out from the heater-A/C control base until the perimeter of the knob (not the knob pointer) protrudes about 6 millimeters (0.25 inch) from the face of the control base.

(4) Rotate the temperature control knob to its full counterclockwise stop. The knob pointer should be aimed at a position about 8 millimeters (0.315 inch) beyond the end of the graduated blue strobe temperature control graphic on the face of the heater-A/C control base. If the knob is not pointed to the correct position, go back to Step 2 and repeat the adjustment procedure.

(5) Rotate the temperature control knob clockwise until the knob pointer is in its full clockwise position again.

(6) Push the temperature control knob straight in towards the heater-A/C control base until the perimeter of the knob (not the knob pointer) is flush with the face of the heater-A/C control base.

(7) Rotate the knob to its full counterclockwise stop again. The knob pointer should be aimed at the end of the graduated blue strobe temperature control graphic on the face of the heater-A/C control base. If OK, go to Step 8. If not OK, go back to Step 2.

(8) Rotate the knob to its full clockwise stop and release the knob. If the knob springs back from the clockwise stop, the self-adjuster clip that secures the temperature control cable to the blend-air door lever is improperly installed. See Temperature Control Cable in the Removal and Installation section of this group for the procedures. If the knob does not spring back, the temperature control cable adjustment is complete.

(9) Rotate the temperature control knob quickly to the full hot and full cold positions. There should be a distinct sound of the blend-air door closing against its stops within the heater-A/C housing at each end of the temperature control knob travel. If not OK, check the blend air door for proper installation, obstructions or faulty seals. See Heater-A/C Mode Door in the Removal and Installation section of this group for the procedures.

EMISSION CONTROL SYSTEMS

CONTENTS

GENERAL INFORMATION

INDEX

GENERAL INFORMATION

INTRODUCTION

Throughout this group, references are made to particular vehicle models by alphabetical designation or by the particular vehicle nameplate. A chart showing a breakdown of the alphabetical designations is included in the Introduction section at the beginning of this manual.

All vehicles are equipped with either a 3.9L (V-6) engine, a 5.2L (V-8) engine, two different 5.9L (V-8) engines, two different 8.0L (V-10) engines, or a 5.9L Cummins in-line 6–cylinder, two-valve-per-cylinder diesel engine.

• The 3.9L (V-6) and 5.2L (V-8) engines will be referred to in this group as: LDC (Light Duty Emission Cycle) engines.

• The 5.9L (V-8) gas powered engine will be referred to as either: LDC (Light Duty Emission Cycle) or HDC (Heavy Duty Emission Cycle) engine.

• The 8.0L (V-10) engine will be referred to as either: MDC (Medium Duty Emission Cycle) or HDC (Heavy Duty Emission Cycle) engine.

• The diesel engine will be referred to as: HDC (Heavy Duty Emission Cycle) engine. When equipped with the California Emission Package, the diesel engine will use an Exhaust Gas Recirculation (EGR) system.

Either of the HDC gas powered engines can be easily identified by the use of an engine mounted air injection pump. The 3.9L/5.2L/5.9L LDC gas engines, the 8.0L MDC V-10 engine or the diesel engine will not use an air injection pump.

Maintenance requirements for LDC, MDC and HDC emission systems differ because of different load and operating conditions. For required part replacement or maintenance schedules in time or mileage intervals, refer to either Group 0, Lubrication and Maintenance in this manual, or the vehicle Owners Manual.

SERVICE REMINDER INDICATOR (SRI) LAMP

The Service Reminder Indicator (SRI) lamp is used with the 5.9L HDC V-8 gasoline powered engine only. The lamp is displayed on the instrument panel as the MAINT REQ'D lamp.

The SRI system is incorporated into the powertrain control module (PCM). The PCM records the vehicles mileage and stores it into memory. At that time, the PCM checks for certain mileage trip points. When the current mileage matches one of the trip points, the SRI lamp is activated.

Certain parts are to be replaced, or certain maintenance must be performed at either an indicated mileage or when the SRI lamp remains on when the key is in the ON position. After performing the part replacement or required maintenance, the SRI lamp must be reset to turn the lamp off. Use the DRB scan tool to reset the SRI lamp.

For required part replacement or maintenance schedules in time or mileage intervals, refer to either Group 0, Lubrication and Maintenance in this manual, or the vehicle Owners Manual.

Failure to perform the part replacement or required maintenance and only reset the SRI lamp may be a violation of federal law. Only after performing the part replacement or required maintenance, should the SRI lamp be reset.

ON-BOARD DIAGNOSTICS

INDEX

GENERAL INFORMATION

SYSTEM DESCRIPTION

The Powertrain Control Module (PCM) monitors many different circuits in the fuel injection, ignition, emission and engine systems. If the PCM senses a problem with a monitored circuit often enough to indicate an actual problem, it stores a Diagnostic Trouble Code (DTC) in the PCM's memory. If the problem is repaired or ceases to exist, the PCM cancels the code after 40 warm-up cycles. Diagnostic trouble codes that affect vehicle emissions illuminate the Malfunction Indicator (check engine) Lamp. Refer to Malfunction Indicator Lamp in this section.

Certain criteria must be met before the PCM stores a DTC in memory. The criteria may be a specific range of engine RPM, engine temperature, and/or input voltage to the PCM.

The PCM might not store a DTC for a monitored circuit even though a malfunction has occurred. This may happen because one of the DTC criteria for the circuit has not been met. **For example**, assume the diagnostic trouble code criteria requires the PCM to monitor the circuit only when the engine operates between 750 and 2000 RPM. Suppose the sensor's output circuit shorts to ground when engine operates above 2400 RPM (resulting in 0 volt input to the PCM). Because the condition happens at an engine speed above the maximum threshold (2000 rpm), the PCM will not store a DTC.

There are several operating conditions for which the PCM monitors and sets DTC's. Refer to Monitored Systems, Components, and Non-Monitored Circuits in this section.

Technicians must retrieve stored DTC's by connecting the DRB scan tool (or an equivalent scan tool) to the 16-way data link connector (Fig. 1). Refer to Diagnostic Trouble Codes in this section.

NOTE: Various diagnostic procedures may actually cause a diagnostic monitor to set a DTC. For instance, pulling a spark plug wire to perform a spark test may set the misfire code. When a repair is completed and verified, connect the DRB scan tool to the 16–way data link connector to erase all DTC's and extinguish the MIL (Check Engine Lamp).

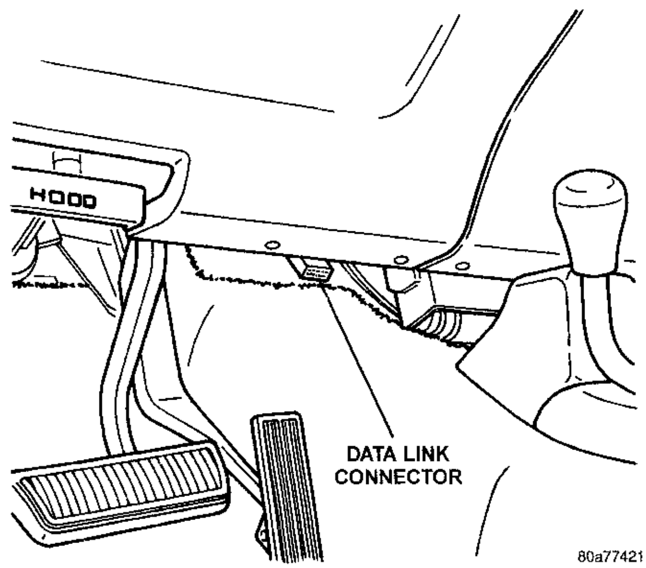

Fig. 1 16–Way Data Link (Diagnostic) Connector Location

DESCRIPTION AND OPERATION

MALFUNCTION INDICATOR LAMP (MIL)

As a functional test, the MIL (check engine) illuminates at key-on before engine cranking. Whenever the Powertrain Control Module (PCM) sets a Diagnostic Trouble Code (DTC) that affects vehicle emissions, it illuminates the MIL. If a problem is detected, the PCM sends a message to the instrument cluster to illuminate the lamp. The PCM illuminates the MIL only for DTC's that affect vehicle emissions. There are some monitors that may take two consecutive trips, with a detected fault, before the MIL is illuminated. The MIL stays on continu-

AUTHENTIC RESTORATION PRODUCT

DESCRIPTION AND OPERATION (Continued)

ously when the PCM has entered a Limp-In mode or identified a failed emission component. Refer to the Diagnostic Trouble Code charts in this group for emission related codes.

Also, the MIL either flashes or illuminates continuously when the PCM detects active engine misfire. Refer to Misfire Monitoring in this section.

Additionally, the PCM may reset (turn off) the MIL when one of the following occur:

- PCM does not detect the malfunction for 3 consecutive trips (except misfire and Fuel system Monitors).
- PCM does not detect a malfunction while performing three successive engine misfire or fuel system tests. The PCM performs these tests while the engine is operating within ± 375 RPM of and within 10 % of the load of the operating condition at which the malfunction was first detected.

STATE DISPLAY TEST MODE

The switch inputs to the Powertrain Control Module (PCM) have two recognized states; HIGH and LOW. For this reason, the PCM cannot recognize the difference between a selected switch position versus an open circuit, a short circuit, or a defective switch. If the State Display screen shows the change from HIGH to LOW or LOW to HIGH, assume the entire switch circuit to the PCM functions properly. Connect the DRB scan tool to the data link connector and access the state display screen. Then access either State Display Inputs and Outputs or State Display Sensors.

CIRCUIT ACTUATION TEST MODE

The Circuit Actuation Test Mode checks for proper operation of output circuits or devices the Powertrain Control Module (PCM) may not internally recognize. The PCM attempts to activate these outputs and allow an observer to verify proper operation. Most of the tests provide an audible or visual indication of device operation (click of relay contacts, fuel spray, etc.). Except for intermittent conditions, if a device functions properly during testing, assume the device, its associated wiring, and driver circuit work correctly. Connect the DRB scan tool to the data link connector and access the Actuators screen.

DIAGNOSTIC TROUBLE CODES

A Diagnostic Trouble Code (DTC) indicates the PCM has recognized an abnormal condition in the system.

Diagnostic trouble codes are the results of a system or circuit failure, but do not directly identify the failed component or components.

Technicians must retrieve stored DTC's by connecting the DRB scan tool (or an equivalent scan tool) to the 16–way data link connector (Fig. 1).

NOTE: For a list of DTC's, refer to the charts in this section.

OBTAINING DIAGNOSTIC TROUBLE CODES

WARNING: APPLY PARKING BRAKE AND/OR BLOCK WHEELS BEFORE PERFORMING ANY TEST ON AN OPERATING ENGINE.

(1) Connect the DRB scan tool to data link (diagnostic) connector.

(2) Turn the ignition switch on, access Read Fault Screen. Record all the DTC's shown on the DRB scan tool.

(3) To erase DTC's, use the Erase Trouble Code data screen on the DRB scan tool.

DIAGNOSTIC TROUBLE CODE DESCRIPTIONS

* Check Engine Lamp (MIL) will illuminate during engine operation if this Diagnostic Trouble Code was recorded.

Hex Code	Generic Scan Tool Code	DRB Scan Tool Display	Description of Diagnostic Trouble Code
00			DTC Error
*01	P0340	No Cam Signal at PCM	No camshaft signal detected during engine cranking.
*02	P0601	Internal Controller Failure	PCM Internal fault condition detected.
05	P0162	Charging System Voltage Too Low	Battery voltage sense input below target charging during engine operation. Also, no significant change detected in battery voltage during active test of generator output circuit.
06	P1594	Charging System Voltage Too High	Battery voltage sense input above target charging voltage during engine operation.

DESCRIPTION AND OPERATION (Continued)

Hex Code	Generic Scan Tool Code	DRB Scan Tool Display	Description of Diagnostic Trouble Code
0A	P1388	Auto Shutdown Relay Control Circuit	An open or shorted condition detected in the auto shutdown relay circuit.
0B	P0622	Generator Field Not Switching Properly	An open or shorted condition detected in the generator field control circuit.
*0C	P0743	Torque Converter Clutch Solenoid/Trans Relay Circuits	An open or shorted condition detected in the torque converter part throttle unlock solenoid control circuit (3 speed auto RH trans. only).
0F	P1595	Speed Control Solenoid Circuits	An open or shorted condition detected in the Speed Control vacuum or vent solenoid circuits.
10	P0645	A/C Clutch Relay Circuit	An open or shorted condition detected in the A/C clutch relay circuit.
*11	P0403	EGR Solenoid Circuit	An open or shorted condition detected in the EGR solenoid control circuit.
*12	P0443	EVAP Purge Solenoid Circuit	An open or shorted condition detected in the duty cycle purge solenoid circuit.
*13	P0203	Injector #3 Control Circuit	Injector #3 output driver does not respond properly to the control signal.
	or		
*14	P0202	Injector #2 Control Circuit	Injector #2 output driver does not respond properly to the control signal.
	or		
*15	P0201	Injector #1 Control Circuit	Injector #1 output driver does not respond properly to the control signal.
*19	P0505	Idle Air Control Motor Circuits	A shorted or open condition detected in one or more of the idle air control motor circuits.
*1A	P0122	Throttle Position Sensor Voltage Low	Throttle position sensor input below the minimum acceptable voltage
	or		
*1B	P0123	Throttle Position Sensor Voltage High	Throttle position sensor input above the maximum acceptable voltage.
*1E	P0117	ECT Sensor Voltage Too Low	Engine coolant temperature sensor input below minimum acceptable voltage.
	or		
*1F	P0118	ECT Sensor Voltage Too High	Engine coolant temperature sensor input above maximum acceptable voltage.
21	P1281	Engine Is Cold Too Long	Engine did not reach operating temperature within acceptable limits.
*24	P0107	MAP Sensor Voltage Too Low	MAP sensor input below minimum acceptable voltage.
	or		
*25	P0108	MAP Sensor Voltage Too High	MAP sensor input above maximum acceptable voltage.
*27	P1297	No Change in MAP From Start to Run	No difference recognized between the engine MAP reading and the barometric (atmospheric) pressure reading from start-up.

MONITORED SYSTEMS

There are new electronic circuit monitors that check fuel, emission, engine and ignition performance. These monitors use information from various sensor circuits to indicate the overall operation of the fuel, engine, ignition and emission systems and thus the emissions performance of the vehicle.

The fuel, engine, ignition and emission systems monitors do not indicate a specific component problem. They do indicate that there is an implied problem within one of the systems and that a specific problem must be diagnosed.

If any of these monitors detect a problem affecting vehicle emissions, the Malfunction Indicator (Check Engine) Lamp will be illuminated. These monitors generate Diagnostic Trouble Codes that can be displayed with the check engine lamp or a scan tool.

The following is a list of the system monitors:

- Misfire Monitor
- Fuel System Monitor
- Oxygen Sensor Monitor
- Oxygen Sensor Heater Monitor
- Catalyst Monitor
- Leak Detection Pump Monitor (if equipped)

All these system monitors require two consecutive trips with the malfunction present to set a fault.

Refer to the appropriate Powertrain Diagnostics Procedures manual for diagnostic procedures.

The following is an operation and description of each system monitor:

OXYGEN SENSOR (O2S) MONITOR

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most importantelement of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperature 300° to 350°C (572° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. The information obtained by the sensor is used to calculate the fuel injector pulse width. This maintains a 14.7 to 1 Air Fuel (A/F) ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrogen oxide (NOx) from the exhaust.

The O2S is also the main sensing element for the Catalyst and Fuel Monitors.

The O2S can fail in any or all of the following manners:

- slow response rate
- reduced output voltage
- dynamic shift
- shorted or open circuits

Response rate is the time required for the sensor to switch from lean to rich once it is exposed to a richer than optimum A/F mixture or vice versa. As the sensor starts malfunctioning, it could take longer to detect the changes in the oxygen content of the exhaust gas.

The output voltage of the O2S ranges from 0 to 1 volt. A good sensor can easily generate any output voltage in this range as it is exposed to different concentrations of oxygen. To detect a shift in the A/F mixture (lean or rich), the output voltage has to change beyond a threshold value. A malfunctioning sensor could have difficulty changing beyond the threshold value.

OXYGEN SENSOR HEATER MONITOR

If there is an oxygen sensor (O2S) shorted to voltage DTC, as well as a O2S heater DTC, the O2S fault MUST be repaired first. Before checking the O2S fault, verify that the heater circuit is operating correctly.

DESCRIPTION AND OPERATION (Continued)

Effective control of exhaust emissions is achieved by an oxygen feedback system. The most important element of the feedback system is the O2S. The O2S is located in the exhaust path. Once it reaches operating temperature 300° to 350°C (572 ° to 662°F), the sensor generates a voltage that is inversely proportional to the amount of oxygen in the exhaust. The information obtained by the sensor is used to calculate the fuel injector pulse width. This maintains a 14.7 to 1 Air Fuel (A/F) ratio. At this mixture ratio, the catalyst works best to remove hydrocarbons (HC), carbon monoxide (CO) and nitrogen oxide (NOx) from the exhaust.

The voltage readings taken from the O2S sensor are very temperature sensitive. The readings are not accurate below 300°C. Heating of the O2S sensor is done to allow the engine controller to shift to closed loop control as soon as possible. The heating element used to heat the O2S sensor must be tested to ensure that it is heating the sensor properly.

The O2S sensor circuit is monitored for a drop in voltage. The sensor output is used to test the heater by isolating the effect of the heater element on the O2S sensor output voltage from the other effects.

LEAK DETECTION PUMP MONITOR (IF EQUIPPED)

The leak detection assembly incorporates two primary functions: it must detect a leak in the evaporative system and seal the evaporative system so the leak detection test can be run.

The primary components within the assembly are: A three port solenoid that activates both of the functions listed above; a pump which contains a switch, two check valves and a spring/diaphragm, a canister vent valve (CVV) seal which contains a spring loaded vent seal valve.

Immediately after a cold start, between predetermined temperature thresholds limits, the three port solenoid is briefly energized. This initializes the pump by drawing air into the pump cavity and also closes the vent seal. During non test conditions the vent seal is held open by the pump diaphragm assembly which pushes it open at the full travel position. The vent seal will remain closed while the pump is cycling due to the reed switch triggering of the three port solenoid that prevents the diaphragm assembly from reaching full travel. After the brief initialization period, the solenoid is de-energized allowing atmospheric pressure to enter the pump cavity, thus permitting the spring to drive the diaphragm which forces air out of the pump cavity and into the vent system. When the solenoid is energized and de energized, the cycle is repeated creating flow in typical diaphragm pump fashion. The pump is controlled in 2 modes:

Pump Mode: The pump is cycled at a fixed rate to achieve a rapid pressure build in order to shorten the overall test length.

Test Mode: The solenoid is energized with a fixed duration pulse. Subsequent fixed pulses occur when the diaphragm reaches the Switch closure point.

The spring in the pump is set so that the system will achieve an equalized pressure of about 7.5" H20. The cycle rate of pump strokes is quite rapid as the system begins to pump up to this pressure. As the pressure increases, the cycle rate starts to drop off. If there is no leak in the system, the pump would eventually stop pumping at the equalized pressure. If there is a leak, it will continue to pump at a rate representative of the flow characteristic of the size of the leak. From this information we can determine if the leak is larger than the required detection limit (currently set at .040" orifice by CARB). If a leak is revealed during the leak test portion of the test, the test is terminated at the end of the test mode and no further system checks will be performed.

After passing the leak detection phase of the test, system pressure is maintained by turning on the LDP's solenoid until the purge system is activated. Purge activation in effect creates a leak. The cycle rate is again interrogated and when it increases due to the flow through the purge system, the leak check portion of the diagnostic is complete.

The canister vent valve will unseal the system after completion of the test sequence as the pump diaphragm assembly moves to the full travel position.

Evaporative system functionality will be verified by using the stricter evap purge flow monitor. At an appropriate warm idle the LDP will be energized to seal the canister vent. The purge flow will be clocked up from some small value in an attempt to see a shift in the 02 control system. If fuel vapor, indicated by a shift in the 02 control, is present the test is passed. If not, it is assumed that the purge system is not functioning in some respect. The LDP is again turned off and the test is ended.

MISFIRE MONITOR

Excessive engine misfire results in increased catalyst temperature and causes an increase in HC emissions. Severe misfires could cause catalyst damage. To prevent catalytic convertor damage, the PCM monitors engine misfire.

The Powertrain Control Module (PCM) monitors for misfire during most engine operating conditions (positive torque) by looking at changes in the crankshaft speed. If a misfire occurs the speed of the crankshaft will vary more than normal.

FUEL SYSTEM MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters

AUTHENTIC RESTORATION PRODUCT

DESCRIPTION AND OPERATION (Continued)

reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide. The catalyst works best when the Air Fuel (A/F) ratio is at or near the optimum of 14.7 to 1.

The PCM is programmed to maintain the optimum air/fuel ratio of 14.7 to 1. This is done by making short term corrections in the fuel injector pulse width based on the O2S sensor output. The programmed memory acts as a self calibration tool that the engine controller uses to compensate for variations in engine specifications, sensor tolerances and engine fatigue over the life span of the engine. By monitoring the actual fuel-air ratio with the O2S sensor (short term) and multiplying that with the program long-term (adaptive) memory and comparing that to the limit, it can be determined whether it will pass an emissions test. If a malfunction occurs such that the PCM cannot maintain the optimum A/F ratio, then the MIL will be illuminated.

CATALYST MONITOR

To comply with clean air regulations, vehicles are equipped with catalytic converters. These converters reduce the emission of hydrocarbons, oxides of nitrogen and carbon monoxide.

Normal vehicle miles or engine misfire can cause a catalyst to decay. A meltdown of the ceramic core can cause a reduction of the exhaust passage. This can increase vehicle emissions and deteriorate engine performance, driveability and fuel economy.

The catalyst monitor uses dual oxygen sensors (O2S's) to monitor the efficiency of the converter. The dual O2S's sensor strategy is based on the fact that as a catalyst deteriorates, its oxygen storage capacity and its efficiency are both reduced. By monitoring the oxygen storage capacity of a catalyst, its efficiency can be indirectly calculated. The upstream O2S is used to detect the amount of oxygen in the exhaust gas before the gas enters the catalytic converter. The PCM calculates the A/F mixture from the output of the O2S. A low voltage indicates high oxygen content (lean mixture). A high voltage indicates a low content of oxygen (rich mixture).

When the upstream O2S detects a lean condition, there is an abundance of oxygen in the exhaust gas. A functioning converter would store this oxygen so it can use it for the oxidation of HC and CO. As the converter absorbs the oxygen, there will be a lack of oxygen downstream of the converter. The output of the downstream O2S will indicate limited activity in this condition.

As the converter loses the ability to store oxygen, the condition can be detected from the behavior of the downstream O2S. When the efficiency drops, no chemical reaction takes place. This means the concentration of oxygen will be the same downstream as upstream. The output voltage of the downstream O2S copies the voltage of the upstream sensor. The only difference is a time lag (seen by the PCM) between the switching of the O2S's.

To monitor the system, the number of lean-to-rich switches of upstream and downstream O2S's is counted. The ratio of downstream switches to upstream switches is used to determine whether the catalyst is operating properly. An effective catalyst will have fewer downstream switches than it has upstream switches i.e., a ratio closer to zero. For a totally ineffective catalyst, this ratio will be one-to-one, indicating that no oxidation occurs in the device.

The system must be monitored so that when catalyst efficiency deteriorates and exhaust emissions increase to over the legal limit, the MIL (check engine lamp) will be illuminated.

TRIP DEFINITION

The term "Trip" has different meanings depending on what the circumstances are. If the MIL (Malfunction Indicator Lamp) is OFF, a Trip is defined as when the Oxygen Sensor Monitor and the Catalyst Monitor have been completed in the same drive cycle.

When any Emission DTC is set, the MIL on the dash is turned ON. When the MIL is ON, it takes 3 good trips to turn the MIL OFF. In this case, it depends on what type of DTC is set to know what a "Trip" is.

For the Fuel Monitor or Mis-Fire Monitor (continuous monitor), the vehicle must be operated in the "Similar Condition Window" for a specified amount of time to be considered a Good Trip.

If a Non-Contiuous OBDII Monitor, such as:

- Oxygen Sensor
- Catalyst Monitor
- Purge Flow Monitor
- Leak Detection Pump Monitor (if equipped)
- EGR Monitor (if equipped)
- Oxygen Sensor Heater Monitor

fails twice in a row and turns ON the MIL, re-running that monitor which previously failed, on the next start-up and passing the monitor is considered to be a Good Trip.

If any other Emission DTC is set (not an OBDII Monitor), a Good Trip is considered to be when the Oxygen Sensor Monitor and Catalyst Monitor have been completed; or 2 Minutes of engine run time if the Oxygen Sensor Monitor or Catalyst Monitor have been stopped from running.

It can take up to 2 Failures in a row to turn on the MIL. After the MIL is ON, it takes 3 Good Trips to turn the MIL OFF. After the MIL is OFF, the PCM will self-erase the DTC after 40 Warm-up cycles. A Warm-up cycle is counted when the ECT (Engine Coolant Temperature Sensor) has crossed 160°F and has risen by at least 40°F since the engine has been started.

DESCRIPTION AND OPERATION (Continued)

COMPONENT MONITORS

There are several components that will affect vehicle emissions if they malfunction. If one of these components malfunctions the Malfunction Indicator Lamp (Check Engine) will illuminate.

Some of the component monitors are checking for proper operation of the part. Electrically operated components now have input (rationality) and output (functionality) checks. Previously, a component like the Throttle Position sensor (TPS) was checked by the PCM for an open or shorted circuit. If one of these conditions occurred, a DTC was set. Now there is a check to ensure that the component is working. This is done by watching for a TPS indication of a greater or lesser throttle opening than MAP and engine rpm indicate. In the case of the TPS, if engine vacuum is high and engine rpm is 1600 or greater and the TPS indicates a large throttle opening, a DTC will be set. The same applies to low vacuum if the TPS indicates a small throttle opening.

All open/short circuit checks or any component that has an associated limp in will set a fault after 1 trip with the malfunction present. Components without an associated limp in will take two trips to illuminate the MIL.

Refer to the Diagnostic Trouble Codes Description Charts in this section and the appropriate Powertrain Diagnostic Procedure Manual for diagnostic procedures.

NON-MONITORED CIRCUITS

The PCM does not monitor the following circuits, systems and conditions that could have malfunctions causing driveability problems. The PCM might not store diagnostic trouble codes for these conditions. However, problems with these systems may cause the PCM to store diagnostic trouble codes for other systems or components. For example, a fuel pressure problem will not register a fault directly, but could cause a rich/lean condition or misfire. This could cause the PCM to store an oxygen sensor or misfire diagnostic trouble code.

FUEL PRESSURE

The fuel pressure regulator controls fuel system pressure. The PCM cannot detect a clogged fuel pump inlet filter, clogged in-line fuel filter, or a pinched fuel supply or return line. However, these could result in a rich or lean condition causing the PCM to store an oxygen sensor or fuel system diagnostic trouble code.

SECONDARY IGNITION CIRCUIT

The PCM cannot detect an inoperative ignition coil, fouled or worn spark plugs, ignition cross firing, or open spark plug cables.

CYLINDER COMPRESSION

The PCM cannot detect uneven, low, or high engine cylinder compression.

EXHAUST SYSTEM

The PCM cannot detect a plugged, restricted or leaking exhaust system, although it may set a fuel system fault.

FUEL INJECTOR MECHANICAL MALFUNCTIONS

The PCM cannot determine if a fuel injector is clogged, the needle is sticking or if the wrong injector is installed. However, these could result in a rich or lean condition causing the PCM to store a diagnostic trouble code for either misfire, an oxygen sensor, or the fuel system.

EXCESSIVE OIL CONSUMPTION

Although the PCM monitors engine exhaust oxygen content when the system is in closed loop, it cannot determine excessive oil consumption.

THROTTLE BODY AIR FLOW

The PCM cannot detect a clogged or restricted air cleaner inlet or filter element.

VACUUM ASSIST

The PCM cannot detect leaks or restrictions in the vacuum circuits of vacuum assisted engine control system devices. However, these could cause the PCM to store a MAP sensor diagnostic trouble code and cause a high idle condition.

PCM SYSTEM GROUND

The PCM cannot determine a poor system ground. However, one or more diagnostic trouble codes may be generated as a result of this condition. The module should be mounted to the body at all times, also during diagnostic.

PCM CONNECTOR ENGAGEMENT

The PCM may not be able to determine spread or damaged connector pins. However, it might store diagnostic trouble codes as a result of spread connector pins.

HIGH AND LOW LIMITS

The PCM compares input signal voltages from each input device with established high and low limits for the device. If the input voltage is not within limits and other criteria are met, the PCM stores a diagnostic trouble code in memory. Other diagnostic trouble code criteria might include engine RPM limits or input voltages from other sensors or switches that must be present before verifying a diagnostic trouble code condition.

All Engines	2% to 8% of Maximum Load	9% to 17% of Maximum Load

EVAPORATIVE EMISSION CONTROLS

INDEX

DESCRIPTION AND OPERATION

EVAPORATION (EVAP) CONTROL SYSTEM

The evaporation control system prevents the emission of fuel tank vapors into the atmosphere. When fuel evaporates in the fuel tank, the vapors pass through vent hoses or tubes into the two charcoal filled evaporative canisters. The canisters temporarily hold the vapors. The Powertrain Control Module (PCM) allows intake manifold vacuum to draw vapors into the combustion chambers during certain operating conditions.

All 3.9L/5.2L/5.9L/8.0L gasoline powered engines use a duty cycle purge system. The PCM controls vapor flow by operating the duty cycle EVAP purge solenoid. Refer to Duty Cycle EVAP Canister Purge Solenoid for additional information.

When equipped with certain emissions packages, a Leak Detection Pump (LDP) will be used as part of the evaporative system. This pump is used as part of OBD II requirements. Refer to Leak Detection Pump in this group for additional information.

NOTE: The hoses used in this system are specially manufactured. If replacement becomes necessary, it is important to use only fuel resistant hose.

ROLLOVER VALVE(S)

Diesel Powered Engine: One rollover valve is used. The valve is used only to vent the fuel tank to the atmosphere. A check valve is located within the rollover valve to prevent fuel flow from the fuel tank in the event of an accidental vehicle rollover. The rollover valve is located on the top of the fuel tank module (Fig. 1). The valve may be serviced separately. If replacement is necessary, refer to the Removal/Installation section of this group.

Gasoline Powered Engines: Two rollover valves are used. Fuel vapors from the fuel tank are drawn through these valves into both of the EVAP canisters by engine vacuum. A check valve is located within each of the rollover valves to prevent fuel flow from the fuel tank in the event of an accidental vehicle rollover.

If equipped with a 26 or 34 gallon fuel tank, two rollover valves are used. One of the valves is permanently mounted to the top of fuel tank (Fig. 2). If replacement of this particular valve is necessary, the fuel tank must be replaced. The other rollover valve is located on the top of the fuel pump module (Fig. 2). This valve may be serviced separately. If replacement is necessary, refer to the Removal/Installation section of this group.

If equipped with a 35 gallon fuel tank, two rollover valves are used. Both valves are permanently mounted to the top of fuel tank (Fig. 3). If replacement is necessary, the fuel tank must be replaced.

Mopar AUTHENTIC RESTORATION PRODUCT

DESCRIPTION AND OPERATION (Continued)

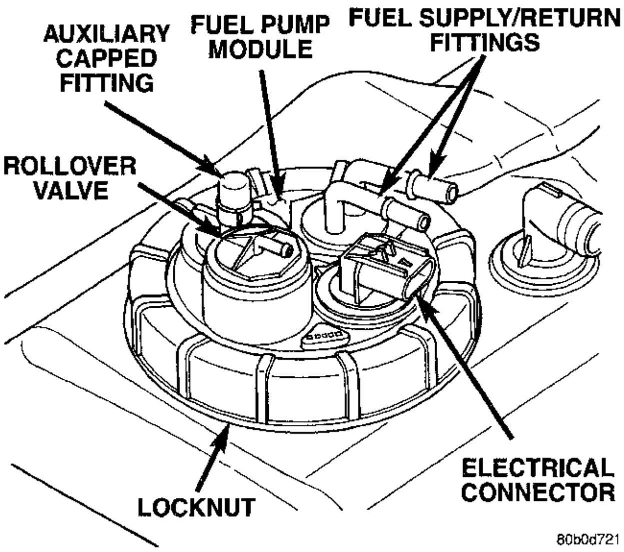

Fig. 1 Rollover Valve Location—Diesel Powered

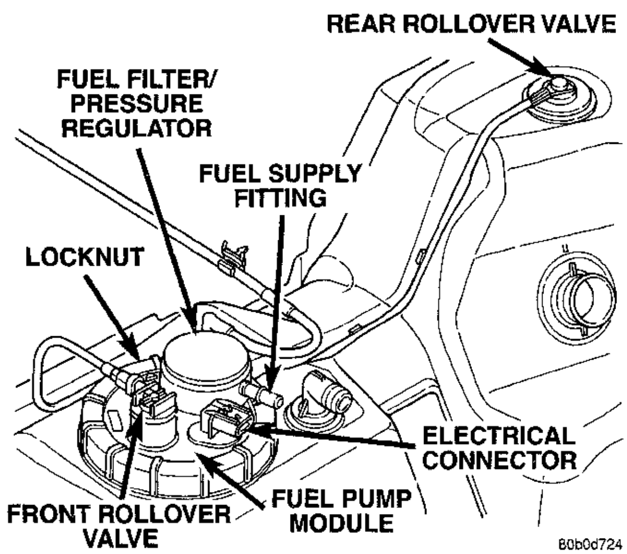

Fig. 2 Rollover Valve Locations—Gas Powered with 26 or 34 Gallon Tank

EVAPORATIVE (EVAP) CANISTER

Two, maintenance free, EVAP canisters are used with all 3.9L/5.2L/5.9L/8.0L gasoline powered engines. Both canisters are mounted to a bracket located below rear of vehicle cab on outside of right frame rail (Fig. 4). The EVAP canisters are filled with granules of an activated carbon mixture. Fuel vapors entering the EVAP canisters are absorbed by the charcoal granules.

Fuel tank pressure vents into the EVAP canisters. Fuel vapors are temporarily held in the canisters until they can be drawn into the intake manifold. The duty cycle EVAP canister purge solenoid allows the EVAP canisters to be purged at predetermined times and at certain engine operating conditions.

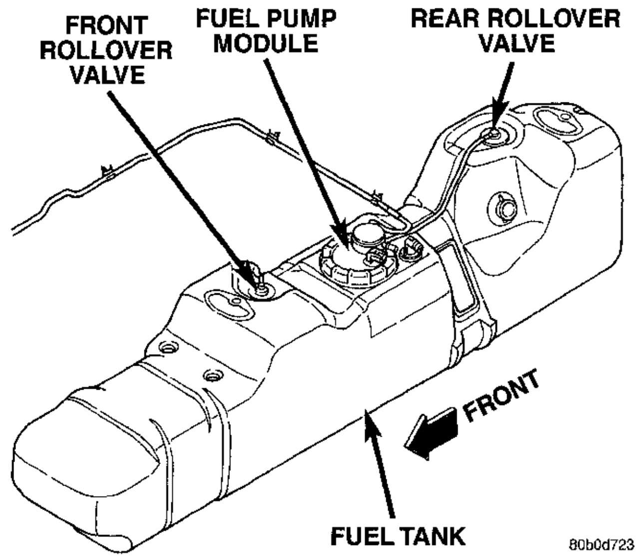

Fig. 3 Rollover Valve Locations—Gas Powered with 35 Gallon Tank

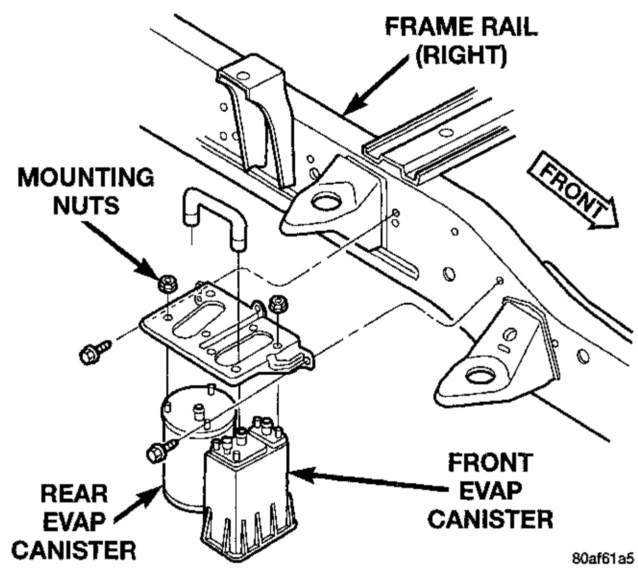

Fig. 4 Location of EVAP Canisters

DUTY CYCLE EVAP CANISTER PURGE SOLENOID

All 3.9L/5.2L/5.9L/8.0L gasoline powered engines use a duty cycle EVAP canister purge solenoid. The solenoid regulates the rate of vapor flow from the EVAP canister to the throttle body. The PCM operates the solenoid.

During the cold start warm-up period and the hot start time delay, the PCM does not energize the solenoid. When de-energized, no vapors are purged. The PCM de-energizes the solenoid during open loop operation.

The engine enters closed loop operation after it reaches a specified temperature and the time delay ends. During closed loop operation, the PCM energizes and de-energizes the solenoid 5 or 10 times per

DESCRIPTION AND OPERATION (Continued)

second, depending upon operating conditions. The PCM varies the vapor flow rate by changing solenoid pulse width. Pulse width is the amount of time the solenoid energizes. The PCM adjusts solenoid pulse width based on engine operating condition.

The solenoid attaches to a bracket mounted to the right inner fender (Fig. 5).

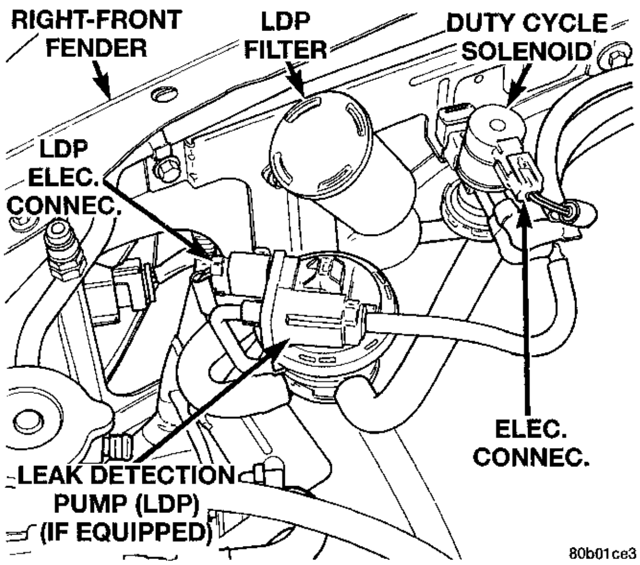

Fig. 5 EVAP Canister Purge Solenoid and LDP Location

LEAK DETECTION PUMP (LDP)

The Leak Detection Pump (LDP) is used only with certain emission packages. The LDP and LDP filter are located in the engine compartment on the right-inner fender (Fig. 5). The EVAP system test port is located in front of the Powertrain Control Module (PCM) (Fig. 6).

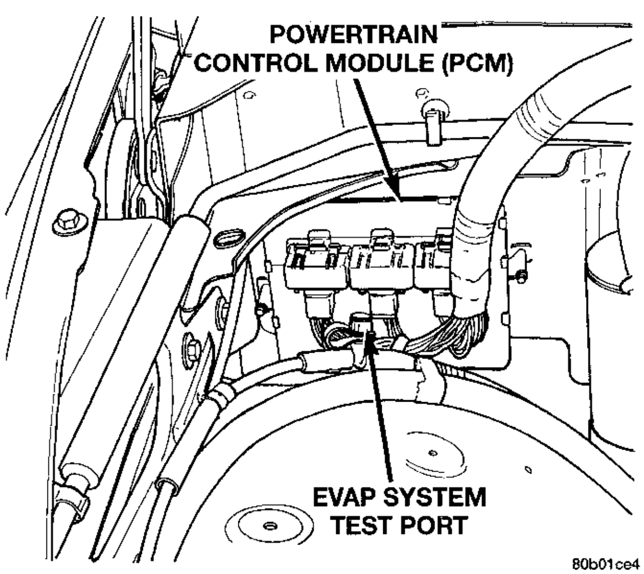

Fig. 6 EVAP System Test Port Location

The LDP is a device used to detect a leak in the evaporative system.

The pump contains a 3 port solenoid, a pump that contains a switch, a spring loaded canister vent valve seal, 2 check valves and a spring/diaphragm.

Immediately after a cold start, engine temperature between 40°F and 86°F, the 3 port solenoid is briefly energized. This initializes the pump by drawing air into the pump cavity and also closes the vent seal. During non-test test conditions, the vent seal is held open by the pump diaphragm assembly which pushes it open at the full travel position. The vent seal will remain closed while the pump is cycling. This is due to the operation of the 3 port solenoid which prevents the diaphragm assembly from reaching full travel. After the brief initialization period, the solenoid is de-energized, allowing atmospheric pressure to enter the pump cavity. This permits the spring to drive the diaphragm which forces air out of the pump cavity and into the vent system. When the solenoid is energized and de-energized, the cycle is repeated creating flow in typical diaphragm pump fashion. The pump is controlled in 2 modes:

PUMP MODE: The pump is cycled at a fixed rate to achieve a rapid pressure build in order to shorten the overall test time.

TEST MODE: The solenoid is energized with a fixed duration pulse. Subsequent fixed pulses occur when the diaphragm reaches the switch closure point.

The spring in the pump is set so that the system will achieve an equalized pressure of about 7.5 inches of water.

When the pump starts, the cycle rate is quite high. As the system becomes pressurized pump rate drops. If there is no leak the pump will quit. If there is a leak, the test is terminated at the end of the test mode.

If there is no leak, the purge monitor is run. If the cycle rate increases due to the flow through the purge system, the test is passed and the diagnostic is complete.

The canister vent valve will unseal the system after completion of the test sequence as the pump diaphragm assembly moves to the full travel position.

POSITIVE CRANKCASE VENTILATION (PCV) SYSTEM

All 3.9L V-6 and 5.2L/5.9L V-8 gas powered engines are equipped with a closed crankcase ventilation system and a positive crankcase ventilation (PCV) valve. The 8.0L V-10 engine is not equipped with a PCV valve. Refer to Crankcase Ventilation System—8.0L V-10 Engine for information.

This system consists of a PCV valve mounted on the cylinder head (valve) cover with a hose extending from the valve to the intake manifold. Another hose connects the opposite cylinder head (valve) cover to the air cleaner housing to provide a source of clean air for the system. A separate crankcase breather/filter is not used.

AUTHENTIC RESTORATION PRODUCT

DESCRIPTION AND OPERATION (Continued)

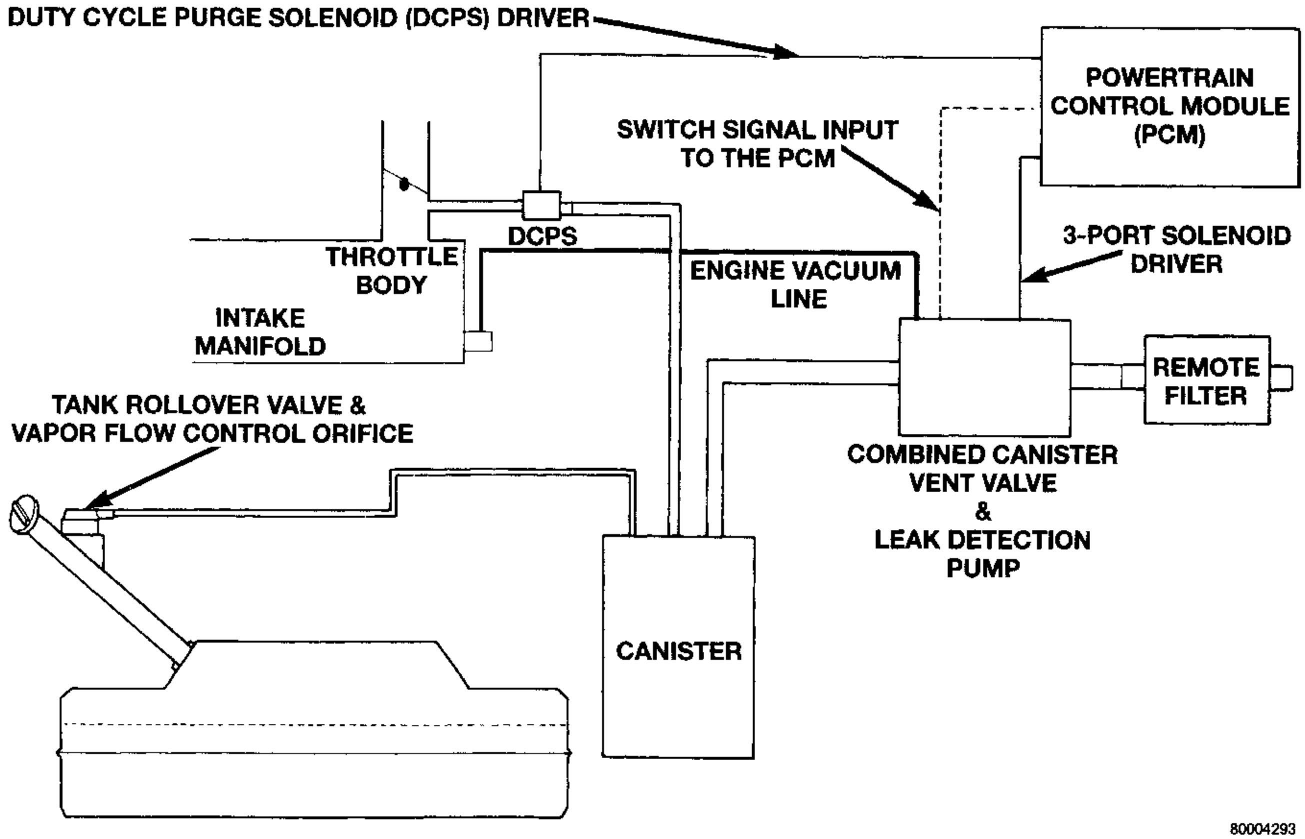

Fig. 7 Evaporative System Monitor Schematic—Typical

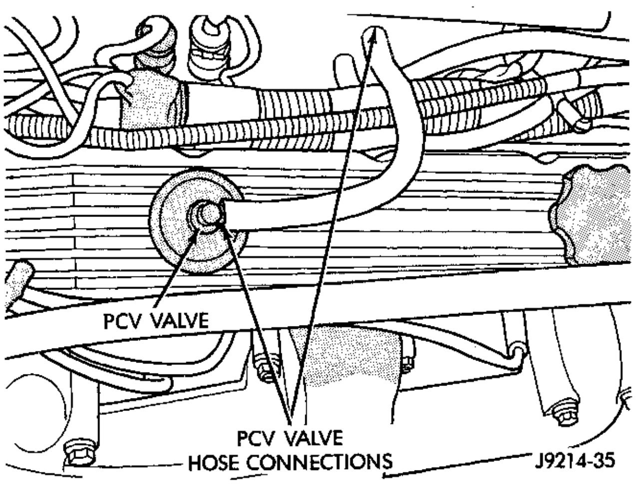

Fig. 8 PCV Valve/Hose—Typical

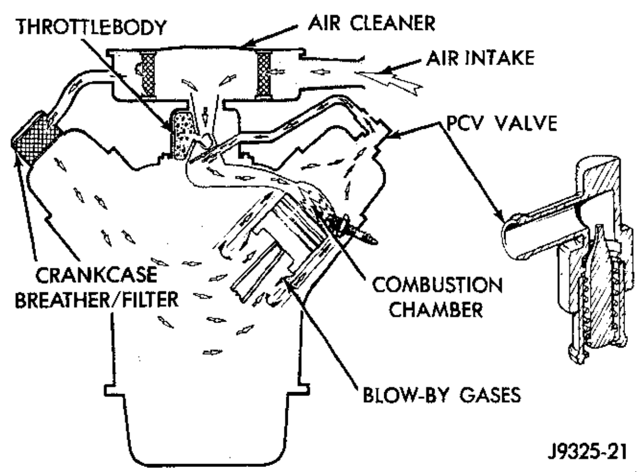

Fig. 9 Typical Closed Crankcase Ventilation System

The PCV system operates by engine intake manifold vacuum (Fig. 9). Filtered air is routed into the crankcase through the air cleaner hose. The metered air, along with crankcase vapors, are drawn through the PCV valve and into a passage in the intake manifold. The PCV system manages crankcase pressure and meters blow by gases to the intake system, reducing engine sludge formation.

The PCV valve contains a spring loaded plunger. This plunger meters the amount of crankcase vapors routed into the combustion chamber based on intake manifold vacuum.

When the engine is not operating or during an engine pop-back, the spring forces the plunger back against the seat. This will prevent vapors from flowing through the valve.

DESCRIPTION AND OPERATION (Continued)

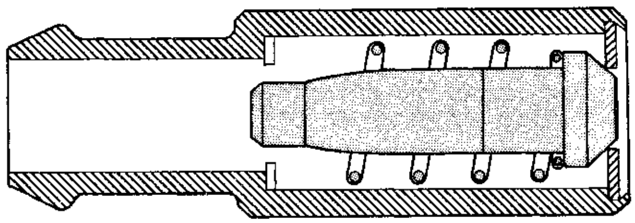

Fig. 10 Engine Off or Engine Pop-Back—No Vapor Flow

During periods of high manifold vacuum, such as idle or cruising speeds, vacuum is sufficient to completely compress spring. It will then pull the plunger to the top of the valve (Fig. 11). In this position there is minimal vapor flow through the valve.

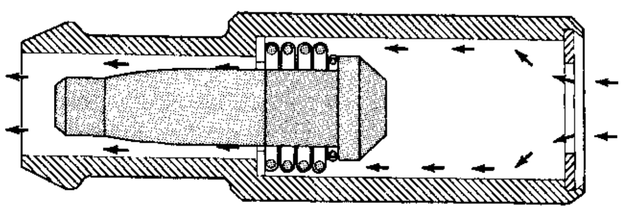

Fig. 11 High Intake Manifold Vacuum—Minimal Vapor Flow

During periods of moderate manifold vacuum, the plunger is only pulled part way back from inlet. This results in maximum vapor flow through the valve (Fig. 12).

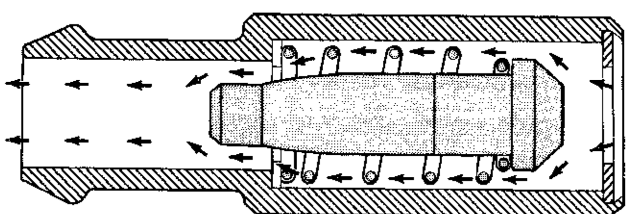

Fig. 12 Moderate Intake Manifold Vacuum—Maximum Vapor Flow

CRANKCASE VENTILATION SYSTEM—8.0L V-10 ENGINE

The 8.0L V-10 engine is equipped with a Crankcase Ventilation (CCV) system. The CCV system performs the same function as a conventional PCV system, but does not use a vacuum controlled valve (PCV valve).

A molded vacuum tube connects manifold vacuum to the top of the right cylinder head (valve) cover. The vacuum tube connects to a fixed orifice fitting (Fig. 13) of a calibrated size 2.6 mm (0.10 inches). It meters the amount of crankcase vapors drawn out of the engine. **The fixed orifice fitting is grey in color.** A similar fitting (but does not contain a fixed orifice) is used on the left cylinder head (valve) cover. This fitting is black in color. Do not interchange these two fittings.

When the engine is operating, fresh air enters the engine and mixes with crankcase vapors. Manifold vacuum draws the vapor/air mixture through the fixed orifice and into the intake manifold. The vapors are then consumed during engine combustion.

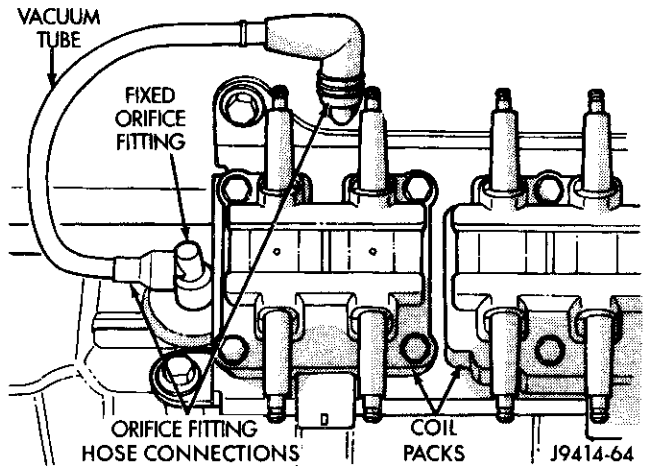

Fig. 13 Fixed Orifice Fitting—8.0L V-10 Engine—Typical

CRANKCASE BREATHER/FILTER

The crankcase breather/filter is no longer used with the 3.9L, 5.2L or 5.9L engine.

VEHICLE EMISSION CONTROL INFORMATION (VECI) LABEL

Vehicles equipped with 3.9L V-6 or 5.2L/5.9L V-8 LDC-gas powered engines have a VECI label.

The label combines both emission control information and vacuum hose routing. This label is located in the engine compartment in front of the radiator (Fig. 14) and contains the following:

- Engine family and displacement
- Evaporative family
- Emission control system schematic
- Certification application
- Engine timing specifications (if adjustable)
- Idle speeds (if adjustable)
- Spark plug and gap

The 5.9L HDC-gas powered engine will have two labels. One of the labels is located in front of the radiator in the engine compartment (Fig. 14) and will contain vacuum hose routing only. The other is attached to the drivers side of the engine air cleaner housing (Fig. 14) and will contain the following:

- Engine family and displacement
- Evaporative family
- Certification application

AUTHENTIC RESTORATION PRODUCT

DESCRIPTION AND OPERATION (Continued)

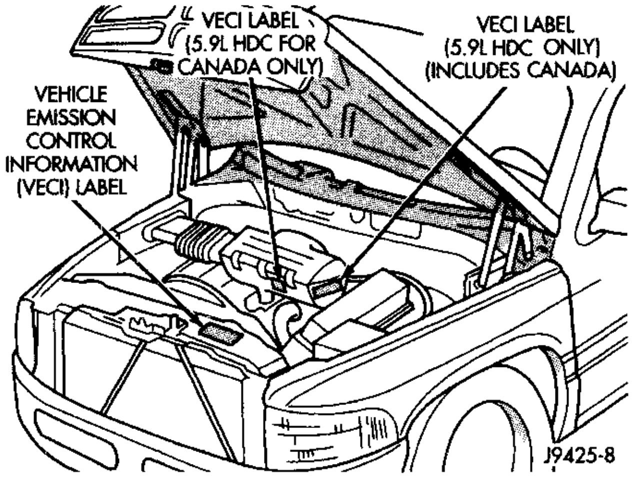

Fig. 14 VECI Label Location

- Engine timing specifications (if adjustable)
- Idle speeds (if adjustable)
- Spark plug and gap

The label for the 8.0L V-10 HDC-gas powered engine is also located in the engine compartment. It is attached to a riveted metal plate located to the right side of the generator (Fig. 15).

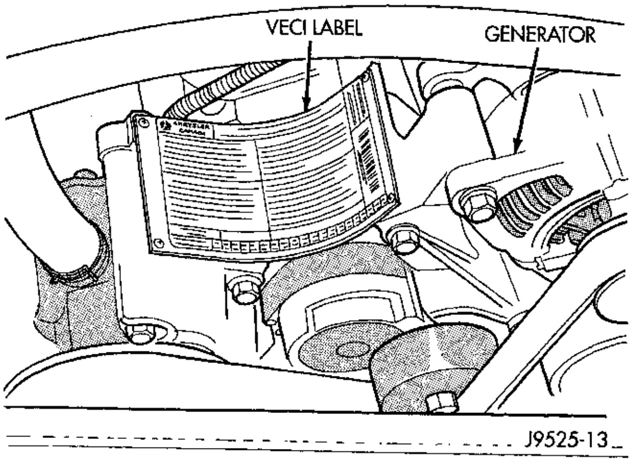

Fig. 15 VECI Label Location—8.0L V-10 Engine

There are unique labels for vehicles built for sale in the country of Canada and for both Light Duty Cycle (LDC) and Heavy Duty Cycle (HDC) engines. Canadian labels are written in both the English and French languages. For all Canadian vehicles, the label is split into two different labels.

The VECI labels are permanently attached and cannot be removed without defacing information and destroying label.

DIAGNOSIS AND TESTING

PCV VALVE TEST—3.9/5.2/5.9L ENGINE

(1) With engine idling, remove the PCV valve from cylinder head (valve) cover. If the valve is not plugged, a hissing noise will be heard as air passes through the valve. Also, a strong vacuum should be felt at the valve inlet (Fig. 16).

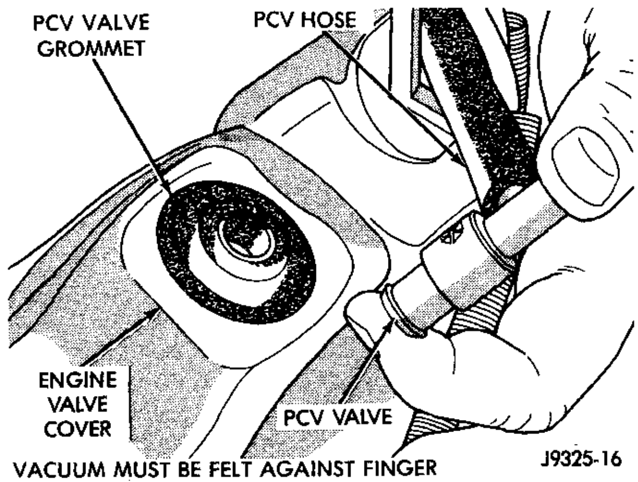

Fig. 16 Vacuum Check at PCV Valve—Typical

(2) Return the PCV valve into the valve cover. Remove the fitting and air hose at the opposite valve cover. Loosely hold a piece of stiff paper, such as a parts tag, over the opening (rubber grommet) at the valve cover (Fig. 17).

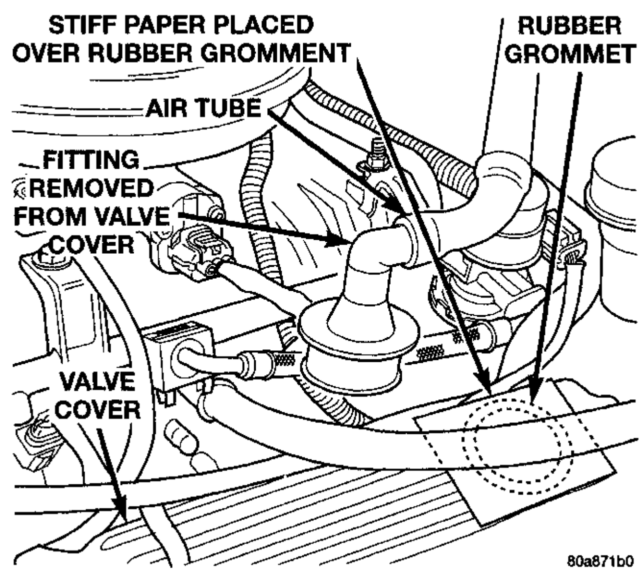

Fig. 17 Vacuum Check at Valve Cover Opening

DIAGNOSIS AND TESTING (Continued)

(3) The paper should be drawn against the opening in the valve cover with noticeable force. This will be after allowing approximately one minute for crankcase pressure to reduce.

(4) Turn engine off and remove PCV valve from valve cover. The valve should rattle when shaken (Fig. 18).

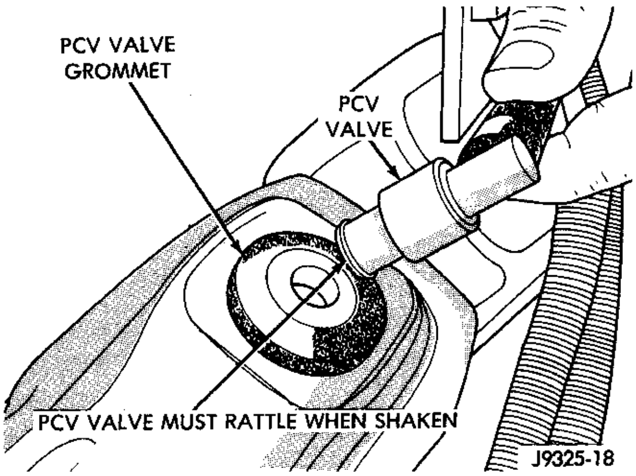

Fig. 18 Shake PCV Valve—Typical

(5) Replace the PCV valve and retest the system if it does not operate as described in the preceding tests. **Do not attempt to clean the old PCV valve.**

(6) If the paper is not held against the opening in valve cover after new valve is installed, the PCV valve hose may be restricted and must be replaced. The passage in the intake manifold must also be checked and cleaned.

(7) To clean the intake manifold fitting, turn a 1/4 inch drill (by hand) through the fitting to dislodge any solid particles. Blow out the fitting with shop air. If necessary, use a smaller drill to avoid removing any metal from the fitting.

VACUUM SCHEMATICS

A vacuum schematic for emission related items can be found on the VECI label. Refer to Vehicle Emission Control Information (VECI) Label in this group for label location.

LEAK DETECTION PUMP (LDP)

Refer to the appropriate Powertrain Diagnostic Procedures service manual for LDP testing procedures.

REMOVAL AND INSTALLATION

EVAPORATIVE (EVAP) CANISTER

Two EVAP canisters are used. Both canisters are mounted to a bracket located below rear of vehicle cab on outside of right frame rail (Fig. 19).

REMOVAL

(1) Remove fuel tubes/lines at each EVAP canister. Note location of tubes/lines before removal for easier installation.

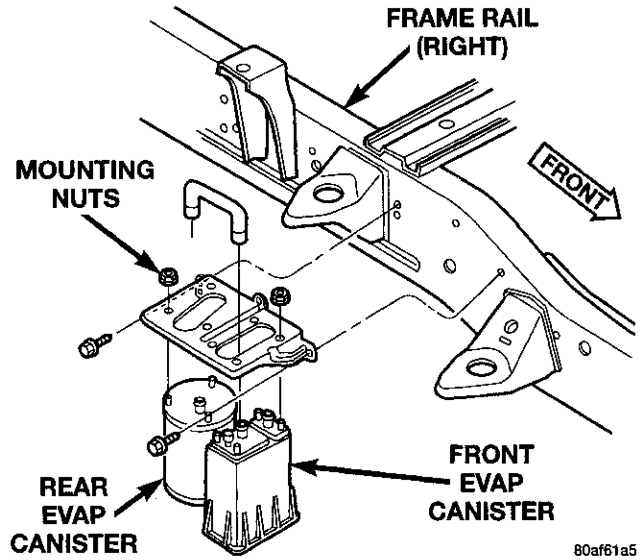

Fig. 19 EVAP Canister Location

(2) Remove mounting nuts at each canister (Fig. 19).

(3) Remove each canister from mounting bracket.

INSTALLATION

(1) Place each canister to mounting bracket (Fig. 19).

(2) Install nuts and tighten to 9 N·m (80 in. lbs.) torque.

(3) Install fuel tubes/lines to each canister.

DUTY CYCLE EVAP CANISTER PURGE SOLENOID

REMOVAL

The duty cycle solenoid is attached to a bracket mounted to the right inner fender (Fig. 20).

(1) Disconnect electrical wiring connector at solenoid (Fig. 20).

(2) Disconnect vacuum harness at solenoid.

(3) Remove solenoid from support bracket.

INSTALLATION

(1) Install solenoid assembly to support bracket.

(2) Connect vacuum harness.

(3) Connect wiring connector.

ROLLOVER VALVE(S)

REMOVAL

WARNING: THE FUEL SYSTEM IS UNDER A CONSTANT PRESSURE (EVEN WITH THE ENGINE OFF). BEFORE SERVICING THE ROLLOVER VALVE, FUEL SYSTEM PRESSURE MUST BE RELEASED (GASOLINE POWERED ENGINES ONLY). REFER TO THE FUEL PRESSURE RELEASE PROCEDURE IN GROUP 14, FUEL SYSTEM.

Mopar AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

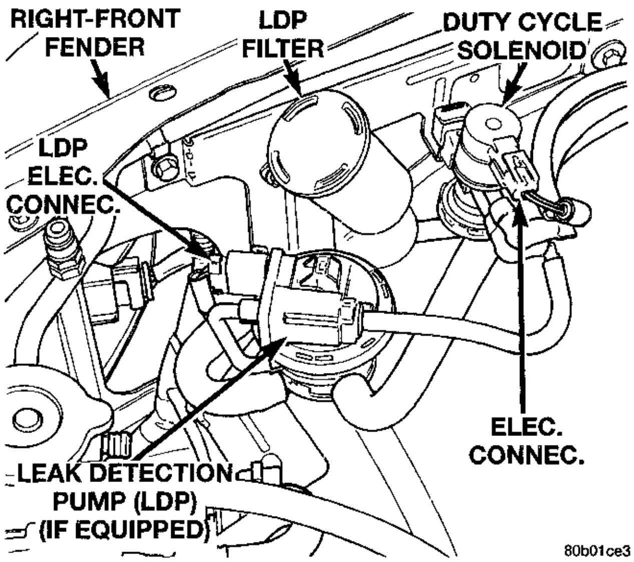

Fig. 20 Duty Cycle EVAP Canister Purge Solenoid Location

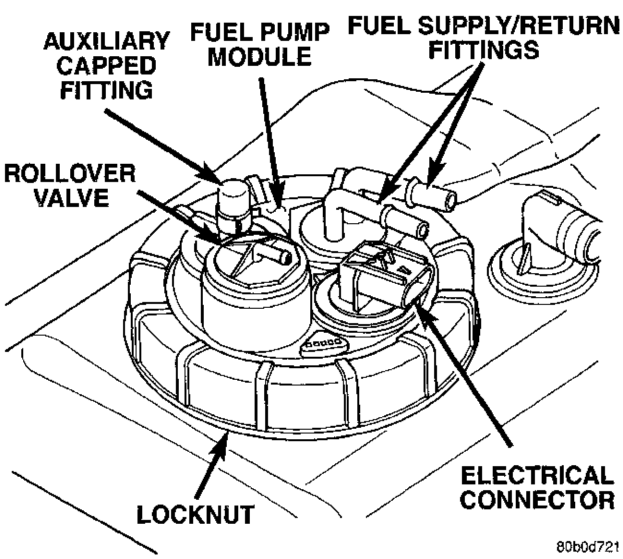

Fig. 21 Rollover Valve Location—Diesel Powered

(1) **Diesel Powered Engine:** One rollover valve is used. The valve is located on top of fuel tank module (Fig. 21) and may be serviced separately.

(a) Disconnect both negative battery cables at both batteries.

(b) Remove fuel filler cap and drain fuel tank.

(c) Remove fuel tank. Refer to Fuel Tank Removal/Installation in Group 14, Fuel System.

(d) The rollover valve is seated into a rubber grommet. Remove valve by prying one side upward and then roll valve out of grommet.

(e) Discard old grommet.

(2) **Gasoline Powered Engines:** If equipped with a 26 or 34 gallon fuel tank, two rollover valves are used. One of the valves is permanently mounted to top of fuel tank (Fig. 22). If replacement of this particular valve is necessary, fuel tank must be replaced. Refer to Fuel Tank Removal/Installation in Group 14, Fuel System. The other rollover valve is located on top of fuel pump module (Fig. 22). This valve may be serviced separately. Refer to following steps for procedures.

If equipped with a 35 gallon fuel tank, two rollover valves are also used, but both valves are permanently mounted to top of fuel tank (Fig. 23). If replacement is necessary, fuel tank must be replaced. Refer to Fuel Tank Removal/Installation in Group 14, Fuel System.

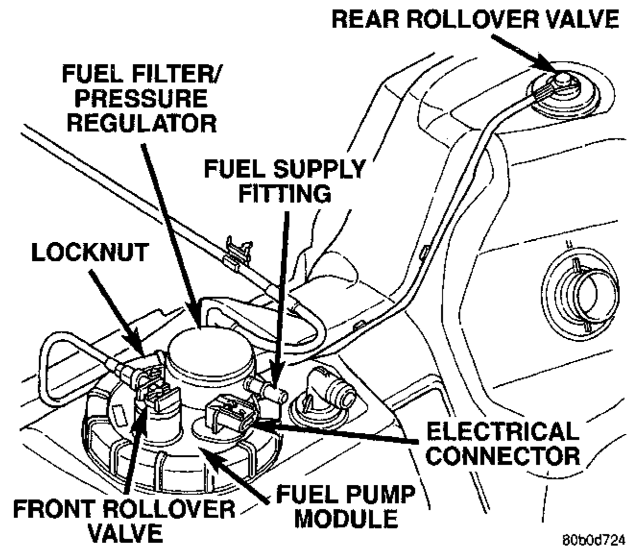

Fig. 22 Rollover Valve Locations—Gas Powered with 26 or 34 Gallon Tank

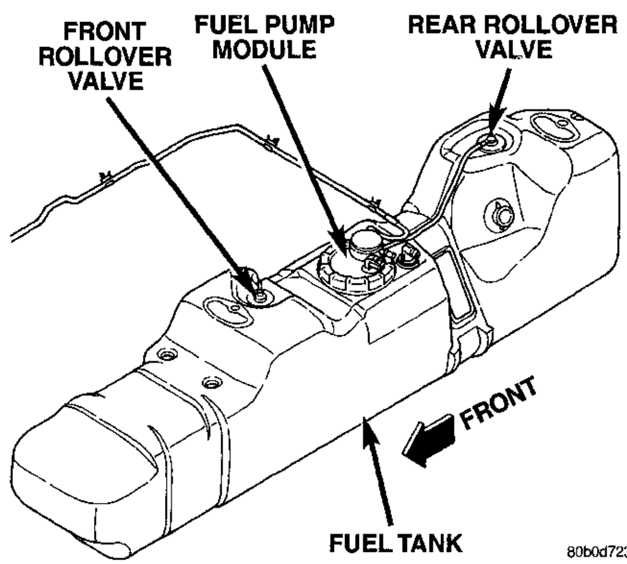

Fig. 23 Rollover Valve Locations—Gas Powered with 35 Gallon Tank

REMOVAL AND INSTALLATION (Continued)

(3)
(a) Disconnect negative battery cable at battery.
(b) Remove fuel filler cap and drain fuel tank.
(c) Remove fuel tank. Refer to Fuel Tank Removal/Installation in Group 14, Fuel System.
(d) Disconnect tube (line) at valve.
(e) The rollover valve is seated into a rubber grommet. Remove valve by prying one side upward and then roll valve out of grommet.
(f) Discard old grommet.

INSTALLATION

(1) Install new grommet into fuel pump (or fuel tank) module.
(2) Using finger pressure only, press valve into place.
(3) Install fuel tank. Refer to Fuel Tank Installation.
(4) Fill fuel tank. Install fuel tank filler cap.
(5) Connect negative battery cable(s).
(6) Start vehicle and check for leaks.

LEAK DETECTION PUMP (LDP)

The LDP and LDP filter are attached to a bracket mounted to the right-inner fender (Fig. 20). The LDP and LDP filter are replaced (serviced) as one unit.

REMOVAL

(1) Carefully remove hose at LDP filter.
(2) Remove LDP filter mounting bolt and remove from vehicle.
(3) Carefully remove vapor/vacuum lines at LDP.
(4) Disconnect electrical connector at LDP (Fig. 20).
(5) Remove LDP mounting screws and remove LDP from vehicle.

INSTALLATION

(1) Install LDP to mounting bracket. Tighten screws to 1 N·m (11 in. lbs.) torque.
(2) Install LDP filter to mounting bracket. Tighten bolt to 7 N·m (65 in. lbs.) torque.
(3) Carefully install vapor/vacuum lines to LDP, and install hose to LDP filter. **The vapor/vacuum lines and hoses must be firmly connected. Check the vapor/vacuum lines at the LDP, LDP filter and EVAP canister purge solenoid for damage or leaks. If a leak is present, a Diagnostic Trouble Code (DTC) may be set.**
(4) Connect electrical connector to LDP.

SPECIFICATIONS

TORQUE CHART

Leak Detection Pump Mounting Screws	1 N·m (11 in. lbs.)
Leak Detection Pump Filter Mounting Bolt	7 N·m (65 in. lbs.)

AIR INJECTION SYSTEM-HDC GAS ENGINES

INDEX

GENERAL INFORMATION

GENERAL INFORMATION

The air injection system (Fig. 1), (Fig. 2) or (Fig. 3) is used on 5.9L V-8 and 8.0L V-10 heavy duty cycle (HDC) gas powered engines only. The air injection system consists of:

- A belt-driven air injection (AIR) pump
- Two air pressure relief valves
- Rubber connecting air injection hoses with clamps
- Metal connecting air tubes
- Two one-way check valves
- A replaceable injection pump air filter (8.0L V-10 engine only)

DESCRIPTION AND OPERATION

AIR INJECTION SYSTEM OPERATION

The air injection system adds a controlled amount of air to the exhaust gases aiding oxidation of hydrocarbons and carbon monoxide in the exhaust stream. The system does not interfere with the ability of the EGR system (if used) to control nitrous oxide (NOx) emissions.

5.9L HDC ENGINE: Air is drawn into the pump through a rubber tube that is connected to a fitting on the air cleaner housing (Fig. 2).

8.0L V-10 ENGINE: Air is drawn into the pump through a rubber tube that is connected to a fitting

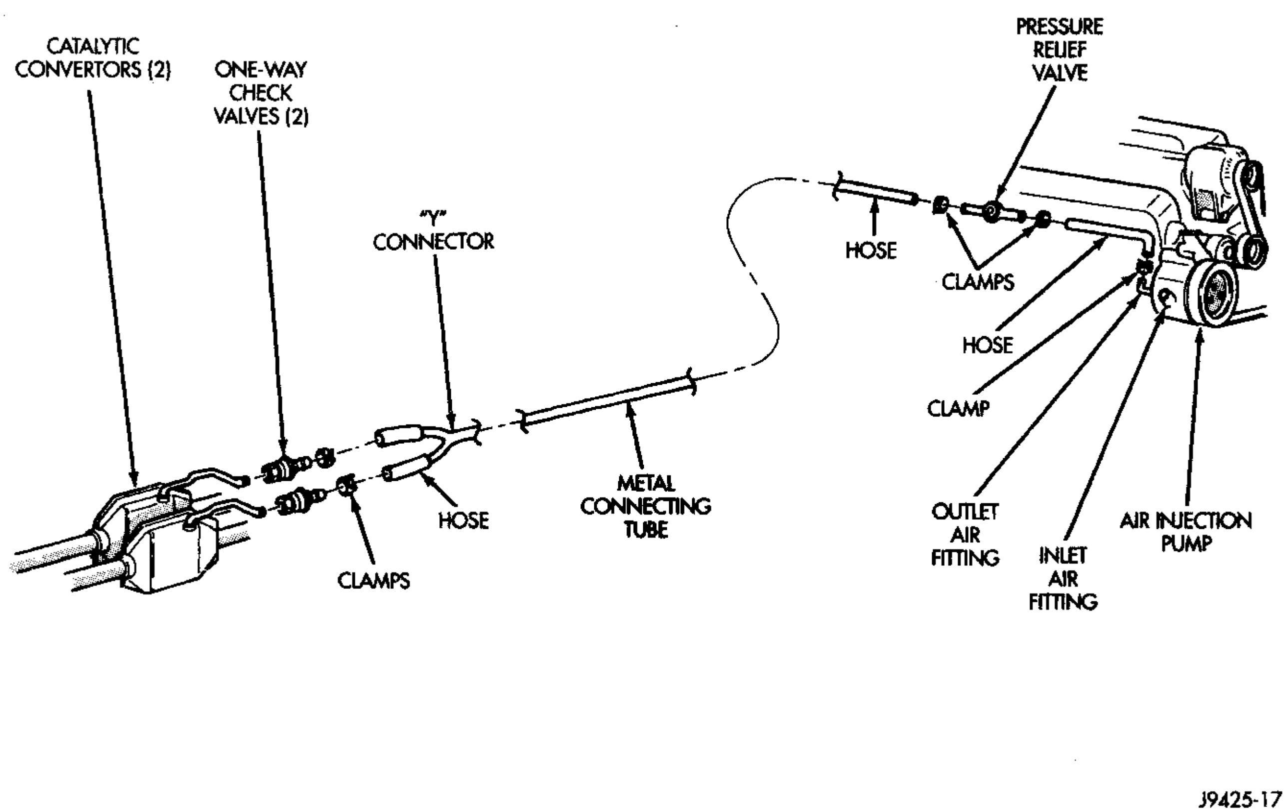

Fig. 1 Air Injection System Components—Typical

DESCRIPTION AND OPERATION (Continued)

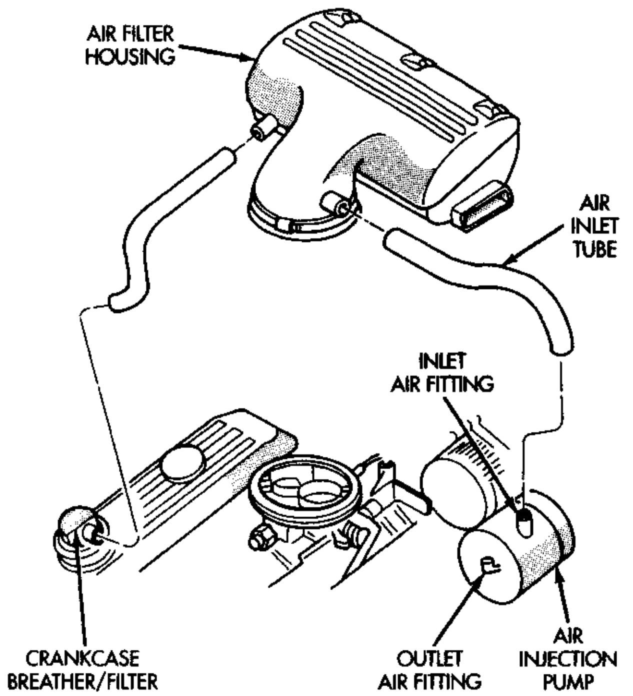

Fig. 2 Air Inlet for Air Pump—5.9L HDC Engine

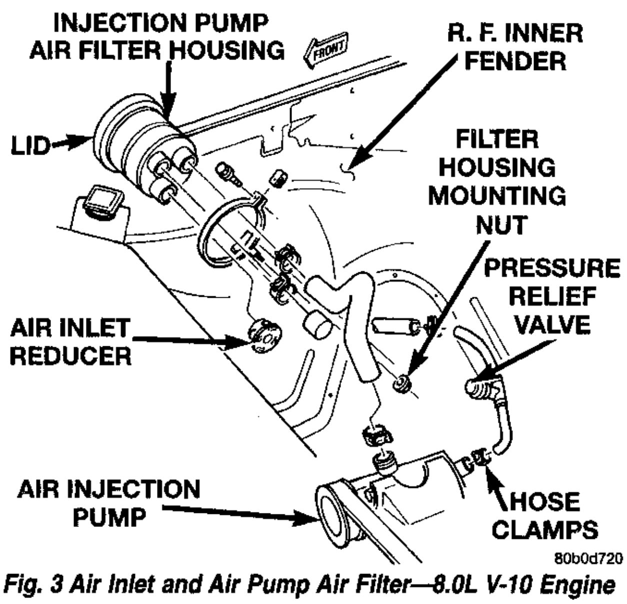

Fig. 3 Air Inlet and Air Pump Air Filter—8.0L V-10 Engine

on the air injection pump filter housing (Fig. 3). Air is drawn into the filter housing from the front of the vehicle with rubber tube. This tube is used as a silencer to help prevent air intake noise at the opening to the pump filter housing. An air filter is located within the air pump filter housing (Fig. 3).

Air is then compressed by the air injector pump. It is expelled from the pump and routed into a rubber tube where it reaches the air pressure relief valve (Fig. 1). Pressure relief holes in the relief valve will prevent excess downstream pressure. If excess downstream pressure occurs at the relief valve, it will be vented into the atmosphere.

Air is then routed (Fig. 1) from the relief valve, through a tube, down to a "Y" connector, through the two one-way check valves and injected at both of the catalytic convertors (referred to as downstream).

The two one-way check valves (Fig. 1) protect the hoses, air pump and injection tubes from hot exhaust gases backing up into the system. Air is allowed to flow through these valves in one direction only (towards the catalytic convertors).

Downstream air flow assists the oxidation process in the catalyst, but does not interfere with EGR operation (if EGR system is used).

AIR INJECTION PUMP

The air pump is mounted on the front of the engine and driven by a belt connected to the crankshaft pulley (Fig. 4).

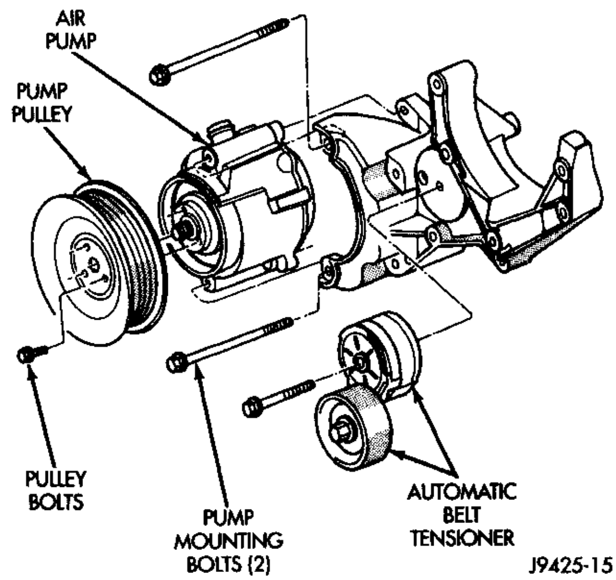

Fig. 4 Air Injection Pump Mounting—Typical

The air injection system is not completely noiseless. Under normal conditions, noise rises in pitch as engine speed increases. To determine if excessive noise is fault of air injection system, disconnect drive belt and operate engine.

CAUTION: Do not attempt to lubricate the air injection pump. Oil in the pump will cause rapid deterioration and failure.

Refer to the AIR PUMP DIAGNOSIS chart for additional information.

Mopar AUTHENTIC RESTORATION PRODUCT

DESCRIPTION AND OPERATION (Continued)

AIR PUMP DIAGNOSIS

EXCESSIVE BELT NOISE	1. Loose belt or defective automatic belt tensioner. 2. Seized pump.	1. Refer to Group 7, Cooling System. 2. Replace pump.
EXCESSIVE PUMP NOISE CHIRPING	1. Insufficient break-in.	1. Recheck for noise after 1600 km (1,000 miles) of operation.
EXCESSIVE PUMP NOISE CHIRPING, RUMBLING, OR KNOCKING	1. Leak in hose. 2. Loose hose. 3. Hose touching other engine parts. 4. Relief valve inoperative. 5. Check valve inoperative. 6. Pump mounting fasteners loose. 7. Pump failure.	1. Locate source of leak using soap solution and correct. 2. Reassemble and replace or tighten hose clamp. 3. Adjust hose position. 4. Replace relief valve. 5. Replace check valve. 6. Tighten mounting screws as specified. 7. Replace pump.
NO AIR SUPPLY. ACCELERATE ENGINE TO 1500 RPM AND OBSERVE AIR FLOW FROM HOSES. IF FLOW INCREASES AS RPM'S INCREASE, PUMP IS FUNCTIONING NORMALLY. IF NOT, CHECK POSSIBLE CAUSE.	1. Loose drive belt. 2. Leaks in supply hose. 3. Leak at fitting(s). 4. Check valve inoperative. 5. Plugged inlet air filter (8.0L).	1. Refer to Group 7, Cooling System. 2. Locate leak and repair or replace as required. 3. Tighten and replace clamps. 4. Replace check valve. 5. Replace filter

ONE-WAY CHECK VALVE

A check valve (Fig. 1) is located on each of the air injection downstream tubes.

Each check valve has a one-way diaphragm which prevents hot exhaust gases from backing up into the hose and pump. The check valve will protect the system if the air injection pump belt fails, an air hose ruptures or exhaust system pressure becomes abnormally high.

DIAGNOSIS AND TESTING

TESTING ONE-WAY CHECK VALVE

The one-way check valves are not repairable. To determine condition of valve, remove the rubber air tube from the inlet side of each check valve. Start the engine. If exhaust gas is escaping through the inlet side of check valve, it must be replaced.

REMOVAL AND INSTALLATION

AIR INJECTION PUMP

REMOVAL

The air injection pump does not have any internal serviceable parts.

(1) Disconnect both of the hoses (tubes) at the air injection pump.

(2) Loosen, but do not remove at this time, the three air pump pulley mounting bolts (Fig. 4).

(3) Relax the automatic belt tensioner and remove the engine accessory drive belt. Refer to Group 7, Cooling System. See Belt Removal/Installation.

(4) Remove the three air pump pulley bolts and remove pulley from pump.

(5) Remove the two air pump mounting bolts (Fig. 4) and remove pump from mounting bracket.

INSTALLATION

(1) Position air injection pump to mounting bracket.

(2) Install two pump mounting bolts to mounting bracket. Tighten bolts to 40 N·m (30 ft. lbs.) torque.

(3) Install pump pulley and three mounting bolts. Tighten bolts finger tight.

(4) Relax tension from automatic belt tensioner and install drive belt. Refer to Group 7, Cooling System. See Belt Removal/Installation.

(5) Tighten pump pulley bolts to 11 N·m (105 in. lbs.) torque.

(6) Install hoses and hose clamps at pump.

REMOVAL AND INSTALLATION (Continued)

AIR INJECTION PUMP AIR FILTER—8.0L V-10 ENGINE

The air filter for the air injection pump is located inside a housing located in right-front side of engine compartment (Fig. 3). A rubber hose connects the filter housing to air injection pump. The filter is used with 8.0L V-10 engines only.

For required maintenance schedules on the air pump filter (listed in time or mileage intervals), refer to Group 0, Lubrication and Maintenance. Also refer to the vehicle Owners Manual.

REMOVAL

(1) Remove rubber tubes at filter housing.

(2) Remove filter housing mounting nut and remove housing.

(3) Remove lid from filter housing (snaps off).

(4) Remove filter from housing.

INSTALLATION

(1) Clean inside of housing and lid before installing new filter.

(2) Install filter into housing.

(3) Install lid to filter housing (snaps on).

(4) Position filter housing to fender.

(5) Install mounting nut and tighten to 11 N·m (8 ft. lbs.) torque.

(6) Install rubber tubes and cap at filter housing.

ONE-WAY CHECK VALVE

REMOVAL

(1) Remove the hose clamp at inlet side of valve.

(2) Remove hose from valve.

(3) Remove valve from catalyst tube (unscrew). **To prevent damage to catalyst tube, a backup wrench must be used on the tube.**

INSTALLATION

(1) Install valve to catalyst tube. Tighten to 33 N·m (25 ft. lbs.) torque.

(2) Install hose and hose clamp to valve.

SPECIFICATIONS

TORQUE CHART

Description	Torque
Air Pump Filter Housing Nut	1 N·m (8 ft. lbs.)
Air Pump Mounting Bolts	40 N·m (30 ft. lbs.)
Air Pump Pulley Mounting Bolts	11 N·m (105 in. lbs.)
One-Way Check Valve to Catalyst Tube	33 N·m (25 ft. lbs.)

Mopar AUTHENTIC RESTORATION PRODUCT

EXHAUST GAS RECIRCULATION (EGR) SYSTEM-DIESEL ENGINE

INDEX

GENERAL INFORMATION

EXHAUST GAS RECIRCULATION (EGR) SYSTEM

The Transitional Low Emission Vehicle (TLEV) EGR system is used with the 5.9L diesel engine when equipped with a California emissions package only.

The EGR system reduces oxides of nitrogen (NOx) in the engine exhaust. This is accomplished by allowing a predetermined amount of hot exhaust gas to recirculate and dilute the incoming fuel/air mixture. This dilution reduces peak flame temperature during combustion.

DESCRIPTION AND OPERATION

EGR SYSTEM OPERATION

The system consists of:

• An EGR valve assembly. The valve assembly is located at the front of intake manifold (Fig. 1). The EGR valve is a poppet style valve (on/off only) and is controlled by an internal diaphragm.

• An EGR valve vacuum regulator solenoid. The solenoid is located at the front/top of cylinder head (Fig. 1) and will control the on-time and off-time of the EGR valve. A vacuum transducer is not used with this solenoid (EGR valve will be fully open or fully closed).

• The Powertrain Control Module (PCM) to operate the EGR valve vacuum regulator solenoid.

• The Engine Coolant Temperature (ECT) sensor (Fig. 2) to supply an engine coolant temperature input to the PCM.

• The Intake Manifold Air Temperature (IAT) sensor (Fig. 3) to supply an intake manifold air temperature input to the PCM.

• The Throttle Position Sensor (TPS) (Fig. 4) to supply a voltage reference input to the PCM. This will tell the PCM how far the throttle has been opened. If equipped with the California Emissions Package (with EGR system), the TPS will be used with **both automatic and manual transmissions.**

• Unique exhaust and intake manifolds.

• An EGR tube (Fig. 1) connecting a passage in the EGR valve to the rear of the exhaust manifold.

• A vacuum pump to supply vacuum for the EGR valve vacuum regulator solenoid and EGR valve. The pump also supplies vacuum for operation of the speed control servo and the heating/air conditioning system. The crankshaft gear driven pump is located at the front of engine and is attached to power steering pump (Fig. 5).

DESCRIPTION AND OPERATION (Continued)

- A quick-release one-way check valve (Fig. 1) to provide a fast release of engine vacuum from EGR valve diaphragm when EGR system is shut down.
- Vacuum lines and hoses to connect the various components.

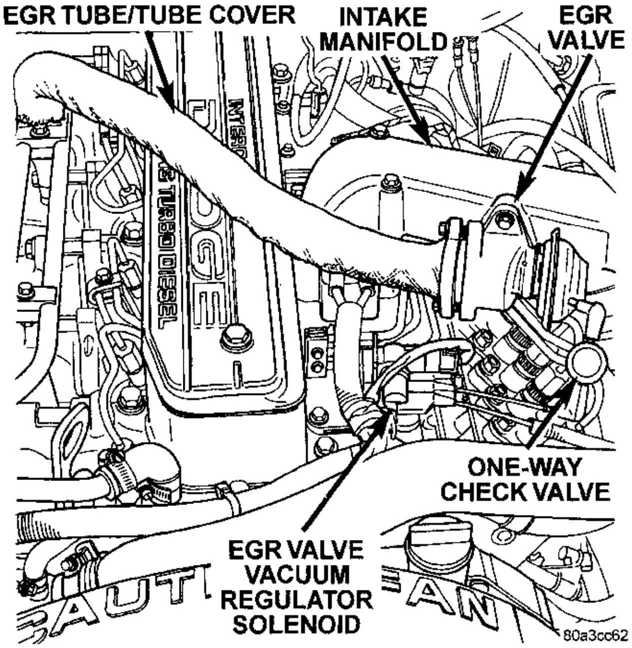

Fig. 1 EGR Valve and Components

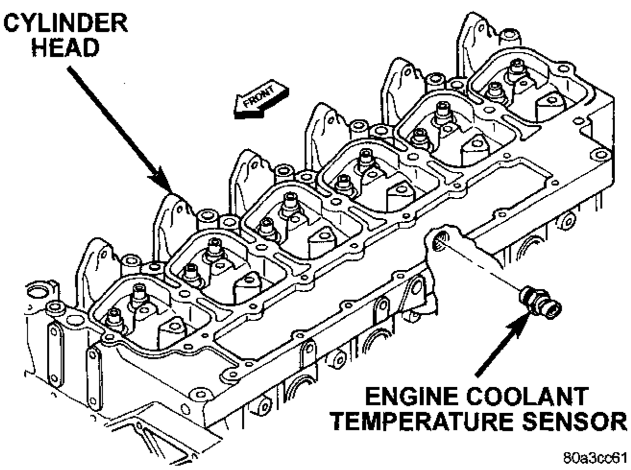

Fig. 2 Engine Coolant Temperature Sensor Location

When the PCM supplies a ground signal to the EGR valve vacuum regulator solenoid, EGR system operation starts to occur. The PCM will monitor and determine when to supply and remove this ground signal. This will depend on inputs from the engine coolant temperature, throttle position and intake manifold air temperature sensors.

When the ground signal is supplied to the EGR solenoid, vacuum from the vacuum pump will be

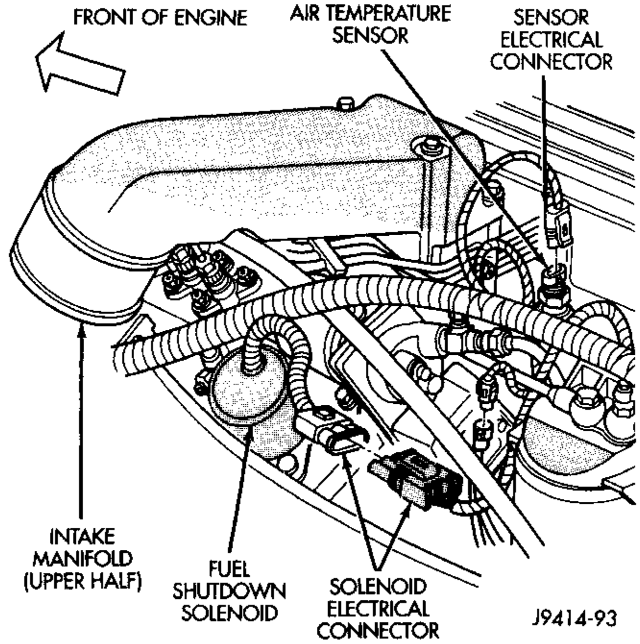

Fig. 3 Intake Manifold Air Temperature Sensor Location—Typical

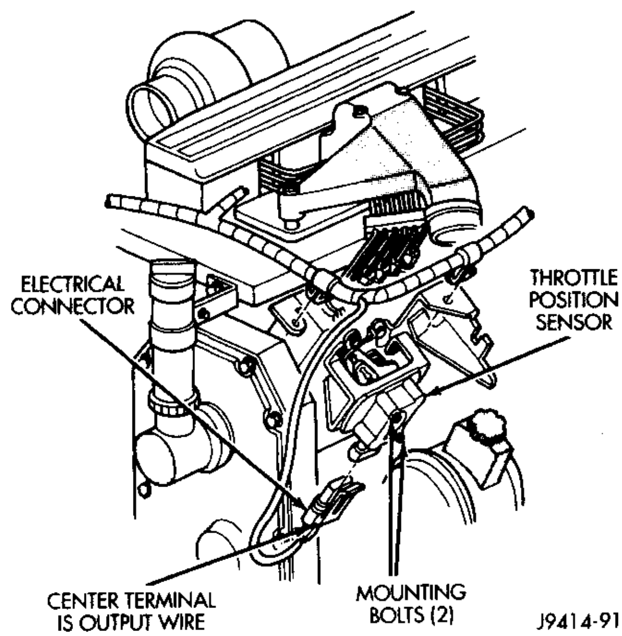

Fig. 4 Throttle Position Sensor Location—Typical

allowed to pass through the EGR solenoid and on to the EGR valve with a connecting hose.

Exhaust gas recirculation will begin in this order when:

- The engine is running to operate the vacuum pump.
- The powertrain control module (PCM) determines that engine coolant temperature is more than

Mopar AUTHENTIC RESTORATION PRODUCT

DESCRIPTION AND OPERATION (Continued)

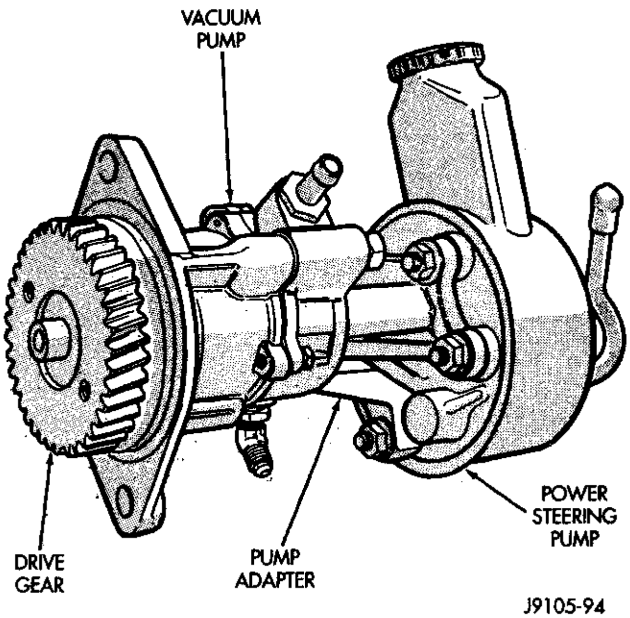

Fig. 5 Engine Vacuum Pump

140° F but less than 220° F, and intake manifold air temperature is more than 20° F but less than 170° F.

- A ground signal from the PCM is supplied to the EGR solenoid.
- Vacuum passes through the EGR solenoid to the EGR valve diaphragm.
- The inlet seat (poppet valve) at the bottom of the EGR valve opens to dilute and recirculate exhaust gas back into the intake manifold.

The EGR system will be activated at engine idle speed. This is if PCM operating parameters for EGR system operation have been met.

The EGR system will be shut down briefly if the PCM has determined that a rapid acceleration is occurring. This is determined by a change in TPS voltage (mechanical throttle movement). The PCM will leave the EGR system shut down for a few additional seconds after the throttle has been depressed.

The EGR system will also be shut down for wide open throttle (WOT) conditions.

The EGR system will also be shut down by the PCM if the PCM has not sensed a TPS voltage change (mechanical throttle movement) after 2 continuous minutes. This shut down may occur at either engine idle speed or normal cruising speeds.

Each time the engine is operated, an on-board diagnostic test will be run to verify EGR system operation. Certain failures will illuminate the MIL (Malfunction Indicator Lamp). The MIL is indicated on the instrument panel as the Check Engine Lamp. Refer to the On-Board Diagnostic section for additional information. Also refer to the appropriate Powertrain Diagnostic Procedures service manual.

DIAGNOSIS AND TESTING

EGR SYSTEM TEST

EGR system operation must first be checked with the DRB scan tool. To perform a test of the EGR system, refer to the appropriate Powertrain Diagnostic Procedures service manual. Check and correct any electrical malfunctions before proceeding.

Do not attempt to diagnose a defective EGR valve by applying vacuum to the EGR valve diaphragm fitting with engine running. Opening the EGR valve at idle speed will not change idle speed.

(1) Check operation of EGR valve vacuum regulator solenoid and EGR system with DRB scan tool.

(2) Start engine and verify that vacuum is available at inlet fitting of EGR valve vacuum regulator solenoid. Vacuum is supplied by an engine driven vacuum pump (Fig. 5). Refer to Group 9, Engines for vacuum pump specifications and test procedures.

(3) Check EGR valve for operation and leaks. Refer to EGR Valve Test.

(4) Check operation of one-way check valve (Fig. 1). Refer to Check Valve Test.

DIAGNOSIS AND TESTING (Continued)

EGR VALVE TEST

Use the following test procedure to determine if exhaust gas is flowing through the EGR valve. It can also be used to determine if the EGR tube is plugged, or the system passages in the intake or exhaust manifolds are plugged.

This is not to be used as a complete test of the EGR system.

(1) To verify EGR valve operation, it must be removed from intake manifold. Refer to EGR Valve Removal/Installation procedures.

(2) Examine the head of poppet valve at base opening on bottom of EGR valve. Look for heavy carbon build-up. A coating of carbon is normal with engine operation. Shine a bright light through valve opening and examine edge (seat) of poppet valve. No light should be evident at valve edge. If either condition exists, replace EGR valve. Do not attempt to clean the poppet valve within the EGR valve assembly.

(3) The EGR valve is equipped with a fitting located on the EGR valve vacuum motor (Fig. 6).

(4) Connect a hand–held vacuum pump equipped with a vacuum gauge to this fitting (Fig. 6).

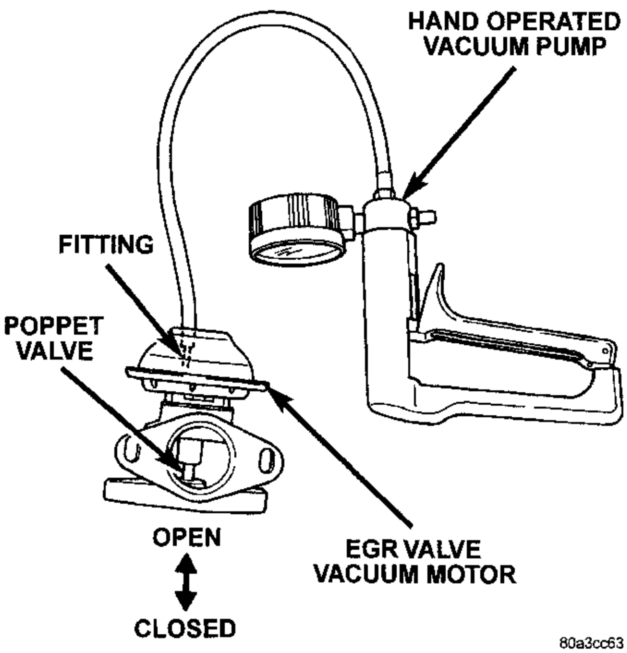

Fig. 6 Vacuum Pump at EGR Valve

(5) Slowly apply 10 inches HG of vacuum to the fitting on the EGR valve motor. The poppet valve (Fig. 6) should start to open at approximately 10 inches of vacuum. Vacuum should hold steady at 10 inches. If not, replace the EGR valve. If vacuum holds steady at 10 inches, and poppet valve has started to open, proceed to next step.

(6) Continue to apply vacuum until gauge reading is at 20 inches. The poppet valve should be fully open at approximately 20 inches of vacuum. Vacuum should also hold steady at 20 inches. If not, replace the EGR valve.

(7) If the EGR valve tested OK, the EGR tube may be plugged with carbon, or the passages in the intake and exhaust manifolds may be plugged with carbon.

(8) While the EGR valve is removed, check passages in EGR tube. Remove the EGR tube between the intake and exhaust manifolds. Check and clean the EGR tube and its related openings on the manifolds. Refer to EGR Tube Removal/Installation in this group for procedures.

(9) While the EGR valve is removed, check for carbon build-up at intake manifold openings. Clean carbon deposits as necessary.

Do not attempt to clean the poppet valve within the EGR valve assembly. If the valve shows evidence of heavy carbon build–up near the base or around poppet valve, replace it.

EGR VALVE VACUUM REGULATOR SOLENOID TEST

To perform an electrical test of this solenoid, refer to the DRB scan tool. Also refer to the appropriate Powertrain Diagnostic Procedures manual. Vacuum to the solenoid is supplied from an engine driven vacuum pump (Fig. 5). Refer to Group 9, Engines for vacuum pump specifications and test procedures.

CHECK VALVE TEST

This is not to be used as a test of the EGR system. Refer to DRB scan tool and appropriate Powertrain Diagnostic Procedures service manual.

A quick-release type, one-way check valve is located in the vacuum line between the EGR valve and the EGR valve vacuum regulator solenoid (Fig. 1). This check valve allows engine vacuum to be quickly bled from EGR valve. If the valve is defective, vacuum will be stored in the EGR valve diaphragm motor (EGR valve will remain open). If the valve is leaking, the EGR valve may not open.

(1) Attach a vacuum gauge with a "T" fitting into the vacuum line at EGR valve (between EGR valve and EGR vacuum regulator solenoid).

(2) Bring engine to operating temperature to allow EGR system operation.

(3) While driving at steady speed, high vacuum should be observed at gauge.

(4) Quickly open the throttle while observing gauge.

(5) Gauge should immediately drop to 0 inches. If any vacuum is being stored (gauge reading anything other than 0 inches), test EGR system electrical operation using the DRB scan tool. If EGR system electrical operation is OK, but gauge reading has not

AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING (Continued)

dropped to 0 inches, proceed to next step before replacing check valve.

(6) Disconnect the vacuum lines at both ends of check valve and remove valve from vehicle.

(7) Attach a hand-operated vacuum pump equipped with a vacuum gauge to the inlet fitting on check valve (to solenoid). The inlet end of fitting is marked with an S (Fig. 7).

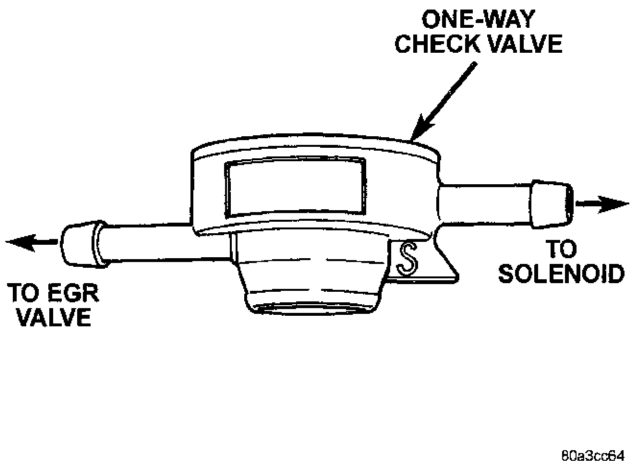

Fig. 7 One-Way Check Valve

(8) Apply a **minimum** of 20 in. vacuum or more to this fitting while plugging opposite fitting with a finger. Vacuum gauge should remain constant at 20 or more inches without any leakage. If not, replace check valve.

(9) Attach vacuum pump to the fitting at EGR valve end of check valve.

(10) Apply vacuum to this fitting while plugging opposite fitting with a finger. While operating vacuum pump, vacuum gauge should remain at or near 0 inches. If any vacuum is being stored, replace check valve.

VACUUM SUPPLY TEST

Vacuum for the EGR valve and EGR solenoid is provided by a vacuum pump. This pump is mounted to the gear housing at front of engine and attached to power steering pump (Fig. 8).

Refer to Group 9, Engines, for additional vacuum pump information and minimum/maximum vacuum specifications.

(1) Disconnect the vacuum supply line at EGR valve vacuum regulator solenoid.

(2) Attach a vacuum gauge at this point.

(3) Start the engine.

(4) If vacuum will not meet specifications as shown in Group 9, Engines, check for leaks in vacuum lines between solenoid and vacuum pump before condemning vacuum pump.

ENGINE COOLANT TEMPERATURE SENSOR—

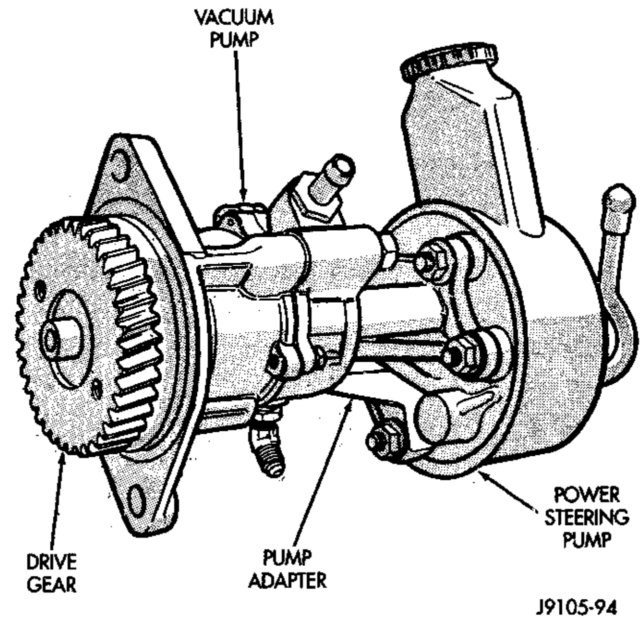

Fig. 8 Vacuum Pump

DIESEL ENGINE

To perform a complete test of the Engine Coolant Temperature (ECT) sensor and its circuitry, refer to DRB scan tool and appropriate Powertrain Diagnostics Procedures manual. To test the sensor only, refer to the following:

The ECT sensor is located on the left side of cylinder head behind fuel filter and below the intake manifold (Fig. 9).

(1) The ECT sensor is equipped with a 9 inch long jumper harness. This harness connects the ECT sensor to the main engine wiring harness. The end of the harness is located near the top of the fuel filter. It is used for sensor tests. Disconnect jumper harness connector from main engine wiring harness.

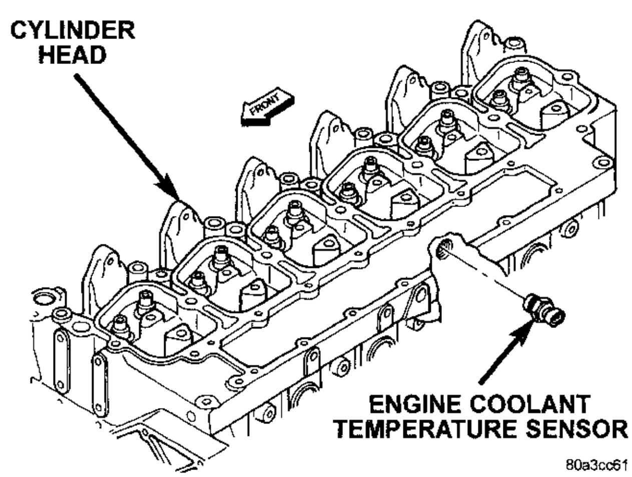

Fig. 9 ECT Sensor—Diesel Engine

DIAGNOSIS AND TESTING (Continued)

(2) Test resistance of sensor with a high input impedance (digital) volt-ohmmeter. The resistance (as measured across the jumper harness terminals) should be as shown in ECT SENSOR RESISTANCE (OHMS) chart. Replace sensor if it is not within range of resistance specified in chart.

ECT SENSOR RESISTANCE (OHMS)

TEMPERATURE		RESISTANCE (OHMS)	
°CEL.	°FAHR.	MIN.	MAX.
-40	-40	291,490	381,710
-20	-4	85,850	108,390
-10	14	49,250	61,430
0	32	29,330	35,990
10	50	17,990	21,810
20	68	11,370	13,610
25	77	9,120	10,880
30	86	7,370	8,750
40	104	4,900	5,750
50	122	3,330	3,880
60	140	2,310	2,670
70	158	1,630	1,870
80	176	1,170	1,340
90	194	860	970
100	212	640	720
110	230	480	540
120	248	370	410

(3) Test continuity of the wire harness between the PCM wire harness connector and the ECT sensor connector terminals. Refer to Group 8, Wiring for terminal/cavity locations. Repair the wire harness if an open circuit is indicated.

(4) After tests are completed, connect jumper harness.

REMOVAL AND INSTALLATION

EGR VALVE

REMOVAL

(1) Disconnect vacuum line at EGR valve vacuum supply fitting (Fig. 10).

(2) Remove the two bolts retaining EGR tube to side of EGR valve (Fig. 10).

(3) Remove the two EGR valve mounting bolts (Fig. 10) and remove EGR valve.

(4) Discard both of the old EGR mounting gaskets.

INSTALLATION

(1) Clean the intake manifold and EGR valve of any old gasket material.

(2) Clean the end of EGR tube of any old gasket material.

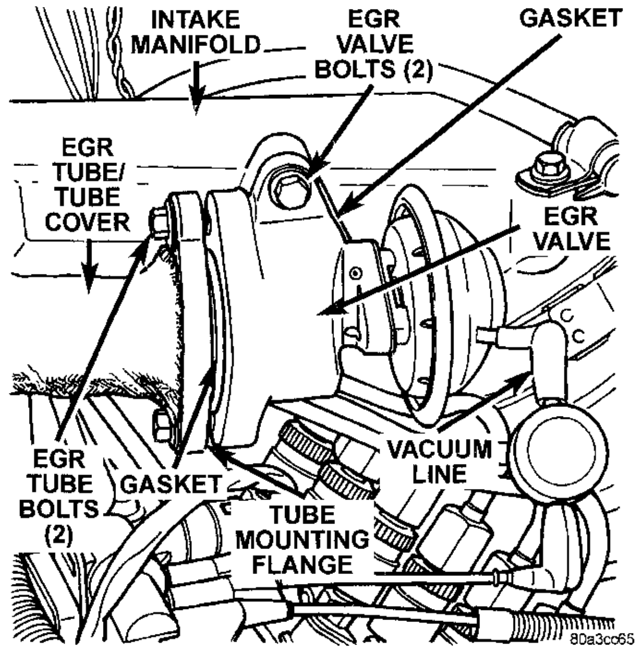

Fig. 10 EGR Valve Removal/Installation

(3) Position new gasket between EGR valve and EGR tube and position EGR valve to tube. Install 2 bolts finger tight only.

(4) Position new gasket between EGR valve and intake manifold.

(5) Install 2 EGR valve-to-intake manifold bolts finger tight only.

(6) A slotted mounting bolt hole is located at lower ear on EGR valve. Rotate EGR valve until square to EGR tube. Tighten 2 EGR valve-to-intake manifold bolts to 24 N·m (212 in. lbs.).

(7) Tighten 2 EGR tube-to-EGR valve mounting bolts to 24 N·m (212 in. lbs.). **When tightening these 2 bolts, alternate between the upper and lower bolt to allow face of EGR valve to remain square to tube mounting flange (Fig. 10) on EGR tube.**

(8) Connect vacuum line to EGR valve.

EGR TUBE

The EGR tube connects the EGR valve to the rear of the exhaust manifold (Fig. 10).

REMOVAL

(1) Remove 2 EGR tube mounting bolts at EGR valve end of tube (Fig. 10).

(2) Remove 2 EGR tube mounting nuts at exhaust manifold end of tube (Fig. 11).

(3) Remove EGR tube and discard old gaskets.

(4) Clean gasket mating surfaces and EGR tube flange gasket surfaces.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

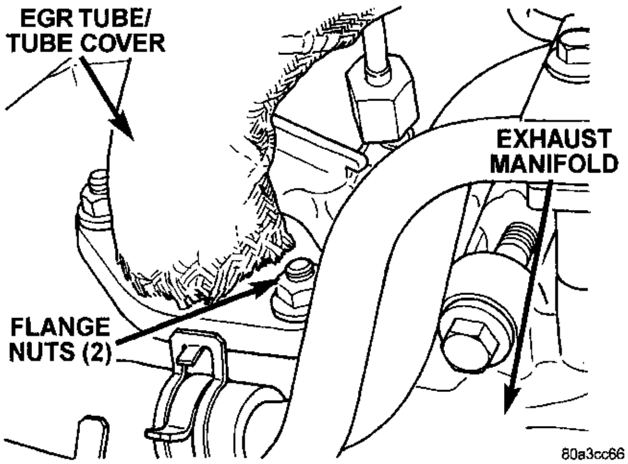

Fig. 11 EGR Tube Nuts at Exhaust Manifold

(5) Check for signs of leakage or cracked surfaces at both ends of tube, exhaust manifold and EGR valve.

INSTALLATION

(1) Install a new gasket to EGR valve end of EGR tube.

(2) Install a new gasket to manifold end of EGR tube.

(3) Position EGR tube to engine and install bolts/ nuts.

(4) Tighten all bolts/nuts to 24 N·m (212 in. lbs.) torque. **When tightening bolts at EGR valve end of tube, alternate between the upper and lower bolt to allow face of EGR valve to remain square to tube mounting flange (Fig. 10) on EGR tube.**

EGR VALVE VACUUM REGULATOR SOLENOID

The solenoid is located at the top/front of cylinder head (Fig. 12).

REMOVAL/INSTALLATION

(1) Disconnect electrical connector at solenoid.

(2) Disconnect vacuum harness at solenoid.

(3) Remove solenoid bracket bolt (Fig. 12).

(4) Remove solenoid and bracket from engine.

(5) Reverse the removal steps for installation. Tighten mounting bolt to 24 N·m (212 in. lbs.) torque.

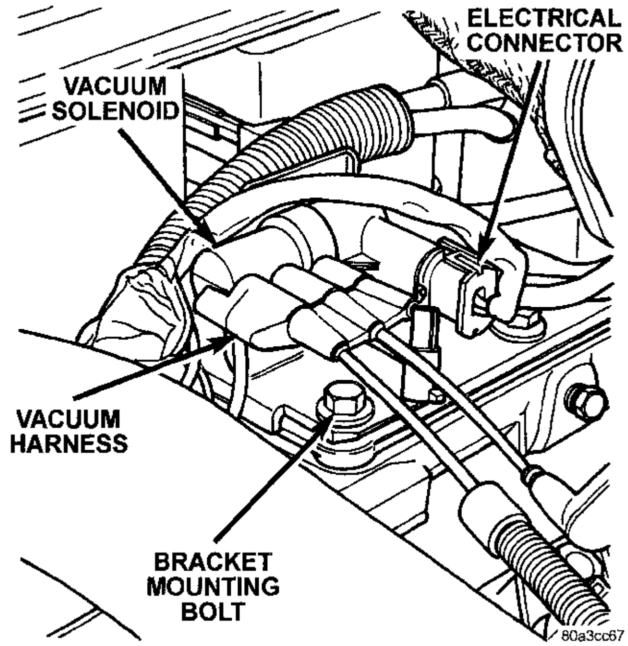

Fig. 12 EGR Valve Vacuum Regulator Solenoid

THROTTLE POSITION SENSOR

For removal, installation, testing and adjustment of the throttle position sensor (TPS), refer to the diesel sections of Group 14, Fuel System. The TPS may also be tested with the DRB scan tool. Refer to the appropriate Powertrain Diagnostic Procedures service manual.

ENGINE COOLANT TEMPERATURE SENSOR—DIESEL ENGINE

The Engine Coolant Temperature (ECT) sensor is located on the left side of the cylinder head behind the fuel filter and below the intake manifold (Fig. 13).

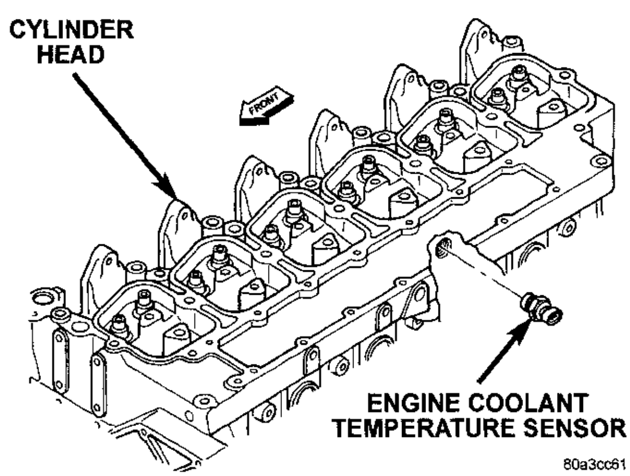

Fig. 13 ECT Sensor Location—Diesel Engine

REMOVAL AND INSTALLATION (Continued)

REMOVAL

WARNING: THE COOLING SYSTEM MAY BE UNDER PRESSURE. HOT COOLANT CAN CAUSE BURNS. OBSERVE THE WARNINGS IN GROUP 7, COOLING SYSTEM BEFORE PROCEEDING.

(1) Partially drain cooling system until coolant level is below cylinder head.

(2) Drain and remove fuel filter/water separator. Refer to Fuel Filter/Water Separator Removal/Installation in the Diesel section of Group 14, Fuel System for procedures.

(3) Disconnect ECT sensor pigtail harness connector from sensor.

(4) Remove ECT sensor from cylinder head.

INSTALLATION

(1) Apply sealant to sensor threads.

(2) Install ECT sensor into cylinder head. Tighten to 55 N·m (40 ft. lbs.) torque.

(3) Connect ECT sensor wire connector.

(4) Install fuel filter and bleed fuel. Refer to Group 14, Fuel System for procedures.

(5) Fill cooling system and check for coolant leaks. Refer to Group 7, Cooling System for procedures.

SPECIFICATIONS

TORQUE CHART

Description	Torque
EGR Valve Mounting Bolts	24 N·m (212 in. lbs.)
EGR Valve Vacuum Regulator Solenoid Mounting Bolt	24 N·m (212 in. lbs.)
EGR Tube Mounting Bolts/Nuts	24 N·m (212 in. lbs.)
Engine Coolant Temperature (ECT) Sensor	55 N·m (40 ft. lbs.)

FOREWORD

This manual is designed as a supplement to be used along with the 1998 Ram Truck service manual, 81-370-8108. It includes information related to the 24 valve, electronically fuel injected, Cummins turbo diesel engine.

The information contained in this service manual has been prepared for the professional automotive technician involved in daily repair operations. This manual does not cover theory of operation, which is addressed in service training material. Information describing the operation and use of standard and optional equipment is included in the Owner's Manual provided with the vehicle.

This manual is designed as a supplement to be used along with the 1998 Ram Truck service manual. It includes information related to engineering changes made during the model year.

Information in this manual is divided into groups. These groups contain general information, diagnosis, testing, adjustments, removal, installation, disassembly, and assembly procedures for the systems and components. To assist in locating a group title page, use the Group Tab Locator on the following page. The solid bar after the group title is aligned to a solid tab on the first page of each group. The first page of the group has a contents section that lists major topics within the group. If you are not sure which Group contains the information you need, look up the Component/System in the alphabetical index located in the rear of this manual.

A Service Manual Comment form is included at the rear of this manual. Use the form to provide Chrysler Corporation with your comments and suggestions.

Tightening torques are provided as a specific value throughout this manual. This value represents the midpoint of the acceptable engineering torque range for a given fastener application. These torque values are intended for use in service assembly and installation procedures using the correct OEM fasteners. When replacing fasteners, always use the same type (part number) fastener as removed.

Chrysler Corporation reserves the right to change testing procedures, specifications, diagnosis, repair methods, or vehicle wiring at any time without prior notice or incurring obligation.

GENERAL INFORMATION

VEHICLE IDENTIFICATION NUMBER

The Vehicle Identification Number (VIN) plate is located on the lower windshield fence near the left A-pillar (Fig. 1). The VIN contains 17 characters that provide data concerning the vehicle. Refer to the VIN decoding chart to determine the identification of a vehicle.

The Vehicle Identification Number is also imprinted on the:

- Body Code Plate.
- Equipment Identification Plate.
- Vehicle Safety Certification Label.
- Frame rail.

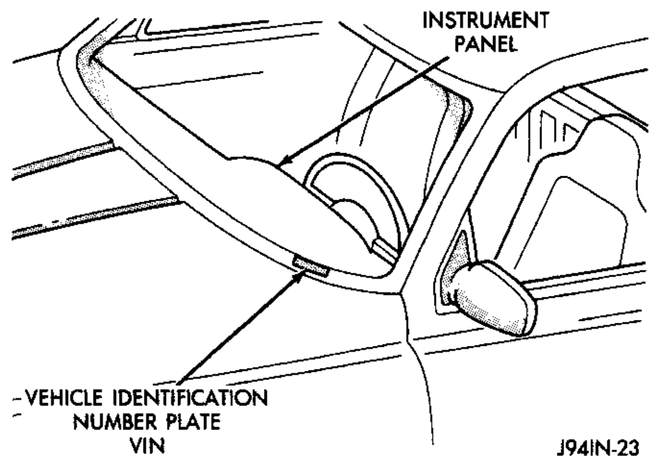

Fig. 1 Vehicle Identification Number (VIN) Location

mopar AUTHENTIC RESTORATION

GENERAL INFORMATION (Continued)

To protect the consumer from theft and possible fraud the manufacturer is required to include a Check Digit at the ninth position of the Vehicle Identification Number. The check digit is used by the manufacturer and government agencies to verify the authenticity of the vehicle and official documentation. The formula to use the check digit is not released to the general public.

POSITION	INTERPRETATION	CODE = DESCRIPTION

LUBRICATION AND MAINTENANCE

CONTENTS

GENERAL INFORMATION

INTRODUCTION

The following is a list of Maintenance Schedules for Diesel Engine equipped vehicles.

There are two maintenance schedules that show proper service based on the conditions that the vehicle is subjected to. Use the schedule that best describes these conditions.

Schedule—**A**, lists all the scheduled maintenance to be performed under normal operating conditions for Diesel Engine equipped vehicles.

Schedule—**B**, lists all the scheduled maintenance to be performed for Diesel Engine equipped vehicles that are operated under the following conditions:

- Frequent short trip driving less than 5 miles (8 km)
- Frequent driving in dusty conditions
- Frequent trailer towing
- Extensive idling
- More than 50% of your driving is at sustained high speeds during hot weather, above 90°F (32°C)

Where time and mileage are listed, follow the interval that occurs first.

UNSCHEDULED INSPECTION

At Each Stop For Fuel

- Check engine oil level, add as required.
- Check windshield washer solvent and add if required.
- Clean windshield and wiper blades as required.
- Drain water from fuel filter.

Once A Month

- Check tire pressure and look for unusual wear or damage.
- Inspect battery and clean and tighten terminals as required.
- Check fluid levels of coolant reservoir, brake master cylinder, power steering, and transmission. Add fluid as required.
- Check all lights and all other electrical items for correct operation.
- **Check Filter Minder®. Replace filter if necessary.**
- Inspect and clean wiper blades. Replace if required.

At Each Oil Change

- Inspect exhaust system.
- Inspect brake hoses.
- Adjust rear brakes.
- Rotate the tires at each oil change interval shown, 7,500 Miles (12 000 km) on Schedule —A or every other interval shown on Schedule—B.
- Check engine coolant level, hoses, and clamps.
- Lubricate steering linkage.

SCHEDULE—A

7,500 Miles (12 000 km) or at 6 months

- Change engine oil and filter.
- Adjust rear brakes.

15,000 Miles (24 000 km) or at 12 months

- Change engine oil and filter.
- Inspect water pump weep hole for blockage.
- Replace fuel filter.
- Adjust rear brakes.

22,500 Miles (36 000 km) or at 18 months

- Change engine oil and filter.
- Inspect drive belts, replace as necessary.
- Inspect brake linings.
- Adjust rear brakes.

30,000 Miles (48 000 km) or at 24 months

- Change engine oil and filter.
- Inspect fan hub.
- Inspect damper.
- Inspect water pump weep hole for blockage.
- Replace fuel filter and clean strainer.
- Drain and refill automatic transmission fluid. Replace filter and adjust bands.
- Inspect front wheel bearings. Clean and repack, if required (4x2).
- Adjust rear brakes.

mopar AUTHENTIC RESTORATION

GENERAL INFORMATION (Continued)

• Flush and replace engine coolant at 24 months, regardless of mileage.

37,500 Miles (60 000 km) or at 30 months
- Change engine oil and filter.
- Adjust rear brakes.

45,000 Miles (72 000 km) or at 36 months
- Change engine oil and filter.
- Inspect drive belts, replace as necessary.
- Inspect water pump weep hole for blockage.
- Replace fuel filter.
- Drain and refill transfer case fluid.
- Inspect brake linings.
- Flush and replace engine coolant if not done at 24 months.
- Adjust rear brakes.

52,500 Miles (84 000 km) or at 42 months
- Change engine oil and filter.
- Adjust rear brakes.

60,000 Miles (96 000 km) or at 48 months
- Change engine oil and filter.
- Drain and refill automatic transmission fluid. Replace filter and adjust bands.
- Inspect fan hub.
- Inspect damper.
- Inspect front wheel bearings. Clean and repack, if required (4x2).
- Inspect water pump weep hole for blockage.
- Replace fuel filter and clean strainer.
- Adjust rear brakes.

67,500 Miles (108 000 km) or at 54 months
- Change engine oil and filter.
- Inspect drive belts, replace as necessary.
- Inspect brake linings.
- Adjust rear brakes.

75,000 Miles (120 000 km) or at 60 months
- Change engine oil and filter.
- Inspect water pump weep hole for blockage.
- Replace fuel filter and clean strainer.
- Flush and replace engine coolant if it has been 30,000 miles (48 000 km) or 24 months since last change.
- Adjust rear brakes.

82,500 Miles (132 000 km) or at 66 months
- Change engine oil and filter.
- Adjust rear brakes.

90,000 Miles (144 000 km) or at 72 months
- Change engine oil and filter.
- Inspect drive belts, replace as required.
- Drain and refill automatic transmission fluid. Replace filter and adjust bands.
- Drain and refill transfer case fluid.
- Inspect fan hub.
- Inspect damper.
- Inspect water pump weep hole for blockage.
- Replace fuel filter.
- Inspect front wheel bearings. Clean and repack, if required (4x2).
- Inspect brake linings.
- Adjust rear brakes.

97,500 Miles (156 000 km) or at 78 months
- Change engine oil and filter.
- Flush and replace engine coolant if it has been 30,000 miles (48 000 km) or 24 months since last change.
- Adjust rear brakes.

105,000 Miles (168 000 km) or at 84 months
- Change engine oil and filter.
- Inspect water pump weep hole for blockage.
- Replace fuel filter.
- Flush and replace engine coolant if it has been 30,000 miles (48 000 km) or 24 months since last change.
- Adjust rear brakes.

112,500 Miles (181 000 km)
- Change engine oil and filter.
- Inspect drive belts, replace if necessary.
- Inspect brake linings.
- Adjust rear brakes.

120,000 Miles (193 000 km) or at 96 months
- Change engine oil and filter.
- Drain and refill automatic transmission fluid. Replace filter and adjust bands.
- Inspect fan hub.
- Inspect damper.
- Inspect front wheel bearings. Clean and repack, if required (4x2).
- Inspect water pump weep hole for blockage.
- Replace fuel filter.
- Adjust rear brakes.

127,500 Miles (205 000 km) or at 102 months
- Change engine oil and filter.
- Adjust rear brakes.

135,000 Miles (217 000 km) or at 108 months
- Change engine oil and filter.
- Inspect drive belts, replace as necessary.
- Inspect water pump weep hole for blockage.
- Replace fuel filter.
- Drain and refill transfer case fluid.
- Inspect brake linings.

Mopar AUTHENTIC RESTORATION PRODUCT

GENERAL INFORMATION (Continued)

• Flush and replace engine coolant if it has been 30,000 miles (48 000 km) or 24 months since last change.
• Adjust rear brakes.

150,000 Miles (241 000 km) or at 150 months
• Change engine oil and filter.
• Drain and refill automatic transmission fluid. Replace filter and adjust bands.
• Inspect fan hub.
• Inspect damper.
• Inspect front wheel bearings. Clean and repack, if required (4x2).
• Inspect water pump weep hole for blockage.
• Adjust valve lash clearance.
• Replace fuel filter.
• Adjust rear brakes.

SCHEDULE—B

3,750 Miles (6 000 km)
• Change engine oil and filter.
• Adjust rear brakes.

7,500 Miles (12 000 km)
• Change engine oil and filter.
• Replace fuel filter.
• Adjust rear brakes.

11,250 Miles (18 000 km)
• Change engine oil and filter.
• Adjust rear brakes.

15,000 Miles (24 000 km)
• Change engine oil and filter.
• Inspect water pump weep hole for blockage.
• Replace fuel filter.
• Drain and refill automatic transmission fluid. Replace filter and adjust bands.
• Change rear axle fluid.
• Change front axle fluid (4x4).
• Inspect brake linings.
• Adjust rear brakes.

18,750 Miles (30 000 km)
• Change engine oil and filter.
• Adjust rear brakes.

22,500 Miles (36 000 km)
• Change engine oil and filter.
• Inspect drive belts, replace as necessary.
• Replace fuel filter.
• Adjust rear brakes.

26,250 Miles (42 000 km)
• Change engine oil and filter.
• Adjust rear brakes.

30,000 Miles (48 000 km)
• Change engine oil and filter.
• Inspect fan hub.
• Inspect damper.
• Inspect water pump weep hole for blockage.
• Replace fuel filter.
• Drain and refill automatic transmission fluid. Replace filter and adjust bands.
• Change rear axle fluid.
• Change front axle fluid (4x4).
• Inspect front wheel bearings. Clean and repack, if required (4x2).
• Inspect brake linings.
• Adjust rear brakes.

33,700 Miles (54 000 km)
• Change engine oil and filter.
• Adjust rear brakes.

37,500 Miles (60 000 km)
• Change engine oil and filter.
• Replace fuel filter.
• Adjust rear brakes.

41,250 Miles (66 000 km)
• Change engine oil and filter.
• Adjust rear brakes.

45,000 Miles (72 000 km)
• Change engine oil and filter.
• Inspect drive belts, replace as necessary.
• Inspect water pump weep hole for blockage.
• Replace fuel filter.
• Drain and refill automatic transmission fluid. Replace filter and adjust bands.
• Drain and refill transfer case fluid.
• Change rear axle fluid.
• Change front axle fluid (4x4).
• Inspect brake linings.
• Adjust rear brakes.

48,750 Miles (78,000 km)
• Change engine oil and filter.
• Adjust rear brakes.

52,500 Miles (84 000 km)
• Change engine oil and filter.
• Replace fuel filter.
• Adjust rear brakes.

56,250 Miles (90 000 km)
• Change engine oil and filter.
• Adjust rear brakes.

60,000 Miles (96 000 km)
• Change engine oil and filter.
• Inspect fan hub.

GENERAL INFORMATION (Continued)

- Inspect damper.
- Inspect water pump weep hole for blockage.
- Replace fuel filter.
- Drain and refill automatic transmission fluid. Replace filter and adjust bands.
- Change rear axle fluid.
- Change front axle fluid (4x4).
- Inspect front wheel bearings. Clean and repack if required (4x2).
- Inspect brake linings.
- Flush and replace engine coolant.
- Adjust rear brakes.

63,750 Miles (102 000 km)
- Change engine oil and filter.
- Adjust rear brakes.

67,500 Miles (108 000 km)
- Change engine oil and filter.
- Inspect drive belts, replace as necessary.
- Replace fuel filter.
- Adjust rear brakes.

71,250 Miles (114 000 km)
- Change engine oil and filter.
- Adjust rear brakes.

75,000 Miles (120 000 km)
- Change engine oil and filter.
- Inspect water pump weep hole for blockage.
- Replace fuel filter.
- Drain and refill automatic transmission fluid. Replace filter and adjust bands.
- Change rear axle fluid.
- Change front axle fluid (4x4).
- Inspect brake linings.
- Adjust rear brakes.

78,750 Miles (126 000 km)
- Change engine oil and filter.
- Adjust rear brakes.

82,500 Miles (132 000 km)
- Change engine oil and filter.
- Replace fuel filter and clean strainer.
- Adjust rear brakes.

86,250 Miles (138 000 km)
- Change engine oil and filter.
- Adjust rear brakes.

90,000 Miles (144 000 km)
- Change engine oil and filter.
- Inspect drive belts, replace as necessary.
- Inspect fan hub.
- Inspect damper.
- Inspect water pump weep hole for blockage.
- Replace fuel filter.
- Drain and refill automatic transmission fluid. Replace filter and adjust bands.
- Drain and refill transfer case fluid.
- Change rear axle fluid.
- Change front axle fluid (4x4).
- Inspect front wheel bearings. Clean and repack if required (4x2).
- Inspect brake linings.
- Adjust rear brakes.

93,750 Miles (150 000 km)
- Change engine oil and filter.
- Adjust rear brakes.

97,500 Miles (156 000 km)
- Change engine oil and filter.
- Flush and replace engine coolant.
- Replace fuel filter.
- Adjust rear brakes.

101,250 Miles (162 000 km)
- Change engine oil and filter.
- Adjust rear brakes.

105,000 Miles (168 000 km)
- Change engine oil and filter.
- Inspect water pump weep hole for blockage.
- Replace fuel filter.
- Drain and refill automatic transmission fluid. Replace filter and adjust bands.
- Change rear axle fluid.
- Change front axle fluid (4x4).
- Inspect brake linings.
- Adjust rear brakes.

108,750 Miles (174 000 km)
- Change engine oil and filter.
- Adjust rear brakes.

112,500 Miles (180 000 km)
- Change engine oil and filter.
- Inspect drive belts, replace as necessary.
- Replace fuel filter.
- Adjust rear brakes.

116,250 Miles (186 000 km)
- Change engine oil and filter.
- Adjust rear brakes.

120,000 Miles (192 000 km)
- Change engine oil and filter.
- Inspect fan hub.
- Inspect damper.
- Inspect water pump weep hole for blockage.
- Replace fuel filter.

AUTHENTIC RESTORATION™ PRODUCT

AUTHENTIC RESTORATION PRODUCT

COOLING SYSTEM

CONTENTS

GENERAL INFORMATION

COOLING SYSTEM

The cooling system regulates engine operating temperature. It allows the engine to reach normal operating temperature as quickly as possible. It also maintains normal operating temperature and prevents overheating.

The cooling system also provides a means of heating the passenger compartment and cooling the automatic transmission fluid (when A/T equipped). The cooling system is pressurized and uses a centrifugal water pump to circulate coolant throughout the system.

COOLING SYSTEM COMPONENTS

The diesel engine cooling system consists of:

- Cross-flow radiator
- Belt driven water pump
- Belt driven mechanical cooling fan
- Thermal viscous fan drive
- Fan shroud
- Radiator pressure cap
- Vertically mounted thermostat
- Coolant reserve/recovery system
- Transmission oil cooler
- Coolant

COOLING SYSTEM CIRCULATION

Coolant is drawn from the radiator by the water pump. The coolant is then passed through the oil cooler cavity, cooling the engine oil that passes through the engine oil cooler element.

From the oil cooler cavity, the coolant travels through the engine block and circulates around each cylinder bore. The cylinder head gasket is orificed to regulate coolant flow through the cylinder head. Coolant entering the cylinder head on the right side of the block travels through the cylinder head lower cavity, across the valve seat area of the head.

It then joins the coolant entering the head on the left side of the block, which travels through the cylinder head upper cavity, cooling the valve bridges and injector bores. The coolant then travels down the exhaust manifold side of the engine, towards the thermostat. A tap point (fitting) in the cylinder head provides coolant to the cab heater core. This coolant returns from the heater core by way of a transfer pipe that delivers the coolant back to the water pump inlet.

When the engine is below operating temperature, the thermostat is closed, allowing coolant to by-pass the radiator and travel back to the water pump inlet through internal passages in the cylinder head and block.

When the engine reaches operating temperature, the thermostat opens, blocking the by-pass passage to the water pump, and allows coolant to circulate through the radiator.

Coolant flow circuits for the 5.9L diesel engine are shown in (Fig. 1).

COOLANT RESERVE/OVERFLOW SYSTEM

The coolant reserve/overflow system works in conjunction with the radiator pressure cap. It utilizes thermal expansion and contraction of coolant to keep coolant free of trapped air. It provides a volume for expansion and contraction of coolant. Refer to Description and Operation in this group for more information.

COOLANT

The cooling system is designed around the coolant. Coolant flows through the engine water jacket absorbing heat produced during engine operation. The coolant carries the heat to radiator and heater core. Here it is transferred to the ambient air passing through the radiator and heater core fins. The coolant also removes heat from the automatic transmission fluid in vehicles equipped with an automatic transmission.

Mopar AUTHENTIC RESTORATION PRODUCT

GENERAL INFORMATION (Continued)

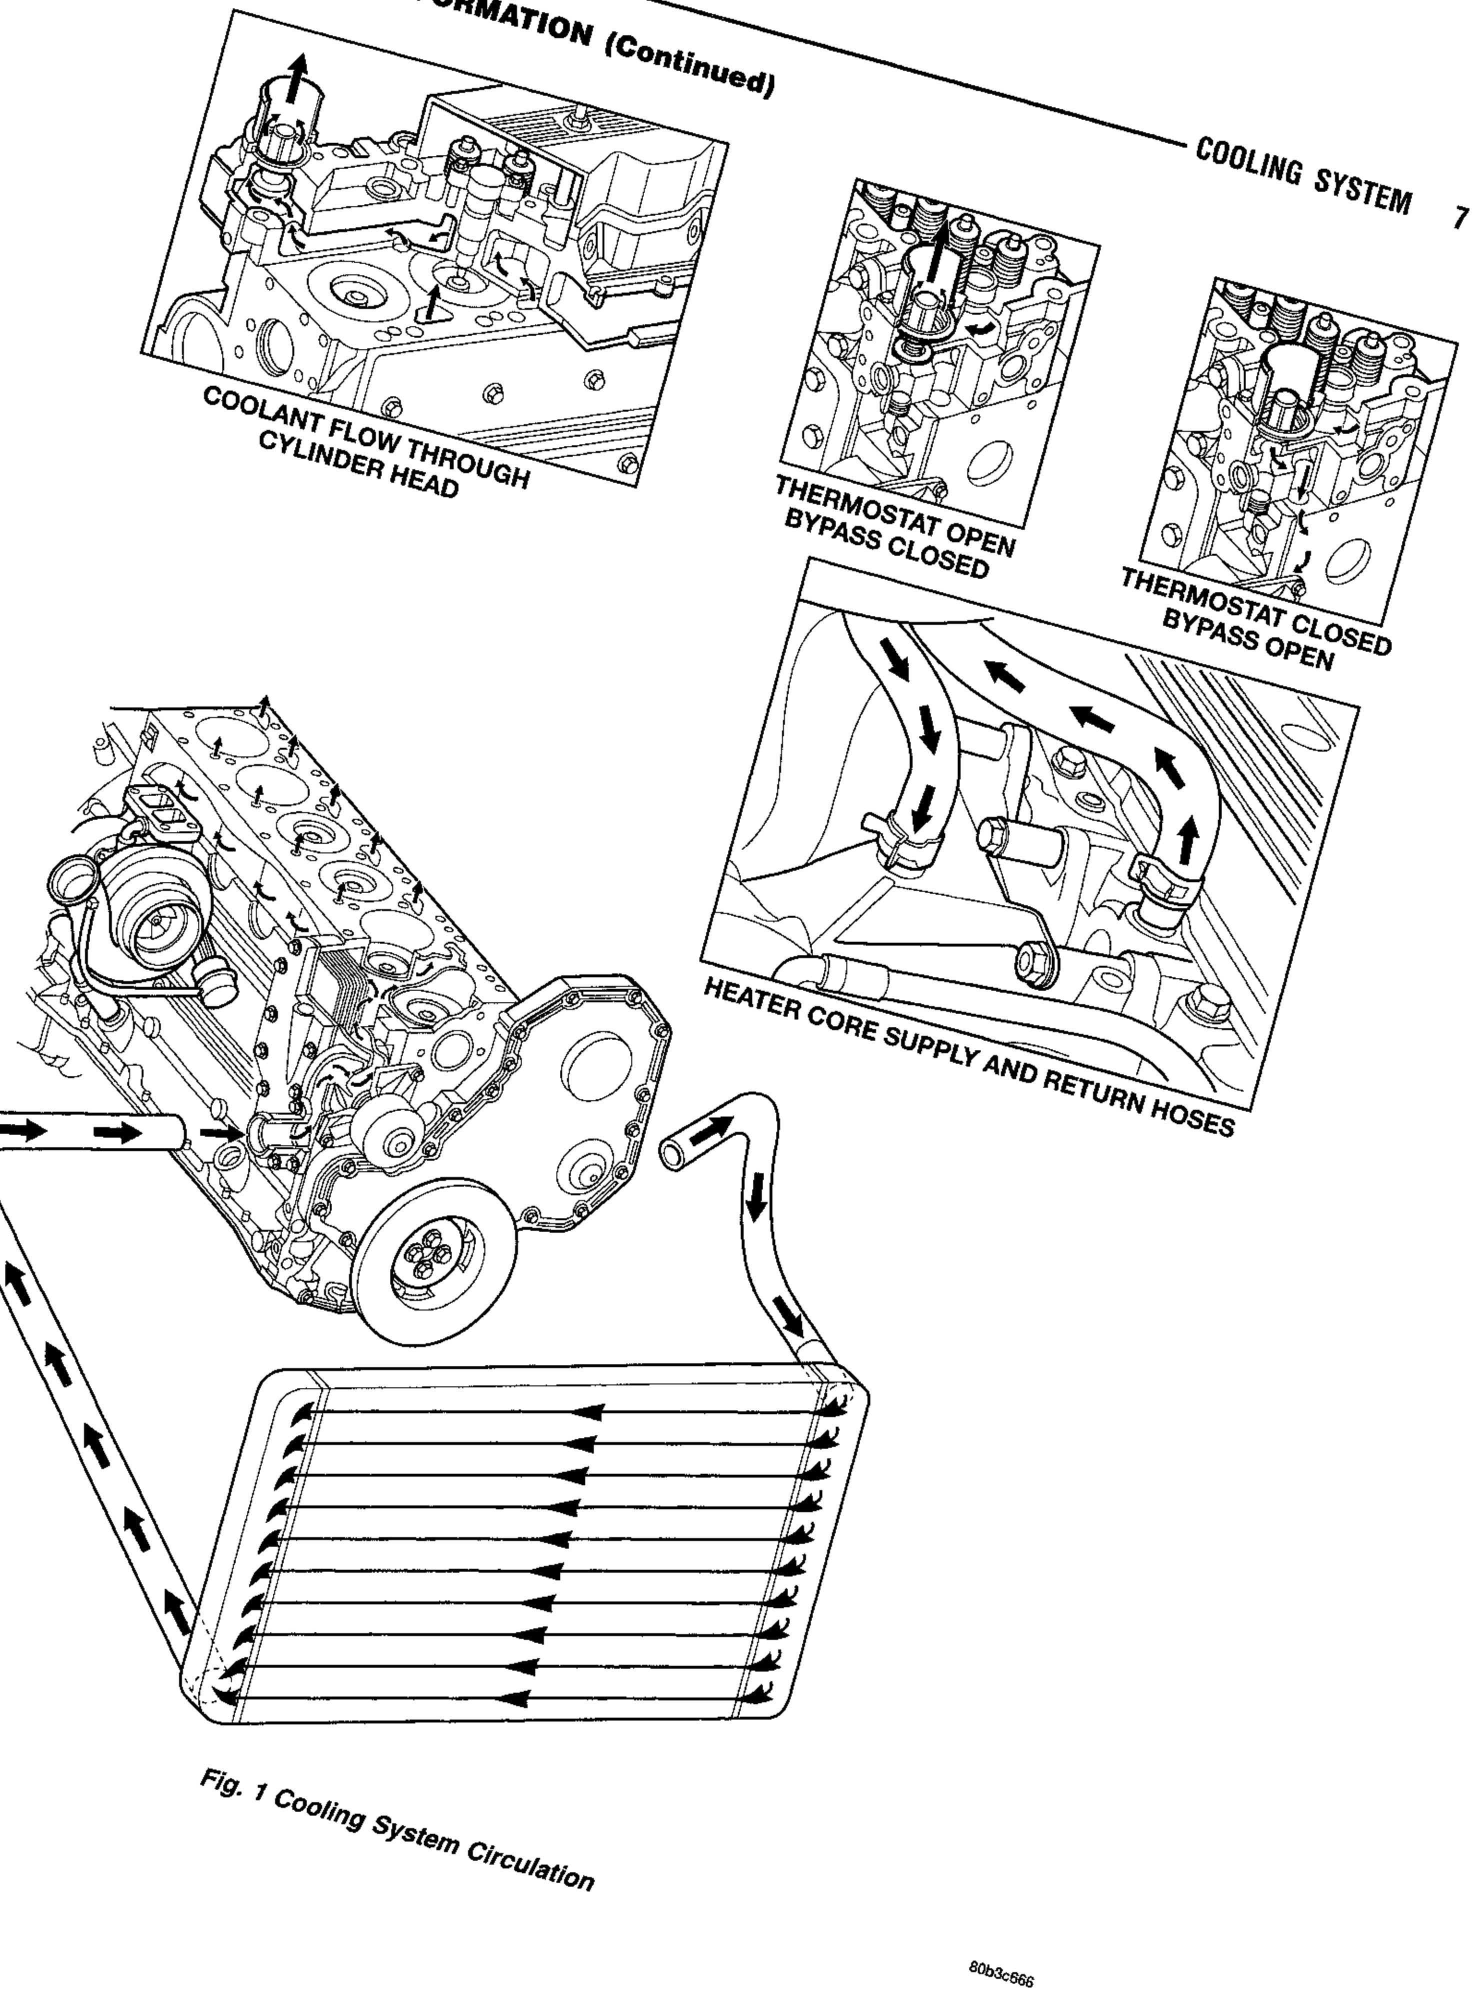

Fig. 1 Cooling System Circulation

GENERAL INFORMATION (Continued)

RADIATOR PRESSURE CAP

Radiators are equipped with a pressure cap, which releases pressure at some point within a range of 97-124 kPa (14-18 psi). The pressure relief point (in pounds) is engraved on top of cap. See Description and Operation in this group for more information.

RADIATOR

The radiator used on the diesel engine is of a cross-flow design with horizontal tubes through the radiator core and vertical side tanks. The radiator consists of an aluminum core and uses brass side tanks.

The radiator supplies sufficient heat transfer to cool the engine and automatic transmission (if equipped).

THERMOSTAT

The thermostat of the 5.9L diesel engine is located in the front of the cylinder head, underneath the water outlet connector (Fig. 2).

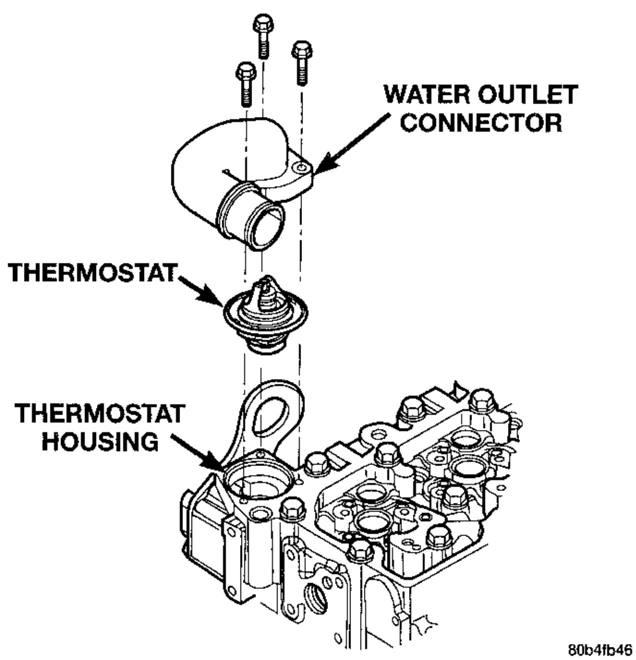

Fig. 2 Thermostat—5.9L Diesel—Typical

The same thermostat is used for winter and summer seasons. An engine should not be operated without a thermostat, except for servicing or testing. Operating without a thermostat causes longer engine warmup time, unreliable warmup performance, increased exhaust emissions and crankcase condensation that can result in sludge formation.

CAUTION: Do not operate an engine without a thermostat, except for servicing or testing. An engine with the thermostat removed will operate in the radiator bypass mode, causing an overheat condition.

ACCESSORY DRIVE BELT AND TENSION

The accessory drive components are driven by a single, crankshaft driven, serpentine accessory drive belt on all engines. An automatic belt tensioner is also used to maintain correct belt tension at all times. This is used on all engines. Refer to Automatic Belt Tensioner proceeding in this group.

Correct accessory drive belt tension is required to be sure of optimum performance of belt driven engine accessories. If specific tension is not maintained, belt slippage may cause; engine overheating, lack of power steering assist, loss of air conditioning capacity, reduced generator output rate and greatly reduced belt life.

It is not necessary to adjust belt tension on the diesel engine because it is equipped with an automatic belt tensioner. The tensioner maintains correct belt tension at all times. For other tensioner information and removal/installation procedures, refer to Accessory Drive Belt Tensioner proceeding in this group. Due to use of this belt tensioner, do not attempt to use a belt tension gauge to measure belt tension.

DESCRIPTION AND OPERATION

THERMOSTAT

The thermostat controls the operating temperature of the engine by controlling the amount of coolant flow to the radiator. When coolant temperature is below 83°C (181°F), the thermostat is closed (Fig. 3).

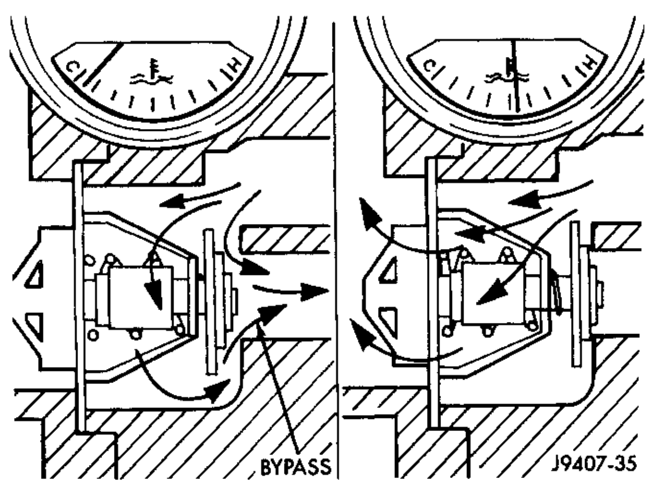

Fig. 3 Thermostat Operation—5.9L Diesel—Typical

DESCRIPTION AND OPERATION (Continued)

The thermostat is vertically mounted and uses caged vent balls (Fig. 4), which act as valves which bleed air from the system. They also quickly vent air when the system is being filled.

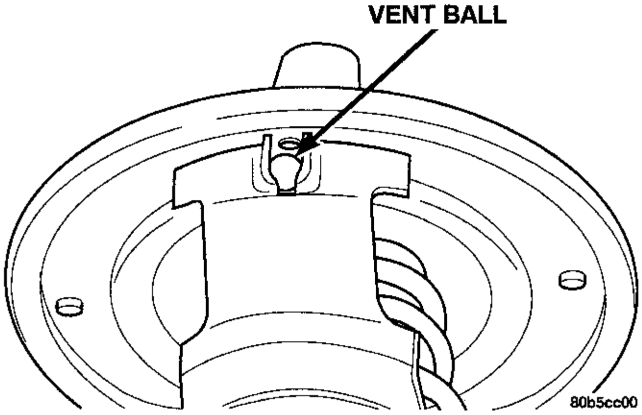

Fig. 4 Thermostat Vent Valve—Typical

When coolant temperature reaches 83°C (181°F), the thermostat begins to open allowing coolant flow to the radiator. This provides quick engine warm-up and overall temperature control. The thermostat is designed to provide a minimum engine operating temperature of 83°C (181°F) and to be fully open for maximum coolant flow at approximately 95°C (203°F). Above 95°C (203°F), coolant temperature is controlled by the radiator, fan and ambient temperature.

AUTOMATIC TRANSMISSION OIL COOLERS

All diesel models equipped with an automatic transmission are equipped with both a main water-to-oil cooler and a separate air-to-oil cooler. Both coolers are supplied as standard equipment on diesel engine powered models when equipped with an automatic transmission.

Transmission oil is cooled when it passes through these coolers.

The main water-to-oil transmission oil cooler is mounted to a bracket on the turbocharger side of the engine (Fig. 5).

The air-to-oil cooler is located in front of and to the left side of the radiator (Fig. 6).

The diesel engine is not equipped with an internal radiator mounted oil cooler.

ACCESSORY DRIVE BELT TENSIONER

Drive belts on all engines are equipped with a spring loaded automatic belt tensioner (Fig. 7). This tensioner maintains constant belt tension at all times and requires no maintenance or adjustment. Refer to Diagnosis and Testing for accessory drive belt and tensioner diagnostic procedures.

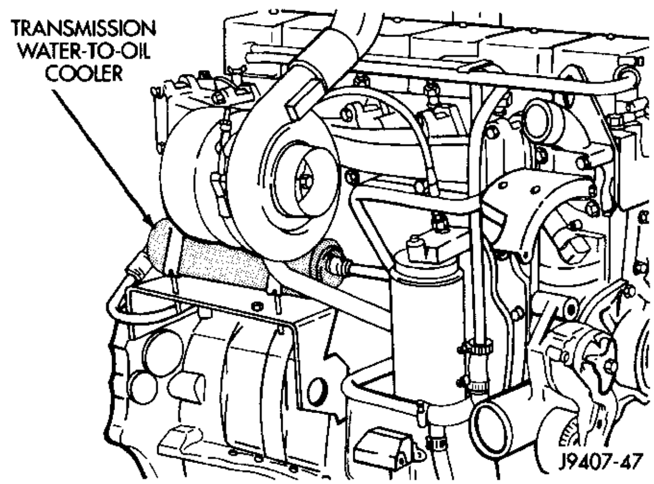

Fig. 5 Transmission Water-To-Oil Cooler—Diesel Engine—Typical

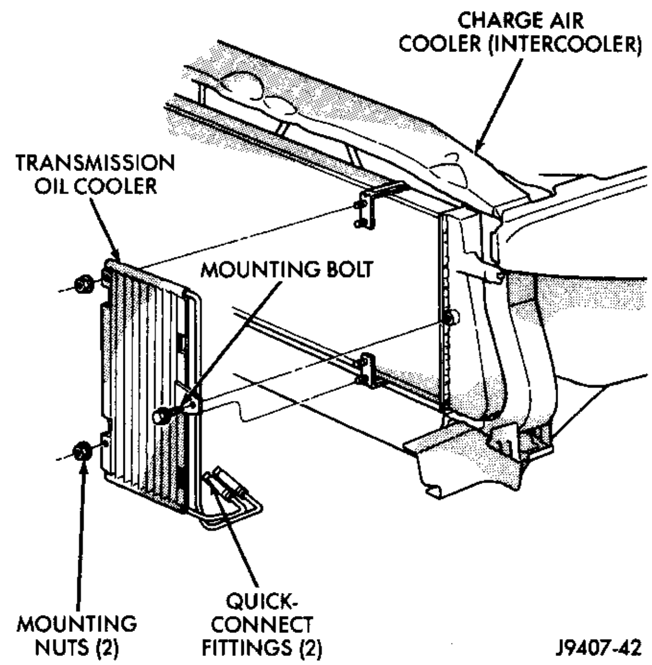

Fig. 6 Auxiliary Transmission Oil Cooler—Diesel Engine

CAUTION: Do not attempt to check belt tension with a belt tension gauge on vehicles equipped with an automatic belt tensioner.

BLOCK HEATER

An optional engine block heater is available on all models. The heater is equipped with a power cord. The cord is attached to an engine compartment component with tie-straps. The heater warms the engine providing easier engine starting and faster warm-up in low temperatures. The heater is mounted in a core hole of the engine cylinder block (in place of a freeze plug) with the heating element immersed in engine

DESCRIPTION AND OPERATION (Continued)

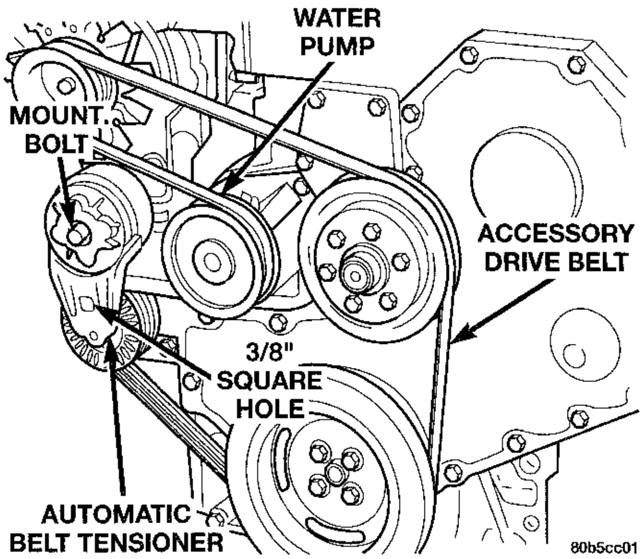

Fig. 7 Belt Tensioner—5.9L Diesel—Typical (non-A/C shown)

coolant. Connect the power cord to a grounded 110-120 volt AC electrical outlet with a grounded three wire extension cord.

WARNING: DO NOT OPERATE ENGINE UNLESS BLOCK HEATER CORD HAS BEEN DISCONNECTED FROM POWER SOURCE AND SECURED IN PLACE. THE POWER CORD MUST BE SECURED IN ITS RETAINING CLIPS AND ROUTED AWAY FROM EXHAUST MANIFOLDS AND MOVING PARTS.

The diesel engine block heater is located on the right side of the engine below the exhaust manifold, threaded into the block next to the oil cooler (Fig. 8).

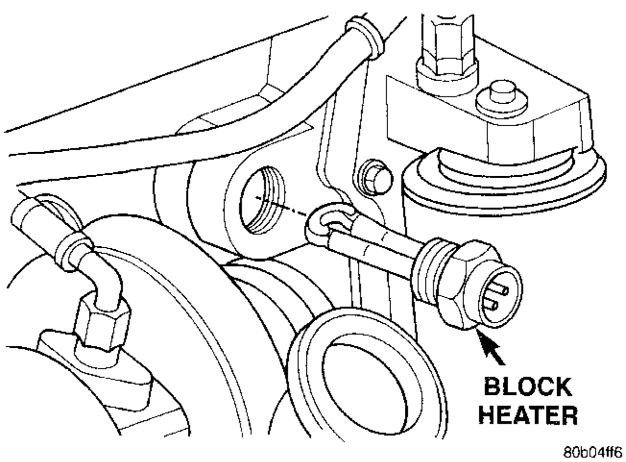

Fig. 8 Engine Block Heater—5.9L Diesel Engine

COOLANT PERFORMANCE

ETHYLENE-GLYCOL MIXTURES

The required ethylene-glycol (antifreeze) and water mixture depends upon the climate and vehicle operating conditions. The recommended mixture of 50/50 ethylene-glycol and water will provide protection against freezing to -37 deg. C (-35 deg. F). The antifreeze concentration **must always** be a minimum of 44 percent, year-round in all climates. **If percentage is lower than 44 percent, engine parts may be eroded by cavitation, and cooling system components may be severely damaged by corrosion.** Maximum protection against freezing is provided with a 68 percent antifreeze concentration, which prevents freezing down to -67.7 deg. C (-90 deg. F). A higher percentage will freeze at a warmer temperature. Also, a higher percentage of antifreeze can cause the engine to overheat because the specific heat of antifreeze is lower than that of water.

100 Percent Ethylene-Glycol—Should Not Be Used in Chrysler Vehicles

Use of 100 percent ethylene-glycol will cause formation of additive deposits in the system, as the corrosion inhibitive additives in ethylene-glycol require the presence of water to dissolve. The deposits act as insulation, causing temperatures to rise to as high as 149 deg. C (300) deg. F). This temperature is hot enough to melt plastic and soften solder. The increased temperature can result in engine detonation. In addition, 100 percent ethylene-glycol freezes at 22 deg. C (-8 deg. F).

Propylene-glycol Formulations—Should Not Be Used in Chrysler Vehicles

Propylene-glycol formulations do not meet Chrysler coolant specifications. It's overall effective temperature range is smaller than that of ethylene-glycol. The freeze point of 50/50 propylene-glycol and water is -32 deg. C (-26 deg. F). 5 deg. C higher than ethylene-glycol's freeze point. The boiling point (protection against summer boil-over) of propylene-glycol is 125 deg. C (257 deg. F) at 96.5 kPa (14 psi), compared to 128 deg. C (263 deg. F) for ethylene-glycol. Use of propylene-glycol can result in boil-over or freeze-up in Chrysler vehicles, which are designed for ethylene-glycol. Propylene glycol also has poorer heat transfer characteristics than ethylene glycol. This can increase cylinder head temperatures under certain conditions.

Propylene-glycol/Ethylene-glycol Mixtures—Should Not Be Used in Chrysler Vehicles

Propylene-glycol/ethylene-glycol Mixtures can cause the destabilization of various corrosion inhibitors, causing damage to the various cooling system

DESCRIPTION AND OPERATION (Continued)

components. Also, once ethylene-glycol and propylene-glycol based coolants are mixed in the vehicle, conventional methods of determining freeze point will not be accurate. Both the refractive index and specific gravity differ between ethylene glycol and propylene glycol.

CAUTION: Richer antifreeze mixtures cannot be measured with normal field equipment and can cause problems associated with 100 percent ethylene-glycol.

COOLANT SELECTION-ADDITIVES

The presence of aluminum components in the cooling system requires strict corrosion protection. Maintain coolant at specified level with a mixture of ethylene glycol based antifreeze and water. Only use an antifreeze containing ALUGARD 340-2 ® such as Mopar Antifreeze. If coolant becomes contaminated or looses color, drain and flush cooling system and fill with correctly mixed solution.

CAUTION: Do not use coolant additives that are claimed to improve engine cooling.

RADIATOR PRESSURE CAP

Radiators are equipped with a pressure cap, which releases pressure at some point within a range of 97-124 kPa (14-18 psi). The pressure relief point (in pounds) is engraved on top of cap.

The cooling system will operate at pressures slightly above atmospheric pressure. This results in a higher coolant boiling point allowing increased radiator cooling capacity. The cap (Fig. 9) contains a spring-loaded pressure relief valve that opens when system pressure reaches release range of 97-124 kPa (14-18 psi).

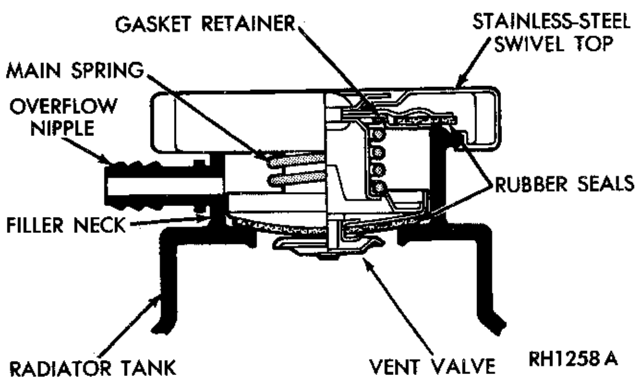

Fig. 9 Radiator Pressure Cap and Filler Neck—Typical

A vent valve in the center of cap allows a small coolant flow through cap when coolant is below boiling temperature. The valve is completely closed when boiling point is reached. As the coolant cools, it contracts and creates a vacuum in the cooling system. This causes the vacuum valve to open and coolant in the reserve/overflow tank to be drawn through its connecting hose into radiator. If the vacuum valve is stuck shut, the radiator hoses will collapse on cool-down. Clean the vent valve (Fig. 9).

A rubber gasket seals radiator filler neck to prevent leakage. This is done to keep system under pressure. It also maintains vacuum during coolant cool-down allowing coolant to return from reserve/overflow tank.

WATER PUMP

The diesel engine water pump draws coolant from radiator outlet and circulates it through engine, heater core and back to radiator inlet. The crankshaft pulley drives the water pump with a serpentine drive belt (Fig. 10). An automatic belt tensioner (Fig. 10) is used to prevent the belt from slipping.

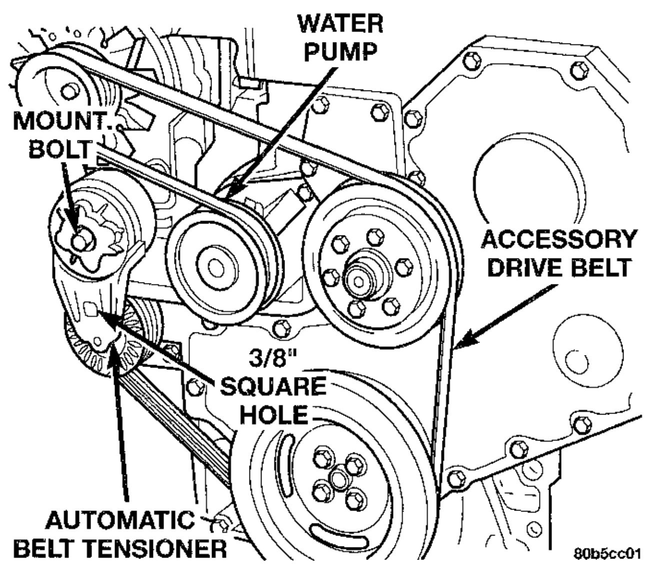

Fig. 10 Water Pump—5.9L Diesel—Typical (non-A/C shown)

COOLING SYSTEM HOSES AND CLAMPS

Rubber hoses route coolant to and from the radiator, intake manifold and heater core. Radiator lower hoses are spring-reinforced to prevent collapse from water pump suction at moderate and high engine speeds.

Inspect the hoses at regular intervals. Replace hoses that are cracked, feel brittle when squeezed or swell excessively when system is pressurized. The use of molded replacement hoses is recommended. When performing a hose inspection, inspect radiator lower hose for proper position and condition of spring.

DESCRIPTION AND OPERATION (Continued)

WARNING: CONSTANT TENSION HOSE CLAMPS ARE USED ON MOST COOLING SYSTEM HOSES. WHEN REMOVING OR INSTALLING, USE ONLY TOOLS DESIGNED FOR SERVICING THIS TYPE OF CLAMP, SUCH AS SPECIAL CLAMP TOOL (NUMBER 6094) (Fig. 11). SNAP-ON CLAMP TOOL (NUMBER HPC-20) MAY BE USED FOR LARGER CLAMPS. ALWAYS WEAR SAFETY GLASSES WHEN SERVICING CONSTANT TENSION CLAMPS.

CAUTION: A number or letter is stamped into the tongue of constant tension clamps (Fig. 12). If replacement is necessary, use only an original equipment clamp with a matching number or letter.

Ordinary worm gear type hose clamps (when equipped) can be removed with a straight screwdriver or a hex socket. **To prevent damage to hoses or clamps, the hose clamps should be tightened to 4 N·m (34 in. lbs.) torque. Do not over tighten hose clamps.**

For all vehicles: In areas where specific routing clamps are not provided, be sure that hoses are positioned with sufficient clearance. Check clearance from exhaust manifolds and pipe, fan blades, drive belts and sway bars. Improperly positioned hoses can be damaged, resulting in coolant loss and engine overheating.

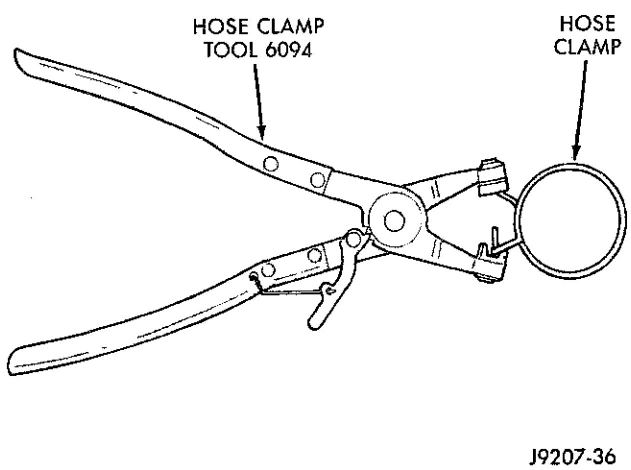

Fig. 11 Hose Clamp Tool—Typical

COOLANT RESERVE/OVERFLOW SYSTEM

The coolant reserve/overflow system works in conjunction with the radiator pressure cap. It utilizes thermal expansion and contraction of coolant to keep coolant free of trapped air. It provides a volume for expansion and contraction of coolant. It also provides a convenient and safe method for checking coolant level and adjusting level at atmospheric pressure. This is done without removing the radiator pressure cap. The system also provides some reserve coolant

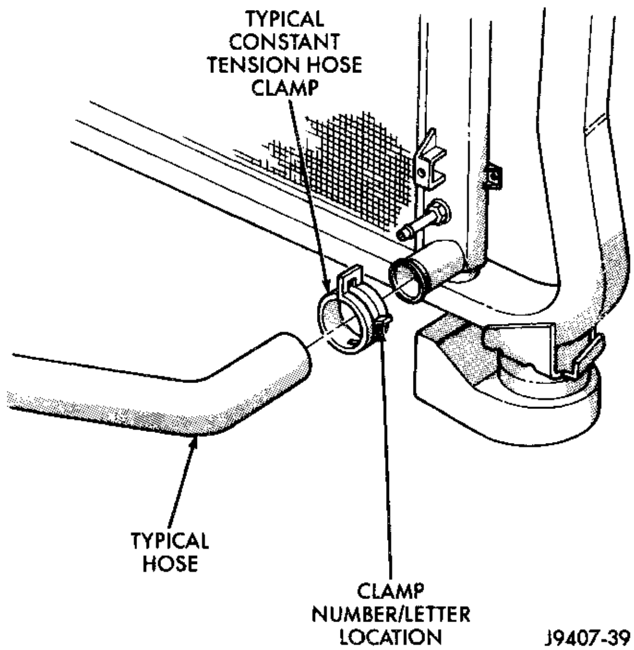

Fig. 12 Clamp Number/Letter Location

to the radiator to cover minor leaks and evaporation or boiling losses.

As the engine cools, a vacuum is formed in the cooling system of both the radiator and engine. Coolant will then be drawn from the coolant tank and returned to a proper level in the radiator.

On the 5.9L diesel engine, the coolant reserve/overflow tank is mounted to the side of the fan shroud (Fig. 13).

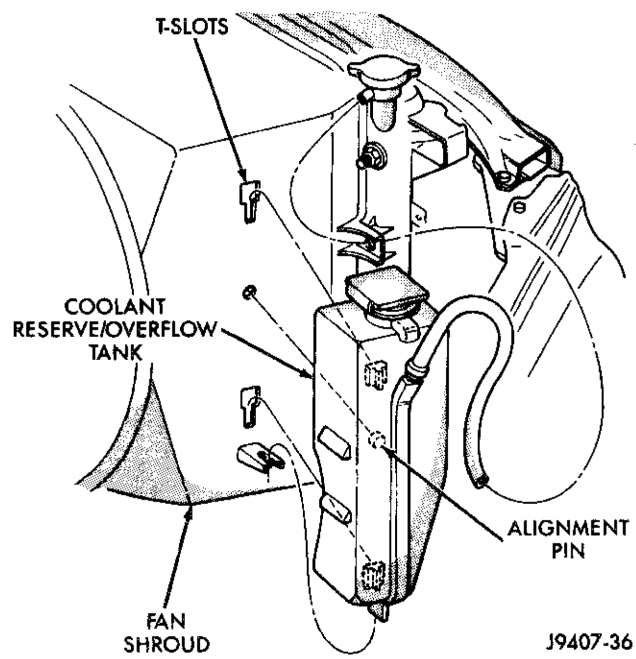

Fig. 13 Coolant Reserve/Overflow Tank

AUTHENTIC RESTORATION PRODUCT

DESCRIPTION AND OPERATION (Continued)

Refer to Coolant Level Check—Service, Deaeration and Radiator Pressure Cap sections in this group for coolant reserve/overflow system operation and service.

Should the reserve/overflow tank become coated with corrosion, it can be cleaned with detergent and water. Rinse tank thoroughly before refilling cooling system as described in the Coolant section of this group.

VISCOUS FAN DRIVE

The thermal viscous fan drive (Fig. 14) is a silicone-fluid- filled coupling used to connect the fan blades to the water pump shaft. The coupling allows the fan to be driven in a normal manner. This is done at low engine speeds while limiting the top speed of the fan to a predetermined maximum level at higher engine speeds.

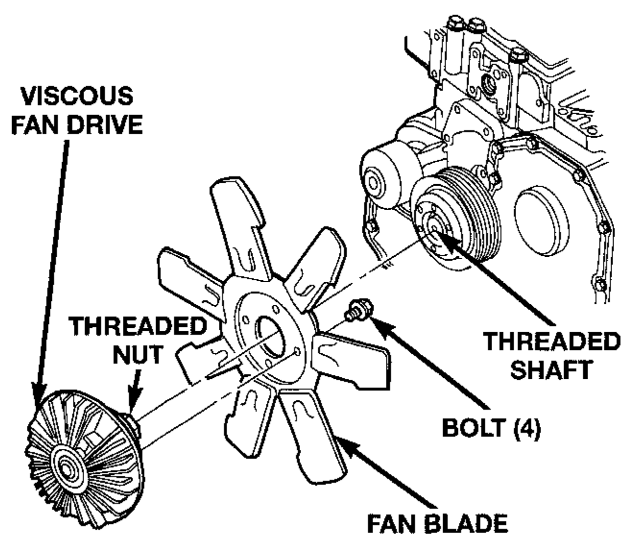

Fig. 14 Viscous Fan/Drive Assembly

A thermostatic bimetallic spring coil is located on the front face of the viscous fan drive unit (a typical viscous unit is shown in (Fig. 15). This spring coil reacts to the temperature of the radiator discharge air. It engages the viscous fan drive for higher fan speed if the air temperature from the radiator rises above a certain point. Until additional engine cooling is necessary, the fan will remain at a reduced rpm regardless of engine speed.

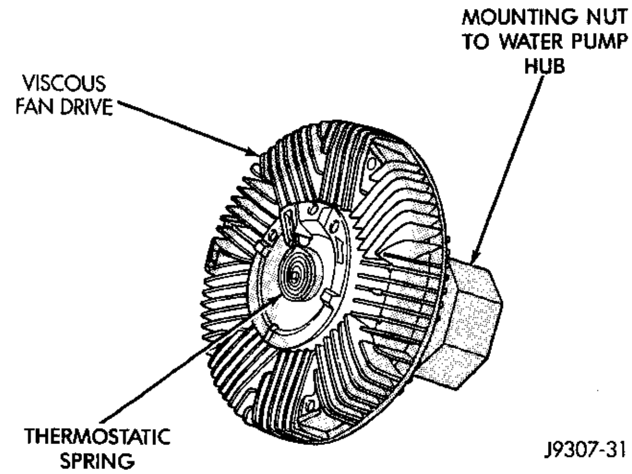

Fig. 15 Viscous Fan Drive—Typical

Only when sufficient heat is present, will the viscous fan drive engage. This is when the air flowing through the radiator core causes a reaction to the bimetallic coil. It then increases fan speed to provide the necessary additional engine cooling.

Once the engine has cooled, the radiator discharge temperature will drop. The bimetallic coil again reacts and the fan speed is reduced to the previous disengaged speed.

CAUTION: If the viscous fan drive is replaced because of mechanical damage, the cooling fan blades should also be inspected. Inspect for fatigue cracks, loose blades, or loose rivets that could have resulted from excessive vibration. Replace fan blade assembly if any of these conditions are found. Also inspect water pump bearing and shaft assembly for any related damage due to a viscous fan drive malfunction.

mopar AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING

PRELIMINARY CHECKS

ENGINE COOLING SYSTEM OVERHEATING

Establish what driving conditions caused the complaint. Abnormal loads on the cooling system such as the following may be the cause:

(1) PROLONGED IDLE, VERY HIGH AMBIENT TEMPERATURE, SLIGHT TAIL WIND AT IDLE, SLOW TRAFFIC, TRAFFIC JAMS, HIGH SPEED OR STEEP GRADES.

Driving techniques that avoid overheating are:

• Idle with A/C off when temperature gauge is at end of normal range.

• Increasing engine speed for more air flow is recommended.

(2) TRAILER TOWING:

Consult Trailer Towing section of owners manual. Do not exceed limits.

(3) AIR CONDITIONING; ADD-ON OR AFTER MARKET:

A maximum cooling package should have been ordered with vehicle if add-on or after market A/C is installed. If not, maximum cooling system components should be installed for model involved per manufacturer's specifications.

(4) RECENT SERVICE OR ACCIDENT REPAIR:

Determine if any recent service has been performed on vehicle that may effect cooling system. This may be:

• Engine adjustments (incorrect timing)

• Slipping engine accessory drive belt(s)

• Brakes (possibly dragging)

• Changed parts. Incorrect water pump or pump rotating in wrong direction due to belt not correctly routed

• Reconditioned radiator or cooling system refilling (possibly under filled or air trapped in system).

NOTE: If investigation reveals none of the previous items as a cause for an engine overheating complaint, refer to following Cooling System Diagnosis charts.

DIAGNOSIS AND TESTING (Continued)

COOLING SYSTEM DIAGNOSIS

COOLING SYSTEM DIAGNOSIS—DIESEL ENGINE

CONDITION	POSSIBLE CAUSES	CORRECTION
TEMPERATURE GAUGE READS LOW	1. Diesel engines, due to their inherent efficiency are slower to warm up than gasoline powered engines, and will operate at lower temperatures when the vehicle is unloaded.	1. The low gauge reading may be normal. Refer to thermostats in the manual text for information. See Thermostat Diagnosis - Diesel Engine.
	2. Is the temperature gauge connected to the temperature gauge coolant sensor on the engine?	2. Check the engine temperature sensor connector in the engine compartment. Refer to Group 8E. Repair as necessary.
	3. Is the temperature gauge operating OK?	3. Check gauge operation. Refer to Group 8E. Repair as necessary.
	4. Coolant level low in cold ambient temperatures accompanied with poor heater performance.	4. Check coolant level in the coolant reserve/overflow tank and the radiator. Inspect system for leaks. Repair leaks as necessary. Refer to the Coolant section of the manual text for WARNINGS and precautions before removing the radiator cap.
	5. Improper operation of internal heater doors or heater controls.	5. Inspect heater and repair as necessary. Refer to Group 24, Heating and Air Conditioning for procedures.
TEMPERATURE GAUGE READS HIGH. COOLANT MAY OR MAY NOT BE LOST OR LEAKING FROM COOLING SYSTEM	1. Trailer is being towed, a steep hill is being climbed, vehicle is operated in slow moving traffic, or engine is being idled with very high ambient (outside) temperatures and the air conditioning is on. Higher altitudes could aggravate these conditions.	1. This may be a temporary condition and repair is not necessary. Turn off the air conditioning and attempt to drive the vehicle without any of the previous conditions. Observe the temperature gauge. The gauge should return to the normal range. If the gauge does not return to normal range, determine the cause for overheating and repair. Refer to POSSIBLE CAUSES (numbers 2 through 17).
	2. Is temperature gauge reading correctly?	2. Check gauge. Refer to Group 8E. Repair as necessary.
	3. Coolant low in coolant reserve/overflow tank and radiator?	3. Check for coolant leaks and repair as necessary. Refer to Testing Cooling System For Leaks in this group.
	4. Pressure cap not installed tightly. If cap is loose, boiling point of coolant will be lowered. Also refer to the following step 5.	4. Tighten cap.
	5. Poor seals at radiator cap.	5. (a) Check condition of cap and cap seals. Refer to Radiator Cap. Replace cap if necessary. (b) Check condition of radiator filler neck. If neck is bent or damaged, replace radiator.

J9507-57

DIAGNOSIS AND TESTING (Continued)

COOLING SYSTEM DIAGNOSIS—DIESEL ENGINE—CONTINUED

CONDITION	POSSIBLE CAUSES	CORRECTION
TEMPERATURE GAUGE READS HIGH. COOLANT MAY OR MAY NOT BE LOST OR LEAKING FROM COOLING SYSTEM - CONT.	6. Coolant level low in radiator but not in coolant reserve/overflow tank. This means the radiator is not drawing coolant from the coolant reserve/overflow tank as the engine cools. As the engine cools, a vacuum is formed in the cooling system of the engine and radiator. If radiator cap seals are defective, or cooling system has leaks, a vacuum can not be formed.	6. (a) Check condition of radiator cap and cap seals. Refer to Radiator Cap in this group. Replace cap if necessary. (b) Check condition of radiator filler neck. If neck is bent or damaged, replace radiator. (c) Check the condition of the hose from the radiator to the coolant tank. It should fit tight at both ends without any kinks or tears. Replace hose if necessary. (d) Check coolant reserve/overflow tank and tank hoses for blockage. Repair as necessary.
	7. Freeze point of antifreeze not correct. Mixture may be too rich.	7. Check antifreeze. Refer to Coolant section of this group. Adjust antifreeze-to-water ratio as required.
	8. Coolant not flowing through system.	8. Check for coolant flow at radiator filler neck with some coolant removed, engine warm and thermostat open. Coolant should be observed flowing through radiator. If flow is not observed, determine reason for lack of flow and repair as necessary.
	9. Radiator or A/C condenser fins are dirty or clogged.	9. Clean insects or debris. Refer to Radiator Cleaning in this group.
	10. Radiator core is corroded or plugged.	10. Have radiator re-cored or replaced.
	11. Aftermarket A/C installed without proper radiator.	11. Install proper radiator.
	12. Dragging brakes.	12. Check and correct as necessary. Refer to Group 5, Brakes in the manual text.
	13. Bug screen is being used reducing airflow.	13. Remove bug screen.
	14. Thermostat partially or completely shut. This is more prevalent on high mileage vehicles.	14. Check thermostat operation and replace as necessary. Refer to Thermostats in this group.
	15. Thermal viscous fan drive not operating properly.	15. Check fan drive operation and replace if necessary. Refer to Viscous Fan Drive in this group.
	16. Cylinder head gasket leaking.	16. Check for cylinder head gasket leaks. Refer to Testing Cooling System For Leaks in this group. For repair, refer to Group 9, Engines.
	17. Heater core leaking.	17. Check heater core for leaks. Refer to Group 24, Heating and Air Conditioning. Repair as necessary.

DIAGNOSIS AND TESTING (Continued)

COOLING SYSTEM DIAGNOSIS—DIESEL ENGINE—CONTINUED

CONDITION	POSSIBLE CAUSES	CORRECTION
TEMPERATURE GAUGE READING IS INCONSISTENT (FLUCTUATES, CYCLES OR IS ERRATIC)	1. During cold weather operation, with the heater blower in the high position, the gauge reading may drop slightly. Fluctuation is also influenced by loads, outside temperature and extended idle time with diesel engines.	1. A normal condition. No correction is necessary.
	2. Temperature gauge or engine mounted gauge sensor defective or shorted. Also, corroded or loose wiring in this circuit.	2. Check operation of gauge and repair if necessary. Refer to Group 8E, Instrument Panel And Gauges.
	3. Gauge reading rises when vehicle is brought to a stop after heavy use (engine still running).	3. A normal condition. No correction is necessary. Gauge reading should return to normal range after vehicle is driven.
	4. Gauge reading high after re-starting a warmed-up (hot) engine.	4. A normal condition. No correction is necessary. The gauge should return to normal range after a few minutes of engine operation.
	5. Coolant level low in radiator (air will build up in the cooling system causing the thermostat to open late).	5. Check and correct coolant leaks. Refer to Testing Cooling System For Leaks in this group.
	6. Cylinder head gasket leaking allowing exhaust gas to enter cooling system causing thermostat to open late.	6. (a) Check for cylinder head gasket leaks with a commercially available Block Leak Tester. Repair as necessary. (b) Check for coolant in the engine oil. Inspect for white steam emitting from exhaust system. Repair as necessary.
	7. Water pump impeller loose on shaft.	7. Check water pump and replace as necessary. Refer to Water Pumps in this group.
	8. Loose accessory drive belt (water pump slipping).	8. Refer to Engine Accessory Drive Belts in this group. Check and correct as necessary.
	9. Air leak on the suction side of water pump allows air to build up in cooling system causing thermostat to open late.	9. Locate leak and repair as necessary.
PRESSURE CAP IS BLOWING OFF STEAM AND/OR COOLANT TO COOLANT TANK. TEMPERATURE GAUGE READING MAY BE ABOVE NORMAL BUT NOT HIGH. COOLANT LEVEL MAY BE HIGH IN COOLANT RESERVE/OVERFLOW TANK	1. Pressure relief valve in radiator cap is defective.	1. Check condition of radiator cap and cap seals. Refer to Radiator Caps in this group. Replace cap as necessary.
COOLANT LOSS TO THE GROUND WITHOUT PRES-SURE CAP BLOWOFF. GAUGE IS READING HIGH OR HOT	1. Coolant leaks in radiator, cooling system hoses, water pump or engine.	1. Pressure test and repair as necessary. Refer to Testing Cooling System For Leaks in this group.

J9507-59

DIAGNOSIS AND TESTING (Continued)

COOLING SYSTEM DIAGNOSIS—DIESEL ENGINE—CONTINUED

CONDITION	POSSIBLE CAUSES	CORRECTION
HOSE OR HOSES COLLAPSE WHEN ENGINE IS COOLING	1. Vacuum created in cooling system on engine cool-down is not being relieved through coolant reserve/overflow system.	1. (a) Radiator cap relief valve stuck. Refer to Radiator Cap in this group. Replace if necessary. (b) Hose between coolant reserve/overflow tank and radiator is kinked. Repair as necessary. (c) Vent at coolant reserve/overflow tank is plugged. Clean vent and repair as necessary. (d) Reserve/overflow tank is internally blocked or plugged. Check for blockage and repair as necessary.
NOISY FAN	1. Fan blades loose.	1. Replace fan blade assembly. Refer to Cooling System Fans in this group.
	2. Fan blades striking a surrounding object.	2. Locate point of fan blade contact and repair as necessary.
	3. Air obstructions at radiator or air conditioning condenser.	3. Remove obstructions and/or clean debris or insects from radiator or A/C condenser.
	4. Thermal viscous fan drive has defective bearing.	4. Replace fan drive. Bearing is not serviceable. Refer to Viscous Fan Drive in this group.
	5. A certain amount of fan noise (roaring) may be evident on models equipped with a thermal viscous fan drive. Some of this noise is normal.	5. Refer to Viscous Fan Drive in this group for an explanation of normal fan noise.
INADEQUATE AIR CONDITIONER PERFORMANCE (COOLING SYSTEM SUSPECTED)	1. Radiator and/or A/C condenser is restricted, obstructed or dirty (insects, leaves etc.).	1. Remove restriction and/or clean as necessary. Refer to Radiator Cleaning in this group.
	2. Thermal viscous fan drive is free-wheeling.	2. Refer to Viscous Fan Drive for diagnosis. Repair as necessary.
	3. Engine is overheating (heat may be transferred from radiator to A/C condenser. High underhood temperatures due to engine overheating may also transfer heat to A/C components).	3. Correct overheating condition. Refer to text in Group 7, Cooling.
	4. Some models with certain engines are equipped with air seals at the radiator and/or A/C condenser. If these seals are missing or damaged, not enough air flow will be pulled through the radiator and A/C condenser.	4. Check for missing or damaged air seals and repair as necessary.

J9507-60

AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING (Continued)

COOLING SYSTEM DIAGNOSIS—DIESEL ENGINE—CONTINUED

CONDITION	POSSIBLE CAUSES	CORRECTION
INADEQUATE HEATER PERFORMANCE. MAY BE ACCOMPANIED BY LOW GAUGE READING	1. Diesel engines, due to their inherent efficiency are slower to warm up than gasoline powered engines, and will operate at lower temperatures when the vehicle is unloaded.	1. The low gauge reading may be normal. Refer to Thermostats in the manual text for information. See Thermostat Diagnosis - Diesel Engine.
	2. Coolant level low.	2. Refer to Testing Cooling System For Leaks in the manual text. Repair as necessary.
	3. Obstructions in heater hose fittings at engine.	3. Remove heater hoses at both ends and check for obstructions. Repair as necessary.
	4. Heater hose kinked.	4. Locate kinked area and repair as necessary.
	5. Water pump is not pumping water to heater core. When the engine is fully warmed up, both heater hoses should be hot to the touch. If only one of the hoses is hot, the water pump may not be operating correctly. The accessory drive belt may also be slipping causing poor water pump operation.	5. Refer to Water Pumps in this group. Repair as necessary. If a slipping belt is detected, refer to Engine Accessory Drive Belts in this group. Repair as necessary.
HEAT ODOR	1. Various heat shields are used at certain drive line components. One or more of these shields may be missing.	1. Locate missing shields and replace or repair as necessary.
	2. Is temperature gauge reading above the normal range?	2. Refer to the previous Temperature Gauge Reads High in these Diagnosis Charts. Repair as necessary.
	3. Is cooling fan operating correctly?	3. Refer to Cooling System Fan in this group for diagnosis. Repair as necessary.
	4. Has undercoating been applied to any unnecessary component?	4. Clean undercoating as necessary.

J9507-61

DIAGNOSIS AND TESTING (Continued)

COOLING SYSTEM DIAGNOSIS—DIESEL ENGINE—CONTINUED

Condition	Possible Causes	Correction
STEAM IS COMING FROM FRONT OF VEHICLE NEAR GRILL AREA WHEN WEATHER IS WET, ENGINE IS WARMED UP AND RUNNING, AND VEHICLE IS STATIONARY. TEMPERATURE GAUGE IS IN NORMAL RANGE	1. During wet weather, moisture (snow, ice or rain condensation) on the radiator will evaporate when the thermostat opens. This opening allows heated water into the radiator. When the moisture contacts the hot radiator, steam may be emitted. This usually occurs in cold weather with no fan or airflow to blow it away.	1. Occasional steam emitting from this area is normal. No repair is necessary.
COOLANT COLOR	1. Coolant color is not necessarily an indication of adequate corrosion or temperature protection. Do not rely on coolant color for determining condition of coolant.	1. Refer to Coolant in this group for antifreeze tests. Adjust antifreeze-to-water ratio as necessary.
COOLANT LEVEL CHANGES IN COOLANT RESERVE/ OVERFLOW TANK. TEMPERATURE GAUGE IS IN NORMAL RANGE	1. Level changes are to be expected as coolant volume fluctuates with engine temperature. If the level in the tank was between the FULL and ADD marks at normal engine operating temperature, the level should return to within that range after operation at elevated temperatures.	1. A normal condition. No repair is necessary.

J9507-55

AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING (Continued)

RADIATOR COOLANT FLOW TEST

Use the following procedure to determine if coolant is flowing through the cooling system.

(1) Idle engine until operating temperature is reached. If the upper radiator hose is warm to the touch, the thermostat is opening and coolant is flowing to the radiator.

WARNING: HOT, PRESSURIZED COOLANT CAN CAUSE INJURY BY SCALDING. USING A RAG TO COVER THE RADIATOR PRESSURE CAP, OPEN RADIATOR CAP SLOWLY TO THE FIRST STOP. THIS WILL ALLOW ANY BUILT-UP PRESSURE TO VENT TO THE RESERVE/OVERFLOW TANK. AFTER PRESSURE BUILD-UP HAS BEEN RELEASED, REMOVE CAP FROM FILLER NECK.

(2) Drain a small amount of coolant from the radiator until the ends of the radiator tubes are visible through the filler neck. Idle the engine at normal operating temperature. If coolant is flowing past the exposed tubes, the coolant is circulating.

TESTING COOLING SYSTEM FOR LEAKS

PRESSURE TESTER METHOD

The engine should be at normal operating temperature. Recheck the system cold if cause of coolant loss is not located during the warm engine examination.

WARNING: HOT, PRESSURIZED COOLANT CAN CAUSE INJURY BY SCALDING.

Carefully remove radiator pressure cap from filler neck and check coolant level. Push down on cap to disengage it from stop tabs. Wipe inside of filler neck and examine lower inside sealing seat for nicks, cracks, paint, dirt and solder residue. Inspect radiator-to- reserve/overflow tank hose for internal obstructions. Insert a wire through the hose to be sure it is not obstructed.

Inspect cams on outside of filler neck. If cams are bent, seating of pressure cap valve and tester seal will be affected. Replace cap if cams are bent.

Attach pressure tester (7700 or an equivalent) to radiator filler neck (Fig. 16).

Operate tester pump to apply 103.4 kPa (15 psi) pressure to system. If hoses enlarge excessively or bulges while testing, replace as necessary. Observe gauge pointer and determine condition of cooling system according to following criteria:

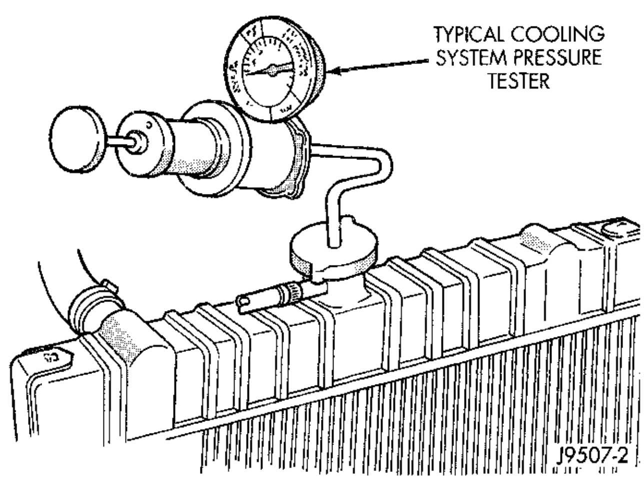

Fig. 16 Pressure Testing Cooling System—Typical

Holds Steady: If pointer remains steady for two minutes, serious coolant leaks are not present in system. However, there could be an internal leak that does not appear with normal system test pressure. If it is certain that coolant is being lost and leaks cannot be detected, inspect for interior leakage or perform Internal Leakage Test.

Drops Slowly: Indicates a small leak or seepage is occurring. Examine all connections for seepage or slight leakage with a flashlight. Inspect radiator, hoses, gasket edges and heater. Seal small leak holes with a sealer lubricant (or equivalent). Repair leak holes and inspect system again with pressure applied.

Drops Quickly: Indicates that serious leakage is occurring. Examine system for external leakage. If leaks are not visible, inspect for internal leakage. Large radiator leak holes should be repaired by a reputable radiator repair shop.

ULTRAVIOLET LIGHT METHOD

A leak detection additive is available through the parts department that can be added to cooling system. The additive is highly visible under ultraviolet light (black light). Pour one ounce of additive into cooling system. Place heater control unit in HEAT position. Start and operate engine until radiator upper hose is warm to touch. Aim the commercially available black light tool at components to be checked. If leaks are present, black light will cause additive to glow a bright green color.

DIAGNOSIS AND TESTING (Continued)

The black light can be used in conjunction with a pressure tester to determine if any external leaks exist (Fig. 17).

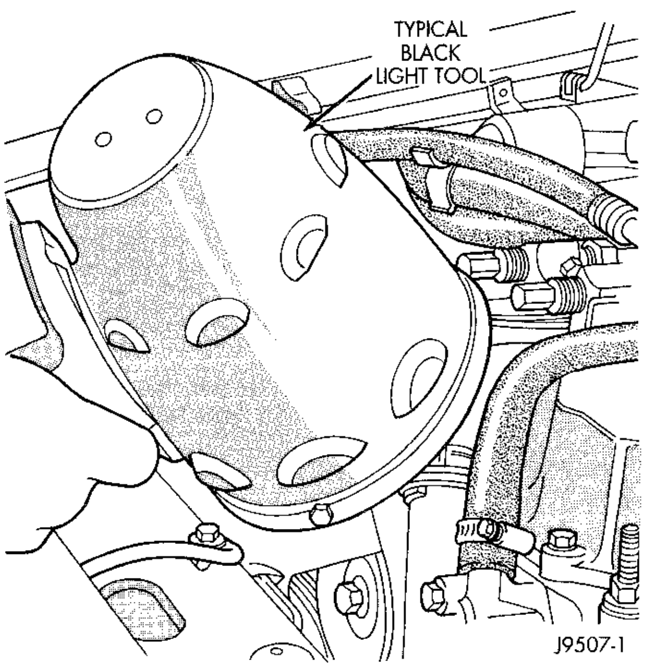

Fig. 17 Leak Detection Using Black Light—Typical

INTERNAL LEAKAGE TEST

Remove engine oil pan drain plug and drain a small amount of engine oil. If coolant is present in the pan, it will drain first because it is heavier than oil. An alternative method is to operate engine for a short period to churn the oil. After this is done, remove engine dipstick and inspect for water globules. Also inspect transmission dipstick for water globules and transmission fluid cooler for leakage.

WARNING: WITH COOLING SYSTEM PRESSURE TESTER TOOL INSTALLED ON RADIATOR, DO NOT ALLOW PRESSURE TO EXCEED 110 KPA (20 PSI). PRESSURE WILL BUILD UP QUICKLY IF A COMBUSTION LEAK IS PRESENT. TO RELEASE PRESSURE, ROCK TESTER FROM SIDE TO SIDE. WHEN REMOVING TESTER, DO NOT TURN TESTER MORE THAN 1/2 TURN IF SYSTEM IS UNDER PRESSURE.

Operate engine without pressure cap on radiator until thermostat opens. Attach a pressure tester to filler neck. If pressure builds up quickly it indicates a combustion leak exists. This is usually the result of a cylinder head gasket leak or crack in engine. Repair as necessary.

If there is not an immediate pressure increase, pump the pressure tester. Do this until indicated pressure is within system range of 110 kPa (16 psi). Fluctuation of gauge pointer indicates compression or combustion leakage into cooling system.

Because the vehicle is equipped with a catalytic converter, **do not** remove spark plug cables or short out cylinders (non-diesel engines) to isolate compression leak.

If the needle on dial of pressure tester does not fluctuate, race engine a few times to check for an abnormal amount of coolant or steam. This would be emitting from exhaust pipe. Coolant or steam from exhaust pipe may indicate a faulty cylinder head gasket, cracked engine cylinder block or cylinder head.

A convenient check for exhaust gas leakage into cooling system is provided by a commercially available Block Leak Check tool. Follow manufacturers instructions when using this product.

COMBUSTION LEAKAGE TEST—WITHOUT PRESSURE TESTER

DO NOT WASTE reusable coolant. If solution is clean, drain coolant into a clean container for reuse.

WARNING: DO NOT REMOVE CYLINDER BLOCK DRAIN PLUGS OR LOOSEN RADIATOR DRAINCOCK WITH SYSTEM HOT AND UNDER PRESSURE. SERIOUS BURNS FROM COOLANT CAN OCCUR.

Drain sufficient coolant to allow thermostat removal. Refer to Thermostat Replacement. Disconnect water pump drive belt.

Add coolant to radiator to bring level to within 6.3 mm (1/4 in) of top of thermostat housing.

CAUTION: Avoid overheating. Do not operate engine for an excessive period of time. Open draincock immediately after test to eliminate boil over.

Start engine and accelerate rapidly three times, to approximately 3000 rpm (2000 rpm for diesel) while observing coolant. If internal engine combustion gases are leaking into cooling system, bubbles will appear in coolant. If bubbles do not appear, internal combustion gas leakage is not present.

VISCOUS FAN DRIVE

NOISE

It is normal for fan noise to be louder (roaring) when:

• The underhood temperature is above the engagement point for the viscous drive coupling. This may occur when ambient (outside air temperature) is very high.

• Engine loads and temperatures are high such as when towing a trailer.

• Cool silicone fluid within the fan drive unit is being redistributed back to its normal disengaged (warm) position. This can occur during the first 15 seconds to one minute after engine start-up on a cold engine.

DIAGNOSIS AND TESTING (Continued)

LEAKS

Viscous fan drive operation is not affected by small oil stains near the drive bearing. If leakage appears excessive, replace the fan drive unit.

TESTING

If the fan assembly free-wheels without drag (the fan blades will revolve more than five turns when spun by hand), replace the fan drive. This spin test must be performed when the engine is cool.

For the following test, the cooling system must be in good condition. It also will ensure against excessively high coolant temperature.

WARNING: BE SURE THAT THERE IS ADEQUATE FAN BLADE CLEARANCE BEFORE DRILLING.

(1) Drill a 3.18-mm (1/8-in) diameter hole in the top center of the fan shroud.

(2) Obtain a dial thermometer with an 8 inch stem (or equivalent). It should have a range of -18°-to-105°C (0°-to-220° F). Insert thermometer through the hole in the shroud. Be sure that there is adequate clearance from the fan blades.

(3) Connect a tachometer and an engine ignition timing light. The timing light is to be used as a strobe light. This step cannot be used on the diesel engine.

(4) Block the air flow through the radiator. Secure a sheet of plastic in front of the radiator (or air conditioner condenser). Use tape at the top to secure the plastic and be sure that the air flow is blocked.

(5) Be sure that the air conditioner (if equipped) is turned off.

WARNING: USE EXTREME CAUTION WHEN THE ENGINE IS OPERATING. DO NOT STAND IN A DIRECT LINE WITH THE FAN. DO NOT PUT YOUR HANDS NEAR THE PULLEYS, BELTS OR FAN. DO NOT WEAR LOOSE CLOTHING.

(6) Start the engine and operate at 1500 rpm. Within ten minutes the air temperature (indicated on the dial thermometer) should be up to 88° C (190° F). Fan drive **engagement** should start to occur at/between 71° to 82° C (160° to 179° F)

Engagement is distinguishable by a definite **increase** in fan flow noise (roaring). The timing light also will indicate an increase in the speed of the fan (non-diesel only).

(7) When viscous drive engagement is verified, remove the plastic sheet. Fan drive **disengagement** should start to occur at between 57° to 79° C (135° to 175° F). A definite **decrease** of fan flow noise (roaring) should be noticed. If not, replace the defective viscous fan drive unit.

CAUTION: If the viscous fan drive is replaced because of mechanical damage, the cooling fan blades should also be inspected. Inspect for fatigue cracks, loose blades, or loose rivets that could have resulted from excessive vibration. Replace fan blade assembly if any of these conditions are found. Also inspect water pump bearing and shaft assembly for any related damage due to a viscous fan drive malfunction.

ACCESSORY DRIVE BELT DIAGNOSIS

VISUAL DIAGNOSIS

When diagnosing serpentine accessory drive belts, small cracks that run across the ribbed surface of the belt from rib to rib (Fig. 18), are considered normal. These are not a reason to replace the belt. However, cracks running along a rib (not across) are **not** normal. Any belt with cracks running along a rib must be replaced (Fig. 18). Also replace the belt if it has excessive wear, frayed cords or severe glazing.

Refer to the Accessory Drive Belt Diagnosis charts for further belt diagnosis.

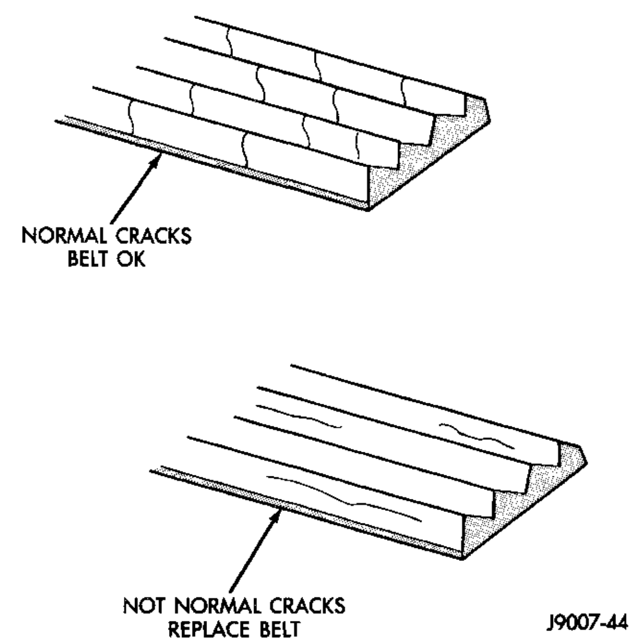

Fig. 18 Belt Wear Patterns

NOISE DIAGNOSIS

Noises generated by the accessory drive belt are most noticeable at idle. Before replacing a belt to resolve a noise condition, inspect all of the accessory drive pulleys for alignment, glazing, or excessive end play.

DIAGNOSIS AND TESTING (Continued)

ACCESSORY DRIVE BELT DIAGNOSIS CHART

CONDITION	POSSIBLE CAUSES	CORRECTION
RIB CHUNKING (One or more ribs has separated from belt body)	1. Foreign objects imbedded in pulley grooves.	1. Remove foreign objects from pulley grooves. Replace belt.
	2. Installation damage	2. Replace belt
RIB OR BELT WEAR	1. Pulley misaligned	1. Align pulley(s)
	2. Abrasive environment	2. Clean pulley(s). Replace belt if necessary
	3. Rusted pulley(s)	3. Clean rust from pulley(s)
	4. Sharp or jagged pulley groove tips	4. Replace pulley. Inspect belt.
	5. Belt rubber deteriorated	5. Replace belt
BELT SLIPS	1. Belt slipping because of insufficient tension	1. Inspect/Replace tensioner if necessary
	2. Belt or pulley exposed to substance that has reduced friction (belt dressing, oil, ethylene glycol)	2. Replace belt and clean pulleys
	3. Driven component bearing failure (seizure)	3. Replace faulty component or bearing
	4. Belt glazed or hardened from heat and excessive slippage	4. Replace belt.
LONGITUDAL BELT CRACKING	1. Belt has mistracked from pulley groove	1. Replace belt
	2. Pulley groove tip has worn away rubber to tensile member	2. Replace belt
"GROOVE JUMPING" (Belt does not maintain correct position on pulley)	1. Incorrect belt tension	1. Inspect/Replace tensioner if necessary
	2. Pulley(s) not within design tolerance	2. Replace pulley(s)
	3. Foreign object(s) in grooves	3. Remove foreign objects from grooves
	4. Pulley misalignment	4. Align component
	5. Belt cordline is broken	5. Replace belt
BELT BROKEN (Note: Identify and correct problem before new belt is installed)	1. Incorrect belt tension	1. Replace Inspect/Replace tensioner if necessary
	2. Tensile member damaged during belt installation	2. Replace belt
	3. Severe misalignment	3. Align pulley(s)
	4. Bracket, pulley, or bearing failure	4. Replace defective component and belt

AUTHENTIC RESTORATION

DIAGNOSIS AND TESTING (Continued)

CONDITION	POSSIBLE CAUSES	CORRECTION
NOISE (Objectional squeal, spueak, or rumble is heard or felt while drive belt is in operation)	1. Incorrect belt tension	1. Inspect/Replace tensioner if necessary
	2. Bearing noise	2. Locate and repair
	3. Belt misalignment	3. Align belt/pulley(s)
	4. Belt to pulley mismatch	4. Install correct belt
	5. Driven component induced vibration	5. Locate defective driven component and repair
TENSION SHEETING FABRIC FAILURE (Woven fabric on outside, circumference of belt has cracked or separated from body of belt)	1. Tension sheeting contacting stationary object	1. Correct rubbing condition
	2. Excessive heat causing woven fabric to age	2. Replace belt
	3. Tension sheeting splice has fractured	3. Replace belt
CORD EDGE FAILURE (Tensile member exposed at edges of belt or separated from belt body)	1. Incorrect belt tension	1. Inspect/Replace tensioner if necessary
	2. Belt contacting stationary object	2. Replace belt
	3. Pulley(s) out of tolerance	3. Replace pulley
	4. Insufficient adhesion between tensile member and rubber matrix	4. Replace belt

THERMOSTAT

The cooling system used with the diesel engine provides the extra coolant capacity and extra cooling protection needed for higher GVWR (Gross Vehicle Weight Rating) and GCWR (Gross Combined Weight Rating) vehicles.

This system capacity will not effect warm up or cold weather operating characteristics if the thermostat is operating properly. This is because coolant will be held in the engine until it reaches the thermostat "set" temperature.

Diesel engines, due to their inherent efficiency are slower to warm up than gasoline powered engines, and will operate at lower temperatures when the vehicle is unloaded. Because of this, lower temperature gauge readings for diesel versus gasoline engines may, at times be normal.

Typically, complaints of low engine coolant temperature are observed as low heater output when combined with cool or cold outside temperatures.

To help promote faster engine warm-up, the electric engine block heater must be used with cool or cold outside temperatures. This will help keep the engine coolant warm when the vehicle is parked. Use the block heater if the outside temperature is below 4°C (40°F). **Do not use the block heater if the outside temperature is above 4°C (40°F).**

A "Cold Weather Cover" is available from the parts department through the Mopar® Accessories product line. This accessory cover is designed to block airflow entering the radiator and engine compartment to promote faster engine warm-up. It attaches to the front of the vehicle at the grill opening. **The cover is to be used with cool or cold temperatures only. If used with high outside temperatures, serious engine damage could result.** Refer to the literature supplied with the cover for additional information.

TESTING

The following test procedure is to be used for the **diesel engine only.**

(1) To determine if the thermostat is defective, it must be removed from the vehicle. Refer to Thermostats for removal and installation procedures.

(2) After the thermostat has been removed, examine the thermostat and inside of thermostat housing for contaminants. If contaminants are found, the thermostat may already be in a "stuck open" position. Flush the cooling system before replacing thermostat. Refer to Cooling System Cleaning/Reverse Flushing in this group for additional information.

(3) Place the thermostat into a container filled with water.

(4) Place the container on a hot plate or other suitable heating device.

(5) Place a commercially available radiator thermometer into the water.

DIAGNOSIS AND TESTING (Continued)

(6) Apply heat to the water while observing the thermostat and thermometer.

(7) When the water temperature reaches 83°C (181°F) the thermostat should start to open (valve will start to move). If the valve starts to move before this temperature is reached, it is opening too early. Replace thermostat. The thermostat should be fully open (valve will stop moving) at 95°C (203°F).

(7) If the valve is still moving when the water temperature reaches 203°, it is opening too late. Replace thermostat.

(7) If the valve refuses to move at any time, replace thermostat.

WATER PUMP

A quick test to determine if pump is working is to check if heater warms properly. A defective water pump will not be able to circulate heated coolant through the long heater hose to the heater core.

RADIATOR CAP-TO-FILLER NECK SEAL—PRESSURE RELIEF CHECK

The pressure cap upper gasket (seal) pressure relief can be tested by removing overflow hose from radiator filler neck nipple. Attach hose of pressure tester tool 7700 (or equivalent) to nipple. It will be necessary to disconnect hose from its adapter for filler neck. Pump air into radiator. The pressure cap upper gasket should relieve at 69-124 kPa (10-18 psi) and hold pressure at a minimum of 55 kPa (8 psi).

WARNING: THE WARNING WORDS —DO NOT OPEN HOT— ON RADIATOR PRESSURE CAP, ARE A SAFETY PRECAUTION. WHEN HOT, PRESSURE BUILDS UP IN COOLING SYSTEM. TO PREVENT SCALDING OR INJURY, RADIATOR CAP SHOULD NOT BE REMOVED WHILE SYSTEM IS HOT AND/OR UNDER PRESSURE.

Do not remove radiator cap at any time **except** for the following purposes:

- Check and adjust antifreeze freeze point
- Refill system with new antifreeze
- Conducting service procedures
- Checking for vacuum leaks

WARNING: IF VEHICLE HAS BEEN RUN RECENTLY, WAIT AT LEAST 15 MINUTES BEFORE REMOVING RADIATOR CAP. WITH A RAG, SQUEEZE RADIATOR UPPER HOSE TO CHECK IF SYSTEM IS UNDER PRESSURE. PLACE A RAG OVER CAP AND WITHOUT PUSHING CAP DOWN, ROTATE IT COUNTER-CLOCKWISE TO FIRST STOP. ALLOW FLUID TO ESCAPE THROUGH THE COOLANT RESERVE/OVERFLOW HOSE INTO RESERVE/ OVERFLOW TANK. SQUEEZE RADIATOR UPPER HOSE TO DETERMINE WHEN PRESSURE HAS BEEN RELEASED. WHEN COOLANT AND STEAM STOP BEING PUSHED INTO TANK AND SYSTEM PRESSURE DROPS, REMOVE RADIATOR CAP COMPLETELY.

RADIATOR CAPS—PRESSURE TESTING

Remove cap from radiator. Be sure that sealing surfaces are clean. Moisten rubber gasket with water and install cap on pressure tester 7700 or an equivalent (Fig. 19).

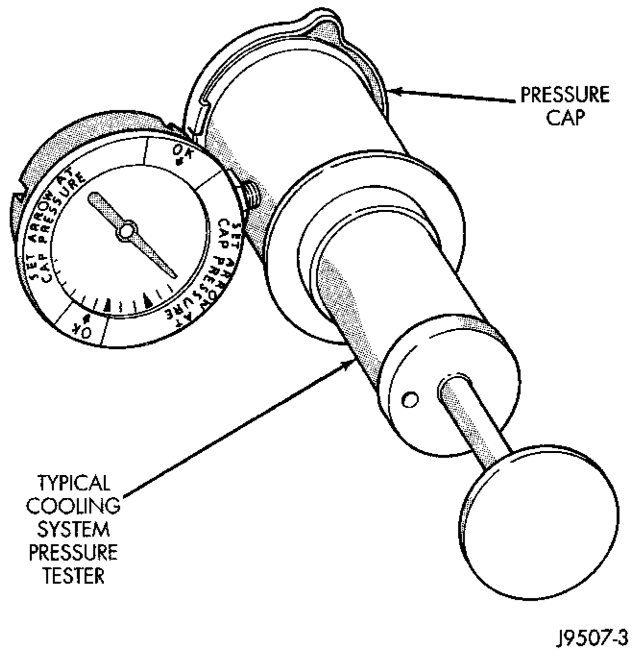

Fig. 19 Pressure Testing Radiator Cap—Typical Tester

Operate tester pump to bring pressure to 104 kPa (15 psi) on gauge. If pressure cap fails to hold pressure of at least 97 kPa (14 psi) replace cap. Refer to **CAUTION** below.

The pressure cap may test properly while positioned on tool 7700 (or equivalent). It may not hold pressure or vacuum when installed on radiator. If so, inspect radiator filler neck and cap's top gasket for damage. Also inspect for dirt or distortion that may prevent cap from sealing properly.

CAUTION: Radiator pressure testing tools are very sensitive to small air leaks, which will not cause cooling system problems. A pressure cap that does not have a history of coolant loss should not be replaced just because it leaks slowly when tested with this tool. Add water to tool. Turn tool upside down and recheck pressure cap to confirm that cap needs replacement.

DIAGNOSIS AND TESTING (Continued)

COOLANT—LOW LEVEL AERATION

If the coolant level in the radiator drops below the top of the radiator core tubes, air will enter the system.

Low coolant level can cause the thermostat pellet to be suspended in air instead of coolant. This will cause the thermostat to open later, which in turn causes higher coolant temperature. Air trapped in cooling system also reduces the amount of coolant circulating in the heater core. This may result in low heat output.

DEAERATION

As the engine operates, air trapped in the cooling system gathers under the radiator cap. The next time engine is operated, thermal expansion of coolant will push trapped air past radiator cap into coolant reserve/overflow tank. Here it escapes to atmosphere in the tank. When engine cools down the coolant, it will be drawn from reserve/overflow tank into radiator to replace removed air.

SERVICE PROCEDURES

COOLANT LEVEL CHECK—ROUTINE

NOTE: Do not remove radiator cap for routine coolant level inspections. The coolant level can be checked at the coolant reserve/overflow tank.

The coolant reserve/overflow system provides a quick visual method for determining the coolant level without removing the radiator pressure cap. With engine idling and at normal operating temperature, observe coolant level in coolant reserve/overflow tank. The coolant level should be between the ADD and FULL marks.

COOLANT SERVICE

Refer to your owner's manual for recommended coolant service intervals.

ADDING ADDITIONAL COOLANT—ROUTINE

Do not remove the radiator cap to add coolant to the system. When adding coolant to maintain the correct level, do so at the coolant reserve/overflow tank with a 50/50 mixture of ethylene glycol antifreeze (containing Alugard 340-2 ®) and water. Remove the radiator cap only for testing or when refilling the system after service. Removing cap unnecessarily can cause loss of coolant and allow air to enter system. This produces corrosion.

COOLANT LEVEL CHECK—SERVICE

The cooling system is closed and designed to maintain coolant level to the top of the radiator.

WARNING: DO NOT OPEN RADIATOR DRAINCOCK WITH ENGINE RUNNING OR WHILE ENGINE IS HOT AND COOLING SYSTEM IS UNDER PRESSURE.

When vehicle servicing requires a coolant level check in the radiator, drain several ounces of coolant from the radiator drain cock. Do this while observing the coolant reserve/overflow system tank. The coolant level in the reserve/overflow tank should drop slightly. If not, inspect for a leak between radiator and coolant reserve/overflow system connection. Remove radiator cap. The coolant level should be to the top of the radiator. If not and if coolant level in reserve/overflow tank is at the ADD mark, check for:

- An air leak in the coolant reserve/overflow tank
- An air leak in the radiator filler neck
- Leak in the pressure cap seal to the radiator filler neck

DRAINING COOLING SYSTEM

WARNING: DO NOT REMOVE THE CYLINDER BLOCK DRAIN PLUGS OR LOOSEN THE RADIATOR DRAIN PLUG WITH SYSTEM HOT AND UNDER PRESSURE. SERIOUS BURNS FROM COOLANT CAN OCCUR.

DO NOT WASTE reusable coolant. If the solution is clean, drain the coolant into a clean container for reuse.

(1) Start the engine and place the heater control temperature selector in the Full-On position. Engine vacuum is needed to actuate the heater controls.

(2) Turn the ignition off.

(3) Do not remove radiator cap when draining coolant from reserve/overflow tank. Open radiator drain plug and when tank is empty, remove radiator cap. If the coolant reserve/overflow tank does not drain, refer to the Testing Cooling System for Leaks section in this group. The coolant need not be removed from tank unless the system is being refilled with fresh mixture.

(4) Remove radiator pressure cap and allow system to drain completely.

REFILLING COOLING SYSTEM

Clean cooling system prior to refilling. Refer to Cooling System Cleaning section of this group.

(1) Install the cylinder block drain plugs (Fig.).

(2) Close radiator drain plug.

(3) Fill the cooling system with a 50/50 mixture of water and antifreeze.

(4) Fill coolant reserve/overflow tank to the FULL mark.

(5) Start and operate engine until thermostat opens. Upper radiator hose should be warm to touch.

SERVICE PROCEDURES (Continued)

(6) If necessary, add 50/50 water and antifreeze mixture to the coolant reserve/overflow tank to maintain coolant level. This level should be between the ADD and FULL marks. The level in the reserve/overflow tank may drop below the ADD mark after three or four warm-up and cool-down cycles.

COOLING SYSTEM CLEANING/REVERSE FLUSHING

CLEANING

Drain cooling system and refill with water. Run engine with radiator cap installed until upper radiator hose is hot. Stop engine and drain water from system. If water is dirty, fill system with water, run engine and drain system. Repeat until water drains clean.

REVERSE FLUSHING

Reverse flushing of cooling system is the forcing of water through the cooling system in the direction opposite of normal coolant flow. It is usually only necessary with very dirty systems with evidence of partial plugging.

REVERSE FLUSHING RADIATOR

Disconnect radiator hoses from radiator inlet and outlet. Attach a section of radiator hose to radiator bottom outlet fitting and insert flushing gun. Connect a water supply hose and air supply hose to flushing gun.

CAUTION: Internal radiator pressure must not exceed 138 kPa (20 psi) as damage to radiator may result.

Allow radiator to fill with water. When radiator is filled, apply air in short blasts. Allow radiator to refill between blasts. Continue this reverse flushing until clean water flows out through rear of radiator cooling tube passages. Have radiator cleaned more extensively by a radiator repair shop.

REVERSE FLUSHING ENGINE—DIESEL

(1) Drain the cooling system.

(2) Disconnect the radiator lower hose from the water inlet connection.

(3) Remove the heater core inlet hose from cylinder head fitting. .

(4) Attach water supply hose to cylinder head fitting.

(5) Back-flush the engine until clean water exits the water pump inlet.

CHEMICAL CLEANING

In some instances, use a radiator cleaner (Mopar Radiator Kleen or equivalent) before flushing. This will soften scale and other deposits and aid flushing operation.

CAUTION: Follow manufacturers instructions when using these products.

REMOVAL AND INSTALLATION

ACCESSORY DRIVE BELT

NOTE: The belt routing schematics are published from the latest information available at the time of publication. If anything differs between these schematics and the Belt Routing Label, use the schematics on Belt Routing Label. This label is located in the engine compartment.

CAUTION: Do not attempt to check belt tension with a belt tension gauge on vehicles equipped with an automatic belt tensioner. Refer to Automatic Belt Tensioner in this group.

Drive belts on diesel engines are equipped with a spring loaded automatic belt tensioner (Fig. 20). **(Fig. 20) displays the tensioner for vehicles without air conditioning.**

This belt tensioner will be used on all belt configurations, such as with or without air conditioning. For more information, refer to Automatic Belt Tensioner, proceeding in this group.

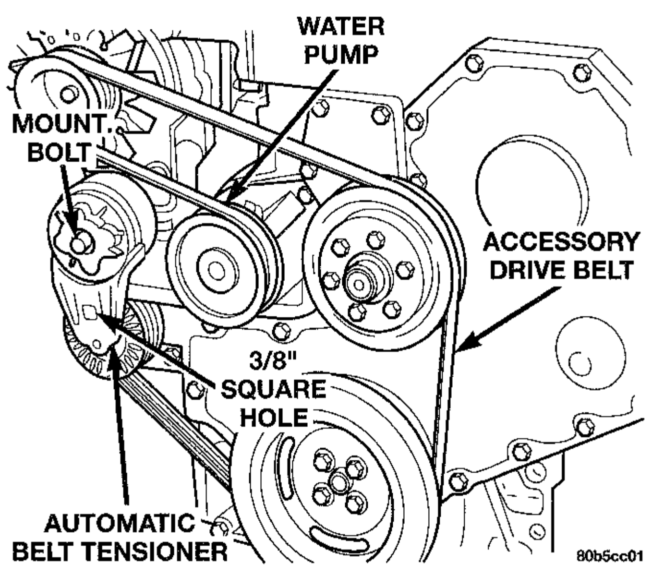

Fig. 20 Belt Tensioner—Typical (non-A/C shown)

REMOVAL

(1) A 3/8 inch square hole is provided in the automatic belt tensioner (Fig. 20). Attach a 3/8 inch drive-long handle ratchet to this hole.

(2) Rotate ratchet and tensioner assembly counterclockwise (as viewed from front) until tension has been relieved from belt.

mopar AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

(3) Remove belt from water pump pulley first.
(4) Remove belt from vehicle.

INSTALLATION

CAUTION: When installing the accessory drive belt, the belt must be routed correctly. If not, engine may overheat due to water pump rotating in wrong direction. Refer to (Fig. 21) (Fig. 22) for correct engine belt routing. The correct belt with correct length must be used.

(1) Position drive belt over all pulleys **except** water pump pulley.
(2) Attach a 3/8 inch ratchet to tensioner.
(3) Rotate ratchet and belt tensioner counterclockwise. Place belt over water pump pulley. Let tensioner rotate back into place. Remove ratchet. Be sure belt is properly seated on all pulleys.

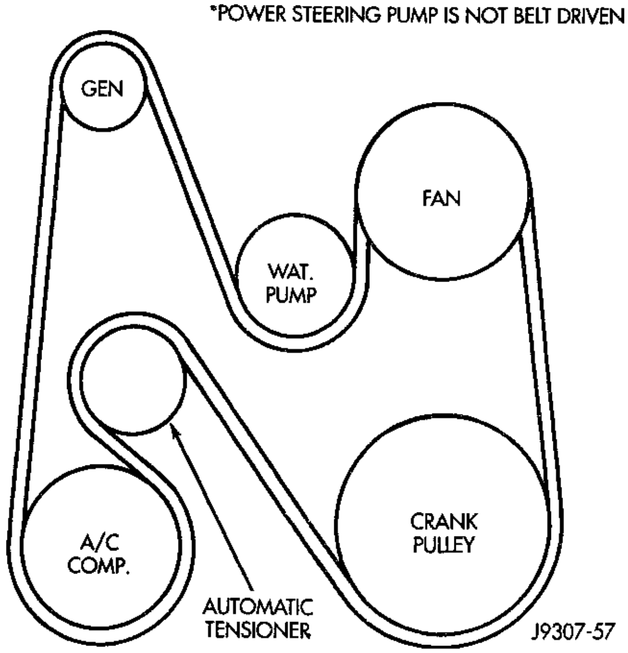

Fig. 21 Belt Routing—With A/C

ACCESSORY DRIVE BELT TENSIONER

REMOVAL

(1) Remove accessory drive belt. Refer to Belt Removal/Installation in this group.
(2) Remove tensioner mounting bolt and remove tensioner (Fig. 23).

WARNING: BECAUSE OF HIGH SPRING PRESSURE, DO NOT ATTEMPT TO DISASSEMBLE AUTOMATIC TENSIONER. UNIT IS SERVICED AS AN ASSEMBLY.

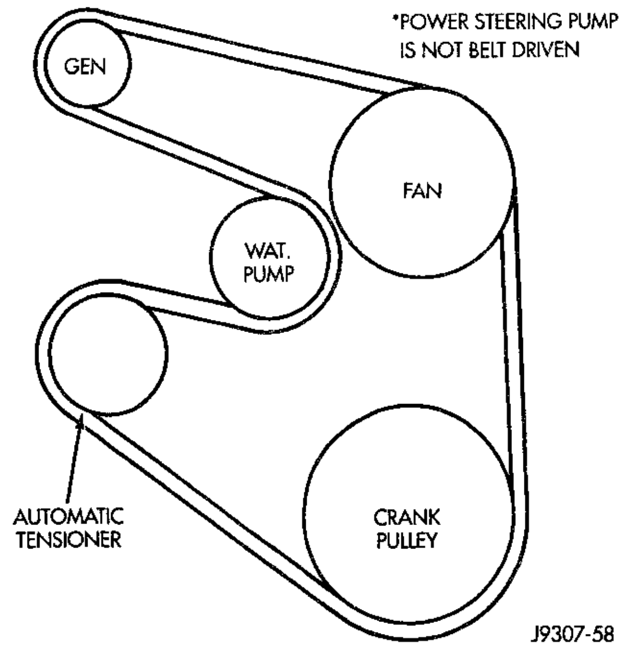

Fig. 22 Belt Routing—Without A/C

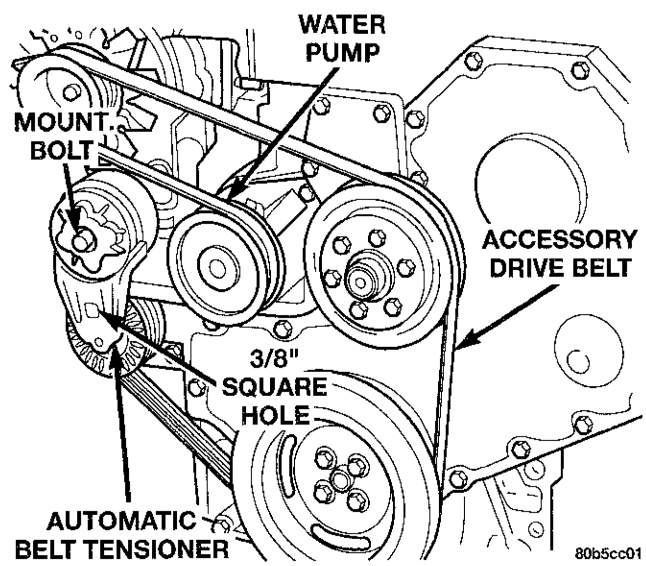

Fig. 23 Accessory Drive Belt Tensioner—Non A/C Shown

INSTALLATION

(1) Install tensioner assembly to mounting bracket. A dowel is located on back of tensioner. Align this dowel to hole in tensioner mounting bracket. Tighten bolt to 41 N·m (30 ft. lbs.) torque.
(2) Install drive belt. Refer to Belt Removal/Installation in this group.

REMOVAL AND INSTALLATION (Continued)

COOLANT RECOVERY BOTTLE

REMOVAL

(1) Remove overflow hose from radiator.

(2) Unsnap the coolant reserve/overflow tank from fan shroud. Lift straight up. The fan shroud is equipped with T-shaped slots (Fig. 24) to attach the tank. An alignment pin is located on the side of tank.

INSTALLATION

(1) Snap the tank into the two T-slots and the alignment pin on fan shroud.

(2) Connect overflow hose to radiator.

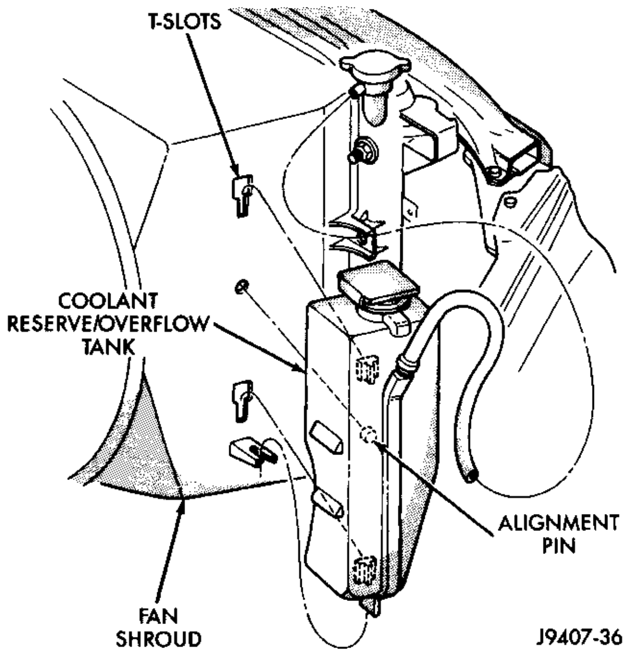

Fig. 24 Coolant Recovery Bottle

THERMOSTAT

REMOVAL

WARNING: DO NOT LOOSEN THE RADIATOR DRAINCOCK WITH THE SYSTEM HOT AND PRESSURIZED. SERIOUS BURNS FROM THE COOLANT CAN OCCUR.

Do not waste reusable coolant. If the solution is clean, drain the coolant into a clean container for reuse.

(1) Disconnect the battery negative cables.

(2) Remove accessory drive belt. Refer to procedure in this group.

(3) Drain cooling system until coolant level is below thermostat. Refer to Draining Cooling System in this section.

WARNING: CONSTANT TENSION HOSE CLAMPS ARE USED ON MOST COOLING SYSTEM HOSES. WHEN REMOVING OR INSTALLING, USE ONLY TOOLS DESIGNED FOR SERVICING THIS TYPE OF CLAMP, SUCH AS SPECIAL CLAMP TOOL (NUMBER 6094). SNAP-ON CLAMP TOOL (NUMBER HPC-20) MAY BE USED FOR LARGER CLAMPS. ALWAYS WEAR SAFETY GLASSES WHEN SERVICING CONSTANT TENSION CLAMPS.

CAUTION: A number or letter is stamped into the tongue of constant tension clamps. If replacement is necessary, use only an original equipment clamp with a matching number or letter.

(4) Remove radiator hose clamp and hose from thermostat housing.

(5) Remove the three (3) water outlet-to-cylinder head bolts and remove the water outlet connector (Fig. 25).

(6) Clean the mating surfaces of the water outlet connector and clean the thermostat seat groove at the top of the thermostat housing (Fig. 25).

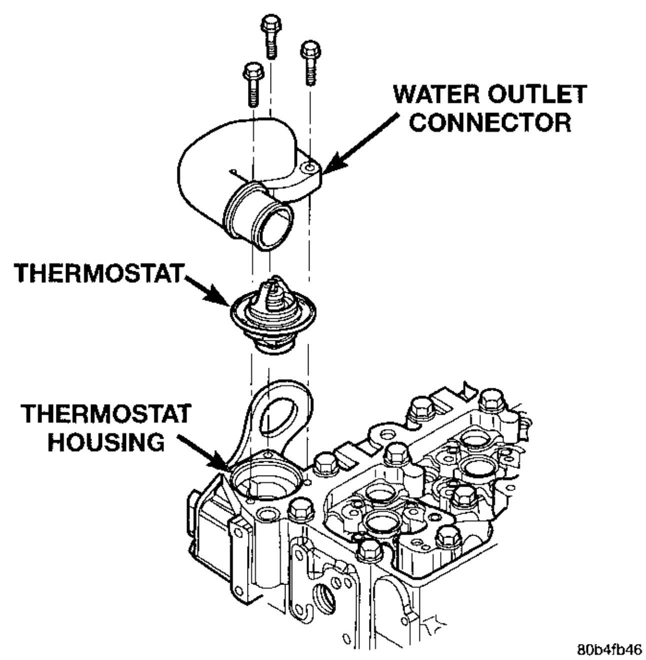

Fig. 25 Thermostat Removal/Installation

INSTALLATION

(1) Install the thermostat into the groove in the top of the thermostat housing (Fig. 25).

(2) Install the water outlet connector and bolts. Tighten the bolts to 24 N·m (18 ft. lbs.) torque.

(3) Install the radiator upper hose and clamp.

(4) Fill the cooling system with coolant.

(5) Connect the battery negative cables.

(6) Start the engine and check for coolant leaks. Run engine to check for proper thermostat operation.

REMOVAL AND INSTALLATION (Continued)

COOLING FAN AND VISCOUS DRIVE

REMOVAL

CAUTION: If the viscous fan drive is replaced because of mechanical damage, the cooling fan blades should also be inspected. Inspect for fatigue cracks, loose blades, or loose rivets that could have resulted from excessive vibration. Replace fan blade assembly if any of these conditions are found. Also inspect water pump bearing and shaft assembly for any related damage due to a viscous fan drive malfunction.

(1) Disconnect the battery negative cables.
(2) Remove the fan shroud mounting bolts. Position fan shroud towards engine.

CAUTION: Do not remove the fan pulley bolts. This pulley is under spring tension.

(3) The thermal viscous fan drive/fan blade assembly is attached (threaded) to the fan hub shaft (Fig. 26). Remove the fan blade/fan drive assembly from fan pulley by turning the mounting nut clockwise (as viewed from front). Threads on the viscous fan drive are **LEFT-HAND.** A Snap-On 36 MM Fan Wrench (number SP346 from Snap-On Cummins Diesel Tool Set number 2017DSP) can be used. Place a bar or screwdriver between the fan pulley bolts to prevent pulley from rotating.

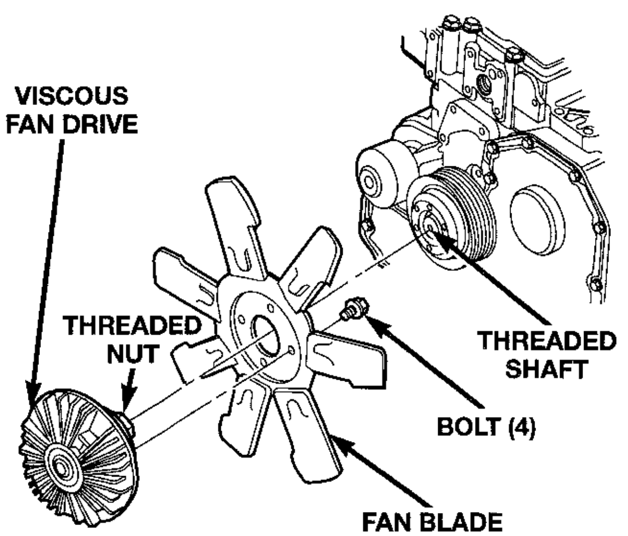

Fig. 26 Fan Blade/Viscous Fan Drive

(4) Remove the fan shroud and the fan blade/viscous drive as an assembly from vehicle.
(5) Remove fan blade-to-viscous fan drive mounting bolts.
(6) Inspect the fan for cracks, loose rivets, loose or bent fan blades.

CAUTION: Some engines equipped with serpentine drive belts have reverse rotating fans and viscous fan drives. They are marked with the word REVERSE to designate their usage. Installation of the wrong fan or viscous fan drive can result in engine overheating.

INSTALLATION

(1) Install fan blade assembly to viscous fan drive. Tighten mounting bolts to 23 N·m (17 ft. lbs.) torque.
(2) Position the fan shroud and fan blade/viscous fan drive to the vehicle as an assembly.
(3) Install viscous fan drive assembly on fan hub shaft (Fig. 26). Tighten mounting nut to 57 N·m (42 ft. lbs.) torque.
(4) Install fan shroud bolts into position and tighten the mounting bolts to 6 N·m (50 in. lbs.) torque.
(5) Connect the battery negative cables.

NOTE: Viscous Fan Drive Fluid Pump Out Requirement: After installing a **new** viscous fan drive, bring the engine speed up to approximately 2000 rpm and hold for approximately two minutes. This will ensure proper fluid distribution within the drive.

COOLING FAN SUPPORT/HUB

REMOVAL

(1) Disconnect the battery negative cables.
(2) Remove the cooling fan and viscous drive. Refer to procedure in this group.
(3) Remove the four (4) fan hub to block bolts (Fig. 27).
(4) If replacing the fan support/hub, transfer the pulley (Fig. 27) to the new component.

INSTALLATION

(1) If removed, install the fan drive pulley (Fig. 27) and tighten the bolts to 9 N·m (84 in. lbs.) torque.
(2) Install the support assy. to the block (Fig. 27), and tighten the bolts to 24 N·m (18. ft. lbs.) torque.
(3) Install the cooling fan and viscous drive. Refer to procedure in this group.
(4) Connect the battery negative cables.

WATER PUMP

REMOVAL

(1) Disconnect battery negative cables.
(2) Drain cooling system. Refer to Draining Cooling System in this section.

REMOVAL AND INSTALLATION (Continued)

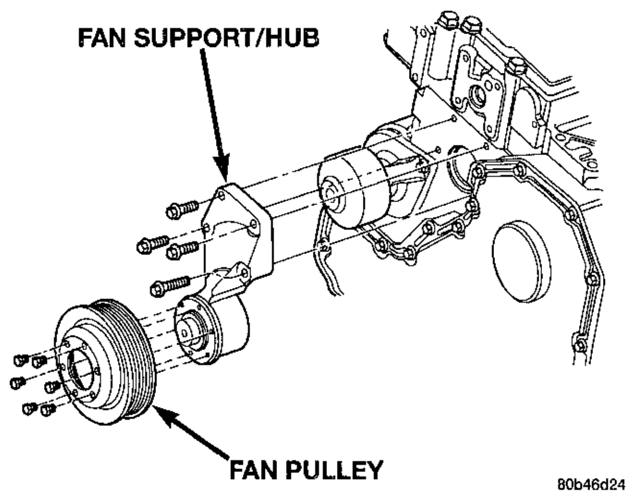

Fig. 27 Cooling Fan Support/Hub Assembly

(3) Remove the bolt retaining the wiring harness near the top of water pump. Position wire harness to the side.

(4) Remove the accessory drive belt. Refer to procedure in this group.

(5) Remove water pump mounting bolts (Fig. 28).

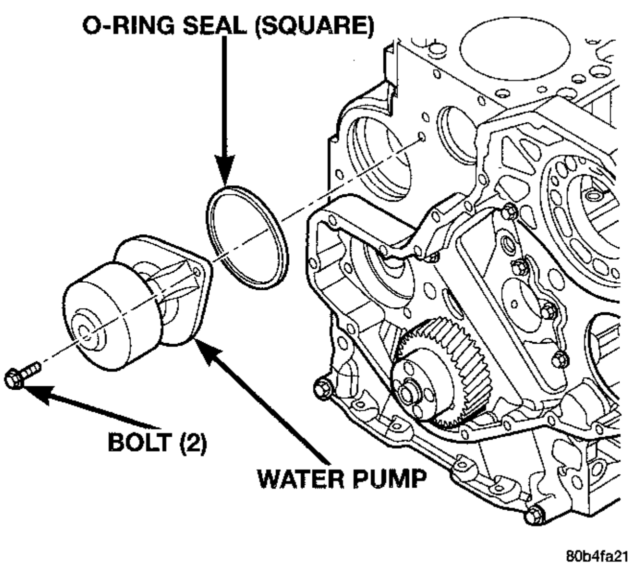

Fig. 28 Water Pump Removal/Installation

(6) Clean water pump sealing surface on cylinder block.

INSTALLATION

(1) Install new O-ring seal in groove on water pump (Fig. 29).

(2) Install water pump. Tighten mounting bolts to 24 N·m (18 ft. lbs.) torque.

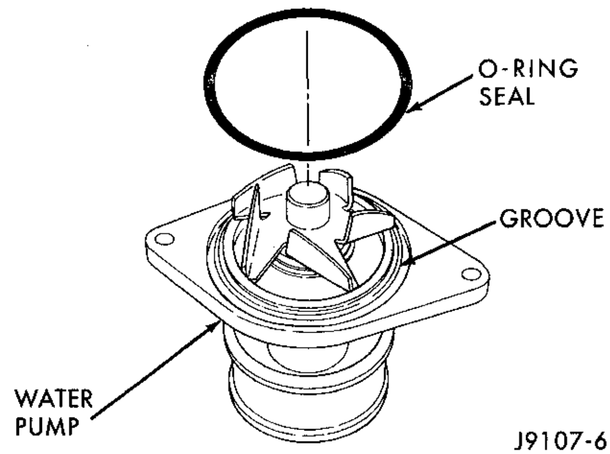

Fig. 29 Pump O-ring Seal

(3) Install accessory drive belt. Refer to procedure in this group.

(4) Install the bolt retaining the wiring harness near top of water pump.

(5) Fill cooling system. Refer to Refilling Cooling System in this section.

(6) Connect both battery cables.

(7) Start and warm the engine. Check for leaks.

RADIATOR

REMOVAL

(1) Disconnect the battery negative cables.

WARNING: DO NOT REMOVE THE CYLINDER BLOCK DRAIN PLUGS OR LOOSEN THE RADIATOR DRAINCOCK WITH THE SYSTEM HOT AND UNDER PRESSURE. SERIOUS BURNS FROM COOLANT CAN OCCUR.

(2) Drain the cooling system. Refer to Draining Cooling System in this group.

WARNING: CONSTANT TENSION HOSE CLAMPS ARE USED ON MOST COOLING SYSTEM HOSES. WHEN REMOVING OR INSTALLING, USE ONLY TOOLS DESIGNED FOR SERVICING THIS TYPE OF CLAMP, SUCH AS SPECIAL CLAMP TOOL (NUMBER 6094). SNAP-ON CLAMP TOOL (NUMBER HPC-20) MAY BE USED FOR LARGER CLAMPS. ALWAYS WEAR SAFETY GLASSES WHEN SERVICING CONSTANT TENSION CLAMPS.

CAUTION: A number or letter is stamped into the tongue of constant tension clamps. If replacement is necessary, use only an original equipment clamp with a matching number or letter.

(3) Remove the radiator upper hose and clamps.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

(4) Disconnect the coolant recovery bottle hose from the radiator filler neck. Remove the coolant recovery bottle from the fan shroud (pull straight up). The tank slips into T-slots on the fan shroud. (Fig. 30).

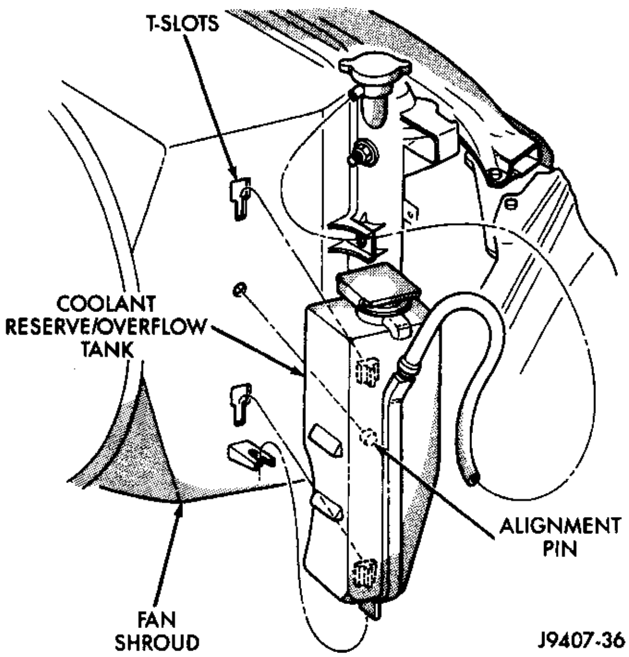

Fig. 30 Coolant Recovery Bottle

(5) Disconnect electrical connectors and supply hose from windshield washer bottle and remove tank. Refer to Group 8K, Windshield Wiper and Washer Systems for procedures.

(6) Remove the two metal clips retaining the upper part of fan shroud to the top of radiator.

(7) Remove the four fan shroud mounting bolts (Fig. 31). Position shroud rearward over the fan blades towards engine.

(8) Disconnect the radiator lower hose and clamp from the radiator.

(9) Remove the two radiator upper mounting bolts (Fig. 32).

(10) Lift radiator straight up and out of engine compartment. The bottom of the radiator is equipped with two alignment dowels that fit into holes in the lower radiator support panel (Fig. 32). Rubber biscuits (insulators) are installed to these dowels. Take care not to damage cooling fins or tubes on the radiator and air conditioning condenser when removing.

INSTALLATION

(1) Position fan shroud over the fan blades rearward towards engine.

(2) Install rubber insulators to alignment dowels at lower part of radiator.

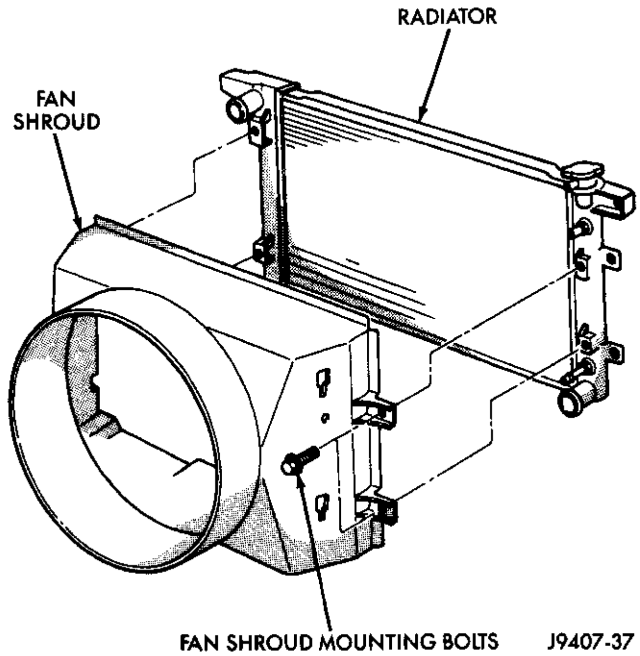

Fig. 31 Fan Shroud Mounting

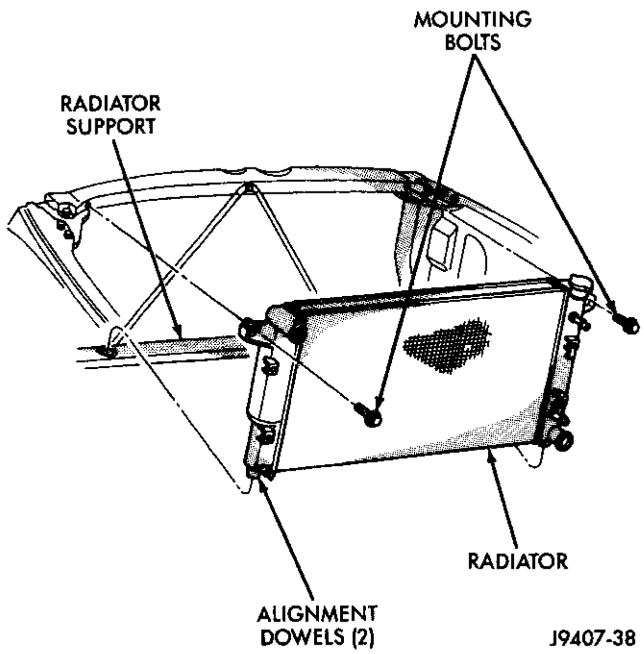

Fig. 32 Radiator Mounting

(3) Lower the radiator into position while guiding the two alignment dowels into lower radiator support (Fig. 32).

(4) Install two upper radiator mounting bolts. Tighten bolts to 11 N·m (95 in. lbs.) torque.

(5) Connect the radiator lower hose and clamp.

(6) Position fan shroud to flanges on sides of radiator. Install fan shroud mounting bolts (Fig. 31). Tighten bolts to 6 N·m (50 in. lbs.) torque.

REMOVAL AND INSTALLATION (Continued)

(7) Install windshield washer reservoir tank. Refer to Group 8K. Connect electrical connections and supply hose.
(8) Install metal clips to top of fan shroud.
(9) Install coolant recovery bottle to fan shroud (Fig. 30).
(10) Install coolant recovery bottle hose to radiator filler neck nipple.
(11) Install the radiator upper hose and clamps.
(12) Connect the battery negative cables.
(13) Fill cooling system with coolant. Refer to Refilling Cooling System in this group.
(14) Start engine and check for leaks.

BLOCK HEATER

WARNING: DO NOT REMOVE THE CYLINDER BLOCK DRAIN PLUGS OR LOOSEN THE RADIATOR DRAINCOCK WITH THE SYSTEM HOT AND UNDER PRESSURE. SERIOUS BURNS FROM COOLANT CAN OCCUR.

REMOVAL

(1) Disconnect the battery negative cables.
(2) Drain coolant from radiator and cylinder block.
(3) Unscrew the power cord retaining cap and disconnect cord from heater element.
(4) Using a suitable size socket, loosen and remove the block heater element (Fig. 33).

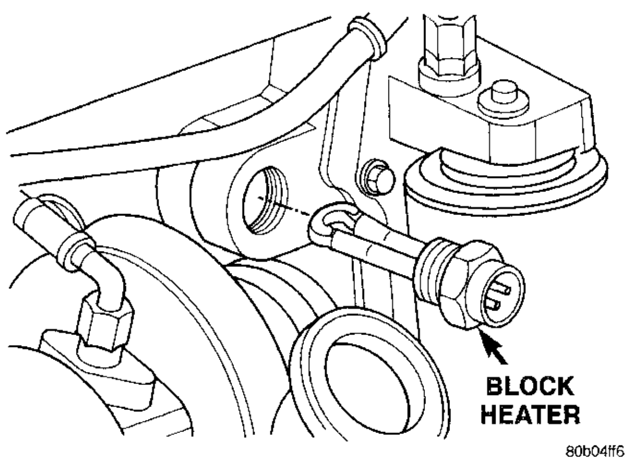

Fig. 33 Block Heater—Diesel Engine

INSTALLATION

(1) Clean and inspect the threads in the cylinder block.
(2) Coat heater element threads with Mopar® Thread Sealer with Teflon.
(3) Screw block heater into cylinder block and tighten to 43 N·m (32 ft. lbs.).
(4) Connect block heater cord and tighten retaining cap.
(5) Fill cooling system with recommended coolant. Refer to Refilling Cooling System section in this group.
(6) Start and warm the engine.
(7) Check block heater for leaks.

WATER INLET CONNECTOR

REMOVAL

(1) Disconnect battery negative cables.
(2) Drain cooling system. Refer to Draining Cooling System in this group.
(3) Remove the accessory drive belt. Refer to procedure in this group.
(4) Remove the generator. Refer to Group 8C, Charging System, for the correct procedure.
(5) If A/C equipped, recover the refrigerant and remove the A/C compressor. Refer to Group 24, Heating and Air Conditioning for the correct procedures.
(6) Disconnect the heater core and transmission oil cooler return hoses at the water inlet connector.
(7) Remove the six (6) water inlet connector-to-block bolts. Remove connector and o-ring (Fig. 34).

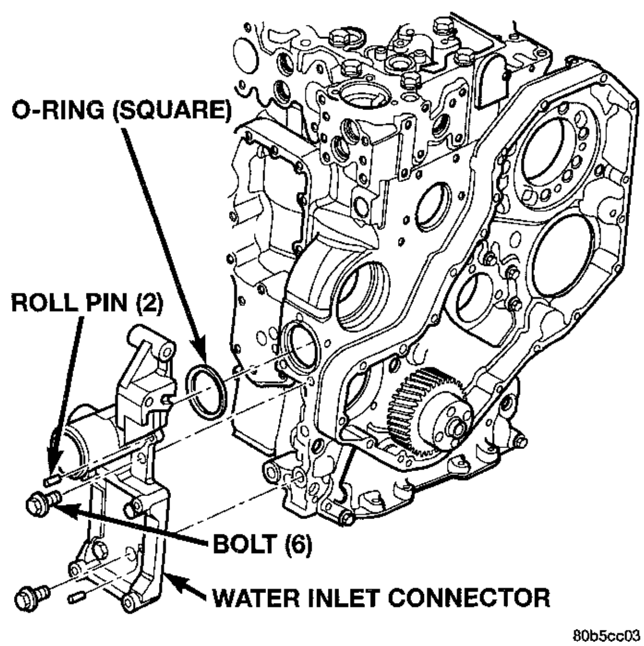

Fig. 34 Water Inlet Connector and O-ring

INSTALLATION

(1) Using a new o-ring, locate the water inlet connector on the roll pins (Fig. 34) and install and tighten all bolts to 24 N·m (18 ft. lbs.) torque.
(2) Install the heater core and transmission oil cooler return hoses and clamps to the connector.
(3) Install the A/C compressor. Refer to Group 24, Heating and Air Conditioning for the correct procedures.

REMOVAL AND INSTALLATION (Continued)

(4) Install the generator. Refer to Group 8C, Charging System for the correct procedures.

(5) Install the accessory drive belt. Refer to the procedure in this group.

(6) Add coolant. Refer to Refilling Cooling System in this group.

(7) Connect the battery negative cables.

(8) Start the engine and check for coolant leaks. Check and adjust the coolant level as necessary.

WATER-TO-OIL COOLER

REMOVAL

CAUTION: If a leak should occur in the water-to-oil cooler mounted to the side of the engine block, engine coolant may become mixed with transmission fluid. Transmission fluid may also enter engine cooling system. Both cooling system and transmission should be drained and inspected in case of oil cooler leakage.

(1) Disconnect both battery negative cables.

(2) Remove air cleaner assembly and air cleaner intake hoses. Refer to Group 14, Fuel System for procedures.

(3) Drain cooling system. Refer to Draining Cooling System in this group.

(4) Disconnect coolant lines from cooler.

(5) Disconnect transmission oil lines from cooler. Plug cooler lines to prevent oil leakage.

(6) Remove oil cooler mounting straps (Fig. 35).

(7) Lift oil cooler off of mounting bracket.

(8) If replacing cooler, make sure to transfer converter drain back valve to new cooler.

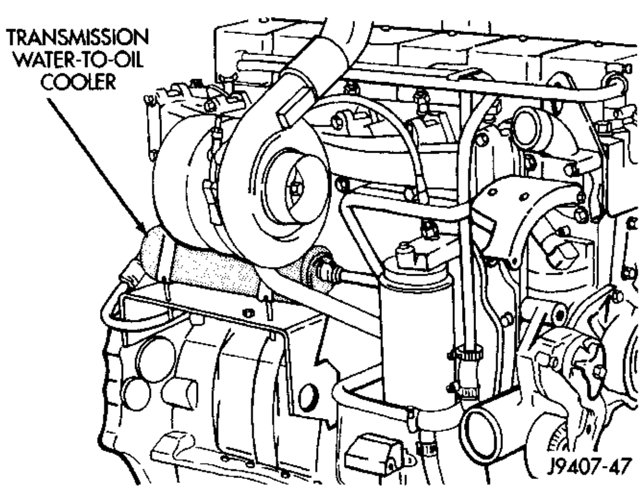

Fig. 35 Transmission Water-To- Oil Cooler—Diesel

INSTALLATION

(1) Position oil cooler on bracket.

(2) Install mounting straps.

(3) Connect transmission oil lines to cooler.

(4) Connect coolant hoses to cooler.

(5) Connect battery negative cables.

(6) Fill cooling system. Refer to Refilling Cooling System in this section.

(7) Check transmission oil level and fill as necessary.

(8) Install air cleaner assembly and air cleaner intake hoses. Refer to Group 14, Fuel System for procedures.

AUXILIARY TRANSMISSION OIL COOLER

REMOVAL

(1) Disconnect the battery negative cables.

(2) Remove front bumper. Refer to Group 13, Frame and Bumpers for the correct procedures.

(3) Place a drain pan under the oil cooler.

(4) Raise the vehicle.

(5) Using special tool #6931, disconnect the oil cooler quick-connect fittings from the transmission lines.

(6) Remove the charge air cooler-to-oil cooler bolt and the two mounting nuts (Fig. 36).

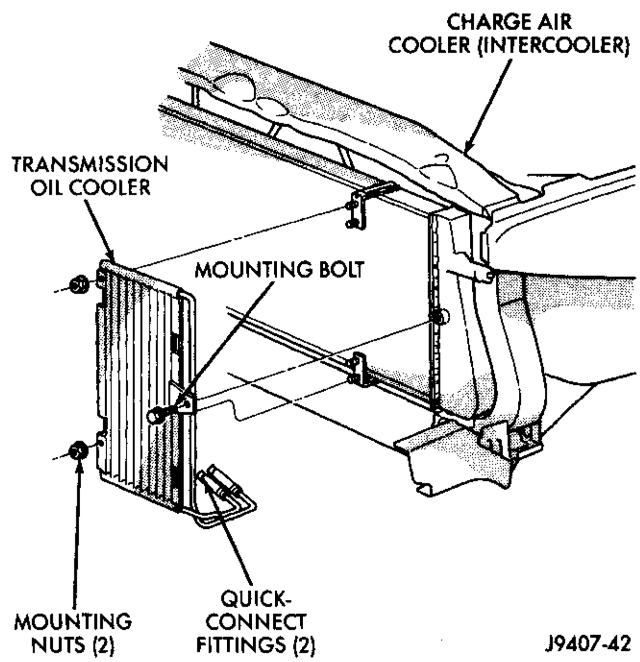

Fig. 36 Auxiliary Transmission Oil Cooler

(7) Remove the oil cooler and line assembly towards the front of vehicle. Cooler must be rotated and tilted into position while removing.

INSTALLATION

(1) Carefully position the oil cooler assembly to the vehicle.

(2) Install two nuts and one bolt (Fig. 36). Tighten to 11 N·m (95 in. lbs.) torque.

REMOVAL AND INSTALLATION (Continued)

(3) Connect the quick-connect fittings to the transmission cooler lines. Push together until an audible "click" is heard. Verify by pulling outward on the connection.

(4) Install front bumper. Refer to Group 13, Frame and Bumpers for the correct procedures.

(5) Connect the battery negative cables.

(6) Start the engine and check all connections for leaks.

(7) Check the fluid level in the automatic transmission. Refer to Group 21, Transmissions for for the correct procedures.

CLEANING AND INSPECTION

RADIATOR CLEANING

The radiator and air conditioning fins should be cleaned when an accumulation of bugs, leaves etc. has occurred. Clean radiator fins are necessary for good heat transfer. With the engine cold, apply cold water and compressed air to the back (engine side) of the radiator to flush the radiator and/or A/C condenser of debris.

COOLING FAN INSPECTION

The fan cannot be repaired. If fan is damaged, it must be replaced. Inspect fan as follows:

(1) Remove fan blade and viscous fan drive as an assembly from the engine. Refer to preceding Removal procedure.

(2) Remove fan blade assembly from viscous fan drive unit (four bolts).

(3) Lay fan on a flat surface with leading edge facing down. With tip of blade touching flat surface, replace fan if clearance between opposite blade and surface is greater than 2.0 mm (.090 inch). Rocking motion of opposite blades should not exceed 2.0 mm (.090 inch). Test all blades in this manner.

WARNING: DO NOT ATTEMPT TO BEND OR STRAIGHTEN FAN BLADES IF NOT WITHIN SPECIFICATIONS.

(4) Inspect fan assembly for cracks, bends, loose rivets or broken welds. Replace fan if any damage is found.

CAUTION: If fan blade assembly is replaced because of mechanical damage, water pump and viscous fan drive should also be inspected. These components could have been damaged due to excessive vibration.

Also refer to the Viscous Fan Drive section for additional information.

RADIATOR CAP INSPECTION

Hold cap at eye level, right side up. The vent valve (Fig. 37) at bottom of cap should open. If rubber gasket has swollen and prevents vent valve from opening, replace cap.

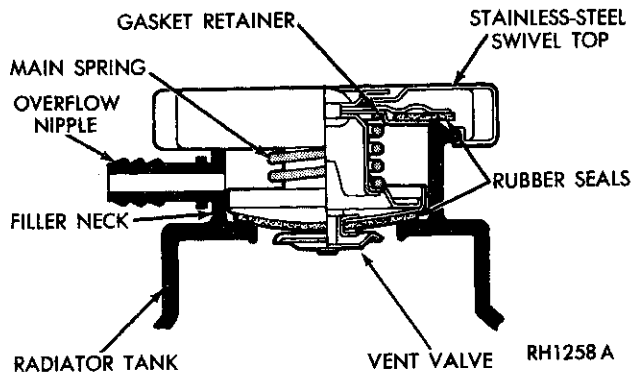

Fig. 37 Radiator Pressure Cap

Hold cap at eye level, upside down. If any light can be seen between vent valve and rubber gasket, replace cap. **Do not use a replacement cap that has a spring to hold vent shut.** A replacement cap must be the type designed for a coolant reserve/overflow system with a completely sealed diaphragm spring and a rubber gasket. This gasket is used to seal to radiator filler neck top surface. Use of proper cap will allow coolant return to radiator.

WATER PUMP INSPECTION

Visually inspect the water pump and replace if it has any of the following conditions:

- The body is cracked or damaged
- Water leaks from the shaft seal. This is evident by traces of coolant below the vent hole
- Loose or rough turning bearing. Also inspect thermal fan drive
- Impeller rubbing the pump body

CHARGING SYSTEM

CONTENTS

GENERAL INFORMATION

OVERVIEW

The battery, starting, and charging systems operate with one another, and must be tested as a complete system. To allow the vehicle to start and charge properly, all of the components involved in these three systems must perform within specifications.

Group 8A in this service manual covers the battery, Group 8B covers the starting system, and Group 8C covers the charging system. Refer to Group 8W, Wiring Diagrams for complete circuit descriptions and diagrams. When attempting to diagnose any of these systems, it is important to keep their interdependency in mind.

Certain charging system circuits are monitored by On-Board Diagnostics (OBD) built into the Powertrain Control Module (PCM) (Fig. 1). Each monitored circuit is assigned a Diagnostic Trouble Code (DTC). The PCM will store a DTC in electronic memory for certain failures it detects. Refer to On-Board Diagnostics in Group 25, Emission Control System for a complete list of DTC's and for information necessary to access a DTC.

DESCRIPTION AND OPERATION

CHARGING SYSTEM OPERATION

The charging system consists of:

- Generator
- Electronic Voltage Regulator (EVR) circuitry within the Powertrain Control Module (PCM) (Fig. 1).
- Ignition switch (refer to Group 8D, Ignition System for information)
- Battery (refer to Group 8A, Battery for information)
- Battery temperature sensor
- Generator Lamp (if equipped)

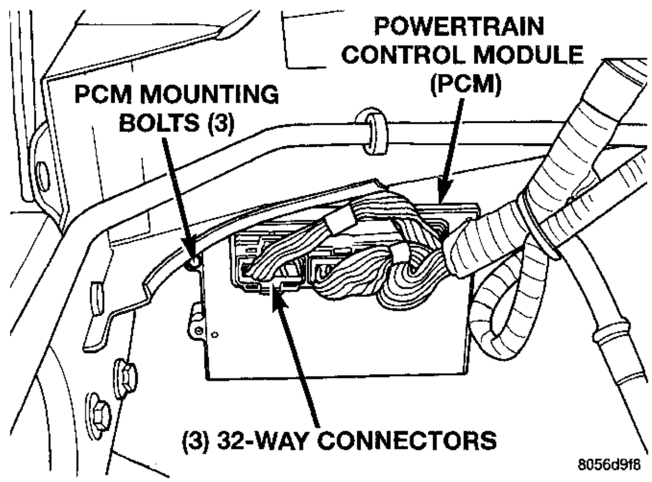

Fig. 1 Powertrain Control Module (PCM) Location

- Voltmeter (refer to Group 8E, Instrument Panel and Gauges for information)
- Wiring harness and connections (refer to Group 8W, Wiring for information)

The charging system is turned on and off with the ignition switch. The system is on when the engine is running and the ASD relay reacted. When the ASD relay is on, voltage is supplied to the ASD relay sense circuit at the PCM. This voltage is connected through the PCM and supplied to one of the generator field terminals (Gen. Source +) at the back of the generator.

The amount of DC current produced by the generator is controlled by the EVR (field control) circuitry contained within the PCM. This circuitry is connected in series with the second rotor field terminal and ground.

A battery temperature sensor, located in the battery tray housing, is used to sense battery temperature. This temperature data, along with data from monitored line voltage, is used by the PCM to vary the battery charging rate. This is done by cycling the

DESCRIPTION AND OPERATION (Continued)

ground path to control the strength of the rotor magnetic field. The PCM then compensates and regulates generator current output accordingly.

All vehicles are equipped with On-Board Diagnostics (OBD). Some OBD-sensed systems, including EVR (field control) circuitry, are monitored by the PCM. Each monitored circuit is assigned a Diagnostic Trouble Code (DTC). The PCM will store a DTC in electronic memory for certain failures it detects. Refer to On-Board Diagnostics in Group 25, Emission Control System for more DTC information.

Operation of the generator lamp is controlled by the PCM.

GENERATOR

The generator is belt-driven by the engine using a serpentine type drive belt. It is serviced only as a complete assembly. If the generator fails for any reason, the entire assembly must be replaced.

As the energized rotor begins to rotate within the generator, the spinning magnetic field induces a current into the windings of the stator coil. Once the generator begins producing sufficient current, it also provides the current needed to energize the rotor.

The Y type stator winding connections deliver the induced AC current to 3 positive and 3 negative diodes for rectification. From the diodes, rectified DC current is delivered to the vehicle electrical system through the generator battery and ground terminals.

Although the generators appear the same externally, different generators with different output ratings are used on this vehicle. Be certain that the replacement generator has the same output rating and part number as the original unit. Refer to Generator Ratings in the Specifications section at the back of this group for amperage ratings and part numbers.

Noise emitting from the generator may be caused by: worn, loose or defective bearings; a loose or defective drive pulley; incorrect, worn, damaged or misadjusted fan drive belt; loose mounting bolts; a misaligned drive pulley or a defective stator or diode.

BATTERY TEMPERATURE SENSOR

The battery temperature sensor is used to determine the battery temperature and control battery charging rate. This temperature data, along with data from monitored line voltage, is used by the Powertrain Control Module (PCM) (Fig. 1) to vary the battery charging rate. System voltage will be higher at colder temperatures and is gradually reduced at warmer temperatures. On diesel powered vehicles, only one sensor is used (dual batteries) and is located under the battery on the drivers side of vehicle.

ELECTRONIC VOLTAGE REGULATOR

The Electronic Voltage Regulator (EVR) is not a separate component. It is actually a voltage regulating circuit located within the Powertrain Control Module (PCM) (Fig. 1). The EVR is not serviced separately. If replacement is necessary, the PCM must be replaced.

Operation: The amount of DC current produced by the generator is controlled by EVR circuitry contained within the PCM. This circuitry is connected in series with the generators second rotor field terminal and its ground.

Voltage is regulated by cycling the ground path to control the strength of the rotor magnetic field. The EVR circuitry monitors system line voltage and battery temperature (refer to Battery Temperature Sensor for more information). It then compensates and regulates generator current output accordingly. Also refer to Charging System Operation for additional information.

REMOVAL AND INSTALLATION

GENERATOR

REMOVAL

WARNING: DISCONNECT BOTH NEGATIVE BATTERY CABLES FROM BOTH BATTERIES BEFORE REMOVING BATTERY OUTPUT WIRE (B+ WIRE) FROM REAR OF GENERATOR. FAILURE TO DO SO CAN RESULT IN INJURY OR DAMAGE TO ELECTRICAL SYSTEM.

(1) Disconnect both negative battery cables at both batteries.

(2) Remove generator drive belt. Refer to Group 7, Cooling System for procedure.

(3) Loosen (but do not remove) generator mounting bracket-to-engine bolt (Fig. 2).

(4) Remove upper generator mounting bolt and lower mounting bolt/nut (Fig. 2).

(5) Position generator for access to wire connectors.

(6) Remove nuts from harness holddown, battery (B+) terminal, ground terminal and 2 field terminals. Remove wire connectors (Fig. 3).

(7) Remove generator from vehicle.

INSTALLATION

(1) Position generator to engine and install wiring to rear of generator. Tighten all wiring fasteners as follows:

- Battery (B+) terminal nut—8.5 N·m (75 in. lbs.)
- Ground terminal nut—8.5 N·m (75 in. lbs.)
- Harness holddown nut—8.5 N·m (75 in. lbs.)

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

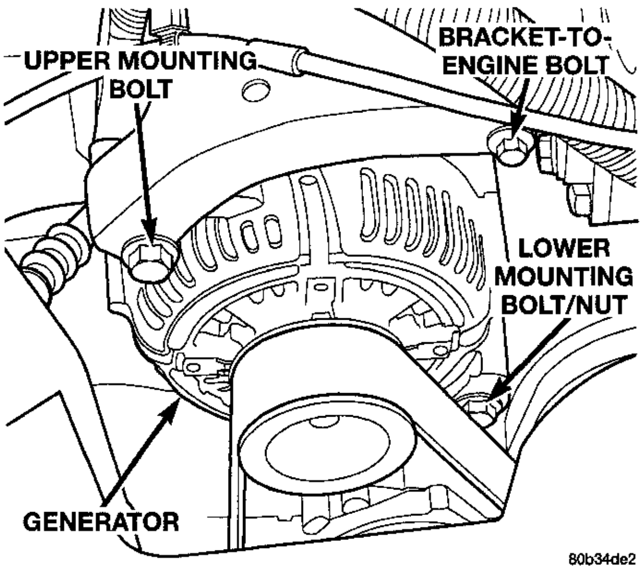

Fig. 2 Remove/Install Generator—Diesel Engine

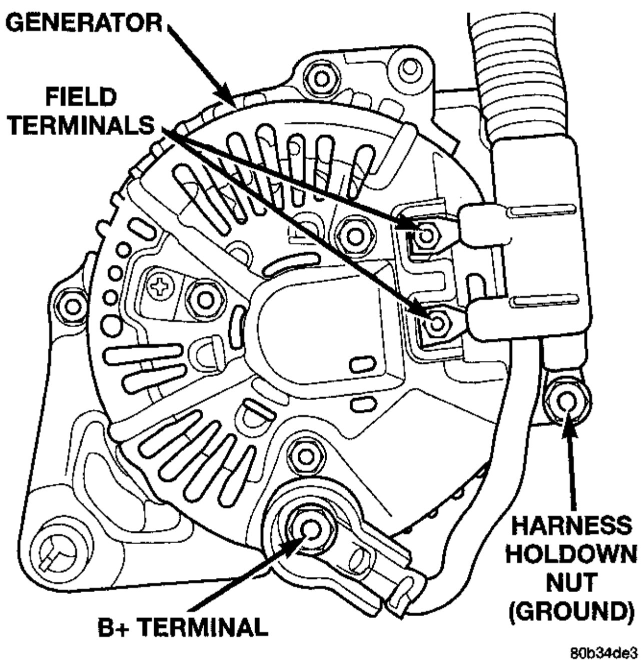

Fig. 3 Remove/Install Generator Electrical Connectors—Diesel Engine

- Field terminal nuts—2.8 N·m (25 in. lbs.)

(2) Install generator mounting fasteners and tighten as follows:

- Generator upper mounting bolt—Diesel powered engines—54 N·m (40 ft. lbs.)
- Generator pivot bolt/nut—Diesel powered engines—54 N·m (40 ft. lbs.)
- Generator mounting bracket-to-engine bolt—Diesel powered engines—24 N·m (18 ft. lbs.)

CAUTION: Never force a belt over a pulley rim using a screwdriver. The synthetic fiber of the belt can be damaged.

CAUTION: When installing a serpentine accessory drive belt, the belt MUST be routed correctly. The water pump will be rotating in the wrong direction if the belt is installed incorrectly, causing the engine to overheat. Refer to belt routing label in engine compartment, or refer to Belt Schematics in Group 7, Cooling System.

(3) Install generator drive belt. Refer to Group 7, Cooling System for procedure.

(4) Install both negative battery cables to both batteries.

BATTERY TEMPERATURE SENSOR

The battery temperature sensor is located under the vehicle battery (Fig. 4) and is attached (snapped into) a mounting hole on battery tray. On models equipped with a diesel engine (dual batteries), only one sensor is used. The sensor is located under the battery on drivers side of vehicle.

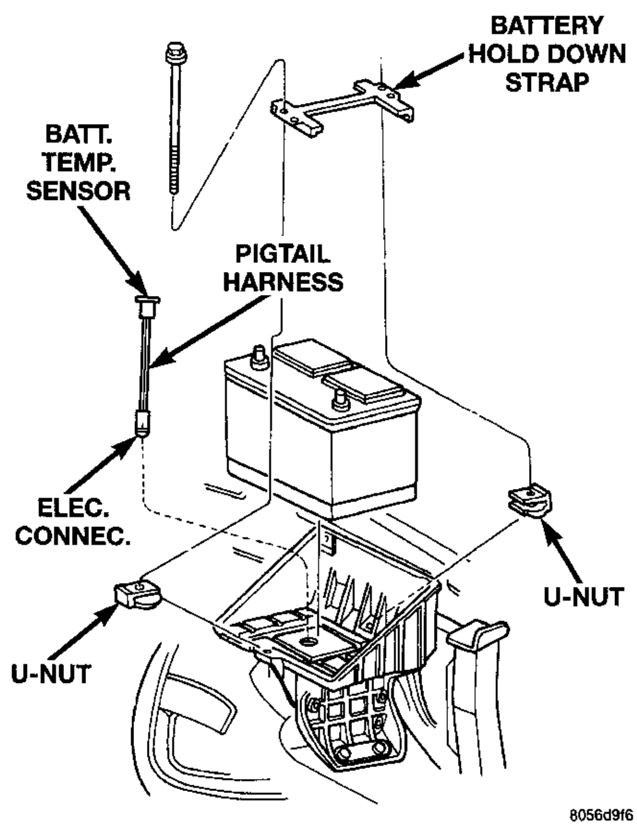

Fig. 4 Battery Temperature Sensor Location

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

REMOVAL

(1) Remove battery. Refer to Group 8A, Battery for procedures.

(2) Disconnect sensor pigtail harness from engine wire harness.

(3) Pry sensor straight up from battery tray mounting hole.

INSTALLATION

(1) Feed pigtail harness through mounting hole in top of battery tray and press sensor into top of tray (snaps in).

(2) Connect pigtail harness.

(3) Install battery. Refer to Group 8A, Battery for procedures.

SPEED CONTROL SYSTEM

CONTENTS

GENERAL INFORMATION

INTRODUCTION

The vehicle speed control system is electronically controlled by the Powertrain Control Module (Fig. 1) and vacuum operated by a servo. The system is designed to operate between approximately 35 and 85 mph (56 and 137 km/h). On diesel powered models, a separate vacuum reservoir **is not used** to supply the servo. Vacuum for the servo is supplied by an engine mounted vacuum pump. Vacuum from this pump is shared by the heating/air-conditioning system.

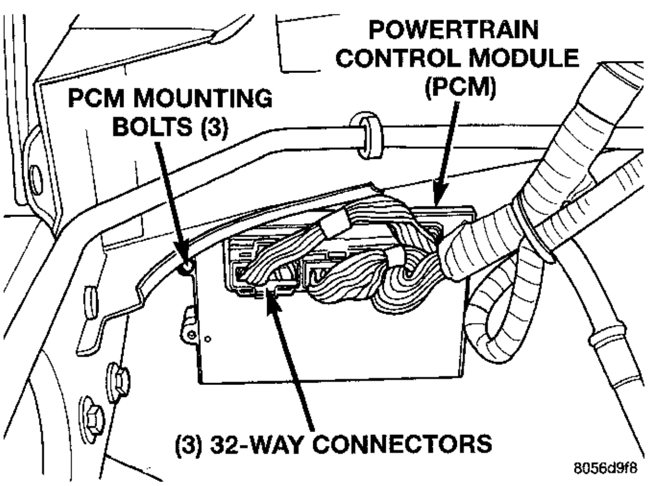

Fig. 1 Powertrain Control Module (PCM) Location

DESCRIPTION AND OPERATION

SPEED CONTROL SERVO

The servo unit consists of a solenoid valve body, a vacuum servo and the mounting bracket. The Powertrain Control Module (PCM) (Fig. 1) controls the solenoid valve body. The solenoid valve body controls the application and release of vacuum to the diaphragm of the vacuum servo. A cable connects the servo with the throttle linkage. The servo unit cannot be repaired and is serviced only as a complete assembly.

SPEED CONTROL SOLENOID CIRCUITS

When all of the speed control parameters are met, and the SET button is pressed, the Powertrain Control Module (PCM) (Fig. 1) actuates the vent solenoid and “duty-cycles” the vacuum solenoid to open the throttle and bring the vehicle up to target speed. When the vehicle is at target speed, it will actuate the vent solenoid with the vacuum solenoid de-activated to maintain the vehicle at target speed. When the vehicle is above target speed, the PCM will “duty-cycle” the vent solenoid with the vacuum solenoid still de-activated to close the throttle to return to target speed.

SPEED CONTROL SWITCHES

Two separate speed control switch modules are mounted on the steering wheel to the left and right side of the driver’s airbag module. Within the two switch modules, five **momentary** contact switches, supporting seven different speed control functions are used. The outputs from these switches are filtered into one input. The Powertrain Control Module (PCM) (Fig. 1) determines which output has been applied through **resistive multiplexing.** The input circuit voltage is measured by the PCM to determine which switch function has been selected.

A speed control indicator lamp, located on the instrument panel cluster is energized by the PCM via the CCD Bus. This occurs when speed control system power has been turned ON, and the engine is running.

AUTHENTIC RESTORATION

DESCRIPTION AND OPERATION (Continued)

The two switch modules are labeled: ON/OFF, SET, RESUME/ACCEL, CANCEL and COAST. Refer to the owner's manual for more information on speed control switch functions and setting procedures. The individual switches cannot be repaired. If one individual switch fails, the switch module must be replaced.

STOP LAMP SWITCH

Vehicles equipped with the speed control option use a dual function stop lamp switch. The switch is mounted on the brake pedal mounting bracket under the instrument panel. The Powertrain Control Module (PCM) (Fig. 1) monitors the state of the dual function stop lamp switch. Refer to Group 5, Brakes for more information on stop lamp switch service and adjustment procedures.

SERVO CABLE

The speed control servo cable is connected between the speed control vacuum servo diaphragm and the throttle control lever. This cable causes the throttle control linkage to open or close in response to movement of the vacuum servo diaphragm.

POWERTRAIN CONTROL MODULE (PCM)

Speed control electronic circuitry is integrated into the Powertrain Control Module (PCM). The PCM speed control functions are monitored by On-Board Diagnostics (OBD). Both the Engine Control Module (ECM), and the PCM monitor OBD-sensed systems. Each controller (PCM and ECM) monitor OBD functions with the PCM controlling operation of the Malfunction Indicator Lamp (MIL). Each controller (PCM and ECM) will store a Diagnostic Trouble Code (DTC) related to its monitor. Both modules will also set a "companion " module DTC when a fault is set in the other module.

The PCM is located in the engine compartment (Fig. 1). The PCM or the ECM cannot be repaired and must be replaced if faulty.

VACUUM SUPPLY

On diesel powered engines, an engine driven pump is used to supply vacuum for speed control operation. A vacuum reservoir is not used if equipped with a diesel powered engine. Refer to Vacuum Pump in Group 9, Engines for information.

VEHICLE SPEED INPUT

The Vehicle Speed Sensor (VSS) is no longer used for any Dodge Truck.

Vehicle speed and distance covered are measured by the Rear Wheel Speed Sensor. The sensor is mounted to the rear axle. A signal is sent from this sensor to the Controller Antilock Brake (CAB) computer. A signal is then sent from the CAB to the Powertrain Control Module (PCM) to determine vehicle speed and distance covered. The PCM will then determine strategies for speed control system operation.

REMOVAL AND INSTALLATION

SPEED CONTROL SERVO

REMOVAL

(1) Disconnect both negative battery cables at both batteries.

(2) Disconnect positive battery cable at battery (drivers side battery).

(3) Remove battery holddown bolts (Fig. 2).

(4) If equipped, pull up on battery heat shield to remove it (Fig. 3).

(5) Remove battery from vehicle.

(6) From under vehicle, and in front of left front wheelhouse, remove 2 lower battery tray nuts (Fig. 4).

(7) Remove 2 nuts and 2 bolts holding battery tray to vehicle (Fig. 5).

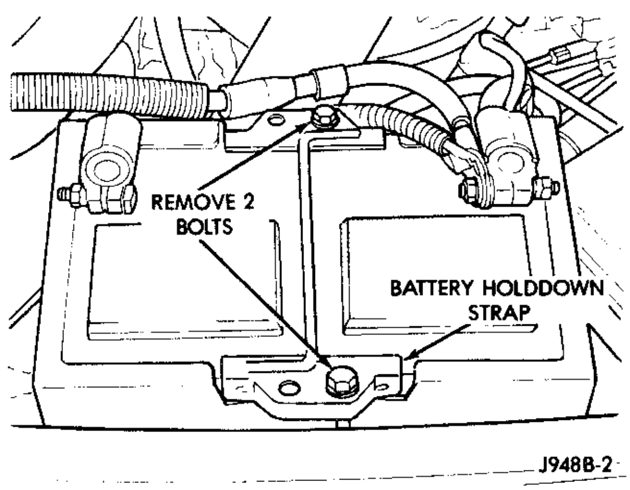

Fig. 2 Battery Holddown Bolts

REMOVAL AND INSTALLATION (Continued)

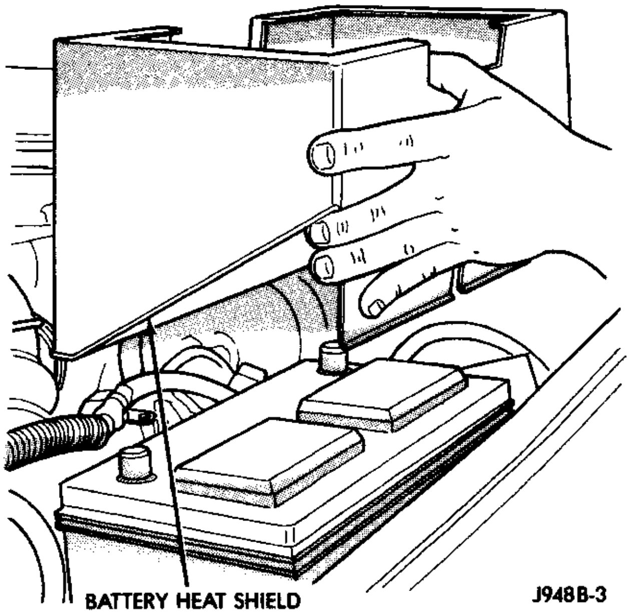

Fig. 3 Battery Heat Shield

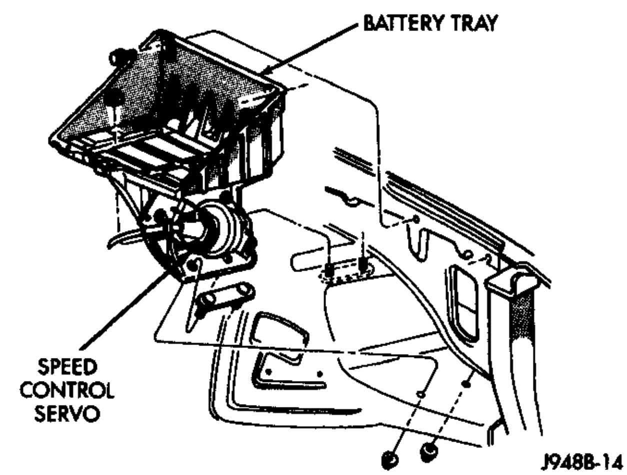

Fig. 4 Battery Tray Lower Mounting Nuts

(8) Remove cable cover (Fig. 6). Cable cover is attached with 2 Phillips screws, 2 plastic retention clips and 2 push tabs (Fig. 6). Remove 2 Phillips screws and carefully pry out 2 retention clips. After clip removal, push rearward on front tab, and upward on lower tab for cover removal.

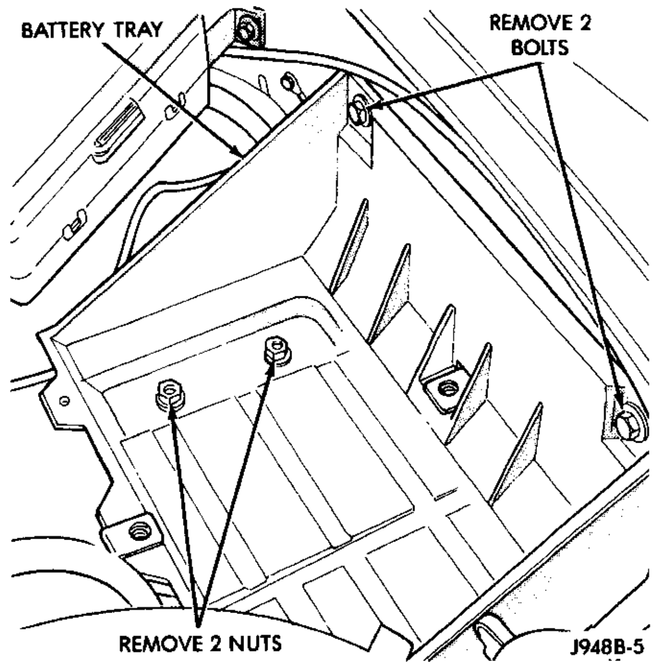

Fig. 5 Battery Tray Upper Mounting Bolts/Nuts

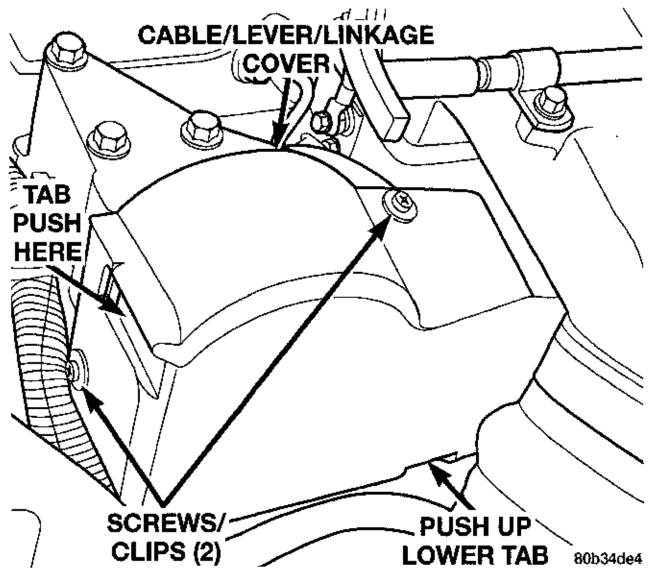

Fig. 6 Cable/Lever/Throttle Linkage Cover

(9) Using finger pressure only, disconnect end of servo cable from throttle lever pin by pulling forward on connector while holding lever rearward (Fig. 7).**DO NOT try to pull connector off perpendicular to lever pin. Connector will be broken.**

REMOVAL AND INSTALLATION (Continued)

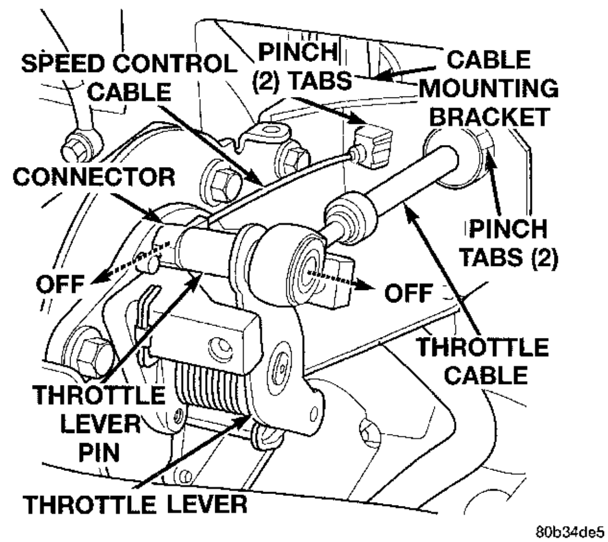

Fig. 7 Servo Cable at Throttle Lever

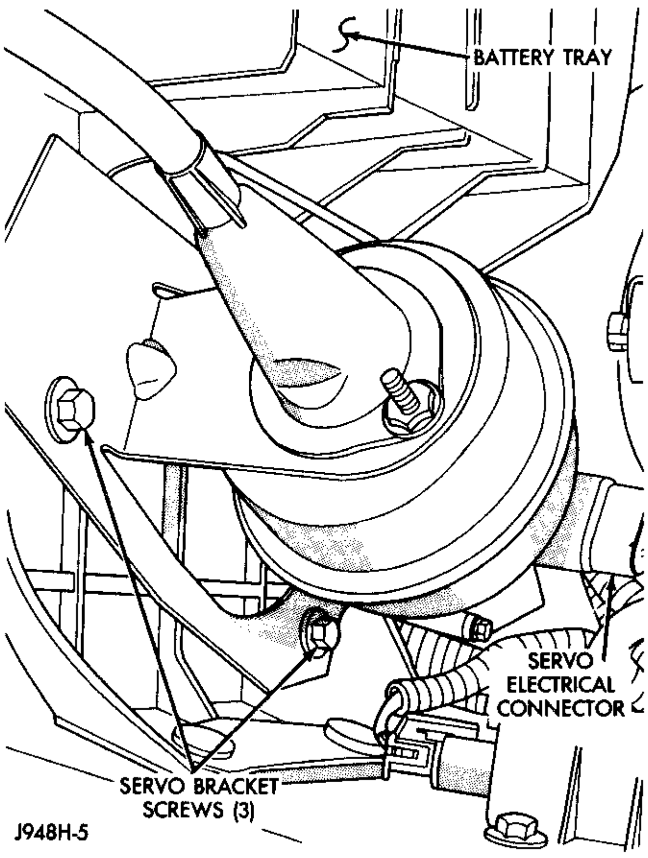

Fig. 8 Servo Location—Removal/Installation

(10) Position battery tray up far enough for access to speed control servo electrical connector and vacuum line.

(11) Disconnect electrical connector and vacuum line at servo.

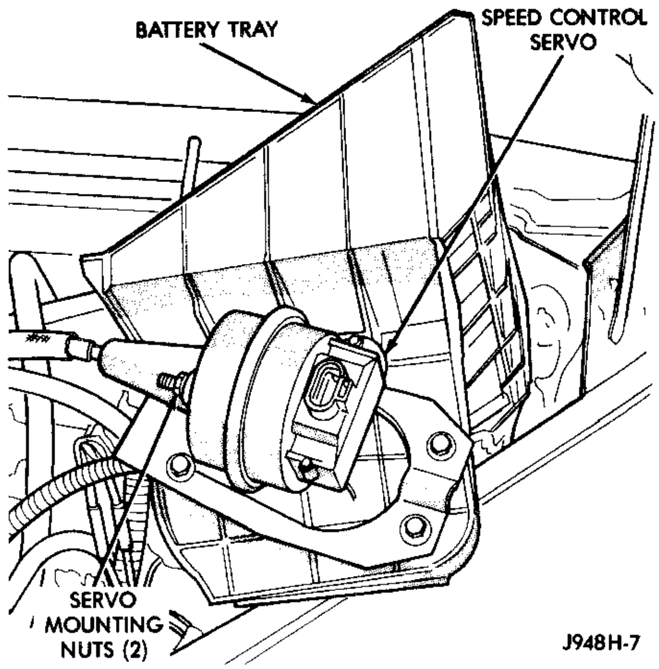

Fig. 9 Servo Mounting at Battery Tray

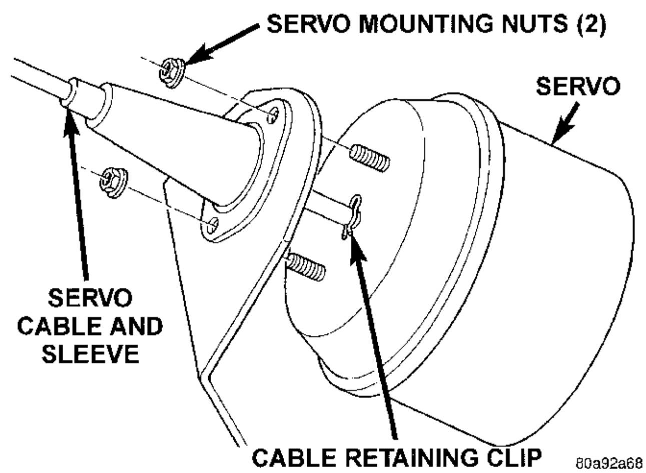

Fig. 10 Servo Cable Clip Remove/Install—Typical

(12) Position battery tray with attached servo assembly to gain access to 2 servo mounting nuts (Fig. 9) or (Fig. 10).

(13) Remove 2 mounting nuts holding servo cable sleeve to bracket (Fig. 10).

(14) Pull speed control cable sleeve and servo away from servo mounting bracket to expose cable retaining clip (Fig. 10) and remove clip. Note: The servo mounting bracket displayed in (Fig. 10) is a typical bracket and may/may not be applicable to this model vehicle.

(15) Remove servo from mounting bracket.

INSTALLATION

(1) Position servo to mounting bracket.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

(2) Align hole in cable connector with hole in servo pin. Install cable-to-servo retaining clip.

(3) Insert servo studs through holes in servo mounting bracket.

(4) Insert servo studs through holes in servo cable sleeve.

(5) Install servo mounting nuts and tighten to 8.5 N·m (75 in. lbs.) torque.

(6) Connect vacuum line to servo.

(7) Connect electrical connector to servo terminals.

(8) Connect servo cable to throttle lever by pushing cable connector rearward onto lever pin while holding lever forward.

(9) Install battery tray. Tighten all battery tray mounting hardware to 16 N·m (140 in. lbs.) torque.

(10) Position battery into battery tray.

(11) If equipped, install battery heat shield.

(12) Install battery holddown clamp. Tighten bolt to 4 N·m (35 in. lbs.) torque.

(13) Connect negative battery cables to both batteries.

(14) Before starting engine, operate accelerator pedal to check for any binding.

(15) Install cable/lever cover.

SPEED CONTROL SWITCHES

REMOVAL

WARNING: BEFORE BEGINNING ANY AIRBAG SYSTEM COMPONENT REMOVAL OR INSTALLATION, REMOVE AND ISOLATE THE NEGATIVE (-) CABLE(S) FROM THE BATTERY. THIS IS THE ONLY SURE WAY TO DISABLE THE AIRBAG SYSTEM. THEN WAIT TWO MINUTES FOR SYSTEM CAPACITOR TO DISCHARGE BEFORE FURTHER SYSTEM SERVICE. FAILURE TO DO THIS COULD RESULT IN ACCIDENTAL AIRBAG DEPLOYMENT AND POSSIBLE INJURY.

(1) Disconnect and isolate negative battery cable(s).

(2) Remove airbag module. Refer to Group 8M, Passive Restraint Systems for procedures.

(3) Remove switch-to-steering wheel mounting screws (Fig. 11).

(4) Remove switch.

(5) Remove electrical connector at switch.

INSTALLATION

(1) Install electrical connector to switch.

(2) Install switch and mounting screws.

(3) Tighten screws to 3 N·m (26 in. lbs. +/– 2 in. lbs.) torque.

(4) Install airbag module. Refer to Group 8M, Passive Restraint Systems for procedures.

(5) Connect negative battery cable(s).

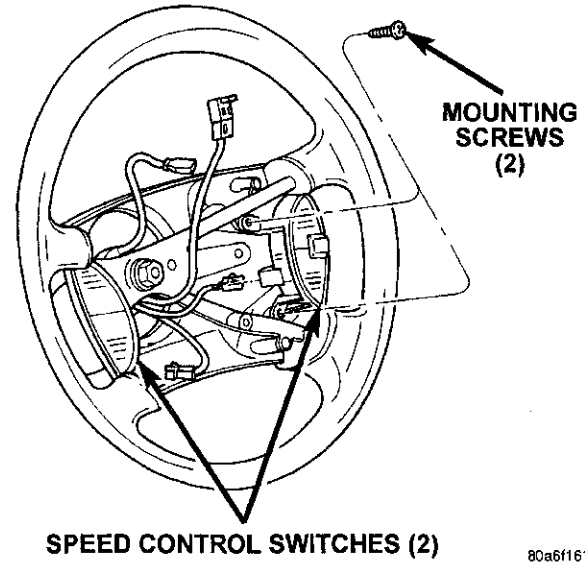

Fig. 11 Speed Control Switches

STOP LAMP SWITCH

Refer to Stop Lamp Switch in Group 5, Brakes for removal/installation and adjustment procedures.

SERVO CABLE

REMOVAL

(1) Disconnect both negative battery cables at both batteries.

(2) Remove cable/lever/linkage cover. Refer to Speed Control Servo Removal/Installation.

(3) Remove (disconnect) servo cable from servo. Refer to Speed Control Servo Removal/Installation.

(4) Using finger pressure only, disconnect end of servo cable from throttle lever pin by pulling forward on connector while holding lever rearward (Fig. 12).**DO NOT try to pull connector off perpendicular to lever pin. Connector will be broken.**

(5) Squeeze 2 pinch tabs (Fig. 12) on sides of speed control cable at mounting bracket and push cable rearward out of bracket.

(6) Remove cable from vehicle.

INSTALLATION

(1) Install (connect) end of speed control servo cable to speed control servo. Refer to Speed Control Servo Removal/Installation.

(2) Install cable through mounting hole on mounting bracket. Cable snaps into bracket.

(3) Connect servo cable to throttle lever by pushing cable connector rearward onto lever pin while holding lever forward.

(4) Connect negative battery cables to both batteries.

(5) Before starting engine, operate accelerator pedal to check for any binding.

(6) Install cable/lever cover.

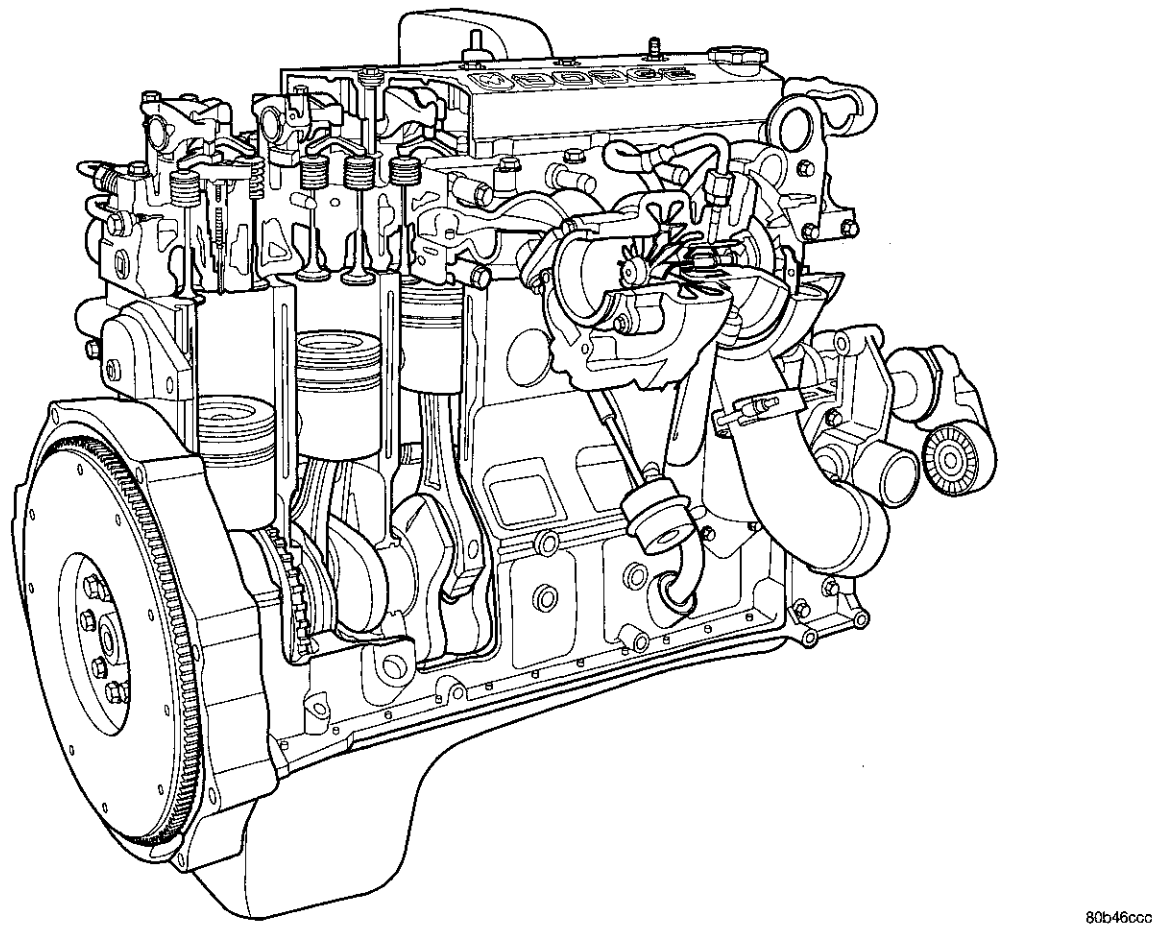
5.9L 24-VALVE TURBO DIESEL ENGINE

CONTENTS

DESCRIPTION AND OPERATION

5.9L DIESEL ENGINE

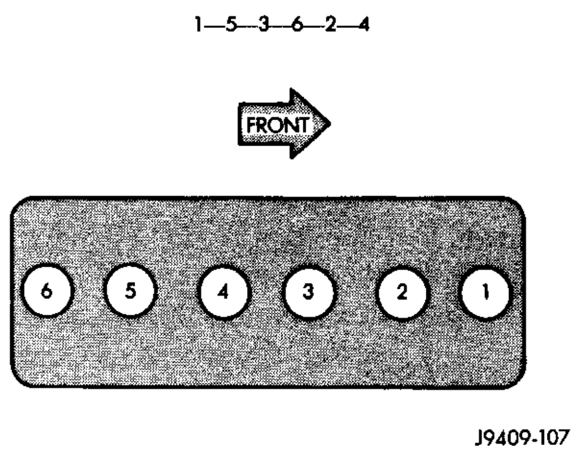


Cummins® 24 Valve Turbo Diesel Engine

5.9L DIESEL ENGINE DESCRIPTION

Engine type	In-line 6 (Diesel Turbo)
Bore and Stroke	102.0 x 120.0 (4.02 x 4.72 in.)
Displacement	5.9L (359 cu. in.)
Compression Ratio	16.5:1
Horsepower (A/T)	215 @ 2700 rpm
Horsepower (M/T)	235 @ 2700 rpm
Torque (A/T)	420 ft. lbs. @ 1600 rpm
Torque (M/T)	460 ft. lbs. @ 1600 rpm
Firing Order	1–5–3–6–2–4
Lubrication	Pressure Feed-Full Flow Filtration w/Bypass Valve
Cooling System	Liquid Cooled – Forced Circulation
Cylinder Block	Cast Iron
Crankshaft	Induction Hardened Forged Steel
Cylinder Head	Cast Iron
Combustion Chambers	High Swirl Bowl
Camshaft	Chilled Ductile Iron
Pistons	Cast Aluminum
Connecting Rods	Forged Steel

The cylinders are numbered from front to rear; 1 to 6. The firing order is 1-5-3-6-2-4.



Firing Order

DESCRIPTION AND OPERATION (Continued)

ENGINE IDENTIFICATION

ENGINE DATA PLATE

The engine data plate contains specific information that is helpful to servicing and obtaining parts for the engine. The data plate is located on the left side of the engine, affixed to the gear housing. Information that can be found on the data plate includes:

- Date of Engine Manufacture
- Engine Serial Number
- Control Parts List (CPL)
- Engine Rated Horsepower
- Engine Firing Order
- Engine Displacement
- Valve Lash Reset Specifications

ENGINE SERIAL NUMBER

If the engine data plate is missing or not legible, the engine serial number is used for engine identification. The engine serial number is stamped on the right side of the block, on top of the oil cooler cavity (Fig. 1).

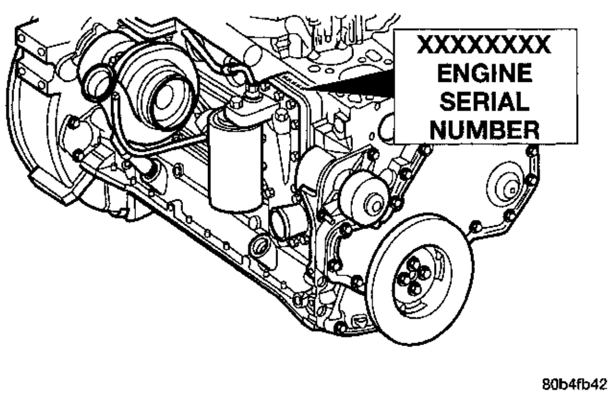


Fig. 1 Engine Serial Number Location

LUBRICATION SYSTEM

OIL CIRCUIT DESCRIPTION

NOTE: Refer to (Fig. 2) and (Fig. 3) for circuit illustrations.

A gerotor style oil pump draws oil from the crankcase through the suction tube and delivers it through the block where it enters the oil cooler cover and pressure regulator valve. When oil pressure exceeds 449 kPa (65 PSI), the valve opens exposing the dump port, which routes excess oil back to the inlet side of the oil pump.

At the same time, oil is directed to a cast in passage in the oil cooler cover, leading to the oil cooler element. As the oil travels through the element plates, it is cooled by engine coolant traveling past the outside of the plates. It is then routed to the oil filter head and through a full flow oil filter. If a plugged filter is encountered, the filter by-pass valve opens, allowing unfiltered oil to lubricate the engine. This condition can be avoided by frequent oil and filter changes, per the maintenance schedules found in the owners manual. The by-pass valve is calibrated to open when it sees a pressure drop of more than 172 kPa (25 PSI) across the filter head.

The oil filter head then divides the oil between the engine and the turbocharger. The turbocharger receives filtered, cooled and pressurized oil through a supply line from the filter head. The oil lubricates the turbocharger and returns to the pan by way of a drain line connecting the bottom of the turbocharger to a pressed in tube in the cylinder block.

Oil is then carried across the block to an angle drilling which intersects the main oil rifle. The main oil rifle runs the length of the block and delivers oil to the crankshaft main journals and valve train. Oil travels to the crankshaft through a series of transfer drillings (one for each main bearing) and lubricates a groove in the main bearing upper shell. From there another drilling feeds the camshaft main journals. The piston cooling nozzles are also supplied by the main bearing upper shell. Crankshaft internal cross-drillings supply oil to the connecting rod journals.

Another series of transfer drillings intersecting the main oil rifle supply the valve train components. Oil travels up the drilling, through a hole in the head gasket, and through a drilling in the cylinder head (one per cylinder), where it enters the rocker arm pedestal and is divided between the intake and exhaust rocker arm. Oil travels up and around the rocker arm mounting bolt, and lubricates the rocker shaft by cross drillings that intersect the mounting bolt hole. Grooves at both ends of the rocker shaft supply oil through the rocker arm where the oil travels to the push rod and socket balls.

5.9L DIESEL ENGINE COMPONENTS

CYLINDER BLOCK

The cylinder block is constructed of cast iron. The casting is a skirted design which incorporates longitudal ribs for superior strength and noise reduction. The block incorporates metric straight thread o-ring fittings at lubrication oil access points.

CRANKSHAFT

The crankshaft is a forged steel, integrally balanced unit. It is supported by seven main bearings, with position number six designated as the thrust journal. The crankshaft is held in place by main caps and 12 mm capscrews. The crankshaft also has a two-piece tone wheel, which supplies crankshaft

DESCRIPTION AND OPERATION (Continued)

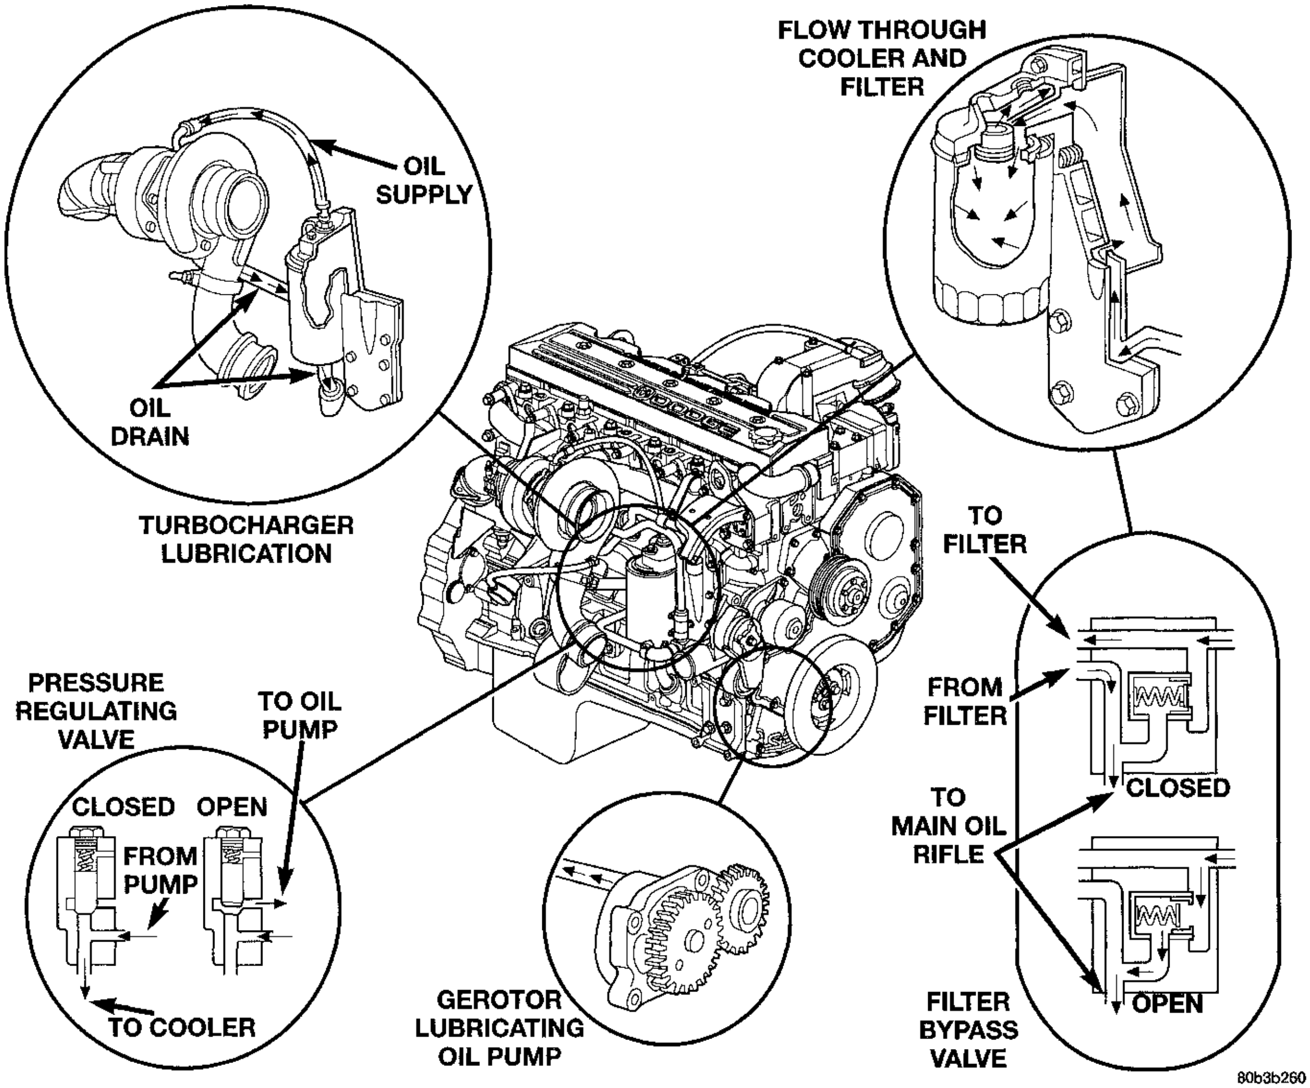

Fig. 2 Lubrication System Circulation

speed and position, mounted between the number five and six journals. Internal cross drillings supply the connecting rods with engine oil.

PISTONS AND CONNECTING RODS

The piston is constructed of aluminum and is gravity cast, free floating design. The piston incorporates a centrally located high swirl combustion bowl, and utilizes a “keystone” style top compression ring (Fig. 4), and a rectangular intermediate ring (Fig. 4), for superior cylinder wall scraping. Piston cooling nozzles cool the piston and pin with engine oil supplied by the crankshaft main journals.

The connecting rods are a split angle design constructed of forged steel construction. The rods have a pressed in place wrist pin bushing which is lubricated by the piston cooling nozzle oil spray.

CYLINDER HEAD

The cylinder head is constructed of cast iron and is a one piece cross flow design with four valves per cylinder. The arrangement of two intake and two exhaust valves per cylinder allows for a centrally located injector. The cylinder head also includes an integral intake manifold, an integral thermostat housing, and a longitudal fuel return rifle, which exits at the rear of the head. The 24 valve design also includes integrally cast valve guides and hardened intake and exhaust valve seats.

VALVES AND VALVE SPRINGS

The valves are made of heat resistant steel, and have chrome plated stems to prevent scuffing. The intake and exhaust valves are both similar in head diameter and overall length, but they have unique face angles which makes them non-interchangeable.

AUTHENTIC RESTORATION PRODUCT

DESCRIPTION AND OPERATION (Continued)

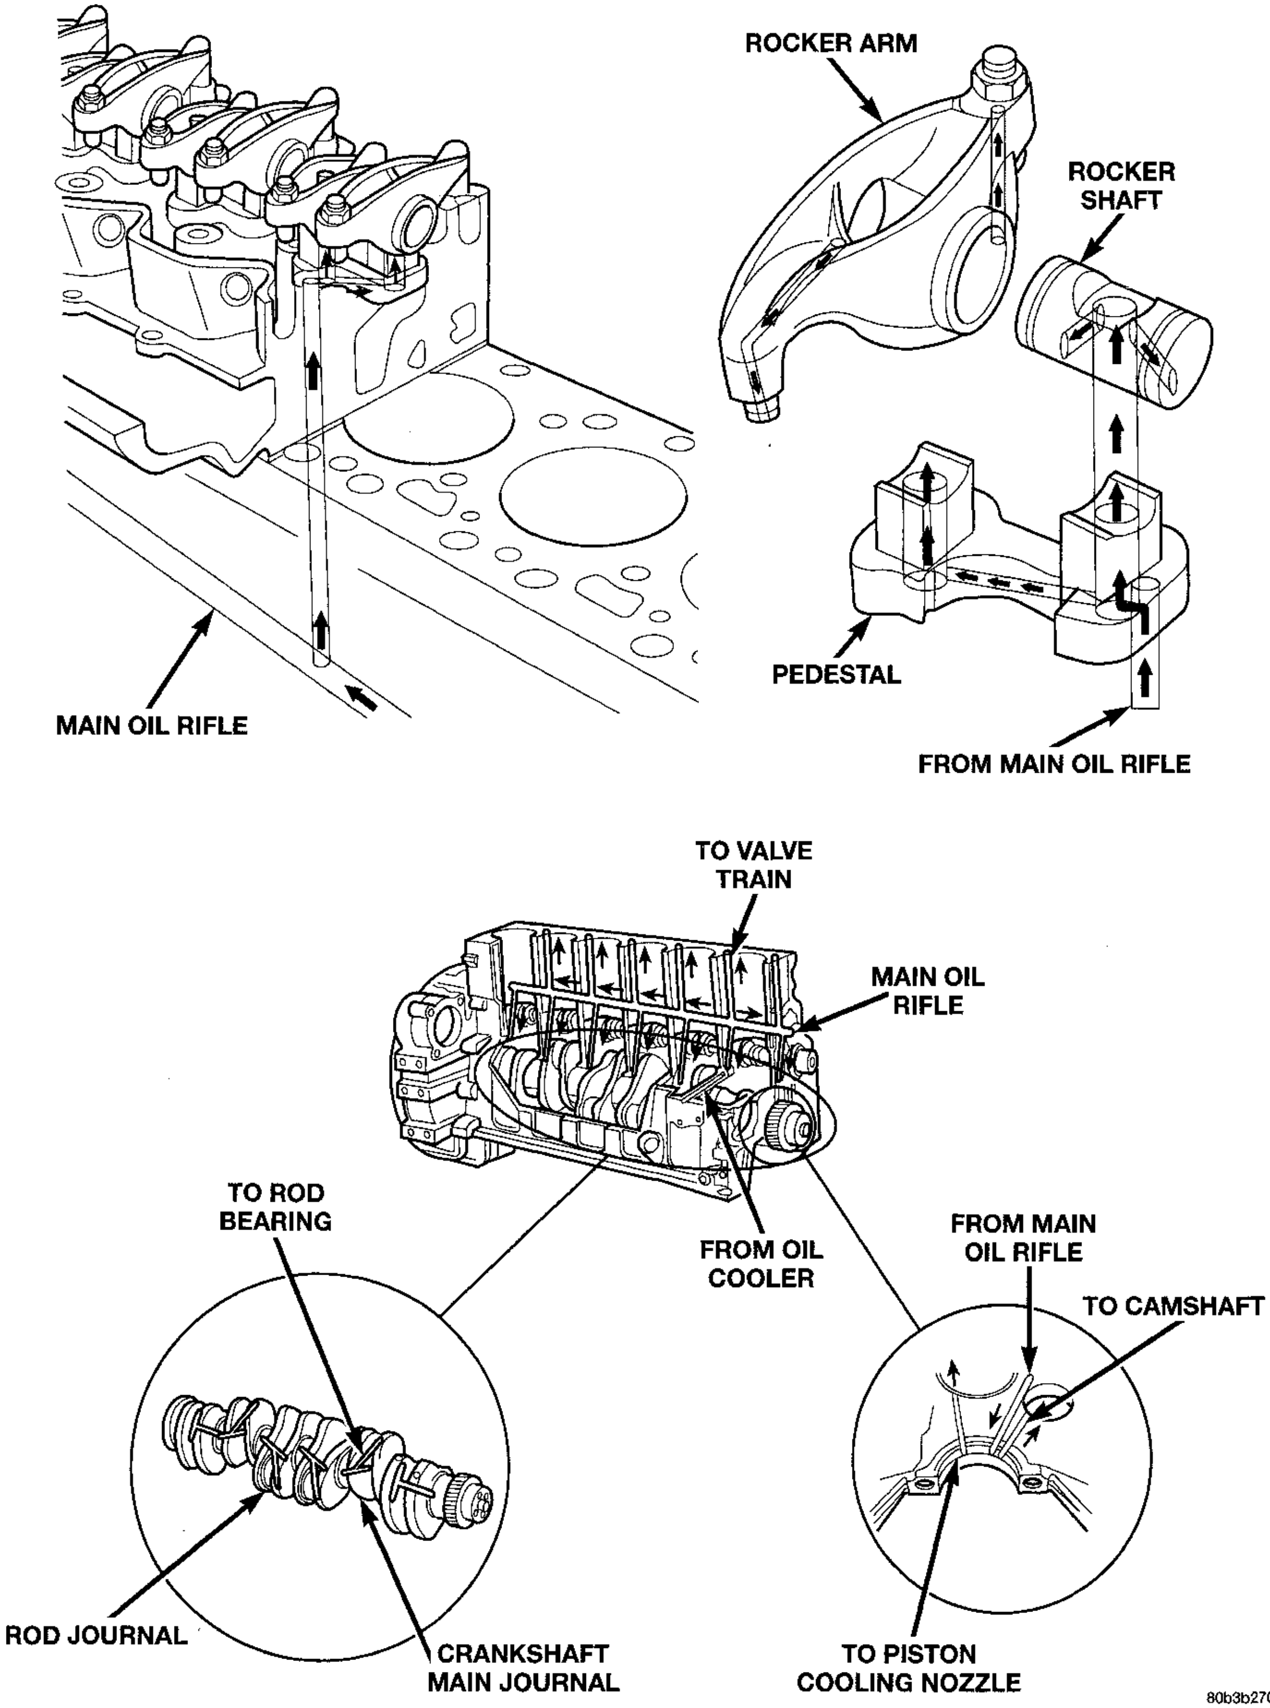

Fig. 3 Lubrication System Circulation—Cont'd

DESCRIPTION AND OPERATION (Continued)

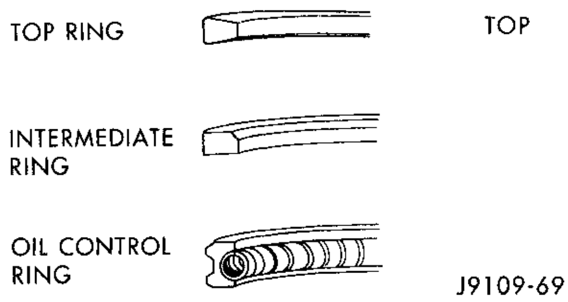

Fig. 4 Piston Ring Identification

The valves are distinguished by unique dimples on the exhaust valve head (Fig. 5).

The exhaust valve springs are made from high strength, chrome silicon steel. The exhaust valve springs are also exhaust brake compatible.

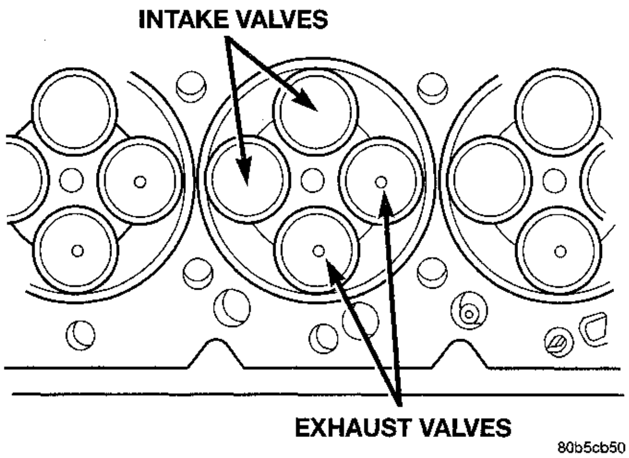

Fig. 5 Valve Identification

CAMSHAFT AND TAPPETS

The camshaft is constructed of ductile iron and is shot-peened in the #1 journal and valve lobe area for superior strength and durability. The camshaft is supported by a bushing at the #1 journal location, and is lubricated by a film of oil supplied by the crankshaft main journals. The camshaft is driven by a pressed on gear and its lateral movement is controlled by a thrust plate. The engine also uses solid "mushroom" style tappets to open and close the valves.

PUSH RODS, ROCKER ARMS, AND CROSSHEADS

The 24–valve overhead system incorporates rocker arms that are designed to allow fuel injector service without removing the rocker arms and pedestals. The unique intake and exhaust rocker arms have their own rocker shafts and are lubricated by passages intersecting the cylinder block main oil rifle. Crossheads are used (Fig. 6), which allow each rocker arm to operate two valves.

The solid push rods are hardened at the rocker arm and tappet contact areas for superior strength and durability.

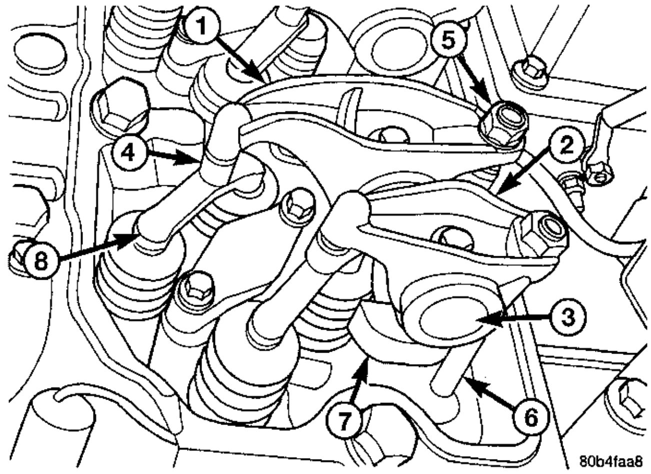

Fig. 6 Overhead System Components

1) Exhaust Rocker Arm	5) Adjusting Screw Lock Nut
2) Intake Rocker Arm	6) Push Rod
3) Rocker Shaft	7) Pedestal
4) Socket	8) Crosshead

ENGINE LUBRICATION

The lubrication system is a pressure fed, full flow filtration system. The oil pump is a gerotor style and is driven by the crankshaft gear. The lubrication system also incorporates a pressure regulator and an oil filter by-pass valve.

VACUUM PUMP

The vacuum pump and the power steering pump are combined into a single assembly on diesel engine models (Fig. 7). Both pumps are operated by a drive gear attached to the vacuum pump shaft. The shaft gear is driven by the camshaft gear.

The vacuum pump is a constant displacement, vane-type pump. Vacuum is generated by four vanes mounted in the pump rotor. The rotor is located in the pump housing and is pressed onto the pump shaft.

The vacuum and steering pumps are operated by a single drive gear pressed onto the vacuum pump shaft. The drive gear is operated by the engine camshaft gear.

The vacuum and power steering pump shafts are connected by a coupling. Each pump shaft has an adapter with drive lugs that engage in the coupling.

The vacuum pump rotating components are lubricated by engine oil. Lubricating oil is supplied to the

AUTHENTIC RESTORATION PRODUCT

DESCRIPTION AND OPERATION (Continued)

pump through an oil line at the underside of the pump housing.

The complete assembly must be removed in order to service either pump. However, the power steering pump can be removed and serviced separately when necessary.

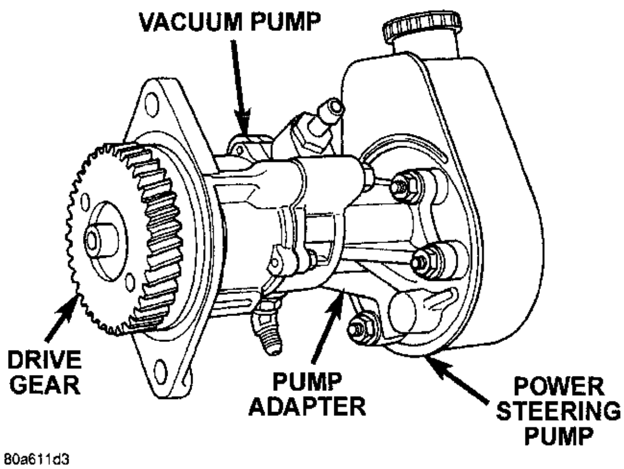

Fig. 7 Diesel Vacuum & Power Steering Pump Assembly

The vacuum pump is not a serviceable component. If diagnosis indicates a pump malfunction, the pump must be replaced as an assembly. Do not disassemble or attempt to repair the pump.

The combined vacuum and steering pump assembly must be removed for access to either pump. However, the vacuum pump can be removed without having to disassemble the power steering pump.

If the power steering pump requires service, simply remove the assembly and separate the two pumps. Refer to the pump removal and installation procedures in this section.

VACUUM PUMP OPERATION

Vacuum pump output is transmitted to the HEVAC, speed control, and EGR systems through a supply hose. The hose is connected to an outlet port on the pump housing and uses an in-line check valve to retain system vacuum when vehicle is not running.

Pump output ranges from a minimum of 8.5 to 25 inches vacuum.

The pump rotor and vanes are rotated by the pump drive gear. The drive gear is operated by the camshaft gear.

DIAGNOSIS AND TESTING

ENGINE OIL PRESSURE

(1) Remove the engine oil pressure sensor and install Oil Pressure Line and Gauge Tool C-3292 with a suitable adapter.

(2) Start engine and warm to operating temperature.

(3) Record engine oil pressure and compare with engine oil pressure chart.

CAUTION: If engine oil pressure is zero at idle, DO NOT RUN THE ENGINE.

Engine Oil Pressure (MIN)

At idle	68.9 kPa (10 psi)
At 2000 rpm	206.9 kPa (30 psi)

If minimum engine oil pressure is below these ranges, refer to the Engine Mechanical Diagnosis Charts in this section.

(4) Remove oil pressure gauge and install the oil pressure sensor. Tighten the sensor to 16 N·m (144 in. lbs.) torque.

mopar AUTHENTIC RESTORATION PRODUCT

ENGINE DIAGNOSIS—MECHANICAL

MECHANICAL DIAGNOSIS CHART—DIESEL ENGINES

CONDITION	POSSIBLE CAUSES	CORRECTION
LUBRICATING OIL PRESSURE LOW	1. Low oil level.	1. A. Check and fill with clean engine oil. B. Check for a severe external oil leak that could reduce the pressure.
	2. Oil viscosity thin, diluted or wrong specification.	2. Verify the correct oil is being used. Check for oil dilution. Refer to Contaminated Lube Oil (Engine Diagnosis Mechanical).
	3. Improperly operating pressure switch/gauge.	3. Verify the pressure switch is functioning correctly. If not, replace switch/gauge.
	4. Relief valve stuck open.	4. Check/replace valve.
	5. Plugged oil filter.	5. Change oil filter. Oil filter change interval may need to be revised.
	6. If cooler was replaced, shipping plugs left in cooler.	6. Check/remove shipping plugs.
	7. Worn oil pump.	7. Check and replace oil pump.
	8. Suction tube loose or seal leaking.	8. Check and replace seal.
	9. Loose main bearing cap.	9. Check and install new bearing and tighten cap to proper torque.
	10. Worn bearings or wrong bearings installed.	10. Inspect and replace connecting rod or main bearings. Check and replace piston cooling nozzles.
	11. Oil jet under piston bad fit into main carrier.	11. Check oil jet position.
LUBRICATING OIL PRESSURE TOO HIGH	1. Pressure switch/gauge not operating properly.	1. Verify the pressure switch is functioning correctly. If not, replace switch/gauge.
	2. Engine running to cold.	2. Refer to Coolant Temperature Below Normal (Engine Diagnosis Performance).
	3. Oil viscosity too thick.	3. Make sure the correct oil being used, (Refer to Group 0, Lubrication and Maintenance).
	4. Oil pressure relief valve stuck closed or binding.	4. Check and replace valve.
LUBRICATING OIL LOSS	1. External leaks.	1. Visually inspect for oil leaks. Repair as required.
	2. Crankcase being overfilled.	2. Verify that the correct dipstick is being used.
	3. Incorrect oil specification or viscosity.	3. A. Make sure the correct oil is being used. B. Look for reduced viscosity from dilution with fuel. C. Review/reduce the oil change intervals.
	4. Oil cooler leak.	4. Check and replace the oil cooler.
	5. High blow-by forcing oil out the breather.	5. Check the breather tube area for signs of oil loss. Perform the required repairs.
	6. Turbocharger leaking oil to the air intake.	6. Inspect the air ducts for evidence of oil transfer. Repair as required.
	7. Piston rings not sealing (oil being consumed by the engine).	7. Perform blow-by check. Repair as required.

J9509-152

AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING (Continued)

MECHANICAL DIAGNOSIS CHART—DIESEL ENGINES—CONT.

CONDITION	POSSIBLE CAUSES	CORRECTION
COMPRESSION KNOCKS	1. Air in the fuel system.	1. Bleed the fuel system (refer to Group 14, Fuel System).
	2. Poor quality fuel or water/ gasoline contaminated fuel.	2. Verify by operating from a temporary tank with good fuel. Clean and flush the fuel supply tanks. Replace fuel/water separator filter.
	3. Engine overloaded.	3. Verify the engine load rating is not being exceeded.
	4. Incorrect injection pump timing.	4. Check and time injection pump (refer to Group 14, Fuel System).
	5. Improperly operating injectors.	5. Check and replace inoperative injectors.
EXCESSIVE VIBRATION	1. Loose or broken engine mounts.	1. Replace engine mounts.
	2. Damaged fan or improperly operating accessories.	2. Check and replace the vibrating components.
	3. Improperly operating vibration damper.	3. Inspect/replace the vibration damper.
	4. Improperly operating viscous fan drive.	4. Inspect/replace the fan drive.
	5. Worn or damaged generator bearing.	5. Check/replace the generator.
	6. Flywheel housing misaligned.	6. Check/correct flywheel alignment.
	7. Loose or broken power component.	7. Inspect the crankshaft and rods for damage that causes an unbalance. repair/replace as required.
	8. Worn or unbalanced driveline components.	8. Check/repair driveline components.
EXCESSIVE ENGINE NOISES	1. Drive belt squeal, insufficient tension or abnormally high loading.	1. Check the automatic tensioner and inspect the drive belt. Make sure water pump, tensioner pulley, fan hub and generator turn freely.
	2. Intake air or exhaust leaks.	2. Refer to Excessive Exhaust smoke (Engine Diagnosis Performance).
	3. Excessive valve lash.	3. Adjust valves. Make sure the push rods are not bent and rocker levers or adjusting screws are not severely worn. Replace bent or severely worn pads.
	4. Turbocharger noise.	4. Check turbocharger impeller and turbine wheel for housing contact. Repair/replace as required.
	5. Gear train noise.	5. Visually inspect and measure gear backlash. Replace gears as required.
	6. Power function knock.	6. Check/replace rod and main bearings.
GENERATOR NOT CHARGING OR INSUFFICIENT CHARGING	1. Loose or corroded battery.	1. Clean/tighten battery connection.
	2. Generator belt slipping.	2. Check/replace automatic belt tensioner. Check/replace drive belt.
	3. Generator pulley loose on shaft.	3. Tighten pulley.
	4. Improperly operating generator.	4. Check/replace generator.

J9509-153

DIAGNOSIS AND TESTING (Continued)

SMOKE DIAGNOSIS CHARTS

The following charts include possible causes and corrections for **excess or abnormal** exhaust smoke.

Small amounts of exhaust smoke (at certain times) are to be considered normal for a diesel powered engine.

EXCESSIVE BLACK SMOKE	
POSSIBLE CAUSE	**CORRECTION**
Air filter dirty or plugged.	Check Filter Minder® at air filter. Refer to Air Cleaner Housing/ Element Removal/Installation in Group 14, Fuel System. Replace filter if necessary.
Air intake system restricted.	Check entire air intake system including all hoses and tubes for restrictions, collapsed parts or damage. Repair/replace as necessary.
Diagnostic Trouble Codes (DTC's) active or multiple, intermittent DTC's.	Refer to Powertrain Diagnostic Procedures manual.
Engine Control Module (ECM) not calibrated or ECM has incorrect calibration.	Refer to Powertrain Diagnostic Procedures manual.
Exhaust system restriction is above specifications.	Check exhaust pipes for damage/restrictions. Repair as necessary. Refer to Group 11, Exhaust System and Turbocharger.
Fuel grade is not correct or fuel quality is poor.	Temporarily change fuel brands and note condition. Change brand if necessary.
Fuel injection pump malfunctioning.	A DTC should have been set. If so, refer to Powertrain Diagnostic Procedures manual.
Fuel injector malfunctioning.	A DTC should have been set. Perform "Cylinder Balance Test" using DRB scan tool to isolate individual cylinders. Also refer to Powertrain Diagnostic Procedures manual and, to Fuel Injector Testing in Group 14, Fuel System.
Fuel return system restricted.	Check fuel return line by checking overflow valve. Refer to Fuel Transfer Pump Pressure Test in Group 14, Fuel System.
Intake manifold restricted.	Remove restriction. Refer to Group 9, Engines.
Manifold Air Pressure (Boost) Sensor or sensor circuit malfunctioning.	A DTC should have been set. Refer to Powertrain Diagnostic Procedures manual. Also refer to Boost Pressure Test in Group 14, Fuel System.
Raw fuel in intake manifold.	Fuel injectors leaking on engine shutdown. Do Fuel Injector Test. Refer to Group 14, Fuel System.
Static timing not correct.	A DTC should have been set. If so, refer to Powertrain Diagnostic Procedures manual. Also refer to Fuel Injection Pump Timing in Group 14, Fuel System.
Turbocharger air intake restriction.	Refer to Group 11, Exhaust System and Turbocharger.
Turbocharger damaged.	Refer to Group 11, Exhaust System and Turbocharger.
Turbocharger has excess build up on compressor wheel and/or diffuser vanes.	Refer to Group 11, Exhaust System and Turbocharger.
Turbocharger wheel clearance out of specification.	Refer to Group 11, Exhaust System and Turbocharger.

AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING (Continued)

EXCESSIVE WHITE SMOKE	
POSSIBLE CAUSE	**CORRECTION**
Air in fuel supply: Possible leak in fuel supply side (between transfer pump and fuel tank module).	Refer to Fuel Transfer Pump Pressure Test in Group 14, Fuel System.
Coolant leaking into combustion chamber.	Do pressure test of cooling system. Refer to Group 7, Cooling System
Diagnostic Trouble Codes (DTC's) active or multiple, intermittent DTC's.	Refer to Powertrain Diagnostic Procedures manual.
In very cold ambient temperatures, engine block heater is malfunctioning (if equipped).	Refer to Group 7, Cooling System.
Engine coolant temperature sensor malfunctioning.	A DTC should have been set. Refer to Powertrain Diagnostic Procedures manual. Also check thermostat operation. Refer to Group 7, Cooling System.
Engine Control Module (ECM) not calibrated or has incorrect calibration.	A DTC should have been set. Refer to Powertrain Diagnostic Procedures manual.
Fuel filter plugged.	Perform Fuel Pressure Drop Test. Refer to Fuel Transfer Pump Pressure Testing in Group 14, Fuel System.
Fuel grade not correct or fuel quality is poor.	Temporarily change fuel brands and note condition. Change brand if necessary.
Fuel heater element or fuel heater temperature sensor malfunctioning. This will cause wax type build-up in fuel filter.	Refer to Fuel Heater Testing in Group 14, Fuel System.
Fuel injector malfunctioning.	A DTC should have been set. Perform "Cylinder Balance Test" using DRB scan tool to isolate individual cylinders. Also refer to Powertrain Diagnostic Procedures manual and, to Fuel Injector Testing in Group 14, Fuel System.
Fuel injector protrusion not correct.	Check washer (shim) at bottom of fuel injector for correct thickness. Refer to Fuel Injector Removal/Installation in Group 14, Fuel System.
Fuel injection pump malfunctioning.	A DTC should have been set. Refer to Powertrain Diagnostic Procedures manual.
Fuel supply side restriction to transfer pump.	Refer to Fuel Transfer Pump Pressure Test in Group 14, Fuel System
Fuel transfer (lift) pump malfunctioning.	A DTC should have been set. Refer to Powertrain Diagnostic Procedures manual. Also refer to Fuel Transfer Pump Pressure Testing in Group 14, Fuel System.
Intake/Exhaust valve adjustments not correct (too tight).	Refer to Group 9, Engines.
Intake manifold air temperature sensor malfunctioning.	A DTC should have been set. Refer to Powertrain Diagnostic Procedures manual.
Intake manifold heater circuit not functioning correctly in cold weather.	A DTC should have been set. Refer to Powertrain Diagnostic Procedures manual. Also check heater elements for correct operation.
Intake manifold heater elements not functioning correctly in cold weather.	A diagnostic trouble code WILL NOT BE SET if heater elements are malfunctioning. Refer to NTC tests in Powertrain Diagnostic Procedures manual.
Internal engine damage (scuffed cylinder).	Analyze engine oil and inspect oil filter to locate area of probable damage.
Restriction in fuel supply side of fuel system.	Refer to Fuel Transfer Pump Pressure Testing in Group 14, Fuel System.
Static timing incorrect.	A DTC should have been set. If so, refer to Fuel injection Pump Timing in Group 14, Fuel System.

DIAGNOSIS AND TESTING (Continued)

EXCESSIVE BLUE SMOKE	
POSSIBLE CAUSE	**CORRECTION**
Dirty air cleaner or restricted turbocharger intake duct.	Check Filter Minder at air filter housing. Refer to Air Cleaner Housing/Element Removal/Installation in Group 14, Fuel System. Replace air remove obstruction and/or replace air cleaner element as necessary.
Air leak in boost system between turbocharger compressor outlet and intake manifold.	Refer to Turbocharger System Diagnostics in Group 11, Exhaust System and Turbocharger.
Obstruction in exhaust manifold.	Remove exhaust manifold and inspect for blockage. Refer to Group 11, Exhaust System and Turbocharger.
Restricted turbocharger drain tube.	Remove turbocharger drain tube and remove obstruction. Refer to Group 11, Exhaust System and Turbocharger.
Crankcase ventilation system plugged.	Inspect crankcase breather and vent tube for sludge formation or obstructions.
Valve seals are worn, brittle, or improperly installed.	Replace valve stem oil seals. Refer to Valve Spring and/or Seal Removal/Installation in this group.
Valve stems and/or guides are worn.	Remove valves and inspect valves and guides. Refer to procedure in this group.
Broken or Improperly installed piston rings.	Tear down engine and inspect piston rings.
Excessive piston ring end gap.	Remove pistons and measure piston ring end gap. Refer to Piston and Connecting Rod Removal/Installation in this group.
Excessive cylinder bore wear and taper.	Remove pistons and measure cylinder bore wear and taper. Refer to applicable procedures in this group.
Cylinder damage.	Remove pistons and inspect cylinder bore for cracks or porosity. Repair with cylinder liner if necessary. Refer to procedure in this group.
Piston damage.	Remove pistons and inspect for cracks, holes. Measure piston for out-of-round and taper. Refer to Piston and Connecting Rod Removal/Installation in this group.
Turbocharger failure.	Refer to Turbocharger Diagnostics in Group 11, Exhaust System and Turbocharger.

VACUUM PUMP OUTPUT

The vacuum pump supplies necessary vacuum to components in the following systems:

- HEVAC system
- Speed Control System

A quick check to determine if the vacuum pump is the cause of the problem in any of these systems is to road test the vehicle and verify that all of these systems are fuctioning properly. If only one of these has a vacuum related failure, then it is likely the vacuum pump is not the cause.

A standard vacuum gauge can be used to check pump output when necessary. Simply disconnect the pump supply hose and connect a vacuum gauge to the outlet port for testing purposes. With the engine running, vacuum output should be a minimum of 25 inches, depending on engine speed.

DIAGNOSING LOW VACUUM OUTPUT CONDITION

If the vacuum pump is suspected of low vacuum output, check the pump and vacuum harnesses as follows:

(1) Visually inspect the vacuum harness for obvious failures (i.e. disconnected, cracks, breaks etc.)

(2) Disconnect the vacuum supply hose at the vacuum pump check valve. Connect vacuum gauge to this valve and run engine at various throttle openings. Output should be a minimum 25 inches of vacuum. If vacuum is consistently below 25 inches, the vacuum pump should be replaced. If output is within specified limits, the vacuum harness should be suspected as the cause.

(3) Disconnect and isolate the vacuum supply harness. Cap off open ends and apply roughly 15 inches of vacuum to the harness. If the vacuum gauge does

AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING (Continued)

not hold its reading, then there is an open in the harness and it should be repaired or replaced.

(4) If the vacuum loss is still not detected at this point, then the pump and harness are not the cause of the low vacuum condition. Apply vacuum to the related components of the vacuum supply system (i.e. valves, servos, solenoids, etc.) to find the source of the vacuum loss.

SERVICE PROCEDURES

ENGINE OIL / FILTER SERVICE

WARNING: NEW OR USED ENGINE OIL CAN BE IRRITATING TO THE SKIN. AVOID PROLONGED OR REPEATED SKIN CONTACT WITH ENGINE OIL. CONTAMINANTS IN USED ENGINE OIL, CAUSED BY INTERNAL COMBUSTION, CAN BE HAZARDOUS TO YOUR HEALTH. THOROUGHLY WASH EXPOSED SKIN WITH SOAP AND WATER. DO NOT WASH SKIN WITH GASOLINE, DIESEL FUEL, THINNER, OR SOLVENTS, HEALTH PROBLEMS CAN RESULT. DO NOT POLLUTE. DISPOSE OF USED ENGINE OIL PROPERLY.

ENGINE OIL SPECIFICATION

CAUTION: Do not use non-detergent or straight mineral oil when adding or changing crankcase lubricant. Engine failure can result.

API SERVICE GRADE CERTIFIED

Standard engine-oil identification notations have been adopted to aid in the proper selection of engine oil. The identifying notations are located on the label of engine oil plastic bottles and the top of engine oil cans.

In diesel engines, use an engine oil that conforms to API Service Grade CF-4 or CG-4/SH (Fig. 8). MOPAR® provides an engine oil that conforms to this particular grade.

Fig. 8 API Service Grade Certification Label—Diesel Engine Oil

SAE VISCOSITY

An SAE viscosity grade is used to specify the viscosity of engine oil. SAE 15W–40 specifies a multiple viscosity engine oil.

When choosing an engine oil, consider the range of temperatures the vehicle will be operated in before the next oil change. Select an engine oil that is best suited to your area's particular ambient temperature range and variation. For diesel engines, refer to (Fig. 9).

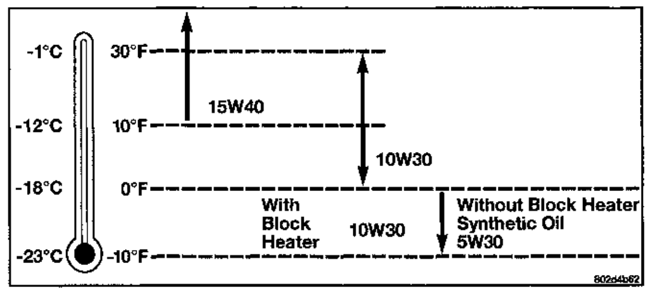

Fig. 9 Engine Oil Viscosity Recommendation—Diesel Engines

CRANKCASE OIL LEVEL INSPECTION

CAUTION: Do not overfill crankcase with engine oil, oil foaming and oil pressure loss can result.

To ensure proper lubrication of an engine, the engine oil must be maintained at an acceptable level. The acceptable oil level is in the SAFE RANGE on the engine oil dipstick (Fig. 10).

Unless the engine has exhibited loss of oil pressure, run the engine for about five minutes before checking oil level. Checking engine oil level of a cold engine is not accurate.

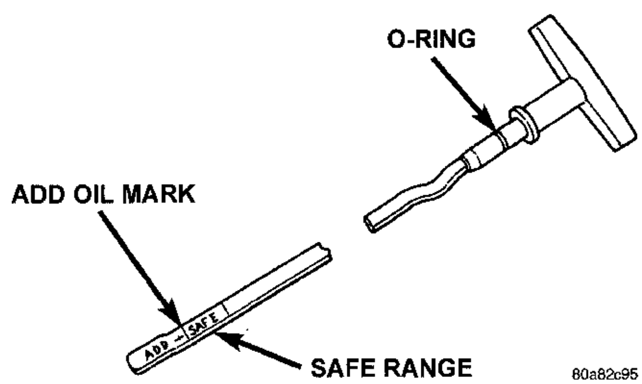

Fig. 10 Oil Level Indicator (Dipstick)

(1) Position vehicle on level surface.

(2) With engine OFF, allow approximately ten minutes for oil to settle to bottom of crankcase, remove engine oil dipstick.

(3) Wipe dipstick clean.

AUTHENTIC RESTORATION PRODUCTS

SERVICE PROCEDURES (Continued)

(4) Replace dipstick and verify it is seated in the tube.
(5) Remove dipstick, with handle held above the tip, take oil level reading.
(6) Add oil only if level is below the SAFE RANGE area on the dipstick.
(7) Replace dipstick

ENGINE OIL AND FILTER CHANGE

WARNING: HOT OIL CAN CAUSE PERSONAL INJURY.

NOTE: Change engine oil and filter at intervals specified in the owner's manual.

(1) Operate the engine until the water temperature reaches 60°C (140°F). Shut the engine off.
(2) Use a container that can hold at least 14 liters (15 quarts) to hold the used oil. Remove the oil drain plug and drain the used engine oil into the container.
(3) Always check the condition of the used oil. This can give you an indication of engine problems that might exist.
- Thin, black oil indicates fuel dilution.
- Milky discoloration indicates coolant dilution.

(4) Clean the area around the oil filter head. Remove the filter using a 90-95 mm filter wrench.
(5) Clean the gasket surface of the filter head. The filter canister O-Ring seal can stick on the filter head. Make sure it is removed.
(6) Fill the oil filter element with clean oil before installation. Use the same type oil that will be used in the engine.
(7) Apply a light film of lubricating oil to the sealing surface before installing the filter.

CAUTION: Mechanical over-tightening may distort the threads or damage the filter element seal.

(8) Install the filter as specified by the filter manufacturer.
(9) Clean the drain plug and the sealing surface of the pan. Check the condition of the threads and sealing surface on the oil pan and drain plug.
(10) Install the drain plug. Tighten the plug to 60 N·m (44 ft. lbs.) torque.
(11) Use only High-Quality Multi-Viscosity lubricating oil in the Cummins Turbo Diesel engine. Choose the correct oil for the operating conditions outlined in Group 0, Lubrication and Maintenance.
(12) Fill the engine with the correct grade of new oil. Refer to Group 0, Lubrication and Maintenance for the correct oil fill capacity.
(13) Start the engine and operate it at idle for several minutes. Check for leaks at the filter and drain plug.
(14) Stop engine. Wait several minutes to allow the oil to drain back to the pan and check the level again.

USED ENGINE OIL DISPOSAL

Care should be exercised when disposing of used engine oil after it has been drained from a vehicle's engine.

VALVE LASH VERIFICATION & ADJUSTMENT

NOTE: To obtain accurate readings, valve lash measurements AND adjustments should only be performed when the engine coolant temperature is less than 60° C (140° F).

The 24–valve overhead system is a "low-maintenance" design. Routine adjustments are no longer necessary, however, measurement should still take place when trouble-shooting performance problems, or upon completion of a repair that includes removal and installation of the valve train components.
(1) Disconnect battery negative cables.
(2) Remove cylinder head cover (Fig. 11). Refer to procedure in this group.
(3) Remove the fuel pump gear access cover (Fig. 12).

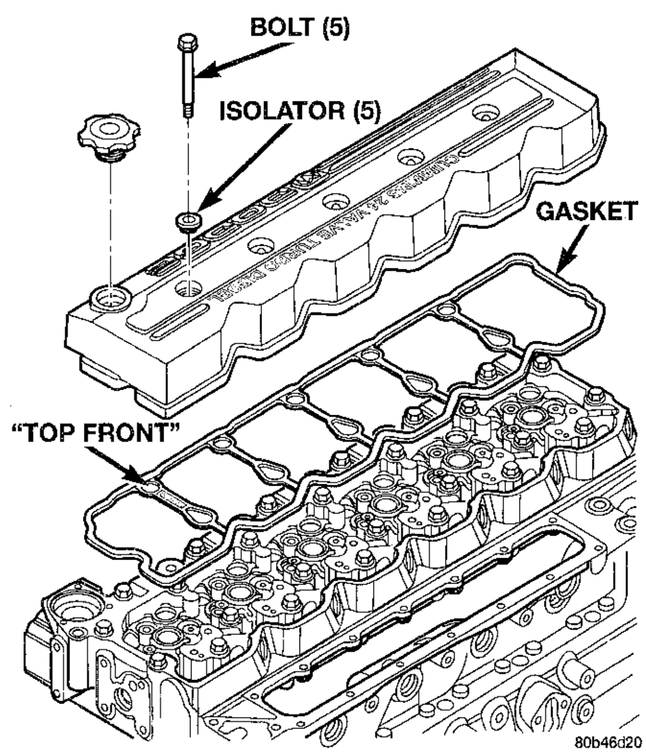

Fig. 11 Cylinder Head Cover and Gasket

(4) Using the crankshaft barring tool #7471B, rotate the engine and align the pump gear mark with

AUTHENTIC RESTORATION PRODUCT

SERVICE PROCEDURES (Continued)

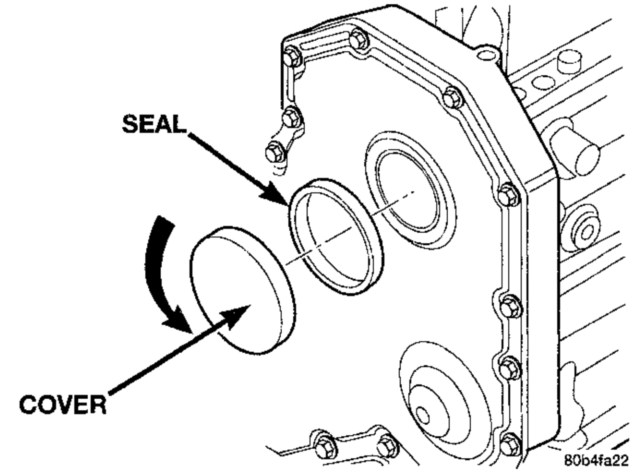

Fig. 12 Fuel Pump Gear Access Cover

the top dead center (TDC) mark on the gear housing cover (Fig. 13).

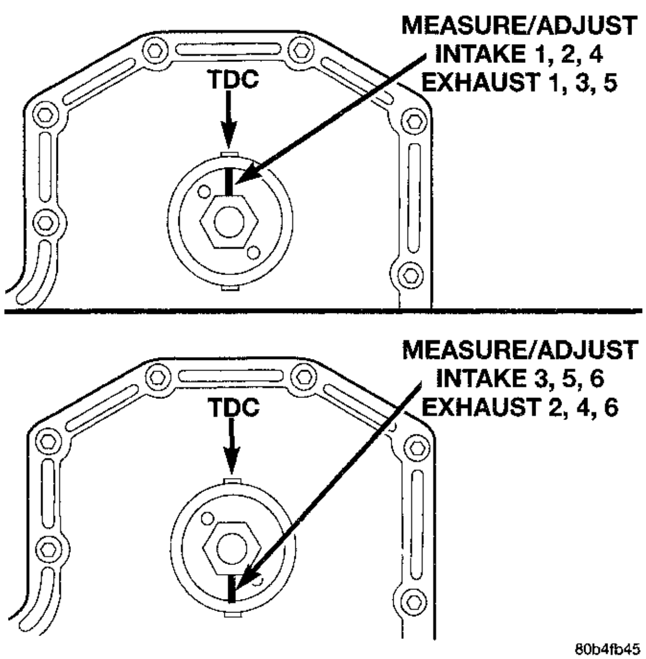

Fig. 13 Fuel Pump Gear Timing Mark Orientation

(5) With the engine in this position (pump gear mark at 12 o'clock), valve lash can be measured at the following rocker arms: **INTAKE 1-2-4 / EXHAUST 1-3-5**. Measure the valve lash by inserting a feeler gauge between the rocker arm socket and crosshead (Fig. 14). Refer to the Valve Lash Limit Chart for the correct specifications. If the measurement falls **within** the limits, adjustment/resetting **is not** necessary. If measurement finds the lash **outside**of the limits, adjustment/resetting **is** required.

VALVE LASH LIMIT CHART

INTAKE	EXHAUST
0.152 mm (0.006 in.) MIN.	0.381 mm (0.015 in.) MIN.
0.381 mm (0.015 in.) MAX.	0.762 mm (0.030 in.) MAX.

NOTE: If measured valve lash falls within these specifications, no adjustment/reset is necessary. Engine operation within these ranges has no adverse affect on performance, emissions, fuel economy or level of engine noise.

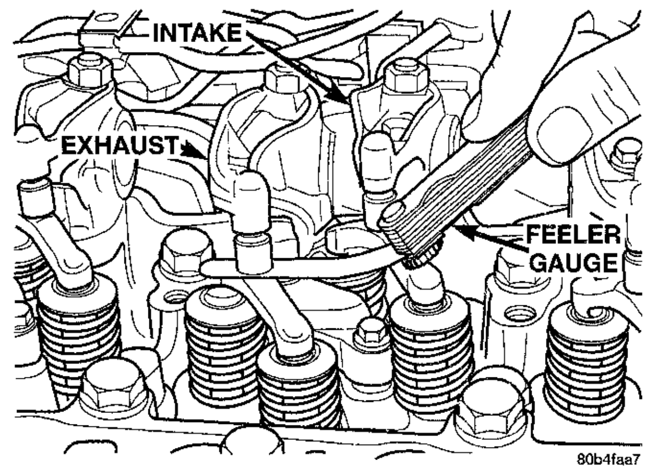

Fig. 14 Measuring Valve Lash

(6) If adjustment/resetting is required, loosen the lock nut on rocker arms and turn the adjusting screw until the desired lash is obtained:

- **INTAKE** 0.254 mm (0.010 in.)
- **EXHAUST** 0.508 mm (0.020 in.)

(6) Tighten the lock nut and re-check the valve lash.

(7) Using the crankshaft barring tool, rotate the **crankshaft** one revolution (360°) to align the pump gear mark to the 6 o'clock position in relation to the TDC mark on the gear housing cover (Fig. 13).

(8) With the engine in this position (pump gear mark at 6 o'clock), valve lash can be measured at the remaining rocker arms: **INTAKE 3-5-6 / EXHAUST 2-4-6**. Use the same method as above for determining whether adjustment is necessary, and adjust those that are found to be outside of the limits.

(9) Install the cylinder head cover (Fig. 11).

(10) Install the fuel pump gear access cover.

(11) Connect the battery negative cables.

CYLINDER BORES—DE-GLAZE

(1) New piston rings may not seat in glazed cylinder bores.

SERVICE PROCEDURES (Continued)

(2) De-glazing gives the bore the correct surface finish required to seat the rings. The size of the bore is not changed by proper de-glazing.

(3) Cover the lube holes in the top of the block with waterproof tape.

(4) A correctly honed surface will have a cross-hatch appearance with the lines at 15° to 25° angles (Fig. 15). For the rough hone, use 80 grit honing stones. To finish hone, use 280 grit honing stones.

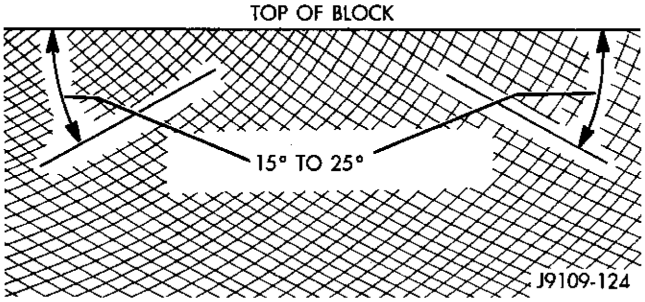

Fig. 15 Cylinder Bore Crosshatch Pattern

(5) Use a drill, a fine grit Flex-hone and a mixture of equal parts of mineral spirits and SAE 30W engine oil to de-glaze the bores.

(6) The crosshatch angle is a function of drill speed and how fast the hone is moved vertically (Fig. 16).

(7) Vertical strokes MUST be smooth continuous passes along the full length of the bore (Fig. 16).

(8) Inspect the bore after 10 strokes.

(9) Use a strong solution of hot water and laundry detergent to clean the bores. Clean the cylinder bores immediately after de-glazing.

(10) Rinse the bores until the detergent is removed and blow the block dry with compressed air.

(11) Check the bore cleanliness by wiping with a white, lint free, lightly oiled cloth. If grit residue is still present, repeat the cleaning process until all residue is removed. Wash the bores and the complete block assembly with solvent and dry with compressed air.

(12) Be sure to remove the tape covering the lube holes after the cleaning process is complete.

CYLINDER BLOCK REFACING

(1) The combustion deck can be refaced twice. The first reface should be 0.25 mm (0.0098 inch). If additional refacing is required, an additional 0.25 mm (0.0098 inch) can be removed. Total allowed refacing is 0.50 mm (0.0197 inch) - (Fig. 17).

(2) The upper right corner of the rear face of the block must be stamped with a X when the block is refaced to 0.25 mm (0.0098 inch). A second X must be stamped beside the first when the block is refaced to 0.50 mm (0.0197 inch) - (Fig. 18).

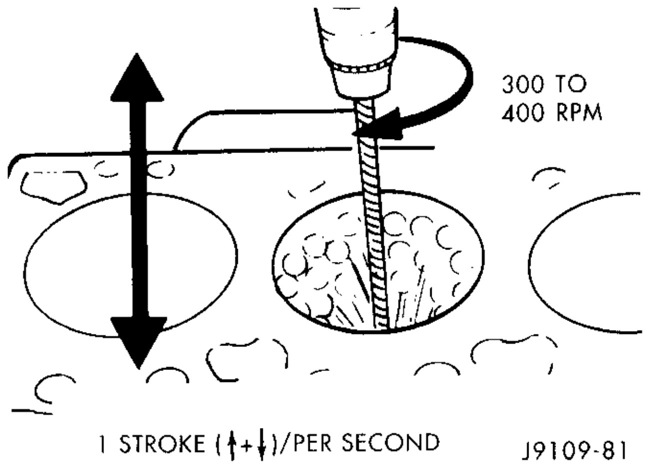

Fig. 16 De-Glazing Drill Speed and Vertical Speed

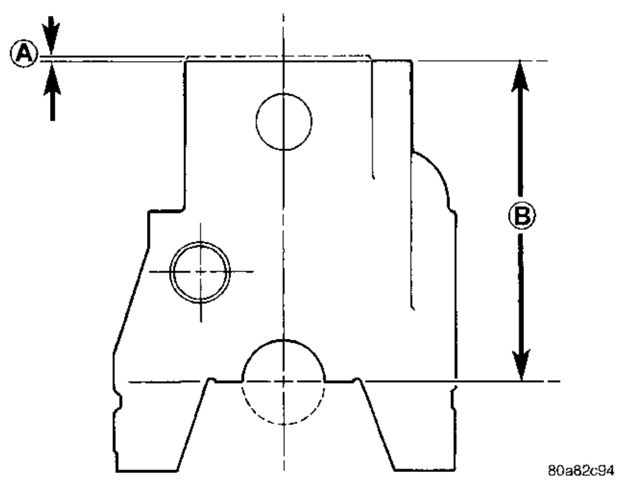

Fig. 17 Refacing Dimensions of the Cylinder Block

(3) Consult the parts catalog for the proper head gaskets which must be used with refaced blocks to ensure proper piston-to-valve clearance.

AUTHENTIC RESTORATION PRODUCT

SERVICE PROCEDURES (Continued)

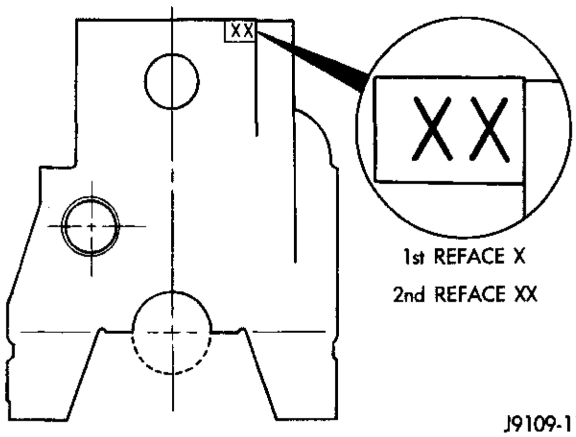

Fig. 18 Stamp Block after Reface

CYLINDER BORE REPAIR

Cylinder bore(s) can be repaired by one of two methods:

• Method 1:—Over boring and using oversize pistons and rings.

• Method 2:—Boring and installing a repair sleeve to return the bore to standard dimensions.

METHOD 1—OVERSIZE BORE

Oversize pistons and rings are available in two sizes - 0.50 mm (0.0197 inch) and 1.00 mm (0.0393 inch).

Any combination of standard, 0.50 mm (0.0197 inch) or 1.00 mm (0.0393 inch) overbore may be used in the same engine.

If more than 1.00 mm (0.0393 inch) overbore is needed, a repair sleeve can be installed (refer to Method 2—Repair Sleeve).

Cylinder block bores may be bored twice before use of a repair sleeve is required (Fig. 19). The first bore is 0.50 mm (0.0197 inch) oversize. The second bore is 1.00 mm (0.0393 inch) oversize.

After boring to size, use a honing stone to chamfer the edge of the bore (Fig. 19).

A correctly honed surface will have a crosshatch appearance with the lines at 15° to 25° angles with the top of the cylinder block (Fig. 20). For the rough hone, use 80 grit honing stones. To finish hone, use 280 grit honing stones.

A maximum of 1.2 micrometer (48 microinch) surface finish must be obtained.

After finish honing is complete, immediately clean the cylinder bores with a strong solution of laundry detergent and hot water.

After rinsing, blow the block dry.

Check the bore cleanliness by wiping with a white, lint-free, lightly- oiled cloth. There should be no grit residue present.

If the block is not to be used right away, coat it with a rust- preventing compound.

Approx. 1.25 mm (0.049 inch)
by 15°

J9109-119

Fig. 19 Cylinder Bore Dimensions

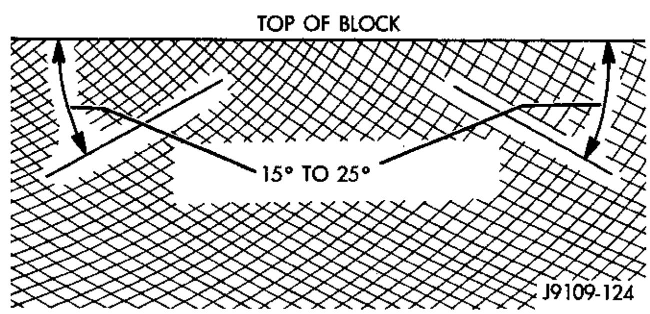

Fig. 20 Crosshatch Pattern of Repaired Sleeve(s)

METHOD 2—REPAIR SLEEVE

If more than a 1.00 mm (0.03937 inch) diameter oversize bore is required, the block must be bored and a repair sleeve installed.

Bore the block cylinder bore to 104.500-104.515 mm (4.1142-4.1148 inch) - (Fig. 21).

SERVICE PROCEDURES (Continued)

Repair sleeves can be replaced by using a boring bar to bore out the old sleeve. DO NOT cut the cylinder bore beyond the oversize limit.

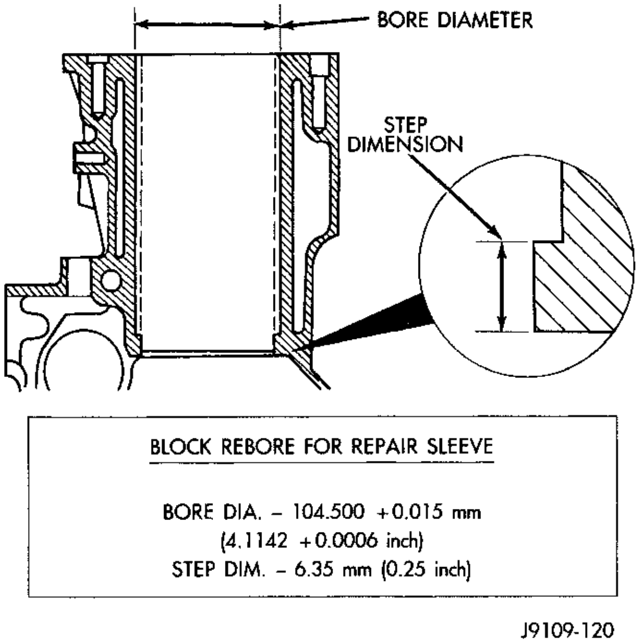

Fig. 21 Block Bore for Repair Sleeve Dimensions

After machining the block for the new repair sleeve, thoroughly clean the bore of all metal chips, debris and oil residue before installing the sleeve.

Cool the repair sleeve(s) to a temperature of -12°C (10°F) or below for a minimum of one hour. Be ready to install the sleeve immediately after removing it from the freezer.

Apply a coat of Loctite 620, or equivalent to the bore that is to be sleeved.

Wear protective gloves to push the cold sleeve into the bore as far as possible.

Using a sleeve driver, drive the sleeve downward until it contacts the step at the bottom of the bore (Fig. 22).

A sleeve driver can be constructed as follows (Fig. 23).

Set up a boring bar and machine the sleeve to 101.956 mm (4.014 inch) - (Fig. 24).

After removing the boring bar, use a honing stone to chamfer the corner of the repair sleeve(s) - (Fig. 24).

A correctly honed surface will have a crosshatch appearance with the lines at 15° to 25° angles with the top of the cylinder block. For the rough hone, use 80 grit honing stones. To finish hone, use 280 grit honing stones.

Finished bore inside dimension is 102.020 ±0.020 mm (4.0165 ±0.0008 inch).

A maximum of 1.2 micrometer (48 microinch) surface finish must be obtained.

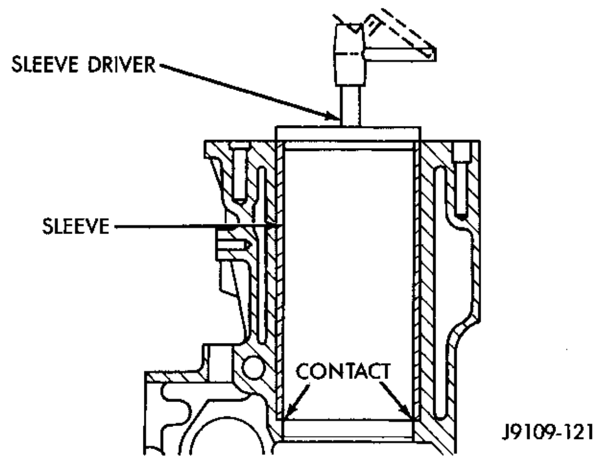

Fig. 22 Sleeve Installation

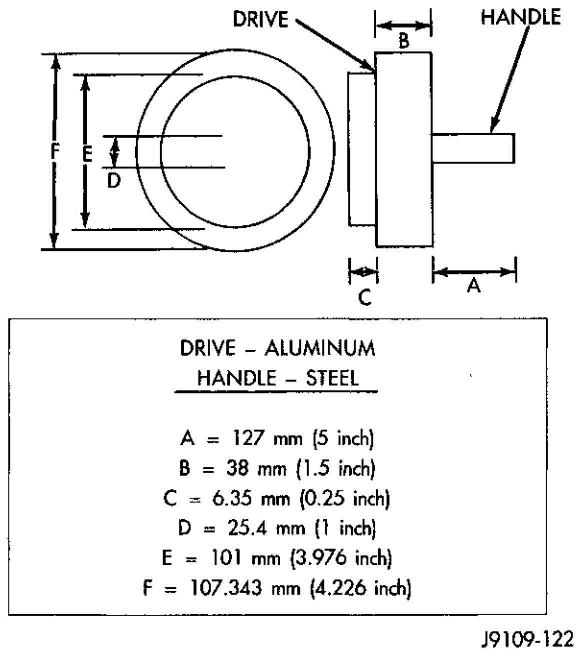

Fig. 23 Sleeve Driver Construction

After finish honing is complete, immediately clean the cylinder bores with a strong solution of laundry detergent and hot water.

After rinsing, blow the block dry with compressed air.

Wipe the bore with a white, lint-free, lightly oiled cloth. Make sure there is no grit residue present.

Apply a rust-preventing compound if the block will not be used immediately.

A standard diameter piston and a piston ring set must be used with a sleeved cylinder bore.

CAM BORE REPAIR

The front cam bushing bore can be bored to 59.235 Mm ±0.013 mm (2.332 inch ±0.0006 inch) oversize. DO NOT bore the intermediate or rear cam bore to

SERVICE PROCEDURES (Continued)

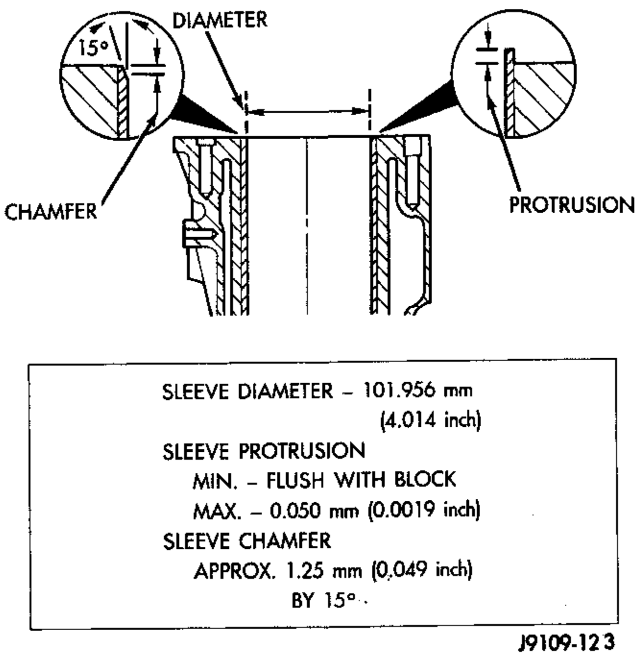

Fig. 24 Sleeve Machining Dimensions

the front cam bore oversize dimensions. Intermediate and rear cam bores may be bored to 57.235 mm ±0.013 mm (2.253 inch ±0.0006– inch) oversize.

A surface finish of 2.3 micrometers (92 microinch) must be maintained. Not more than 20% of an area of any one bore may be 3.2 micrometers (126 microinch).

Camshaft bores can be repaired individually. It is not necessary to repair undamaged cam bores in order to repair individually damaged cam bores. The standard front bushing cannot be used to repair intermediate or rear bores.

Install all cam bushings flush or below the front cam bore surface. The oil hole must align to allow a 3.2 mm (0.125 inch) rod to pass through freely (Fig. 25).

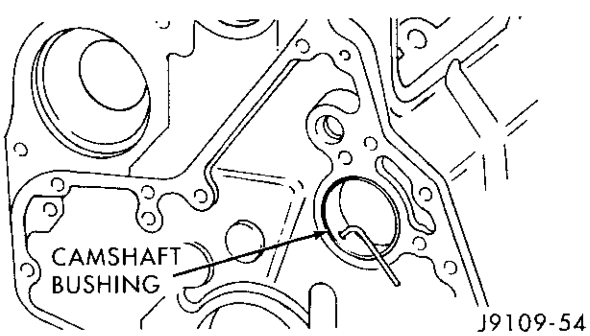

Fig. 25 Oil Hole Alignment

CYLINDER BLOCK CUP PLUG REPLACEMENT

(1) Remove the cup plugs from the oil passages (Fig. 26).

(2) Apply a bead of Loctite 277 around the outside diameter of the oil passage cup plugs.

(3) Drive the cup plugs in until they bottom in the bore (Fig. 26).

(4) Fill the engine with oil. Run the engine and check for leaks.

(5) Stop the engine and check the oil level with the dipstick.

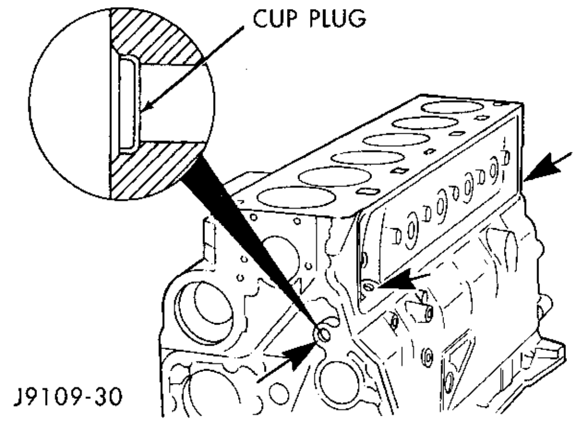

Fig. 26 Cup Plug Locations in Cylinder Block

PISTON GRADING PROCEDURE

• When rebuilding an engine with the original cylinder block, crankshaft and pistons, make sure the pistons are installed in their original cylinder.

• If replacing the piston(s), make sure the replacement piston(s) are the same grade as the one being replaced.

• If a new cylinder block and/or crankshaft is used, the piston grading procedure **MUST** be performed to determine the proper piston grade for each cylinder.

(1) Install any of the original connecting rod and piston assemblies into the No.1 cylinder. DO NOT install the piston rings.

(2) Install the upper bearing shell in the connecting rod with the tang of the bearing in the slot of the connecting rod. The connecting rod bearing shell must be installed in the original connecting rod and cap. Use clean lubricating oil to coat the inside diameter of the connecting rod bearing shell.

(3) Install the bearing shell in the connecting rod cap with the tang of the bearing in the slot to the cap. Use clean lubricating oil to coat the inside diameter of the bearing shell.

(4) The four digit number stamped on the connecting rod and cap at the parting line must match and be installed on the oil cooler side of the engine. Install the connecting rod cap and capscrews. Tighten the capscrews to 35 N·m (26 ft. lbs.) torque.

(5) Use a fine grit stone to remove any burrs from the cylinder block head deck. Zero the dial indicator to the cylinder block head deck.

SERVICE PROCEDURES (Continued)

(6) Move the dial indicator directly over the piston pin to eliminate any side-to-side movement.

(7) Rotate the crankshaft to top dead center (TDC). Rotate the crankshaft clockwise and counterclockwise to find the highest dial indicator reading. Record the reading.

(8) Remove the piston and connecting rod assembly from the No.1 cylinder and install the assembly into the No.2 cylinder. Repeat the procedure for every cylinder using the same piston and connecting rod assembly.

(9) Determine the grade of the piston being used by referring to the Piston Protrusion Chart below. Four digits on top of the piston can be cross referenced to a Chrysler part number for replacement (Fig. 27). If the number on the piston cannot be seen, measure from the top of the piston to the top of the piston pin to see what grade piston is used (Fig. 28).

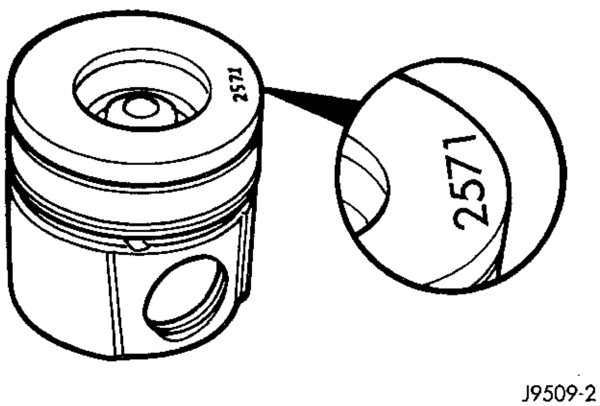

Fig. 27 Piston Grading Number Location

NOTE: Use the table below when piston grading numbers are missing or not legible.

CONNECTING ROD BEARING AND CRANKSHAFT JOURNAL CLEARANCE

Measure the connecting rod bore with the bearings installed and the bolts tightened to 100 N·m (73 ft. lbs.) torque.

Record the smaller diameter.

Measure the diameter of the rod journal at the location shown (Fig. 29). Calculate the average diameter for each side of the journal.

The clearance is the difference between the connecting rod bore (smallest diameter) and the average diameter for each side of the crankshaft journal.

If the crankshaft is within limits, replace the bearing. If the crankshaft is out of limits, grind the crankshaft to the next smaller size and use oversize rod bearings.

PISTON PROTRUSION CHART

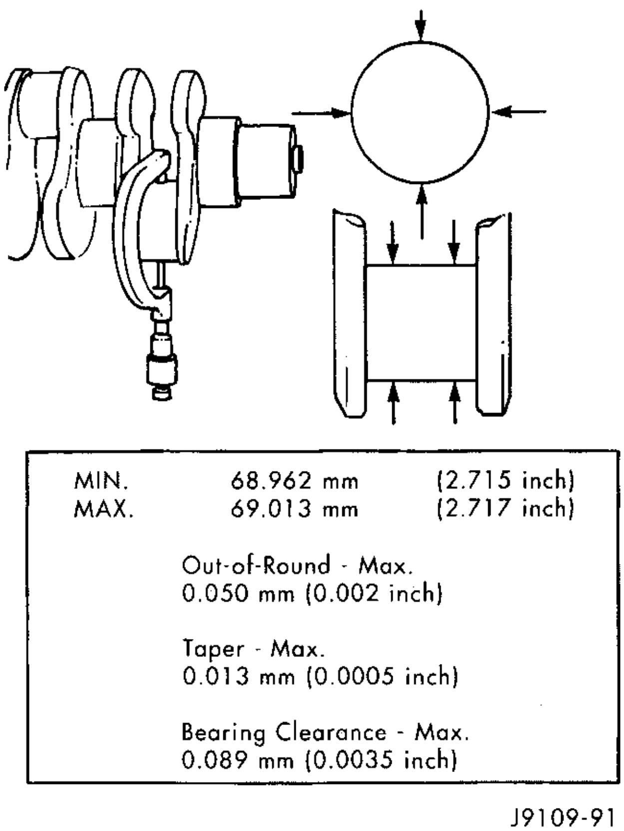

Fig. 29 Connecting Rod Journal Diameter Limits

ifications, grind the crankshaft to next size and use oversize bearings.

CRANKSHAFT SERVICE

Crankshaft main and rod journals may be ground in increments of 0.25 mm (0.0098 inch) up to a total of 1.00 mm (0.0394 inch).

The only exception is the main journal thrust width surface. This journal must be ground in increments of 0.50 mm (0.0197 inch) up to a total of 1.00

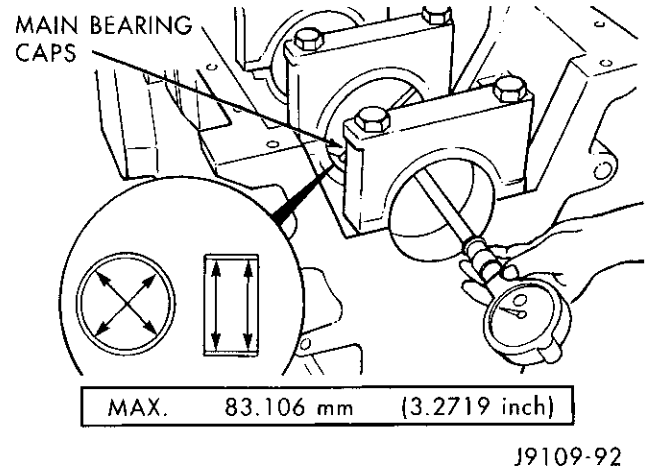

Fig. 30 Crankshaft Main Bearing Bore Diameter

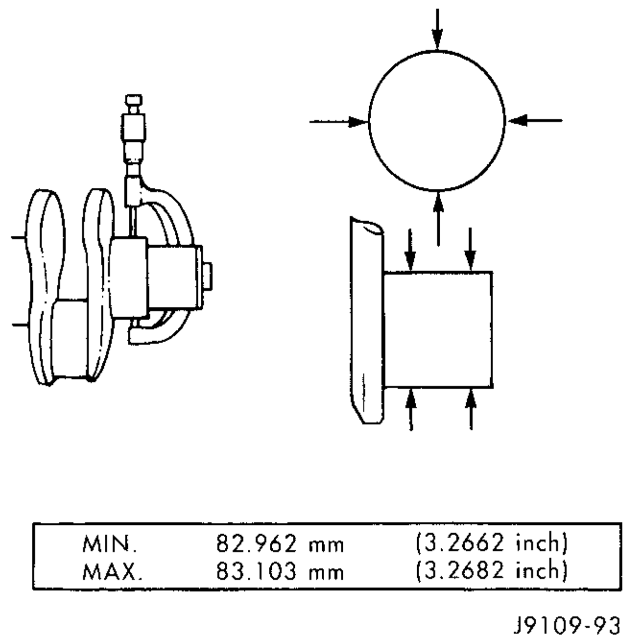

Fig. 31 Crankshaft Main Journal Diameter

mm (0.0394 inch). The thrust surface is located on the No.6 main bearing. When the thrust surface requires grinding, the main journal must be ground to the same undersize dimension.

CAUTION: Welding of the crankshaft is not allowed. Failure of the crankshaft will result.

MAIN JOURNAL

All main journals are to be ground in the opposite direction of engine rotation (clockwise as viewed from the front of crankshaft). Polish the journals in the same direction as engine rotation.

The main bearing grinding specifications are shown in (Fig. 32).

OUT-OF ROUND & TAPER (MAX.)	
0.005 mm (0.0002 inch)	
ALL MAIN JOURNALS ARE TO BE PARALLEL TO THE FRONT AND REAR MAINS WITHIN: 0.030 mm (0.001 inch)	

J9109-125

Fig. 32 Crankshaft Main Journal Dimensions

Thrust journals can be ground in the same increments and using the same specifications as all other main journals. The main journal radius may be ground using either the preferred or the alternative procedure providing the thrust surface width is not being ground. The preferred procedure must be used when the main bearing thrust width surface is ground. When the thrust surface width requires grinding, the main journal must be ground to the same undersize dimension (Fig. 33).

THRUST JOURNAL WIDTH	
37.500 ±0.025 mm (1.4764 ±0.001 inch)	
UNDERSIZES	REGRIND WIDTH TO
0.50 mm (0.0197 inch)	38.000 ±0.025 mm (1.4961 ±0.001 inch
1.00 mm (0.0394 inch)	38.500 ±0.025 mm (1.5158 ±0.001 inch)

J9109-127

Fig. 33 Crankshaft Thrust Journal Width Dimensions

The thrust surface is to be ground on center within 0.10 mm (0.004 inch). It also must be perpendicular to the front and rear mains within 0.0015 mm (0.00006 inch) per radial inch on the thrust area (Fig. 34). The surface finish requirement is 0.04 micrometer (16.0 microinch).

PREFERRED PROCEDURE:

Smoothly blend a 4.20 ±0.020 mm (0.1654 ±0.0008 inch) radius to the ground diameters (Fig. 35).

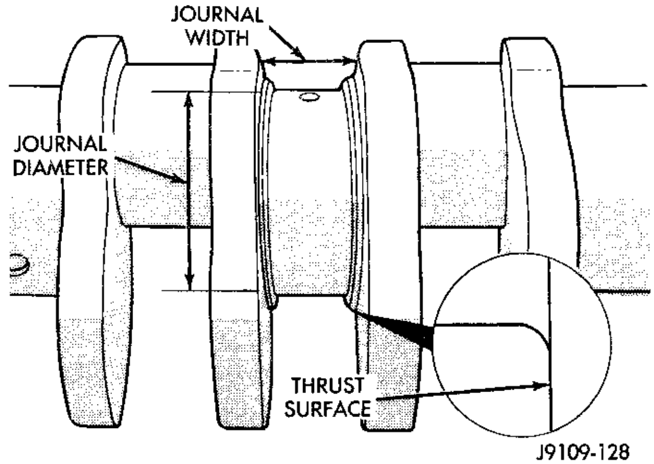

Fig. 34 Crankshaft Thrust Surface

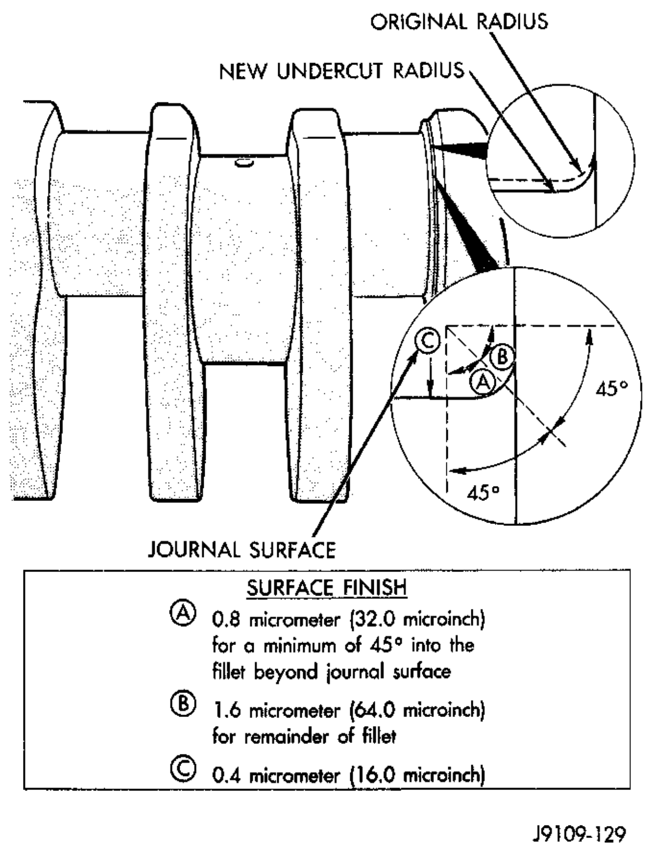

Fig. 35 Grind Crankshaft Main Journal—Preferred Method

CAUTION: DO NOT use the Alternative Procedure when the thrust surface width is ground.

ALTERNATIVE PROCEDURE:

Smoothly blend a 1.25 ±0.020 mm (0.0492 ±0.0008 inch) radius to the ground diameters (Fig. 36).

AUTHENTIC RESTORATION

SERVICE PROCEDURES (Continued)

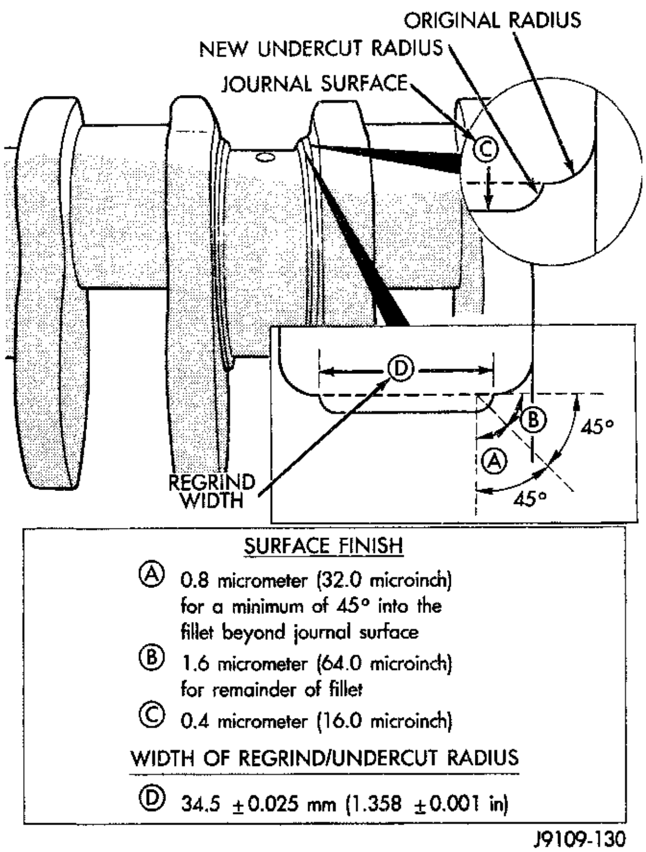

Fig. 36 Grind Crankshaft Main Journal—Alternative Method

ROD JOURNAL

All rod journals are to be ground in the opposite direction of engine rotation (clockwise as viewed from the front of crankshaft). Polish the journals in the same direction as engine rotation.

The rod bearing grinding specifications are shown in (Fig. 37).

STANDARD ROD JOURNAL DIAMETER

Fig. 37 Crankshaft Rod Journal Dimensions

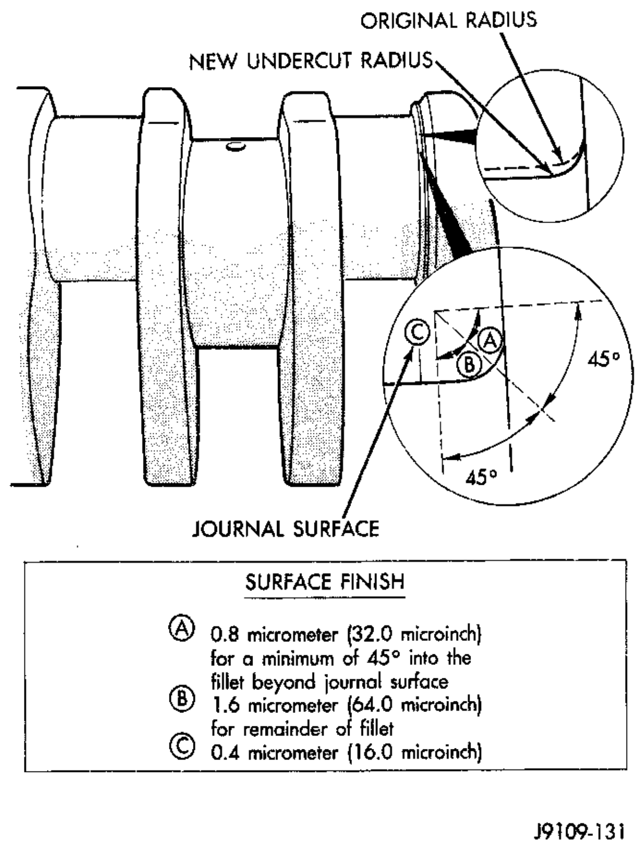

Fig. 38 Crankshaft Rod Journal Grind—Preferred Method

PREFERRED PROCEDURE:

Smoothly blend a 4.00 ±0.020 (0.1575 ±0.0008 inch) radius to the ground diameters and side faces (Fig. 38).

ALTERNATIVE PROCEDURE:

Smoothly blend a 1.25 ±0.020 mm (0.0492 ±0.0008 inch) radius to the ground journals (Fig. 39).

REMOVAL AND INSTALLATION

ENGINE MOUNTS—FRONT

REMOVAL

(1) Disconnect the battery negative cables.
(2) Remove the viscous fan/drive assy.
(3) Raise vehicle on hoist.
(4) Support engine with a screw jack and wood block.
(5) Loosen the thru-bolt and nut (Fig. 40).

REMOVAL AND INSTALLATION (Continued)

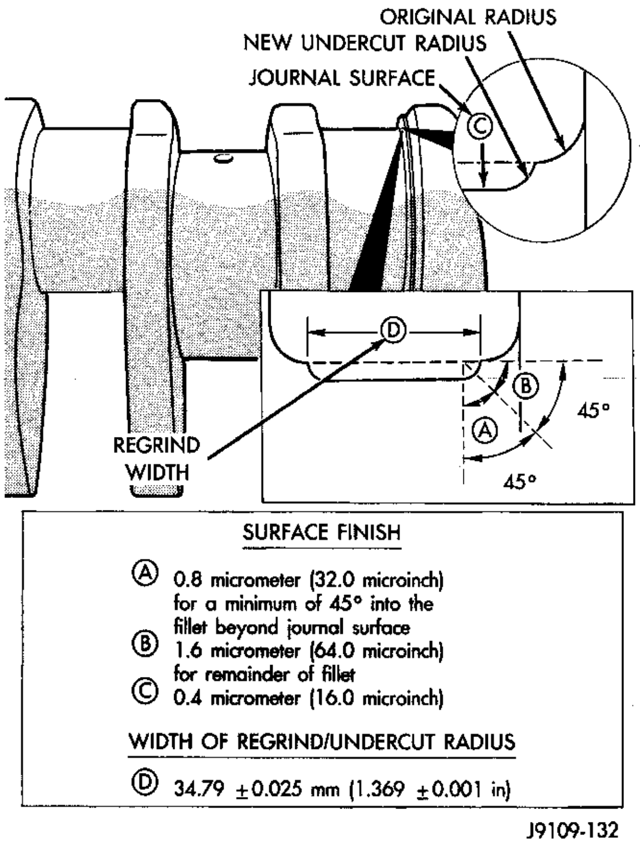

Fig. 39 Grind Crankshaft Rod Journal—Alternative Method

(6) Passenger side mount: Remove the two (2) transmission oil cooler bracket to engine mount bolts.

(7) Lift the engine SLIGHTLY and remove the four (4) mount to block bolts.

(8) Remove the mount from the vehicle.

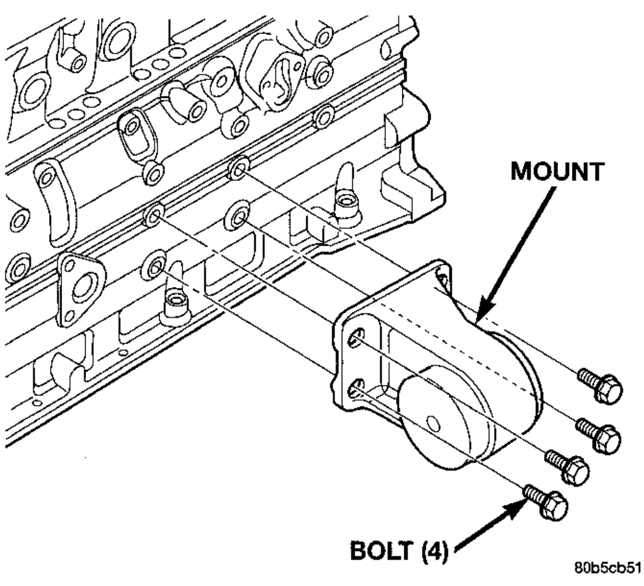

Fig. 40 Front Engine Mount—Typical

INSTALLATION

(1) With engine raised SLIGHTLY, position the engine mount to the block. Install the bolts and tighten to 149 N·m (110 ft. lbs.) torque.

(2) Install the thru-bolt into the engine mount.

(3) Lower the engine while guiding the mount and thru-bolt into the frame mounted support cushion brackets (Fig. 41).

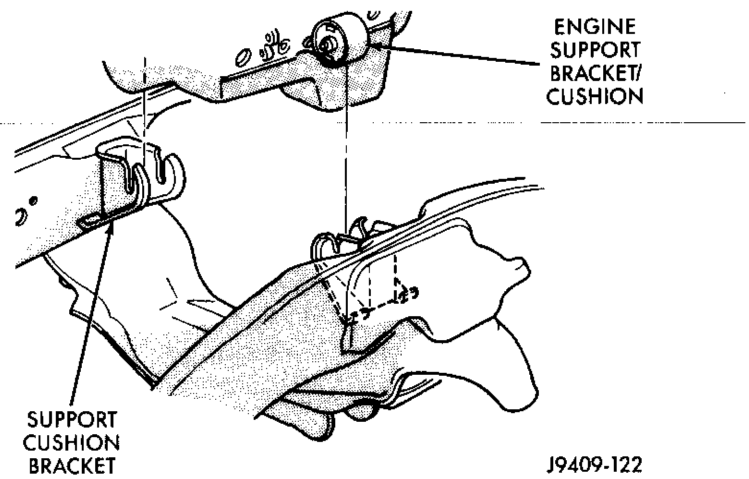

Fig. 41 Positioning Engine Front Mounts

(4) Install the thru-bolt nut and tighten the nut to 88 N·m (65 ft. lbs.) torque.

(5) Passenger side: Install the two (2) transmission oil cooler bracket to mount bolts. Tighten the bolts to 47 N·m (35 ft. lbs.) torque.

(6) Remove lifting fixture.

(7) Lower the vehicle.

(8) Install the viscous fan/drive assy. and torque to 57 N·m (42 ft. lbs.) torque.

(9) Connect the battery negative cables.

ENGINE MOUNT—REAR

REMOVAL

(1) Raise the vehicle on a hoist.

(2) Position a transmission jack in place.

(3) Remove support cushion stud nuts (Fig. 42).

(4) Raise rear of transmission and engine SLIGHTLY.

(5) Remove the bolts holding the support cushion to the transmission support bracket. Remove the support cushion.

(6) If necessary, remove the bolts holding the transmission support bracket to the transmission.

INSTALLATION

(1) If removed, position the transmission support bracket to the transmission. Install new attaching bolts and tighten to 102 N·m (75 ft. lbs.) torque.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

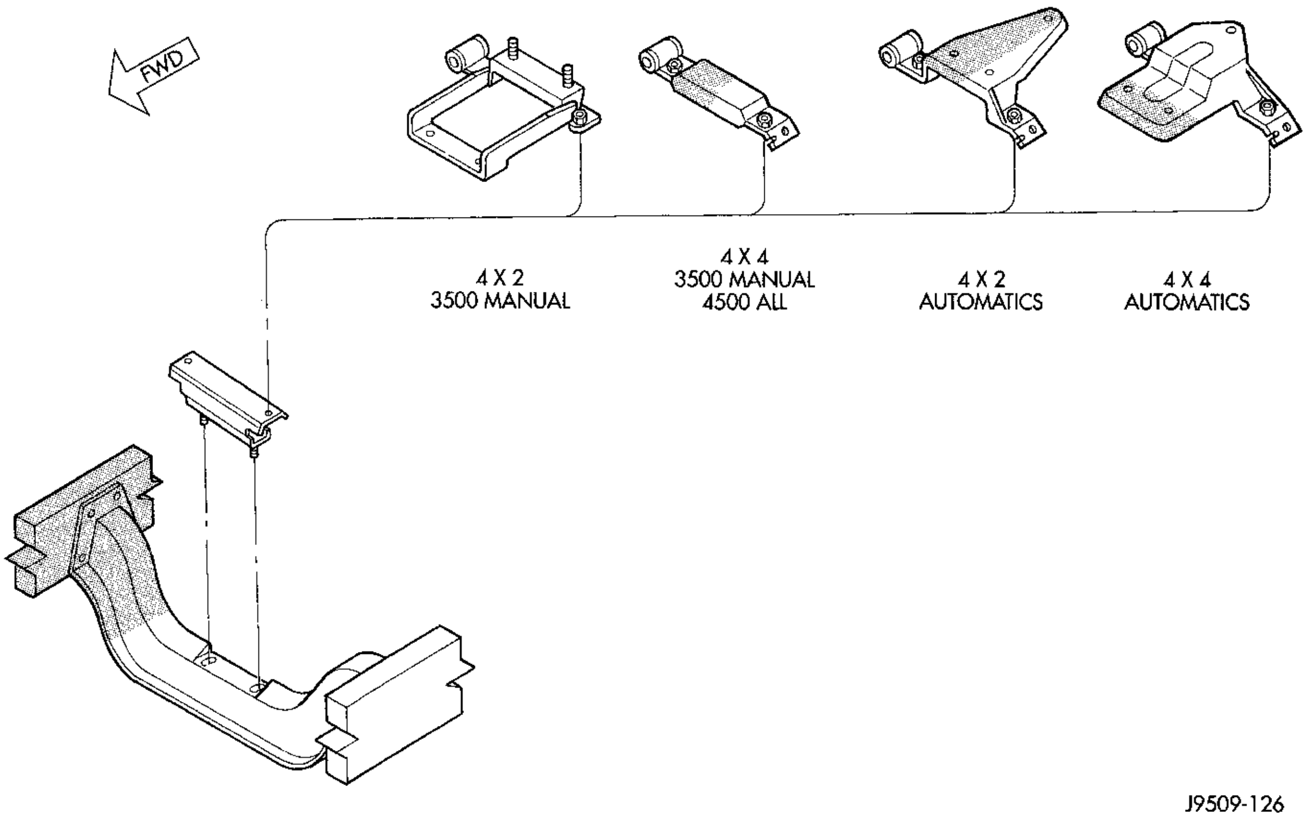

Fig. 42 Engine Rear Support Cushion Assemblies

(2) Position support cushion to transmission support bracket. Install stud nuts and tighten to 47 N·m (35 ft. lbs.) torque.

(3) Using the transmission jack, lower the transmission and support cushion onto the crossmember (Fig. 42).

(4) Install the support cushion bolts and tighten to 47 N·m (35 ft. lbs.) torque.

(5) Remove the transmission jack.

(6) Lower the vehicle.

ENGINE ASSEMBLY

REMOVAL

(1) Disconnect both battery negative cables.

(2) Recover A/C refrigerant (if A/C equipped). Refer to Group 24, Heating and Air Conditioning for the correct procedure.

(3) Raise vehicle on hoist.

(4) Drain engine coolant into container suitable for re-use.

(5) Remove engine oil drain plug and drain engine oil.

(6) Lower vehicle.

(7) Remove radiator upper hose.

(8) Remove the cooling fan shroud-to-radiator mounting bolts.

(9) Using a 36 mm wrench, remove viscous fan/drive assembly. **The fan hub and nut have left hand threads.**Remove the cooling fan and shroud together.

(10) Disconnect the coolant recovery bottle hose from the radiator filler neck and remove bottle from fan shroud (Fig. 43).

(11) Disconnect heater core supply and return hoses from the cylinder head fitting and coolant pipe.

(12) Raise vehicle on hoist.

(13) Remove transmission and transfer case (if equipped.) Refer to Group 21, Transmission and Transfer Case for the correct procedures.

(14) Disconnect exhaust pipe from turbocharger extension pipe (Fig. 44).

(15) Remove starter motor.

(16) Disconnect A/C suction/discharge hose from the rear of the A/C compressor.

(17) Lower vehicle.

(18) Disconnect lower radiator hose from radiator outlet.

(19) **Automatic Transmission models:** Disconnect transmission oil cooler lines from radiator using special tool #6931.

(20) Remove radiator mounting screws and lift radiator out of engine compartment.

(21) Remove upper radiator support panel.

REMOVAL AND INSTALLATION (Continued)

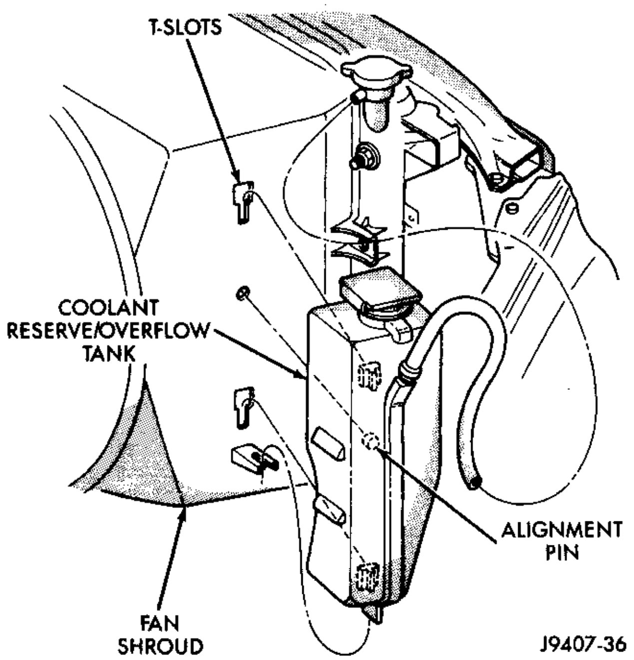

Fig. 43 Coolant Recovery Bottle

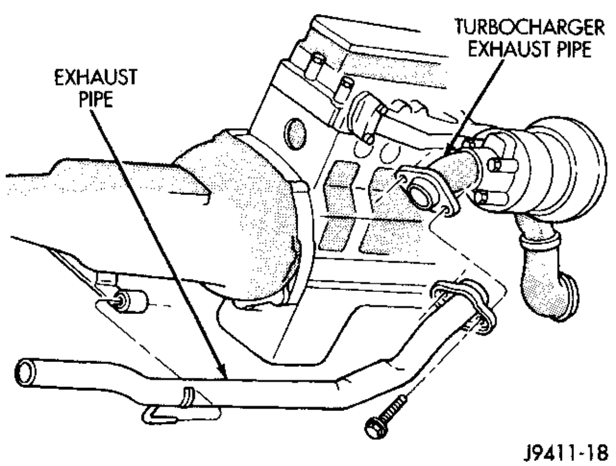

Fig. 44 Exhaust Pipe Connection at Turbocharger

(22) Remove front bumper assy. Refer to Group 13, Frame and Bumpers for the correct procedure.

(23) If A/C equipped, disconnect A/C condenser refrigerant lines. Refer to Group 24, Heating and Air Conditioning for the correct procedures.

(24) Disconnect charge air cooler piping.

(25) Remove the two charge air cooler mounting bolts.

(26) Remove charge air cooler (and A/C condenser if equipped) from vehicle.

(27) Disconnect engine block heater connector.

(28) Disconnect A/C compressor electrical connectors.

(29) Remove the passenger battery ground cable from the engine block.

(30) Disconnect power steering pump pressure and return lines.

(31) Remove accelerator linkage cover.

(32) Leaving all cables attached, remove accelerator pedal position sensor assy. (APPS) (Fig. 45) from cylinder head bracket and secure out of the way.

(33) Disconnect APPS connector (Fig. 46).

(34) Disconnect vacuum pump supply hose (Fig. 47).

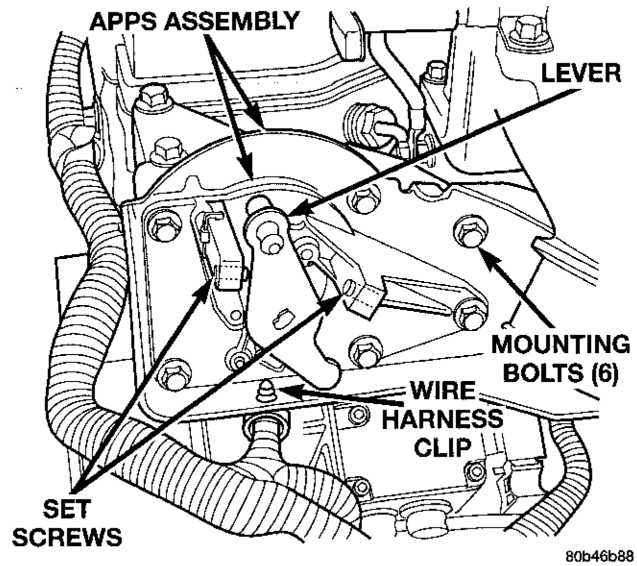

Fig. 45 APPS Assembly

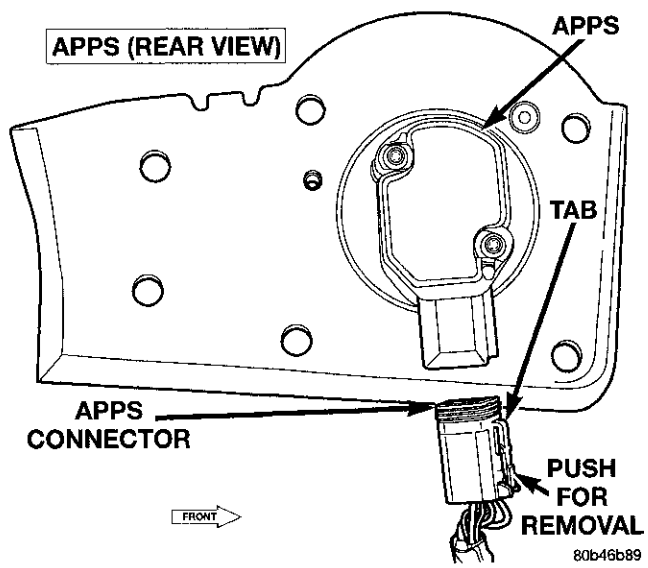

Fig. 46 APPS Connector

(35) Disconnect the engine harness and ground cable from the PDC.

(36) Disconnect the fuel supply and return hoses (Fig. 48).

(37) Remove the cylinder head cover.

REMOVAL AND INSTALLATION (Continued)

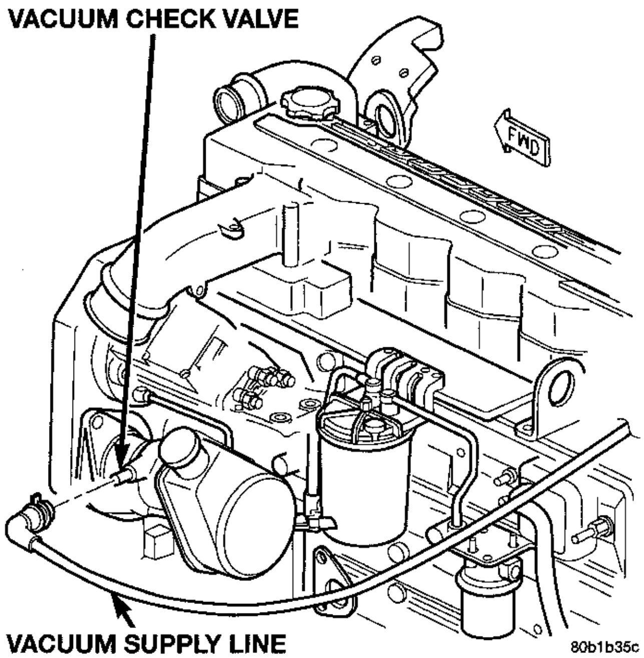

Fig. 47 Vacuum Pump Supply Hose

(38) Remove the #5 and #6 cylinder intake and exhaust rocker arms and pedestals (Fig. 49). Note the original location for re-assembly.

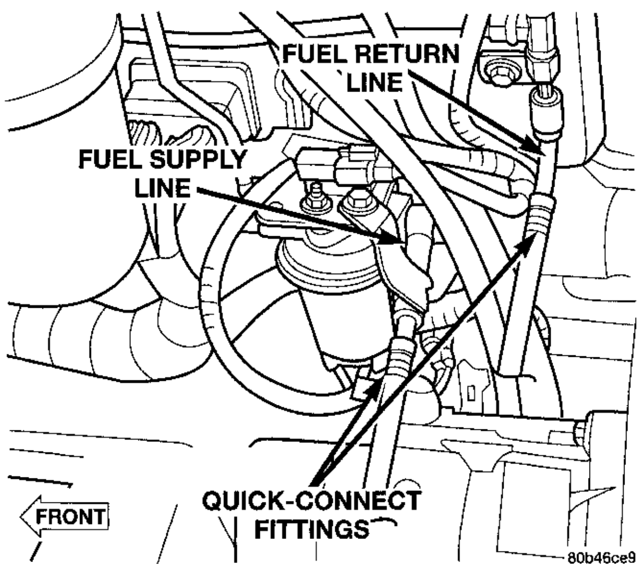

Fig. 48 Fuel Return and Supply Line Quick-Connect Locations

(39) Loosen but do not remove engine mount through bolts and nuts.

(40) Attach chain accross engine lift brackets.

(41) Lift engine up and out of engine compartment.

(42) Install engine to suitable engine stand.

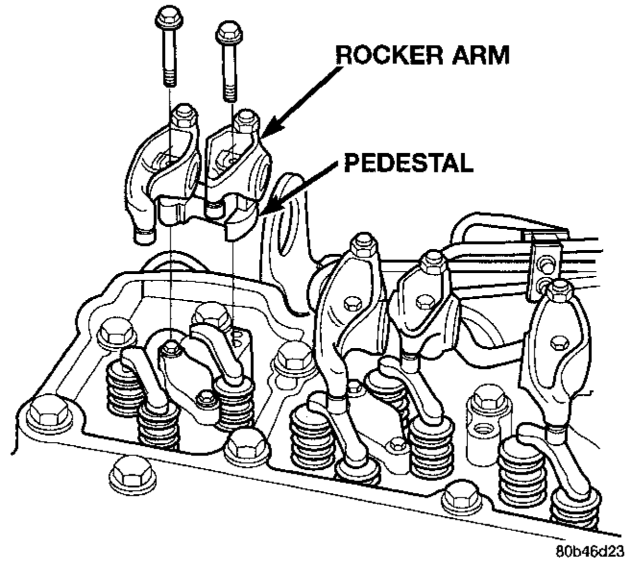

Fig. 49 Rocker Arm and Pedestal—Removal/Installation

INSTALLATION

(1) Install the engine with the cylinder head cover and the #5 and 6 rocker arm assemblies removed.

(2) Lower the engine into the compartment and install the engine mount through bolts and nuts.

(3) Tighten the mount through bolts and nuts to 88 N·m (65 ft. lbs.) torque.

(4) Remove the engine lifting device.

(5) Install the #5 and #6 rocker arms and pedestals in their original locations (Fig. 49). Torque the mounting bolts to 36 N·m (27 ft. lbs.) torque.

(6) Install the cylinder head cover and gasket. Tighten the bolts to 24 N·m (18 ft. lbs.) torque.

(7) Connect the fuel supply and return hoses (Fig. 48). Refer to Group 14, Fuel System for the correct procedure.

(8) Connect the engine harness connector and ground cable to the PDC.

(9) Connect the vacuum pump supply hose.

(10) Connect the APPS connector (Fig. 46).

(11) Install the APPS assembly bracket to the cylinder head bracket.

(12) Install the throttle linkage cover.

(13) Connect the power steering pressure and return lines.

(14) Connect the passenger battery ground cable to the engine block. Tighten the bolt to 77 N·m (57 ft. lbs.) torque.

(15) Connect the engine block heater connector.

(16) Connect the a/c compressor electrical connectors.

(17) Install the charge air cooler and a/c condenser (if a/c equipped). Install and tighten the charge air cooler mounting bolts to 2 N·m (17 in. lbs.) torque.

REMOVAL AND INSTALLATION (Continued)

(18) Connect the charge air cooler piping. Torque all clamps to 8 N·m (72 in. lbs.) torque.

(19) Connect the a/c refrigerant lines to the a/c condenser (if equipped). Refer to Group 24, Heating and Air Conditioning for the correct procedures.

(20) Install the front bumper assy. Refer to Group 13, Frame and Bumpers for the correct procedure.

(21) Install the radiator upper support panel.

(22) Install the radiator and tighten the mounting bolts to 11 N·m (95 in. lbs.) torque.

(23) Connect the transmission quick-connect oil cooler lines to the radiator. Push together until an audible "click" is heard. Verify connection by pulling apart.

(24) Raise vehicle.

(25) Connect a/c compressor suction/discharge hose (if a/c equipped). Refer to Group 24, Heating and Air Conditioning for the correct procedure.

(26) Install the radiator lower hose and clamps.

(27) Install the starter motor and connect the wires. Refer to Group 8B, Starting Systems for the correct procedures.

(28) Install the transmission and transfer case (if equipped). Refer to Group 21, Transmission and Transfer Case for the correct procedures.

(29) Connect the exhaust pipe to the turbocharger elbow (Fig. 44). Torque the bolts to 34 N·m (25 ft. lbs.) torque.

(30) Connect the transmission auxiliary oil cooler lines (if equipped).

(31) Lower the vehicle

(32) Connect the heater core supply and return hoses.

(33) Install the cooling fan and shroud at the same time. Tighten the fan nut to 57 N·m (42 ft. lbs.) torque. Tighten the fan shroud to radiator bolts to 11 N·m (95 in. lbs.) torque.

(34) Install the coolant recovery bottle to the fan shroud (Fig. 43) and connect the hose to the radiator filler neck.

(35) Install the windshield washer bottle to the fan shroud and connect the pump supply hose and electrical connections.

(36) Install the radiator upper hose and clamps.

(37) Change oil filter and install new engine oil.

(38) Fill cooling system with coolant.

(39) Connect battery negative cables.

(40) Perform the fuel line air bleed procedure. Refer to Group 14, Fuel System for the correct procedure.

(41) Start engine and inspect for engine oil, coolant, and fuel leaks.

CYLINDER HEAD COVER

REMOVAL

(1) Disconnect both battery negative cables.

(2) Loosen the five (5) cylinder head cover bolts (Fig. 50). Remove the front three bolts and leave the rear two bolts in the cover.

(3) Lift cover off of cylinder head.

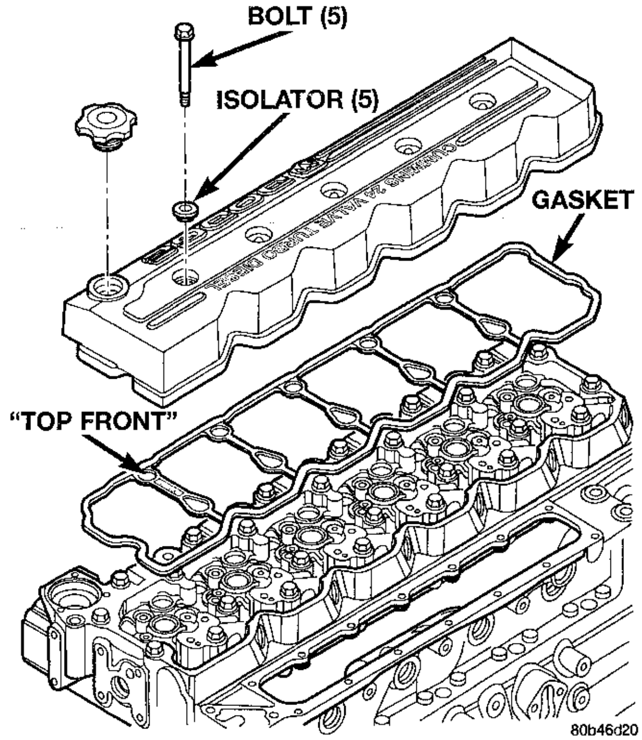

Fig. 50 Cylinder Head Cover and Gasket

CLEANING

Using a suitable solvent, Clean and dry gasket mating surfaces on cylinder head and cover. Wipe gasket dry and inspect for re-use.

INSPECTION

The cylinder head cover gasket and isolators are reusable. However, should cracks be present in the rubber/silicone construction, the defective components should be replaced.

INSTALLATION

(1) Install the gasket as shown in (Fig. 50). Make sure the gasket is properly located around the cylinder head bolts, with the words "top front" facing up and towards front of engine.

(2) Place two bolts and isolators into the rear two mounting holes and install the cover.

(3) Install the remaining bolts and isolators. Starting with the center bolt, torque in a circular pattern to 24 N·m (18 ft. lbs.).

(4) Connect both battery negative cables.

REMOVAL AND INSTALLATION (Continued)

ROCKER ARMS, CROSSHEADS, AND PUSH RODS

REMOVAL

(1) Disconnect the battery negative cables.

(2) Remove cylinder head cover (Fig. 51). Refer to procedure in this group.

(3) Remove the rocker arm/pedestal fasteners (Fig. 52) and remove rocker arm and pedestal from cylinder head. Mark the arms and pedestals so they can be installed in their original position.

CAUTION: When removing the rocker arms, the sockets (Fig. 53) may come loose and fall into the engine. Make sure they stay with the arm upon removal/installation.

(4) Lift the push rod(s) up and out of the engine (Fig. 54). Mark them so they can be installed in their original position.

NOTE: The #5 cyl. exhaust and #6 cyl. intake and exhaust push rods must be raised through the provided cowl panel access holes.

(5) Lift the crosshead(s) off of the valve stems. Mark them so they can be installed in their original position.

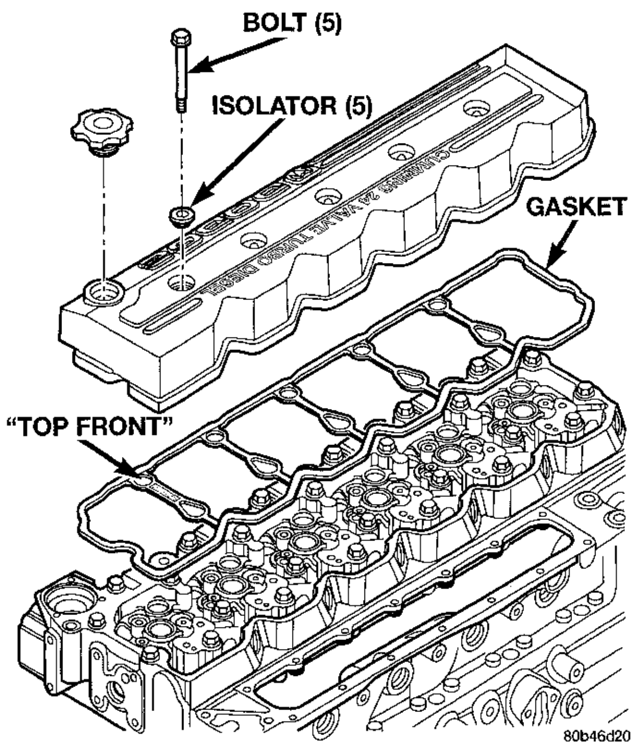

Fig. 51 Cylinder Head Cover—Removal/Installation

CLEANING

Clean all components in a suitable solvent. If necessary, use a wire brush or wheel to remove stubborn

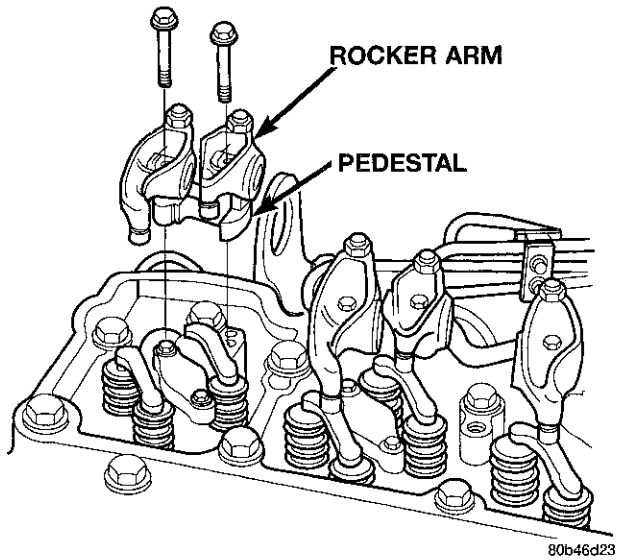

Fig. 52 Rocker Arms and Pedestals—Removal/Installation

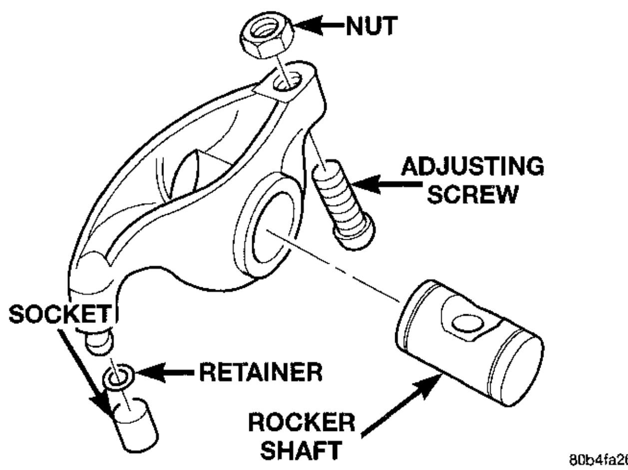

Fig. 53 Rocker Arm Assembly Identification

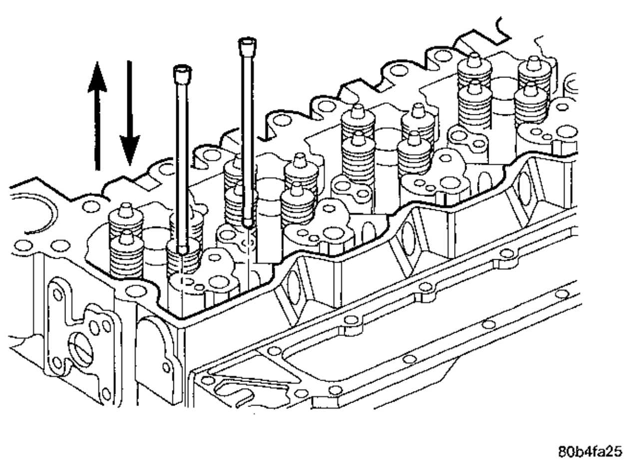

Fig. 54 Push Rod Removal/Installation

REMOVAL AND INSTALLATION (Continued)

deposits. Rinse in hot water and blow dry with compressed air. Inspect oil passages in rocker arms and pedestals. Apply compressed air to lubrication orifices to purge contaminants.

INSPECTION

Rocker Arms

(1) Remove rocker shaft and inspect for cracks and excessive wear in the bore or shaft. Remove socket and inspect ball insert and socket for signs of wear. Replace retainer if necessary.

Measure the rocker arm bore and shaft (Fig. 55)(Fig. 56).

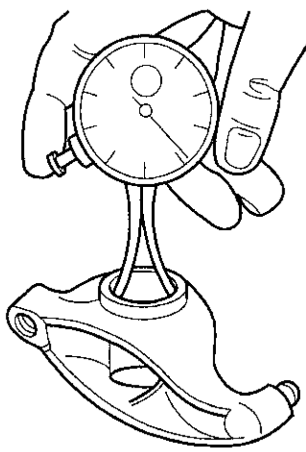

Fig. 55 Measuring Rocker Arm Bore

ROCKER ARM BORE (MAX.)
22.027 mm (.867 in.)

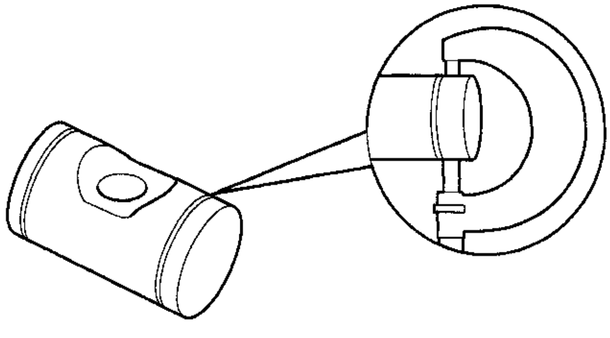

Fig. 56 Measuring Rocker Arm Shaft

ROCKER ARM SHAFT (MIN.)
21.965 mm (.865 in.)

Push Rods

Inspect the push rod ball and socket for signs of scoring. Check for cracks where the ball and the socket are pressed into the tube (Fig. 57).

Roll the push rod on a flat work surface with the socket end hanging off the edge (Fig. 58). Replace any push rod that appears to be bent.

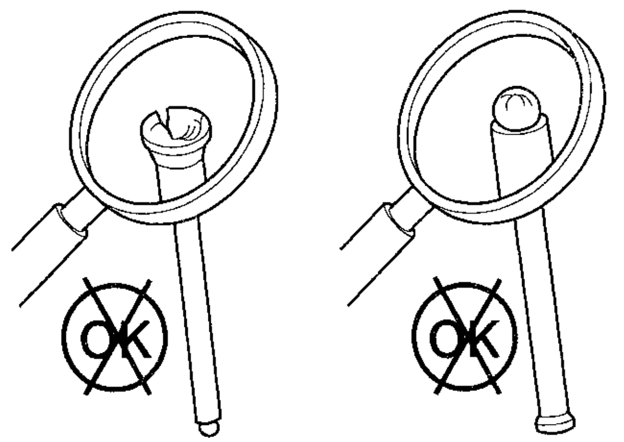

Fig. 57 Inspecting Push Rod for Cracks

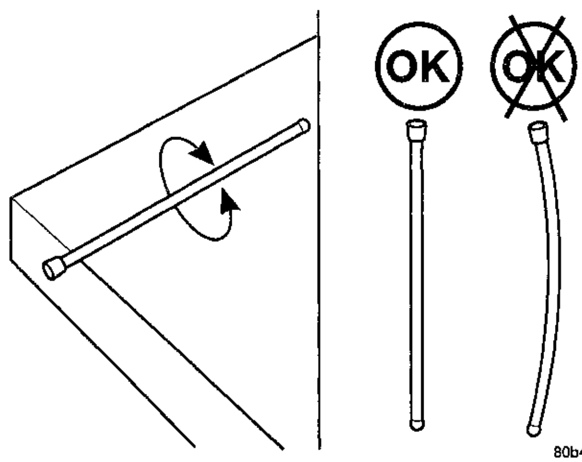

Fig. 58 Inspecting Push Rod for Flatness

Crossheads

Inspect the crossheads for cracks and/or excessive wear on rocker lever and valve tip mating surfaces (Fig. 59).

INSTALLATION

(1) If previously removed, install the push rods in their original location (Fig. 54). **Verify that they are seated in the tappets.**

(2) Lubricate the valve tips and install the crossheads in their original locations.

(3) Lubricate the crossheads and push rod sockets and install the rocker arms and pedestals (Fig. 52) in their original locations. Tighten bolts to 36 N·m (27 ft. lbs.) torque.

REMOVAL AND INSTALLATION (Continued)

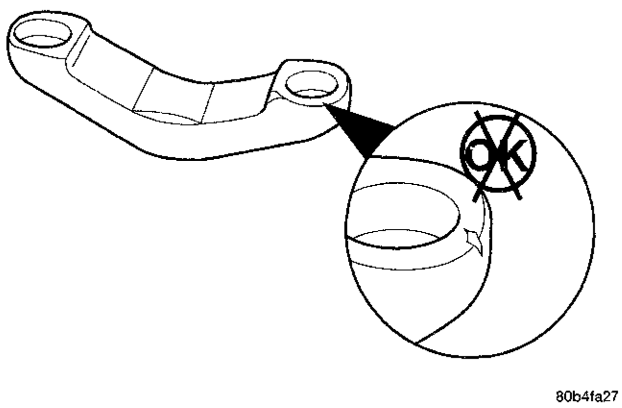

Fig. 59 Inspecting Crosshead for Cracks

(4) **Verify valve lash adjustment. Refer to Valve Lash Verification/Adjustment in Service Procedures.**

(5) Install cylinder head cover and reusable gasket (Fig. 51). Torque bolts to 24 N·m (18 ft. lbs.).

(6) Connect battery negative cables.

VALVE SPRINGS AND SEALS (IN VEHICLE)

REMOVAL

(1) Disconnect the battery negative cables.

(2) Remove the cylinder head cover (Fig. 61).

(3) Remove the rocker arms and crossheads (Fig. 62) from the cylinder(s) to be serviced. Mark each component so they can be installed in their original position.

(4) Remove the fuel pump gear access cover (Fig. 64).

(5) Using the crankshaft barring tool #7471B (Fig. 60), rotate the engine to line up the mark on the pump gear with the TDC mark on the cover. **At this engine position, cylinders #1 and #6 can be serviced.**

(6) Remove the accessory drive belt. Refer to Group 7, Cooling for the correct procedure.

(7) With the fuel injection pump gear mark aligned at TDC, add a paint mark anywhere on the gear housing cover next to the crankshaft damper. Place another mark on the vibration damper in alignment with the mark you just made on the cover.

(8) Divide the crankshaft damper into three equally sized segments as follows:

(a) Using a tape measure, measure the circumference of the crankshaft damper and divide the measurement by three (3).

(b) Measure that distance in a counter-clockwise direction from the first balancer mark and place another mark on the balancer.

(c) From the second damper mark, again measure in a counter-clockwise direction and place a mark on the damper at the same distance you measured when placing the second damper mark.

The damper should now be marked in three equally spaced locations and the fuel pump gear mark should still be aligned with the TDC mark on the cover.

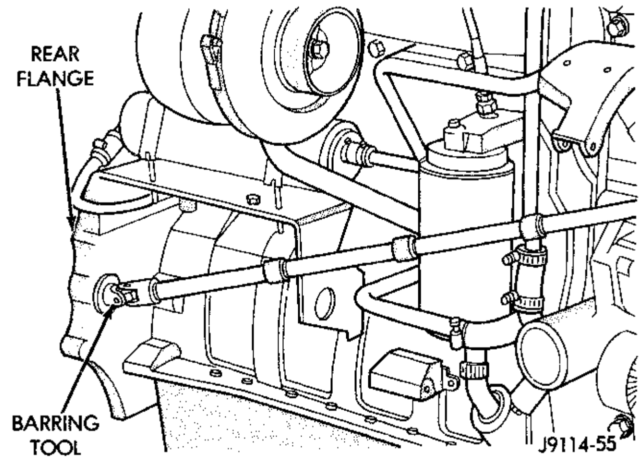

Fig. 60 Rotating Engine with Barring Tool

(9) Compress the valve springs at cyls. #1 and #6 as follows:

(a) Remove the injector clamp (Fig. 63) from the cylinder(s) to be serviced. **Do not remove the bolt shown in (Fig. 63).**

(b) Install the valve spring compressor mounting base as shown in (Fig. 65). Reinstall the injector clamp bolt finger tight.

(c) Install the top plate, washer, and nut. Using a suitable wrench tighten the nut (clock-wise) (Fig. 66) to compress the valve springs and remove the collets.

(d) Rotate the compressor nut counter-clockwise to relieve tension on springs. Remove spring compressor.

(e) Remove and replace retainers, springs, and seals as necessary.

(f) **Do not rotate the engine until the springs and retainers are re-installed.**

(g) Install seals, springs and retainers. Install spring compressor, compress valve springs and install the collets.

(h) Release the spring tension and remove the compressor. Verify that the collets are seated by tapping on the valve stem with a plastic hammer.

(10) Using the crankshaft barring tool, rotate the engine clockwise until the next crankshaft damper paint mark aligns with the mark you placed on the cover. **In this position, cylinders #2 and #5 can be serviced.**

(11) Repeat the valve spring compressing procedure previously performed and service the retainers, springs, and seals as necessary.

REMOVAL AND INSTALLATION (Continued)

(12) Using the crankshaft barring tool, rotate the engine clockwise until the next crankshaft damper paint mark aligns with the mark you placed on the cover. **In this position, cylinders #3 and #4 can be serviced.**

(13) Repeat the spring compressing procedure previously performed and service the retainers, springs, and seals as necessary.

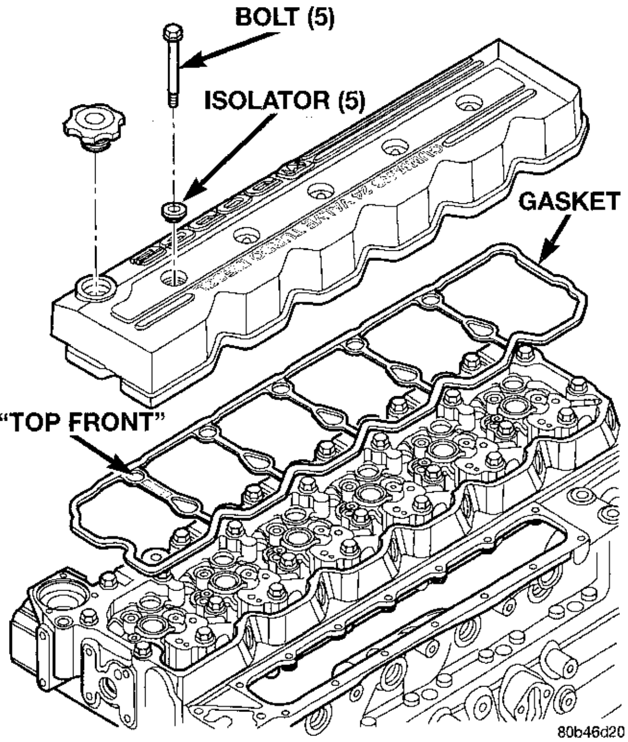

Fig. 61 Cylinder Head Cover Removal/Installation

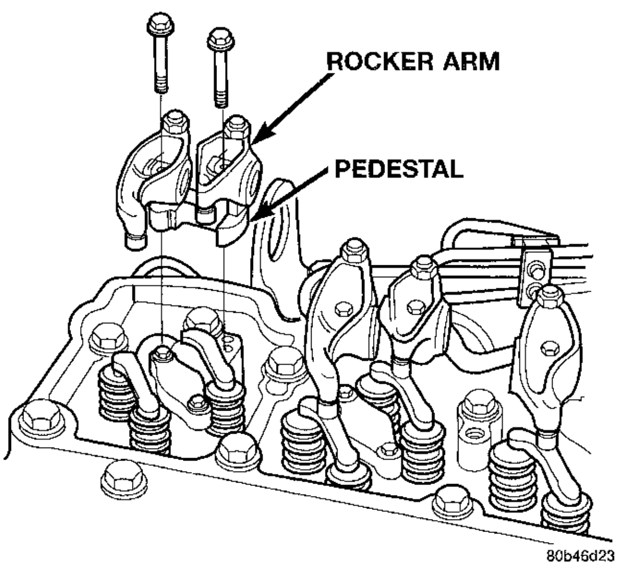

Fig. 62 Rocker Arm and Crosshead Removal/ Installation

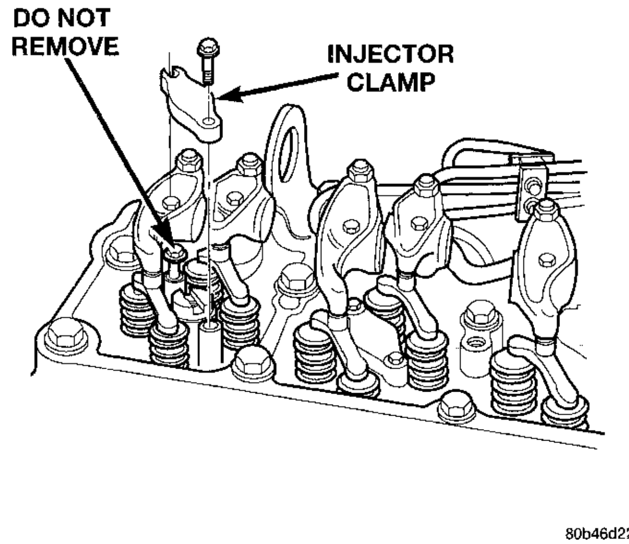

Fig. 63 Injector Clamp Removal/Installation

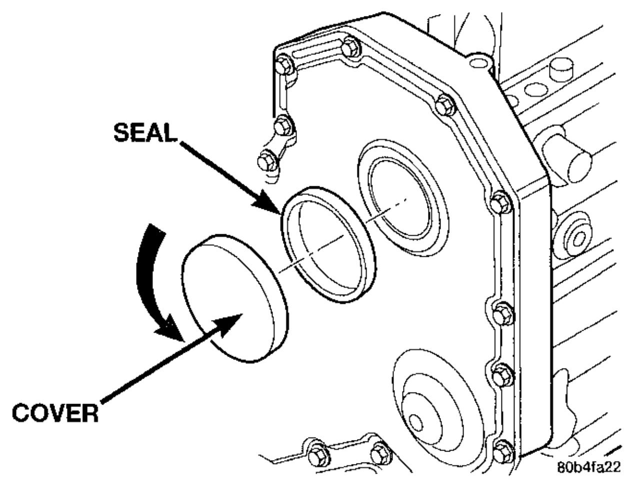

Fig. 64 Fuel Pump Gear Access Cover

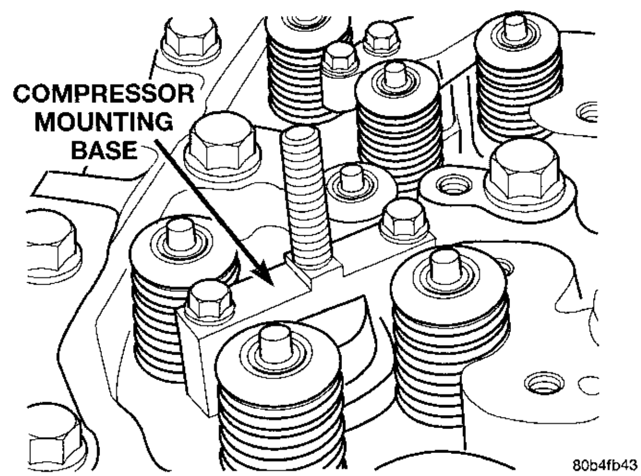

Fig. 65 Spring Compressor Mounting Base—Part of Tool 8319

REMOVAL AND INSTALLATION (Continued)

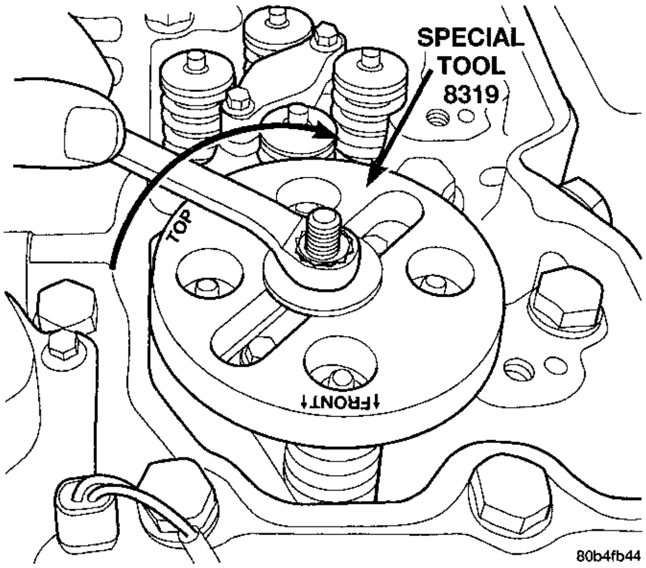

Fig. 66 Compressing Valve Springs with Tool 8319

INSTALLATION

(1) Install all injector clamps into their original location (Fig. 63). Tighten the hold down bolt to 10 N·m (89 in. lbs.) torque.

(2) Lubricate the valve tips and install the crossheads in their original locations .

(3) Lubricate the crossheads and push rod sockets and install the rocker arms and pedestals in their original locations (Fig. 62). Tighten bolts to 36 N·m (27 ft. lbs.) torque.

(4) **Verify valve lash adjustment. Refer to Valve Lash Verification/Adjustment in Service Procedures.**

(5) Install cylinder head cover and reusable gasket (Fig. 61). Torque bolts to 24 N·m (18 ft. lbs.).

(6) Install the accessory drive belt. Refer to Group 7, Cooling for the correct procedure.

(7) Connect battery negative cables.

CYLINDER HEAD ASSEMBLY

REMOVAL

(1) Disconnect battery negative cables.

(2) Raise vehicle on hoist.

(3) Drain engine coolant.

(4) Disconnect exhaust pipe from turbocharger elbow (Fig. 67).

(5) Lower vehicle.

(6) Remove air cleaner housing and snorkel from the vehicle. Cap off turbocharger air inlet to prevent intrusion of dirt or foreign material.

(7) Disconnect cab heater core supply and return hoses from the cylinder head and heater pipe.

(8) Disconnect turbocharger oil drain tube at rubber hose connection. Cap off open ports to prevent intrusion of dirt or foreign material.

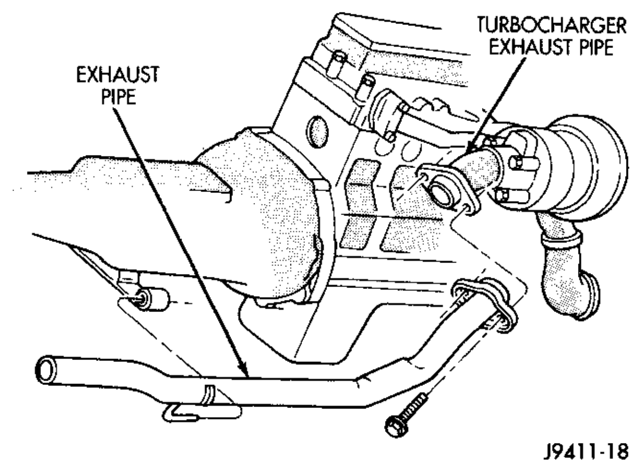

Fig. 67 Exhaust Pipe-to-Turbocharger Elbow

(9) Disconnect turbocharger oil supply line at the turbocharger end. Cap off open ports to prevent intrusion of dirt or foreign material.

(10) Remove exhaust manifold-to-cylinder head bolts and spacers. Remove exhaust manifold and turbocharger from the vehicle as an assembly.

(11) Remove accessory drive belt. Refer to Group 7, Cooling Systems for the correct procedures.

(12) Remove generator upper bracket.

(13) Disconnect radiator upper hose from the thermostat housing.

(14) Disconnect the coolant temperature sensor connector.

(15) Remove the engine harness to cylinder head attaching bolt at front of head.

(16) Remove the engine harness ground fastener at front of head below the thermostat housing.

(17) Remove the throttle linkage cover (Fig. 68).

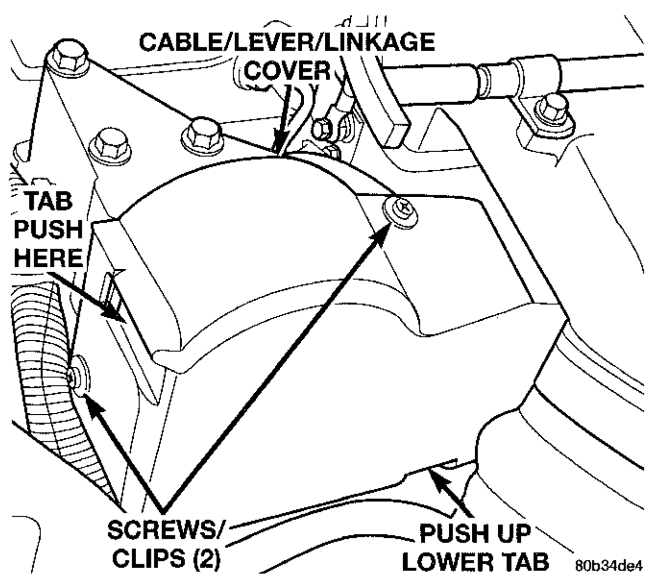

Fig. 68 Throttle Linkage Cover

REMOVAL AND INSTALLATION (Continued)

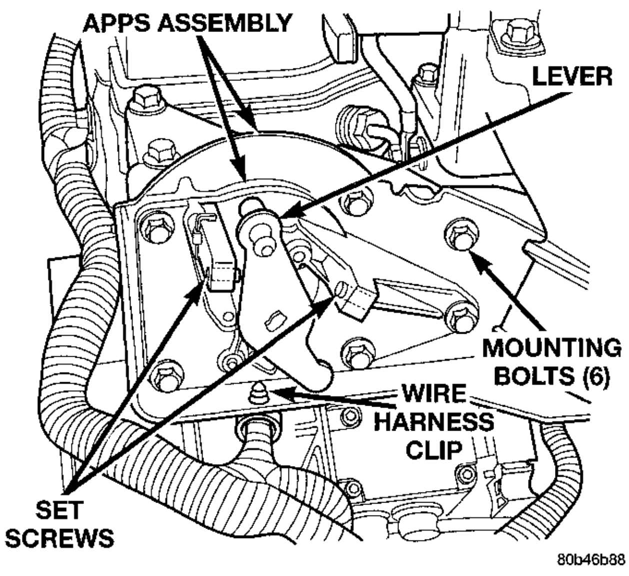

Fig. 69 APPS Assembly

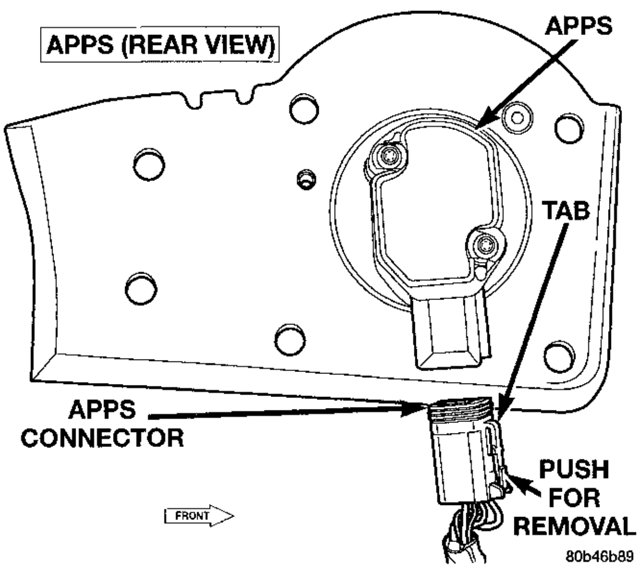

Fig. 70 APPS Connector

(18) Remove the six (6) accelerator pedal position sensor assy.-to-cylinder head bracket bolts (Fig. 69) and secure the entire assembly out of the way. Disconnect the APPS connector (Fig. 70). **It is not necessary to disconnect the cables from the throttle control assy.** Refer to Group 14, Fuel Systems for applicable cautions and warnings.

(19) Remove the intake air grid heater wires from the grid heater.

(20) Remove engine oil level indicator tube attaching bolt from the air inlet housing.

(21) Remove the charge air cooler-to-air inlet housing pipe.

(22) Remove the air inlet housing and intake grid heater from the intake manifold cover.

(23) Remove the engine lift bracket from the rear of the cylinder head.

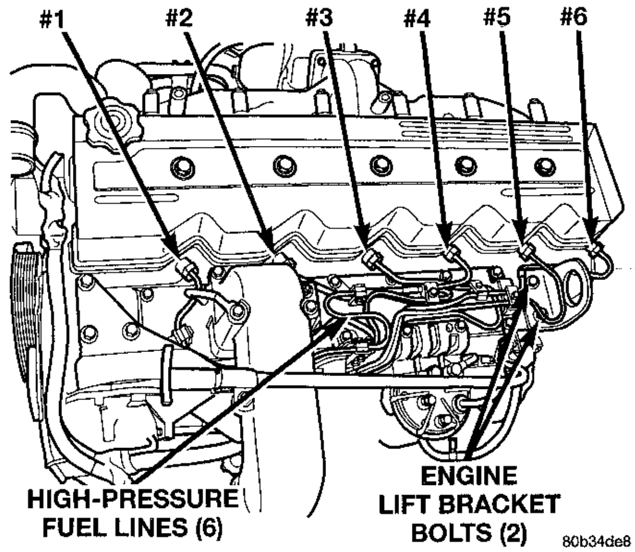

Fig. 71 High-Pressure Lines at Cylinder Head

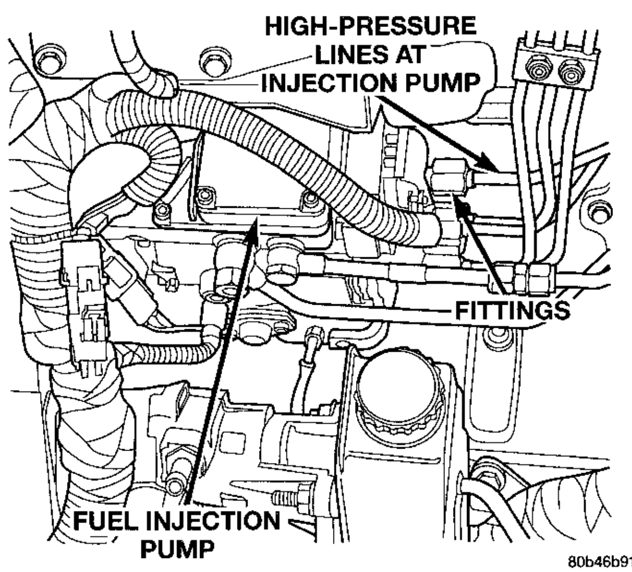

Fig. 72 High-Pressure Lines at Fuel Injection Pump

(24) **Remove the high pressure fuel lines (Fig. 71)(Fig. 72) from the engine as follows:**

(a) Remove all injection line-to-intake manifold cover support bracket bolts.

(b) Loosen the #1, 2, and 4 cylinder high pressure lines at the injection pump.

(c) Loosen the #1, 2, and 4 cylinder high pressure lines at the cylinder head.

(d) Remove the #1, 2, and 4 cylinder high pressure line bundle from the engine.

(e) Loosen the #3, 5, and 6 cylinder high pressure lines at the injection pump.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

(f) Loosen the #3, 5, and 6 cylinder high pressure lines at the cylinder head.

(g) Remove the #3, 5, and 6 cylinder high pressure line bundle from the engine.

(25) Remove the lift pump-to-fuel filter low pressure line.

(26) Remove the fuel filter-to-injection pump low pressure line.

(27) Disconnect the water-in-fuel and fuel heater connectors.

(28) Remove the fuel filter assy.-to-manifold cover bolts and remove filter assy. from vehicle.

(29) Disconnect the Intake Air Temperature and Manifold Air Pressure sensor connectors (Fig. 73).

(30) Remove the cylinder head cover (Fig. 74). Refer to procedure in this group.

(31) Remove the rocker levers (Fig. 75), cross heads and push rods (Fig. 76). Mark each component so they can be installed in their original positions.

NOTE: The #5 cylinder exhaust and the #6 cylinder intake and exhaust pushrods are removed by lifting them up and through the provided cowl panel access holes. Remove the rubber plugs to expose these relief holes.

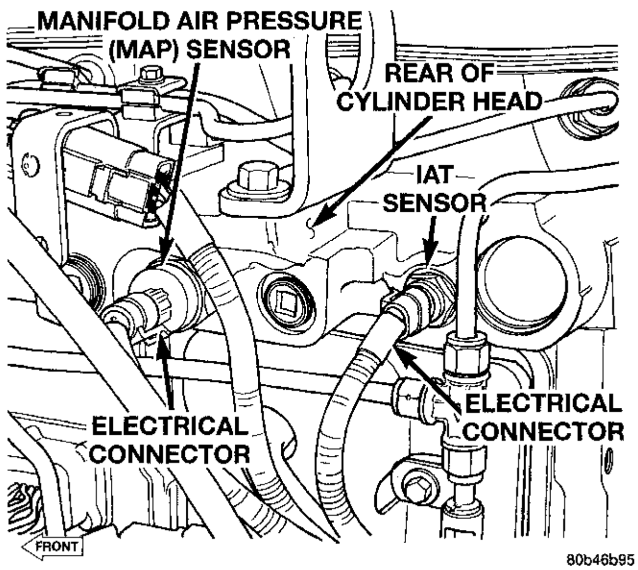

Fig. 73 IAT and MAP Sensor Location

(32) Remove the fuel return line banjo bolt at the rear of the cylinder head (Fig. 77). Be careful not to drop the two (2) sealing washers.

(33) Reinstall the engine lift bracket at the rear of cylinder head.

(34) Remove twenty six (26) cylinder head-to-block bolts.

(35) Attach an engine lift crane to engine lift brackets and lift cylinder head off engine and out of vehicle.

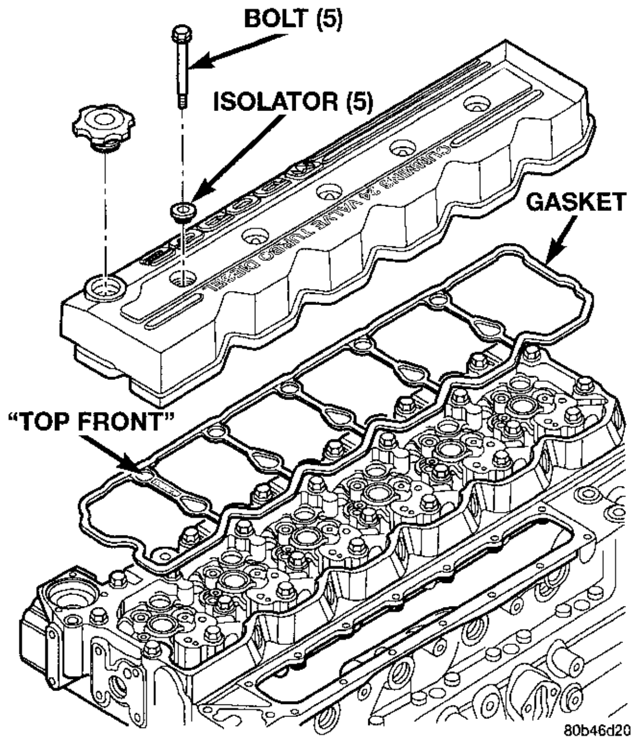

Fig. 74 Cylinder Head Cover Removal

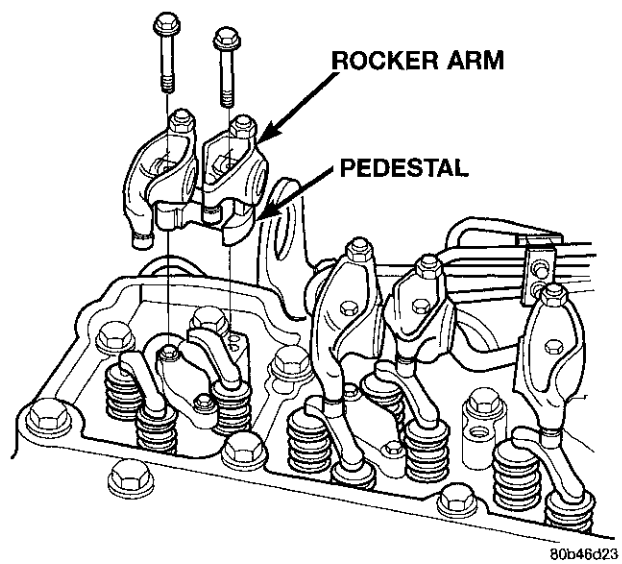

Fig. 75 Rocker Arms and Pedestal Removal

(36) Remove the head gasket and inspect for failure.

CLEANING

Clean the cylinder head and cylinder block mating surfaces with an ordinary scraper. Remove all excess gasket material and carbon. Use a quality wire brush on stubborn areas. Inspect head bolt holes for damage and remove any foreign material.

REMOVAL AND INSTALLATION (Continued)

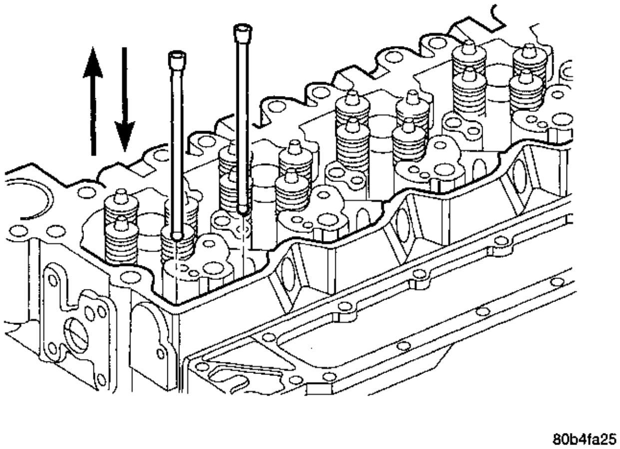

Fig. 76 Push Rod Removal

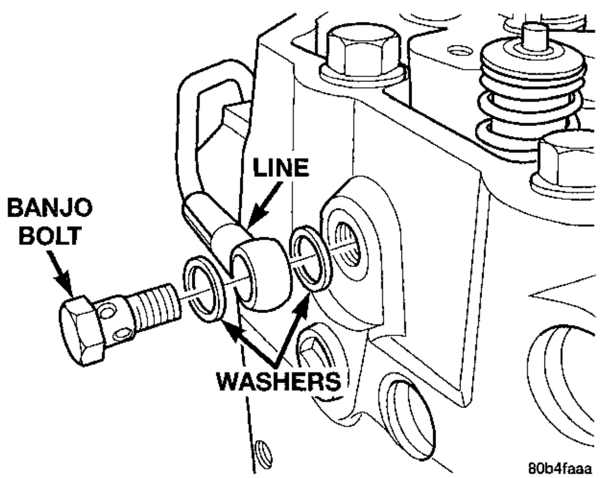

Fig. 77 Fuel Drain Fitting at Rear of Head

Clean the cylinder head bolts with a wire brush or a soft wire wheel. Remove deposits from the shank and threads.

Remove any excess coolant, oil, or foreign material from the top of the pistons and inside the piston bowls.

INSPECTION

CHECKING FOR CRACKS

Inspect the cylinder head for cracks in the combustion surface. Pressure test any cylinder head that is visibly cracked. A cylinder head that is cracked between the injector bore and valve seat can be pressure tested and re-used if o.k.; however, if the crack extends **into** the valve seat, the valve seat **must** be replaced.

SURFACE CONDITION

Visually inspect the cylinder block and head combustion surfaces for localized dips or imperfections. Check the cylinder head and block combustion surfaces for overall out-of-flatness. If either the visual or manual inspection exceeds the limits, then the head or block must be surfaced.

CYLINDER HEAD FLATNESS (MAX)

End to End	0.305 mm (0.012 in.)
Side to Side	0.076 mm (0.003 in.)

CYLINDER BLOCK FLATNESS (MAX)

End to End	0.075 mm (0.003 in.)
Side to Side	0.075 mm (0.003 in.)

HEAD BOLT INSPECTION

Visually inspect the cylinder head bolts for damaged threads, corroded/pitted surfaces, or a reduced diameter due to bolt stretching.

If the bolts are not damaged, their "free length" should be measured using the capscrew stretch gauge provided with the replacement head gasket. Place the head of the bolt against the base of the slot and align the bolt with the straight edge of gauge (Fig. 78). If the end of the bolt touches the foot of the gauge, the bolt **must** be discarded. **The maximum bolt free length is 132.1 mm (5.200 in.).**

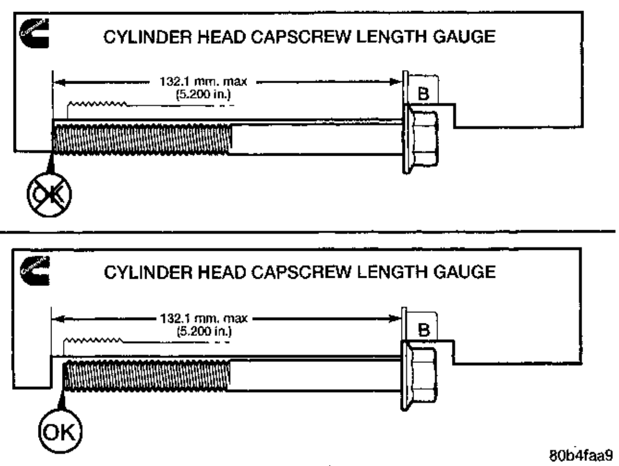

Fig. 78 Head Bolt Stretch Gauge

INSTALLATION

WARNING: THE OUTSIDE EDGE OF THE HEAD GASKET IS VERY SHARP. WHEN HANDLING THE NEW HEAD GASKET, USE CARE NOT TO INJURE YOURSELF.

(1) Install a new gasket with the part number side up, and locate the gasket over the dowel sleeves.

(2) Using an engine lifting crane, lower the cylinder head onto the engine.

(3) Lightly lubricate head bolts with engine oil and install. Using the sequence shown in (Fig. 79), torque bolts in the following three (3) steps:

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

(a) Torque bolts to 90 N·m (66 ft. lbs.)
(b) Re-check all bolts to 90 N·m (66 ft. lbs.)
(c) Torque all bolts an additional ¼ turn (90°)

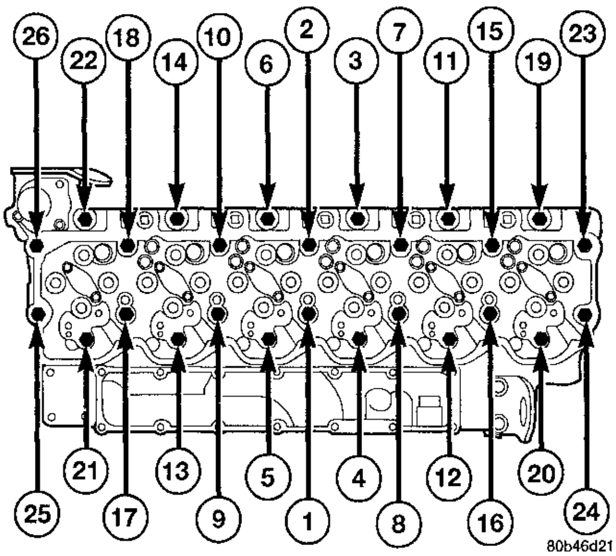

Fig. 79 Cylinder Head Bolt Torque Sequence

(4) Connect fuel return line at rear of head (Fig. 77). Install both sealing washers and torque banjo bolt to 24 N·m (18 ft. lbs.).

(5) Install push rods into their original locations (Fig. 80). **Verify that they are seated in the tappets.**

(6) Lubricate valve stem tips and install the cross-heads in their original locations.

(7) Lubricate the rocker arms and pedestals and install them in their original locations (Fig. 81). Install the bolts and torque them to 36 N·m (27 ft. lbs.).

(8) Verify that the valve lash settings are maintained. Refer to Valve Lash Verification/Adjustment in the Service Procedures section of this group.

(9) Install cylinder head cover (Fig. 82). Refer to procedure in this group.

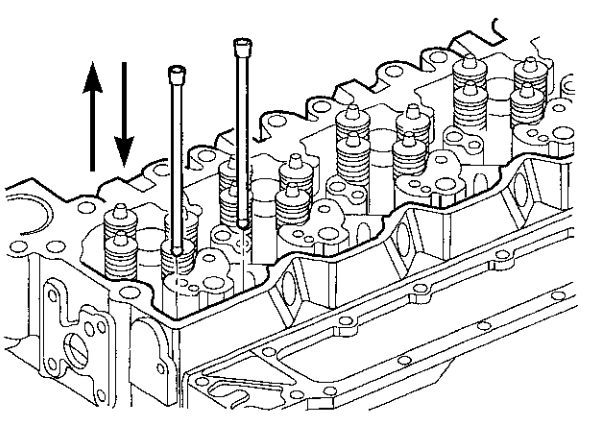

Fig. 80 Push Rod Installation

(10) Connect the IAT and MAP sensor connectors.

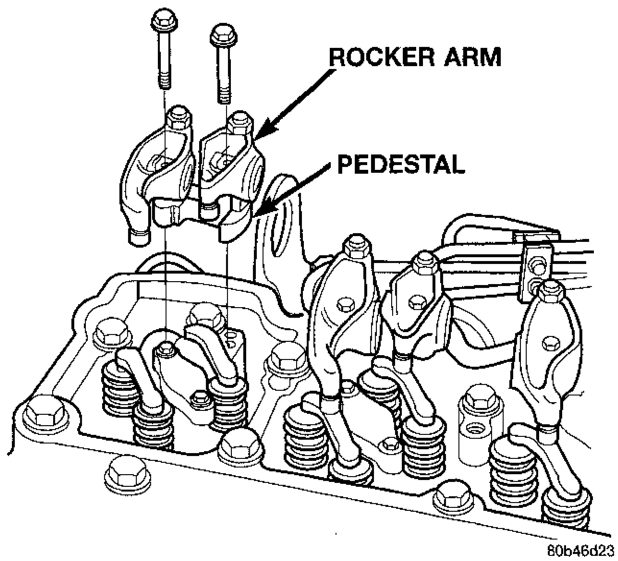

Fig. 81 Rocker Arms and Pedestal Installation

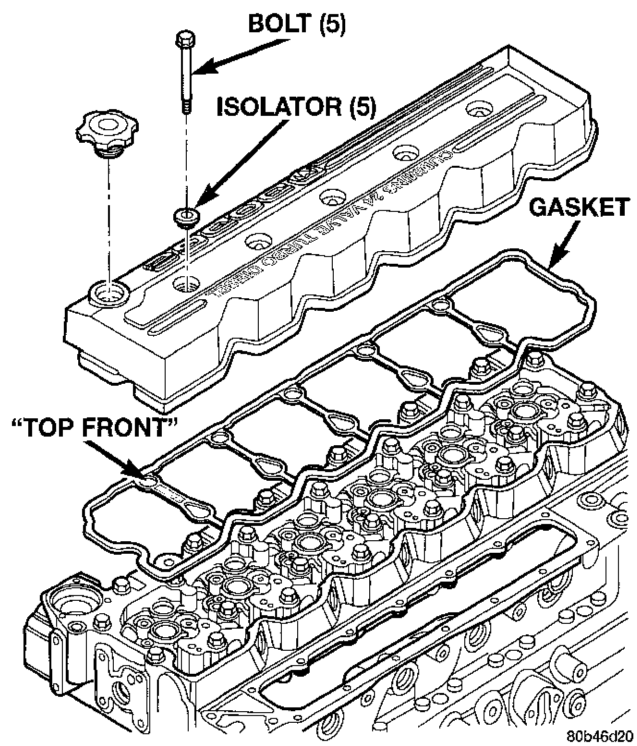

Fig. 82 Cylinder Head Cover Installation

(11) Install the fuel filter cannister assy. and torque mounting bolts to 24 N·m (18 ft. lbs.).

(12) Connect the lift pump to fuel filter low pressure line. Torque fittings to 24 N·m (18 ft. lbs.).

(13) Connect the Water-in-Fuel and Fuel Heater Element connectors at the filter assy.

(14) Remove the engine lift bracket at rear of cylinder head.

(15) **Install the high pressure fuel lines (Fig. 71)(Fig. 72) as follows:**

REMOVAL AND INSTALLATION (Continued)

(a) Lubricate the threads (both ends) of the high pressure line nuts with diesel fuel or engine oil.

(b) Install the rear line bundle (cyls. #3,5, and 6), and tighten the threads at the head and pump by hand.

(c) Torque the connections at the cylinder head first. Torque connections to 40 N·m (30 ft. lbs.).

(d) Torque the line connections at the injection pump to 24 N·m (18 ft. lbs.).

(e) Install the front line bundle (cyls. #1,2, and 4) following the same procedure used for the rear line bundle.

(f) Torque the connections at the cylinder head first. Torque connections to 40 N·m (30 ft. lbs.).

(g) Torque the line connections at the injection pump to 24 N·m (18 ft. lbs.).

(h) Install the injection line support bracket to intake cover/cylinder head bolts and torque to 24 N·m (18 ft. lbs.).

(16) Install the engine lift bracket at the rear of cylinder head.

(17) Install the fuel filter to injection pump low pressure line. Inspect and replace sealing washers if necessary. Torque banjo bolts to 24 N·m (18 ft. lbs.).

(18) Using new gaskets, install the intake grid heater and air inlet housing. Torque bolts to 24 N·m (18 ft. lbs.).

(19) Connect the APPS connector (Fig. 70).

(20) Install the APPS assy. to the cylinder head bracket and torque bolts to 12 N·m (105 in. lbs.).

(21) Install the throttle linkage cover (Fig. 68).

(22) Install the charge air cooler-to-air inlet housing duct assy. Torque all clamps to 8 N·m (71 in. lbs.).

(23) Connect intake grid heater wires.

(24) Fasten engine harness to front of cylinder head with bolt.

(25) Install engine harness ground wire and torque bolt to 24 N·m (18 ft. lbs.).

(26) Connect engine coolant temperature sensor connector.

(27) Connect radiator upper hose to thermostat housing.

(28) Install generator upper bracket and torque bolts to 41 N·m (31 ft. lbs.).

(29) Install accessory drive belt. Refer to Group 7, Cooling System for the correct procedure.

(30) Install exhaust manifold/turbocharger assy. and start all bolts/spacers by hand. Torque bolts to 43 N·m (32 ft. lbs.).

(31) Connect turbocharger oil drain tube.

(32) Perform the turbocharger pre-lube procedure. Refer to Group 11, Exhaust System and Turbocharger for the correct procedure.

(33) Connect the turbocharger oil supply line.

(34) Install air cleaner housing and duct.

(35) Raise vehicle on hoist.

(36) Install exhaust pipe to turbocharger elbow (Fig. 67). Torque bolts to 34 N·m (25 ft. lbs.).

(37) Lower vehicle.

(38) Add coolant.

(39) Start engine and check for leaks.

VALVES, SPRINGS, AND SEALS (OFF VEHICLE)

REMOVAL

(1) Remove cylinder head. Refer to Cylinder Head Removal and Installation in this group.

(2) Support cylinder head on stands, or install head bolts upside down (through combustion surface side) to protect injector tips from damage from work bench.

(3) Remove the injector clamp (Fig. 83) from the cylinder(s) to be serviced. **Do not remove the bolt shown in (Fig. 83).**

(4) Install the valve spring compressor mounting base (special tool 8319) as shown in (Fig. 84). Reinstall the injector clamp bolt finger tight.

(5) Install the compressor top plate, washer, and nut. Using a suitable wrench, tighten the nut (clockwise) to compress the valve springs (Fig. 85) and remove the locks.

(6) Rotate the compressor nut counter-clockwise to relieve tension on the springs. Remove the spring compressor.

(7) Remove the retainers, springs, valve seals (if necessary), and valves (Fig. 86). Arrange or number all components so they can be installed in their original locations.

(8) Repeat the procedure on all cylinders to be serviced.

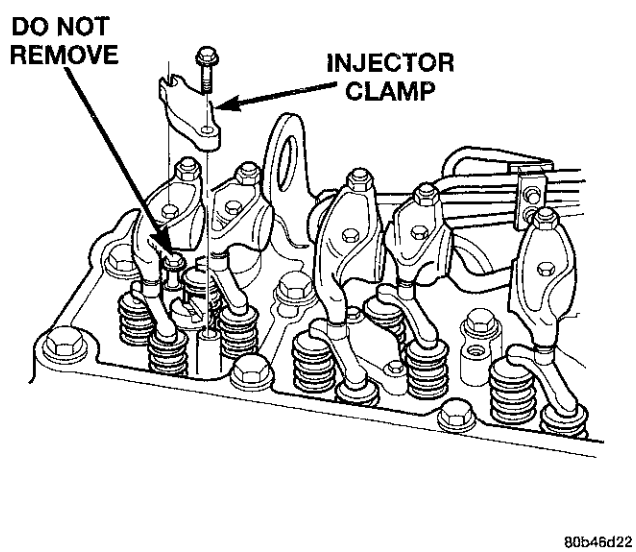

Fig. 83 Injector Clamp Removal/Installation

REMOVAL AND INSTALLATION (Continued)

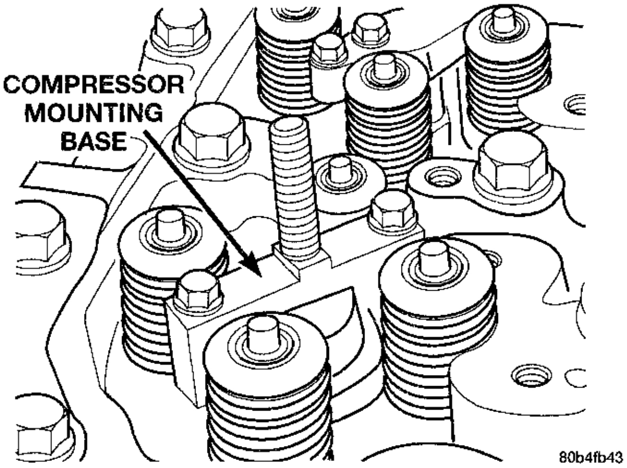

Fig. 84 Spring Compressor Mounting Base—Part of Tool 8319

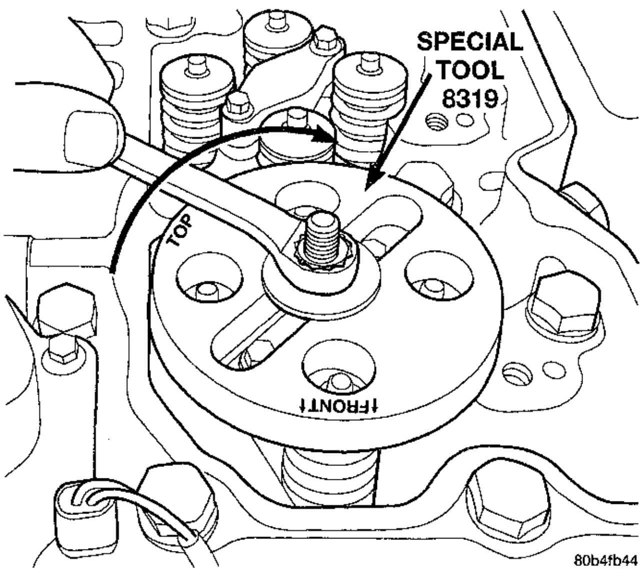

Fig. 85 Compressing Valve Springs with Tool 8319

CLEANING

Clean the valve stems with crocus cloth or a Scotch-Brite™ pad. Remove carbon with a soft wire brush. Clean valves, springs, retainers, and valve retaining locks in a suitable solvent. Rinse in hot water and blow dry with compressed air.

INSPECTION

Visually inspect the valves for abnormal wear on the heads, stems, and tips. Replace any valve that is worn out or bent (Fig. 87).

Measure the valve stem diameter in three places as shown in (Fig. 88).

Measure the cylinder head valve guide bore (Fig. 89). Subtract the corresponding valve stem diameter to obtain valve stem-to-guide clearance.

Measure valve margin (rim thickness) (Fig. 90).

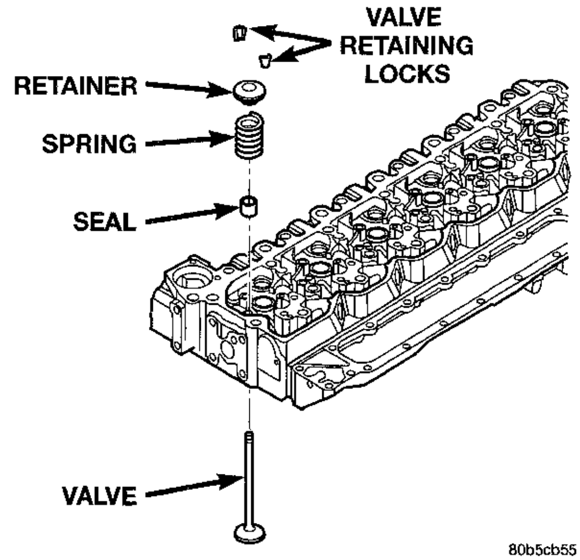

Fig. 86 Valve Spring, Seal, and Retainers

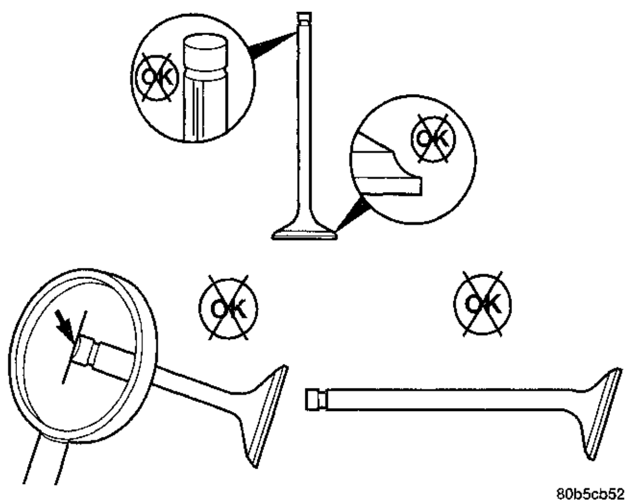

Fig. 87 Visually Inspect Valves for Abnormal Wear

Measure the valve spring free length and maximum inclination (Fig. 91).

Test valve spring force with tool C-647 (Fig. 92).

INSTALLATION

(1) Install new valve seals. The yellow seals are for the intake valves and the green seals are for the exhaust valves.

(2) Install the valves in their original postion. The exhaust valves are identified by a dimple on the valve head (Fig. 93).

(3) Install the valve springs and retainer.

(4) Install the valve spring compressor tool 8319 as shown in (Fig. 84) and (Fig. 85).

(5) Compress the valve springs and install the valve retaining locks (Fig. 86).

REMOVAL AND INSTALLATION (Continued)

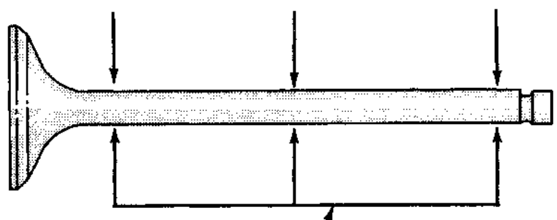

Fig. 88 Measure Valve Stem Diameter

VALVE STEM DIAMETER
6.990 mm (0.2752 in.) MIN
7.010 mm (0.2760 in.) MAX

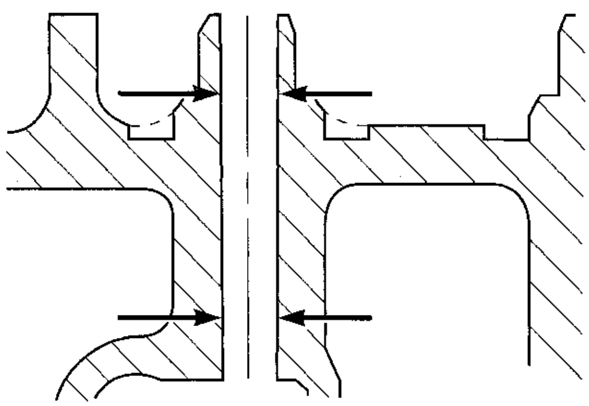

Fig. 89 Measure Valve Guide Bore

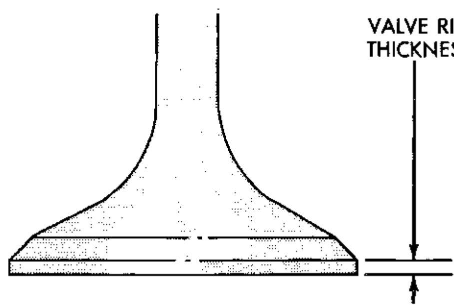

Fig. 90 Measure Valve Margin (Rim Thickness)

VALVE MARGIN (RIM THICKNESS)
0.72 mm (0.031 in.) MIN.

(6) Remove the compressor and repeat the procedure on the remaining cylinders.

(7) Install the injector clamp and hold down bolts and tighten to 10 N·m (89 in. lbs.) torque.

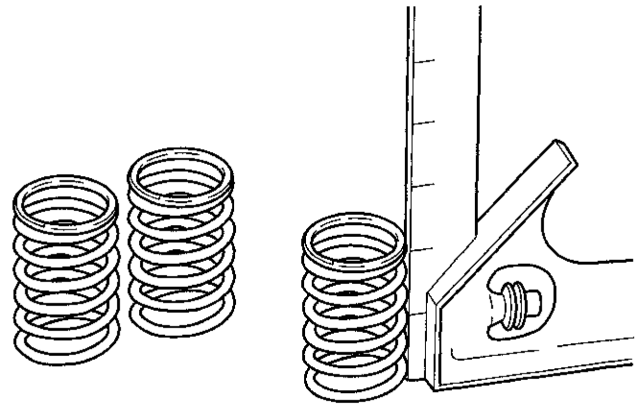

Fig. 91 Measure Valve Spring Free Length and Max. Inclination

VALVE SPRING FREE LENGTH
47.75 mm (1.88 in.)

MAX INCLINATION
1.5 mm (.059 in.)

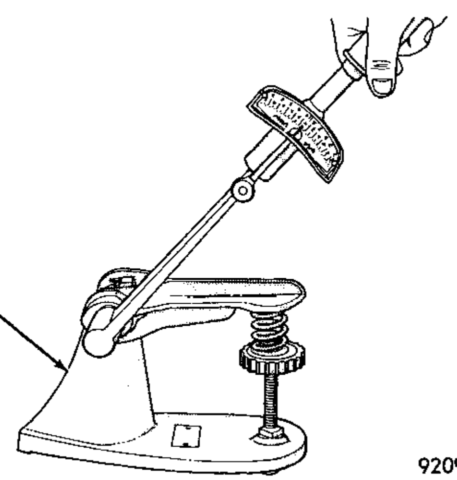

Fig. 92 Testing Valve Spring with Tool C-647

VALVE SPRING MINIMUM LOAD
@ 35.33 mm — 339.8 N
@ 1.39 in. — 76.4 lbs.

(8) Install the cylinder head. Refer to Cylinder Head Removal and Installation in this group.

REMOVAL AND INSTALLATION (Continued)

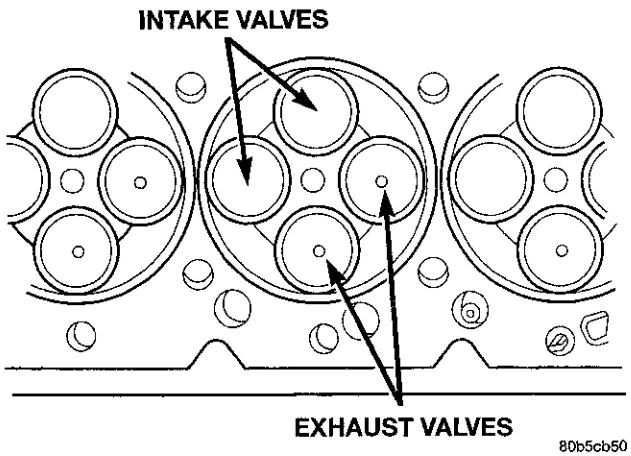

Fig. 93 Valve Identification

CRANKSHAFT DAMPER

REMOVAL

(1) Remove the accessory drive belt. Refer to Group 7, Cooling System for the correct procedure.

(2) Remove the four (4) damper to crankshaft bolts and remove damper (Fig. 94).

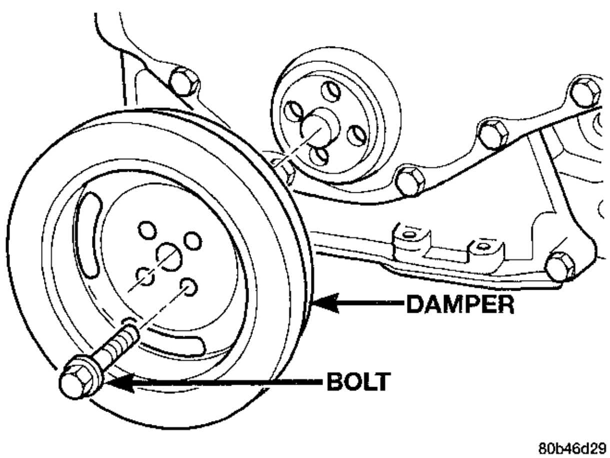

Fig. 94 Crankshaft Damper Removal/Installation

INSPECTION

(1) Inspect the damper hub for cracks and replace if any are found.

(2) Inspect the index lines on the damper hub and the inertia member (Fig. 95). If the lines are more than 1.59 mm (1/16 in.) out of alignment, replace the damper.

(3) Inspect the rubber member for deterioration or missing segments (Fig. 96).

INSTALLATION

(1) Install the crankshaft damper and bolts (Fig. 94). Tighten bolts to 125 N·m (92 ft. lbs.) torque.

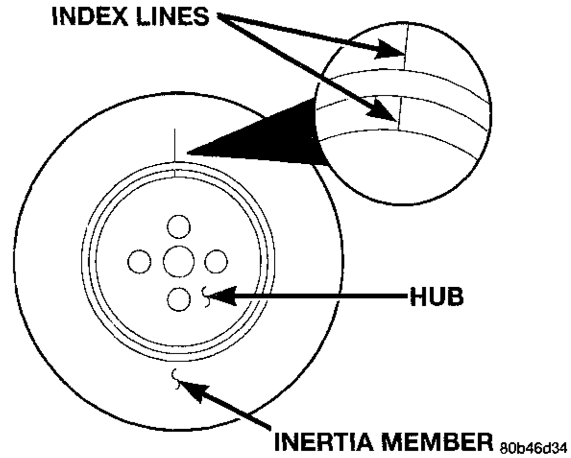

Fig. 95 Inspect Index Lines for Alignment

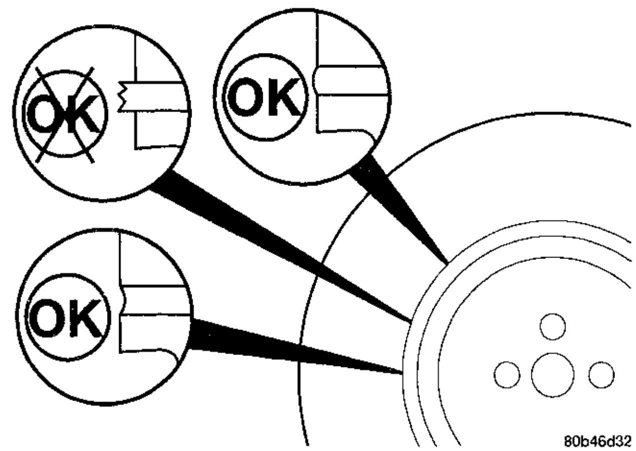

Fig. 96 Inspect Damper Rubber Member

(2) Install the accessory drive belt. Refer to Group 7, Cooling System for the correct belt schematic and procedure.

CRANKSHAFT OIL SEAL—FRONT

REMOVAL

(1) Disconnect both battery negative cables.

(2) Raise vehicle on hoist.

(3) Partially drain engine coolant into container suitable for re-use.

(4) Lower vehicle.

(5) Remove radiator upper hose.

(6) Disconnect coolant recovery bottle from radiator filler neck and lift bottle off of fan shroud.

(7) Disconnect windshield washer pump supply hose and electrical connections and lift washer bottle off of fan shroud.

(8) Remove the fan shroud-to-radiator mounting bolts.

REMOVAL AND INSTALLATION (Continued)

(9) Remove viscous fan/drive assembly. **The fan drive nut has left handed threads.** Refer to Group 7, Cooling System for the correct procedure.

(10) Remove cooling fan shroud and fan assy. from the vehicle.

(11) Remove the accessory drive belt. Refer to Group 7, Cooling for the correct procedure.

(12) Remove the cooling fan support/hub from the front of the engine (Fig. 97).

(13) Raise the vehicle on hoist.

(14) Remove the vibration damper (Fig. 98).

(15) Remove the gear cover-to-housing bolts and gently pry the cover away from the housing, taking care not to mar the gasket surfaces.

(16) Support the cover on a flat work surface with wooden blocks (Fig. 99), and using a suitable punch and hammer, drive the old seal out of the cover from the the outside of the cover (Fig. 99).

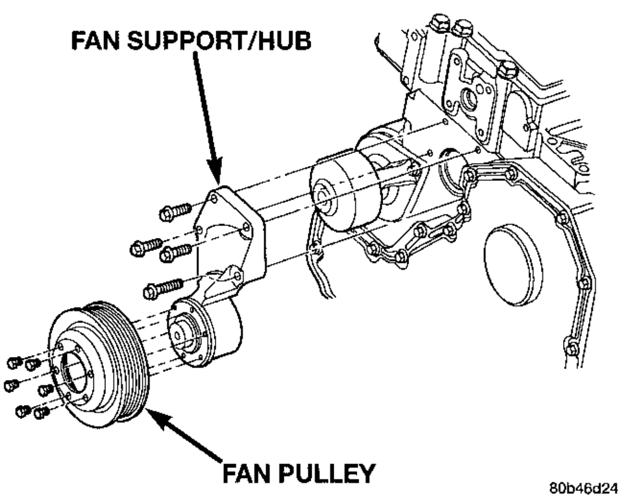

Fig. 97 Fan Support Hub Assembly—Removal/Installation

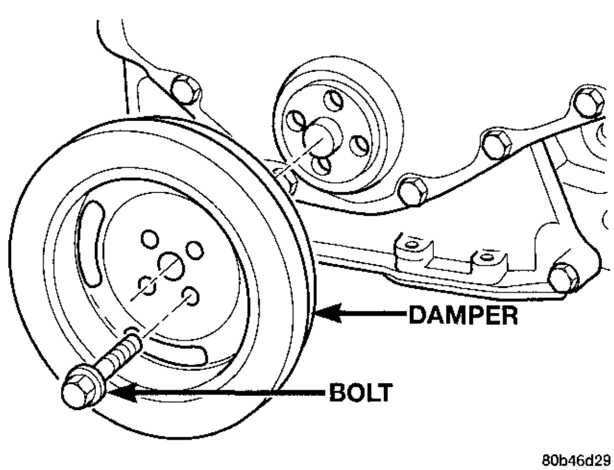

Fig. 98 Vibration Damper—Removal/Installation

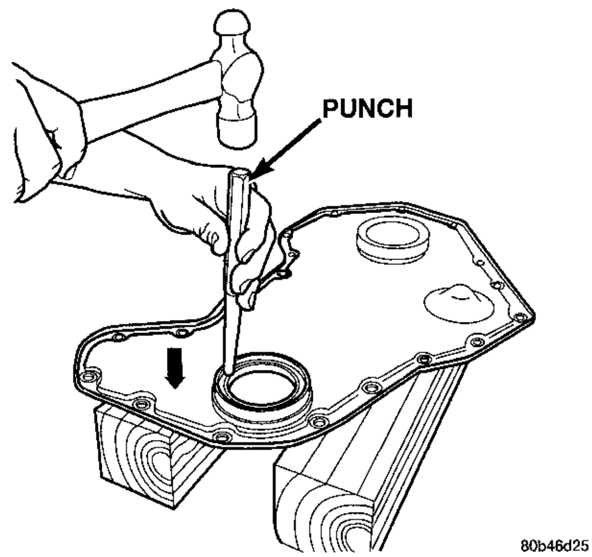

Fig. 99 Removing Seal from Cover

CLEANING

Clean cover and housing gasket mating surfaces. Use a suitable scraper and be careful not to damage the gear housing surface, since it is aluminum. Remove any old sealer from the oil seal bore. Thoroughly clean the front seal area of the crankshaft. The seal lip and the sealing surface on the crankshaft must be free from all oil residue to prevent seal leaks.

INSPECTION

Inspect the gear housing and cover for cracks and replace if necessary. Carefully straighten any bends or imperfections in the gear cover with a ball-peen hammer on a flat surface. Inspect the crankshaft front journal for any grooves or nicks that would affect the integrity of the new seal.

INSTALLATION

(1) Apply a bead of Loctite 277® or equivalent to the outside diameter of the seal. Do not lubricate the inside diameter of the new seal.

(2) With the cover supported by wood blocks, install the seal into the rear of the cover using crankshaft seal installer tool #8281 and universal driver handle C4171 (Fig. 100). Strike the driver handle until the installation tool bottoms out on the inside of the cover.

(3) Install the plastic seal pilot (provided with seal kit) into the crankshaft seal.

(4) Apply a bead of Mopar® Silicone Rubber Adhesive Sealant or equivalent to the cover sealing surface.

(5) Install the cover to the gear housing, aligning the seal pilot with the nose of the crankshaft (Fig. 101).

REMOVAL AND INSTALLATION (Continued)

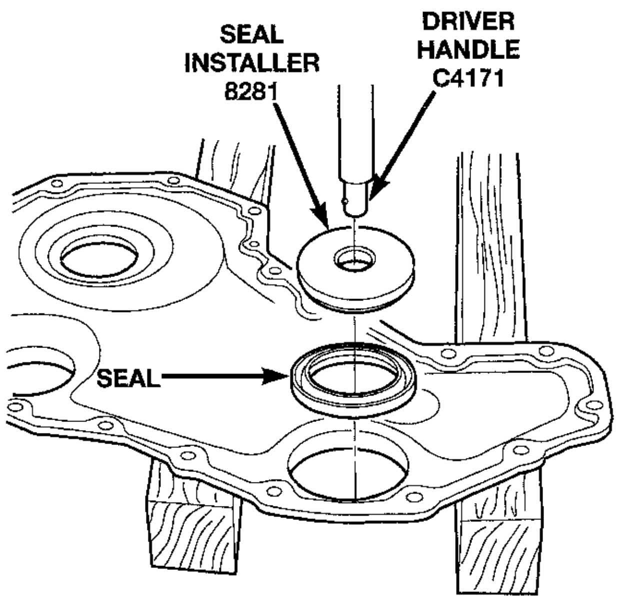

Fig. 100 Installing Seal Into Cover With Tool 8281

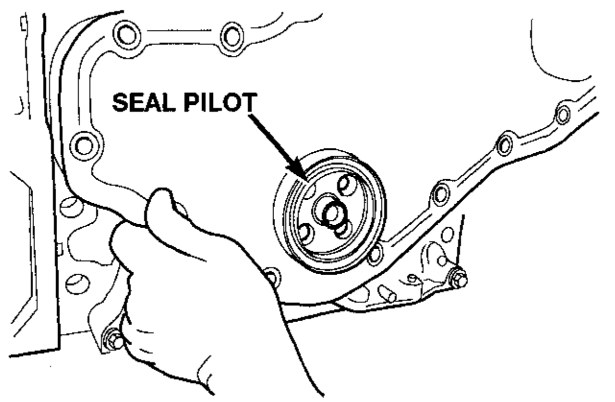

Fig. 101 Installing Front Cover with Seal Pilot

(6) Install the cover bolts and tighten to 24 N·m (18 ft. lbs.) torque. Remove pilot tool.

(7) Install the vibration damper (Fig. 98) and torque the bolts to 125 N·m (92 ft. lbs.). Use the engine barring tool to keep the engine from rotating during tightening operation.

(8) Install the fan support/hub assembly (Fig. 97)and torque bolts to 24 N·m (18 ft. lbs.).

(9) Install the accessory drive belt. Refer to Group 7, Cooling for the correct procedure.

(10) Connect battery negative cables.

(11) Start engine and check for oil leaks.

GEAR HOUSING COVER

REMOVAL

(1) Disconnect both battery negative cables.

(2) Raise vehicle on hoist.

(3) Partially drain engine coolant into container suitable for re-use.

(4) Lower vehicle.

(5) Remove radiator upper hose.

(6) Disconnect coolant recovery bottle hose from radiator filler neck and lift bottle off of fan shroud.

(7) Disconnect windshield washer pump supply hose and electrical connections and lift washer bottle off of fan shroud.

(8) Remove the fan shroud-to-radiator mounting bolts.

(9) Remove viscous fan/drive assembly. **The fan drive nut has left handed threads.** Refer to Group 7, Cooling System for the correct procedure.

(10) Remove cooling fan shroud and fan assy. from the vehicle.

(11) Remove the accessory drive belt. Refer to Group 7, Cooling for the correct procedure.

(12) Remove the cooling fan support/hub from the front of the engine (Fig. 102).

(13) Raise the vehicle on hoist.

(14) Remove the crankshaft damper (Fig. 103).

(15) Lower the vehicle.

(16) Remove the gear cover-to-housing bolts and gently pry the cover away from the housing, taking care not to mar the gasket surfaces.

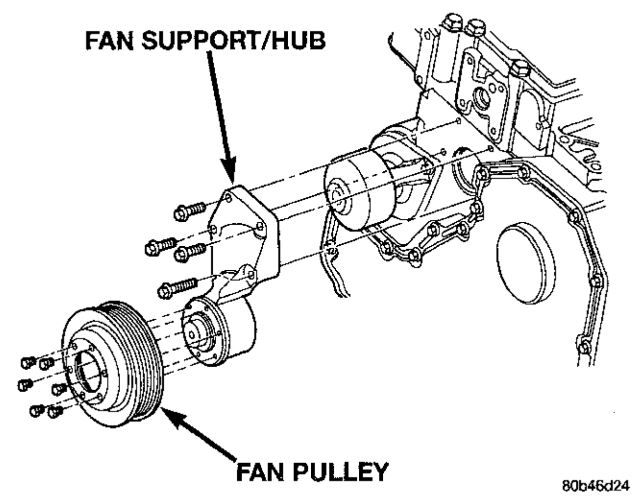

Fig. 102 Fan Support/Hub Assembly—Removal/ Installation

CLEANING

Clean cover and housing gasket mating surfaces. Use a suitable scraper and be careful not to damage the gear housing surface, since it is aluminum. Thor-

REMOVAL AND INSTALLATION (Continued)

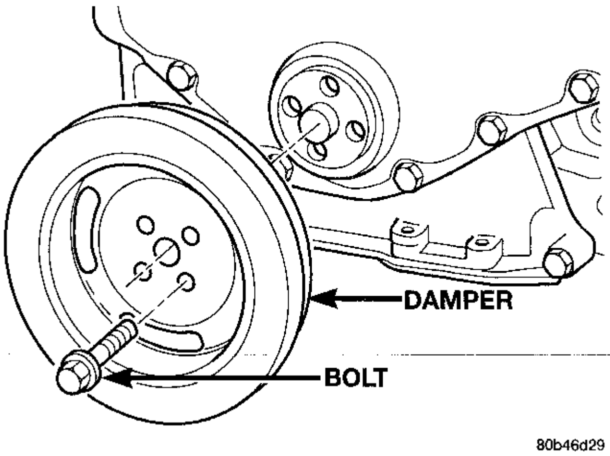

Fig. 103 Crankshaft Damper—Removal/Installation

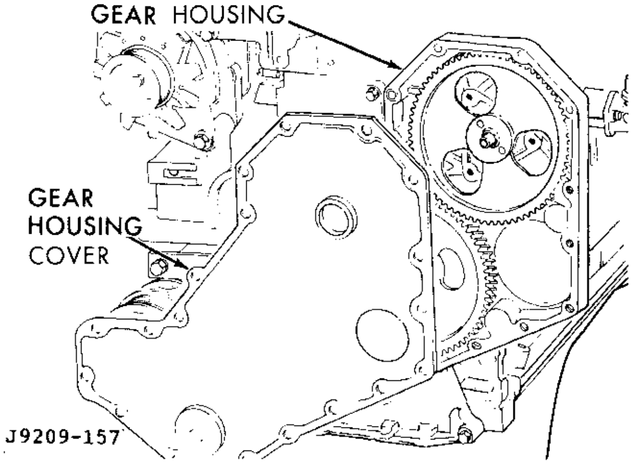

Fig. 104 Gear Housing and Cover

oughly clean the front seal area of the crankshaft. The seal lip and the sealing surface on the crankshaft must be free from all oil residue to prevent seal leaks.

INSPECTION

Inspect the gear housing and cover for cracks and replace if necessary. Carefully straighten any bends or imperfections in the gear cover with a ball-peen hammer on a flat surface. Inspect the crankshaft front seal and journal for imperfections and replace seal if necessary. Refer to procedure in this group.

INSTALLATION

(1) Obtain a seal pilot/installation tool from a crankshaft front seal service kit and install the pilot into the seal.

(2) Apply a bead of Mopar® Silicone Rubber Adhesive Sealant or equivalent to the gear housing cover. Be sure to surround all through holes.

(3) Using the seal pilot to align the cover (Fig. 105), install the cover to the housing and install the bolts. Tighten the bolts to 24 N·m (18 ft. lbs.) torque.

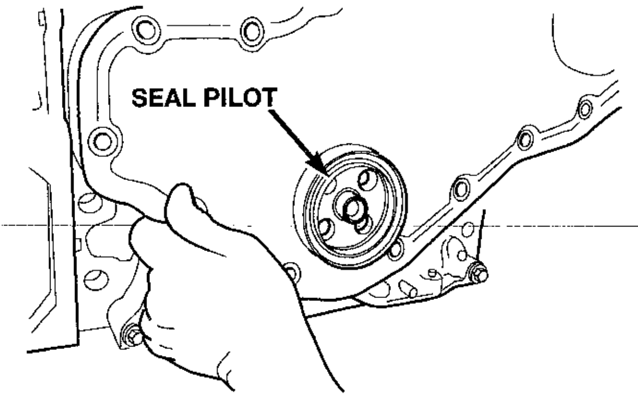

Fig. 105 Installing Cover with Seal Pilot

(4) Remove the seal pilot.

(5) Raise the vehicle.

(6) Install the crankshaft damper (Fig. 103) and tighten bolts to 125 N·m (92 ft. lbs.) torque.

(7) Lower vehicle.

(8) Install the fan support/hub assy. (Fig. 102)and tighten bolts to 24 N·m (18 ft. lbs.) torque.

(9) Install the accessory drive belt. Refer to Group 7, Cooling System for the correct procedure.

(10) Install the cooling fan and shroud together. Start fan nut and fan shroud-to-radiator bolts by hand.

(11) Torque fan drive nut to 57 N·m (42 ft. lbs.) torque.

(12) Torque fan shroud-to-radiator bolts to 11 N·m (95 in. lbs.) torque.

(13) Install the windshield washer reservoir to the fan shroud and connect the washer pump supply hose and electrical connection.

(14) Install the coolant recovery bottle to the fan shroud and connect the hose to the radiator filler neck.

(15) Install the radiator upper hose and clamps.

(16) Add coolant.

(17) Connect the battery cables.

(18) Start engine and inspect for leaks.

GEAR HOUSING

REMOVAL

(1) Disconnect the battery negative cables.

(2) Raise vehicle on hoist.

(3) Remove the oil pan and suction tube. Refer to procedure in this group.

(4) Partially drain engine coolant into container suitable for re-use.

REMOVAL AND INSTALLATION (Continued)

(5) Lower vehicle.

(6) Remove radiator upper hose.

(7) Disconnect coolant recovery bottle hose from radiator filler neck and lift bottle off of fan shroud.

(8) Disconnect windshield washer pump supply hose and electrical connections and lift washer bottle off of fan shroud.

(9) Remove the fan shroud-to-radiator mounting bolts.

(10) Remove viscous fan/drive assembly. **The fan drive nut has left handed threads.** Refer to Group 7, Cooling System for the correct procedure.

(11) Remove cooling fan shroud and fan assy. from the vehicle.

(12) Remove the accessory drive belt. Refer to Group 7, Cooling for the correct procedure.

(13) Remove the cooling fan support/hub from the front of the engine (Fig. 106).

(14) Raise the vehicle on hoist.

(15) Remove the crankshaft damper (Fig. 107).

(16) Lower the vehicle.

(17) Remove the gear cover-to-housing bolts and gently pry the cover away from the housing (Fig. 108), taking care not to mar the gasket surfaces.

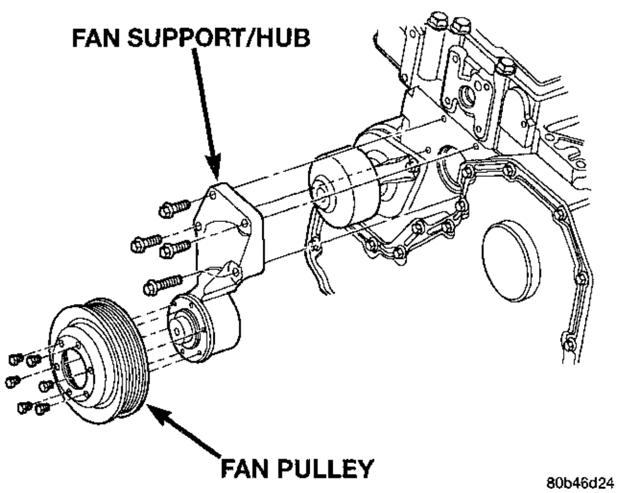

Fig. 106 Fan Support/Hub Assembly—Removal/ Installation

(18) Remove the fuel injection pump. Refer to Group 14, Fuels Systems for the correct procedure.

(19) Disconnect the camshaft position sensor connector.

(20) Raise the tappets and remove the camshaft. Refer to procedure in this group.

(21) Remove the gear housing and gasket (Fig. 109).

(22) Clean the gasket material from the cylinder block.

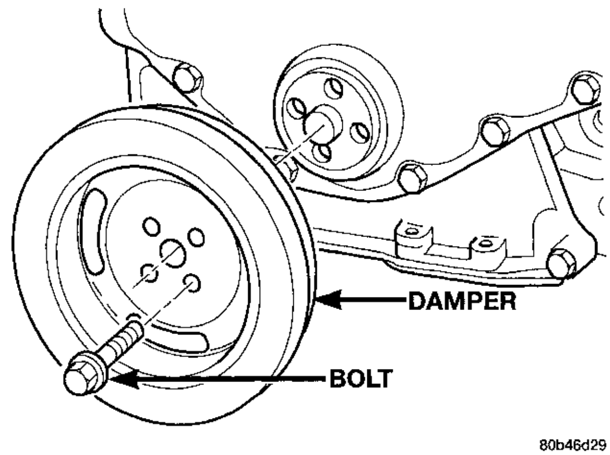

Fig. 107 Crankshaft Damper—Removal/Installation

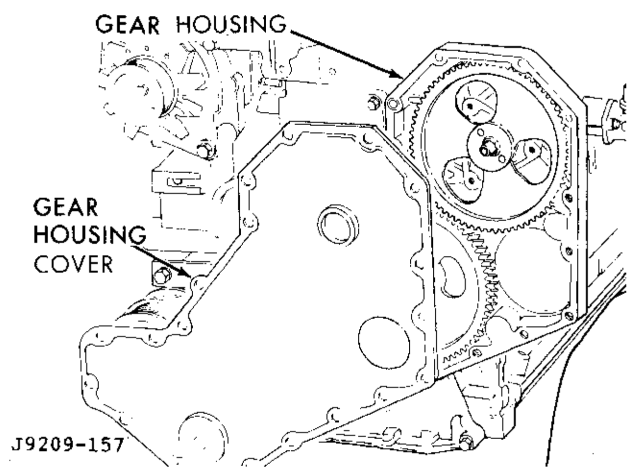

Fig. 108 Gear Housing and Cover

INSTALLATION

(1) Install a new gasket and the gear housing (Fig. 109). Tighten the bolts to 24 N·m (18 ft. lbs.) torque.

(2) Connect the camshaft position sensor connector.

(3) Install the injection pump. Refer to Group 14, Fuel System for the correct procedure.

(4) Install the camshaft. Align the crankshaft, camshaft, and injection pump gear marks as shown in (Fig. 110).

(5) If a new housing is installed, the camshaft position sensor must be transferred to the new housing.

(6) Obtain a seal pilot/installation tool from a crankshaft front seal service kit and install the pilot into the crankshaft front oil seal.

(7) Apply a bead of Mopar® Silicone Rubber Adhesive Sealant or equivalent to the gear housing cover. Be sure to surround all through holes.

(8) Using the seal pilot to align the cover (Fig. 111), install the cover to the housing and install the bolts. Tighten the bolts to 24 N·m (18 ft. lbs.) torque.

REMOVAL AND INSTALLATION (Continued)

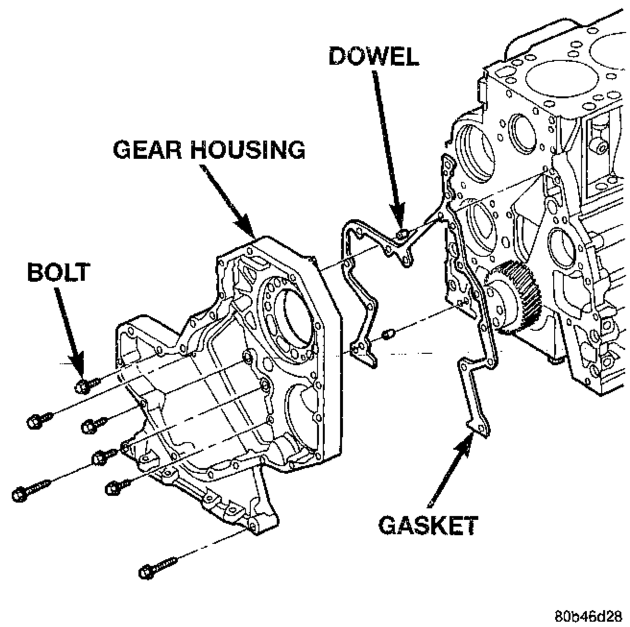

Fig. 109 Gear Housing and Gasket

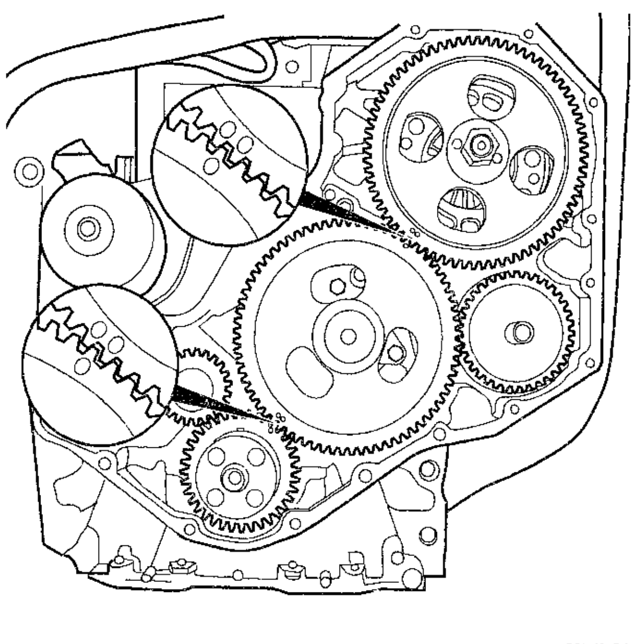

Fig. 110 Camshaft/Crankshaft Gear Alignment

(9) Remove the seal pilot.

(10) Raise the vehicle.

(11) Trim any excess gear housing gasket to make it flush with the oil pan rail.

(12) Using a new gasket, install the oil pan and suction tube. Refer to procedure in this group.

(13) Install the crankshaft damper (Fig. 107) and tighten bolts to 125 N·m (92 ft. lbs.) torque.

(14) Lower vehicle.

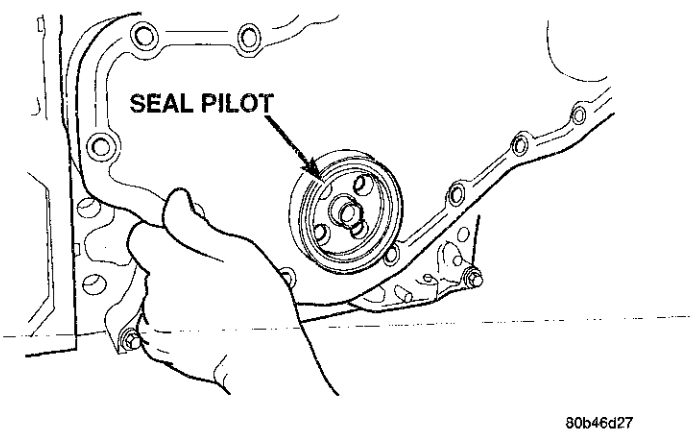

Fig. 111 Installing Cover with Seal Pilot

(15) Install the fan support/hub assy. (Fig. 106)and tighten bolts to 24 N·m (18 ft. lbs.) torque.

(16) Install the accessory drive belt. Refer to Group 7, Cooling System for the correct procedure.

(17) Install the cooling fan and shroud together. Start fan nut and fan shroud-to-radiator bolts by hand.

(18) Torque fan drive nut to 57 N·m (42 ft. lbs.) torque.

(19) Torque fan shroud-to-radiator bolts to 11 N·m (95 in. lbs.) torque.

(20) Install the windshield washer reservoir to the fan shroud and connect the washer pump supply hose and electrical connection.

(21) Install the coolant recovery bottle to the fan shroud and connect the hose to the radiator filler neck.

(22) Install the radiator upper hose and clamps.

(23) Add engine oil.

(24) Add coolant.

(25) Connect the battery cables.

(26) Start engine and inspect for leaks.

CAMSHAFT

NOTE: This procedure requires use of the Cummins Tappet Replacement Tool Kit #3822513.

REMOVAL

(1) Disconnect both battery negative cables.

(2) Recover A/C refrigerant (if A/C equipped). Refer to Group 24, Heating and Air Conditioning for the correct procedure.

(3)

(3) Raise vehicle on hoist.

(4) Drain engine coolant into container suitable for re-use.

(5) Lower vehicle.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

(6) Remove radiator upper hose.
(7) Remove viscous fan/drive assembly.
(8) Disconnect the coolant recovery bottle hose from the radiator filler neck.
(9) Remove cooling fan shroud.
(10) Disconnect lower radiator hose from radiator outlet.
(11) **Automatic Transmission models:** Disconnect transmission oil cooler lines from radiator using special tool #6931 (unless equipped with finger-release disconnect).
(12) Remove radiator mounting screws and lift radiator out of engine compartment.
(13) Remove upper radiator support panel.
(14) Remove front bumper assy. Refer to Group 13, Frame and Bumpers for the correct procedure.
(15) If A/C equipped, disconnect A/C condenser refrigerant lines. Refer to Group 24, Heating and Air Conditioning for the correct procedures.
(16) Disconnect charge air cooler piping from the cooler inlet and outlet.
(17) Remove the two charge air cooler mounting bolts.
(18) Remove charge air cooler (and A/C condenser if equipped) from vehicle.
(19) Remove accessory drive belt. Refer to Group 7, Cooling System for the correct procedure.
(20) Remove the fan support/hub assembly (Fig. 112).
(21) Remove crankshaft damper (Fig. 113).
(22) Remove the pump gear access cover by rotating counter-clockwise (Fig. 114).

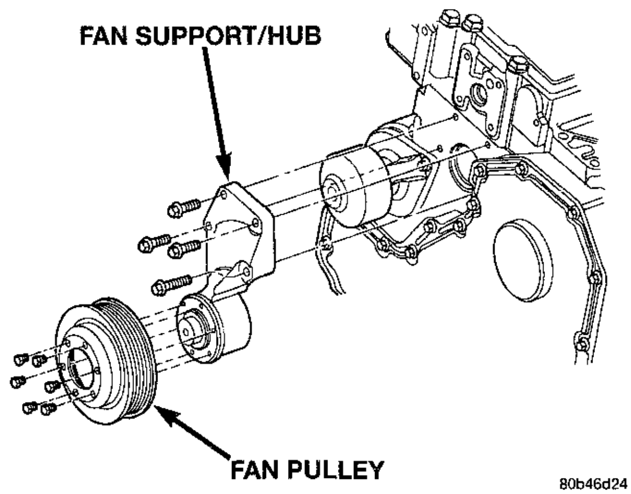

Fig. 112 Fan Support/Hub Removal/Installation

(23) Using an engine barring tool, rotate the crankshaft to bring the engine to TDC #1.

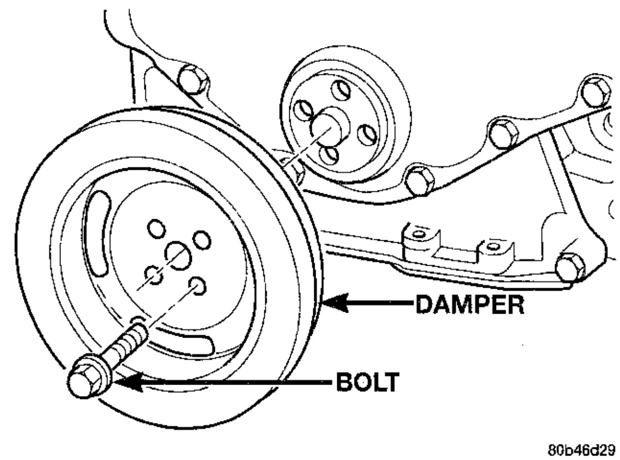

Fig. 113 Crankshaft Damper Removal/Installation

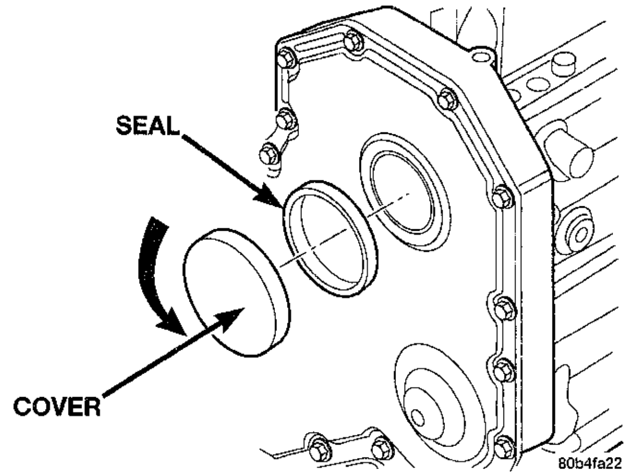

Fig. 114 Removing Injection Pump Gear Access Cover

(24) Remove the gear cover-to-housing bolts and gently pry the cover away from the housing, taking care not to mar the sealing surfaces.
(25) Remove the cylinder head cover (Fig. 115).
(26) Remove the rocker arms (Fig. 116), cross heads, and push rods (Fig. 117). Mark each component so they can be installed in their original positions.

NOTE: The #5 cylinder exhaust and the #6 cylinder intake and exhaust pushrods are removed by lifting them up and through the provided cowl panel access holes. Remove the rubber plugs to expose these relief holes.

(27) Raise the tappets as follows, using the wooden dowel rods (Fig. 118)provided with the Cummins tappet replacement tool kit #3822513:
(a) Insert the slotted end of the dowel rod into the tappet. **The dowel rods for the rear two cylinders will have to be cut for cowl panel**

REMOVAL AND INSTALLATION (Continued)

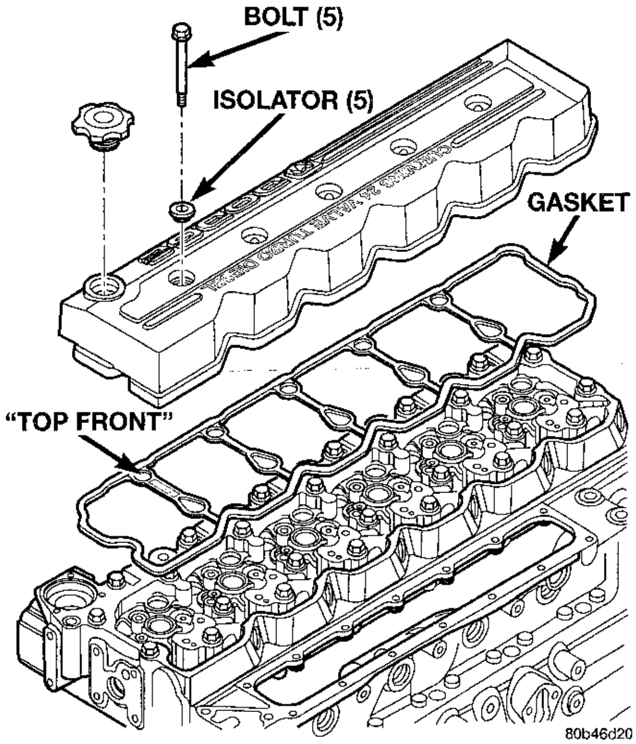

Fig. 115 Cylinder Head Cover Removal/Installation

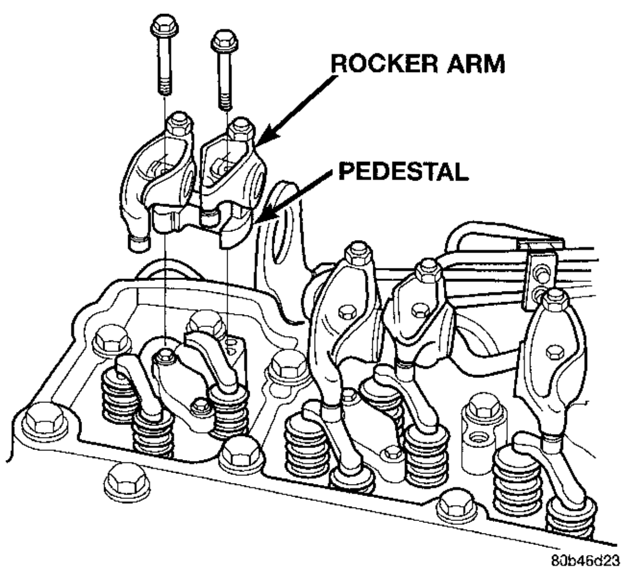

Fig. 116 Rocker Arm and Pedestal Removal/ Installation

clearance. Press firmly to ensure that it is seated in the tappet.

(b) Raise the dowel rod to bring the tappet to the top of its travel, and wrap a rubber band around the dowel rods (Fig. 118) to prevent the tappets from dropping into the crankcase.

(c) Repeat this procedure for the remaining cylinders.

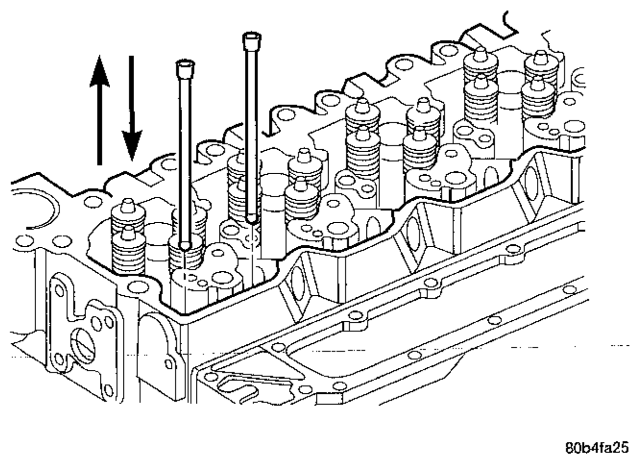

Fig. 117 Push Rod Removal/Installation

(28) Verify that the camshaft timing marks are aligned with the crankshaft and injection pump marks (Fig. 119).

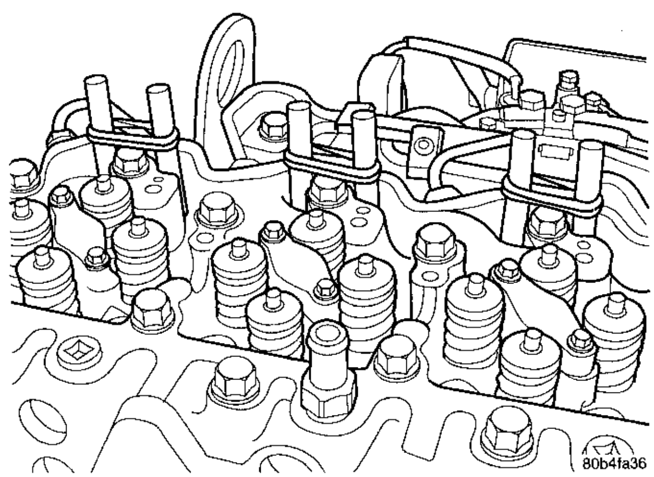

Fig. 118 Use Wooden Dowel Rods to Secure Tappets in Place

(29) Remove the bolts from the thrust plate (Fig. 120).

CAUTION: When removing the camshaft and thrust plate, grab the thrust plate to prevent it from falling into the crankcase.

(30) Remove the camshaft (Fig. 121) and thrust plate.

CLEANING

Clean the camshaft with a suitable solvent. Rinse in hot water and blow dry with compressed air.

REMOVAL AND INSTALLATION (Continued)

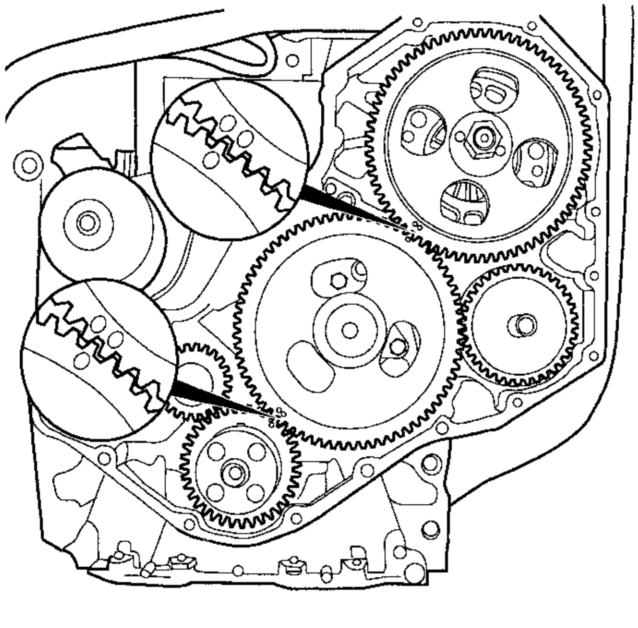

Fig. 119 Timing Mark Alignment

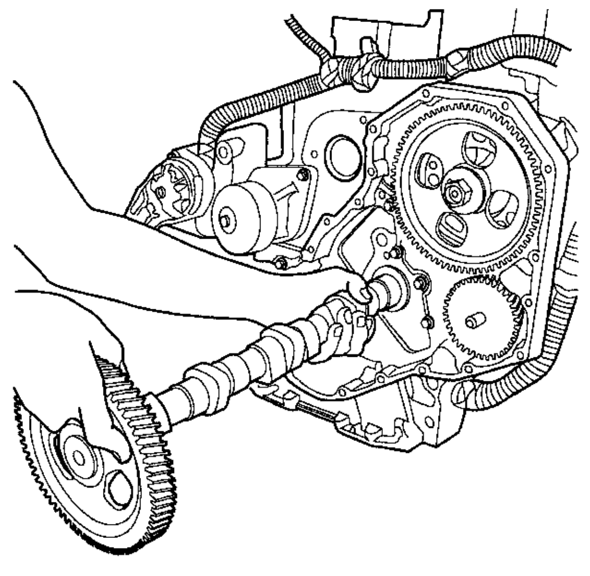

Fig. 121 Camshaft Removal/Installation

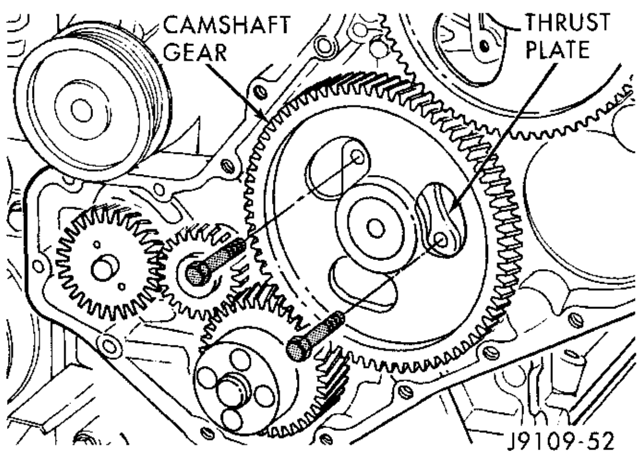

Fig. 120 Thrust Plate Bolt Location

INSPECTION

Camshaft

(1) Inspect the valve lobes and bearing journals for cracks, pitting, scoring, or generally excessive wear. Replace any camshaft that exceeds the allowable limits.

(2) Measure the bearing journals and lobes (Fig. 122).

CAUTION: If Camshaft lobes are worn, requiring camshaft replacement, it is necessary to replace the tappets also. Refer to Tappet Removal and Installation in this group.

Camshaft Bushing/Bores

Camshaft bores No. 2–7 **do not** use a bushing.

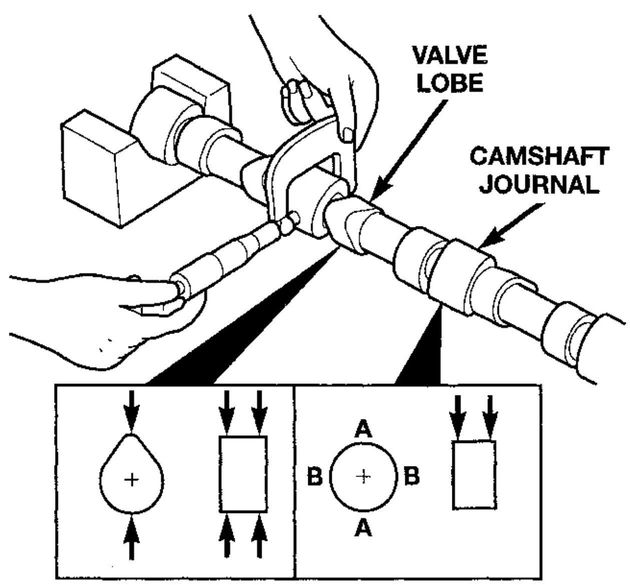

Fig. 122 Measuring Camshaft Main Journals and Lobes

Camshaft Journal Diameter
Journal #1 54.028 mm (2.1270 in.) MIN.
Journal #2-7 53.987 mm (2.1245 in.) MIN.

Camshaft Lobe Height
Intake Lobe 47.173 mm (1.857 in.) MIN.
Exhaust Lobe 45.636 mm (1.796 in.) MIN.

REMOVAL AND INSTALLATION (Continued)

(1) Inspect the camshaft bushing and bores for signs of excessive wear.

(2) Measure the camshaft bushing and bores (Fig. 123)with a telescoping bore gauge and micrometer. If out of specification, refer to Camshaft Bushing Removal and Installation for replacement procedures.

(3) Inspect the camshaft bushing oil hole for alignment with cylinder block (Fig. 124).

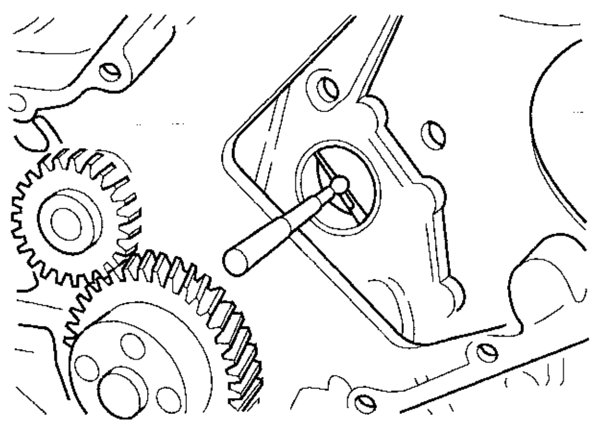

Fig. 123 Measuring Camshaft Bushing and Bores

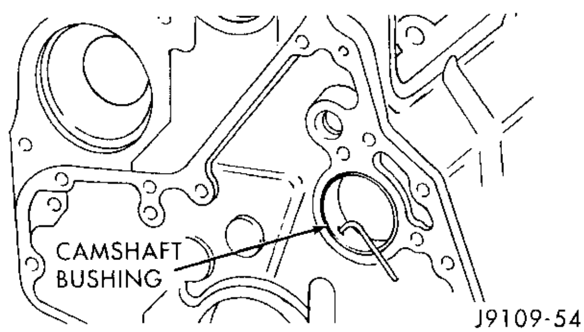

Fig. 124 Inspecting Oil Hole Alignment

Camshaft Gear

Inspect the camshaft gear for cracks (gear and hub) (Fig. 125), and chipped/broken/fretted teeth (Fig. 126). If replacement is necessary, refer to Camshaft Gear Removal and Installation in this group.

Thrust Plate

Inspect the camshaft thrust plate for excessive wear in the camshaft contact area. Measure thrust plate thickness using the following chart. Replace any thrust plate that falls outside of these specifications:

CAMSHAFT THRUST PLATE THICKNESS
9.34 mm (0.368 in.) MIN.
9.58 mm (0.377 in.) MAX.

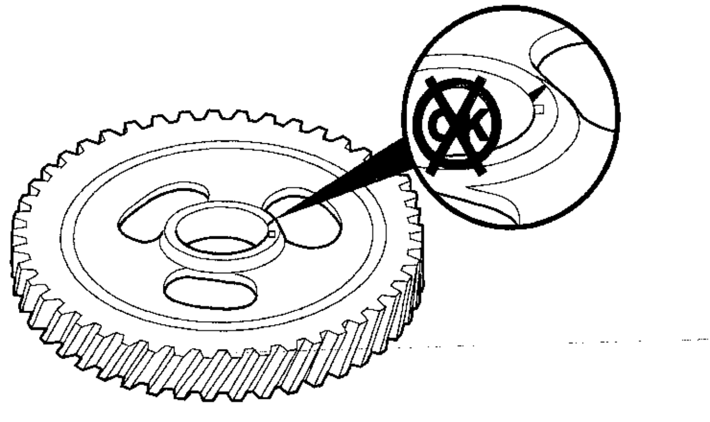

Fig. 125 Inspect Camshaft Gear Hub for Cracks

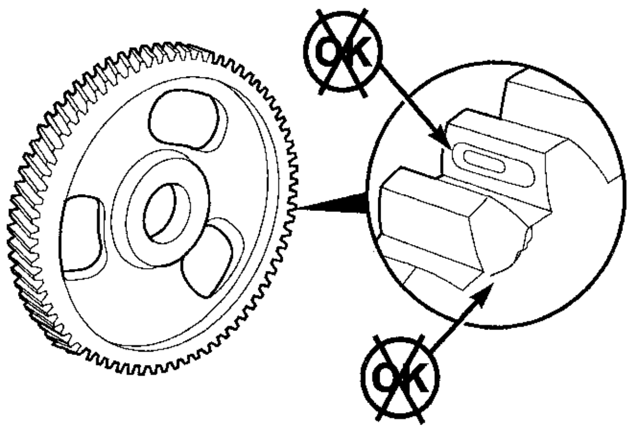

Fig. 126 Inspect Camshaft Gear for Cracks and Fretting

BUSHING REPLACEMENT

(1) Measure the diameter of each bore. (The limit for the bushing in the No.1 bore is the same as for the other bores without bushings). The limit of the inside diameter is 54.133 mm (2.1312 inch). If the camshaft bore for the first cam bushing is worn beyond the limit, install a new service bushing. Inspect the rest of the camshaft bores for damage or excessive wear.

(2) If the bores without a bushing are worn beyond the limit, the engine must be removed for machining and installation of service bushings. If badly worn, replace the cylinder block.

(3) Remove the bushing from the No.1 bore, using a universal cam bushing tool.

(4) Mark the cylinder block so you can align the oil hole in the cylinder block with the oil hole in the bushing.

Apply a coating of Loctite® 609 to the backside of the new bushing. Avoid getting Loctite® in the oil hole.

REMOVAL AND INSTALLATION (Continued)

(5) Use a universal cam bushing installation tool and install the bushing so that it is even with the front face of the cylinder block. The oil hole must be aligned. A 3.2 mm (0.128 inch) diameter rod must be able to pass through the hole (Fig. 127).

(6) Measure the installed bushing. The limit of the inside diameter is 54.133 mm (2.1312 inch).

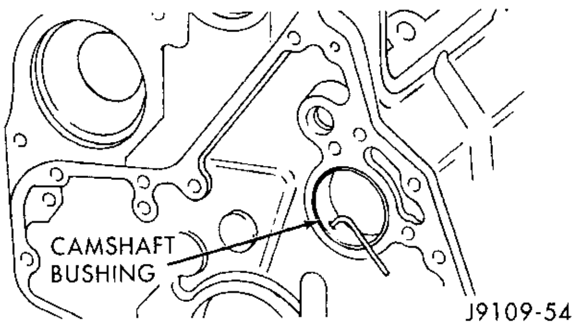

Fig. 127 Oil Hole Alignment

INSTALLATION

(1) Lubricate the camshaft bushing and bores with fresh engine oil or suitable equivalent.

(2) Liberally coat the camshaft lobes, journals, and thrust washer with fresh engine oil or suitable equivalent.

CAUTION: When installing the camshaft (Fig. 121), DO NOT push it in farther than it will go with the thrust washer in place. Pushing it too far can dislodge the plug in the rear of the camshaft bore and cause an oil leak.

(3) Install the camshaft (Fig. 121) and thrust plate. Align the timing marks as shown in (Fig. 119).

(4) Install the thrust plate bolts and tighten to 24 N·m (18 ft. lbs.) torque.

(5) Measure camshaft back lash and end clearance(Fig. 128).

(6) Remove the wooden dowel rods and rubber bands from the tappets.

(7) Lubricate the push rods with engine oil and install in their original location (Fig. 117). **Verify that they are seated in the tappets.**

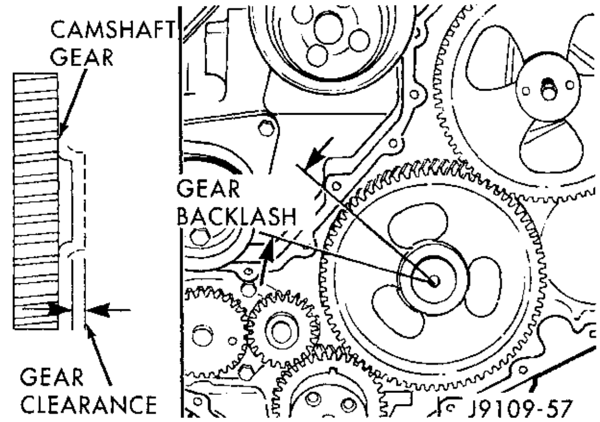
(8) Lubricate the valve tips with engine oil and install the crossheads in their original locations.

(9) Lubricate the crossheads and push rod sockets with engine oil and install the rocker arms and pedestals in their original locations (Fig. 116).

(10) **Verify valve lash adjustment. Refer to Valve Lash Verification and Adjustment in Service Procedures.**

(11) Install the cylinder head cover and reusable gasket (Fig. 115). Torque bolts to 24 N·m (18 ft. lbs.).

(12) Apply a bead of Mopar® Silicone Rubber Adhesive Sealant or equivalent to the gear housing cover. Install and tighten bolts to 24 N·m (18 ft. lbs.) torque.



BACKLASH - 0.080-0.330 mm (0.003-0.013 inch)
CLEARANCE - 0.152-0.254 mm (0.006-0.010 inch)

Fig. 128 Camshaft Backlash and End Clearance

(13) Install the crankshaft damper (Fig. 113) and tighten bolts to 125 N·m (92 ft. lbs.) torque.

(14) Install the fan support/hub assy. (Fig. 112)and tighten bolts to 24 N·m (18 ft. lbs.) torque.

(15) Install the fuel pump gear access cover. Tighten clock-wise by hand.

(16) Install the charge air cooler (with a/c condenser and auxiliary transmission oil cooler, if equipped) and tighten the mounting bolts to 2 N·m (17 in. lbs.) torque.

(17) Connect charge air cooler inlet and outlet pipes. Tighten clamps to 8 N·m (72 in. lbs.) torque.

(18) Install the radiator upper support panel.

(19) Close radiator petcock and lower the radiator into the engine compartment. Tighten the mounting bolts to 11 N·m (95 in. lbs.) torque.

(20) Raise vehicle on hoist.

(21) Connect radiator lower hose and install clamp.

(22) Connect transmission auxiliary oil cooler lines (if equipped).

(23) Lower vehicle.

(24) Install the fan shroud and tighten the mounting screws to 6 N·m (50 in. lbs.) torque.

(25) Install the viscous fan/drive assy. and tighten to 57 N·m (42 ft. lbs.) torque.

(26) Install the coolant recovery and windshield washer fluid reservoirs to the fan shroud.

(27) Connect the coolant recovery hose to the radiator filler neck.

(28) Install the accessory drive belt. Refer to Group 7, Cooling for the correct procedure.

(29) Install the front bumper assy. Refer to Group 13, Frame and Bumper for the correct procedure.

REMOVAL AND INSTALLATION (Continued)

(30) Add engine coolant.

(31) Connect the battery negative cables.

(32) Start engine and check for engine oil and coolant leaks.

(33) Charge A/C system with refrigerant (if A/C equipped). Refer to Group 24, Heating and Air Conditioning for the correct procedure.

CAMSHAFT GEAR (CAMSHAFT REMOVED)

CAUTION: DO NOT use an oxygen/acetylene torch to heat the gear upon removal from the camshaft. This will weaken the gear-to-hub joint and result in gear failure.

REMOVAL

(1) Remove camshaft. Refer to Camshaft Removal and Installation in this group.

(2) Support gear hub and press the camshaft out of the gear.

(3) Remove all burrs and smooth any rough surfaces caused by removing the gear.

INSPECTION

Visually inspect the camshaft gear for cracks (hub and gear), chipped or broken teeth, or excessive fretting (Fig. 129)(Fig. 130). Inspect and replace the keyway, if damaged.

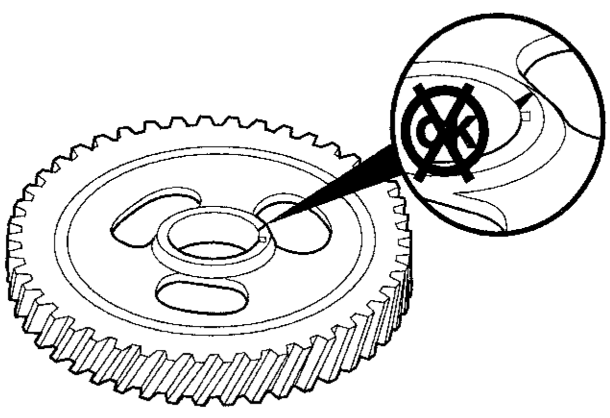


Fig. 129 Inspecting Camshaft Gear Hub for Cracks

INSTALLATION

(1) If replacing the camshaft, make sure the keyway is transferred to the new camshaft.

(2) Lubricate the camshaft surface with Lubriplate 105, or equivalent.

CAUTION: The camshaft gear will be permanently distorted if overheated. The oven temperature should never exceed 177°C (350°F).

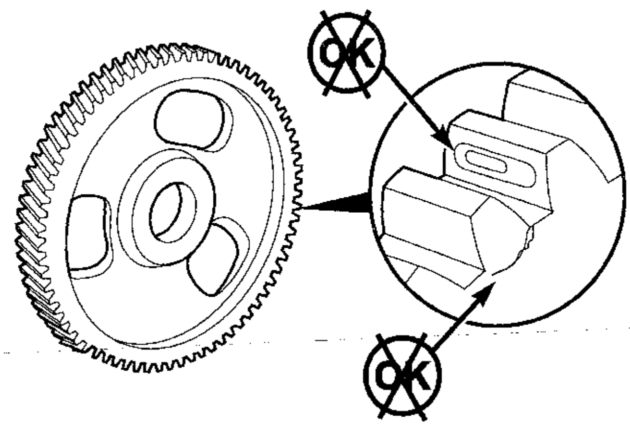

Fig. 130 Inspecting Camshaft Gear for Cracks and Fretting

(3) Heat the gear in an oven at 177°C (350°F) for 45 minutes.

WARNING: WEAR PROTECTIVE GLOVES (Fig. 131) TO HANDLE THE HOT GEAR.

(4) Install the gear with the timing marks visible (Fig. 131). Be sure the gear is seated against the camshaft shoulder (Fig. 132).

(5) If the camshaft is not to be used immediately, lubricate the lobes and journals to prevent rust.

(6) Install the camshaft, referring to the Camshaft Removal and Installation procedure in this group.

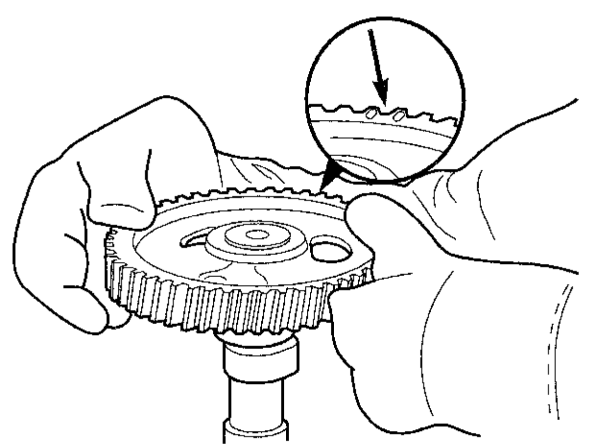

Fig. 131 Installing Camshaft Gear

TAPPETS

NOTE: This procedure requires use of the Cummins Tappet Replacement Tool Kit #3822513.

(1) Raise tappets and remove camshaft. Refer to Camshaft Removal and Installation procedure in this group.

REMOVAL AND INSTALLATION (Continued)

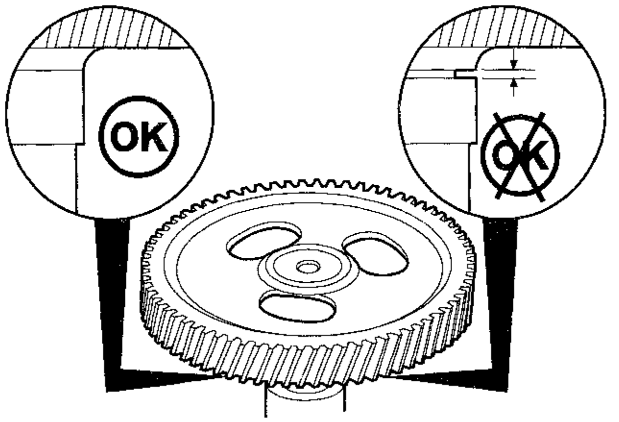

Fig. 132 Verify Correct Gear Installation

(2) Insert the trough (provided with tool kit) the full length of the camshaft bore (Fig. 133). Make sure the cap end goes in first and the open side faces up (towards lifters).

(3) **Remove only one tappet at a time.** Remove rubber band from one cylinder pair and attach tappet dowel not being removed to the next cylinder pair (Fig. 134).

(4) Raise dowel rod (disengage from tappet) and allow tappet to fall into trough (Fig. 135).

(5) Carefully remove trough **(do not rotate)** and tappet. If the tappet is not being replaced, mark it so it can be installed in its original location.

(6) Re-install trough and repeat procedure on remaining tappets.

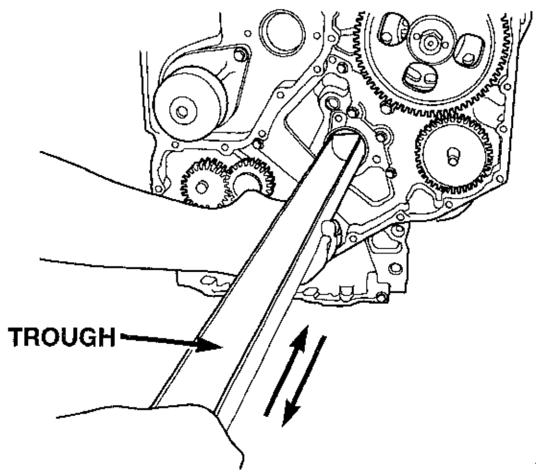

Fig. 133 Inserting the Trough

CLEANING

Clean tappet with a suitable solvent. Rinse in hot water and blow dry with a clean shop rag or compressed air.

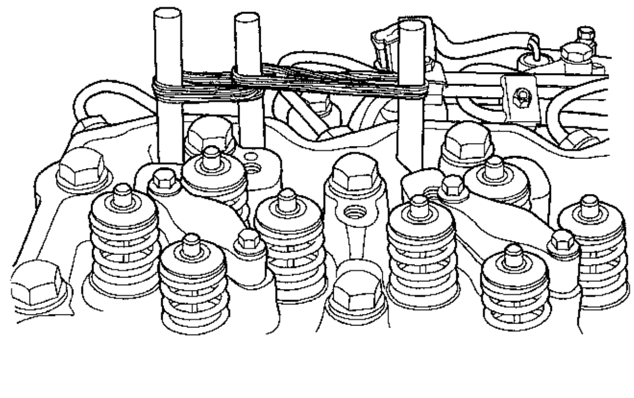

Fig. 134 Secure Dowel/Tappet to Adjacent Cylinder

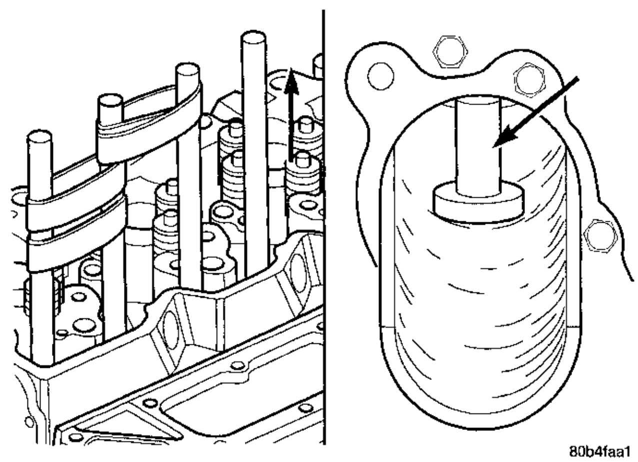

Fig. 135 Lift Dowel Rod to Disengage from Tappet

INSPECTION

(1) Visually inspect the tappet the tappet socket, stem, and face for excessive wear, cracks, or obvious damage (Fig. 136).

(2) Measure the tappet stem diameter. Replace the tappet if it falls below the minimum size (Fig. 136).

INSTALLATION

(1) Insert the trough the full length of the camshaft bore (Fig. 133). Again, make sure the cap end goes in first and the open side faces up (towards lifters).

(2) Lower the tappet installation tool through the push rod hole (Fig. 137) and into the trough.

(3) Retrieve the tappet installation tool using the hooked rod provided with the tool kit (Fig. 138).

(4) Lubricate the tappet with clean engine oil or suitable equivalent and install the tappet to the installation tool (Fig. 139).

(5) Pull the tappet up and into position (Fig. 139). If difficulty is experienced getting the tappet to make

REMOVAL AND INSTALLATION (Continued)

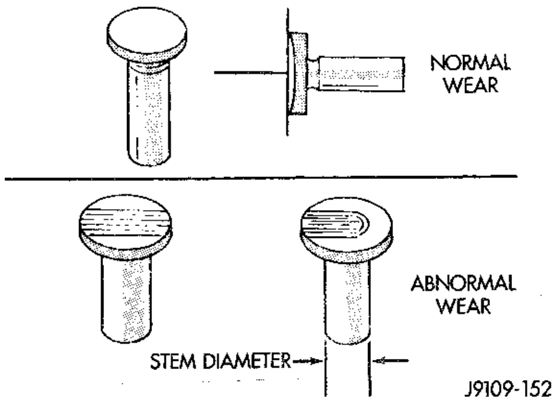

Fig. 136 Tappet Inspection

TAPPET STEM DIAMETER
15.925 mm (0.627 in.) MIN.
15.977 mm (0.629 in.) MAX.

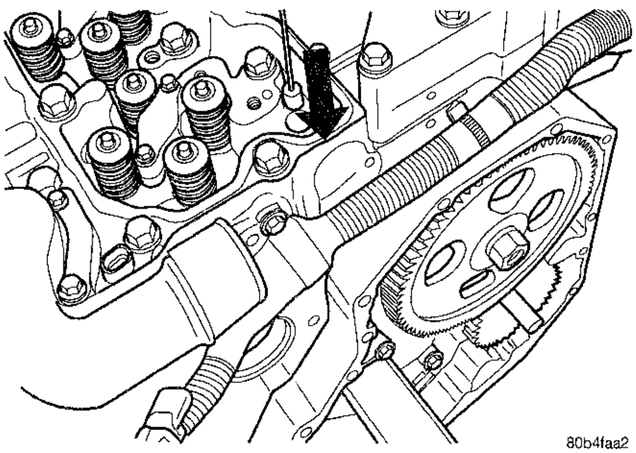

Fig. 137 Insert Installation Tool through Push Rod Hole

the turn into the tappet bore, wiggle the trough while **gently** pulling up on the tappet.

(6) With the tappet in place, rotate the trough one half turn so the open side is down (toward crankshaft) (Fig. 140).

(7) Remove the tappet installation tool from the tappet.

(8) Re-install a dowel rod and secure the rod with a rubber band.

(9) Rotate the trough one half turn and repeat the procedure for the remaining tappets.

(10) Install the camshaft and previously removed components. Refer to Camshaft Removal and Installation in this group.

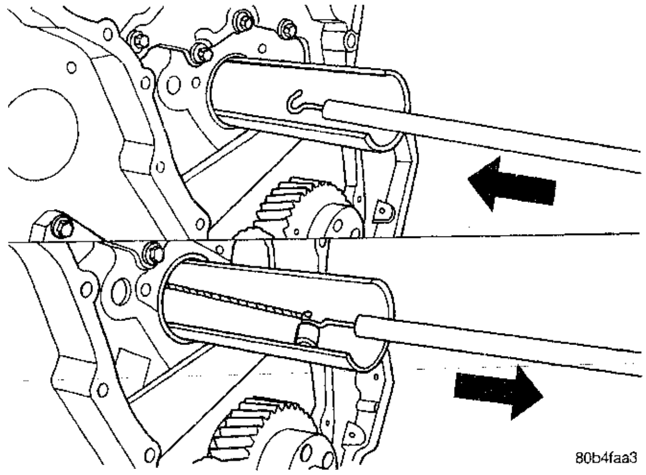

Fig. 138 Retrieve Tappet Installation Tool through Cam Bore

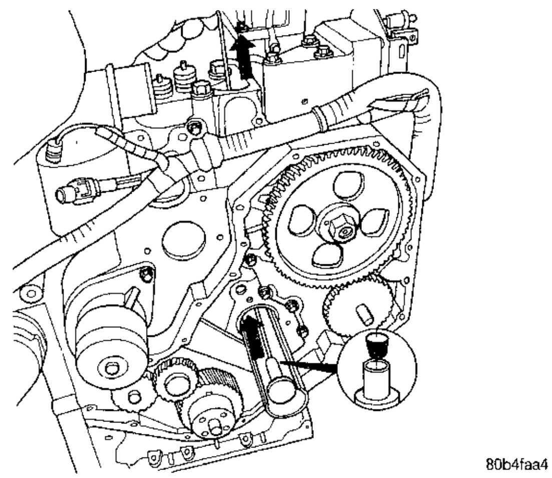

Fig. 139 Insert Tool and Pull Tappet Into Place

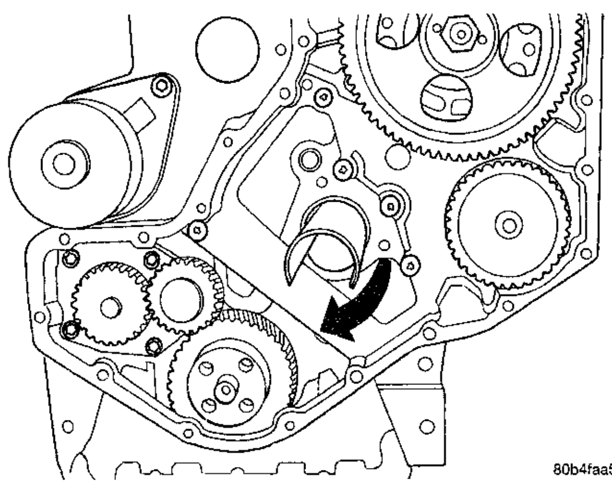

Fig. 140 Rotate Trough One Half Turn (180°)

REMOVAL AND INSTALLATION (Continued)

OIL PAN AND SUCTION TUBE

REMOVAL

(1) Disconnect the battery negative cables.

(2) Raise vehicle on hoist.

(3) Remove transmission and transfer case (if equipped) from vehicle, refer to Group 21 Transmission and Transfer Case.

(4) Remove flywheel.

(5) Disconnect starter cables from starter motor.

(6) Remove starter motor and transmission adapter plate assembly.

WARNING: HOT OIL CAN CAUSE PERSONAL INJURY.

(7) Drain the used engine oil. Dispose of the used oil properly.

(8) Install the oil pan drain plug with a new sealing washer and tighten to 60 N·m (44 ft. lbs.) torque.

(9) Remove oil pan bolts, break the pan to block seal, and lower pan slightly and remove oil suction tube fasteners.

(10) Remove oil pan and suction tube (Fig. 141).

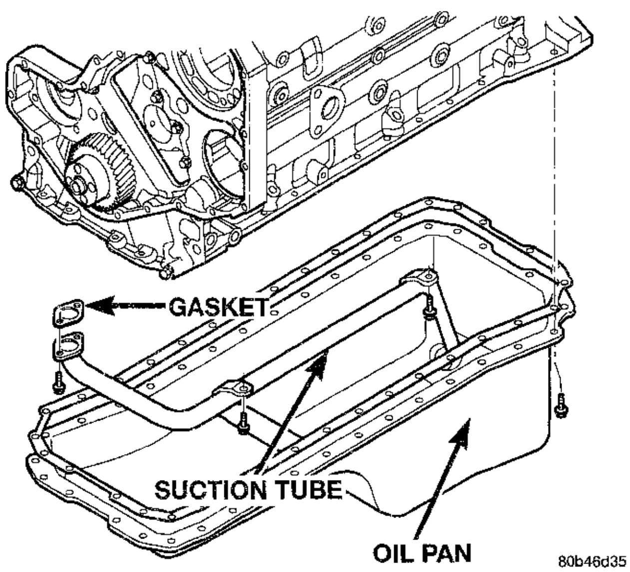

Fig. 141 Oil Pan, Suction Tube and Gasket

CLEANING

Remove all gasket material from the oil pan and cylinder block sealing surfaces. Extra effort may be required around T-joint areas. Clean oil pan and flush suction tube with a suitable solvent.

INSPECTION

Inspect the oil pan, suction tube, and tube braces for cracks and damage. Replace any defective component. Inspect the oil drain plug and drain hole threads. Inspect the oil pan sealing surface for straightness. Repair any minor imperfections with a ball-peen hammer. Do not attempt to repair an oil pan by welding.

INSTALLATION

(1) Fill the T-joint between the pan rail/gear housing and pan rail/rear seal retainer with sealant. Use Mopar® Silicone Rubber Adhesive Sealant or equivalent.

(2) Place suction tube in oil pan and guide them into place (Fig. 141). Using a new tube to oil pump gasket, install and tighten the suction tube bolts by hand. Starting with the oil pump inlet bolts, tighten the bolts to 24 N·m (18 ft. lbs.) torque. Tighten the remaining tube brace bolts to 24 N·m (18 ft. lbs.) torque.

(3) Starting in the center and working outward, tighten the oil pan bolts to 24 N·m (18 ft. lbs.) torque.

(4) Install the flywheel housing assembly with the starter motor attached and tighten bolts to 60 N·m (44 ft. lbs.) torque.

(5) Connect starter motor cables.

(6) Install transmission and transfer case (if equipped). Refer to Group 21, Transmission and Transfer Case.

(7) Lower vehicle.

(8) Install battery negative cables.

(9) Fill the crankcase with new engine oil.

(10) Start engine and check for leaks. Stop engine, check oil level, and adjust if necessary.

PISTON AND CONNECTING ROD ASSEMBLY

REMOVAL

(1) Disconnect the battery cables.

(2) Remove the cylinder head. Refer to procedure in this group.

(3) Remove the oil pan and suction tube. Refer to procedure in this group.

(4) Using the crankshaft barring tool #7471B, rotate the crankshaft so all of the pistons are below TDC.

(5) Before removing the piston(s) from the bore(s):

(a) Remove any carbon ridge formations or deposits at the top of the bore with a dull scraper or soft wire brush.

(b) If cylinder bore wear ridges are found, use a ridge reamer to cut the ridge from the bore. DO NOT remove more metal than necessary to remove the ridge.

NOTE: If cylinders have ridges, the cylinders are oversize and will more than likely need boring.

(6) Using a hammer and steel stamp, identify the front of the piston by stamping the cylinder number in each piston to be removed at the top of the piston toward the front of the engine. DO NOT stamp in the outside 5 mm (.197 in.) of the piston diameter.

REMOVAL AND INSTALLATION (Continued)

(7) Mark the connecting rod and cap with the corresponding cylinder numbers.

(8) Remove the connecting rod bolts and rod caps. Use care so the cylinder bores and connecting rods are not damaged.

(9) Use a hammer handle or similar object to push the piston and connecting rod through the cylinder bore.

(10) Store the piston/rod assemblies in a rack.

(11) If a piston must be replaced, replace with the same part number (grading) that was removed.

PISTON GRADING PROCEDURE

- If a new cylinder block and/or crankshaft is used, the piston grading procedure **MUST** be performed to determine the proper piston grade for each cylinder.
- When rebuilding an engine with the original cylinder block, crankshaft and pistons, make sure the pistons are installed in their original cylinder.
- If replacing the piston(s), make sure the replacement piston(s) are the same grade as the one being replaced.

(1) Install any of the original connecting rod and piston assemblies into the No.1 cylinder. DO NOT install the piston rings.

(2) Install the upper bearing shell in the connecting rod with the tang of the bearing in the slot of the connecting rod. The connecting rod bearing shell must be installed in the original connecting rod and cap. Use clean lubricating oil to coat the inside diameter of the connecting rod bearing shell.

(3) Install the bearing shell in the connecting rod cap with the tang of the bearing in the slot to the cap. Use clean lubricating oil to coat the inside diameter of the bearing shell.

(4) The number stamped on the connecting rod and cap at the parting line must match and be installed on the oil cooler side of the engine. Install the connecting rod cap and capscrews. Tighten the capscrews to 35 N·m (26 ft. lbs.) torque.

(5) Use a fine grit stone to remove any burrs from the cylinder block head deck. Zero the dial indicator to the cylinder block head deck.

(6) Move the dial indicator directly over the piston pin to eliminate any side-to-side movement.

(7) Rotate the crankshaft to top dead center (TDC). Rotate the crankshaft clockwise and counterclockwise to find the highest dial indicator reading. Record the reading.

(8) Remove the piston and connecting rod assembly from the No.1 cylinder and install the assembly into the No.2 cylinder. Repeat the procedure for every cylinder using the same piston and connecting rod assembly.

(9) Determine the grade of the piston being used by referring to the Piston Protrusion Chart below. Four digits on top of the piston can be cross referenced by a letter to a Chrysler part number for replacement (Fig. 142). If the number on the piston cannot be seen, use the alternate method for determining grade by measuring from the top of the piston to the top of the piston pin bore to see what grade piston is used. Refer to the illustration and chart (Fig. 143).

Ideal piston protrusion is 0.610 to 0.711 mm (0.024 to 0.028 in.)

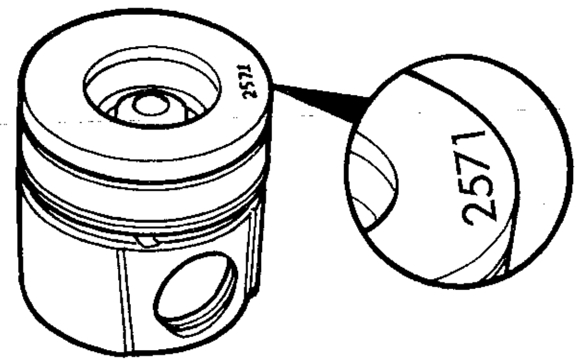

Fig. 142 Piston Grading Number Location

PISTON PROTRUSION CHART

IF MEASURING PISTON IS GRADING #:	AND PROTRUSION IS:	USE GRADE:
3708	0.609-0.711 mm (0.024-0.028 in.)	A
3708	0.508-0.609mm (0.020-0.024 in.)	B
3708	0.406-0.508 mm (0.016-0.020 in.)	C
3709	0.711-0.813 mm (0.028-0.032 in.)	A
3709	0.609-0.711 mm (0.024-0.028 in.)	B
3709	0.508-0.609 mm (0.020-0.024 in.)	C
3710	0.813-0.914 mm (0.032-0.036 in.)	A
3710	0.711-0.813 mm (0.028-0.032 in.)	B
3710	0.609-0.711 mm (0.024-0.028 in.)	C

REMOVAL AND INSTALLATION (Continued)

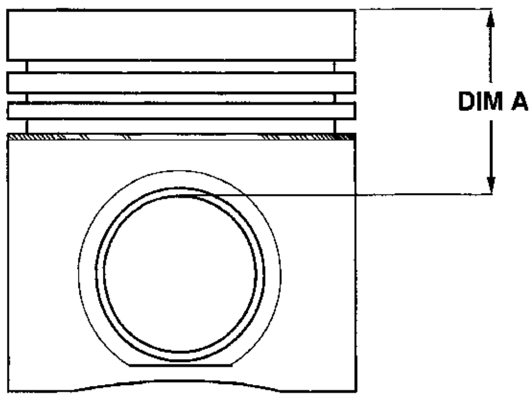

Fig. 143 Piston Grading Measurement

NOTE: Use the table below when piston grading numbers are missing or not legible.

ALTERNATIVE GRADE IDENTIFICATION METHOD

DIMENSION "A"	REF. NUMBER	GRADE
51.554-51.607 mm (2.029-2.031 in.)	3708	A
51.654-51.707 mm (2.033-2.035 in.)	3709	B
51.754-51.807 mm (2.037-2.039 in.)	3710	C

DISASSEMBLY

(1) Remove the retaining rings from the piston (Fig. 144).

(2) Slide the piston pin out of the bore. Heating the connecting rod is not required.

(3) Remove the piston rings (Fig. 151).

CLEANING

Pistons

Clean the pistons and pins in a suitable solvent, rinse in hot water and blow dry with compressed air. Soaking the pistons over night will loosen most of the carbon build up. De-carbon the ring grooves with a broken piston ring and again clean the pistons in solvent. Rinse in hot water and blow dry with compressed air.

Connecting Rods

Clean the connecting rods in a suitable solvent, rinse in hot water and blow dry with compressed air.

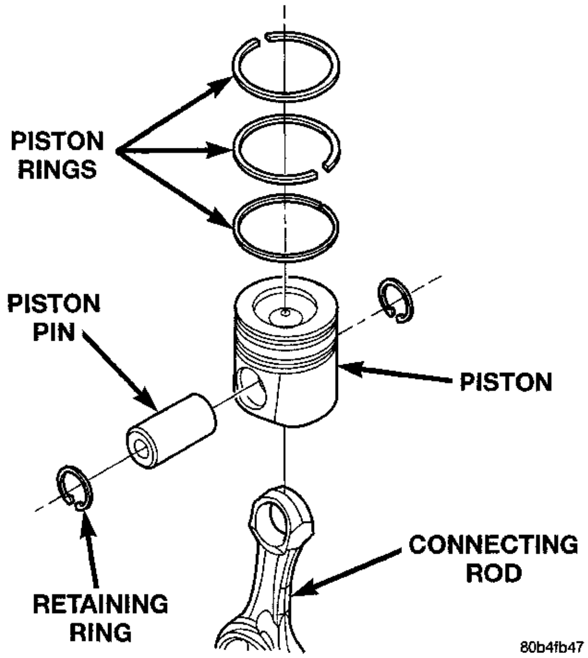

Fig. 144 Piston and Connecting Rod Assembly

INSPECTION

Pistons

Inspect the pistons for damage and excessive wear. Check top of the piston, ring grooves, skirt and pin bore. Measure the piston skirt diameter (Fig. 145). If the piston is out of limits, replace the piston.

Uses new piston rings to measure the ring side clearance (Fig. 146). Refer to the illustration and chart for specifications.

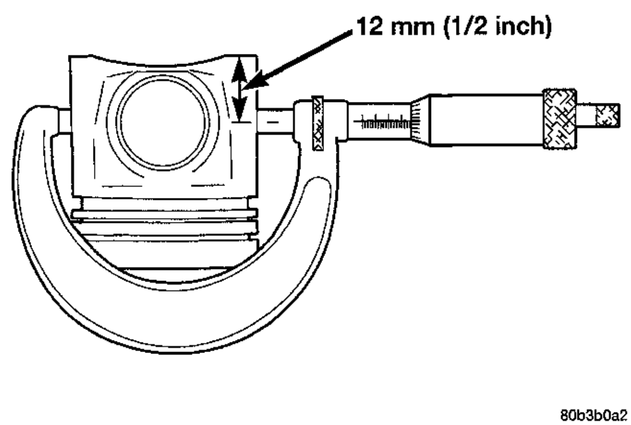

Fig. 145 Piston Skirt Diameter

PISTON SKIRT DIAMETER (MIN.)
101.864 mm (4.0104 in.)

REMOVAL AND INSTALLATION (Continued)

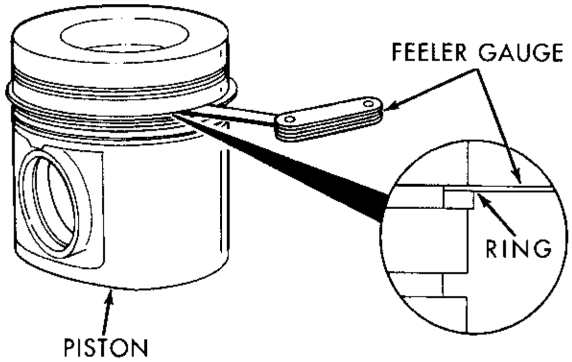

Fig. 146 Intermediate and Oil Ring Clearances

RING SIDE CLEARANCE	
TOP KEYSTONE	0.075 mm (0.003 in.) MIN 0.150 mm (0.006 in.) MAX
INTERMEDIATE	0.045 mm (0.0018 in.) MIN 0.095 mm (0.0037 in.) MAX
OIL CONTROL	0.040 mm (0.0016 in.) MIN 0.085 mm (0.0033 in.) MAX

Measure the pin bore (Fig. 147). The maximum diameter is 40.025 mm (1.5758 inch). If the bore is over limits, replace the piston.

Inspect the piston pin for nicks, gouges and excessive wear. Measure the pin diameter (Fig. 148). The minimum diameter is 39.990 mm (1.5744 inch). If the diameter is out of limits, replace the pin.

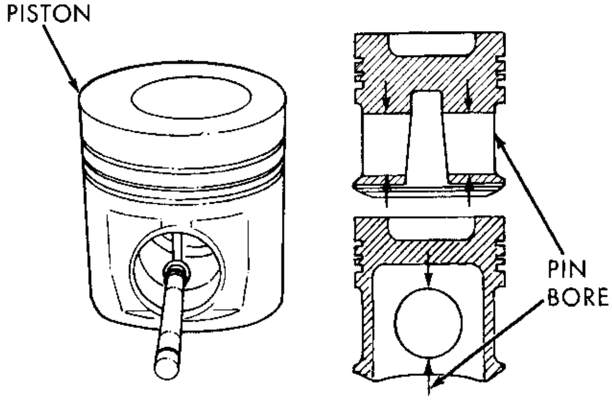

Fig. 147 Piston Pin Bore

Connecting Rods

Inspect the connecting rod for damage and wear. The I-Beam section of the connecting rod cannot have dents or other damage. Damage to this part can cause stress risers which will progress to breakage.

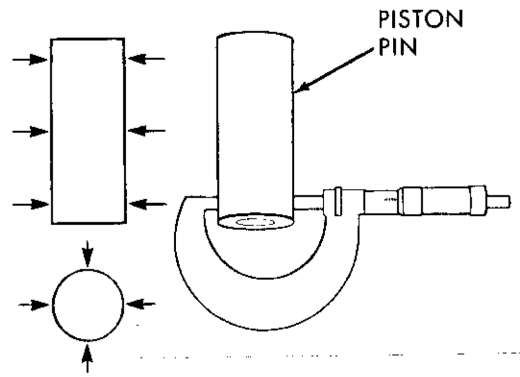

Fig. 148 Piston Pin Diameter

Measure the connecting rod pin bore (Fig. 149). The maximum diameter is 40.042 mm (1.5764 inch). If out of limits, replace the connecting rod.

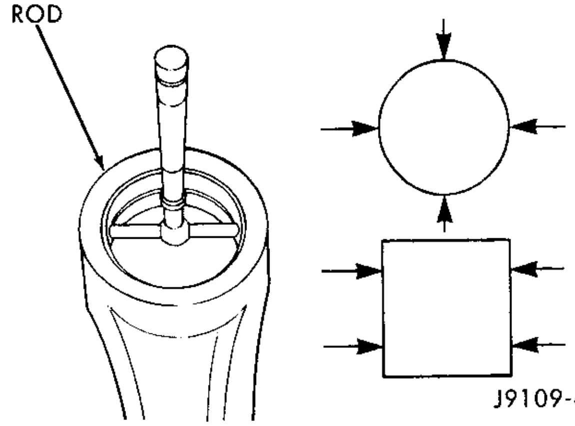

Fig. 149 Connecting Rod Pin Bore

ASSEMBLY

NOTE: The piston is symmetrical and can be installed to the connecting rod in either direction. It is good practice to re-install the piston in the same orientation as it was removed.

(1) Position the rod into the piston, orienting the mark you made on removal and the numbers on the rod and cap the same way(Fig. 150). Install the retaining ring into the pin groove on the one side of the piston.

(2) Lubricate the pin and bore with engine oil.

(3) Install the piston pin in the opposite side of the installed retaining pin. Pistons and rods do not

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

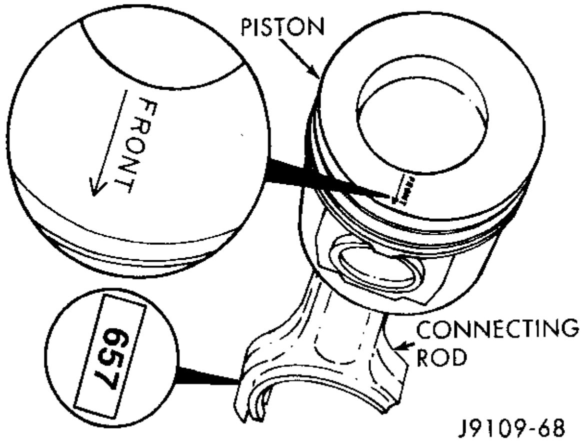

Fig. 150 Proper Markings on the Piston and Connecting Rod

require heating to install the pin, however, the piston does need to be at room temperature or above.

(4) Determine the piston diameter and obtain the appropriate ring set. The piston rings can be identified as shown in (Fig. 151).

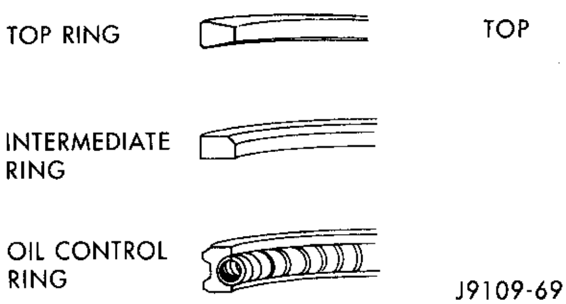

Fig. 151 Piston Ring Identification

(5) Position each ring in the cylinder and use a piston to square it with the bore at a depth of 89.0 mm (3.5 inch) - (Fig. 152).

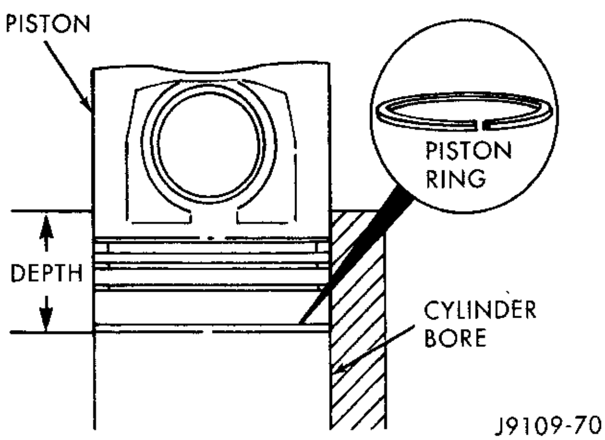

Fig. 152 Position of Ring in Cylinder Bore

(6) Use a feeler gauge to measure the piston ring gap (Fig. 153).

	MINIMUM	MAXIMUM
TOP	0.400 mm (0.0160 inch)	0.700 mm (0.0275 inch)
INTERMEDIATE	0.250 mm (0.0100 inch)	0.550 mm (0.0215 inch)
OIL CONTROL	0.250 mm (0.0100 inch)	0.550 mm (0.0215 inch)

J9109-71

Fig. 153 Piston Ring Gap

(7) The top surface of all of the rings are identified with the word TOP or the supplier's MARK. Assemble the rings with the word TOP or the supplier's MARK up.

(8) Position the oil ring expander in the oil control ring groove (bottom groove).

(9) Install the oil control ring with the end gap OPPOSITE the ends on the expander (Fig. 154).

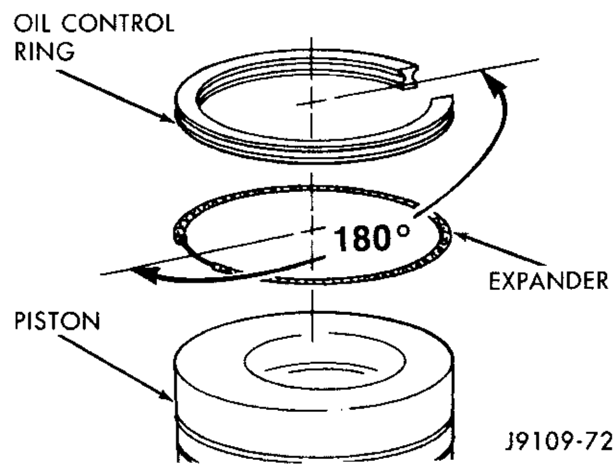

Fig. 154 Oil Control Ring/Expander Location in Groove

(10) Install the intermediate piston ring in the second groove (Fig. 152).

(11) Install the top piston ring in the top groove (Fig. 155).

(12) Position the rings as shown in (Fig. 156).

(13) Install the original bearings as removed or install new bearings. If new bearings are used, be

REMOVAL AND INSTALLATION (Continued)

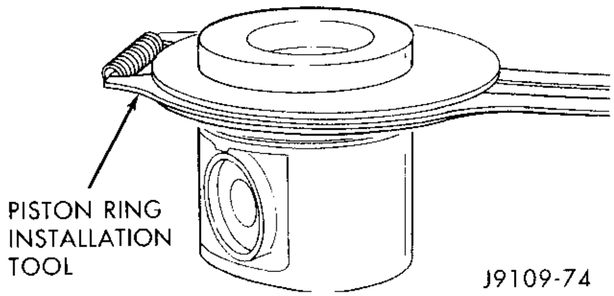

Fig. 155 Piston Ring Installation Tool

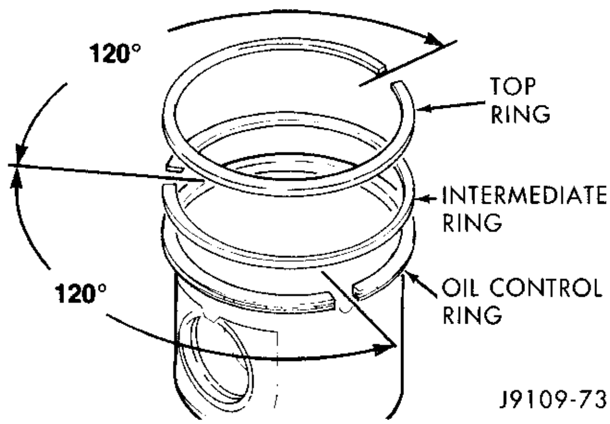

Fig. 156 Piston Ring Orientation

sure to obtain the proper bearing clearance (Fig. 157).

(14) DO NOT lubricate the side of the bearing that is against the connecting rod or cap. Apply a coat of Lubriplate 105, or equivalent to the new upper and lower connecting rod bearings.

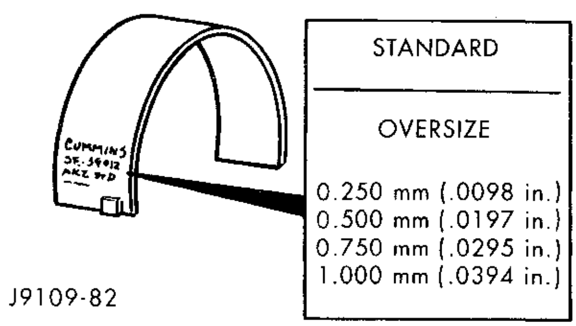

Fig. 157 Connecting Rod Bearing Size Location

INSTALLATION

(1) Lubricate the cylinder bores with clean engine oil.

(2) Generously lubricate the rings and piston skirts with clean engine oil.

(3) Compress the rings using a piston ring compressor tool (Fig. 158). If using a strap-type ring compressor, make sure the inside end of the strap does not hook on a ring gap and break the ring.

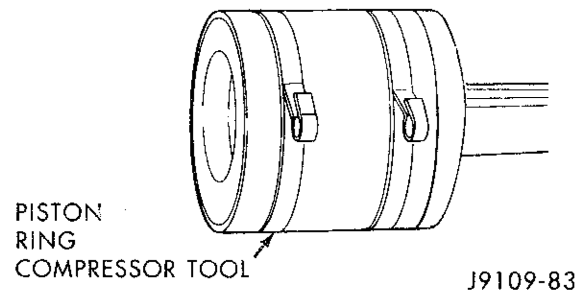

Fig. 158 Piston Ring Compressor Tool

(4) Bar the crankshaft so the rod journal for the piston to be installed is at BDC (Bottom Dead Center) - (Fig. 159).

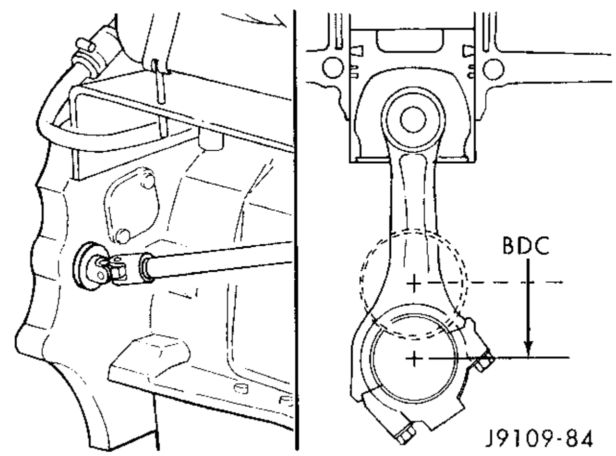

Fig. 159 Piston/Rod Assembly at BDC

(5) Be sure the mark you made on the piston and the numbers on the rod and cap are oriented as illustrated.

(6) Position the piston and rod assembly into the cylinder bore with the mark you made on the piston towards the front of the cylinder block. In this position the numbers on the connecting rod should be facing the oil cooler side of the engine, and the rod bolt holes toward the camshaft. Use care when you install the piston and connecting rod so the cylinder bore is not damaged.

(7) Push the piston into the bore until the top of the piston is approximately 50 mm (2 inch) below the top of the block. Carefully pull the connecting rod onto the crankshaft journal.

(8) Use clean engine oil to lubricate the threads and under the heads of the connecting rod bolts.

(9) The number stamped on the rod cap at the parting line must match and be installed towards the oil cooler side of the engine (Fig. 160).

(10) Install the rod cap and bolts to the connecting rod. Tighten the connecting rod and bolt evenly in 3 steps.

- Tighten the bolts to 35 N·m (26 ft. lbs.) torque.

REMOVAL AND INSTALLATION (Continued)

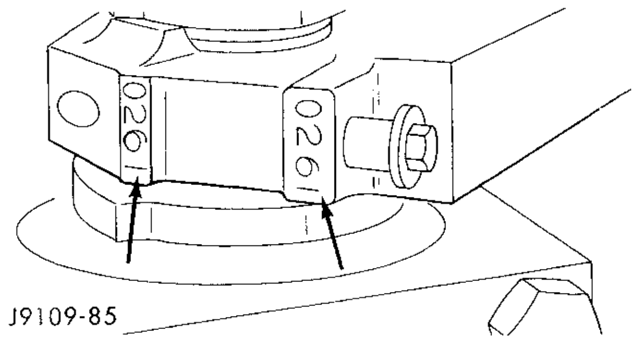

Fig. 160 Correct Rod Cap Installation

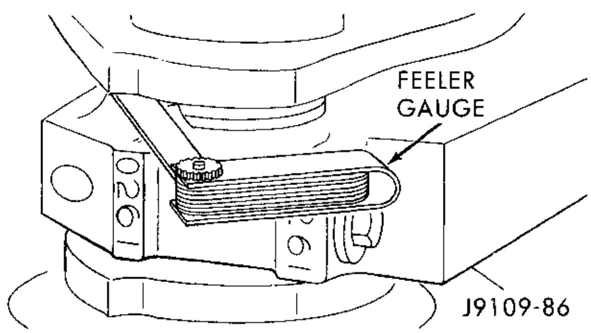
- Tighten the bolts to 70 N·m (51 ft. lbs.) torque.
- Tighten the bolts to 100 N·m (73 ft. lbs.) torque.

(11) The crankshaft must rotate freely. Check for freedom of rotation as the caps are installed. If the crankshaft does not rotate freely, check the installation of the rod bearing and the bearing size.

(12) Measure the side clearance between the connecting rod and the crankshaft (Fig. 161). DO NOT measure the clearance between the cap and crankshaft.



SIDE CLEARANCE LIMITS		
MIN.	0.100 mm	(0.004 inch)
MAX.	0.300 mm	(0.012 inch)

Fig. 161 Side Clearance between Connecting Rod/Crankshaft

(13) Install the suction tube and oil pan. Refer to Procedure in this Group.

(14) Install the cylinder head onto the engine. Refer to Procedure in this group.

(15) Install a new filter and fill the crankcase with new engine oil.

(16) Connect the battery negative cables and start engine.

CRANKSHAFT OIL SEAL—REAR

REMOVAL

(1) Disconnect the battery negative cables.

(2) Remove the transmission and transfer case (if equipped). Refer to Group 21, Transmission and transfer case for the correct procedures.

(3) Remove the clutch cover and disc (if manual trans equipped).

(4) Remove the flywheel or converter drive plate.

(5) Drill holes 180° apart into the seal. Be careful not to get the drill against the crankshaft.

(6) Install #10 sheet metal screws in the drilled holes and remove the rear seal with a slide hammer (Fig. 162).

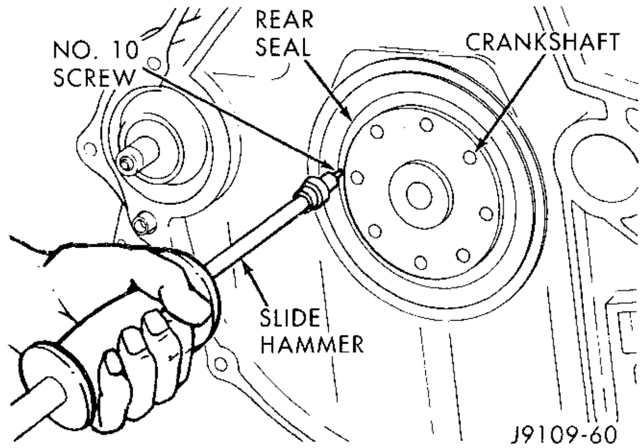


Fig. 162 Crankshaft Rear Seal Removal

CLEANING

Clean the cranshaft journal with a suitable solvent and dry with a clean shop towel or compressed air. Wipe the inside bore of the crankshaft seal retainer with a clean shop towel.

INSPECTION

Inspect the crankshaft journal for gouges, nicks, or other imperfections. If the seal groove in the crankshaft is excessively deep, install the new seal 1/8" deeper into the retainer bore, or obtain a crankshaft wear sleeve that is available in the aftermarket.

INSTALLATION

CAUTION: The seal lip and the sealing surface on the crankshaft must be free from all oil residue to prevent seal leaks. The crankshaft and seal must be completely dry when the seal is installed.

(1) Install the seal pilot, provided in the replacement kit, onto the crankshaft.

(2) Using the provided alignment/installation tool, start the seal over the pilot and into the retainer by hand.

(3) Using a ball peen hammer, strike the tool at the 12, 3, 6, and 9 o'clock positions until the alignment tool bottoms out on the retainer (Fig. 163).

(4) Remove the seal pilot.

REMOVAL AND INSTALLATION (Continued)

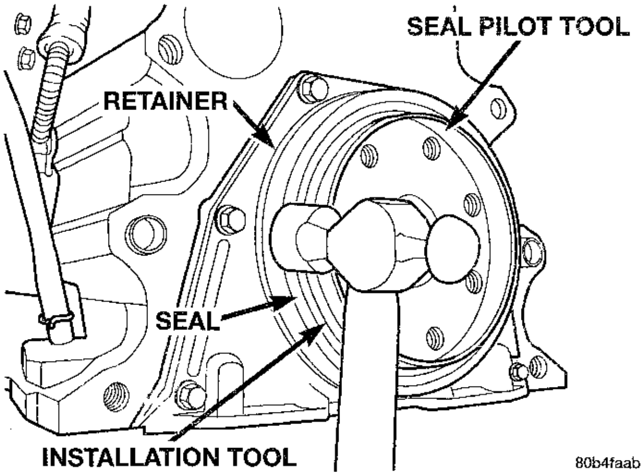

Fig. 163 Seal Installation using Alignment Tool and Hammer

(5) Install the flywheel or converter drive plate. Tighten the bolts to 137 N·m (101 ft. lbs.) torque.

(6) Install the clutch cover and disc (if equipped). Refer to Group 6, Clutch for the correct procedures.

(7) Intsall the transmission and transfer case (if equipped). Refer to Group 21, Transmission and Transfer Case for the correct procedures.

(8) Lower vehicle.

(9) Connect battery negative cables.

(10) Check engine oil level and adjust, if necessary.

(11) Start engine and check for oil leaks.

CRANKSHAFT REAR SEAL RETAINER

REMOVAL

(1) Disconnect the battery negative cables.

(2) Raise vehicle on hoist.

(3) Remove the oil pan drain plug and drain the engine oil. Re-install plug and torque to 60 N·m (44 ft. lbs.) torque.

(4) Remove transmission and transfer case (if equipped) from vehicle, refer to Group 21, Transmission and Transfer Case.

(5) Remove flywheel or torque converter drive plate.

(6) Disconnect starter cables from starter motor.

(7) Remove starter motor and transmission adapter plate assembly.

(8) Disconnect cables from starter motor.

(9) Remove the eight flywheel housing to block bolts and remove housing and starter motor as an assembly.

(10) Remove oil pan bolts, break the pan to block seal, and lower pan slightly and remove oil suction tube fasteners.

(11) Remove oil pan and suction tube (Fig. 164).

(12) Remove the six (6) retainer-to-block bolts (Fig. 165).

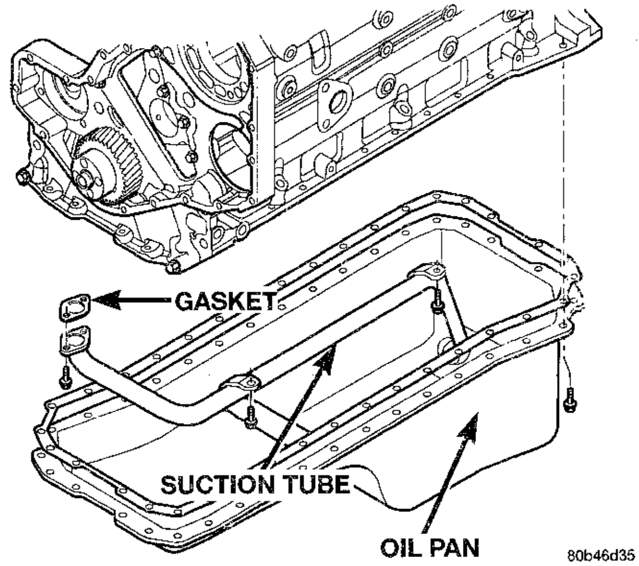

Fig. 164 Oil Pan, Suction Tube and Gasket

(13) Remove the rear seal retainer and gasket (Fig. 165).

(14) Support the seal retainer and drive out the crankshaft seal with a hammer and suitable punch.

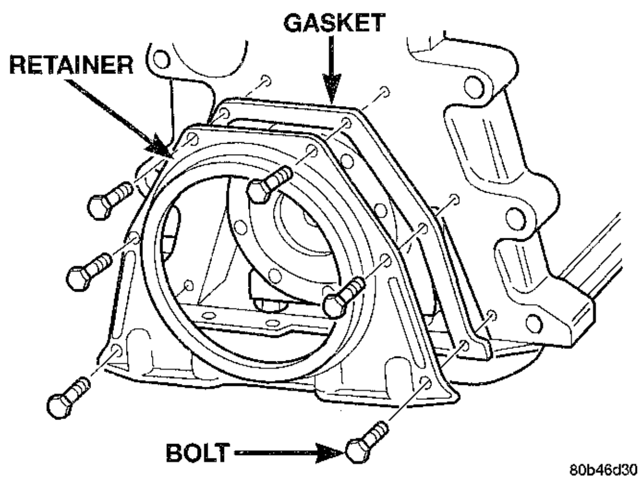

Fig. 165 Crankshaft Rear Seal Housing and Gasket

CLEANING

Clean the cylinder block and seal retainer gasket surfaces with a suitable scraper. Use care not to allow any gasket material to fall into the crankcase. Clean and dry the crankshaft sealing surface. **The seal lip and the sealing surface on the crankshaft must be free from all oil residue to prevent seal leaks.**

INSPECTION

Inspect the crankshaft flange for nicks or an excessively deep seal groove. Inspect the seal retainer for cracks and replace if necessary.

REMOVAL AND INSTALLATION (Continued)

INSTALLATION

(1) If using the old seal retainer, it is recommended that the crankshaft seal is replaced. Support the seal retainer and drive out the old seal.

(2) Using the retainer alignment/seal installation tool provided in the seal service kit, install the alignment tool into the retainer and install to the cylinder block (Fig. 166), using a new gasket. Tighten the six (6) mounting bolts by hand.

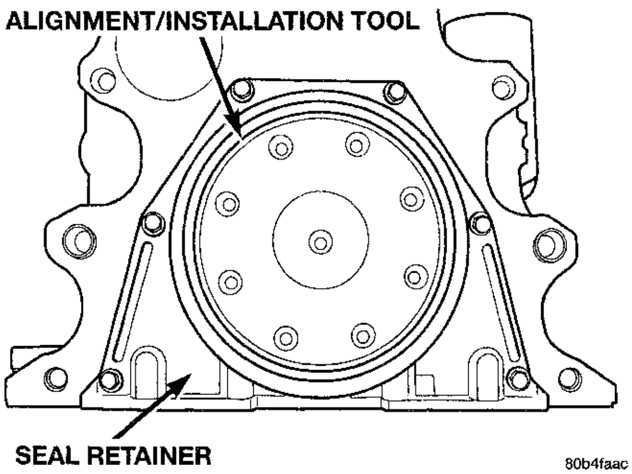

Fig. 166 Aligning Seal Retainer with Alignment/ Installation

(3) Starting with the center two bolts, tighten the retainer in a circular pattern to 9 N·m (80 in. lbs.). Remove the alignment tool.

NOTE: Install the crankshaft seal dry, with no lubrication on either the inside or outside diameters.

(4) Make sure the provided seal pilot is installed into the new crankshaft seal. Use the alignment/installation tool and press the seal onto the crankshaft (Fig. 167). Alternately drive the seal at the 12, 3, 6 and 9 o'clock positions.

(5) Remove the alignment tool and trim the retainer gasket even with the oil pan mounting surface (Fig. 168).

(6) Remove the seal pilot.

(7) Apply a small amount of Mopar® Silicone Rubber Adhesive Sealant to the oil pan rail T-joints.

(8) Install the oil pan, suction tube and gaskets. Tighten the suction tube fasteners to 24 N·m (18 ft. lbs.). Tighten the oil pan mounting bolts, starting from the center and working outward, to 24 N·m (18 ft. lbs.) torque.

(9) Install the flywheel housing and bolts. Tighten the bolts to 60 N·m (44 ft. lbs.) torque.

(10) Connect the starter motor wires.

(11) Install the flywheel or converter drive plate. Tighten bolts to 137 N·m (101 ft. lbs.)

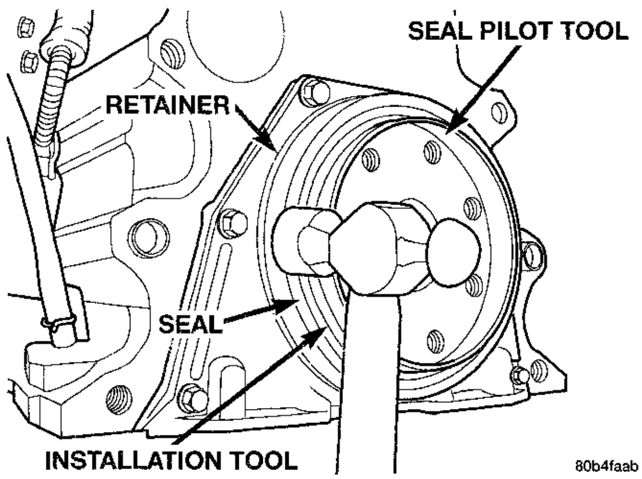

Fig. 167 Installing Seal Using Alignment/Installation Tool

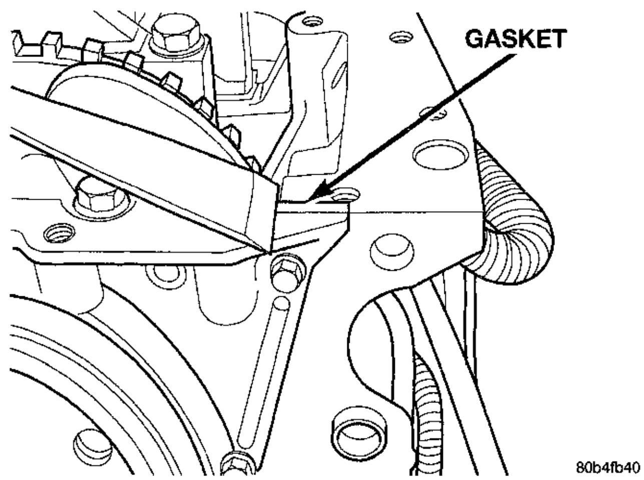

Fig. 168 Trimming Excess Gasket Material

(12) Install the transmission and transfer case (if equipped). Refer to Group 21, Transmission and Transfer Case for the correct procedures.

(13) Lower vehicle.

(14) Fill the crankcase with new engine oil.

(15) Connect the battery negative cables.

(16) Start engine and check for oil leaks.

CRANKSHAFT

REMOVAL

(1) Remove engine from vehicle and place on a stand. Refer to procedure in this group.

(2) Remove oil pan and suction tube. Refer to procedure in this group.

(3) Remove the crankshaft rear seal retainer. Refer to procedure in this group.

(4) Remove the front gear housing. Refer to procedure in this group.

(5) The main bearing caps should be numbered. If they are not, be sure to mark them, beginning with

REMOVAL AND INSTALLATION (Continued)

number one at the front and ending with number seven at the rear (Fig. 169).

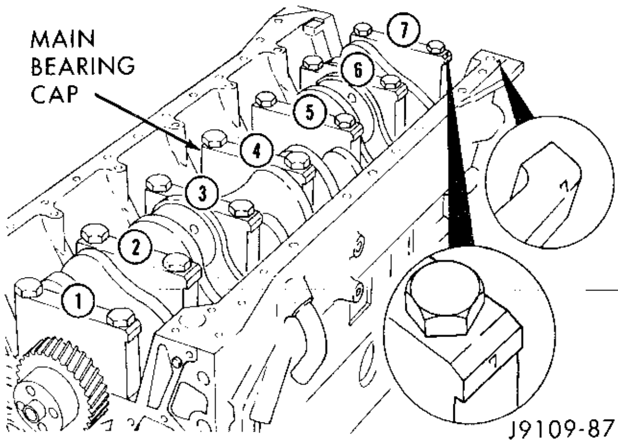

Fig. 169 Numbering Main Bearing Caps

CAUTION: DO NOT pry on the main caps to free them from the cylinder block.

(6) Use two of the main bearing cap bolts to wiggle the main cap loose (Fig. 170), being careful not to damage the bolt threads. Remove all caps in the same manner.

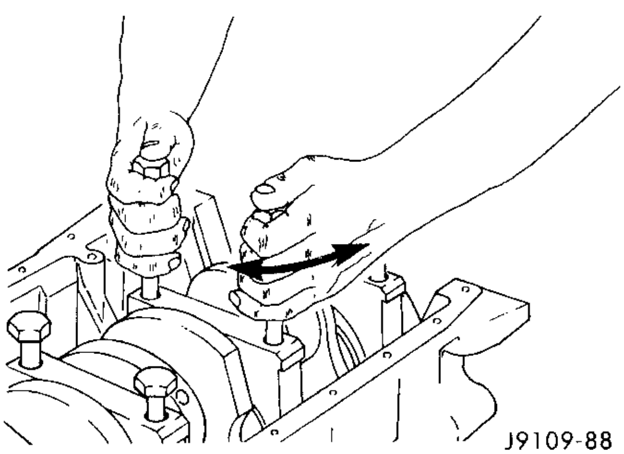

Fig. 170 Main Bearing Cap Removal

WARNING: USE A HOIST TO AVOID INJURY.

(7) Lift the crankshaft and gear from the cylinder block (Fig. 171).

(8) Remove the main bearings from the block and the main caps.

(9) Remove the piston cooling nozzles by using a 3/16 inch pin punch to push them out (Fig. 172).

CLEANING

Clean the crankshaft oil galley holes with a nylon brush.

Rinse in clean solvent and dry with compressed air.

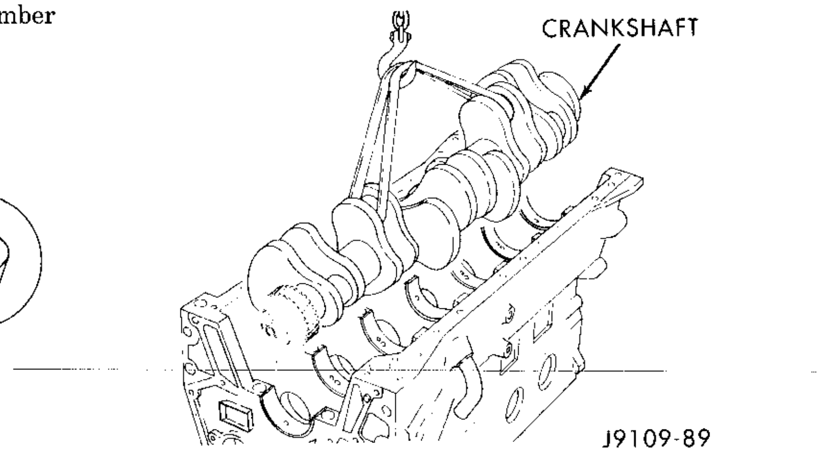

Fig. 171 Lifting Crankshaft Out of Cylinder Block

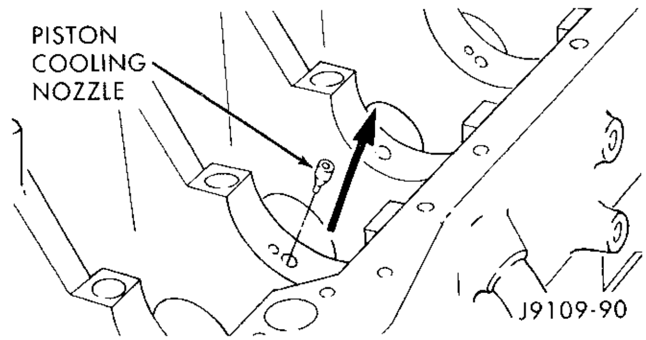

Fig. 172 Piston Cooling Nozzles

INSPECTION

Inspect the rod and main journal for deep scores, signs of overheating and other abnormal marks. Inspect the front and rear seal contact areas of the crankshaft for scratches or grooving.

The service seal kit will position the seal slightly deeper into the seal bore so it will contact the crankshaft at a different location. If this has already been done and the crankshaft has two worn areas, install a wear sleeve to provide a new contact surface for the seal.

(1) Visually inspect the tone wheel for missing teeth, cracks, and out-of-round.

NOTE: For additional crankshaft procedures, refer to "Crankshaft Service" in the Service Procedures section of this group.

INSTALLATION

CAUTION: Use only hand force to push the nozzle in place. If driven with a hammer, the nozzle will be damaged.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

(1) Use a center punch to push the piston cooling nozzle into place. Install nozzles so they are flush with or slightly below the saddle surface.

(2) Make sure the saddle surface is clean and dry. Install the upper main bearings.

(3) Install the combination thrust/main bearing in the number six main bearing location.

(4) Lubricate the bearings with Lubriplate 105, or equivalent.

WARNING: TO AVOID INJURY, USE A HOIST TO INSTALL THE CRANKSHAFT.

(5) If replacing the crankshaft, transfer the tone wheel to the new crankshaft.

(a) Install the large section of the tone wheel.

(b) Coat the bolts with Mopar® Lock 'N Seal or Loctite® 242, install and torque to 8 N·m (71 in. lbs.) torque.

(c) Rotate the crankshaft and install the small section of the tone wheel.

(d) Coat the bolts with Mopar® Lock 'N Seal or Loctite® 242, install and torque to 8 N·m (71 in. lbs.) torque.

(6) Install the crankshaft.

CAUTION: Crankshaft must be lowered onto the bearings straight to prevent damage to thrust bearings.

(7) Install the ring dowels in the main bearing caps (Fig. 173).

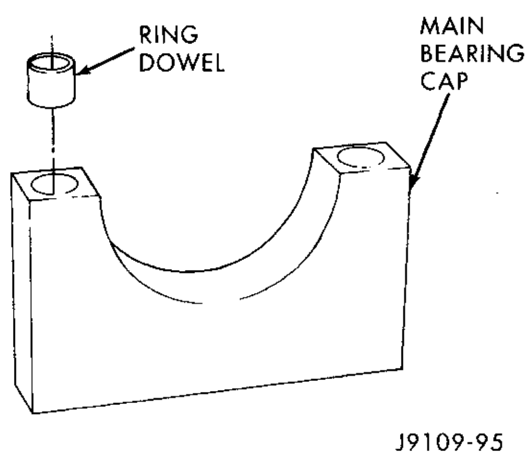

Fig. 173 Install Ring Dowels

(8) Install the lower main bearings in the caps.

(9) Lubricate the bearings with Lubriplate, or equivalent.

(10) Numbers on the main bearings caps face the oil cooler side of the engine with number one at the front of the engine.

(11) Place the caps in their respective positions.

(12) Lubricate the main bearing bolt threads and underside of the bolt head with clean engine oil.

(13) Tighten the bolts in the sequence shown in (Fig. 174)using the following steps:

- STEP 1—Torque all bolts in sequence to 60 N·m (44 ft. lbs.) torque.
- STEP 2—Torque all bolts in sequence to 119 N·m (88 ft. lbs.) torque.
- STEP 3—Torque all bolts in sequence to 176 N·m (129 ft. lbs.) torque.

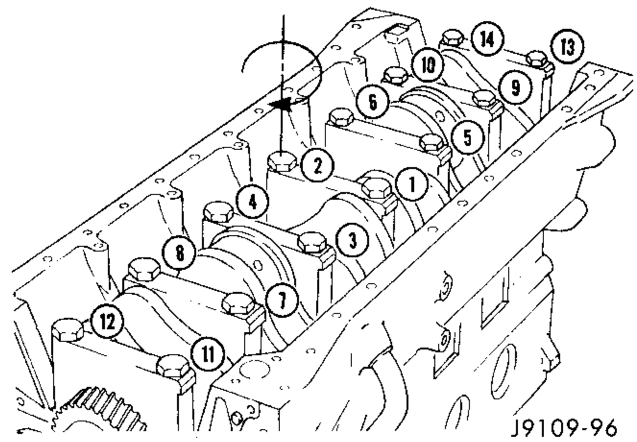

Fig. 174 Crankshaft Main Bearing Bolt Torque Sequence

(14) Turn the crankshaft to determine that it will rotate freely all 360°. Check the main bearing cap installations and/or the bearing sizes if the shaft does not turn easily.

(15) **Verify crankshaft end play:** Push the crankshaft towards one end of its thrust and place a dial indicator as shown in (Fig. 175). Zero the indicator needle and push the crankshaft towards the other end of its thrust and record the crankshaft end clearance (Fig. 176).

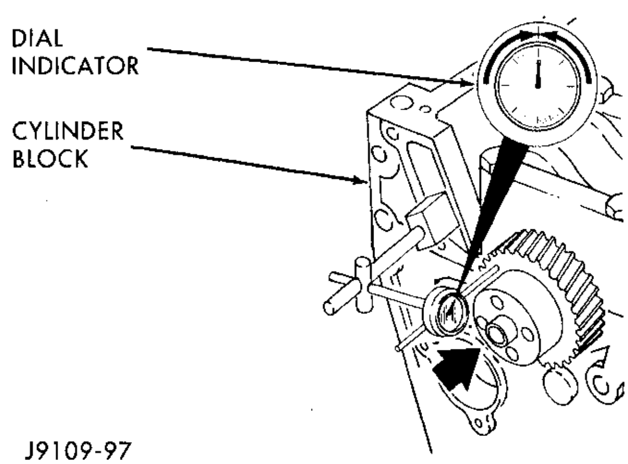

Fig. 175 Measuring Crankshaft End Play

REMOVAL AND INSTALLATION (Continued)

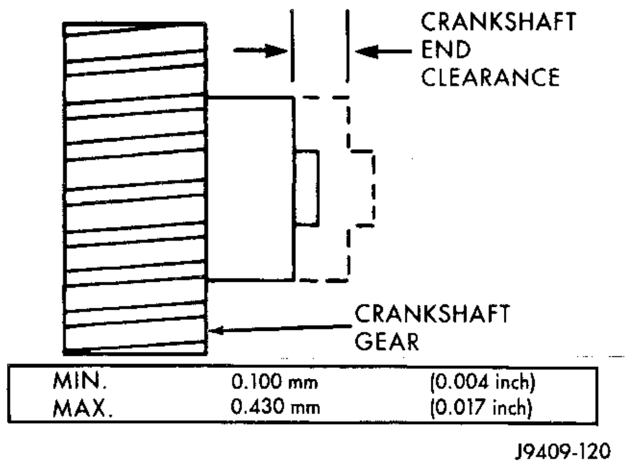

Fig. 176 Crankshaft End Clearance

CRANKSHAFT END PLAY SPECIFICATIONS

MIN	0.100 mm (0.004 in.)
MAX	0.430 mm (0.017 in.)

(16) Install the front gear housing. Refer to procedure in this group.

(17) Install the crankshaft rear oil seal retainer. Refer to procedure in this group.

(18) Install the oil pan and suction tube. Refer to procedure in this group.

(19) Install engine into vehicle. Refer to procedure in this group.

CRANKSHAFT TONE WHEEL

REMOVAL

(1) Disconnect the battery negative cables.

(2) Remove the oil pan and suction tube. Refer to procedure in this group.

(3) Using the crankshaft barring tool #7471B, rotate the crankshaft so the small section of the ring is facing away from the engine.

(4) Remove the #6 main bearing cap.

(5) Remove the two bolts fastening the small section of the wheel to the crankshaft. Remove the small section (Fig. 177).

(6) Using the barring tool, rotate the crankshaft and remove the three bolts from the large section of the tone wheel.

(7) Rotate the large section of the ring off of the crankshaft (Fig. 178). The crankshaft might have to be rotated to allow clearance for removal.

CLEANING

Clean the tone wheel with a suitable solvent. Rinse with hot water and blow dry with compressed air. Make sure the mounting surface of the wheel and crankshaft are free of all debris.

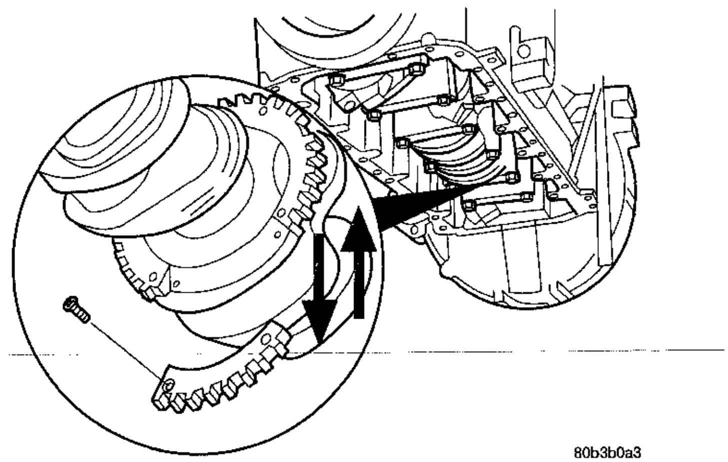

Fig. 177 Removing/Installing Small Section of Tone Wheel

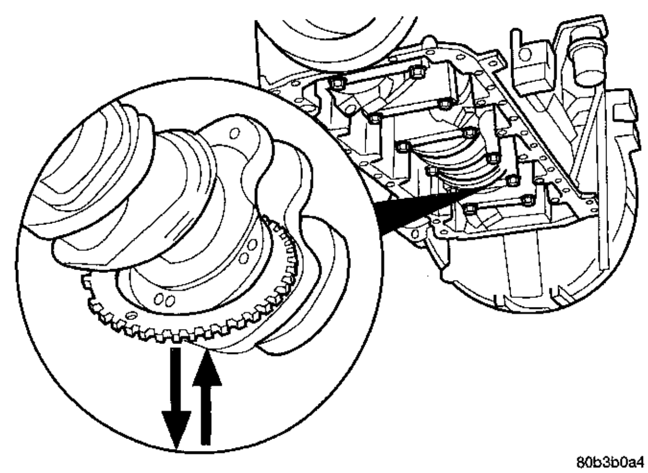

Fig. 178 Removing Installing Large Section of Tone Wheel

INSPECTION

Inspect the tone wheel for missing teeth, cracks, or a damaged mounting surface (Fig. 179). Place the wheel on a known flat surface and verify that it is not out of flat. Replace the tone wheel if any of these conditions are found.

INSTALLATION

(1) Install the large section of the tone wheel.

(2) Coat the bolts with Mopar® Lock 'N Seal or Loctite® 242, install and torque to 8 N·m (71 in. lbs.) torque.

(3) Rotate the crankshaft and install the small section of the tone wheel.

(4) Coat the bolts with Mopar® Lock 'N Seal or Loctite® 242, install and torque to 8 N·m (71 in. lbs.) torque.

(5) Install the #6 main bearing cap. Install the bolts and torque in three steps:

REMOVAL AND INSTALLATION (Continued)

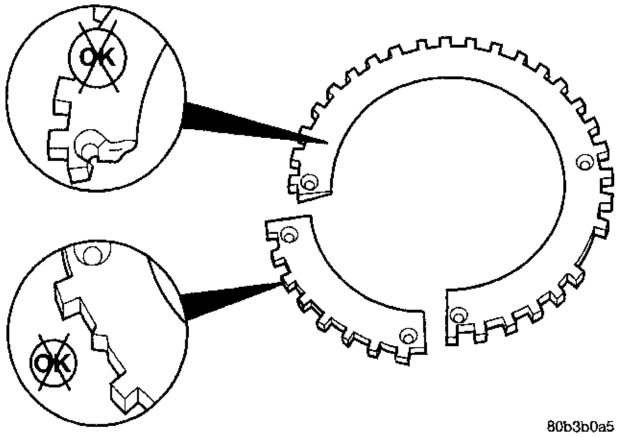

Fig. 179 Inspecting Tone Wheel for Damage

Step 1—Preliminary . . . . 60 N·m (44. ft. lbs.)
Step 2—Secondary . . . . 119 N·m (88 ft. lbs.)
Step 3—Final . . . . 176 N·m (129 ft. lbs.)

(6) Using a new gasket, install the oil pan and suction tube. Refer to procedure in this group.
(7) Add engine oil.
(8) Connect the battery negative cables and start engine.

OIL PRESSURE SENSOR

REMOVAL

(1) Disconnect the battery negative cables.
(2) Disconnect the oil pressure sensor connector (Fig. 180).
(3) Using a suitable socket, remove the oil pressure sensor from the block (counter-clockwise).

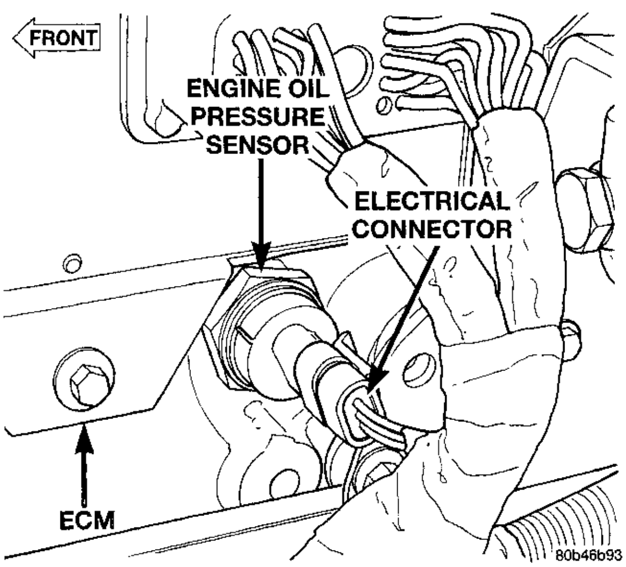

Fig. 180 Oil Pressure Sensor Location

INSTALLATION

(1) If the sensor is not being replaced, inspect the o-ring (Fig. 181) and replace if necessary.
(2) Install the oil pressure sensor and tighten to 16 N·m (144 in. lbs.) torque.
(3) Connect the battery negative cables.
(4) Start engine and check for oil leaks at the sensor.

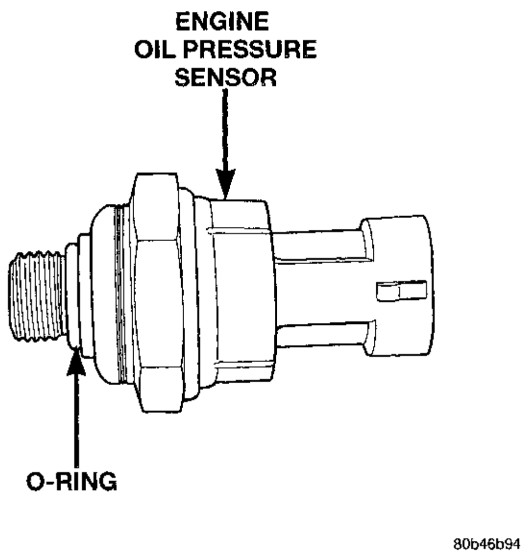

Fig. 181 Oil Pressure Sensor and O-Ring

OIL PRESSURE REGULATOR VALVE AND SPRING

REMOVAL

(1) Disconnect the battery negative cables.
(2) Remove the threaded plug, spring and plunger (Fig. 182). Insert a finger or a seal pick to lift the plunger from the bore.

NOTE: If the plunger is stuck in the bore, it will be necessary to remove the filter head.

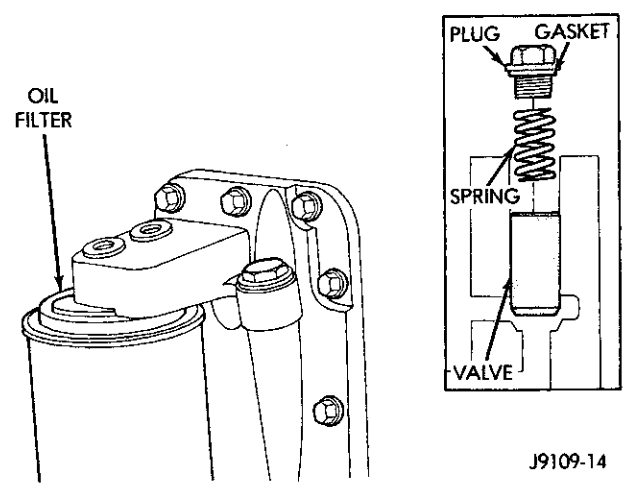

Fig. 182 Oil Pressure Regulator

REMOVAL AND INSTALLATION (Continued)

CLEANING

(1) Clean the regulator spring and plunger with a suitable solvent and blow dry with compressed air. If the plunger bore requires cleaning, it is necessary to remove the oil filter head to avoid getting debris into the engine.

INSPECTION

Inspect the plunger and plunger bore for cracks and excessive wear. Polished surfaces are acceptable. Verify that the plunger moves freely in the bore.

Check the spring for height and load limitations (Fig. 183). Replace the spring if out of limits shown in the figure.

Inspect the plug o-ring for cracks or brittleness, and replace as necessary.

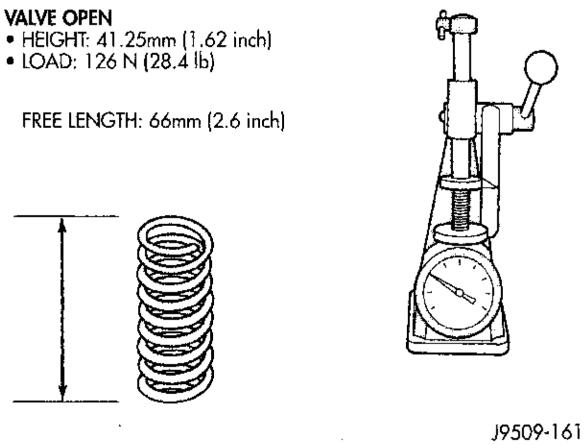

Fig. 183 Oil Pressure Regulator Spring Check

INSTALLATION

(1) Install the plunger, spring, and plug as shown in (Fig. 183). Tighten the plug to 80 N·m (60 ft. lbs.) torque.

(2) Connect the battery negative cables.

(3) Start the engine and verify that it has oil pressure.

OIL PUMP

REMOVAL

(1) Disconnect the battery negative cables.

(2) Remove fan/drive assembly.

(3) Remove the accessory drive belt.

(4) Remove the fan support/hub assembly.

(5) Remove crankshaft damper (Fig. 184).

(6) Remove the gear cover-to-housing bolts and gently pry the cover away from the housing, taking care not to mar the gasket surfaces (Fig. 185).

(7) Remove the four mounting bolts and pull the pump from the bore in the cylinder block (Fig. 186).

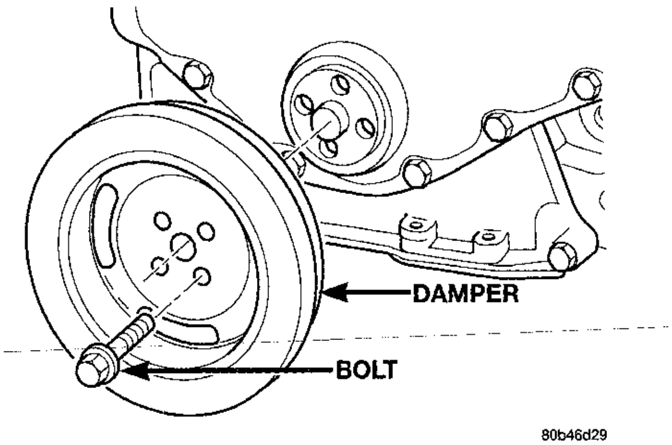

Fig. 184 Crankshaft Damper Removal/Installation

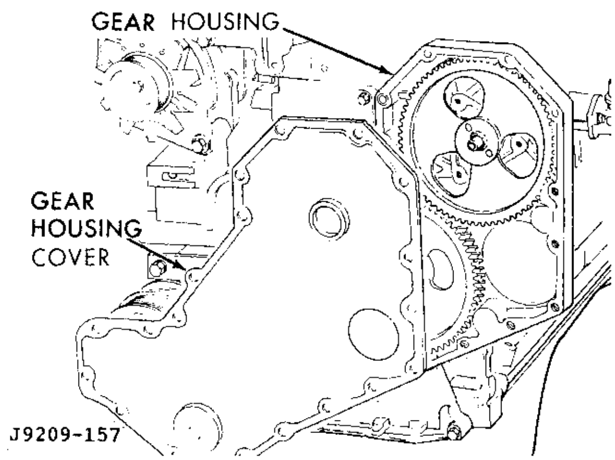

Fig. 185 Gear Housing and Cover

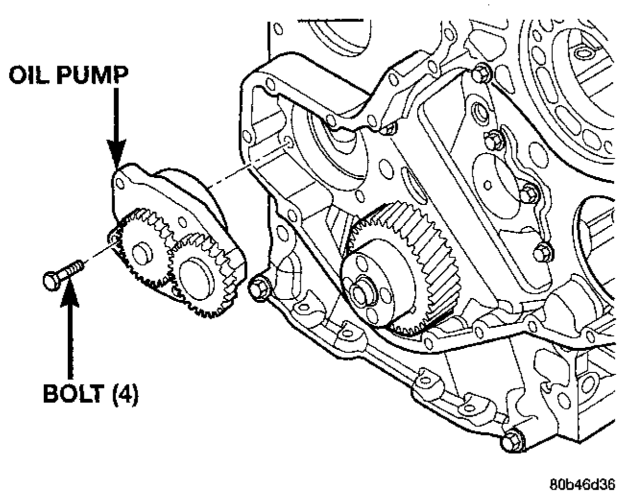

Fig. 186 Oil Pump Removal

REMOVAL AND INSTALLATION (Continued)

CLEANING

Clean all parts in solvent and dry with compressed air. Clean the old sealer residue from the back of the gear housing cover and front of the gear housing.

INSPECTION

Disassemble and inspect the oil pump as follows:

(1) Visually inspect the lube pump gears for chips, cracks or excessive wear.

(2) Remove the back plate (Fig. 187).

(3) Mark TOP on the gerotor planetary using a felt tip pen (Fig. 187).

(4) Remove the gerotor planetary (Fig. 187). Inspect for excessive wear or damage. Inspect the pump housing and gerotor drive for damaged and excessive wear.

(5) Install the gerotor planetary in the original position. The chamfer must be on the O.D. and down.

(6) Measure the tip clearance (Fig. 188). Maximum clearance is 0.1778 mm (0.007 inch). If the oil pump is out of limits, replace the pump.

(7) Measure the clearance of the gerotor drive/gerotor planetary to port plate (Fig. 189). Maximum clearance is 0.127 mm (0.005 inch). If the oil pump is out of limits, replace the pump.

(8) Measure the clearance of the gerotor planetary to the body bore (Fig. 190). Maximum clearance is 0.381 mm (0.015 inch). If the oil pump is out of limits, replace the pump.

(9) Measure the gears backlash (Fig. 191). The limits of a used pump is 0.080- 0.380 mm (0.003-0.015 inch). If the backlash is out of limits, replace the oil pump.

(10) Install the back plate.

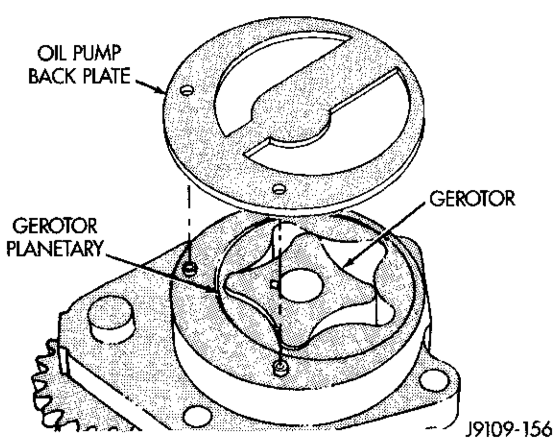

Fig. 187 Gerotor Planetary and Gerotor

INSTALLATION

(1) Lubricate the pump with clean engine oil. Filling the pump with clean engine oil during installation will help to prime the pump at engine start up.

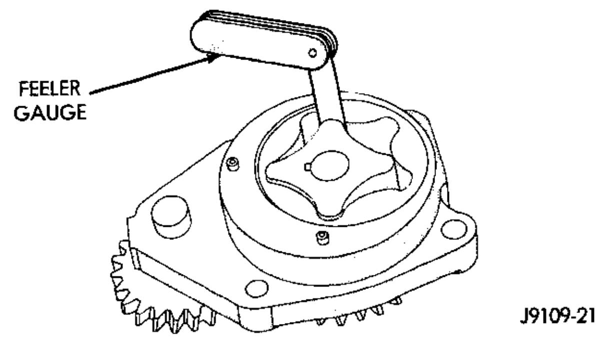

Fig. 188 Measuring Tip Clearance

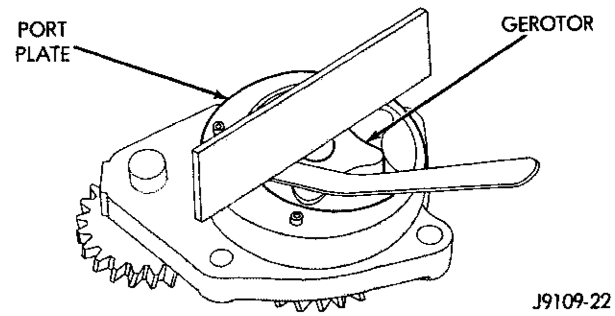

Fig. 189 Measuring Gerotor to Port Plate Clearance

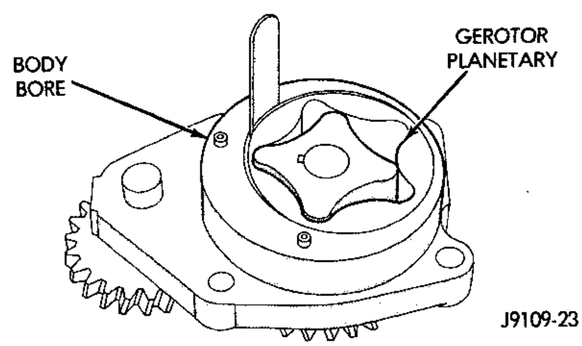

Fig. 190 Measuring Gerotor Planetary to Body Bore Clearance

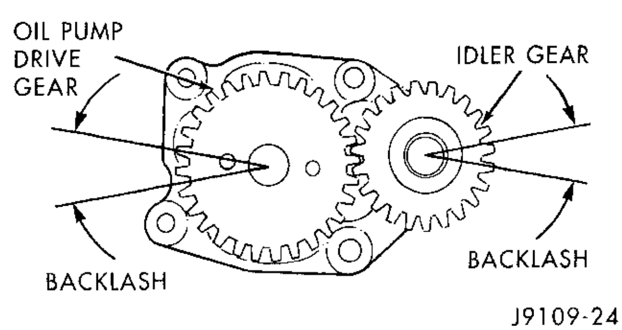

Fig. 191 Measure Gear Backlash

(2) Verify the idler gear pin is installed in the locating bore in the cylinder block.

REMOVAL AND INSTALLATION (Continued)

(3) Install the pump (Fig. 186). Tighten the oil pump mounting bolts in two steps, in the sequence shown in (Fig. 192).
- Step 1—Tighten to 5 N·m (44 in. lbs.) torque.
- Step 2—Tighten to 24 N·m (18 ft. lbs.) torque.

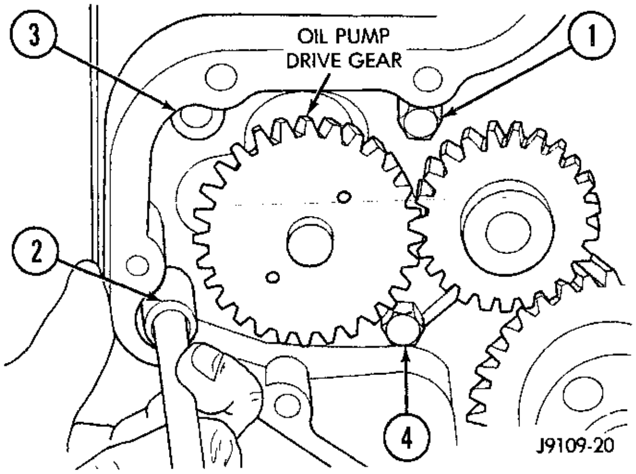

Fig. 192 Oil Pump Mounting Bolt Torque Sequence

(4) The back plate on the pump seats against the bottom of the bore in the cylinder block. When the pump is correctly installed, the flange on the pump will not touch the cylinder block.

(5) Measure the idler gear to pump drive gear backlash and the idler gear to crankshaft gear backlash (Fig. 193). The backlash should be 0.080- 0.330 mm (0.003-0.013 inch). If the backlash is out of limits, replace the oil pump drive gear and the idler gear.

(6) If the adjoining gear moves when you measure the backlash, the reading will be incorrect.

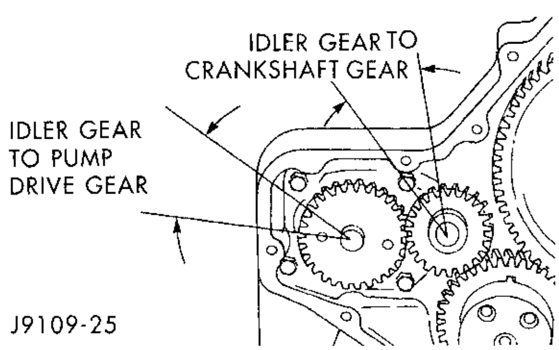

Fig. 193 Idler Gear to Pump Drive Gear and Crankshaft Gear Backlash

(7) Apply a bead of Mopar® Silicone Rubber Adhesive Sealant or equivalent to the gear housing cover sealing surface.

(8) Install the gear housing cover and tighten to 24 N·m (18 ft. lbs.) torque.

(9) Install the vibration damper and torque the bolts to 125 N·m (92 ft. lbs.). Use the engine barring tool to keep the engine from rotating during tightening operation.

(10) Install the fan support/hub assembly and torque bolts to 24 N·m (18 ft. lbs.).

(11) Install the accessory drive belt. Refer to Group 7, Cooling for the correct procedure.

(12) Connect battery negative cables.

(13) Start engine and check for oil leaks.

VACUUM PUMP

REMOVAL

(1) Disconnect battery negative cables.

(2) Position drain pan under power steering pump.

(3) Disconnect vacuum and steering pump hoses.

(4) Disconnect lubricating oil feed line from fitting at underside of vacuum pump (Fig. 194).

(5) Remove lower bolt that attaches pump assembly to engine block (Fig. 195).

(6) Remove bottom, inboard nut that attaches adapter to steering pump. This nut secures a small bracket to engine block. Nut and bracket must be removed before pump assembly can be removed from block.

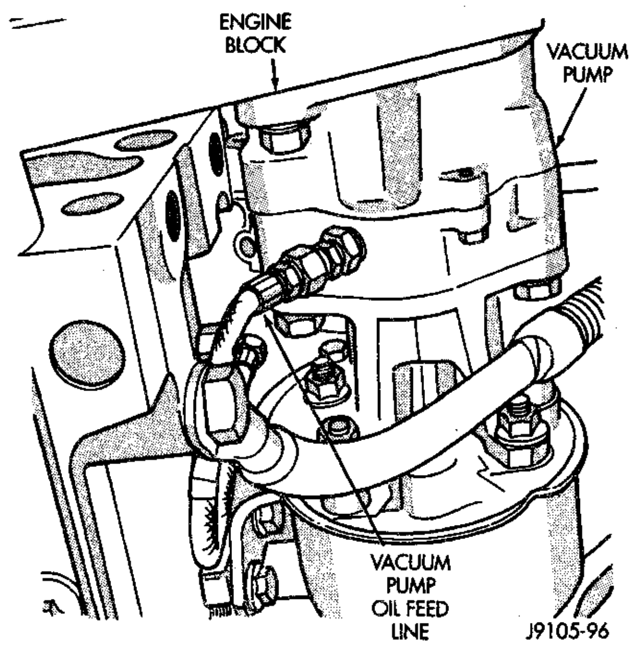

Fig. 194 Vacuum Pump Oil Feed Line

(7) Remove upper bolt that attaches pump assembly to engine block (Fig. 196).

(8) Remove pump assembly from vehicle.

(9) Remove nuts attaching vacuum pump to adapter (Fig. 197).

REMOVAL AND INSTALLATION (Continued)

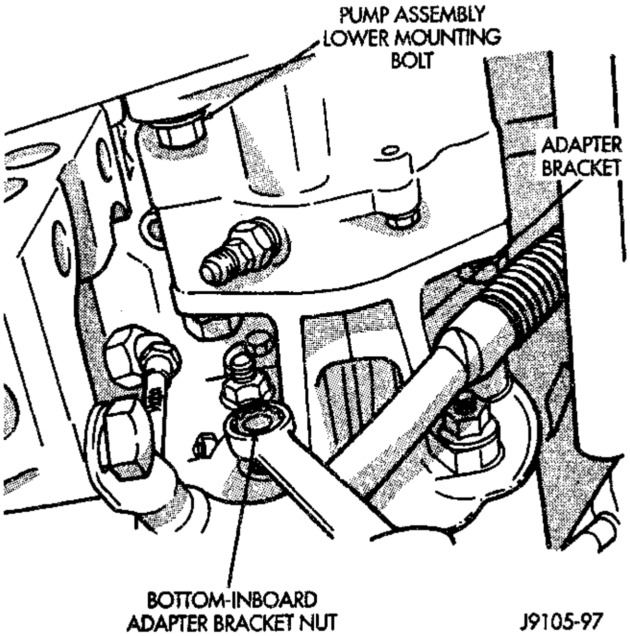

Fig. 195 Vacuum Pump Mounting

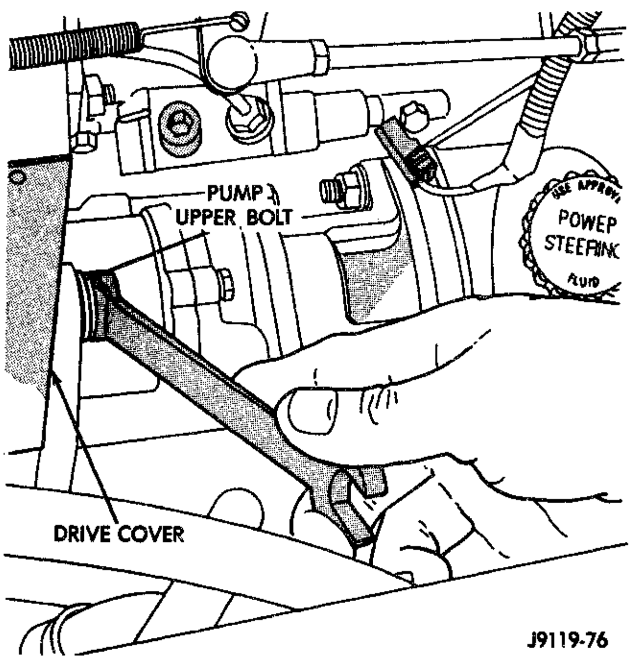

Fig. 196 Pump Assembly Upper Mounting Bolt

(10) Remove vacuum pump from adapter (Fig. 198). Turn pump gear back and forth to disengage pump shaft from coupling.

(11) Remove coupling from adapter (Fig. 199).

(12) Remove remaining adapter attaching nuts and remove adapter from steering pump (Fig. 200). If steering pump will be serviced, remove spacer from each inboard mounting stud on pump.

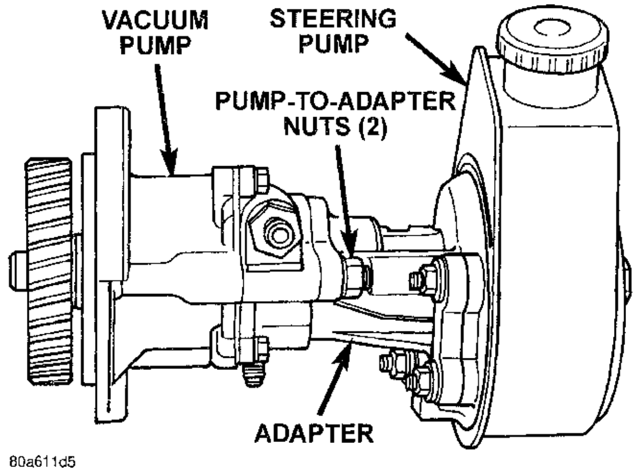

Fig. 197 Pump Assembly

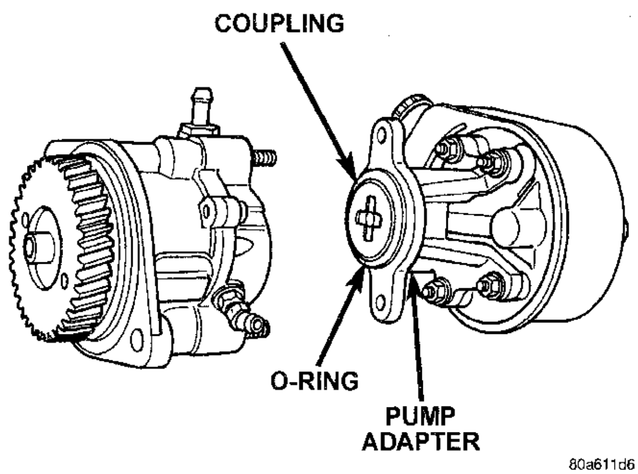

Fig. 198 Vacuum Pump Adapter

INSTALLATION

(1) Clean and lubricate pump shaft with engine oil.

(2) Install spacers on steering pump studs.

(3) Install O-ring on adapter.

(4) Position adapter on pump studs.

(5) Install attaching nuts on outboard stud and on the two upper pump studs. Do **not** install nut on lower, inboard stud at this time. Tighten nuts to 24 N·m (18 ft. lbs.).

(6) Install coupling on pump shaft. Be sure coupling is securely engaged in shaft drive tangs.

(7) Install vacuum pump on adapter. Rotate drive gear until tangs on pump shaft engage in coupling. Verify that pump is seated before installing attaching nuts.

(8) Install and tighten vacuum pump attaching nuts.

(9) Inspect adapter O-ring and replace O-ring if cut or torn.

(10) Lubricate adapter O-ring with engine oil.

REMOVAL AND INSTALLATION (Continued)

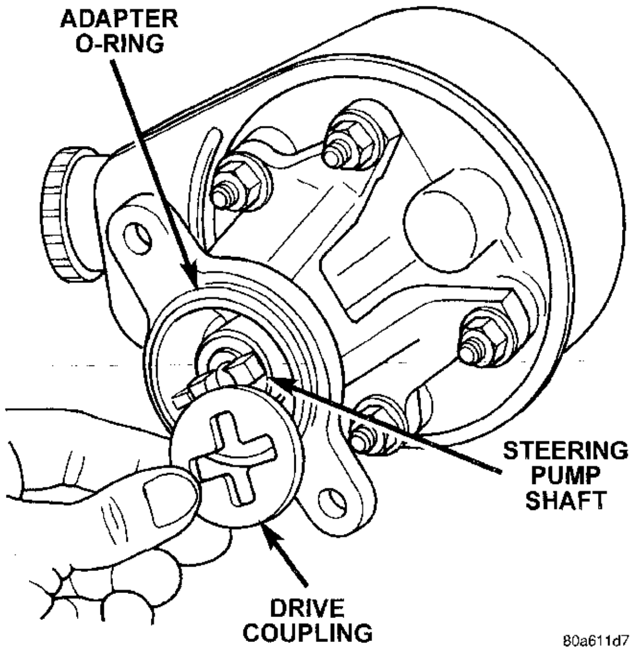

Fig. 199 Pump Drive Coupling

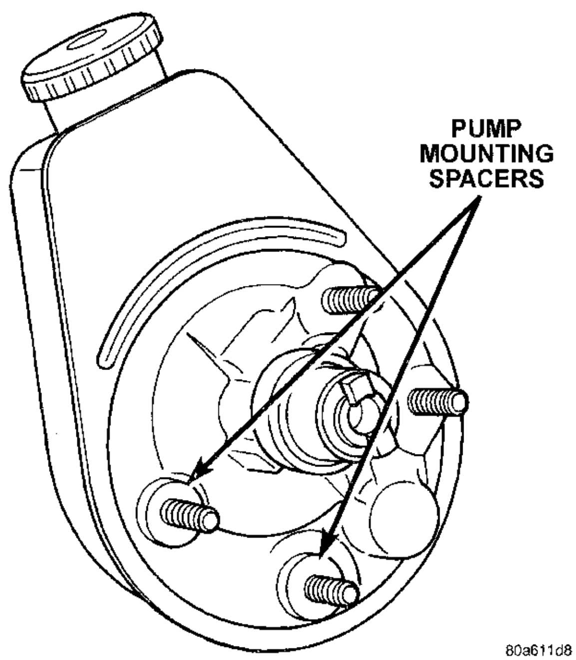

Fig. 200 Steering Pump Mounting Stud Spacers

(11) Note position of drive slots in coupling (Fig. 201). Then rotate drive gear to align tangs on vacuum pump shaft with coupling.

(12) Verify that pump is seated in adapter and coupling.

(13) Install and tighten pump attaching nuts and washers.

(14) Position new gasket on vacuum pump mounting flange (Fig. 202). Use Mopar Perfect Seal, or silicone adhesive/sealer to hold gasket in place.

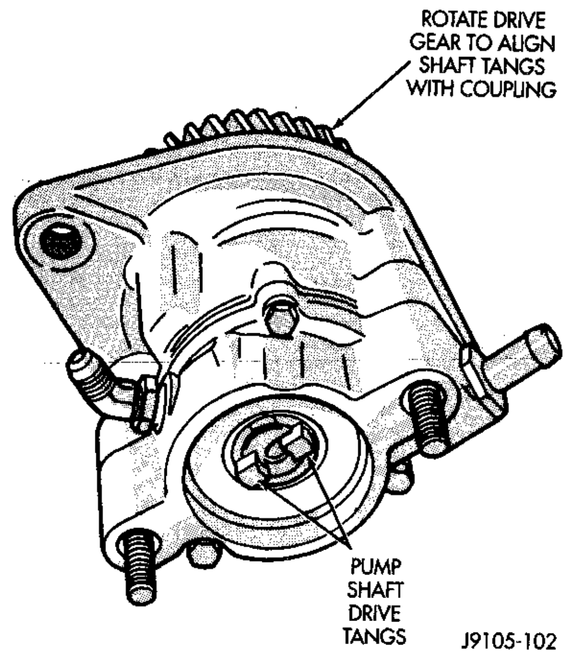

Fig. 201 Pump Shaft Drive Tangs

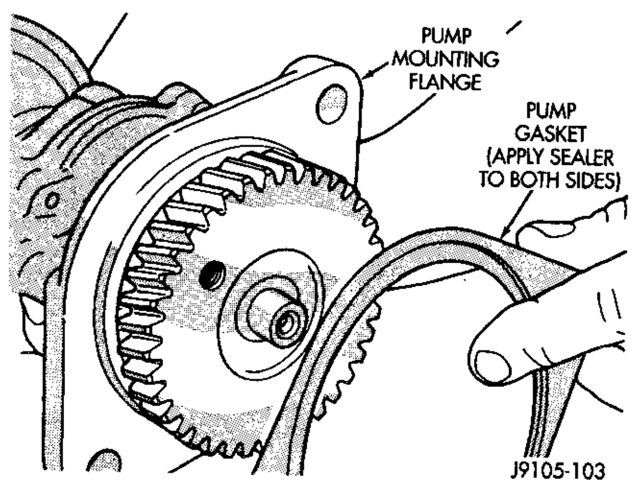

Fig. 202 Pump Mounting Flange Gasket

(15) Insert pump assembly upper attaching bolt in mounting flange and gasket. Use sealer or grease to hold bolt in place if necessary.

(16) Position pump assembly on engine and install upper bolt (Fig. 203). Tighten upper bolt only enough to hold assembly in place at this time.

(17) Working from under vehicle, install pump assembly lower attaching bolt. Then tighten upper and lower bolt to 77 N·m (57 ft. lbs.).

(18) Position bracket on steering pump inboard stud. Then install remaining adapter attaching nut on stud. Tighten nut to 24 N·m (18 ft. lbs.).

(19) Connect oil feed line to vacuum pump connector and tighten line fitting.

REMOVAL AND INSTALLATION (Continued)

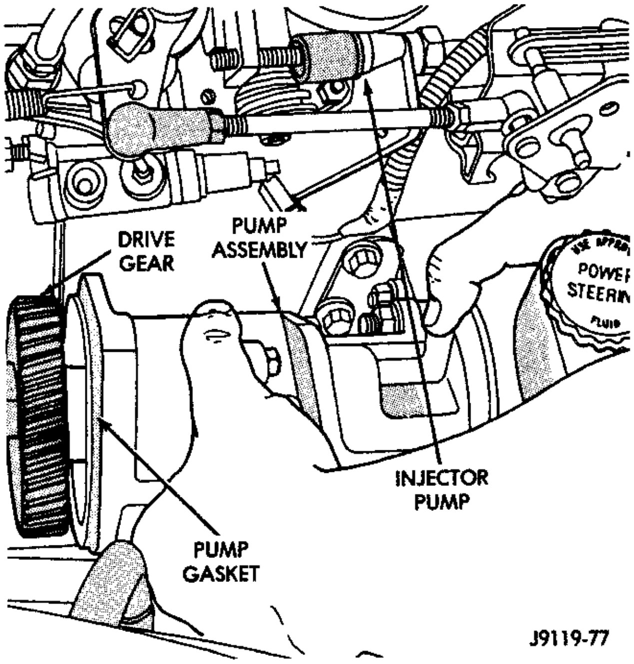

Fig. 203 Installing Pump Assembly On Engine

(20) Connect steering pump pressure and return lines to pump. Tighten pressure line fitting to 30 N·m (22 ft. lbs.).
(21) Connect vacuum hose to vacuum pump.
(22) Connect battery cables, if removed.
(23) Fill power steering pump reservoir.
(24) Purge air from steering pump lines. Start engine and slowly turn steering wheel left and right to circulate fluid and purge air from system.
(25) Stop engine and top off power steering reservoir fluid level.
(26) Start engine and verify that steering action is correct. Do this before moving vehicle.

CLEANING AND INSPECTION

CYLINDER BLOCK

INSPECTION

Measure the combustion deck face using a straight edge and a feeler gauge(Fig. 204). The distortion of the combustion deck face is not to exceed 0.010 mm (0.0004 inch) in any 50.00 mm (2.0 inch) diameter. Overall variation end to end or side to side is 0.075 mm (0.003 inch).

If the surface exceeds the limit, refer to Cylinder Block Refacing.

Inspect the cylinder bores for damage or excessive wear.

Measure the cylinder bores (Fig. 205). If the cylinder bores exceeds the limit, refer to Cylinder Bore Repair.

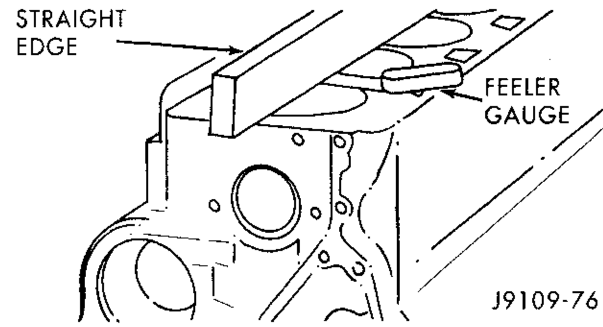

Fig. 204 Combustion Deck Face Measurement

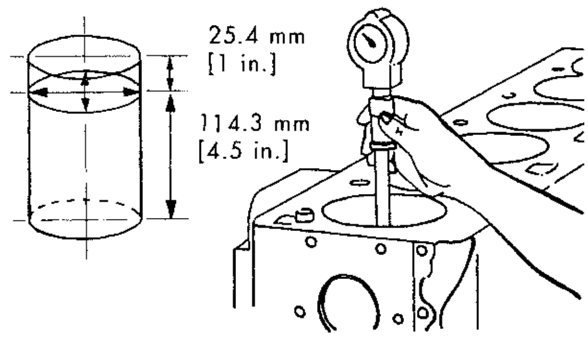


MIN.	102.0 mm	(4.0157 inch)
MAX.	102.116 mm	(4.0203 inch)
Out-of-Round	0.038 mm	(0.0015 inch)
Taper	0.076 mm	(0.003 inch)
Oversize pistons and rings are available for bored cylinder blocks.		

J9209-167

Fig. 205 Cylinder Bore Diameter

Inspect the camshaft bores for scoring or excessive wear.

Measure the camshaft bores. Refer to engine specifications at the rear of this section. Limit for the No.1 bore applies to the ID of the bushing.

If a bore exceeds the limit, refer to Camshaft Bore Repair.

Inspect the tappet bores for scoring or excessive wear (Fig. 206). If out of limits, replace the cylinder block.

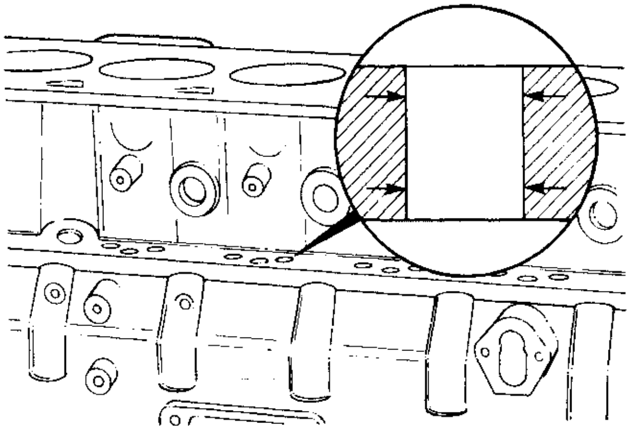
CYLINDER HEAD

INSPECTION

Remove the cup plugs and inspect the coolant passages. A large build up of rust and lime will require removal of the cylinder block for cleaning in a hot tank.

Inspect the cylinder bores for damage or excessive wear. Rotate the crankshaft so the piston is at Bottom Dead Center (BDC) to inspect the bores.

CLEANING AND INSPECTION (Continued)

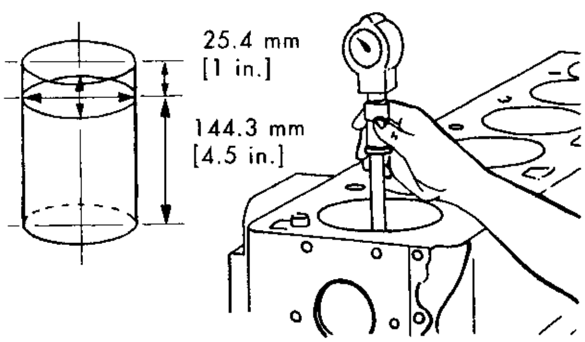


TAPPET BORE DIAMETER		
MAX.	16.055 mm	(0.632 inch)

J9109-79

Fig. 206 Tappet Bore Diameter

Measure the cylinder bores (Fig. 207). DO NOT proceed with in-chassis repair if the bores are damaged or worn beyond the limits (refer to Cylinder Bore Repair - Cylinder Block).



MIN.	102.0 mm	(4.0157 inch)
MAX.	102.116 mm	(4.0203 inch)
Out-of-Round	0.038 mm	(0.0015 inch)
Taper	0.76 mm	(0.003 inch)
Oversize pistons and rings are available for bored cylinder blocks.		

J9109-75

Fig. 207 Cylinder Bore Diameter

Check the top surface for damage caused by the cylinder head gasket leaking between cylinders.

Inspect the block and head surface for nicks, erosion, etc.

Check the head distortion (Fig. 208). The distortion of the combustion deck face is not to exceed 0.010 mm (0.0004 inch) in any 50.8 mm (2.00 inch) diameter. Overall variation end to end or side to side 0.30 mm (0.012 inch).

DO NOT proceed with the in-chassis overhaul if the cylinder head or block surface is damaged or not flat (within specifications).

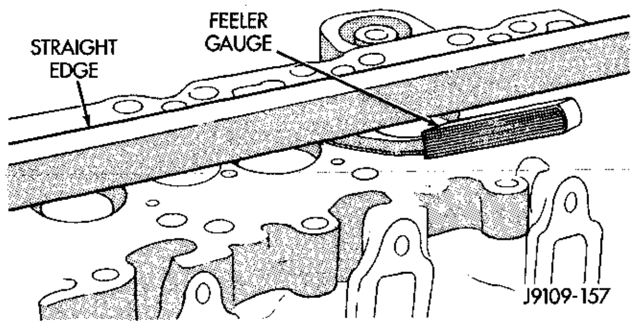


Fig. 208 Cylinder Head Combustion Deck Face Measurement

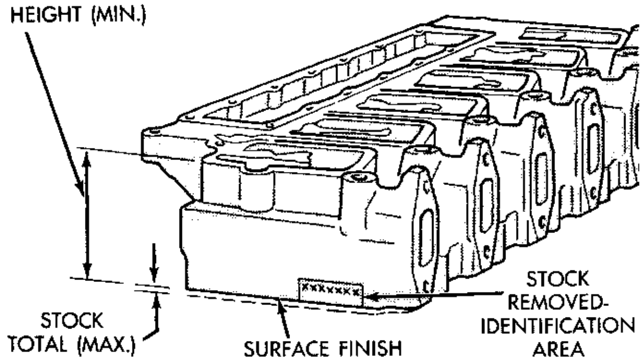
REFACING HEAD SURFACE

The cylinder head combustion deck may be refaced in whatever increments necessary to clean up the surface and maintain the surface finish and flatness tolerances. The combined total of stock removed must not exceed 1.00 mm (0.03937 inch). The amount of stock removed each time must be steel stamped above combustion deck edge, on the lower right hand corner of the rear face (Fig. 209). Check valve protrusion after head surface refacing.

Surface finish requirements are 1.5-3.2 micrometers (60-126 microinch).

REFERENCE HEIGHT (MIN.)



STOCK TOTAL (MAX.)
1.00 mm (0.03937 inch)
REFERENCE HEIGHT (MIN.)
94.00 ±0.25 mm
(3.7008 ±0.0010 inch)
SURFACE FINISH
1.5 to 3.2 micrometers
(60 to 128 microinches)

J9109-134

Fig. 209 Cylinder Head Stock Removal

AUTHENTIC RESTORATION PRODUCT

CLEANING AND INSPECTION (Continued)

CLEANING

Clean the carbon from the injector nozzle seat with a nylon or brass brush.

Scrape the gasket residue from all gasket surfaces.

Wash the cylinder head in hot soapy water solution (88°C or 140°F).

After rinsing, use compressed air to dry the cylinder head.

Polish the gasket surface with 400 grid paper. Use an orbital sander or sanding block to maintain a flat surface.

VALVES AND VALVE SPRINGS

CLEANING

Clean the valve stems with crocus cloth or a Scotch-Brite® pad. Remove carbon with a soft wire brush. Clean valves, springs, retainers, and collets in a suitable solvent. Rinse in hot water and blow dry with compressed air.

INSPECTION

Visually inspect the valves for abnormal wear on the heads, stems, and tips. Replace any valve that is worn out or bent (Fig. 210).

Measure the valve stem diameter in three places

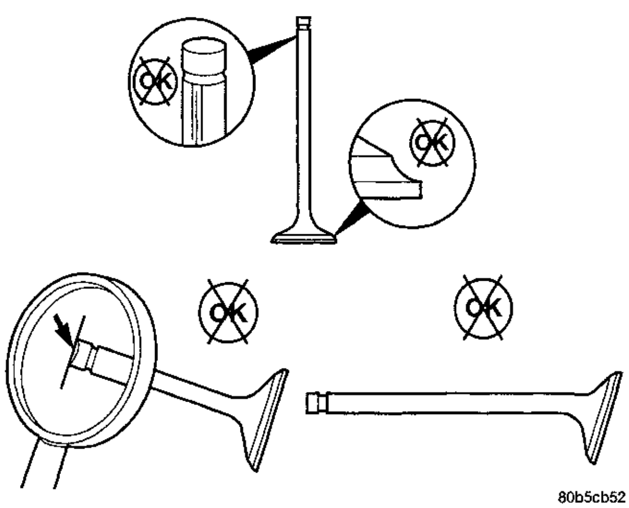


Fig. 210 Visually Inspect Valves for Abnormal Wear

as shown in (Fig. 211).

Measure the cylinder head valve guide bore (Fig. 212). Subtract the corresponding valve stem diameter to obtain valve stem-to-guide clearance.

Measure valve margin (rim thickness) (Fig. 213).

Measure the valve spring free length and maximum inclination (Fig. 214).

Test valve spring force with tool C-647 (Fig. 215).

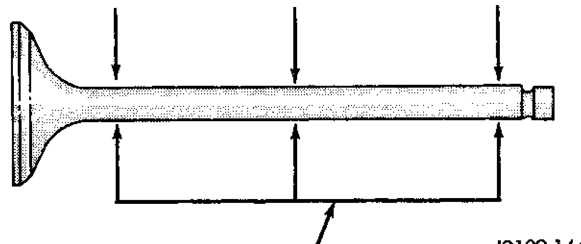

Fig. 211 Measure Valve Stem Diameter

VALVE STEM DIAMETER
6.990 mm (0.2752 in.) MIN
7.010 mm (0.2760 in.) MAX

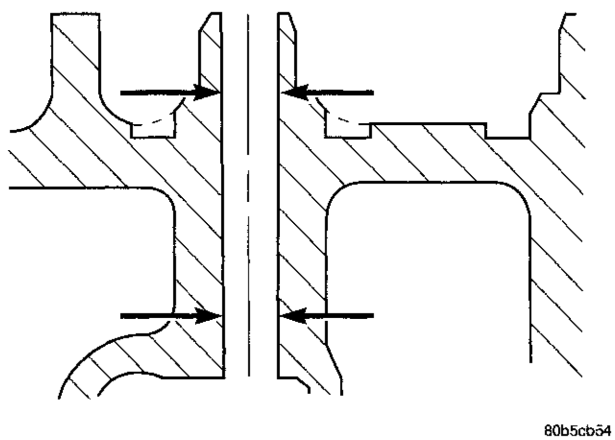

Fig. 212 Measure Valve Guide Bore

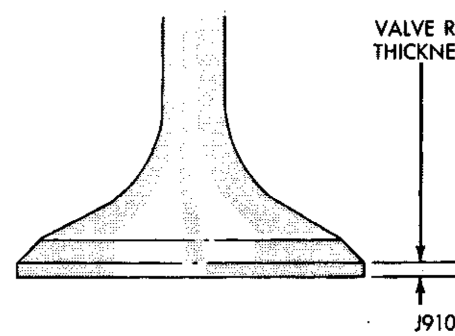

Fig. 213 Measure Valve Margin (Rim Thickness)

VALVE MARGIN (RIM THICKNESS)
0.72 mm (0.031 in.) MIN.

CRANKSHAFT

CLEANING AND INSPECTION

Clean the crankshaft oil galley holes with a nylon brush.

CLEANING AND INSPECTION (Continued)

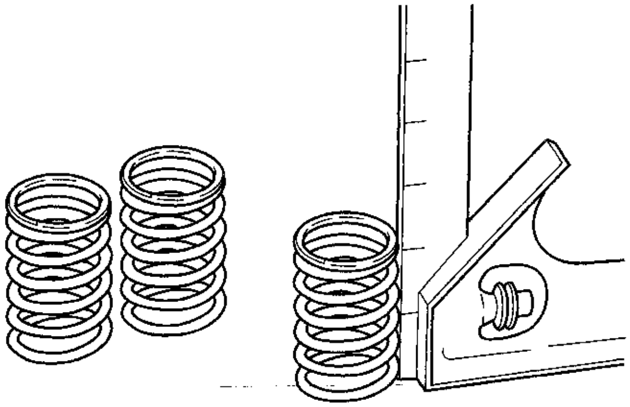

Fig. 214 Measure Valve Spring Free Length and Max. Inclination

VALVE SPRING FREE LENGTH
47.75 mm (1.88 in.)

MAX INCLINATION
1.5 mm (.059 in.)

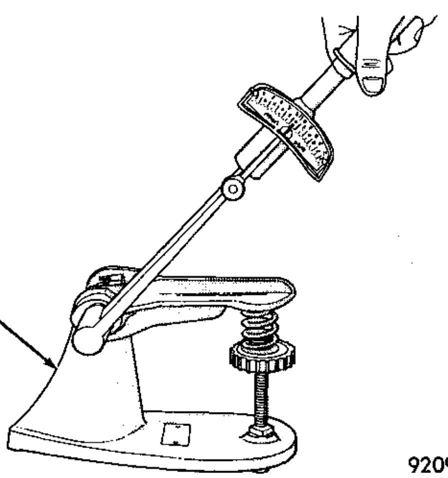

Fig. 215 Testing Valve Spring with Tool C-647

VALVE SPRING MINIMUM LOAD
@ 35.33 mm — 339.8 N
@ 1.39 in. — 76.4 lbs.

Rinse in clean solvent and dry with compressed air.

Inspect the front and rear seal contact areas of the crankshaft for scratches or grooving.

The service seal kit will position the seal slightly deeper into the seal bore so it will contact the crankshaft at a different location. If this has already been done and the crankshaft has two worn areas, install a wear sleeve to provide a new contact surface for the seal.

Inspect the rod and main journal for deep scores, signs of overheating and other abnormal marks.

PISTON AND CONNECTING ROD ASSEMBLY

CLEANING

Pistons

CAUTION: DO NOT use bead blast to clean the pistons. DO NOT clean the pistons and rods in an acid tank.

Clean the pistons and pins in a suitable solvent, rinse in hot water and blow dry with compressed air. Soaking the pistons over night will loosen most of the carbon build up. De-carbon the ring grooves with a broken piston ring and again clean the pistons in solvent. Rinse in hot water and blow dry with compressed air.

Connecting Rods

Clean the connecting rods in a suitable solvent, rinse in hot water and blow dry with compressed air.

INSPECTION

Pistons

Inspect the pistons for damage and excessive wear. Check top of the piston, ring grooves, skirt and pin bore. Measure the piston skirt diameter (Fig. 216). If the piston is out of limits, replace the piston.

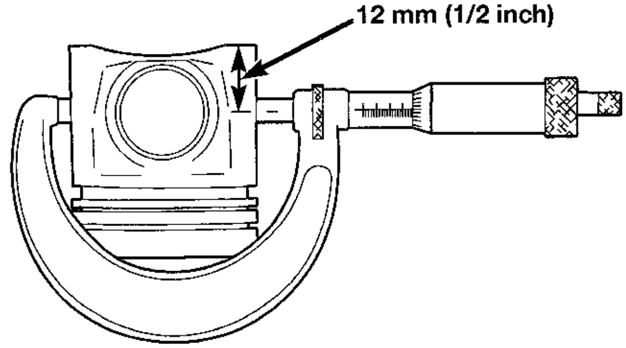

Fig. 216 Piston Skirt Diameter

PISTON SKIRT DIAMETER (MIN.)
101.864 mm (4.0104 in.)

CLEANING AND INSPECTION (Continued)

The upper groove only needs to be inspected for damage. Use a new piston ring to measure the clearance in the intermediate ring groove (Fig. 217). If the clearance of the intermediate ring exceeds 0.152 mm (0.006 inch), replace the piston.

Use a new oil ring to measure the clearance in the oil groove (Fig. 217). If the clearance exceeds 0.127 mm (0.005 inch), replace the piston.

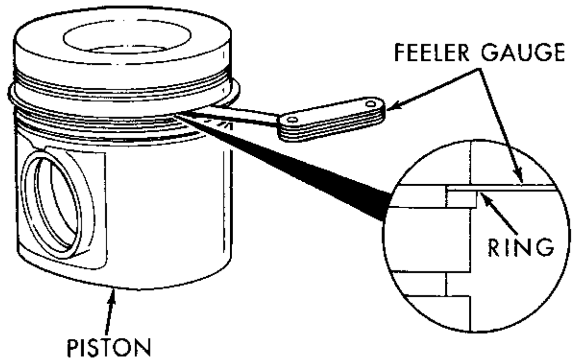

Fig. 217 Intermediate and Oil Ring Clearances

Measure the pin bore (Fig. 218). The maximum diameter is 40.025 mm (1.5758 inch). If the bore is over limits, replace the piston.

Inspect the piston pin for nicks, gouges and excessive wear. Measure the pin diameter (Fig. 219). The minimum diameter is 39.990 mm (1.5744 inch). If the diameter is out of limits, replace the pin.

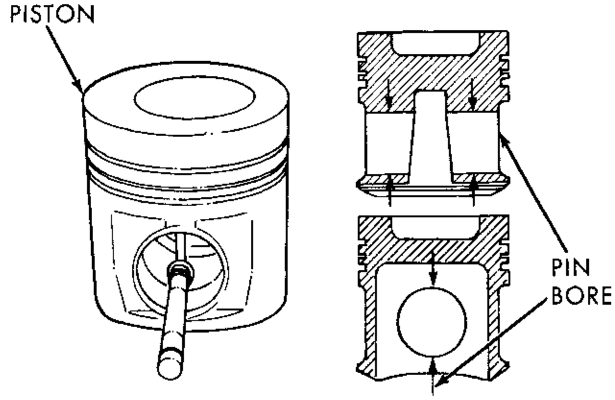

Fig. 218 Piston Pin Bore

Connecting Rods

Inspect the connecting rod for damage and wear. The I-Beam section of the connecting rod cannot have dents or other damage. Damage to this part can cause stress risers which will progress to breakage.

Measure the connecting rod pin bore (Fig. 220). The maximum diameter is 40.042 mm (1.5764 inch). If out of limits, replace the connecting rod.

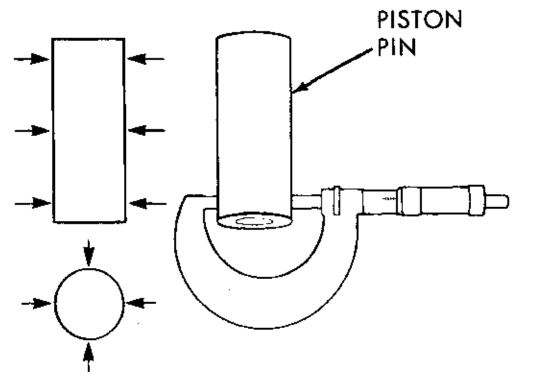

Fig. 219 Piston Pin Diameter

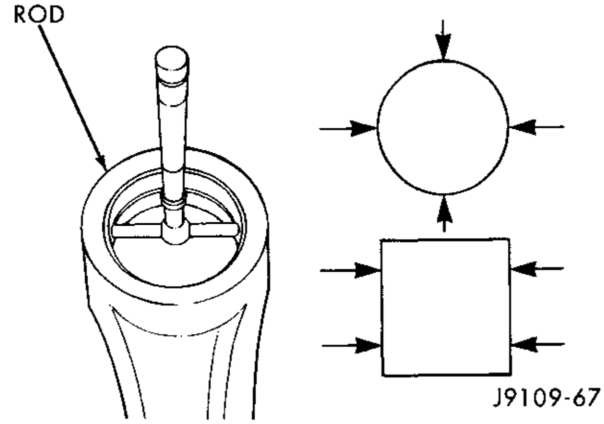

Fig. 220 Connecting Rod Pin Bore

CAMSHAFT

CLEANING

Clean the camshaft in a suitable solvent. Rinse in hot water and blow dry with compressed air.

INSPECTION

NOTE: For camshaft gear inspection, refer to procedure in this group.

(1) Inspect the valve lobes and bearing journals for cracks, pitting, scoring, or generally excessive wear. Replace any camshaft that exceeds the allowable limits.

(2) Measure the bearing journals and lobes (Fig. 221).

CAUTION: If Camshaft lobes are worn, requiring camshaft replacement, it is necessary to replace the tappets also. Refer to Tappet Removal and Installation in this group.

CLEANING AND INSPECTION (Continued)

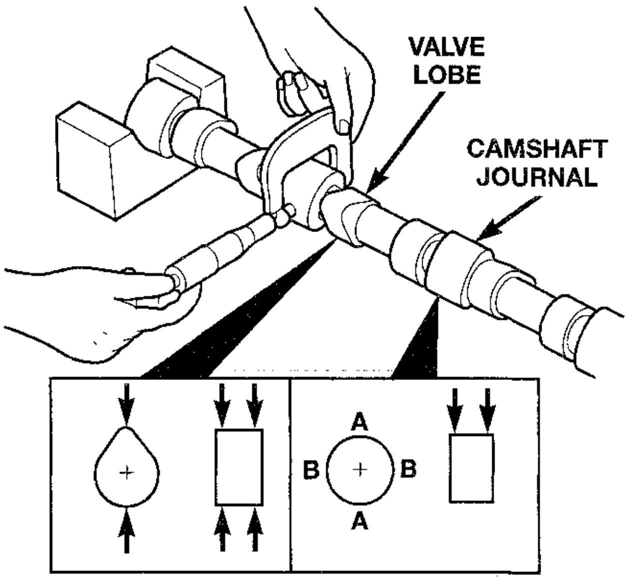

Fig. 221 Measuring Camshaft Main Journals and Lobes

Camshaft Journal Diameter
Journal #1 54.028 mm (2.1270 in.) MIN.
Journal #2-7 53.987 mm (2.1245 in.) MIN.

Camshaft Lobe Height
Intake Lobe 47.173 mm (1.857 in.) MIN.
Exhaust Lobe 45.636 mm (1.796 in.) MIN.

CAMSHAFT GEAR

INSPECTION

Visually inspect the camshaft gear for cracks (hub and gear), chipped or broken teeth, or excessive fretting (Fig. 222)(Fig. 223). Inspect and replace the keyway, if damaged.

TAPPETS

CLEANING

Clean tappet with a suitable solvent. Rinse in hot water and blow dry with a clean shop rag or compressed air.

INSPECTION

(1) Visually inspect the tappet the tappet socket, stem, and face for excessive wear, cracks, or obvious damage (Fig. 224).

(2) Measure the tappet stem diameter. Replace the tappet if it falls below the minimum size (Fig. 224).

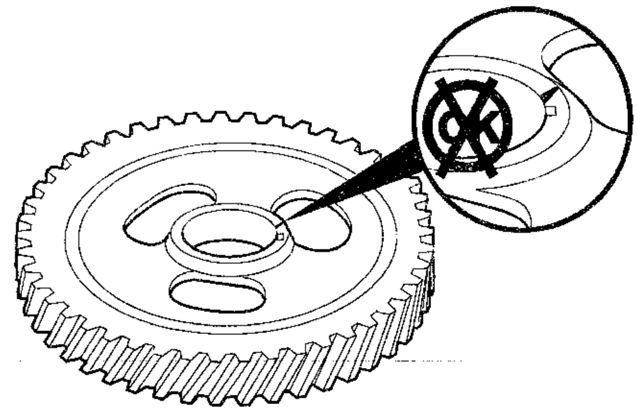

Fig. 222 Inspecting Camshaft Gear Hub for Cracks

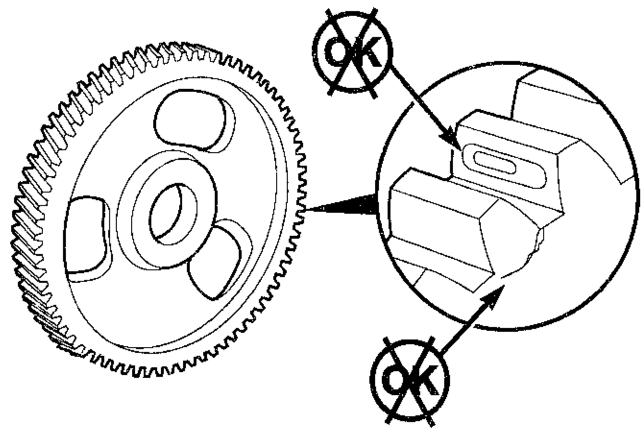

Fig. 223 Inspecting Camshaft Gear for Cracks and Fretting

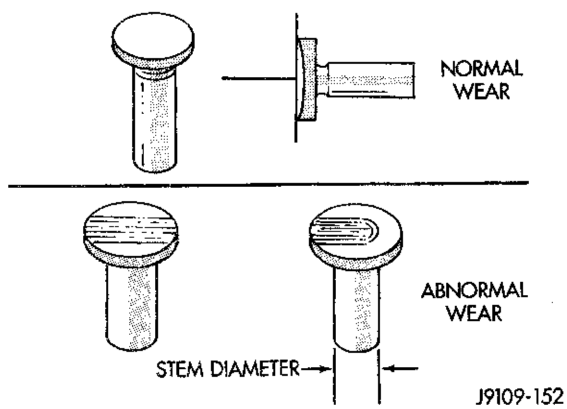

Fig. 224 Tappet Inspection

TAPPET STEM DIAMETER
15.925 mm (0.627 in.) MIN.

CLEANING AND INSPECTION (Continued)

CRANKSHAFT DAMPER

INSPECTION

(1) Inspect the damper hub for cracks and replace if any are found.

(2) Inspect the index lines on the damper hub and the inertia member (Fig. 225). If the lines are more than 1.59 mm (1/16 in.) out of alignment, replace the damper.

(3) Inspect the rubber member for deterioration or missing segments (Fig. 226).

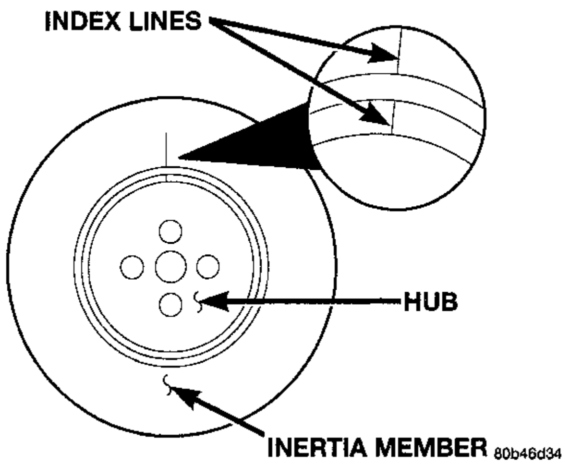

Fig. 225 Inspect Index Lines for Alignment

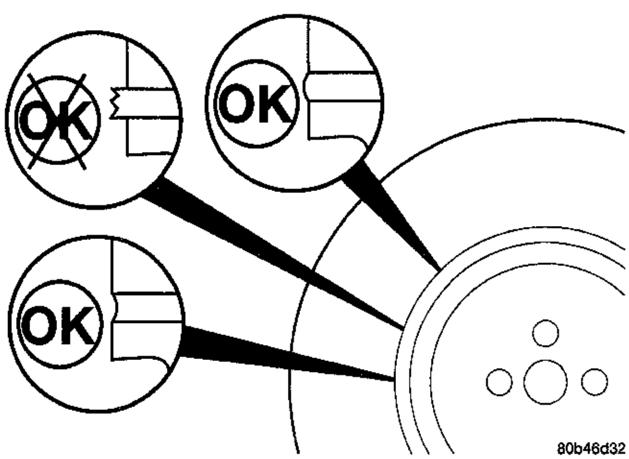

Fig. 226 Inspect Damper Rubber Member

ROCKER ARM AND SHAFT

CLEANING

Disassemble and clean the rocker arm(s) (Fig. 227)in a suitable solvent. Rinse in hot water and blow dry with compressed air. If necessary, use a wire brush or wheel to remove stubborn deposits. Inspect oil passages in rocker arms and pedestals. Apply compressed air to oil orifices to purge contaminants.

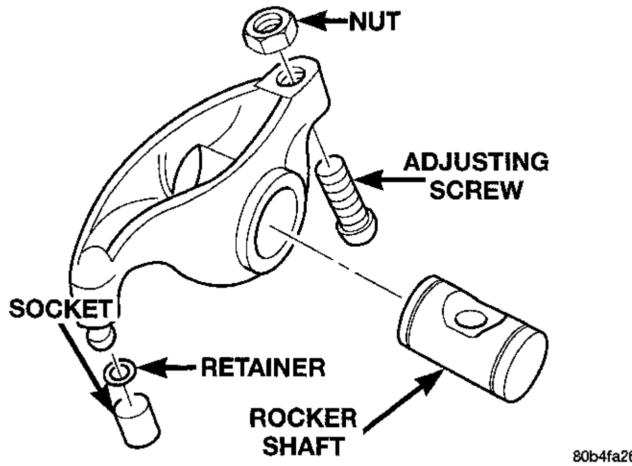

Fig. 227 Rocker Arm Assembly

INSPECTION

(1) Remove rocker shaft and inspect for cracks and excessive wear in the bore or shaft. Remove socket and inspect ball insert and socket for signs of wear. Replace retainer if necessary.

(2) Measure the rocker arm bore and shaft (Fig. 228)(Fig. 229).

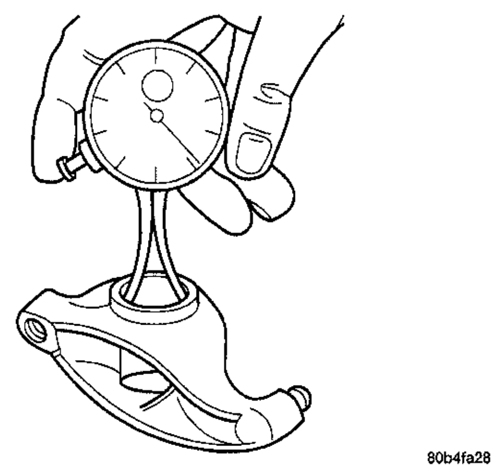

Fig. 228 Measuring Rocker Arm Bore

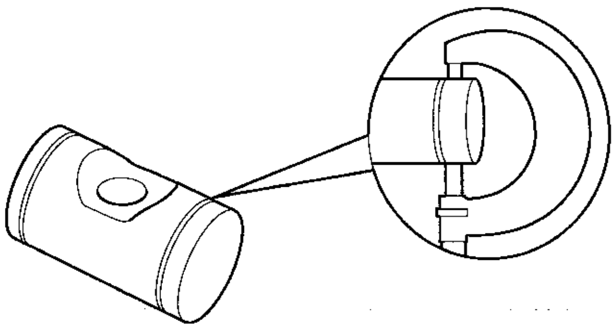
ROCKER ARM BORE (MAX.)
22.027 mm (.867 in.)

PUSHRODS

CLEANING

Clean the push rods in a suitable solvent. Rinse in hot water and blow dry with compressed air. If necessary, use a wire brush or wheel to remove stubborn deposits.

CLEANING AND INSPECTION (Continued)



80b4fa29

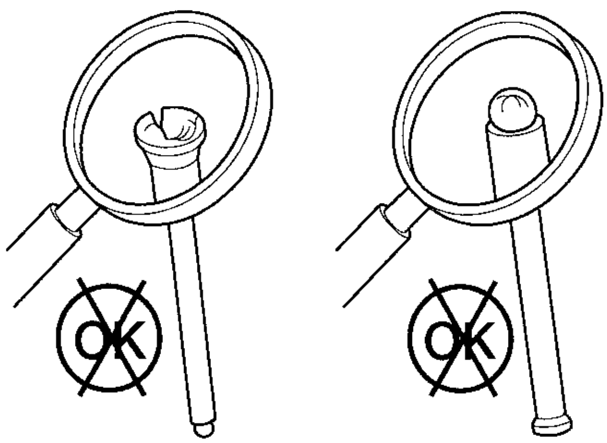
Fig. 229 Measuring Rocker Arm Shaft

ROCKER ARM SHAFT (MIN.)
21.965 mm (.865 in.)

INSPECTION

Inspect the push rod ball and socket for signs of scoring. Check for cracks where the ball and the socket are pressed into the tube (Fig. 230).

Roll the push rod on a flat work surface with the socket end hanging off the edge (Fig. 231). Replace any push rod that appears to be bent.



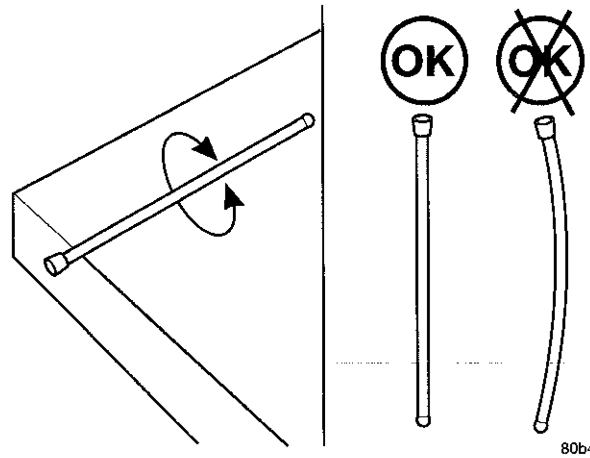
80b4fa24

Fig. 230 Inspecting Push Rod for Cracks

CROSSHEADS

CLEANING

Clean all crossheads in a suitable solvent. If necessary, use a wire brush or wheel to remove stubborn deposits. Rinse in hot water and blow dry with compressed air.

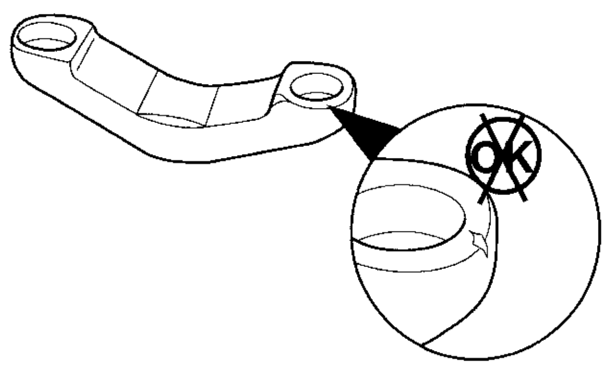


80b4fa23

Fig. 231 Inspecting Push Rod for Flatness

INSPECTION

Inspect the crossheads for cracks and/or excessive wear on rocker lever and valve tip mating surfaces (Fig. 232). Replace any crossheads that exhibit abnormal wear or cracks.



80b4fa27

Fig. 232 Inspecting Crosshead for Cracks

OIL COOLER ELEMENT AND GASKET

CLEANING AND INSPECTION

Clean the sealing surfaces.

Apply 483 kPa (70 psi) air pressure to the element to check for leaks. If the element leaks, replace the element.

OIL PRESSURE REGULATOR VALVE AND SPRING

CLEANING

(1) Clean the regulator spring and plunger (Fig. 233)with a suitable solvent and blow dry with compressed air. If the plunger bore requires cleaning, it is necessary to remove the oil filter head to avoid getting debris into the engine.

CLEANING AND INSPECTION (Continued)

INSPECTION

Inspect the plunger and plunger bore for cracks and excessive wear. Polished surfaces are acceptable. Verify that the plunger moves freely in the bore.

Check the spring for height and load limitations (Fig. 233). Replace the spring if out of limits shown in the figure.

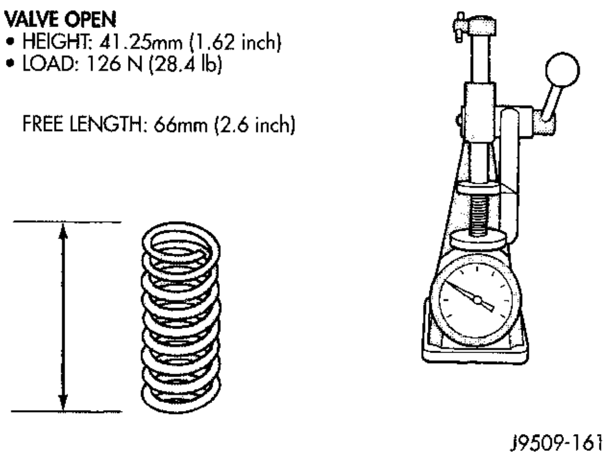


Fig. 233 Oil Pressure Regulator Spring Check

OIL PUMP

CLEANING

Clean all parts in a suitable solvent . Rinse with hot water and blow dry with compressed air. Clean the old sealer residue from the back of the gear housing cover and front of the gear housing.

INSPECTION

Disassemble and inspect the oil pump as follows:

(1) Visually inspect the lube pump gears for chips, cracks or excessive wear.

(2) Remove the back plate (Fig. 234).

(3) Mark TOP on the gerotor planetary using a felt tip pen (Fig. 234).

(4) Remove the gerotor planetary (Fig. 234). Inspect for excessive wear or damage. Inspect the pump housing and gerotor drive for damaged and excessive wear.

(5) Install the gerotor planetary in the original position. The chamfer must be on the O.D. and down.

(6) Measure the tip clearance (Fig. 235). Maximum clearance is 0.1778 mm (0.007 inch). If the oil pump is out of limits, replace the pump.

(7) Measure the clearance of the gerotor drive/gerotor planetary to port plate (Fig. 236). Maximum clearance is 0.127 mm (0.005 inch). If the oil pump is out of limits, replace the pump.

(8) Measure the clearance of the gerotor planetary to the body bore (Fig. 237). Maximum clearance is 0.381 mm (0.015 inch). If the oil pump is out of limits, replace the pump.

(9) Measure the gears backlash (Fig. 238). The limits of a used pump is 0.080- 0.380 mm (0.003-0.015 inch). If the backlash is out of limits, replace the oil pump.

(10) Install the back plate.

EXHAUST SYSTEM AND TURBOCHARGER

CONTENTS

GENERAL INFORMATION

TURBOCHARGER SHUT-DOWN PROCEDURE

The most common turbocharger failure is bearing failure related to repeated hot shutdowns with inadequate "cool-down" periods. A sudden engine shut down after prolonged operation will result in the transfer of heat from the turbine section of the turbocharger to the bearing housing. This causes the oil to overheat and break down, which causes bearing and shaft damage the next time the vehicle is started.

Letting the engine idle after extended operation allows the turbine housing to cool to normal operating temperature. The following chart should be used as a guide in determining the amount of engine idle time required to sufficiently cool down the turbocharger before shut down, depending upon the type of driving and the amount of cargo.

EXHAUST SYSTEM

The diesel engine exhaust system consists of an engine exhaust manifold, turbocharger, exhaust pipe, resonator, extension pipe (if needed), muffler and exhaust tailpipe.

The exhaust manifold is a one piece design and is constructed of cast iron. Spacers are used between the fasteners and the manifold to reduce the impact of thermal stress on the manifold and fasteners.

The exhaust system must be properly aligned to prevent stress, leakage and body contact. If the system contacts any body panel, it may amplify objectionable noises from the engine or body.

When inspecting an exhaust system, critically inspect for cracked or loose joints, stripped screw or

TURBOCHARGER "COOL DOWN" CHART			
Driving Condition	**Load**	**Turbocharger Temperature**	**Idle Time (in minutes) Before Engine Shut Down**
Stop & Go	Empty	Cool	Less than 1
Stop & Go	Medium	Warm	1
Highway Speeds	Medium	Warm	2
City Traffic	Max. GCWR	Warm	3
Highway Speeds	Max. GCWR	Warm	4
Uphill Grade	Max. GCWR	HOT!!	5

GENERAL INFORMATION (Continued)

bolt threads, corrosion damage and worn, cracked or broken hangers. Replace all components that are badly corroded or damaged. DO NOT attempt to repair.

When replacement is required, use original equipment parts (or their equivalent). This will assure proper alignment and provide acceptable exhaust noise levels.

CAUTION: Avoid application of rust prevention compounds or undercoating materials to exhaust system floor pan exhaust heat shields. Light overspray near the edges is permitted. Application of coating will result in excessive floor pan temperatures and objectionable fumes.

DESCRIPTION AND OPERATION

AIR INTAKE / BOOST SYSTEM

The air intake system consists of the air cleaner/ housing assembly, turbocharger, charge air cooler piping, charge air cooler, intake air grid heater, and the intake manifold.

Intake air is drawn through the air cleaner and into the turbocharger compressor housing. Pressurized air from the turbocharger then flows forward through the charge air cooler (Fig. 1) located in front of the radiator. From the charge air cooler the air flows back into the intake manifold.

The charge air cooler is a heat exchanger that uses air flow from vehicle motion to dissipate heat from the intake air. As the turbocharger increases air pressure, the air temperature increases. Lowering the intake air temperature increases engine efficiency and power.

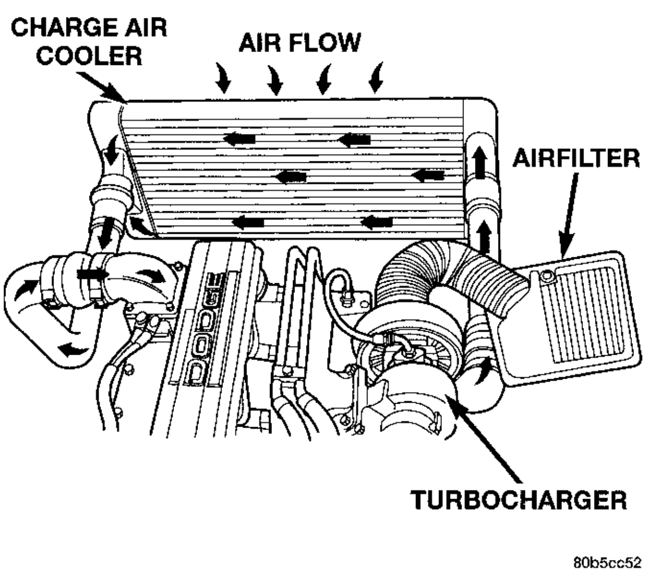

Fig. 1 Intake Air Circulation

CAUTION: The charge air cooler must be cleaned following turbocharger failure involving an oil leak. Oil leaking from the turbocharger can cause engine runaway, possibly leading to engine failure. Refer to Charge Air Cooler Removal and Installation in this group.

TURBOCHARGER

CAUTION: The turbocharger is a performance part and must not be tampered with. The wastegate bracket is an integral part of the turbocharger. Tampering with the wastegate components can reduce durability by increasing cylinder pressure and thermal loading due to incorrect inlet and exhaust manifold pressure. Poor fuel economy and failure to meet regulatory emissions laws may result. Increasing the turbocharger boost WILL NOT increase engine power.

DESCRIPTION

The turbocharger is an exhaust-driven supercharger which increases the pressure and density of the air entering the engine. With the increase of air entering the engine, more fuel can be injected into the cylinders, which creates more power during combustion.

The turbocharger assembly consists of four (4) major component systems (Fig. 2) (Fig. 3):

- Turbine section
- Compressor section
- Bearing housing
- Wastegate

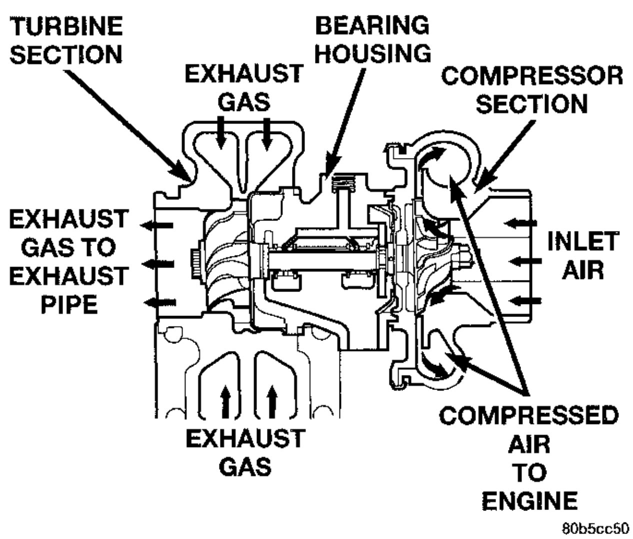

Fig. 2 Turbocharger Operation

AUTHENTIC RESTORATION PRODUCT

DESCRIPTION AND OPERATION (Continued)

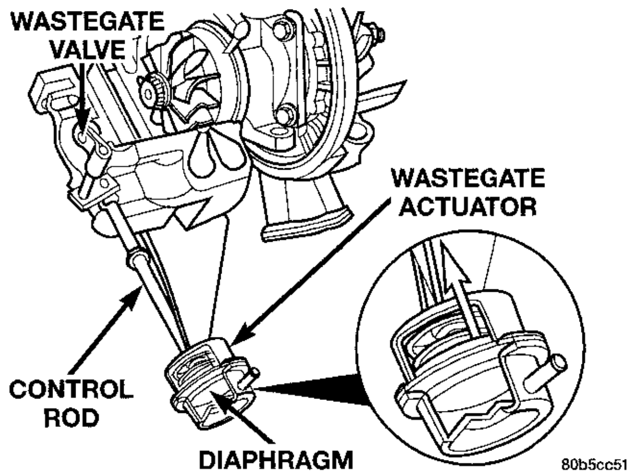

Fig. 3 Turbocharger Wastegate

OPERATION

Exhaust gas pressure and energy drive the turbine, which in turn drives a centrifugal compressor that compresses the inlet air, and forces the air into the engine through the charge air cooler and plumbing. Since heat is a by-product of this compression, the air must pass through a charge air cooler to cool the incoming air and maintain power and efficiency.

Increasing air flow to the engine provides:
- Improved engine performance
- Lower exhaust smoke density
- Improved operating economy
- Altitude compensation
- Noise reduction.

The turbocharger also uses a wastegate (Fig. 4), which regulates intake manifold air pressure and prevents over boosting at high engine speeds. When the wastegate valve is closed, all of the exhaust gases flow through the turbine wheel. As the intake manifold pressure increases, the wastegate actuator opens the valve, diverting some of the exhaust gases away from the turbine wheel. This limits turbine shaft speed and air output from the impeller.

LUBRICATION

The turbocharger is lubricated by engine oil that is pressurized, cooled, and filtered. The oil is delivered to the turbocharger by a supply line that is tapped into the oil filter head. The oil travels into the bearing housing, where it lubricates the shaft and bearings (Fig. 5). A return pipe at the bottom of the bearing housing, routes the engine oil back to the crankcase.

DIAGNOSIS AND TESTING

EXHAUST SYSTEM DIAGNOSIS CHART

EXCESSIVE EXHAUST NOISE OR LEAKING EXHAUST GASES	
POSSIBLE CAUSE	**CORRECTION**
Leaks at pipe joints.	Tighten clamps/bolts at leaking joints.
Rusted or blown out muffler.	Replace muffler. Inspect exhaust system.
Broken or rusted out exhaust pipe.	Replace exhaust pipe.
Exhaust pipe leaking at manifold flange.	Tighten/replace flange attaching nuts/bolts.
Exhaust manifold cracked or broken.	Replace exhaust manifold.
Leak between exhaust manifold and cylinder head.	Tighten exhaust manifold to cylinder head bolts.
Turbocharger mounting flange cracked.	Remove turbocharger and inspect. Refer to Turbocharger Removal and Installation in this group.
Restriction in exhaust system.	Remove restriction, if possible. Replace restricted part if necessary.

TURBOCHARGER / AIR INTAKE SYSTEM DIAGNOSIS

CAUTION: Never operate the engine with the turbocharger air inlet hose and air cleaner housing removed. The turbocharger is a precision component and it is imperative that it always recieves filtered air. Otherwise, premature turbocharger and/or engine failure can result.

Proper turbocharger/air intake system diagnosis is critical when it involves low power or noise complaints. Low power, noise, and oil leak complaints can be easily misdiagnosed as a faulty turbocharger, resulting in the unnecessary replacement of an expensive component. Therefore, it is essential that the following diagnosis be performed prior to any turbocharger/air intake system service.

LOW POWER/NOISE DIAGNOSIS

NOTE: Before proceeding with turbocharger and boost system diagnosis, verify that there are no performance related DTC's or fuel and emission system faults present.

It is normal for the turbocharger to emit a "whine" sound that varies in intensity depending on engine speed and load. The sound is caused by the very high rotational speed of the rotor assembly (up to 130,000 rpm) and the method used to balance the rotor assembly during manufacturing. Consequently, the sound will be more audible at full speed.

Leaks in the air system intake and/or exhaust components can produce excessive noise. These noises are typically a high pitched "whine" or sucking sound, depending on which side of the compressor they are located. Lower pitched noises or rattles at low engine speeds may indicate debris in the system or an impeller-to-housing rubbing condition.

(1) Make sure engine is off (not running).

(2) Install a DRB III to the vehicle and check for any performance related DTC's. Repair DTC setting failures before further diagnosis. Refer to Group 25, Emission Control Systems for the correct procedures.

(3) Remove the air cleaner housing from the vehicle and inspect for obstructions. Replace the air filter as necessary. Refer to Group 14, Fuel System for air filter housing and Filter Minder® procedures.

(4) Inspect the turbocharger:

(a) Visually inspect the impeller and compressor wheel fins for nicks, cracks, or chips. Note: Some impellers may have a factory placed paint mark which, after normal operation, appears to be a crack. Remove this mark with a suitable solvent to verify that it is not a crack.

(b) Visually inspect the compressor and turbine housing for an impeller rubbing condition. Apply light side to side pressure to the nose of the impeller to see if contact with the housing will restrict impeller rotation. Replace the turbocharger if an impeller to housing rubbing condition exists.

(c) Measure rotor shaft axial end play and radial bearing clearances. Refer to procedure in this group. Replace turbocharger if measurements are outside of specifications.

(5) Inspect and test boost system for leaks:

(a) Visually inspect boost system for cracked tubes and rubber connectors, poor connections and

mopar AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING (Continued)

loose clamps. Verify torque at all boost system clamps at 8 N·m (71 in. lbs.) torque.

(b) Leak test boost system. Obtain the Charge Air Cooler Tester Kit #3824556 from Cummins® Service Products.

(I) Disconnect boost tube from the air inlet/intake manifold. Cap off the tube end.

(II) Install the appropriate test plug from the kit to the turbocharger air inlet.

(III) Apply 172 kPa (25 psi) to the boost system. Listen for leaks and repair as necessary. Use a solution of soap and water at connections and on suspect areas to help determine possible leak areas.

(IV) If the charge air cooler is suspected of leaking, remove the boost tubes and install the necessary cap and test plug from the CAC tester kit. Apply 172 kPa (25 psi) to the charge air cooler and replace if found to be leaking.

(6) Inspect the wastegate signal line for cracks and verify wastegate operation and adjustment. Refer to Wastegate Verification/Adjustment in this group.

(7) Perform the Boost Pressure Test to determine if there are any intake system restrictions, plugging, or damage. Refer to Group 14, Fuel System for the correct procedure.

TURBOCHARGER OIL LEAKS

Turbocharger oil leaks can be classified as one of two types: external or internal. External leaks are usually limited to the turbocharger oil supply line fitting and the oil drain tube flange and gasket. Internal leaks, however, are more complicated to detect. Many turbocharger internal oil leaks are caused by problems in systems outside of the turbocharger.

NOTE: A light trace of oil present in the turbine or compressor housing is acceptable and repair is not necessary. Repair is only necessary when oil is dripping or wet to the touch.

NOTE: When a component fails causing engine oil migration into the intake air/boost system, the charge air cooler and related tubing must be flushed. Refer to Charge Air Cooler Removal/Installation for the related procedures.

TURBOCHARGER OIL LEAK DIAGNOSIS CHARTS

EXTERNAL OIL LEAKS	
POSSIBLE CAUSE	**CORRECTION**
Oil supply line or o-ring leaking	Disconnect the oil supply line and inspect o-ring. Replace if necessary. Install and tighten line fitting to 20 N·m (133 in. lbs.) torque.
Oil drain tube leaking.	Inspect drain tube flange and gasket. Replace gasket if necessary.
Turbocharger bearing housing leaking.	Replace turbocharger assy.

INTERNAL LEAKS (OIL FOUND IN COMPRESSOR HOUSING)	
POSSIBLE CAUSE	**CORRECTION**
Dirty air cleaner or restricted air inlet system.	Inspect air cleaner, housing, and inlet duct for restriction. Repair/replace as necessary.
Foreign object in exhaust manifold.	Remove exhaust manifold and inspect for obstruction. Refer to Exhaust Manifold Removal and Installation in this group.
Restricted exhaust system.	Repair/replace restricted component as necessary.
Restricted turbocharger oil drain tube, causing engine oil to migrate past the seal.	Remove tube and inspect for obstructions.
Restricted crankcase breather.	Remove crankcase breather and inspect for obstructions.
Defective turbocharger compressor seal.	Replace turbocharger assy.
Engine mechanical problem.	Excessive crankcase pressure (blow-by). This condition does not allow the oil to drain, and oil is drawn past the compressor seal and into the engine. Refer to Group 9, Engine.

DIAGNOSIS AND TESTING (Continued)

INTERNAL LEAKS (OIL FOUND IN TURBINE HOUSING)	
POSSIBLE CAUSE	**CORRECTION**
Restricted turbocharger oil drain tube, causing engine oil to migrate past the seal.	Remove tube and inspect for obstructions.
Restricted crankcase breather.	Remove crankcase breather and inspect for obstructions.
Engine mechanical problem.	Remove turbocharger assy. Inspect turbine inlet for the presence of engine oil. If oil is present, then engine oil consumption problem exists. Refer to Group 9, Engine. If no oil is present at turbine inlet, replace turbocharger.
Defective turbocharger turbine seal.	Replace turbocharger assy.

REMOVAL AND INSTALLATION

EXHAUST PIPE

WARNING: IF TORCHES ARE USED WHEN WORKING ON THE EXHAUST SYSTEM, DO NOT ALLOW THE FALME NEAR THE FUEL LINES.

REMOVAL

(1) Disconnect the battery negative cables.
(2) Raise and support the vehicle on a hoist.
(3) Saturate the bolts and nuts with heat valve lubricant. Allow 5 minutes for penetration.
(4) Remove the exhaust pipe-to-extension pipe clamp. Separate the exhaust pipe and extension pipe.
(5) Remove the exhaust pipe-to-turbocharger elbow bolts (Fig. 6).
(6) Remove the exhaust pipe from the transmission support (Fig. 6).

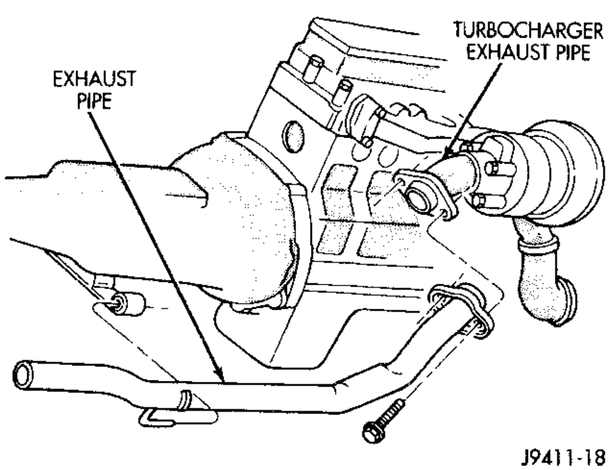

Fig. 6 Exhaust Pipe Removal/Installation

INSTALLATION

(1) Install the exhaust pipe into the transmission support and onto the turbocharger flange (Fig. 6).
(2) Install the exhaust pipe-to-turbocharger elbow bolts and tighten to 34 N·m (25 ft. lbs.) torque.
(3) Install the extension pipe and clamp to the exhaust pipe using a new clamp and tighten the clamp nuts to 43 N·m (32 ft. lbs.) torque.
(4) Lower the vehicle.
(5) Connect the battery negative cables.
(6) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. Adjust the alignment, if needed.

RESONATOR

WARNING: IF TORCHES ARE USED WHEN WORKING ON THE EXHAUST SYSTEM, DO NOT ALLOW THE FLAME NEAR THE FUEL LINES.

REMOVAL

(1) Disconnect the battery negative cables.
(2) Raise vehicle on hoist.
(3) Remove the exhaust clamps from the resonator to extension pipes (Fig. 7).
(4) Separate the resonator from the front and rear extension pipes (Fig. 7) and remove the resonator from the vehicle.

INSTALLATION

(1) Assemble the resonator to the front and rear extension pipes (Fig. 7).
(2) Install new exhaust clamps, align the exhaust system, and tighten the exhaust clamps to 43 N·m (32 ft. lbs.) torque.
(3) Lower the vehicle.
(4) Connect the battery negative cables.
(5) Start the engine and inspect for exhaust leaks.

MUFFLER

WARNING: IF TORCHES ARE USED WHEN WORKING ON THE EXHAUST SYSTEM, DO NOT ALLOW THE FLAME NEAR THE FUEL LINES.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

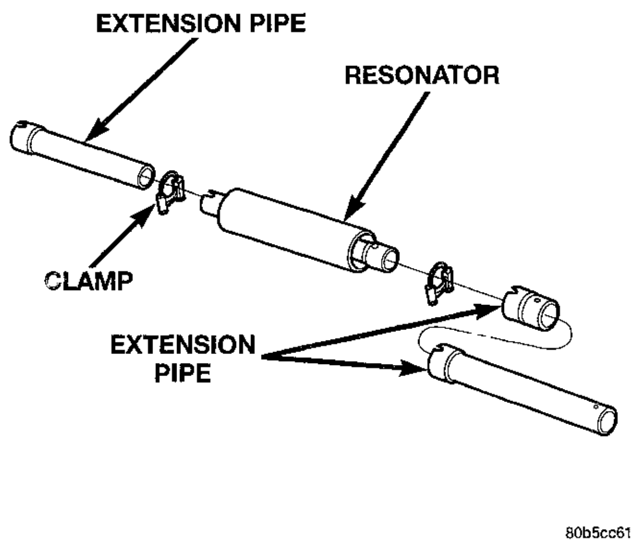

Fig. 7 Resonator Removal/Installation

REMOVAL

(1) Disconnect the battery negative cables.
(2) Raise and support the vehicle.
(3) Remove the muffler to tail pipe and extension pipe clamps (Fig. 8).
(4) Disconnect the muffler from the hanger isolators (Fig. 8).
(5) Disconnect the muffler from the tailpipe.
(6) Disconnect the muffler from the extension pipe and remove from the vehicle..

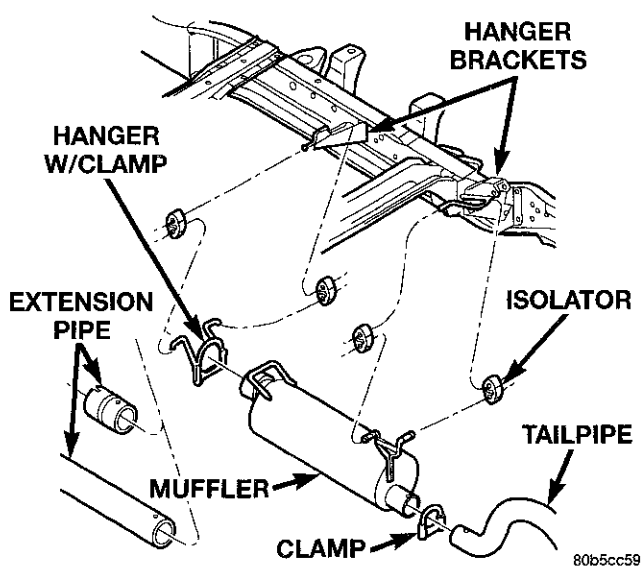

Fig. 8 Muffler Removal/Installation

INSTALLATION

(1) Install the muffler hanger rods into the isolators (Fig. 8).
(2) Install the muffler into the extension pipe.
(3) Install the muffler into the tail pipe.
(4) Install the exhaust clamps, align the exhaust system, and tighten the exhaust clamps to 43 N·m (32 ft. lbs.) torque.
(5) Lower the vehicle.
(6) Connect the battery negative cables.
(7) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. Adjust the alignment, if needed.

TAILPIPE

WARNING: IF TORCHES ARE USED WHEN WORKING ON THE EXHAUST SYSTEM, DO NOT ALLOW THE FLAME NEAR THE FUEL LINES.

REMOVAL

(1) Disconnect the battery negative cables.
(2) Raise and support the vehicle.
(3) Saturate the clamp nuts with heat valve lubricant. Allow 5 minutes for penetration.
(4) Disconnect the exhaust tailpipe support hanger isolators (Fig. 9).
(5) Remove the muffler-to-tailpipe clamps (Fig. 9).
(6) Remove the tailpipe from the vehicle.

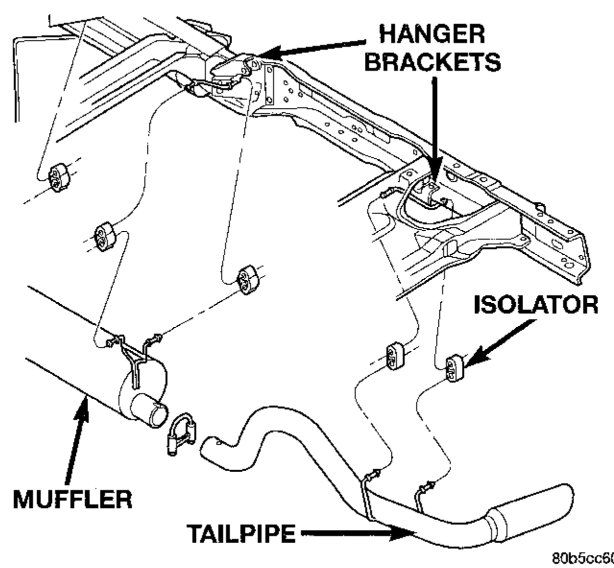

Fig. 9 Tailpipe Removal/Installation

REMOVAL AND INSTALLATION (Continued)

INSTALLATION

(1) Install the tailpipe into the muffler.

(2) Install the tailpipe hanger rods into the isolators (Fig. 9)

(3) Install the exhaust clamp, align the exhaust system, and tighten the clamp 43 N·m (32 ft. lbs.) torque.

(4) Lower the vehicle.

(5) Connect the battery negative cables.

(6) Start the engine and inspect for exhaust leaks and exhaust system contact with the body panels. Adjust the alignment, if needed.

HEAT SHIELDS

REMOVAL

(1) Raise and support the vehicle.

(2) Remove the nuts or bolts holding the exhaust heat shield to the floor pan, crossmember or bracket.

(3) Slide the shield out around the exhaust system.

INSTALLATION

(1) Position the exhaust heat shield to the floor pan, crossmember or bracket and install the nuts or bolts.

(2) Tighten the nuts and bolts.

(3) Lower the vehicle.

EXHAUST MANIFOLD

REMOVAL

(1) Disconnect the battery negative cables.

(2) Raise vehicle on hoist.

(3) Disconnect the exhaust pipe from the turbocharger elbow (Fig. 10).

(4) Lower vehicle.

(5) Disconnect the turbocharger air inlet hose (Fig. 11).

(6) Disconnect the turbocharger oil supply line and the oil drain tube from the turbocharger (Fig. 12).

(7) Disconnect the charge air cooler inlet pipe from the turbocharger (Fig. 12).

(8) Remove the turbocharger and gasket from the exhaust manifold.

(9) Remove the cab heater return pipe nut from the exhaust manifold stud. Position the tube out of the way.

(10) Remove the exhaust manifold-to-cylinder head bolts and spacers (Fig. 13).

(11) Remove the exhaust manifold and gaskets (Fig. 13).

CLEANING

Clean the cylinder head and exhaust manifold sealing surfaces with a suitable scraper. Use a Scotch-Brite™ pad or equivalent.

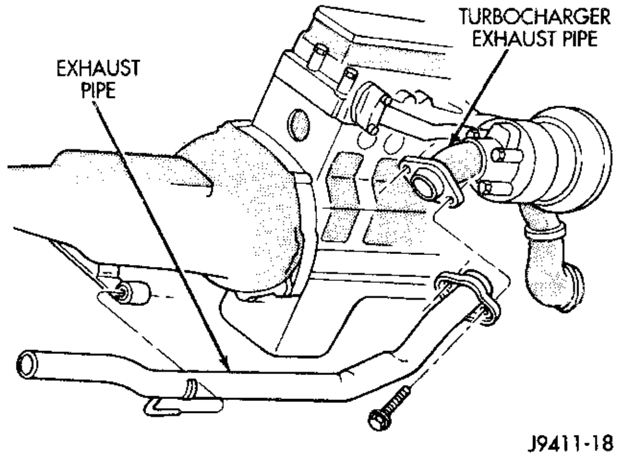

Fig. 10 Exhaust Pipe

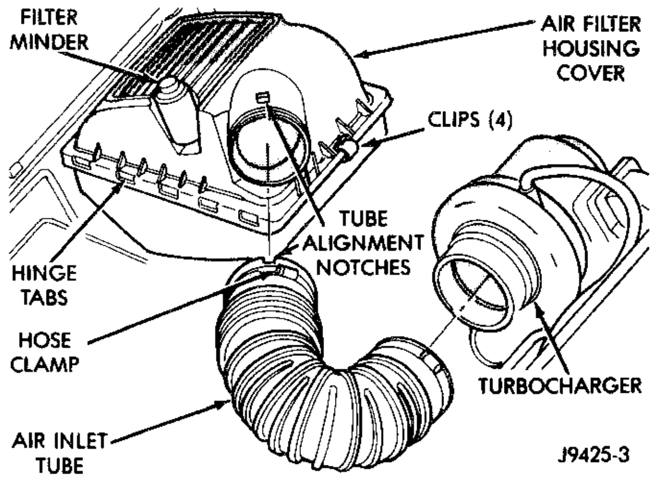

Fig. 11 Turbocharger Air Inlet Hose

INSPECTION

Inspect the exhaust manifold for cracks. Measure the exhaust manifold for flatness. Place a ruler over all of the exhaust ports and insert a feeler gauge between the port flange and the ruler.

INSTALLATION

(1) Using new gaskets, install the exhaust manifold and gaskets. Install the bolts and spacers and tighten the bolts in the sequence shown in (Fig. 13) to 43 N·m (32 ft. lbs.) torque.

(2) Install the cab heater return hose to the manifold bolt stud. Tighten the nut to 24 N·m (18 ft. lbs.) torque.

(3) Install the turbocharger. Apply anti-seize to the studs and then tighten the turbocharger mounting nuts to 32 N·m (24 ft. lbs.) torque.

(4) Install the oil drain tube and oil supply line to the turbocharger. Tighten the drain tube bolts to 24 N·m (18 ft. lbs.) torque.

REMOVAL AND INSTALLATION (Continued)

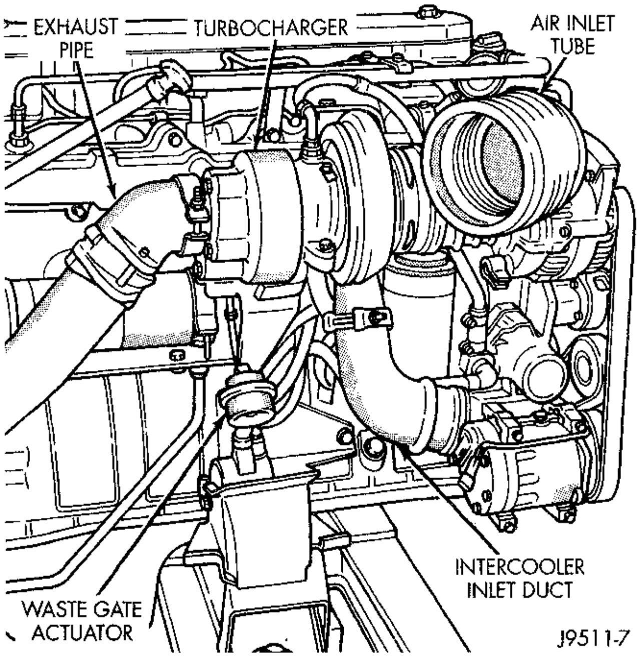

Fig. 12 Oil Supply Line and Charge Air Cooler Inlet Duct

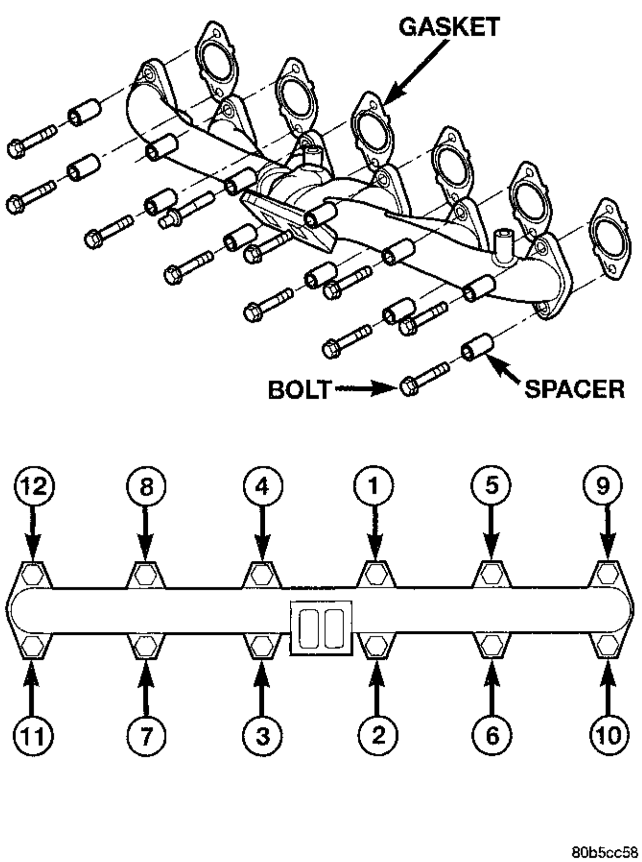

Fig. 13 Exhaust Manifold and Gaskets

EXHAUST MANIFOLD FLATNESS
0.20 mm (0.008 in.) MAX.

(5) **Pre-lube the turbocharger.** Pour 50 to 60 cc (2 to 3 oz.) clean engine oil in the oil supply line fitting. Rotate the turbocharger impeller by hand to distrubute the oil thoroughly.

(6) Install and tighten the oil supply line fitting nut to 20 N·m (133 in. lbs.) torque.

(7) Position the charge air cooler inlet pipe to the turbocharger. With the clamp in position, tighten the clamp nut to 8 N·m (72 in. lbs.) torque.

(8) Position the air inlet hose to the turbocharger (Fig. 11). Tighten the clamp to 8 N·m (72 in. lbs.) torque.

(9) Raise vehicle on hoist.

(10) Connect the exhaust pipe to the turbocharger (Fig. 10) and tighten the bolts to 34 N·m (25 ft. lbs.) torque.

(11) Lower the vehicle.

(12) Connect the battery negative cables.

(13) Start the engine to check for leaks.

INTAKE MANIFOLD COVER

REMOVAL

(1) Disconnect the battery negative cables.

(2) Remove the charge air cooler outlet tube from the air inlet housing (Fig. 14).

(3) Remove the engine oil dipstick tube mounting bolt (Fig. 14). Position dipstick tube to the side.

(4) Disconnect the air grid heater power cables at the cable mounting studs (Fig. 15).

(5) Remove the four (4) air inlet housing mounting bolts (Fig. 15) and remove the housing from top of the heater elements.

(6) Remove the intake air grid heater from the manifold (Fig. 16).

(7) Remove the high pressure fuel lines. Refer to Group 14, Fuel System for the correct procedure.

(8) Remove the remaining intake manifold cover-to-cylinder head bolts.

(9) Remove the intake manifold cover and gasket. Keep the gasket material and any other material out of the air intake.

(10) Clean the intake manifold cover and cylinder head sealing surface.

INSTALLATION

(1) Using a new gasket, install the intake manifold cover.

(2) Install the cover-to-cylinder head bolts that do not hold down the high pressure fuel line support brackets. Tighten the bolts to 24 N·m (18 ft. lbs.) torque.

REMOVAL AND INSTALLATION (Continued)

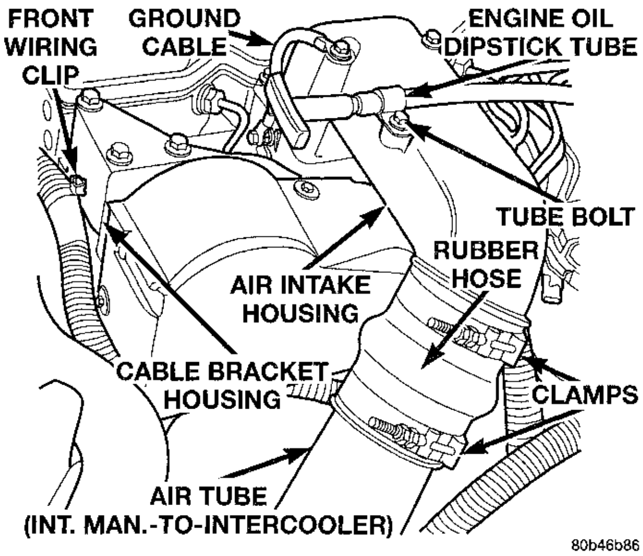

Fig. 14 Charge Air Cooler Air Tube

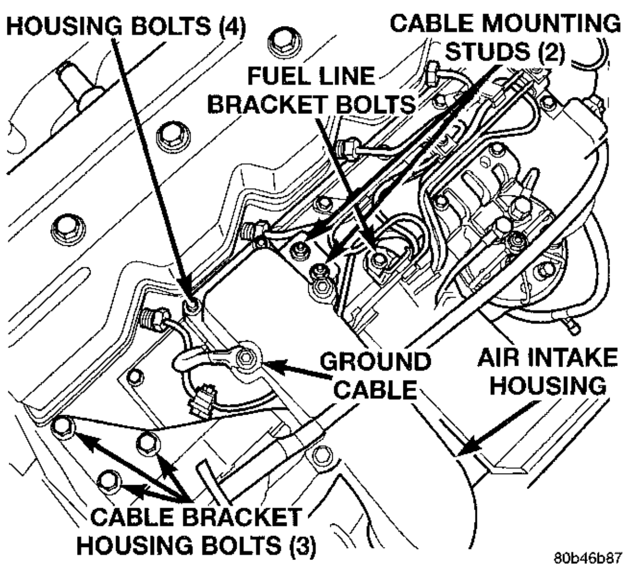

Fig. 15 Air Inlet Housing

(3) Install the high pressure fuel lines. Refer to Group 14, Fuel System for the correct procedure.

(4) Install the high pressure fuel line support bracket-to-intake manifold cover bolts and tighten to 24 N·m (18 ft. lbs.) torque.

(5) Using two (2) new gaskets, install the intake air grid heater and air inlet housing (Fig. 15). Position the ground cable and install and tighten the bolts to 24 N·m (18 ft. lbs.) torque.

(6) Install and tighten the air intake heater power supply nuts to 14 N·m (120 in. lbs.) torque.

(7) Install the engine oil dipstick tube and mounting bolt (Fig. 14).

(8) Position the charge air cooler outlet tube onto the air inlet housing (Fig. 14). Tighten the clamps to 8 N·m (72 in. lbs.) torque.

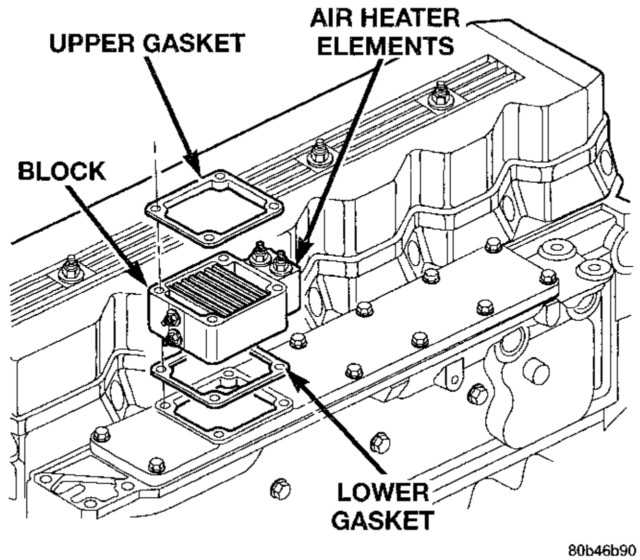

Fig. 16 Intake Air Grid Heater

(9) Perform the fuel system air bleed procedure. Refer to Air Bleed Procedure in Group 14, Fuel System.

(10) Connect the battery negative cables.

TURBOCHARGER

CAUTION: Failed turbochargers introduce engine oil and metal into the charge air cooler and air intake system. The charge air cooler and air intake system MUST be flushed of oil and metallic debris to prevent engine runaway and/or damage.

REMOVAL

(1) Disconnect the battery negative cables.

(2) Raise vehicle on hoist.

(3) Disconnect the exhaust pipe from the turbocharger elbow (Fig. 17).

(4) Lower vehicle.

(5) Disconnect the turbocharger air inlet hose (Fig. 18).

(6) Disconnect the turbocharger oil supply line and the oil drain tube from the turbocharger (Fig. 19).

(7) Disconnect the charge air cooler inlet pipe from the turbocharger (Fig. 19).

(8) Remove the turbocharger and gasket from the exhaust manifold.

(9) If the turbocharger is not to be installed immediately, cover the opening to prevent material from entering into the manifold.

(10) If replacing the turbocharger, transfer the discharge elbow and clamp to the new assembly.

(11) Clean and inspect the sealing surface.

REMOVAL AND INSTALLATION (Continued)

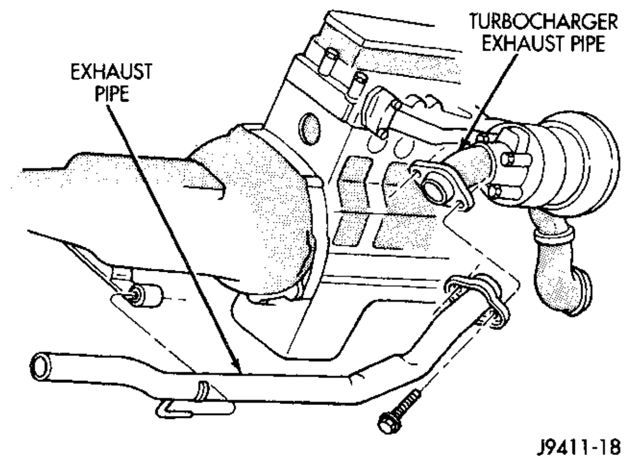

Fig. 17 Exhaust Pipe

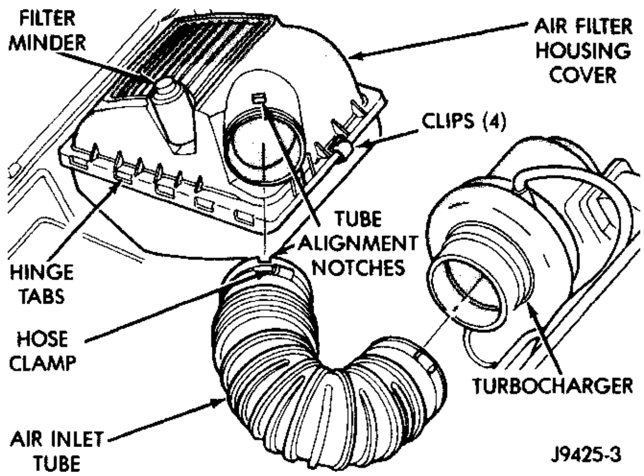

Fig. 18 Turbocharger Air Inlet Hose

CAUTION: The turbocharger is only serviced as an assembly. Do not attempt to repair the turbocharger as turbocharger and/or engine damage can result.

CLEANING

Clean the turbocharger and exhaust manifold mounting surfaces with a suitable scraper.

INSPECTION

Visually inspect the turbocharger and exhaust manifold gasket surfaces. Replace stripped or eroded mounting studs.

(1) Visually inspect the turbocharger for cracks. The following cracks are NOT acceptable:

- Cracks in the turbine and compressor housing that go completely through.
- Cracks in the mounting flange that are longer than 15 mm (0.6 in.).
- Cracks in the mounting flange that intersect bolt through-holes.

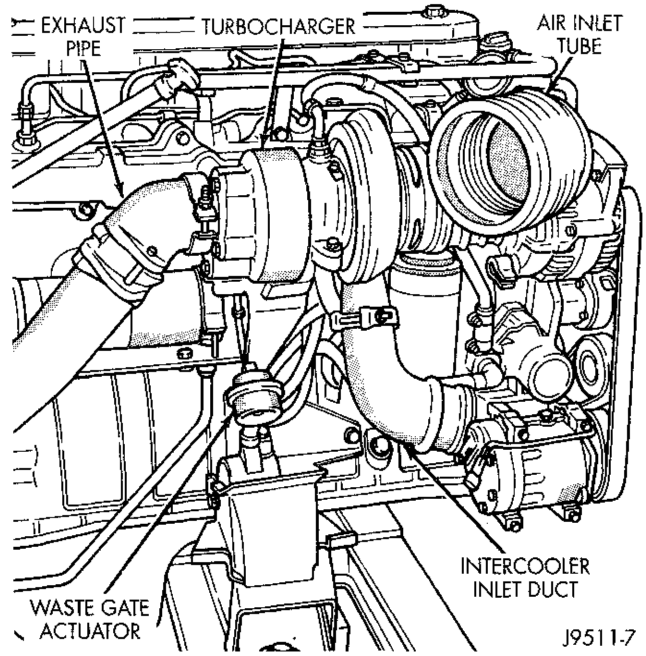

Fig. 19 Oil Supply Line and Charge Air Cooler Inlet Duct

- Two (2) Cracks in the mounting flange that are closer than 6.4 mm (0.25 in.) together.

(2) Inspect the turbocharger compressor housing for an impeller rubbing condition (Fig. 20). Replace the turbocharger if the condition exists.

(3) Measure the turbocharger axial end play:

(a) Install a dial indicator as shown in (Fig. 21). Zero the indicator at one end of travel.

(b) Move the impeller shaft fore and aft and record the measurement. Allowable end play is 0.038 mm (0.0015 in.) MIN. and 0.089 mm (0.0035 in.) MAX. If the recorded measurement falls outside these parameters, replace the turbocharger assembly.

(4) Measure the turbocharger bearing radial clearance:

(a) Insert a narrow blade or wire style feeler gauge between the compressor wheel and the housing (Fig. 22).

(b) Gently push the compressor wheel toward the housing and record the clearance.

(c) With the feeler gauge in the same location, gently push the compressor wheel away from the housing and again record the clearance.

(d) Subtract the smaller clearance from the larger clearance. This is the radial bearing clearance.

(e) Allowable radial bearing clearance is 0.326 mm (0.0128 in.) MIN. and 0.496 mm (0.0195 in.) MAX. If the recorded measurement falls outside these specifications, replace the turbocharger assy.

REMOVAL AND INSTALLATION (Continued)

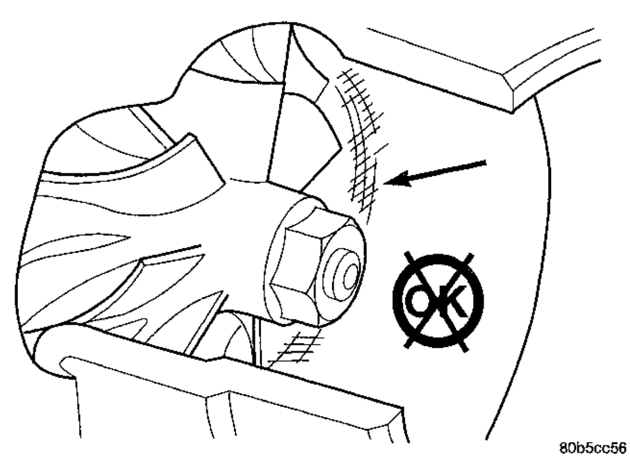

Fig. 20 Inspect Compressor Housing for Impeller Rubbing Condition

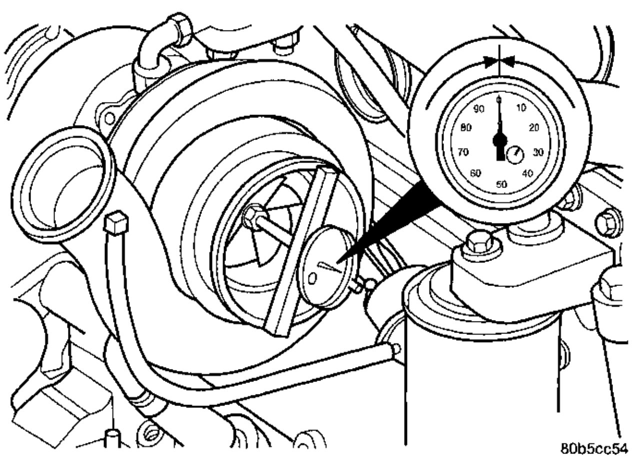

Fig. 21 Measure Turbocharger Axial End Play

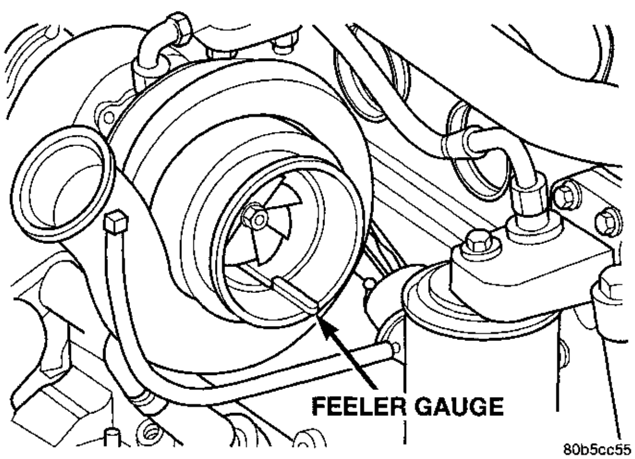

Fig. 22 Measure Turbocharger Bearing Radial Clearance

INSTALLATION

(1) Install the turbocharger. Apply anti-seize to the studs and then tighten the turbocharger mounting nuts to 32 N·m (24 ft. lbs.) torque.

(2) Install the oil drain tube and oil supply line to the turbocharger (Fig. 19). Tighten the drain tube bolts to 24 N·m (18 ft. lbs.) torque.

(3) **Pre-lube the turbocharger.** Pour 50 to 60 cc (2 to 3 oz.) clean engine oil in the oil supply line fitting. Carefully rotate the turbocharger impeller by hand to distribute the oil thoroughly.

(4) Install and tighten the oil supply line fitting nut to 20 N·m (133 in. lbs.) torque.

(5) Position the charge air cooler inlet pipe to the turbocharger. With the clamp in position, tighten the clamp nut to 8 N·m (72 in. lbs.) torque.

(6) Position the air inlet hose to the turbocharger (Fig. 18). Tighten the clamp to 8 N·m (72 in. lbs.) torque.

(7) Raise vehicle on hoist.

(8) Connect the exhaust pipe to the turbocharger (Fig. 17) and tighten the bolts to 34 N·m (25 ft. lbs.) torque.

(9) Lower the vehicle.

(10) Connect the battery negative cables.

(11) Start the engine to check for leaks.

CHARGE AIR COOLER

REMOVAL

WARNING: IF THE ENGINE WAS JUST TURNED OFF, THE AIR INTAKE SYSTEM TUBES MAY BE HOT.

(1) Disconnect the battery negative cables.

(2) Remove the front bumper. Refer to Group 13, Frame and Bumper for the correct procedure.

(3) Remove the front support bracket.

(4) Discharge the A/C system and remove the A/C condenser (Fig. 23) (if A/C equipped). Refer to Group 24, Heating and Air Conditioning for the correct procedures.

(5) Remove the transmission auxiliary cooler (Fig. 23) (if equipped). Refer to Group 7, Cooling System for the correct procedure.

(6) Remove the boost tubes from the charge air cooler (Fig. 24).

(7) Remove the charge air cooler bolts. Pivot the charge air cooler forward and up to remove.

CLEANING

(1) If the engine experiences a turbocharger failure or any other situation where oil or debris get into the charge air cooler, the charge air cooler must be cleaned internally.

Mopar AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

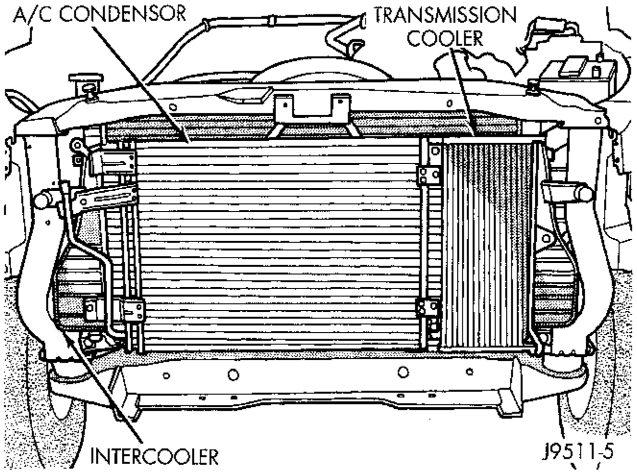

Fig. 23 Condenser and Transmission Auxiliary Cooler

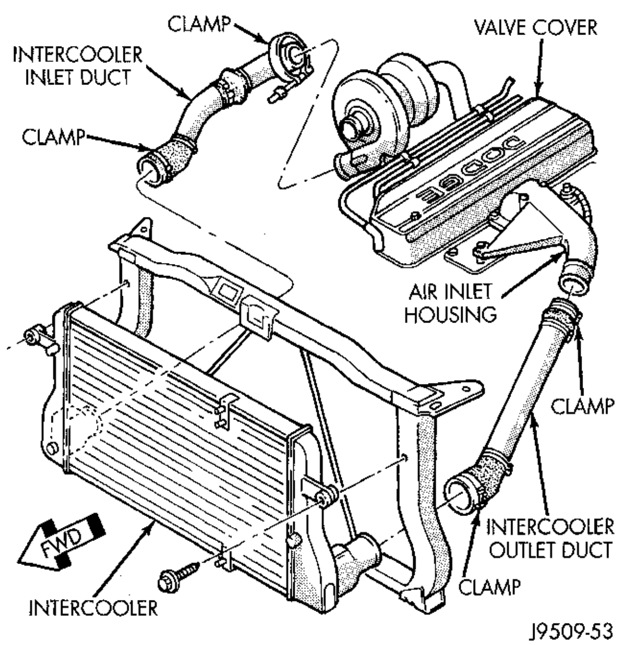

Fig. 24 Air Intake System Tubes

CAUTION: Do not use caustic cleaners to clean the charge air cooler. Damage to the charge air cooler will result.

(2) Position the charge air cooler so the inlet and outlet tubes are vertical.

(3) Flush the cooler internally with solvent in the direction opposite of normal air flow.

(4) Shake the cooler and lightly tap on the end tanks with a rubber mallet to dislodge trapped debris.

(5) Continue flushing until all debris or oil are removed.

(6) Rinse the cooler with hot soapy water to remove any remaining solvent.

(7) Rinse thoroughly with clean water and blow dry with compressed air.

INSPECTION

Visually inspect the charge air cooler for cracks, holes, or damage. Inspect the tubes, fins, and welds for tears, breaks, or other damage.

Pressure test the charge air cooler, using Charge Air Cooler Tester Kit #3824556. This kit is available through Cummins® Service Products. Instructions are provided with the kit.

INSTALLATION

(1) Position the charge air cooler. Install the bolts and tighten to 2 N·m (17 in. lbs.) torque.

(2) Install the air intake system tubes to the charge air cooler. With the clamps in position, tighten the clamps to 8 N·m (72 in. lbs.) torque.

(3) Install the transmission auxiliary cooler (if equipped). Refer to Group 7, Cooling for the correct procedures.

(4) Install the A/C condenser (if A/C equipped). Refer to Group 24, Heating and Air Conditioning for the correct procedures.

(5) Install the front support bracket. Install and tighten the bolts.

(6) Install the front bumper. Refer to Group 13, Frame and Bumpers for the correct procedures.

(7) Connect the battery negative cables.

(8) Start engine and check for boost system leaks.

CLEANING AND INSPECTION

CHARGE AIR COOLER

CLEANING

(1) If the engine experiences a turbocharger failure or any other situation where oil or debris get into the charge air cooler, the charge air cooler must be cleaned internally.

CAUTION: Do not use caustic cleaners to clean the charge air cooler. Damage to the charge air cooler will result.

NOTE: If internal debris cannot be removed from the cooler, the charge air cooler MUST be replaced.

(2) Position the charge air cooler so the inlet and outlet tubes are vertical.

(3) Flush the cooler internally with solvent in the direction opposite of normal air flow.

(4) Shake the cooler and lightly tap on the end tanks with a rubber mallet to dislodge trapped debris.

(5) Continue flushing until all debris or oil are removed.

CLEANING AND INSPECTION (Continued)

(6) Rinse the cooler with hot soapy water to remove any remaining solvent.

(7) Rinse thoroughly with clean water and blow dry with compressed air.

INSPECTION

Visually inspect the charge air cooler for cracks, holes, or damage. Inspect the tubes, fins, and welds for tears, breaks, or other damage. Replace the charge air cooler if damage is found.

Pressure test the charge air cooler, using Charge Air Cooler Tester Kit #3824556. This kit is available through Cummins® Service Products. Instructions are provided with the kit.

TURBOCHARGER

CLEANING

Clean the turbocharger and exhaust manifold mounting surfaces with a suitable scraper.

INSPECTION

Visually inspect the turbocharger and exhaust manifold gasket surfaces. Replace stripped or eroded mounting studs.

(1) Visually inspect the turbocharger for cracks. The following cracks are NOT acceptable:

- Cracks in the turbine and compressor housing that go completely through.
- Cracks in the mounting flange that are longer than 15 mm (0.6 in.).
- Cracks in the mounting flange that intersect bolt through-holes.
- Two (2) Cracks in the mounting flange that are closer than 6.4 mm (0.25 in.) together.

(2) Visually inspect the impeller and compressor wheel fins for nicks, cracks, or chips. Note: Some impellers may have a factory placed paint mark which, after normal operation, appears to be a crack. Remove this mark with a suitable solvent to verify that it is not a crack.

(3) Visually inspect the turbocharger compressor housing for an impeller rubbing condition (Fig. 25). Replace the turbocharger if the condition exists.

(4) Measure the turbocharger axial end play:

(a) Install a dial indicator as shown in (Fig. 26). Zero the indicator at one end of travel.

(b) Move the impeller shaft fore and aft and record the measurement. Allowable end play is 0.038 mm (0.0015 in.) MIN. and 0.089 mm (0.0035 in.) MAX. If the recorded measurement falls outside these parameters, replace the turbocharger assembly.

(5) Measure the turbocharger bearing radial clearance:

(a) Insert a narrow blade or wire style feeler gauge between the compressor wheel and the housing (Fig. 27).

(b) Gently push the compresser wheel toward the housing and record the clearance.

(c) With the feeler gauge in the same location, gently push the compressor wheel away from the housing and again record the clearance.

(d) Subtract the smaller clearance from the larger clearance. This is the radial bearing clearance.

(e) Allowable radial bearing clearance is 0.326 mm (0.0128 in.) MIN. and 0.496 mm (0.0195 in.) MAX. If the recorded measurement falls outside these specifications, replace the turbocharger assy.

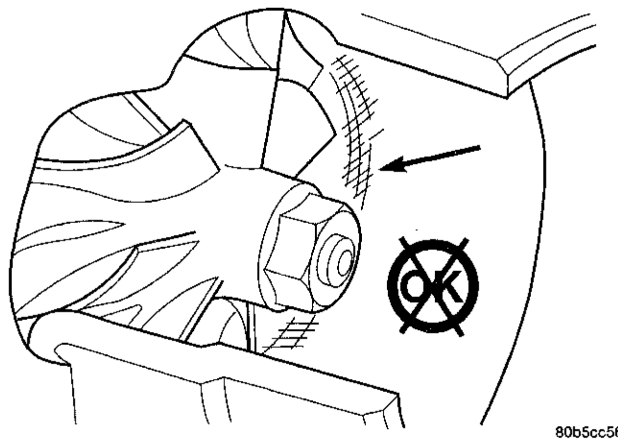

Fig. 25 Inspect Compressor Housing for Impeller Rubbing Condition

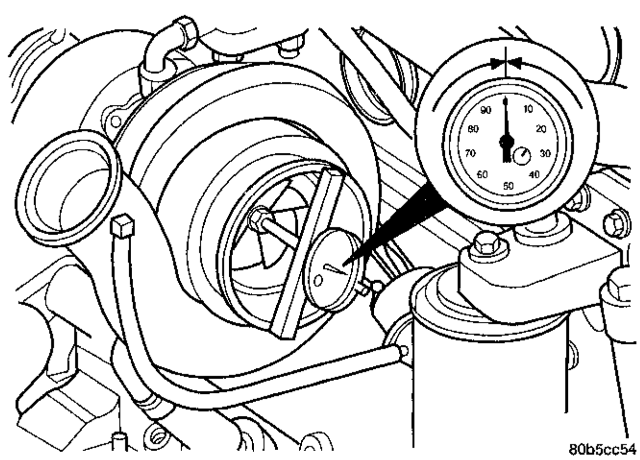

Fig. 26 Measure Turbocharger Axial End Play

EXHAUST MANIFOLD

CLEANING

Clean the cylinder head and exhaust manifold sealing surfaces with a suitable scraper. Use a Scotch-Brite® pad or equivalent.

CLEANING AND INSPECTION (Continued)

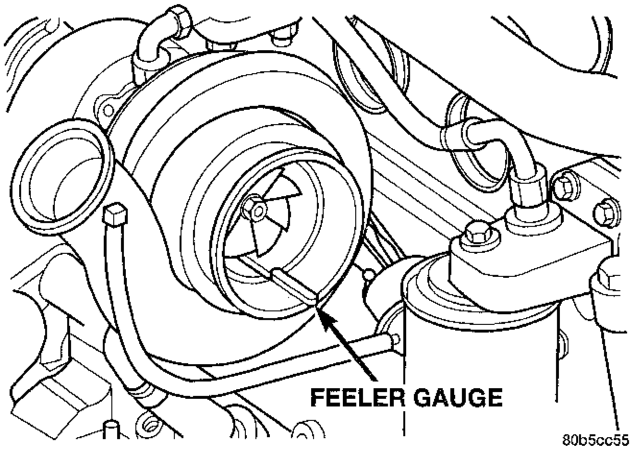

Fig. 27 Measure Turbocharger Bearing Radial Clearance

INSPECTION

Inspect the exhaust manifold for cracks. Measure the exhaust manifold for flatness. Place a ruler over all of the exhaust ports and insert a feeler gauge between the port flange and the ruler. Replace any manifold that is cracked or warped.

EXHAUST MANIFOLD FLATNESS
0.20 mm (0.008 in.) MAX.

ADJUSTMENTS

WASTEGATE ADJUSTMENT

The wastegate turbocharger provides additional low speed boost without over-boost at high speeds. This increases low speed torque and better driveability.

Proper adjustment of the wastegate assembly is critical to the operation of the wastegate turbocharger (Fig. 28). The control rod is set at the factory and no adjustment should be necessary, unless wastegate assembly is damaged.

CAUTION: DO NOT adjust the wastegate so that higher pressures are required to open the wastegate valve. The turbocharger speed will be increased and can cause damage to the turbocharger and cause a loss of engine performance.

(1) Remove signal line from wastegate actuator. **The signal line may be installed with tamper-proof clamps. These can be discarded and replaced with standard worm-gear clamps.**

(2) Connect regulated air pressure to the wastegate actuator (Fig. 29). Install a dial indicator to measure the control rod movement. Apply 103 - 138 kPa (15 - 20 psi) to seat the components and take

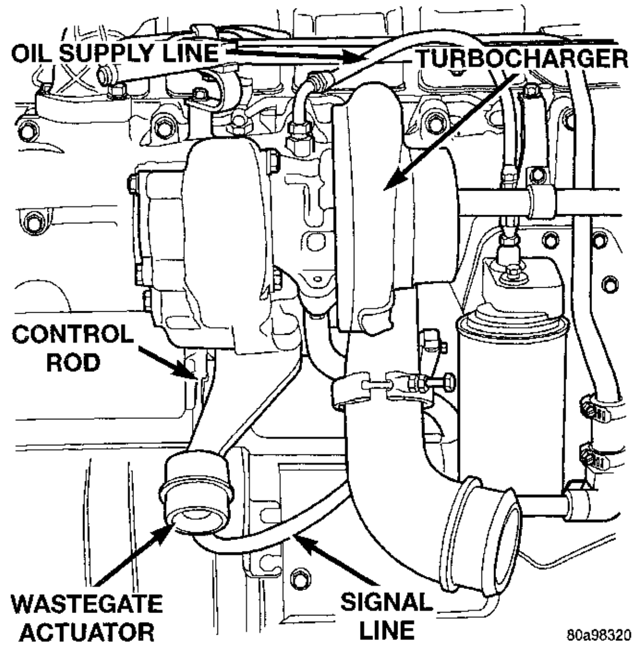

Fig. 28 Wastegate Turbocharger

any slack out of the control rod. Release the air pressure and zero the dial indicator gauge.

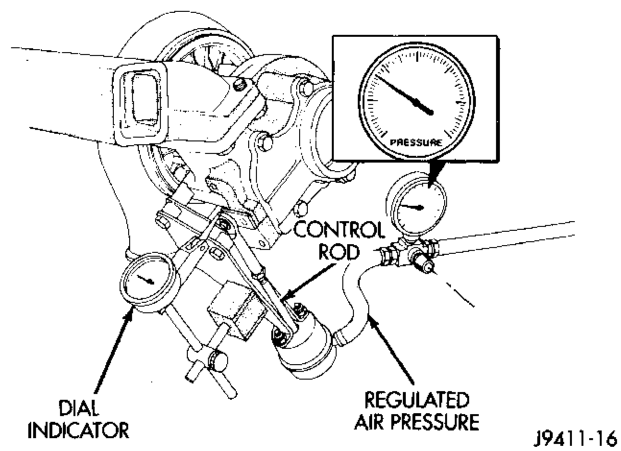

Fig. 29 Wastegate and Dial Indicator

(3) Apply 144.8 kPa (21 psi) air pressure to the actuator. The control rod should move 0.33 - 1.27 mm (0.013 - 0.050 in) total travel. If the rod travel is out of limits, the wastegate linkage must be adjusted.

(4) To adjust the wastegate linkage, apply air pressure to the actuator to release the spring tension on the lever. Remove the control rod from the wastegate lever (Fig. 30). Pull the wastegate lever toward the actuator (closed position).

(5) Adjust the length of the clevis end of the control rod to align the clevis pin hole to the wastegate lever. Install the adjusting link and retaining clip (Fig. 30).

ADJUSTMENTS (Continued)

CAUTION: DO NOT pull, push or force the alignment of the clevis pin.

(6) After the adjustment is complete, tighten the actuator rod jam nut.

(7) Recheck the travel on the wastegate control rod. Adjust, if necessary.

FUEL SYSTEM

CONTENTS

GENERAL INFORMATION

INDEX

GENERAL INFORMATION

FUEL REQUIREMENTS—DIESEL ENGINE

WARNING: Do not use alcohol or gasoline as a fuel blending agent. They can be unstable under certain conditions and hazardous or explosive when mixed with diesel fuel.

Use good quality diesel fuel from a reputable supplier in your Dodge truck. For most year-round service, number 2 diesel fuel meeting ASTM specification D-975 will provide good performance. If the vehicle is exposed to extreme cold (below 0°F/-18°C), or is required to operate at colder-than-normal conditions for prolonged periods, use climatized No. 2 diesel fuel or dilute the No. 2 diesel fuel with 50% No. 1 diesel fuel. This will provide better protection from fuel gelling or wax-plugging of the fuel filters.

Diesel fuel is seldom completely free of water. To prevent fuel system trouble, including fuel line freezing in winter, drain the accumulated water from the fuel/water separator using the fuel/water separator drain provided. If you buy good-quality fuel and follow the cold-weather advice above, fuel conditioners should not be required in your vehicle. If available in your area, a high cetane "premium" diesel fuel may offer improved cold starting and warm-up performance.

mopar AUTHENTIC RESTORATION PRODUCT

FUEL DELIVERY SYSTEM-DIESEL ENGINE

INDEX

DESCRIPTION AND OPERATION

FUEL DELIVERY SYSTEM—DIESEL ENGINE

Two different fuel systems (early and late) are used for the diesel engine in this model year. The **early** fuel system, using the two-valve-per-cylinder engine, will retain the mechanical fuel injection pump as used in previous model years. The **late** fuel system, using the four-valve-per-cylinder engine, will use an **electronic** fuel injection pump with three control modules. This book will include information for the **late** fuel system only.

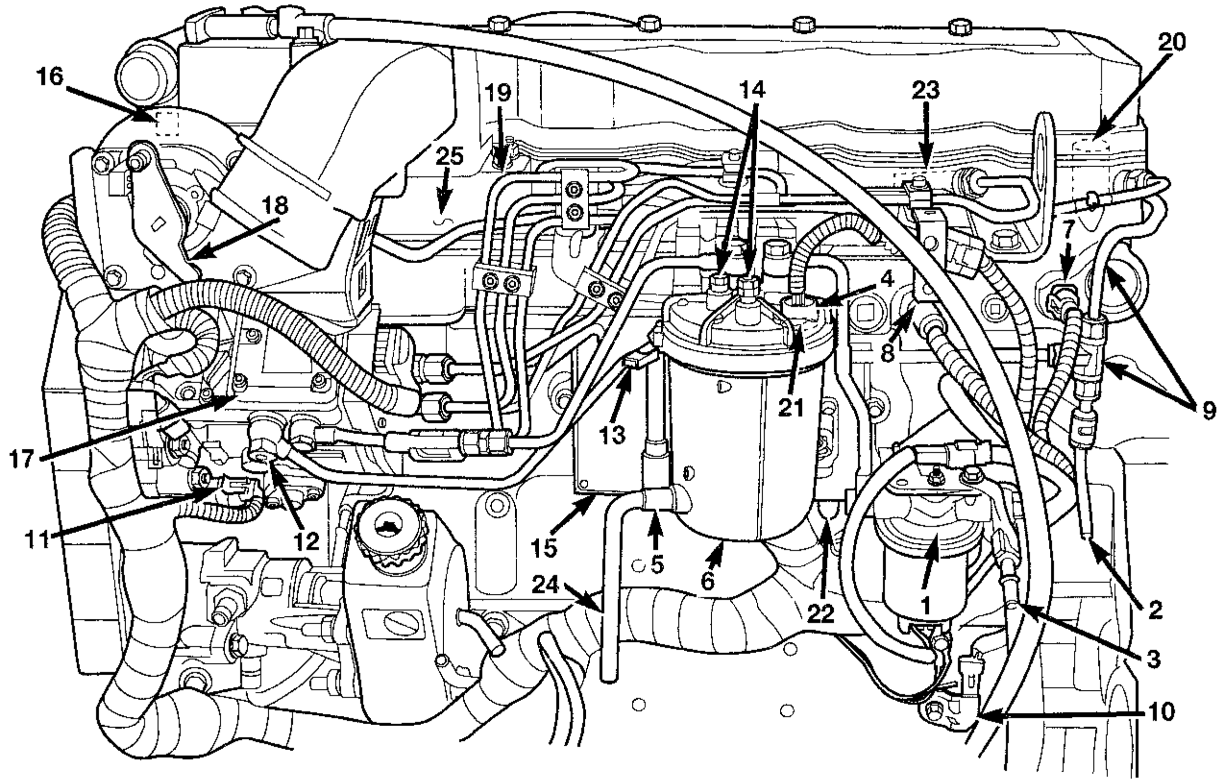
Also refer to the Powertrain Control Module (PCM) or Engine Control Module sections.

Some fuel system components are shown in (Fig. 1).

The fuel delivery system consists of the:

- Accelerator pedal
- Air cleaner housing/element
- Fuel drain manifold (passage)
- Fuel filter/water separator
- Fuel heater
- Fuel heater relay
- Fuel transfer (lift) pump
- Fuel injection pump
- Fuel injectors
- Fuel heater temperature sensor
- Fuel tank
- Fuel tank filler/vent tube assembly
- Fuel tank filler tube cap
- Fuel tank module containing the rollover valve, fuel gauge sending unit (fuel level sensor) and a separate fuel filter located at bottom of tank module
- Fuel tubes/lines/hoses
- High-pressure fuel injector lines
- In-tank fuel filter (at bottom of fuel tank module)
- Low-pressure fuel supply lines
- Low-pressure fuel return line
- Overflow valve
- Quick-connect fittings
- Throttle cable
- Water draining

DESCRIPTION AND OPERATION (Continued)



1. FUEL TRANSFER (LIFT) PUMP

Fig. 1 Fuel System Components—Diesel Engine

DESCRIPTION AND OPERATION (Continued)

FUEL TANK MODULE

An electric fuel pump is **not used** in the fuel tank module for diesel powered engines. Fuel is supplied by the engine mounted fuel transfer pump and the fuel injection pump.

The fuel tank module is installed in the top of the fuel tank (Fig. 2). The fuel tank module (Fig. 2) contains the following components:

- Fuel reservoir
- A separate in-tank fuel filter
- Rollover valve
- Fuel gauge sending unit (fuel level sensor)
- Fuel supply line connection
- Fuel return line connection
- Auxiliary non-pressurized fuel supply fitting

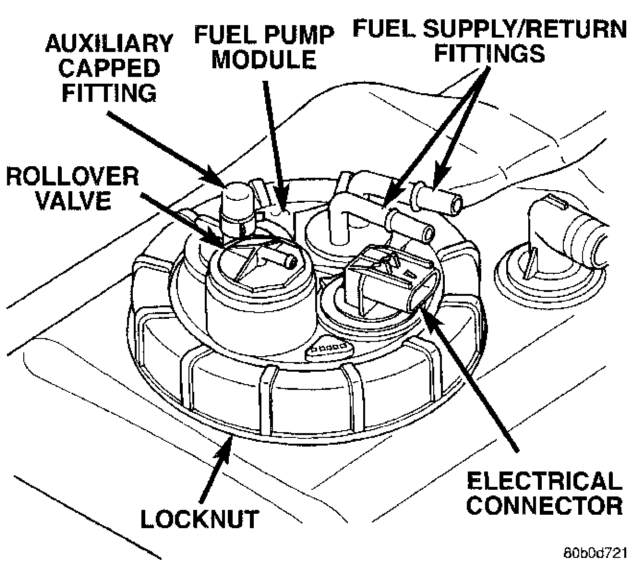

Fig. 2 Top View of Fuel Tank Module—Diesel

FUEL GAUGE SENDING UNIT

The fuel gauge sending unit (fuel level sensor) is attached to the side of the fuel tank module. The sending unit consists of a float, an arm, and a variable resistor (track). The resistor track is used to send electrical signals to the Powertrain Control Module (PCM) for fuel gauge operation. After this signal is sent to the PCM, the PCM will transmit the data across the CCD bus circuits to the instrument panel. Here it is translated into the appropriate fuel gauge level reading.

As fuel level increases, the float and arm move up. This decreases the sending unit resistance, causing the fuel gauge to read full. As fuel level decreases, the float and arm move down. This increases the sending unit resistance causing the fuel gauge to read empty.

FUEL HEATER

The fuel heater is used to prevent diesel fuel from waxing during cold weather operation. The fuel heater assembly is located in the top of the fuel filter housing (Fig. 3).

The heater/element assembly is equipped with a temperature sensor (thermostat) that senses fuel temperature. This sensor is attached to the fuel heater/element assembly (Fig. 4) (bottom view). When the temperature is below 45 ±8 degrees F, the sensor allows current to flow to the heater element warming the fuel. When the temperature is above 75 ±8 degrees F, the sensor stops current flow to the heater element.

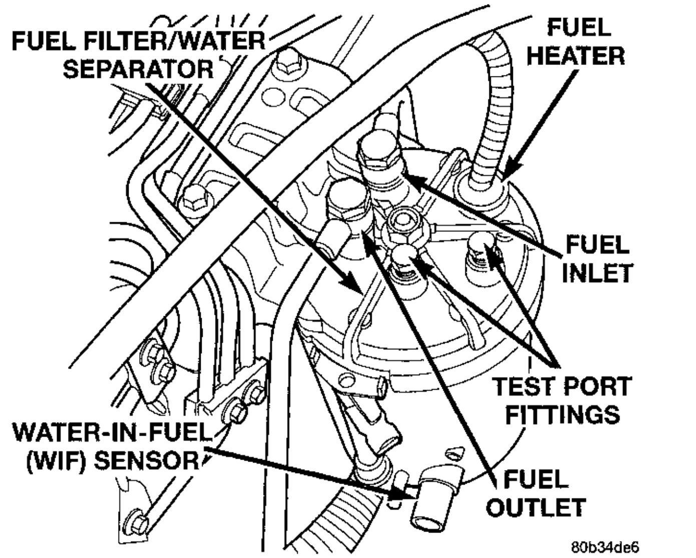

Fig. 3 Fuel Heater Location

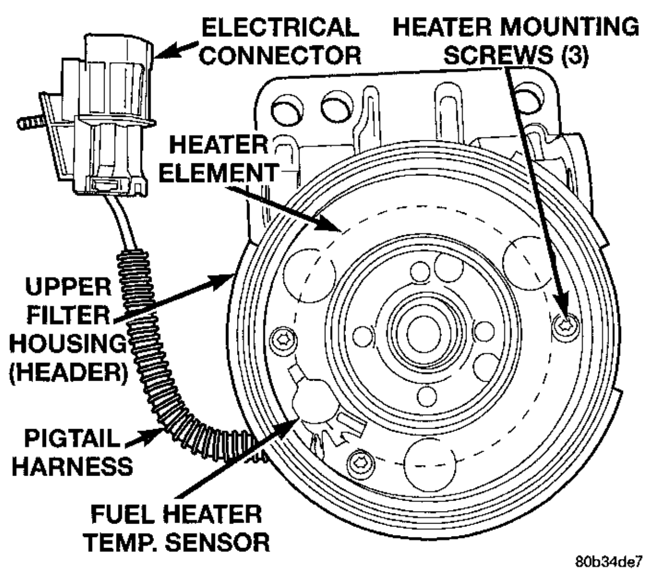

Fig. 4 Fuel Heater Temperature Sensor Location

DESCRIPTION AND OPERATION (Continued)

Battery voltage to operate the fuel heater element is supplied from the ignition switch and through the fuel heater relay. Also refer to Fuel Heater Relay. **The fuel heater element and fuel heater relay are not computer controlled.**

The heater element operates on 12 volts, 300 watts at 0 degrees F.

FUEL HEATER RELAY

Battery voltage to operate the fuel heater element is supplied from the ignition switch through the fuel heater relay. **The fuel heater element and fuel heater relay are not computer controlled.**

The fuel heater relay is located in Power Distribution Center (PDC) (Fig. 5). Refer to label on inside of PDC cover for relay location.

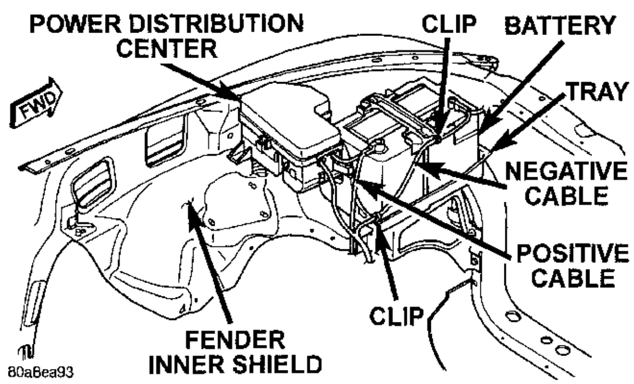

Fig. 5 Power Distribution Center Location

FUEL TRANSFER (LIFT) PUMP

The fuel transfer pump (fuel lift pump) is located on the left-rear side of the engine cylinder block above the starter motor (Fig. 6). The 12–volt electric vane-type pump is operated and controlled by the Engine Control Module (ECM). The ECM is bolted to the left side of the engine block behind the fuel filter (Fig. 7).

The purpose of the fuel transfer pump is to supply (transfer) a low-pressure fuel source: **from** the fuel tank, **through** the fuel filter/water separator and **to** the fuel injection pump. Here, the low-pressure is raised to a high-pressure by the fuel injection pump for operation of the high-pressure fuel injectors. Check valves within the pump, control direction of fuel flow and prevent fuel bleed-back during engine shut down.

Normal current flow to the pump is 12 amperes.

With the engine running, the pump has **2** modes of operation: Mode 1: 100 percent duty-cycle with a minimum pressure of 10 psi **except when the**

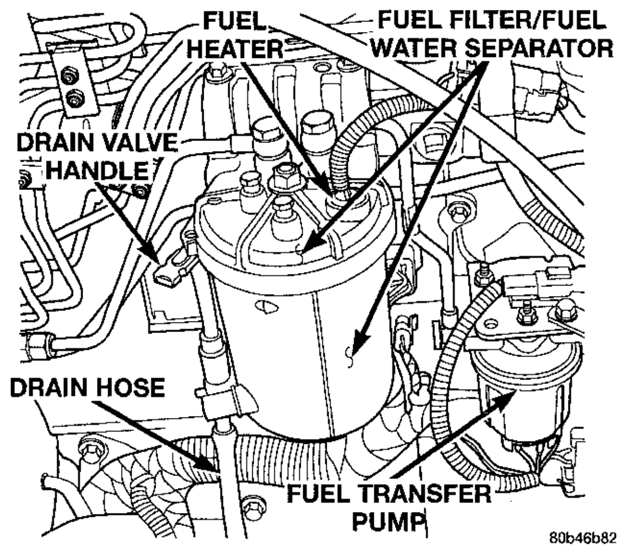

Fig. 6 Fuel Transfer Pump Location

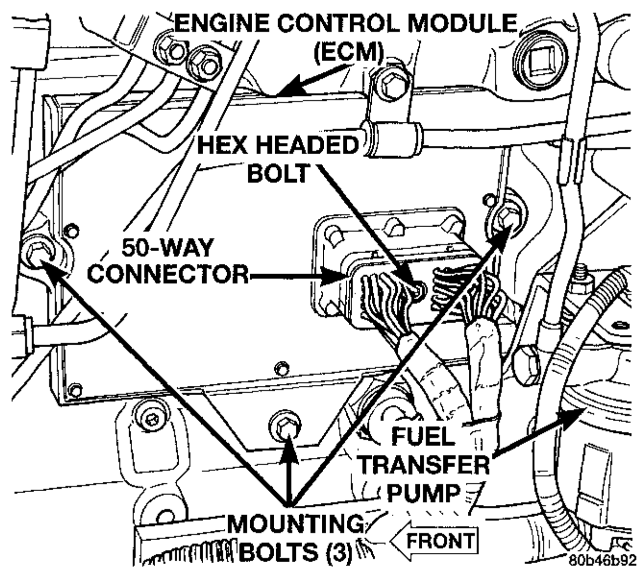

Fig. 7 Engine Control Module (ECM) Location

engine is cranking. Mode 2: 25 percent duty-cycle with minimum pressure of 7 psi **with the engine cranking**

The 25 percent duty-cycle is used to limit injection pump inlet pressure until the engine is running.

The transfer pump is self-priming: When the key is first turned on (without cranking engine), the pump will operate for approximately 2 seconds and then shut off. The pump will also operate for up to 25 seconds after the starter is engaged, and then disengaged and the engine is not running. The pump shuts off immediately if the key is on and the engine stops running.

DESCRIPTION AND OPERATION (Continued)

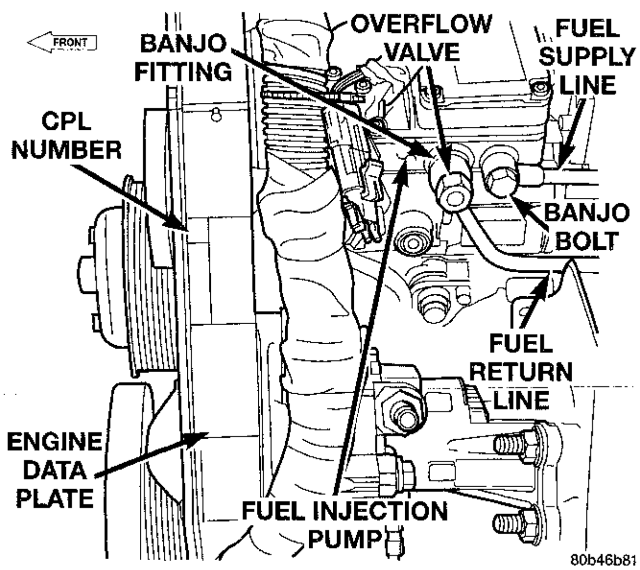

Fig. 8 Injection Pump Overflow Valve Location

The fuel volume of the transfer pump will always provide more fuel than the fuel injection pump requires. Excess fuel is returned from the injection pump through an overflow valve. The valve is located on the side of the injection pump (Fig. 8). It is also used to connect the fuel return line to the side of the injection pump. This valve opens at approximately 97 kPa (14 psi) and returns fuel to the fuel tank through the fuel return line.

FUEL TANK

The fuel tank is similar to the tank used with gasoline powered models. The tank is equipped with a separate fuel return line and a different fuel tank module for diesel powered models. A fuel tank mounted, electric fuel pump is not used with diesel powered models. Refer to Fuel Tank Module for additional information.

ROLLOVER VALVE(S)

Refer to Group 25, Emission Control System for information.

FUEL FILTER/WATER SEPARATOR

The fuel filter/water separator protects the fuel injection pump by removing water and contaminants from the fuel. The construction of the filter/separator allows fuel to pass through it, but helps prevent moisture (water) from doing so. Moisture collects at the bottom of the canister.

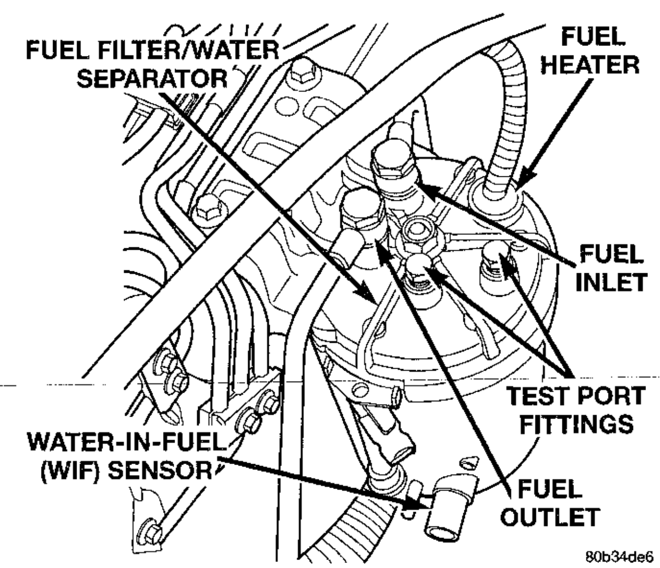

Fig. 9 Fuel Filter/Water Separator Location

The fuel filter/water separator assembly is located on left side of engine above starter motor (Fig. 9). The assembly also includes the fuel heater and Water-In-Fuel (WIF) sensor.

Refer to the maintenance schedules in Group 0 in this manual for the recommended fuel filter replacement intervals.

For draining of water from canister, refer to Fuel Filter/Water Separator Removal/Installation section.

A Water-In-Fuel (WIF) sensor is attached to side of canister. Refer to Water-In-Fuel Sensor Description/ Operation.

The fuel heater is installed into the top of the filter/separator housing. Refer to Fuel Heater Description/Operation.

FUEL SYSTEM PRESSURE WARNING

WARNING: HIGH-PRESSURE FUEL LINES DELIVER DIESEL FUEL UNDER EXTREME PRESSURE FROM THE INJECTION PUMP TO THE FUEL INJECTORS. THIS MAY BE AS HIGH AS 120,000 KPA (17,405 PSI) . USE EXTREME CAUTION WHEN INSPECTING FOR HIGH-PRESSURE FUEL LEAKS. INSPECT FOR HIGH-PRESSURE FUEL LEAKS WITH A SHEET OF CARDBOARD. HIGH FUEL INJECTION PRESSURE CAN CAUSE PERSONAL INJURY IF CONTACT IS MADE WITH THE SKIN.

DESCRIPTION AND OPERATION (Continued)

FUEL INJECTION PUMP

The Bosch VP44 fuel injection pump (Fig. 10) is a solenoid-valve controlled-radial-piston-distributor type pump. The pump is mounted to the rear of the timing gear housing on the left side of engine (Fig. 11).

The injection pump is driven by the engine camshaft. A gear on the end of the pump shaft meshes with the camshaft gear. The pump is timed to the engine. The VP44 is controlled by an integral (and non-serviceable) Fuel Pump Control Module (FPCM) (Fig. 11). The FPCM can operate the engine as an engine controller if a Crankshaft Position Sensor (CKP) signal is not present.

Fuel from the transfer (lift) pump enters the VP44 where it is pressurized and then distributed through high-pressure lines to the fuel injectors. The VP44 is cooled by the fuel that flows through it. A greater quantity of fuel is required for cooling the VP44 than what is necessary for engine operation. Because of this, approximately 70 percent of fuel entering the pump is returned to the fuel tank through the overflow valve and fuel return line. Refer to Overflow Valve Description/Operation for additional information.

The VP44 is not self-priming. At least two fuel injectors must be bled to remove air from the system. When servicing the fuel system, disconnecting components up to the pump will usually not require air bleeding from the fuel system. However, removal of the high-pressure lines, removal of the VP44 pump, or allowing the vehicle to completely run out of fuel, will require bleeding air from the high-pressure lines at the fuel injectors.

VP44 timing is matched to engine timing by an offset keyway that fits into the pump shaft. This keyway has a stamped number on it that is matched to a number on the VP44 pump (each keyway is calibrated to each pump).

When removing/installing the VP44, the same numbered keyway must always be installed. Also, the arrow on the top of the keyway should be installed pointed to the rear of pump.

Because of electrical control, the injection pump high and low idle speeds are not adjustable. Also, adjustment of fuel pump timing is not required and is not necessary.

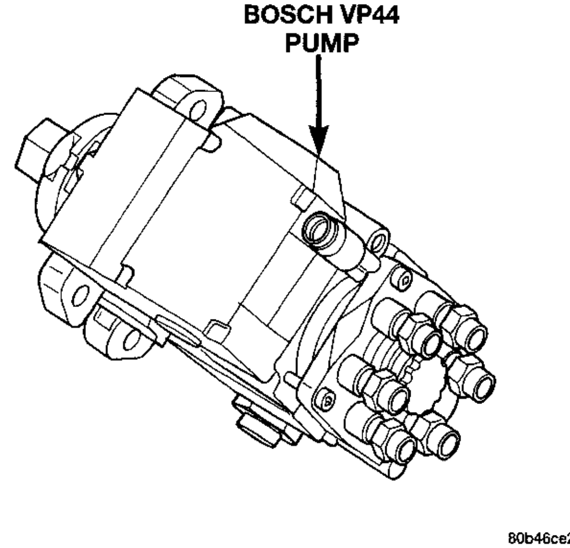

Fig. 10 Bosch VP44 Fuel Injection Pump

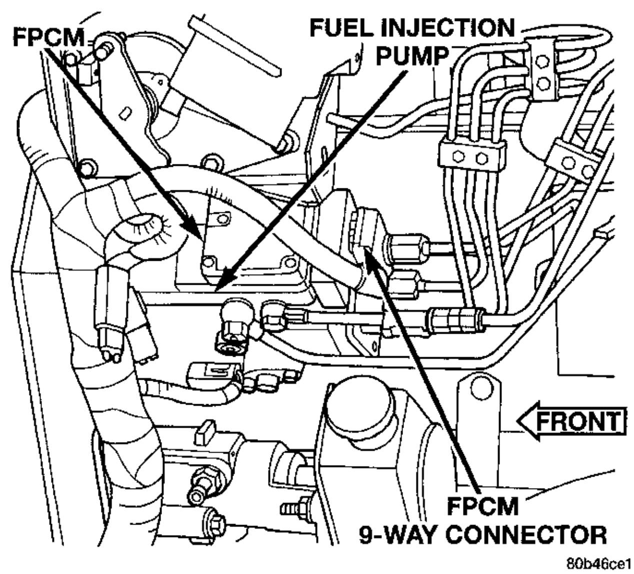

Fig. 11 Fuel Injection Pump Location

DESCRIPTION AND OPERATION (Continued)

FUEL INJECTORS

Six individual, high-pressure fuel injectors are used. The injectors are vertically mounted (Fig. 12) into a bored hole in the top of the cylinder head. This bored hole is located between the intake/exhaust valves.

High-pressure fuel is supplied from the injection pump, through a high-pressure fuel line, through a steel connector and into the fuel injector. When fuel pressure rises to approximately 31,026 kPa (4,500 psi), the needle valve spring tension is overcome. The needle valve rises and fuel flows through the spray holes in the nozzle tip into the combustion chamber. The pressure required to lift the needle valve is the nozzle opening pressure. This is sometimes referred to as the "pop" pressure setting.

Each fuel injector is connected to each high-pressure fuel line with a steel connector (Fig. 13). This steel connector is positioned into the cylinder head and sealed with an o-ring. The connectors are sealed to the high-pressure fuel lines with fittings (Fig. 13). The ferrule (Fig. 13) on the end of the high-pressure fuel line pushes against the steel connector when the fuel line fitting is torqued into the cylinder head. This torquing force provides a sealing pressure between both the fuel line-to-connector and the fuel connector-to-fuel injector. **The fitting torque is very critical.** If the fitting is under torqued, the mating surfaces will not seal and a high-pressure fuel leak will result. If the fitting is over torqued, the connector and injector will deform and also cause a high-pressure fuel leak. This leak will be inside the cylinder head and will not be visible. The result will be a possible fuel injector miss-fire and low power.

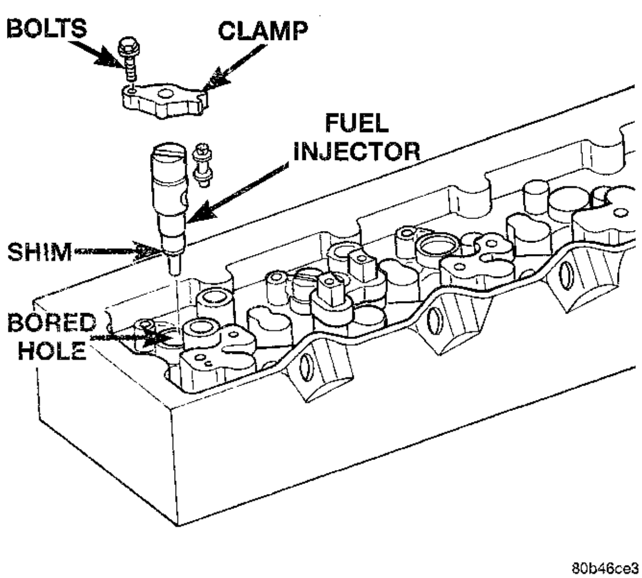

Fig. 12 Fuel Injector Location

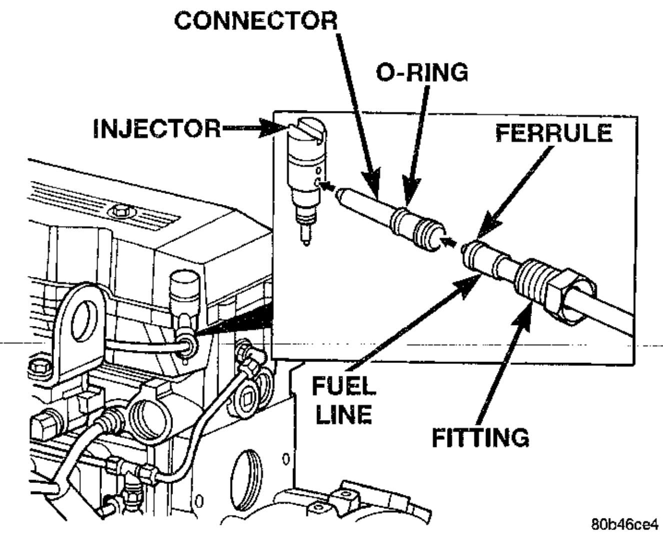

Fig. 13 Fuel Injector Connections

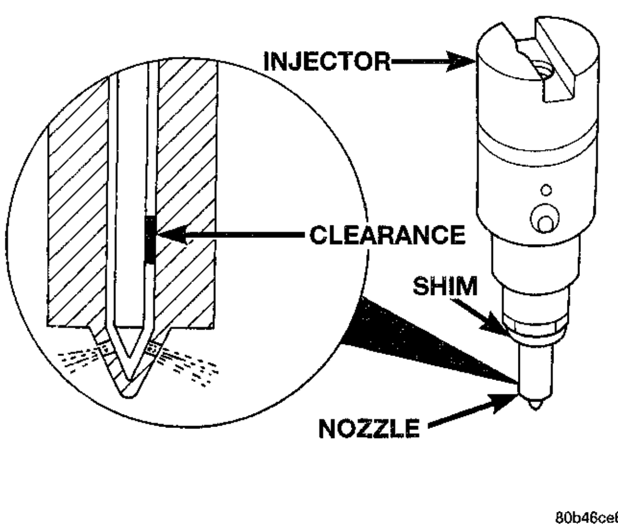

Fig. 14 Fuel Injector Spray Pattern

The fuel injectors use hole type nozzles (Fig. 14). High-pressure flows into the side of the injector and causes the injector needle to lift and fuel to be injected. The clearances in the nozzle bore (Fig. 14) are extremely small and any sort of dirt or contaminants will cause the injector to stick. Because of this, it is very important to do a thorough cleaning of any lines before opening up any fuel system component. Always cover or cap any open fuel connections before a fuel system repair is performed.

DESCRIPTION AND OPERATION (Continued)

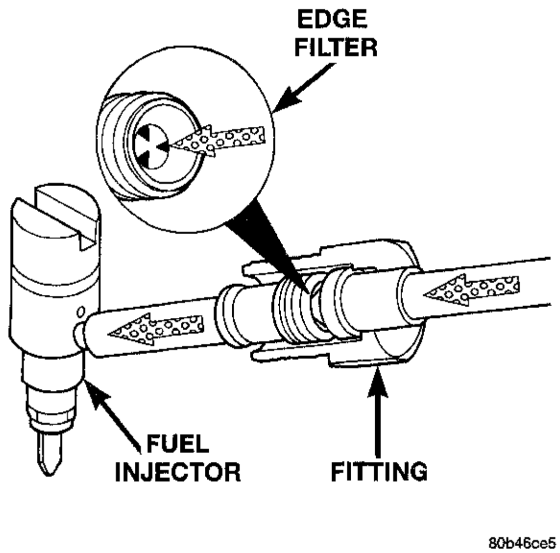

Fig. 15 Fuel Injector Edge Filter

Each fuel injector connector tube contains an edge filter (Fig. 15) that breaks up small contaminants that enter the injector. The edge filter uses the injectors pulsating high-pressure to break up most particles so they are small enough to pass through the injector. **The edge filters are not a substitute for proper cleaning and covering of all fuel system components during repair.**

The bottom of each fuel injector is sealed to the cylinder head with a **1.5mm** thick copper shim (gasket) (Fig. 14). The correct thickness shim must always be re-installed after removing an injector.

Fuel pressure in the injector circuit decreases after injection. The injector needle valve is immediately closed by the needle valve spring and fuel flow into the combustion chamber is stopped. Exhaust gases are prevented from entering the injector nozzle by the needle valve.

QUICK-CONNECT FITTINGS

Different types/sizes of quick-connect fittings are used to attach various fuel system components. These may be: a single-tab type, a two-tab type or a plastic retainer ring-type. Most fittings on diesel applications are the two-tab type. Refer to Quick-Connect Fittings Removal/Installation for more information.

CAUTION: The interior components (o-rings, spacers) of quick-connect fittings are not serviced separately, but new clips are available for some types. Do not attempt to repair damaged fittings or fuel lines/tubes. If repair is necessary, replace the complete fuel tube assembly.

LOW-PRESSURE FUEL LINES

All fuel lines up to the fuel injection pump are considered low-pressure. This includes the fuel lines from: the fuel tank to the fuel transfer pump, and the fuel transfer pump to the fuel injection pump. The fuel return lines, the fuel drain manifold and the fuel drain manifold lines are also considered low-pressure lines. High-pressure lines are used between the fuel injection pump and the fuel injectors. Also refer to High-Pressure Fuel Lines Description/Operation.

HIGH-PRESSURE FUEL LINES

The high-pressure fuel lines are the 6 lines located between the fuel injection pump and the fuel injector connector tubes (Fig. 16). All other fuel lines are considered low-pressure lines.

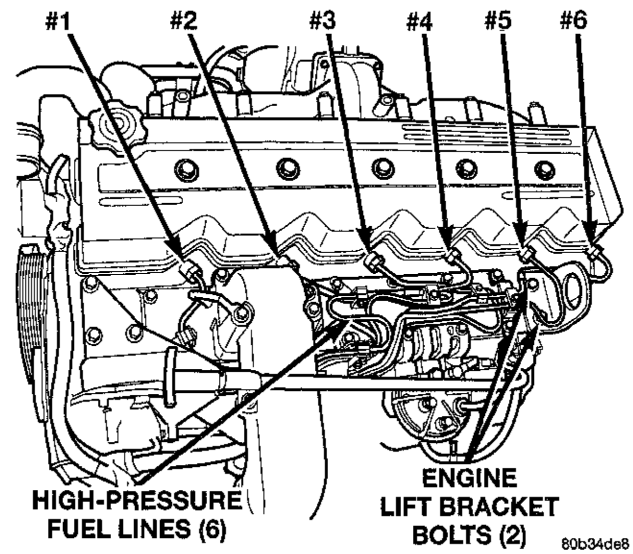

Fig. 16 High-Pressure Fuel Lines

CAUTION: The high-pressure fuel lines must be held securely in place in their holders. The lines cannot contact each other or other components. Do not attempt to weld high-pressure fuel lines or to repair lines that are damaged. If lines are ever kinked or bent, they must be replaced. Use only the recommended lines when replacement of high-pressure fuel line is necessary.

High-pressure fuel lines deliver fuel under pressure of up to approximately 120,000 kPa (17,405 PSI) from the injection pump to the fuel injectors. The lines expand and contract from the high-pressure fuel pulses generated during the injection process. All high-pressure fuel lines are of the same length and inside diameter. Correct high-pressure fuel line usage and installation is critical to smooth engine operation.

mopar AUTHENTIC RESTORATION

DESCRIPTION AND OPERATION (Continued)

WARNING: USE EXTREME CAUTION WHEN INSPECTING FOR HIGH-PRESSURE FUEL LEAKS. INSPECT FOR HIGH-PRESSURE FUEL LEAKS WITH A SHEET OF CARDBOARD. HIGH FUEL INJECTION PRESSURE CAN CAUSE PERSONAL INJURY IF CONTACT IS MADE WITH THE SKIN.

FUEL DRAIN MANIFOLD PASSAGE

When the engine is running, and during injection, a small amount of fuel flows past the injector nozzle and is not injected into the combustion chamber. This fuel is used to lubricate the fuel injectors. Excess fuel drains into the fuel drain manifold (or passage). The fuel drain manifold is actually a rifled passage within the cylinder head (Fig. 17). Fuel is drained from this passage into a line at the rear of the cylinder head (Fig. 17). After exiting the cylinder head, fuel is routed (returned) back to the fuel tank. A "T" is installed into the fuel return line (Fig. 17). This "T" is used to allow excess fuel from the injection pump to be returned into the fuel tank. A one-way check valve within the overflow valve prevents fuel (from the fuel drain manifold) from entering the fuel injection pump.

A **small** amount of fuel is returned from the fuel injectors, while a **large** amount (about 70% of supplied fuel) is returned from the fuel injection pump.

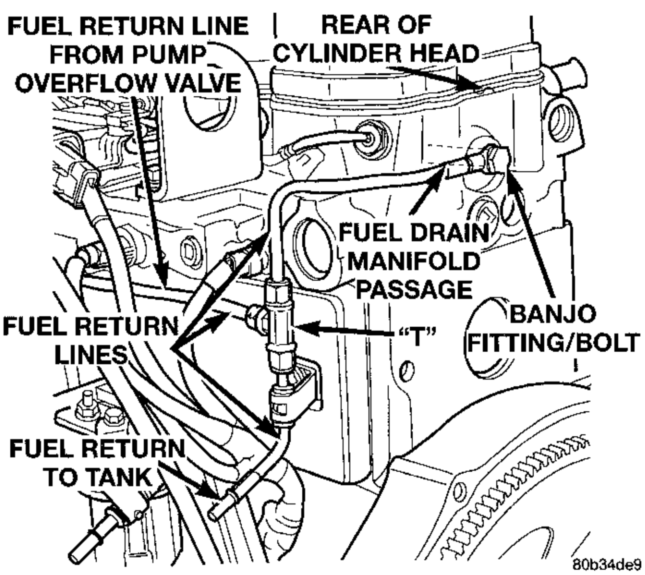

Fig. 17 Fuel Drain Manifold Passage

OVERFLOW VALVE

Fuel volume from the fuel transfer (lift) pump will always provide more fuel than the fuel injection pump requires. The overflow valve (a pressure relief valve) is used to route excess fuel through the fuel return line and back to the fuel tank. Approximately 70% of supplied fuel is returned to the fuel tank. The valve is located on the side of the injection pump (Fig. 18). It is also used to connect the fuel return line (banjo fitting) to the fuel injection pump. The valve opens at approximately 97 kPa (14 psi). If the check valve within the assembly is sticking, low engine power, hard starting or white smoke may result.

If a Diagnostic Trouble Code (DTC) has been stored for "decreased engine performance due to high injection pump fuel temperature", the overflow valve may be stuck in closed position.

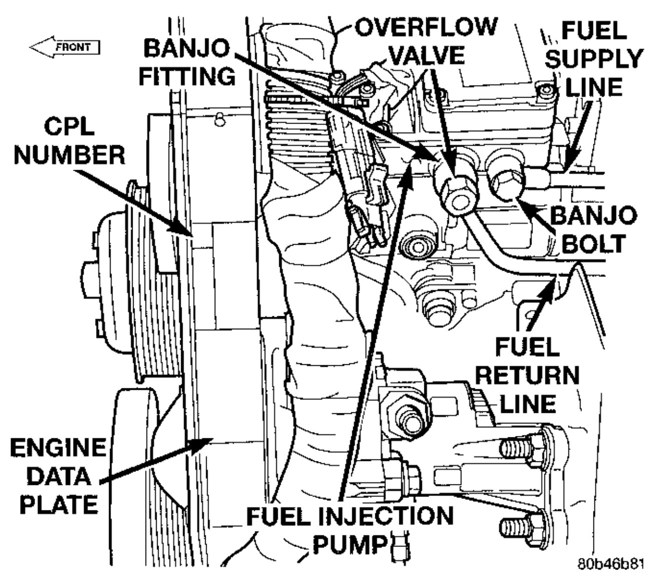

Fig. 18 Overflow Valve Location

DIAGNOSIS AND TESTING

AIR IN FUEL SYSTEM

Air will enter the fuel system whenever fuel supply lines, separator filters, injection pump, high-pressure lines or injectors are removed or disconnected. Air trapped in the fuel system can result in hard starting, a rough running engine, engine misfire, low power, excessive smoke and fuel knock. After service is performed, air must be bled from the system before starting the engine.

Inspect the fuel system from the fuel transfer pump to the injectors for loose connections. Leaking fuel is an indicator of loose connections or defective seals. Air can also enter the fuel system between the fuel tank and the transfer pump. Inspect the fuel tank and fuel lines for damage that might allow air into the system.

For air bleeding, refer to the Air Bleed Procedure.

FUEL SUPPLY RESTRICTIONS

LOW-PRESSURE LINES

Fuel supply line restrictions or a defective fuel transfer pump can cause starting problems and prevent engine from revving up. The starting problems include; low power and/or white fog like exhaust.

Test all fuel supply lines for restrictions or blockage. Flush or replace as necessary. Bleed fuel system of air once a fuel supply line has been replaced. Refer to Air Bleed Procedure for procedures.

To test for fuel line restrictions, a vacuum restriction test may be performed. Refer to Fuel Transfer Pump Pressure Test.

HIGH-PRESSURE LINES

Restricted (kinked or bent) high-pressure lines can cause starting problems, poor engine performance, engine mis-fire and white smoke from exhaust.

Examine all high-pressure lines for any damage. Each radius on each high-pressure line must be smooth and free of any bends or kinks.

Replace damaged, restricted or leaking high-pressure fuel lines with correct replacement line.

CAUTION: All high-pressure fuel lines must be clamped securely in place in holders. Lines cannot contact each other or other components. Do not attempt to weld high-pressure fuel lines or to repair lines that are damaged. If line is kinked or bent, it must be replaced. Use only recommended lines when replacement of high-pressure fuel line is necessary.

FUEL TRANSFER PUMP PRESSURE TEST

The following tests will include: pressures tests of fuel transfer pump (engine running and engine cranking), a pressure drop test of fuel filter, a test for supply side restrictions, and a test for air in fuel supply side.

Refer to Fuel Transfer Pump Description/Operation for an operational description of transfer pump.

The fuel transfer (lift) pump is located on left side of engine and above starter motor (Fig. 19).

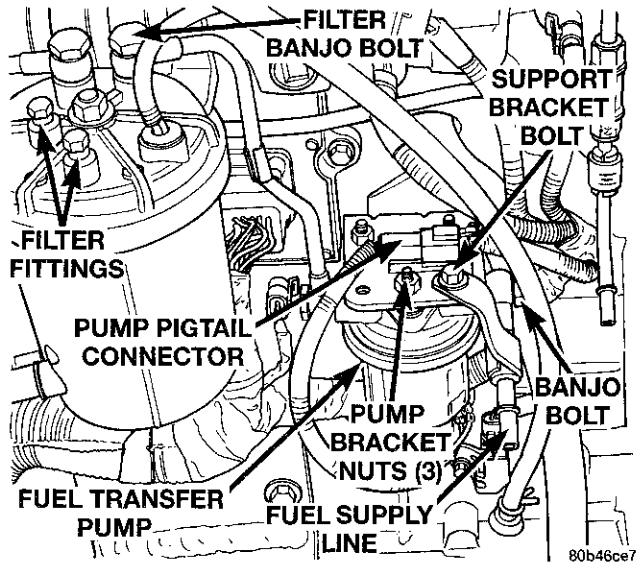

Fig. 19 Fuel Transfer Pump Location

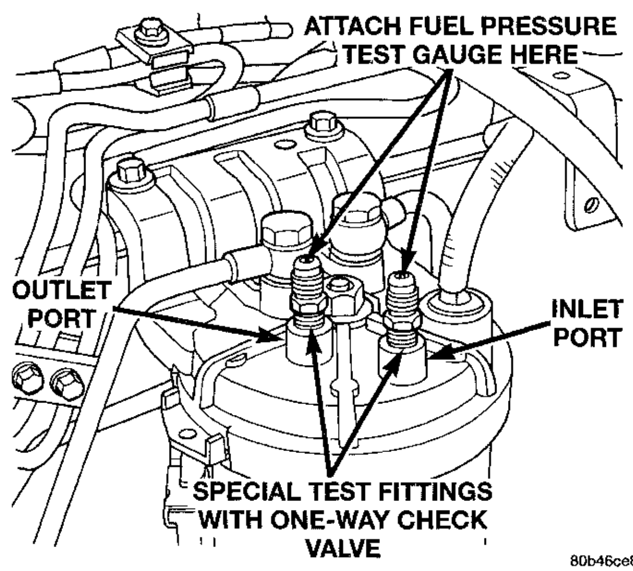

Fig. 20 Fuel Pressure Test Port Fitting Location

DIAGNOSIS AND TESTING (Continued)

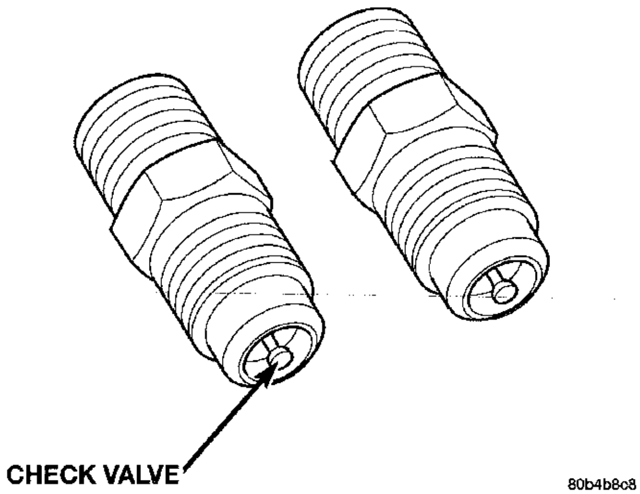

Fig. 21 Fuel Pressure Test Port Fittings

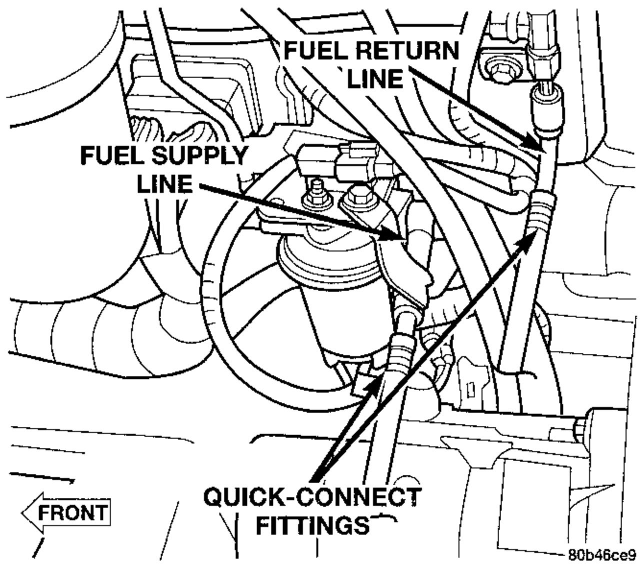

Fig. 22 Fuel Return and Supply Line Quick-Connect Locations

An improperly operating fuel transfer pump, a plugged or dirty fuel filter, or a defective overflow valve can cause low engine power, excessive white smoke and/or hard engine starting.

Before performing following tests, inspect fuel supply and return lines for restrictions, kinks or leaks.

Fuel leaking from pump casing indicates a leaking pump which must be replaced.

Pressure Test: Because the transfer pump is operating at two different pressure cycles (engine running and engine cranking), two different pressure tests will be performed.

(1) Remove 2 existing filter fittings (plugs) at top of fuel filter housing (Fig. 19) (clean area around fittings before fitting removal). In place of 2 fittings

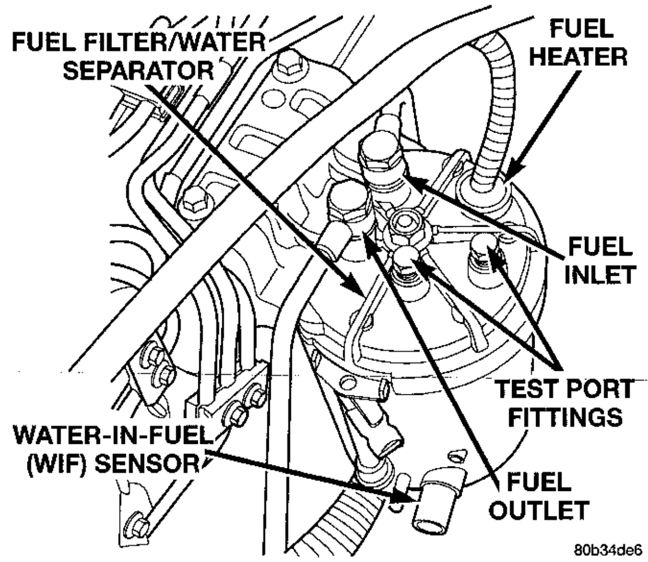

Fig. 23 Test Port at Fuel Inlet

(plugs), install 2 special fittings (Fig. 20). These special fittings are equipped with a spring-loaded shut-off valve (one-way check valve) and are commercially available from a Tube Fitting Supplier. Use Parker® Access Valve, Male Connector part number AVU1-2 or equivalent (Fig. 21).

(2) Install Special Fuel Pressure Test Gauge 6828 (or equivalent) to special fitting at INLET PORT (Fig. 20).

(3) To prevent engine from starting, remove fuel system relay (fuel injection pump relay). Relay is located in Power Distribution Center (PDC). Refer to label under PDC cover for relay location.

(4) Using key, crank engine over while observing gauge. Pressure should be 5–7 psi.

(5) Re-install fuel system relay to PDC.

(6) Start engine and record fuel pressure. Pressure should be a **minimum** of 69 kPa (10 psi) at idle speed.

(7) Because fuel pump relay was removed, a Diagnostic Trouble Code (DTC) may have been set. After testing, use DRB scan tool to remove DTC.

Pressure Drop Test:

(8) Shut engine off and remove test gauge from INLET PORT. Re-attach 6828 test gauge to OUTLET PORT (Fig. 20). Start engine and record fuel pressure. Pressure should not be more than 34 kPa (5 psi) lower than INLET PORT pressure test. If so, replace fuel filter.

Fuel Supply Restriction Test:

Due to very small vacuum specifications, the DRB scan tool along with the Periphal Expansion Port (PEP) Module and 0–15 psi transducer must be used.

(9) Verify transfer pump pressure is OK before performing restriction test.

AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING (Continued)

(10) Locate and disconnect fuel supply line quick-connect fitting at left-rear of engine (Fig. 22). After disconnecting line, plastic clip will remain attached to metal fuel line at engine. Carefully remove clip from metal line. Snap same clip into fuel supply hose.

(11) Install Special Rubber Adapter Hose Tool 6631 (3/8") into ends of disconnected fuel supply line.

(12) Install transducer from PEP module to brass "T" fitting on tool 6631.

(13) Hook up DRB scan tool to transducer.

(14) Start engine and record vacuum reading with engine speed at high-idle (high-idle means engine speed is at 100 percent throttle and no load). The fuel restriction test **MUST** be done wth engine speed at high-idle.

(15) If vacuum reading is **less** than 6 in/hg. (0–152 mm hg.), test is OK. If vacuum reading is **higher** than 6 in/hg. (152 mm hg.), restriction exists in fuel supply line or in fuel tank module. Check fuel supply line for damage, dents or kinking. If OK, remove module and check module and lines for blockage. Also check fuel pump inlet filter at bottom of module for obstructions.

Testing For Air Leaks in Fuel Supply Side:

(16) A 3–foot section of 1/4" I.D. clear tubing and a 1/8" NPT fitting are required for this test.

(17) Two test port fittings (plugs) are located at top of fuel filter housing (Fig. 23). Remove fitting at fuel **inlet** side of housing (towards rear of filter housing). Clean area around fitting before removal. In place of test port fitting (plug), install a 1/8" NPT fitting having a 1/4" O.D. nipple.

(18) Attach and clamp clear hose to fitting nipple.

(19) Place other end of hose into a clear container.

(20) The fuel transfer pump can be put into a 25 second run mode if key is turned to crank position and released back to run position without starting engine.

(21) Allow air to purge from empty hose before examining for air bubbles. Air bubbles should not be present.

(22) If bubbles are present, check for leaks in supply line to fuel tank.

(23) If supply line is not leaking, remove fuel tank module and remove filter at bottom of module (filter snaps to module). Check for leaks between supply nipple at top of module, and filter opening at bottom of module. Replace module if necessary.

OVERFLOW VALVE TEST

Fuel volume from the fuel transfer (lift) pump will always provide more fuel than the fuel injection pump requires. The overflow valve (a pressure relief valve) is used to route excess fuel through the fuel return line and back to the fuel tank. Approximately 70% of supplied fuel is returned to the fuel tank. The valve is located on the side of the injection pump (Fig. 24). It is also used to connect the fuel return line (banjo fitting) to the fuel injection pump. The valve opens at approximately 97 kPa (14 psi). If the check valve within the assembly is sticking, low engine power or hard starting may result.

If a Diagnostic Trouble Code (DTC) has been stored for "decreased engine performance due to high injection pump fuel temperature", the overflow valve may be stuck in closed position.

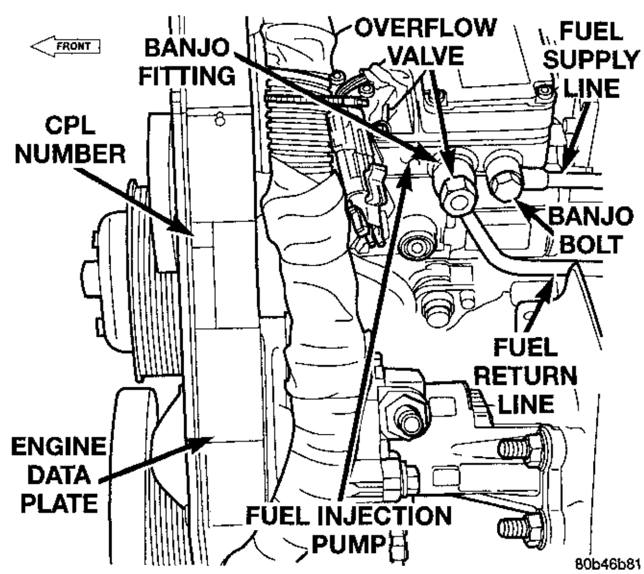

Fig. 24 Overflow Valve Location

A rubber tipped blow gun with regulated air line pressure is needed for this test.

(1) Clean area around overflow valve and fuel return line at injection pump before removal.

(2) Remove valve from pump and banjo fitting.

(3) Discard old sealing gaskets.

(4) Set regulated air pressure to approximately 97 kPa (14–16 psi).

(5) Using blow gun, apply pressure to overflow valve inlet end (end that goes into injection pump).

DIAGNOSIS AND TESTING (Continued)

(6) Internal check valve should release, and air should pass through valve at 97 kPa (14–16 psi). If not, replace valve.

(7) Reduce regulated air pressure to 10 psi and observe valve. Valve should stay shut. If not, replace valve.

(8) Install new sealing gaskets to valve.

(9) Install valve through banjo fitting and into pump.

(10) Tighten to 30 N·m (24 ft. lbs.) torque.

FUEL HEATER TEST

The fuel heater is used to prevent diesel fuel from waxing during cold weather operation.

NOTE: The fuel heater element, fuel heater relay and fuel heater temperature sensor are not controlled by the powertrain control module (PCM).

A malfunctioning fuel heater can cause a wax build-up in the fuel filter/water separator. Wax build-up in the filter/separator can cause engine starting problems and prevent the engine from revving up. It can also cause blue or white fog-like exhaust. If the heater is not operating in cold temperatures, the engine may not operate due to fuel waxing.

The fuel heater assembly is located in the top of the fuel filter housing (Fig. 25).

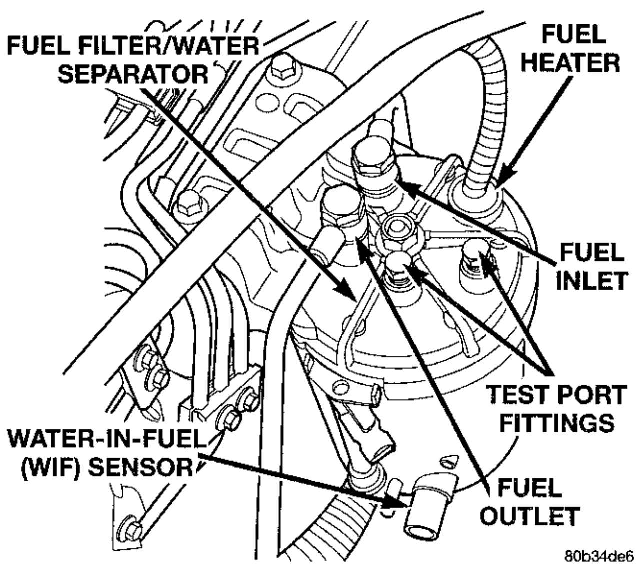

Fig. 25 Fuel Heater Location

The heater assembly is equipped with a built-in fuel temperature sensor (thermostat) (Fig. 26) that senses fuel temperature. When fuel temperature drops below 45 degrees ± 8 degrees F, the sensor allows current to flow to the built-in heater element to warm the fuel. When fuel temperature rises above

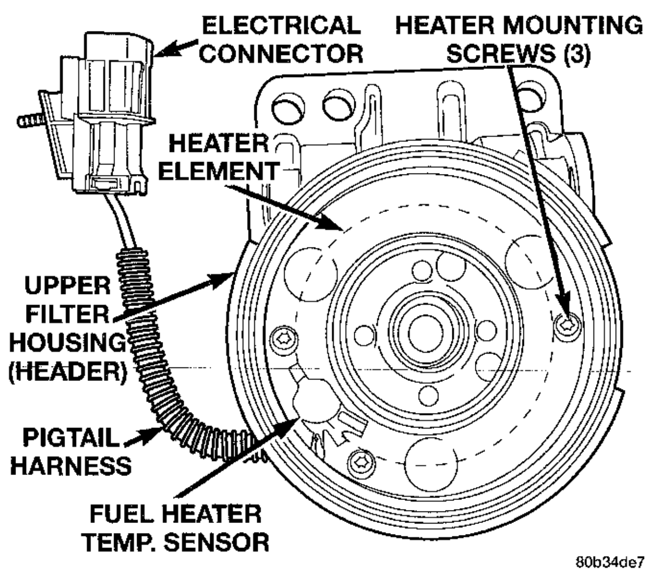

Fig. 26 Fuel Heater Assembly (Bottom View)

75 degrees ± 8 degrees F, the sensor stops current flow to the heater element (circuit is open).

Voltage to operate the fuel heater element is supplied from the ignition switch, through the fuel heater relay (also refer to Fuel Heater Relay), to the fuel temperature sensor and on to the fuel heater element.

The heater element operates on 12 volts, 300 watts at 0 degrees F. As temperature increases, power requirements decrease.

A minimum of 7 volts is required to operate the fuel heater. The resistance value of the heater element is less than 1 ohm (cold) and up to 1000 ohms warm.

TESTING

(1) Disconnect heater pigtail harness (Fig. 26) from main engine harness. Connection is made above and slightly rearward of fuel filter. All heater testing will be done at these 2 connectors.

Turn key to ON position. 12 volts should be present at red wire (at engine harness side of connector). If not, check fuel heater relay and related wiring. Refer to Relay Test—Fuel Heater. If OK, proceed.

Turn key OFF. Check black wire (at engine harness side of connector) for ground continuity with an ohmmeter. If continuity is not present, correct ground circuit. If OK, proceed.

(2) With pigtail harness connector still unplugged and key OFF, check electrical/mechanical operation of fuel temperature sensor (Fig. 26). Proceed to next step:

(3) Using an ohmmeter, check resistance across two terminals in connector (at heater side of connector). Sensor circuit should be open if fuel tempera-

AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING (Continued)

ture has risen above 75 degrees ± 8 degrees F. Sensor circuit should be closed if fuel temperature has dropped below 45 degrees ± 8 degrees F. If not, replace fuel heater assembly. This same test can also be performed using a voltmeter, with key ON, and by back-probing connector.

RELAY TEST—FUEL HEATER

The fuel heater relay is located in the Power Distribution Center (PDC). Refer to label under PDC cover for relay location.

To test the fuel heater, refer to Fuel Heater Test.

To test the relay only, refer to following:

The relay terminal numbers from (Fig. 27) can be found on the bottom of the relay.

- Terminal number 30 is connected to battery voltage and can be switched or B+ (hot) at all times.
- The center terminal number 87A is connected (a circuit is formed) to terminal 30 in the de-energized (normally OFF) position.
- Terminal number 87 is connected (a circuit is formed) to terminal 30 in the energized (ON) position. Terminal number 87 then supplies battery voltage to the component being operated.
- Terminal number 86 is connected to a switched (+) power source.
- Terminal number 85 is grounded by the powertrain control module (PCM).

TESTING

(1) Remove relay before testing.

(2) Using an ohmmeter, perform a resistance test between terminals 85 and 86. Resistance value (ohms) should be 75 ±5 ohms for resistor equipped relays.

(3) Connect the ohmmeter between terminals number 87A and 30. Continuity should be present at this time.

(4) Connect the ohmmeter between terminals number 87 and 30. Continuity should not be present at this time.

(5) Use a set of jumper wires (16 gauge or smaller). Connect one jumper wire between terminal number 85 (on the relay) to the ground side (-) of a 12 Volt power source.

(6) Attach the other jumper wire to the positive side (+) of a 12V power source. Do not connect this jumper wire to relay at this time.

CAUTION: Do not allow the ohmmeter to contact terminals 85 or 86 during these tests. Damage to ohmmeter may result.

(7) Attach the other jumper wire (12V +) to terminal number 86. This will activate the relay. Continuity should now be present between terminals number 87 and 30. Continuity should not be present between terminals number 87A and 30.

(8) Disconnect jumper wires from relay and 12 Volt power source.

(9) If continuity or resistance tests did not pass, replace relay. If tests passed, refer to Group 8W, Wiring Diagrams for (fuel system) relay wiring schematics and for additional circuit information.

FUEL INJECTOR TEST

The fuel injectors are located in the top of the cylinder head between the intake/exhaust valves (Fig. 28).

A leaking fuel injector can cause fuel knock, poor performance, black smoke, poor fuel economy and rough engine idle. If fuel injector needle valve does not operate properly, engine may misfire and produce low power.

A leak in injection pump-to-injector high-pressure fuel line can cause many of same symptoms as malfunctioning injector. Inspect for leaks in high-pressure lines before checking for malfunctioning fuel injector.

WARNING: THE INJECTION PUMP SUPPLIES HIGH-PRESSURE FUEL OF UP TO APPROXIMATELY 120,000 kPa (17,400 psi) TO EACH INDIVIDUAL INJECTOR THROUGH HIGH-PRESSURE LINES. FUEL UNDER THIS AMOUNT OF PRESSURE CAN PENETRATE SKIN AND CAUSE PERSONAL INJURY. WEAR SAFETY GOGGLES AND ADEQUATE PROTECTIVE CLOTHING. AVOID CONTACT WITH FUEL SPRAY WHEN BLEEDING HIGH-PRESSURE FUEL LINES.

WARNING: DO NOT BLEED AIR FROM FUEL SYSTEM OF A HOT ENGINE. DO NOT ALLOW FUEL TO SPRAY ONTO EXHAUST MANIFOLD WHEN BLEEDING AIR FROM FUEL SYSTEM.

(1) To determine which fuel injector is malfunctioning, run engine and isolate each cylinder using DRB scan tool. Note RPM drop for each cylinder. As an alternative, loosen high-pressure fuel line fitting at fuel injector connector tube (Fig. 29). Listen for a change in engine speed. After testing, tighten line fitting to 40 N·m (30 ft. lbs.) torque. If engine speed drops, injector was operating normally. If engine speed remains same, injector may be malfunctioning. Test all injectors in same manner one at a time.

(2) Once injector has been found to be malfunctioning, remove it from engine and test it. Refer to Fuel Injector Removal/Installation.

DIAGNOSIS AND TESTING (Continued)

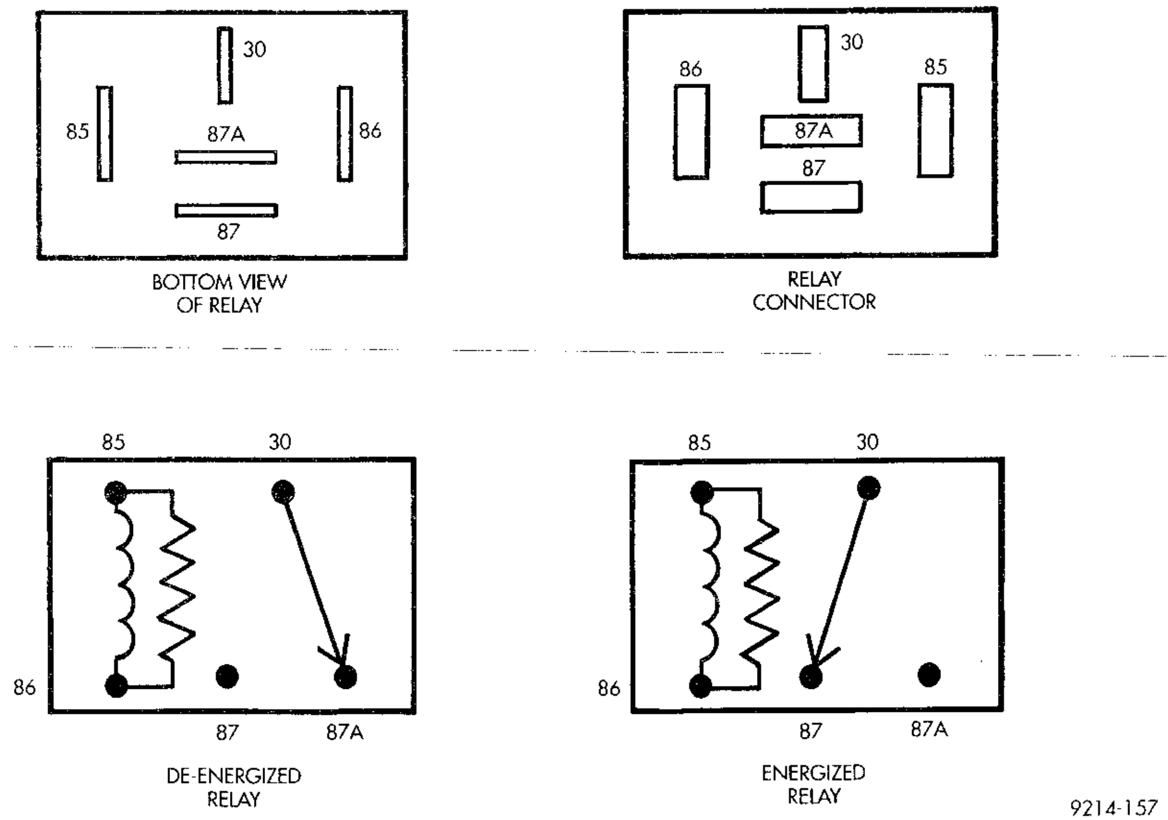

Fig. 27 Relay Terminals

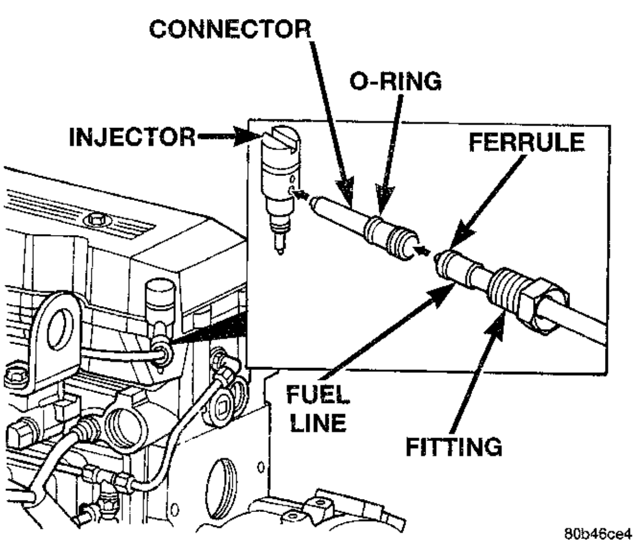

Fig. 28 Fuel Injector Connections

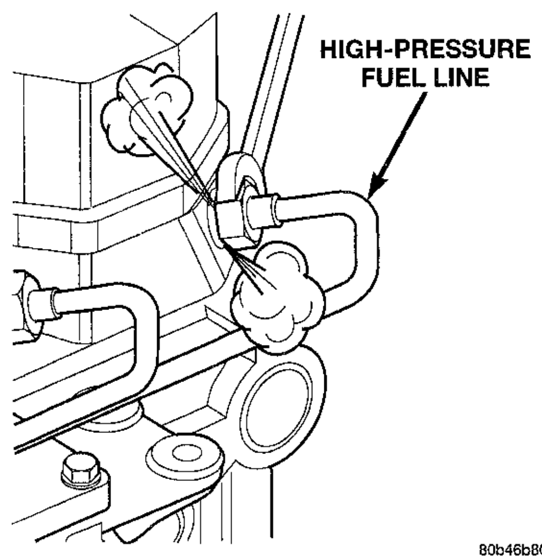

Fig. 29 Inspecting Injector Operation

DIAGNOSIS AND TESTING (Continued)

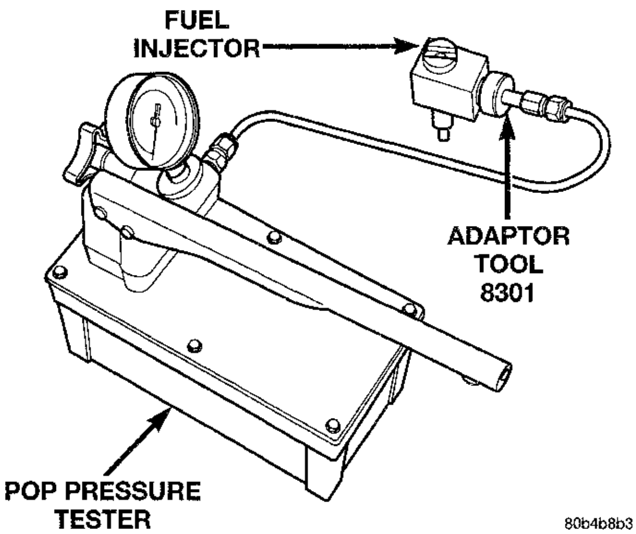

Fig. 30 Fuel Injector Tester and Adapter Tool

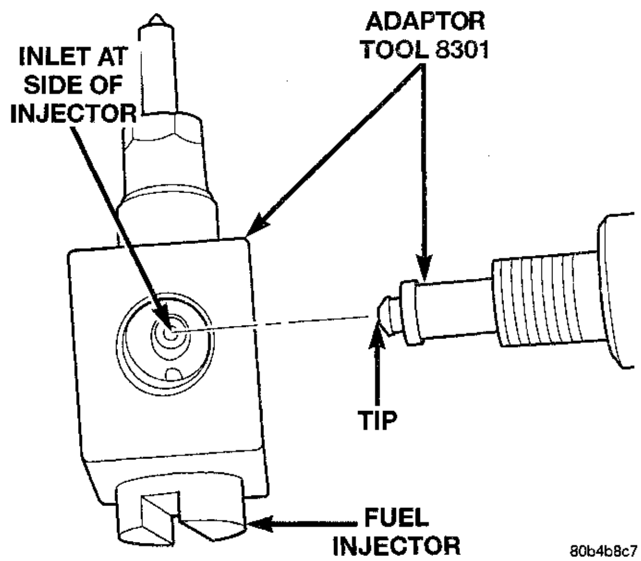

Fig. 31 Installing Injector to Adaptor Tool 8301

WARNING: FUEL INJECTOR TESTERS CAN DEVELOP EXTREMELY HIGH PRESSURES. FUEL UNDER THIS AMOUNT OF PRESSURE CAN PENETRATE SKIN AND CAUSE PERSONAL INJURY. WEAR SAFETY GOGGLES AND ADEQUATE PROTECTIVE CLOTHING. AVOID CONTACT WITH FUEL SPRAY WHEN OPERATING INJECTOR TESTOR.

(3) After injector has been removed, obtain bench-mount fuel injector tester OTC® (SPX®) part number 4210 (Fig. 30) (or equivalent). Install Special Tool number 8301 (Fuel Injector Adapter) to 4210 tester. Install fuel injector into 8301 adapter. Be sure tip of adapter tool 8301 is aligned to inlet hole at side of injector (Fig. 31) before tightening tool. Tighten tool 8301 to injector. Position container below injector before testing.

(4) Refer to operating instructions supplied with pressure tester for procedures.

(a) Check opening pressure or "pop" pressure. Pressure should be approximately 31,026 kPa (310 bars) or (4500 psi ± 250 psi). If fuel injector needle valve is opening (popping) too early or too late, replace injector.

(b) Perform a leak-down test on injector. Apply pressure with injector tester. The injector should not leak (drip) fuel with pressure at approximately 20 bars (291 psi) lower than pop pressure.

(c) Operate tester lever quickly several times to check injector spray pattern. Verify fuel is spraying from each injector nozzle hole. Injector should also spray evenly from each nozzle hole.

(d) Pay attention to size and shape of spray plumes. They should all be equal. If possible, compare spray pattern to that of a new fuel injector with same part number. Checking each plume for consistency is an excellent indicator of injector performance. Even if only one nozzle hole is plugged, significant performance problems could result.

(e) Look for burrs on injector inlet.

(f) Check nozzle holes for hole erosion or plugging.

(g) Inspect end of nozzle for burrs or rough machine marks.

(h) Look for cracks at nozzle end.

(i) Check nozzle color for signs of overheating. Overheating will cause nozzle to turn a dark yellow/tan or blue (depending on overheating temperature).

(j) Look at end of injector tube where it meets injector. A small, shiny band should be seen at this point. The band should have a consistent thickness. If not, injector could be leaking into fuel return.

(k) If any of these conditions occur, replace injector.

HIGH-PRESSURE FUEL LINE LEAK TEST

High-pressure fuel line leaks can cause starting problems and poor engine performance.

WARNING: DUE TO EXTREME FUEL PRESSURES OF UP TO 120,000 kPa (17,400 PSI), USE EXTREME CAUTION WHEN INSPECTING FOR HIGH-PRESSURE FUEL LEAKS. DO NOT GET YOUR HAND NEAR A SUSPECTED LEAK. INSPECT FOR HIGH-PRESSURE FUEL LEAKS WITH A SHEET OF CARDBOARD. HIGH FUEL INJECTION PRESSURE CAN CAUSE PERSONAL INJURY IF CONTACT IS MADE WITH THE SKIN.

DIAGNOSIS AND TESTING (Continued)

Start the engine. Move the cardboard over the high-pressure fuel lines and check for fuel spray onto the cardboard (Fig. 32). If a high-pressure line connection is leaking, bleed the system and tighten the connection. Refer to the Air Bleed Procedure in this group for procedures. Replace damaged, restricted or leaking high-pressure fuel lines with the correct replacement line.

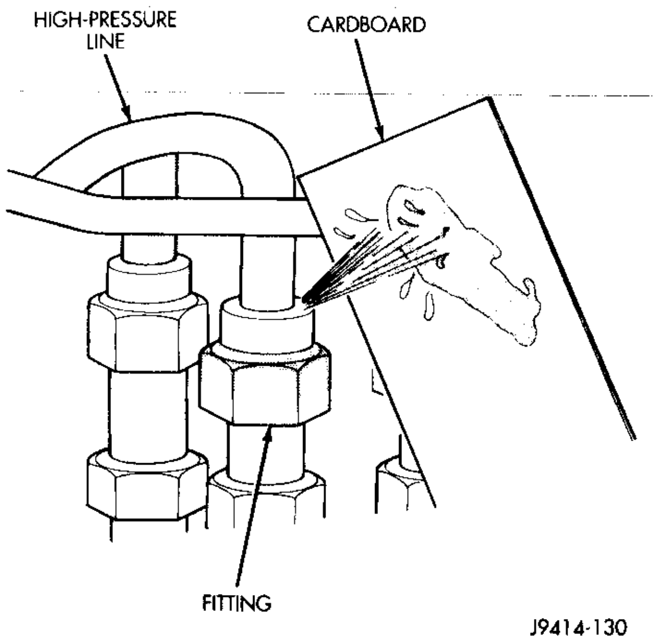

Fig. 32 Typical Test for Leaks with Cardboard

CAUTION: The high-pressure fuel lines must be clamped securely in place in the holders. The lines cannot contact each other or other components. Do not attempt to weld high-pressure fuel lines or to repair lines that are damaged. Only use the recommended lines when replacement of high-pressure fuel line is necessary.

FUEL INJECTION PUMP TIMING

With the Bosch VP44 injection pump, there are no mechanical adjustments needed for fuel injection timing. All timing and fuel adjustments are made by the Engine Control Module (ECM). However, if a Diagnostic Trouble Code (DTC) has been stored indicating an "engine sync error" or a "static timing error", perform the following.

Note: If this DTC appears after installation of a new or rebuilt injection pump, the pump keyway has probably been installed backwards. Refer to Fuel Injection Pump Removal/Installation for keyway information.

(1) Remove plastic access cover, injection pump nut and washer (Fig. 33). Locate keyway behind washer.

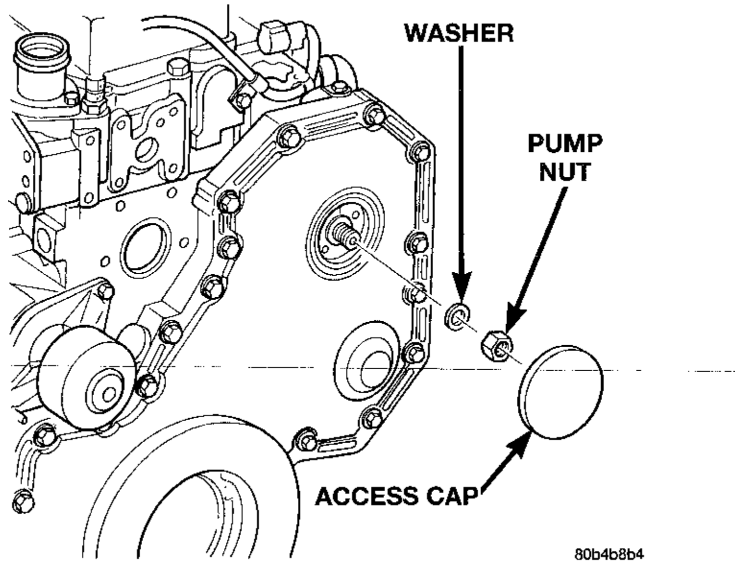

Fig. 33 Injection Pump Gear Access Cap

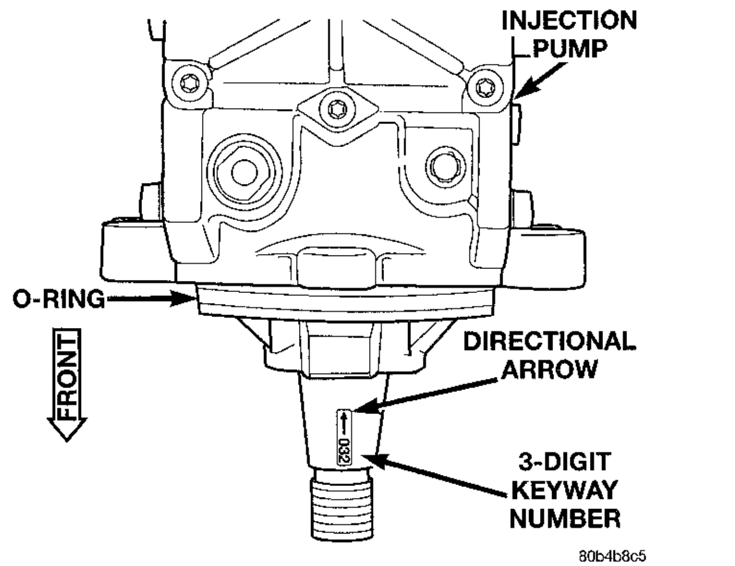

Fig. 34 Pump Keyway, Keyway Arrow and Keyway Number

(2) Be sure keyway aligning fuel injection pump shaft to injection pump gear is in proper position and pump gear has not slipped on pump shaft.

The following steps will require removing timing gear cover to gain access to timing gears. Refer to Group 9, Engines for procedures.

(3) Use a T-type puller to separate injection pump gear from pump shaft.

(4) Be sure keyway has been installed with arrow pointed to **rear** of pump (Fig. 34).

(5) **Pump timing has been calibrated to pump keyway. Be sure 3–digit number on pump keyway (Fig. 34) matches 3–digit number on fuel injection pump data plate. Plate is located on**

AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING (Continued)

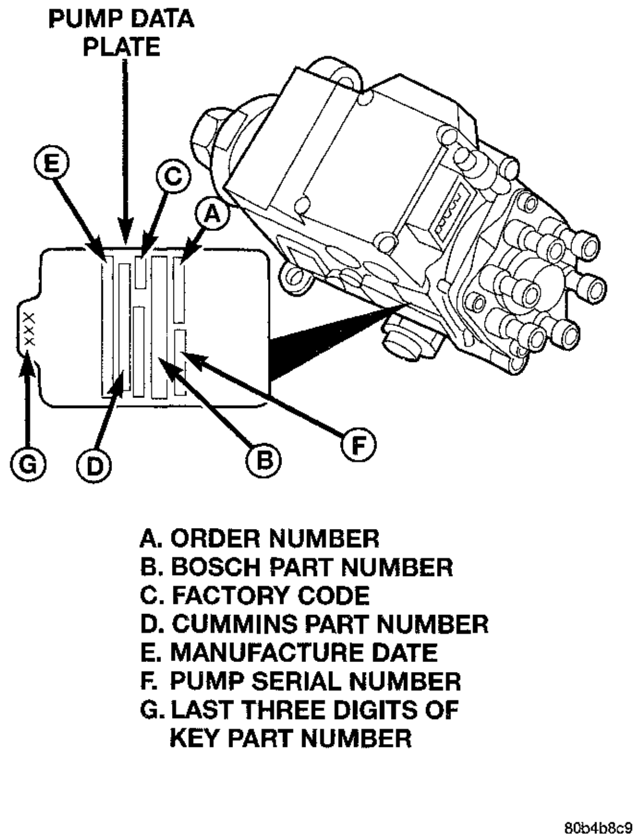

Fig. 35 Pump Data Plate Location

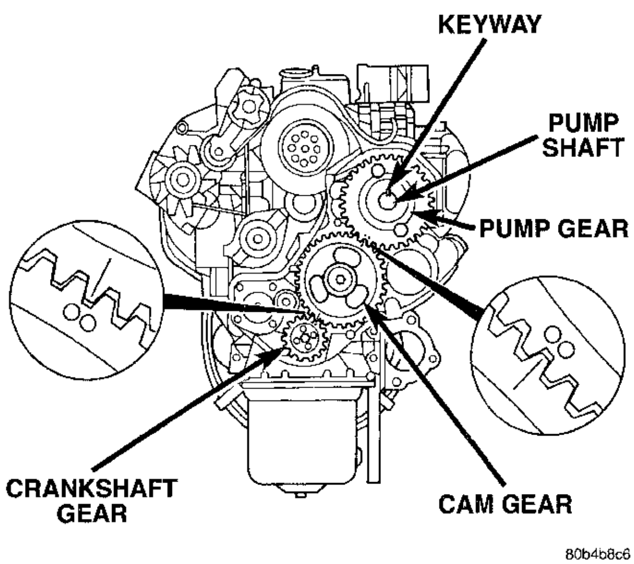

Fig. 36 Checking Fuel Injection Pump Gear Timing

side of injection pump (Fig. 35). Twenty–one different calibrated keyways/pumps are available.

(6) Verify timing marks on crank, cam and pump are aligned (Fig. 36).

(7) Perform necessary gear alignment/repairs as needed.

(8) After repairs are completed, erase DTC using DRB Scan Tool.

SERVICE PROCEDURES

CLEANING FUEL SYSTEM PARTS

CAUTION: Cleanliness cannot be overemphasized when handling or replacing diesel fuel system components. This especially includes the fuel injectors, high-pressure fuel lines and fuel injection pump. Very tight tolerances are used with these parts. Dirt contamination could cause rapid part wear and possible plugging of fuel injector nozzle tip holes. This in turn could lead to possible engine misfire. Always wash/clean any fuel system component thoroughly before disassembly and then air dry. Cap or cover any open part after disassembly. Before assembly, examine each part for dirt, grease or other contaminants and clean if necessary. When installing new parts, lubricate them with clean engine oil or clean diesel fuel only.

AIR BLEED PROCEDURE

A certain amount of air becomes trapped in the fuel system when fuel system components on the supply and/or high-pressure side are serviced or replaced. Primary air bleeding is accomplished using the electric fuel transfer (lift) pump. If the vehicle has been allowed to run completely out of fuel, the fuel injectors must also be bled as the fuel injection pump **is not** self-bleeding (priming).

Servicing or replacing components on the fuel return side will not require air bleeding.

WARNING: DO NOT BLEED AIR FROM THE FUEL SYSTEM OF A HOT ENGINE.

(1) Loosen, but do not remove, banjo bolt holding low-pressure fuel supply line to side of fuel injection pump (Fig. 37). Place a shop towel around banjo fitting to catch excess fuel.

The fuel transfer (lift) pump is self-priming: When the key is first turned on (without cranking engine), the pump operates for approximately 2 seconds and then shuts off. The pump will also operate for up to 25 seconds after the starter is engaged, and then disengaged and the engine is not running. The pump shuts off immediately if the key is on and the engine stops running.

(2) Turn key to CRANK position and quickly release key to ON position before engine starts. This will operate fuel transfer pump for approximately 25 seconds.

(3) If fuel is not present at fuel supply line after 25 seconds, turn key OFF. Repeat previous step until fuel is exiting at fuel supply line.

SERVICE PROCEDURES (Continued)

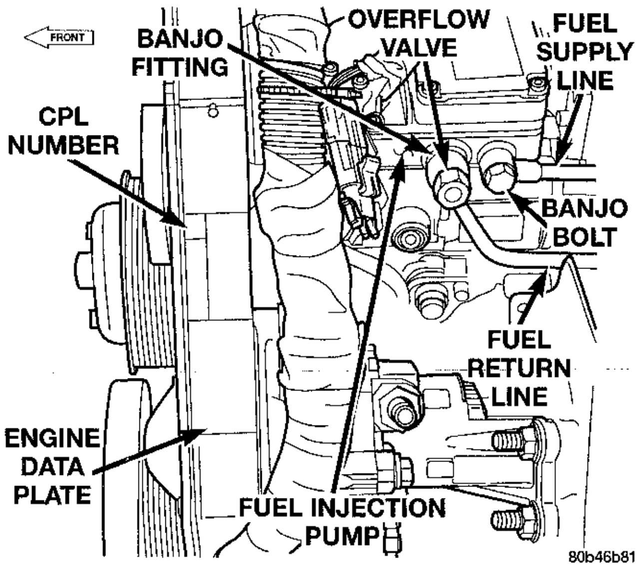

Fig. 37 Fuel Supply Line Banjo Bolt

(4) Tighten banjo bolt at fuel supply line to 24 N·m (18 ft. lbs.) torque. Primary air bleeding is now completed.

(5) Attempt to start engine. If engine will not start, proceed to following steps. **If engine does start, it may run erratically and be very noisy for a few minutes. This is a normal condition.**

(6) **Continue to next step if:**

- The vehicle fuel tank has been allowed to run empty
- The fuel injection pump has been replaced
- High-pressure fuel lines have been replaced
- Vehicle has not been operated after an extended period

CAUTION: Do not engage the starter motor for more than 30 seconds at a time. Allow two minutes between cranking intervals.

(7) Perform previous air bleeding procedure steps using fuel transfer pump. Be sure fuel is present at fuel supply line (Fig. 37) before proceeding.

(8) Crank the engine for 30 seconds at a time to allow air trapped in the injection pump to vent out the drain manifold.

WARNING: THE FUEL INJECTION PUMP SUPPLIES EXTREMELY HIGH FUEL PRESSURE TO EACH INDIVIDUAL INJECTOR THROUGH THE HIGH-PRESSURE LINES. FUEL UNDER THIS AMOUNT OF PRESSURE CAN PENETRATE THE SKIN AND CAUSE PERSONAL INJURY. WEAR SAFETY GOGGLES AND ADEQUATE PROTECTIVE CLOTHING AND AVOID CONTACT WITH FUEL SPRAY WHEN BLEEDING HIGH-PRESSURE FUEL LINES.

WARNING: ENGINE MAY START WHILE CRANKING STARTER MOTOR.

Engine may start, may run erratically and be very noisy for a few minutes. This is a normal condition.

(9) Thoroughly clean area around injector fittings where they join injector connector tubes.

(10) Bleed air by loosening high-pressure fuel line fittings (Fig. 38) at cylinders number 3, 4 and 5.

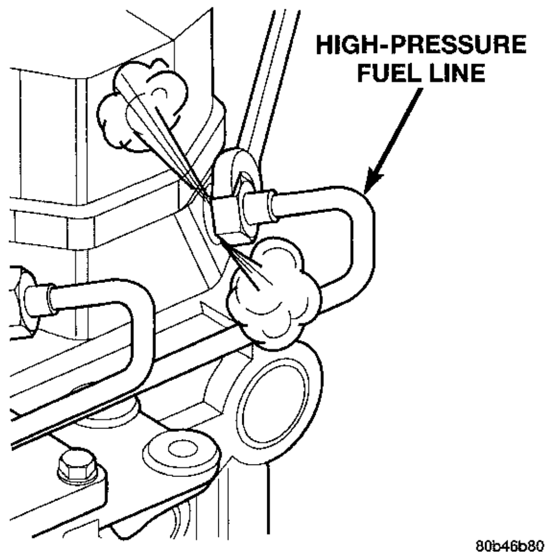

Fig. 38 Bleeding High-Pressure Fuel Lines at Injectors

(11) Continue bleeding injectors until engine runs smoothly. It may take a few minutes for engine to run smooth.

(12) Tighten fuel line(s) at injector(s) to 40 N·m (30 ft. lbs.) torque.

WATER DRAINING AT FUEL FILTER

Refer to Fuel Filter/Water Separator removal/installation for procedures.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION

ACCELERATOR PEDAL

REMOVAL

CAUTION: Be careful not to damage or kink the cable core wire (within the cable sheathing) while servicing accelerator pedal or cables.

(1) From inside vehicle, hold up accelerator pedal. Remove plastic cable retainer and throttle cable core wire from upper end of pedal arm (Fig. 39). The plastic cable retainer snaps into pedal arm.

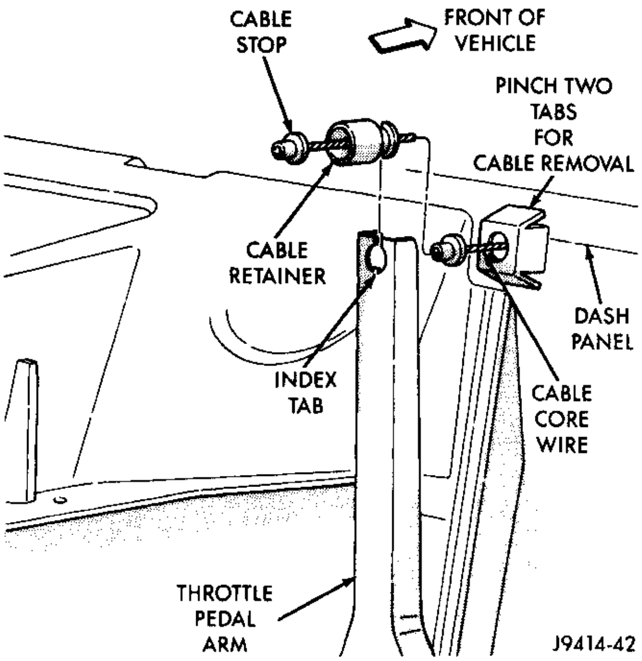

Fig. 39 Cable Removal/Installation at Pedal

(2) Insert a small screwdriver into square holes located on pivots/bushings (Fig. 40). Twist screwdriver to disengage pivot locks from pivot pin. Pivots will be damaged when removing. Discard old pivots.
(3) Remove pedal/bracket assembly from vehicle.

INSTALLATION

(1) Position pedal/bracket assembly over pivot pin (Fig. 40).
(2) Install two new pivots/bushings. Using large pliers, press both bushings together until they bottom on sides of pedal/bracket assembly. Bushing retaining ears will snap into position when properly installed.

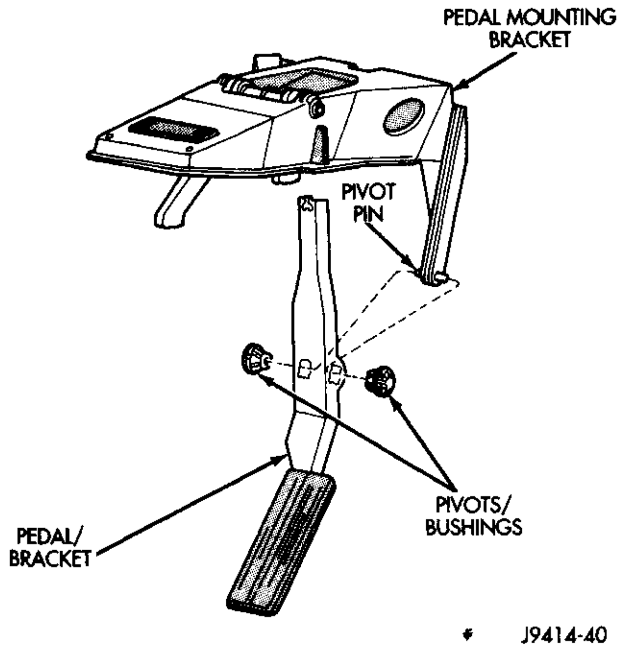

Fig. 40 Accelerator Pedal—Removal or Installation

(3) From inside vehicle, hold up accelerator pedal. Install throttle cable core wire and plastic cable retainer into and through upper end of pedal arm (the plastic retainer is snapped into pedal arm). When installing plastic retainer to accelerator pedal arm, note index tab on pedal arm (Fig. 39). Align index slot on plastic cable retainer to this index tab.

THROTTLE CABLE

CAUTION: Be careful not to damage or kink the cable core wire (within the cable sheathing) while servicing accelerator pedal or cables.

REMOVAL

(1) Disconnect both negative battery cables at both batteries.
(2) From inside vehicle, hold up accelerator pedal. Remove plastic cable retainer and throttle cable core wire from upper end of pedal arm (Fig. 39). The plastic cable retainer snaps into pedal arm.
(3) Remove cable core wire at pedal arm.
(4) From inside vehicle, pinch both sides of plastic cable housing retainer tabs at dash panel (Fig. 39).
(5) Remove cable housing from dash panel and pull cable into engine compartment.

REMOVAL AND INSTALLATION (Continued)

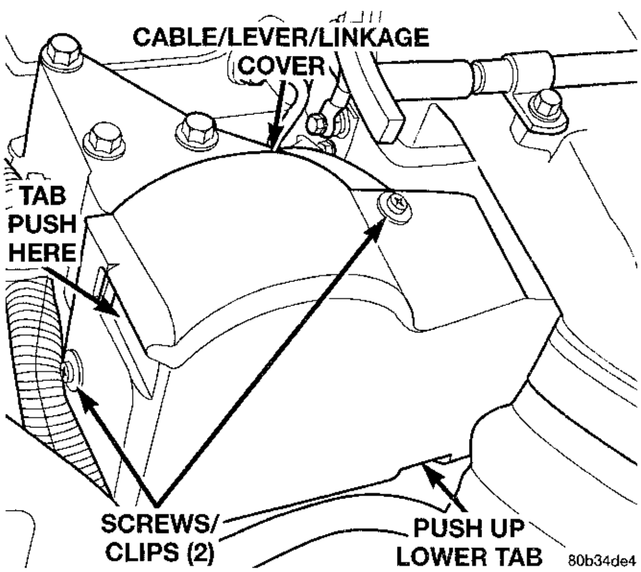

Fig. 41 Cable/Lever/Throttle Linkage Cover

(6) Remove cable cover (Fig. 41). Cable cover is attached with 2 Phillips screws, 2 plastic retention clips and 2 push tabs (Fig. 41). Remove 2 Phillips screws and carefully pry out 2 retention clips. After clip removal, push rearward on front tab, and upward on lower tab for cover removal.

(7) Using 2 screwdrivers, pry cable connector socket from throttle lever ball (Fig. 42). **Be very careful not to bend throttle lever arm.**

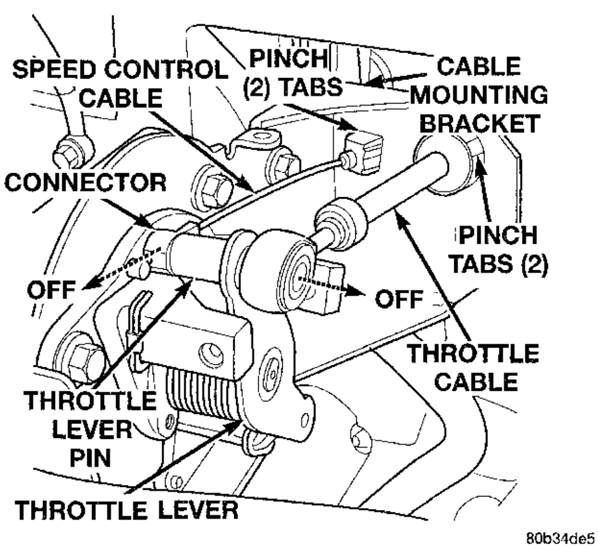

Fig. 42 Throttle Cable at Throttle Lever

(8) Squeeze 2 pinch tabs on sides of throttle cable at mounting bracket (Fig. 42) and push cable rearward out of bracket .

INSTALLATION

(1) Install cable through mounting hole on cable mounting bracket (Fig. 42). Cable snaps into bracket. Be sure 2 pinch tabs are secure.

(2) Using large pliers, connect cable end socket to throttle lever ball (snaps on).

(3) Install remaining cable housing end into and through dash panel opening (snaps into position). The two plastic pinch tabs (Fig. 39) should lock cable to dash panel.

(4) From inside vehicle, hold up accelerator pedal. Install throttle cable core wire and plastic cable retainer into and through upper end of pedal arm (the plastic retainer is snapped into pedal arm). When installing plastic retainer to accelerator pedal arm, note index tab on pedal arm (Fig. 39). Align index slot on plastic cable retainer to this index tab.

(5) Connect negative battery cables to both batteries.

(6) Before starting engine, operate accelerator pedal to check for any binding.

(7) Install cable/lever cover.

AIR CLEANER HOUSING/AIR CLEANER ELEMENT

TESTING AIR CLEANER ELEMENT

Do not attempt to unnecessarily remove the top of the air cleaner housing for air cleaner element inspection on diesel engines.

The air cleaner (filter) housing is equipped with an air Filter Minder® gauge (Fig. 43). This air flow restriction gauge will determine when the air cleaner element is restricted and should be replaced.

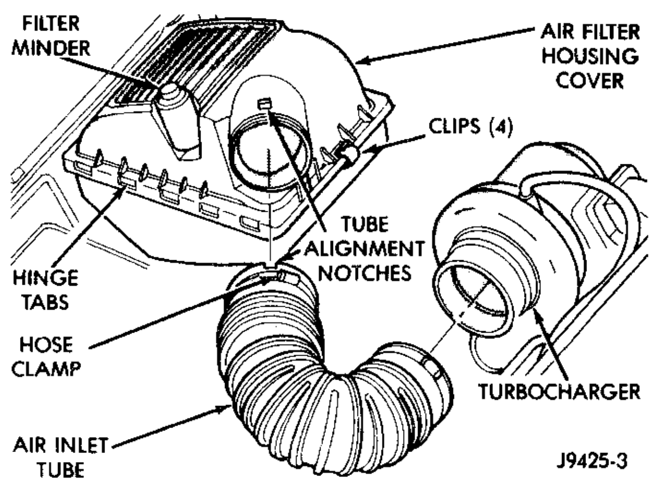

Fig. 43 Filter Minder®—Location—Diesel Engine

AUTHENTIC RESTORATION

REMOVAL AND INSTALLATION (Continued)

The Filter Minder™ consists of a diaphragm and calibrated spring sealed inside of a plastic housing (Fig. 44). A yellow colored disc attached to the diaphragm moves along a graduated scale on the side of the Filter Minder. After the engine has been shut off, a ratcheting device located within the Filter Minder will hold the yellow disc at the highest restriction that the air cleaner element has experienced. A drop in air pressure due to an air cleaner element restriction moves the diaphragm and the yellow disc will indicate the size of the air drop.

CAUTION: Certain engine degreasers or cleaners may discolor or damage the plastic housing of the Filter Minder. Cover and tape the Filter Minder if any engine degreasers or cleaners are to be used.

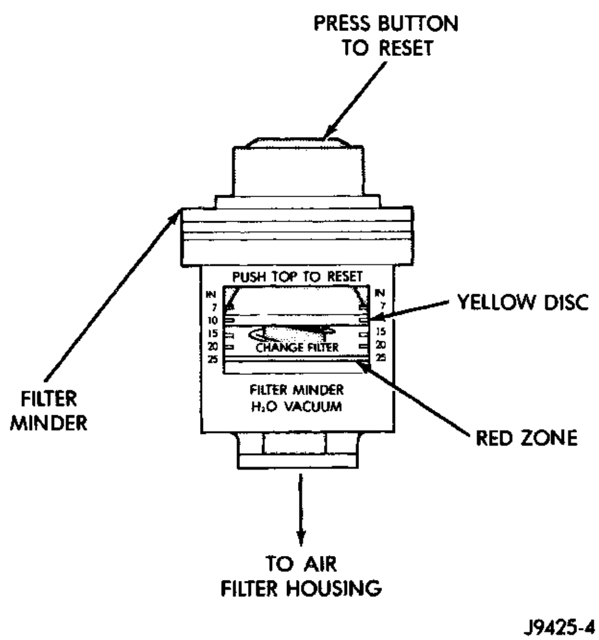

Fig. 44 Filter Minder™—Diesel Engine

To test, turn the engine off. If the yellow disc (Fig. 44) has reached the red colored zone on the graduated scale, the air cleaner element should be replaced. Refer to the proceeding removal/installation paragraphs.

Resetting the Filter Minder: After the air cleaner (filter) element has been replaced, press the rubber button on the top of the Filter Minder (Fig. 44). This will allow the yellow colored disc to reset. After the button has been pressed, the yellow disc should spring back to the UP position.

If the Filter Minder gauge has reached the red colored zone, and after an examination of the air cleaner (filter) element, the element appears to be clean, the high reading may be due to a temporary condition such as snow build-up at the air intake. Temporary high restrictions may also occur if the air cleaner (filter) element has gotten wet such as during a heavy rain or snow. If this occurs, allow the element to dry out during normal engine operation. Reset the rubber button on the top of the Filter Minder and retest after the element has dried.

REMOVAL

(1) Loosen air inlet tube clamp at air cleaner housing inlet (Fig. 43). Remove this tube at air cleaner housing cover.

(2) The housing cover is equipped with four (4) spring clips (Fig. 43) and is hinged at front with plastic tabs. Unlatch clips from top of air cleaner housing and tilt housing cover up and forward for cover removal.

(3) Remove air cleaner element from air cleaner housing.

INSTALLATION

(1) Before installing a new air cleaner element, clean inside of air cleaner housing.

(2) Position air cleaner cover to tabs on front of air cleaner housing. Latch four spring clips to seal cover to housing.

(3) Install air inlet tube at air cleaner housing inlet. Note hose alignment notches at both inlet hose and air cleaner cover (Fig. 43).

(4) Position tube clamp to inlet tube and tighten to 3 N·m (25 in. lbs.) torque.

FUEL DRAIN MANIFOLD

The fuel drain manifold (line) connects a fuel return passage within the cylinder head to a "T" fitting on the fuel return line. It is located at the rear of the cylinder head.

REMOVAL

(1) Disconnect both negative battery cables at both batteries.

(2) Remove starter motor. Refer to Group 8B for procedures.

(3) Disconnect fitting at "T" (Fig. 45).

(4) Remove banjo bolt at rear of cylinder head. Discard old sealing washers.

(5) Remove fuel line from vehicle.

(6) Clean connection at rear of cylinder head before line installation.

INSTALLATION

Servicing fuel return components will not require air bleeding.

(1) Using new sealing washers, assemble banjo bolt to fuel line.

(2) Position line to engine and loosely tighten fasteners.

(3) Tighten banjo bolt to 24 N·m (18 ft. lbs.) torque.

REMOVAL AND INSTALLATION (Continued)

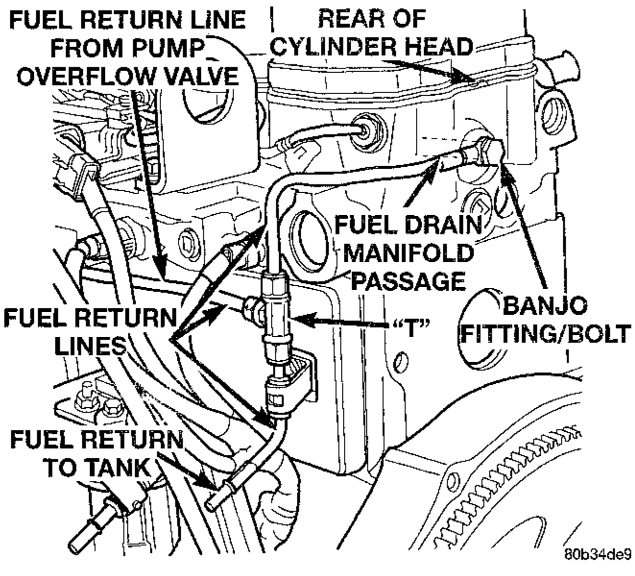

Fig. 45 Fuel Return Line at Rear of Cylinder Head

(4) Tighten fitting at "T" to 12 N·m (106 in. lbs.) torque.

(5) Install starter motor. Refer to Group 8B for procedures.

(6) Connect both negative battery cables at both batteries.

FUEL FILTER/WATER SEPARATOR

Refer to maintenance schedules in Group 0 in this manual for recommended fuel filter replacement intervals.

The fuel filter/water separator assembly is located on left/rear side of engine above starter motor (Fig. 46). The assembly contains the fuel filter cartridge, Water-In-Fuel (WIF) sensor, and fuel heater.

REMOVAL

Draining water from filter canister:

The canister drain valve (Fig. 47) serves two purposes. One is to **partially** drain filter canister of excess water. The other is to **completely** drain canister for filter, heater or water-in-fuel sensor replacement.

The filter should be drained whenever water-in-fuel warning lamp remains illuminated. (Note that lamp will be illuminated for approximately two seconds when ignition key is initially placed in ON position for a bulb check).

(1) A drain hose is located at bottom of drain valve (Fig. 48). Place drain pan under drain hose.

(2) **With engine not running,** rotate drain valve handle forward to OPEN (DRAIN) position (Fig. 47). Hold drain valve open until all water and contaminants have been removed and clean fuel exits drain hose.

(3) If fuel filter, fuel heater or Water-In-Fuel (WIF) sensor is being replaced, drain canister completely. Dispose of mixture in drain pan according to applicable regulations.

(4) After draining operation, rotate valve handle rearward to CLOSE position (Fig. 47). **If fuel filter, fuel heater or WIF sensor is being replaced, proceed to next step.**

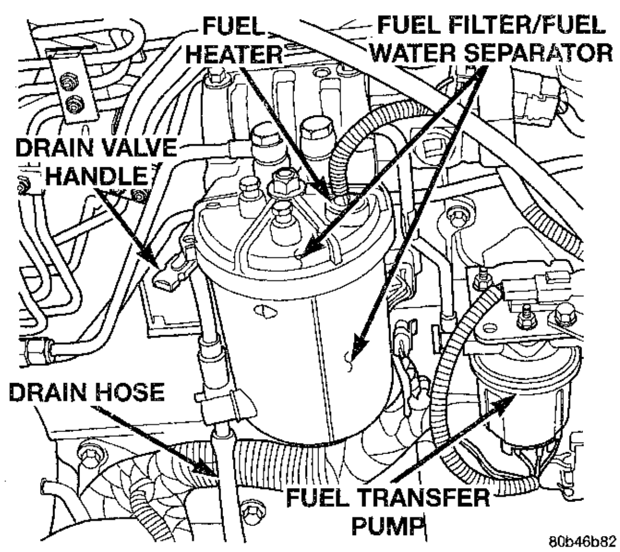

Fig. 46 Fuel Filter/Water Separator/Drain Hose Location

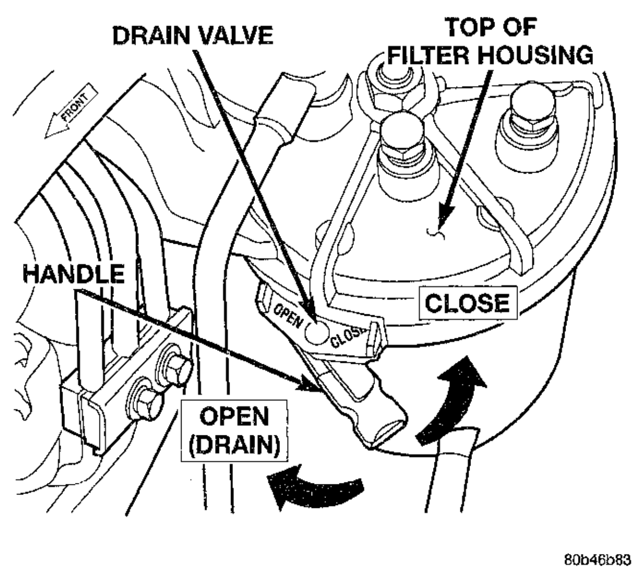

Fig. 47 Drain Valve at Fuel Filter/Water Separator

(5) Remove drain hose at drain valve (Fig. 46).

(6) Disconnect Water-In-Fuel (WIF) sensor electrical connector at sensor. The WIF sensor is located at side of filter canister (Fig. 48).

REMOVAL AND INSTALLATION (Continued)

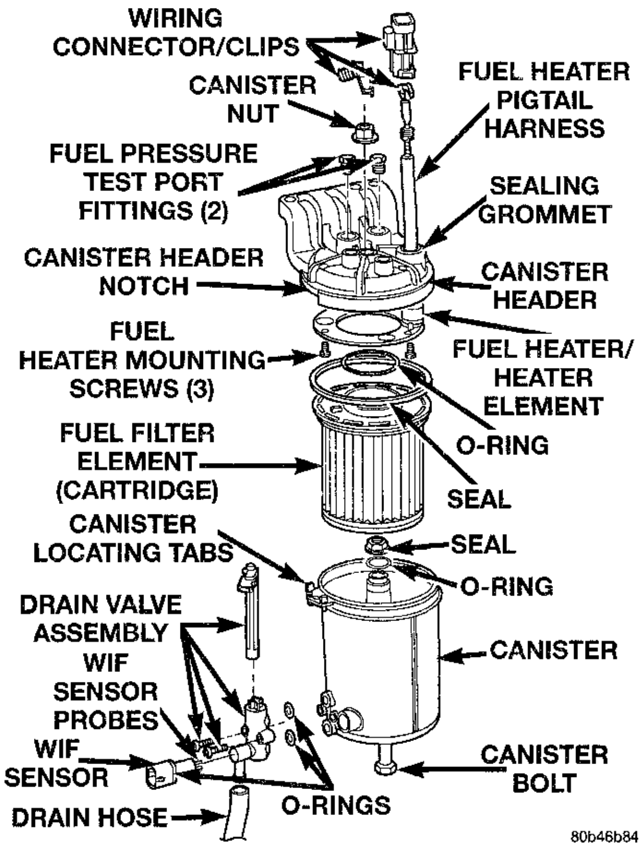

Fig. 48 Fuel Filter/Water Separator Components

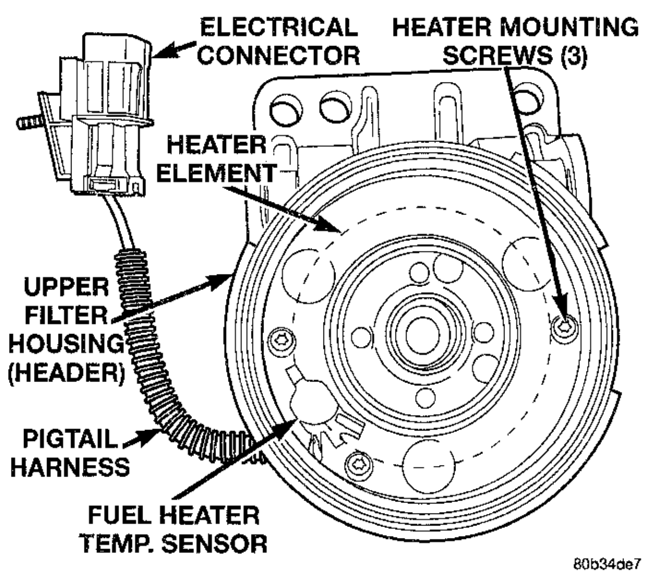

Fig. 49 Fuel Heater Mounting Screws (Bottom View)

(7) Loosen filter canister nut at top of header (Fig. 48) while lowering canister assembly from header.

(8) Remove and discard seals and center o-rings (Fig. 48).

(9) Remove filter element (cartridge) from canister.

(10) Remove WIF sensor and its o-ring seal from canister (Fig. 48).

(11) Inspect WIF sensor probes (Fig. 48). Carefully clean contaminants from sensor probes with a cloth if necessary. Replace sensor if probes are covered with contaminants and will not clean up.

(12) **Fuel Heater:** The fuel heater is located inside fuel filter housing (header) (Fig. 46), (Fig. 48) or (Fig. 49). The heater mounting plate, heating element, temperature sensor and wiring harness are serviced as one assembly.

(a) Disconnect heater pigtail harness electrical connector (Fig. 49) from main engine wiring harness near upper/rear of filter.

(b) The plastic electrical connector (Fig. 49) at end of 2–wire pigtail harness will have to be removed from wiring harness before attempting to pass harness through filter header.

(c) Note locations (colors) of wires in connector before removing connector.

(d) Remove clip (Fig. 48) retaining wires to connector.

(e) Remove wires from connector.

(f) Remove 3 fuel heater mounting screws (Fig. 48) or (Fig. 49).

(g) Press down on heater sealing grommet (Fig. 48) to remove heater from filter canister header.

(h) Pass wire harness through hole in filter header while removing heater from header.

INSTALLATION

(1) Clean inside of canister and canister header.

(2) **Fuel Heater:**

(a) Lift fuel heater assembly into filter header while passing wire harness upward through hole in header. Heater sealing grommet should protrude at top of filter header.

(b) Install 3 fuel heater mounting screws (Fig. 49) or (Fig. 48) and tighten to 2–3 N·m (15–20 in. lbs.) torque.

(c) Install 2 wires into electrical connector and install connector clip.

(d) Connect heater pigtail harness electrical connector (Fig. 49) to main engine wiring harness.

(3) Install new o-ring seal to WIF sensor.

(4) Install WIF sensor to canister. Tighten to 2–3 N·m (15–20 in. lbs.) torque.

(5) If drain valve assembly is being replaced, tighten mounting screws to 3–5 N·m (30–40 in. lbs.) torque.

(6) Install new o-rings.

(7) Install new seal between canister and canister header.

If filter canister is not filled with clean diesel fuel before installation, manual air bleeding of fuel system may be necessary (temporary rough engine running may occur). If necessary, refer to Air Bleed Procedures.

REMOVAL AND INSTALLATION (Continued)

(8) Load filter into canister.
(9) Fill filter canister with clean diesel fuel.
(10) Apply a light film of clean diesel oil to all seals.
(11) Position canister assembly to canister header. Note locating tabs on canister should align into notch on canister header (Fig. 48).
(12) Install canister nut and tighten to 14 N·m (10 ft. lbs.) torque.
(13) Connect electrical connector to WIF sensor.
(14) Connect drain hose to bottom of drain valve.
(15) Start engine and check for leaks.

FUEL TANK

Depending on body style, tank may have to be lowered for fuel draining. Refer to following procedures.

REMOVAL

(1) Remove fuel tank filler tube cap.
(2) Disconnect both negative battery cables at both batteries.
(3) Raise vehicle on hoist.
(4) Open fuel fill door and remove screws mounting fuel filler tube assembly to body (some body styles only). Do not disconnect rubber fuel fill or vent hoses from tank at this time.
(5) Place a transmission jack under center of fuel tank. Apply a slight amount of pressure to fuel tank with transmission jack.
(6) Remove fuel tank mounting strap nuts from mounting strap studs (Fig. 50). If equipped, remove fuel tank shield bolts.
(7) Lower fuel tank only enough to allow access to top of tank. The 2 tank fittings (where rubber fuel fill and vent hose connections are made) must be positioned above tank level. Rotate tank slightly to allow these fittings to be above tank level.

WARNING: WRAP SHOP TOWELS AROUND HOSES TO CATCH ANY DIESEL FUEL SPILLAGE.

(8) While working over left rear tire/wheel, disconnect rubber fuel vent hose at fuel vent fitting (Fig. 51) (vent hose is the smallest of 2 hoses). Position fuel siphoning/drain hose into this fitting at tank. Drain fuel into an approved portable holding tank or a properly labeled diesel fuel safety container.
(9) Disconnect rubber fuel fill hose at fuel tank (Fig. 50).
(10) While working over left rear tire/wheel, disconnect wiring harness connector from electrical connector at top of fuel tank module (Fig. 51).
(11) Disconnect fuel supply and fuel return lines at fuel tank module fittings (Fig. 51). Refer to Quick-Connect Fittings for procedures.
(12) Continue lowering fuel tank for removal.
(13) If fuel tank module removal is necessary, refer to Fuel Tank Module Removal/Installation in this group.

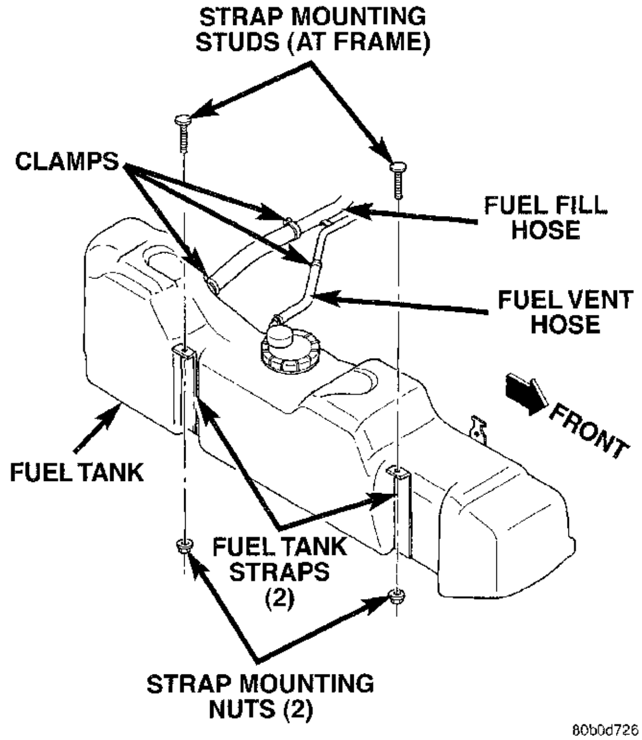

Fig. 50 Fuel Tank Mounting—Typical

INSTALLATION

(1) If fuel tank module is being installed, refer to Fuel Tank Module Removal/Installation in this group.
(2) Place fuel tank on top of transmission jack.
(3) Install rubber fill and vent lines to tank. Tighten hose clamps to 2.3 N·m (20 in. lbs.) torque.
(4) Raise tank into position while guiding fill and vent hoses to body. Raise tank only enough to allow access to top of tank.
(5) Connect electrical connector to fuel tank module.

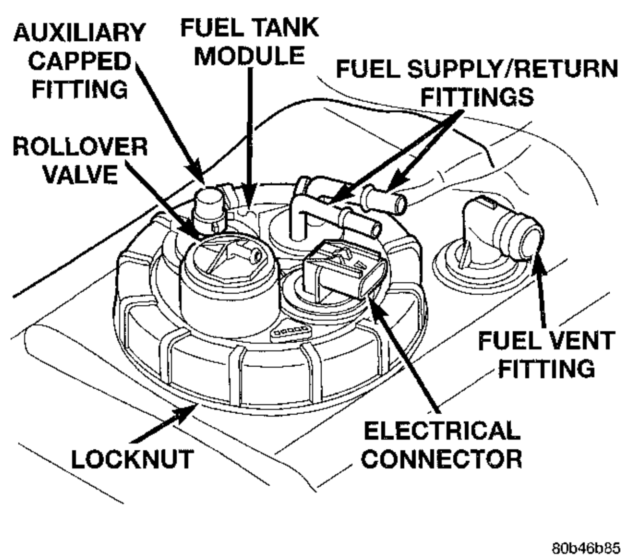

Fig. 51 Fuel Tank Module Location

REMOVAL AND INSTALLATION (Continued)

(6) Connect fuel supply and fuel return lines to fuel tank module fittings. Refer to Quick-Connect Fittings in this group.

(7) Connect two mounting straps and mounting strap nuts.

(8) Tighten strap nuts to 41 N·m (30 ft. lbs.) torque. Do not over tighten retaining strap nuts.

(9) Remove transmission jack.

(10) Connect fuel filler tube assembly to body.

(11) Refill fuel tank and inspect all hoses and lines for leaks.

(12) Connect both negative battery cables to both batteries.

FUEL TANK MODULE

REMOVAL

(1) Drain and remove fuel tank. Refer to Fuel Tank Removal/Installation.

(2) Thoroughly clean area around tank module at top of tank.

(3) The plastic fuel tank module locknut is threaded onto fuel tank (Fig. 51). Install Special Tool 6856 to locknut and remove locknut (Fig. 52). The fuel tank module will spring up when locknut is removed.

(4) Remove module from fuel tank.

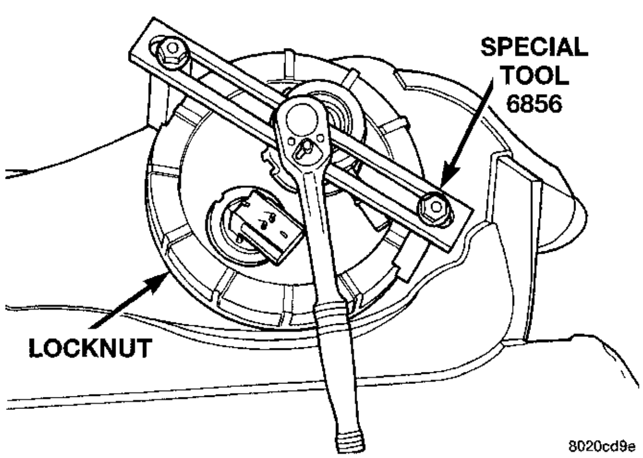

Fig. 52 Locknut Removal/Installation—TYPICAL MODULE

INSTALLATION

CAUTION: Whenever the fuel tank module is serviced, the rubber gasket must be replaced.

(1) Thoroughly clean locknut and locknut threads at top of tank.

(2) Using new gasket, carefully position fuel tank module into opening in fuel tank.

(3) Position locknut over top of fuel tank module. Install locknut finger tight.

(4) When looking down at tank from drivers side of tank, the arrow at top of module should be aligned between two marks stamped into tank (approximately 2 o'clock position). The fuel line connectors, roll over valve and fuel gauge electrical connector should all be pointed to drivers side of vehicle. Rotate and align module/tank marks if necessary before tightening locknut. **This step must be performed to prevent the module's float from contacting side of fuel tank.**

(5) Tighten locknut to 24–44 N·m (18–32 ft. lbs.) torque.

(6) Install fuel tank. Refer to Fuel Tank Removal/Installation.

FUEL HEATER

The fuel heater/element/sensor assembly is located inside of the fuel filter housing. Refer to Fuel Filter/Water Separator Removal/Installation for procedures.

FUEL HEATER RELAY

The fuel heater relay is located in the Power Distribution Center (PDC) (Fig. 53). Refer to label under PDC cover for relay location.

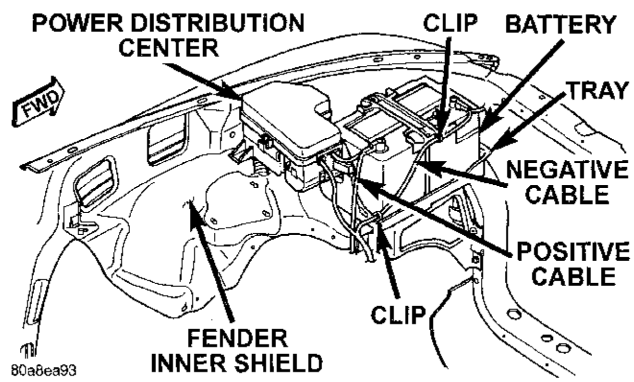

Fig. 53 Power Distribution Center (PDC) Location

REMOVAL

(1) Remove PDC cover.

(2) Remove relay from PDC.

(3) Check condition of relay terminals and PDC connector terminals for damage or corrosion. Repair if necessary before installing relay.

(4) Check for pin height (pin height should be the same for all terminals within the PDC connector). Repair if necessary before installing relay.

INSTALLATION

(1) Install relay to PDC.

(2) Install cover to PDC.

REMOVAL AND INSTALLATION (Continued)

HIGH-PRESSURE FUEL LINES

High-pressure lines are used between the fuel injection pump and the fuel injectors only. All high-pressure fuel lines are of the same length and inside diameter. Correct high-pressure fuel line usage and installation is critical to smooth engine operation.

Whenever the high-pressure lines are removed, they should be removed as a bundle (if possible). They should also be tagged for return to original position.

CAUTION: The high-pressure fuel lines must be clamped securely in place in the holders. The lines cannot contact each other or other components. Do not attempt to weld high-pressure fuel lines or to repair lines that are damaged. Only use the recommended lines when replacement of high-pressure fuel line is necessary.

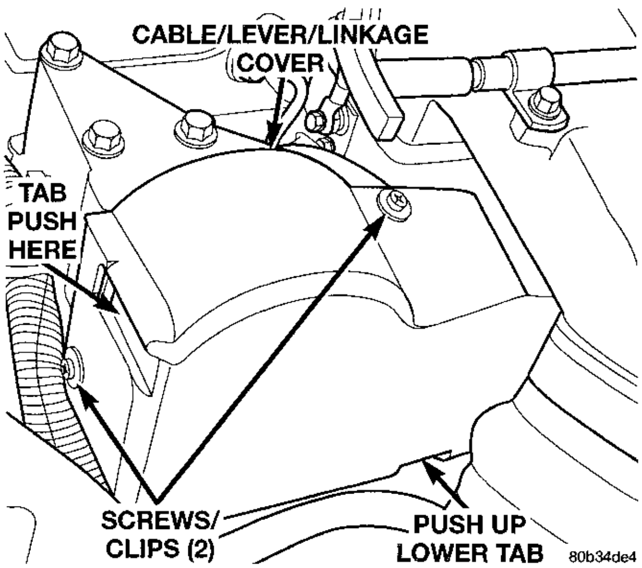

Fig. 54 Cable/Lever/Throttle Linkage Cover

REMOVAL

CAUTION: Refer to Cleaning Fuel System Parts.

(1) Disconnect both negative battery cables from both batteries. Cover and isolate ends of cables.

(2) Thoroughly clean fuel lines at cylinder head and injection pump ends.

(3) Remove cable cover (Fig. 54). Cable cover is attached with 2 Phillips screws, 2 plastic retention clips and 2 push tabs (Fig. 54). Remove 2 Phillips screws and carefully pry out 2 retention clips. After clip removal, push rearward on front tab, and upward on lower tab for cover removal. **Do not remove any cables at lever.**

(4) Disconnect wiring harness (clip) at bottom of Accelerator Pedal Position Sensor (APPS) mounting bracket (Fig. 55).

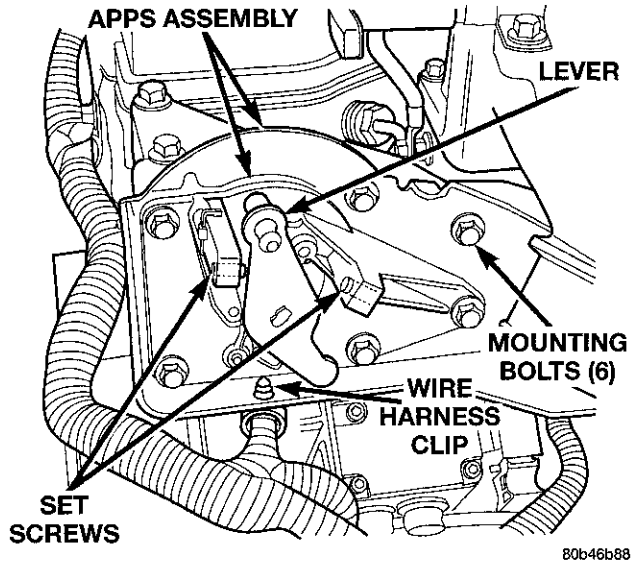

Fig. 55 Wiring Clip at APPS

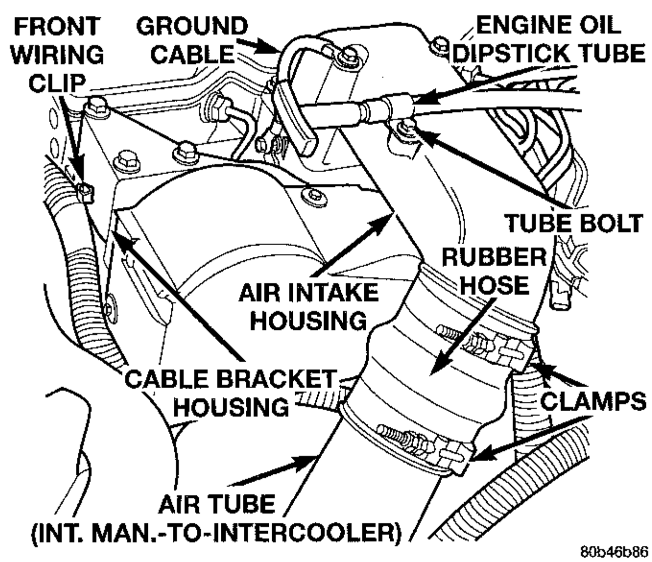

Fig. 56 Air Tube

(5) Using 2 small screwdrivers, pry front wiring clip (Fig. 56) from cable bracket housing. Position wiring harness towards front of engine.

(6) Remove electrical connector from APPS by pushing connector tab rearward while pulling down on connector (Fig. 57).

(7) Disconnect 2 electrical cables from cable mounting studs (Fig. 58) at intake air heater on top of intake manifold.

(8) Remove engine oil dipstick from engine.

(9) Remove engine oil dipstick tube support mounting bolt (Fig. 56) and position tube to side.

(10) Disconnect clamps and remove air tube (intake manifold-to-intercooler) (Fig. 56).

REMOVAL AND INSTALLATION (Continued)

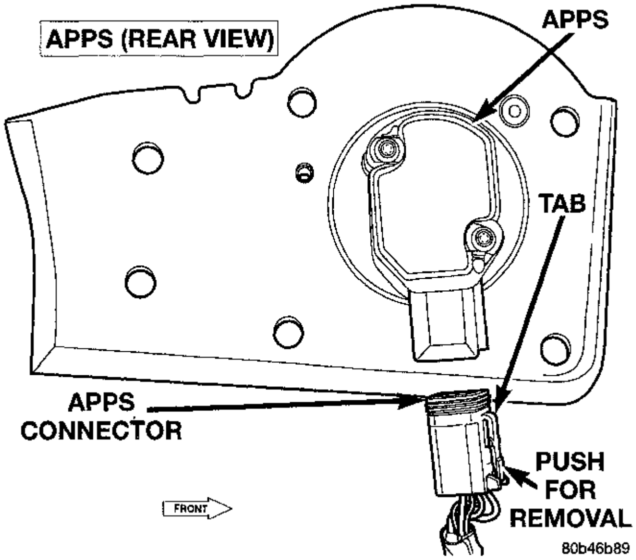

Fig. 57 Rear View of APPS

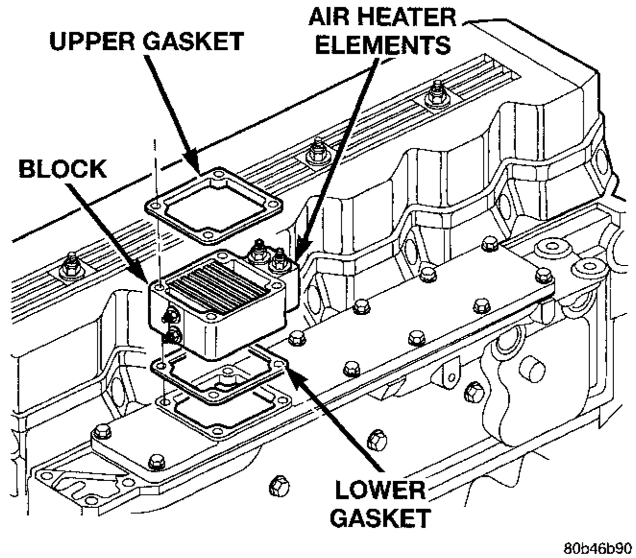

Fig. 59 Intake Manifold Air Heater (Elements)

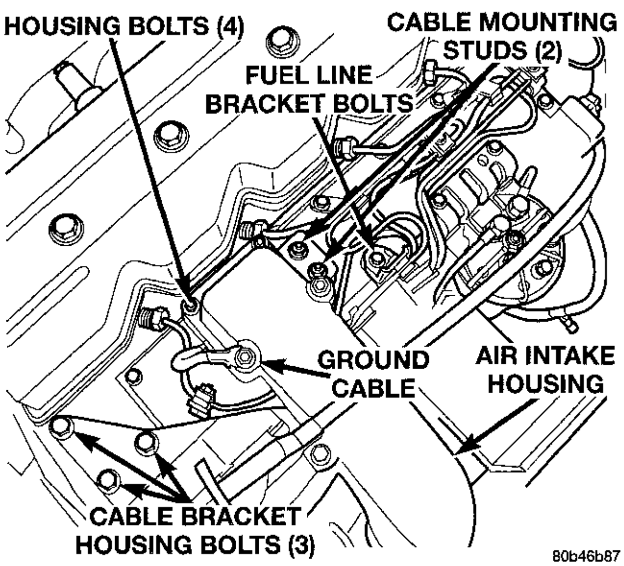

Fig. 58 Air Intake Housing

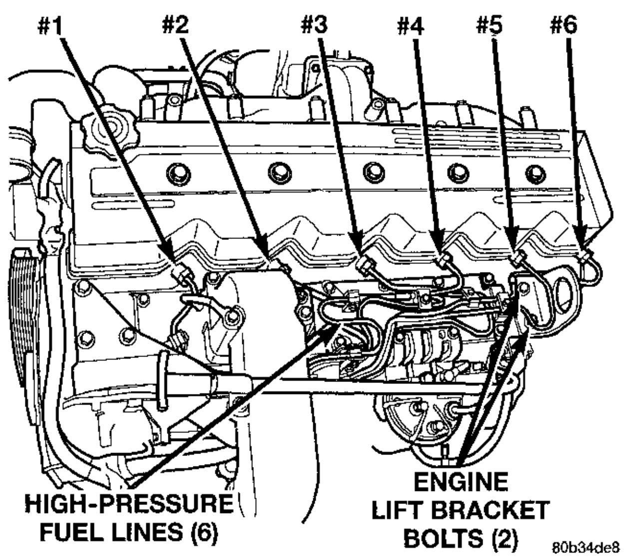

Fig. 60 High-Pressure Lines at Cylinder Head

(11) Remove 4 air intake housing mounting bolts and remove housing (Fig. 58). Position ground cable at top of air intake housing to front of engine.

(12) Remove intake manifold air heater element block from engine (Fig. 59). Discard old upper and lower gaskets

(13) Remove 3 cable bracket housing mounting bolts (Fig. 58). Carefully position cable bracket and cable assembly to side of engine. **Leave cables connected to lever.**

(14) Remove engine lifting bracket at rear of intake manifold (2 bolts) (Fig. 60).

(15) Remove bolts from all fuel injection line support brackets at intake manifold (Fig. 58).

(16) Place shop towels around fuel lines at fuel injectors. Do not allow fuel to drip down side of engine.

CAUTION: WHEN LOOSENING OR TIGHTENING HIGH-PRESSURE FITTINGS AT INJECTION PUMP, USE A BACK-UP WRENCH ON DELIVERY VALVE AT PUMP. DO NOT ALLOW DELIVERY VALVE TO ROTATE.

(17) Loosen high-pressure lines at injection pump (Fig. 61) beginning with cylinders 1, 2 and 4.

(18) Loosen high-pressure lines at cylinder head for cylinders 1, 2 and 4 (Fig. 60).

REMOVAL AND INSTALLATION (Continued)

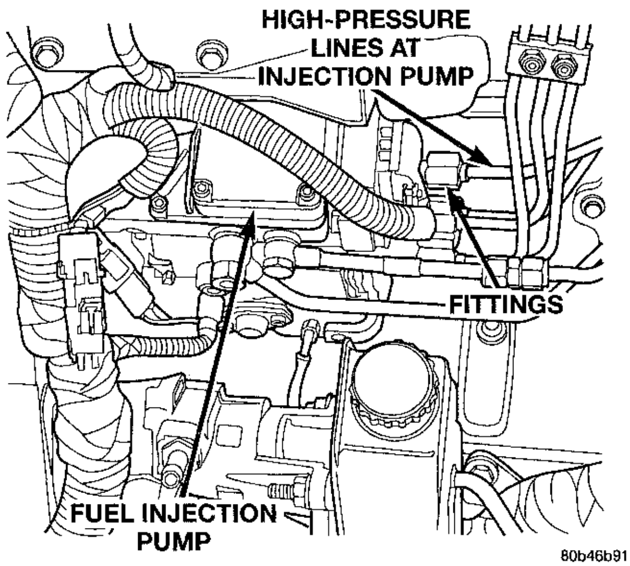

Fig. 61 High-Pressure Lines at Fuel Injection Pump

(19) Carefully remove front line bundle from engine. **Do not bend lines while removing.** While removing front line bundle, note line position.

(20) Loosen high-pressure lines at injection pump beginning with cylinders 3, 5 and 6.

(21) Loosen high-pressure lines at cylinder head for cylinders 3, 5 and 6 (Fig. 60).

(22) Carefully remove rear line bundle from engine. **Do not bend lines while removing.** While removing rear line bundle, note line position.

INSTALLATION

CAUTION: Be sure that the high-pressure fuel lines are installed in the same order that they were removed.

(1) Lubricate threads of injector line fittings with clean engine oil.

(2) Loosen, but do not remove, all fuel line support bracket bolts.

(3) Install **rear** injection line bundle beginning with cylinder head (fuel injector) connections, followed by injection pump connections. Tighten all fittings finger tight.

(4) Tighten fittings at fuel injector ends for cylinders number 6 and 5 to 40 N·m (30 ft. lbs.) torque. **Do not tighten number 3 line at this time. It will be tightened during bleeding procedure.**

(5) Tighten 3 fittings at fuel injection pump ends to 24 N·m (18 ft. lbs.) torque.

(6) Install **front** injection line bundle beginning with cylinder head (fuel injector) connections, followed by injection pump connections. Tighten all fittings finger tight.

(7) Tighten fitting at fuel injector end for cylinder number 2 to 40 N·m (30 ft. lbs.) torque. **Do not tighten lines number 1 or 4 at this time. They will be tightened during bleeding procedure.**

(8) Tighten remaining 3 fittings at fuel injection pump ends to 24 N·m (18 ft. lbs.) torque.

(9) Install fuel line support bracket bolts to intake manifold and tighten to 24 N·m (18 ft. lbs.) torque.

CAUTION: Be sure fuel lines are not contacting each other or any other component. Noise will result.

(10) Install engine lifting bracket at rear of intake manifold. Tighten 2 bolts to 77 N·m (57 ft. lbs.) torque.

(11) Install cable bracket housing/cable assembly and tighten 3 mounting bolts to 24 N·m (18 ft. lbs.) torque.

(12) Clean any old gasket material below and above intake manifold air heater element block. Also clean mating areas at intake manifold and air intake housing.

(13) Using new gaskets, position intake manifold air heater element block to engine.

(14) Install air intake housing and position ground cable. Install 4 mounting bolts (Fig. 58) and tighten to 24 N·m (18 ft. lbs.) torque.

(15) Install air tube (intake manifold-to-intercooler) (Fig. 56). Tighten clamps to 8 N·m (72 in. lbs.) torque.

(16) Install engine oil dipstick tube support mounting bolt (Fig. 56) and tighten to 24 N·m (18 ft. lbs.) torque.

(17) Install engine oil dipstick to engine.

(18) Connect 2 electrical cables to cable mounting studs (Fig. 58).

(19) Connect electrical connector to bottom of APPS by pushing connector upward until it snaps into position.

(20) Connect wiring harness (clip) at bottom of Accelerator Pedal Position Sensor (APPS) mounting bracket (Fig. 55).

(21) Connect front wiring clip (Fig. 56) to cable bracket housing.

(22) Install cable cover (Fig. 54).

(23) Connect both negative battery cables to both batteries.

(24) Bleed air from fuel system. Do this at fuel injector ends of lines. Use cylinders numbers 1, 3 and 4 for bleeding . Refer to Air Bleed Procedure section of this group. After bleeding, tighten fittings to 40 N·m (30 ft. lbs.) torque.

(25) Check lines/fittings for leaks.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

OVERFLOW VALVE

The overflow valve (pressure relief valve) is located at the outside of fuel injection pump (Fig. 62). It connects the fuel return line (banjo fitting) to the pump. The valve has no internal serviceable parts and must be replaced as an assembly. Two sealing gaskets are used. One gasket is located between pump and banjo fitting. The other is located between the banjo fitting and end of valve.

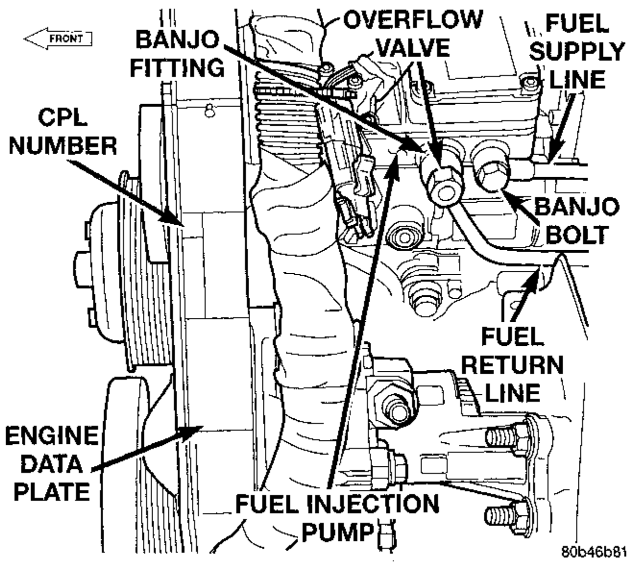

Fig. 62 Overflow Valve Location

REMOVAL

(1) Clean area around overflow valve and fuel return line at injection pump before removal.

(2) Remove valve from pump and banjo fitting.

(3) Discard old sealing gaskets.

INSTALLATION

(1) Install new sealing gaskets to valve.

(2) Install valve through banjo fitting and into pump.

(3) Tighten to 30 N·m (24 ft. lbs.) torque.

FUEL INJECTION PUMP

New or remanufactured fuel injection pumps should have a new overflow valve temporarily installed into side of pump. **Do not install a used overflow valve into a new or remanufactured injection pump.**.

CAUTION: Whenever the fuel injection pump is removed from the engine, the pump drive gear is laying loose on the camshaft drive gear. Never attempt to crank or rotate the engine with the pump removed from the engine. Serious damage will occur.

REMOVAL

CAUTION: Refer to Cleaning Fuel System Parts.

(1) Disconnect both negative battery cables at both batteries. Cover and isolate ends of cables.

(2) Thoroughly clean fuel lines at cylinder head and injection pump ends. Thoroughly clean fuel injection pump and supply/return lines at side of pump.

(3) Disconnect 9–way electrical connector at Fuel Pump Control Module (FPCM) (Fig. 63).

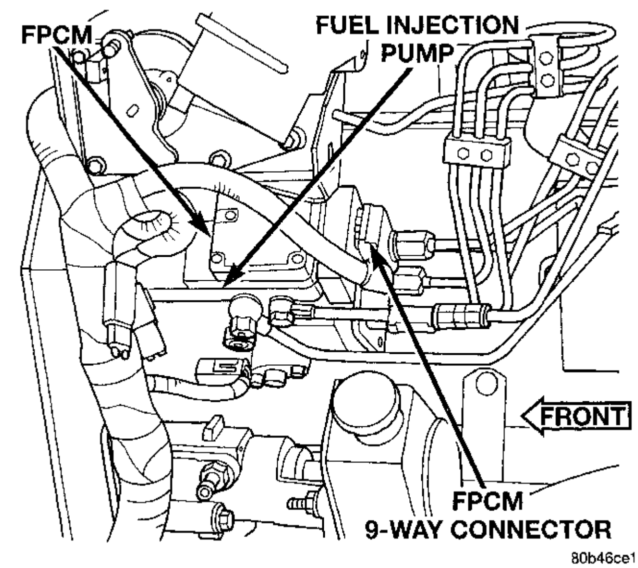

Fig. 63 FPCM 9–Way Connector

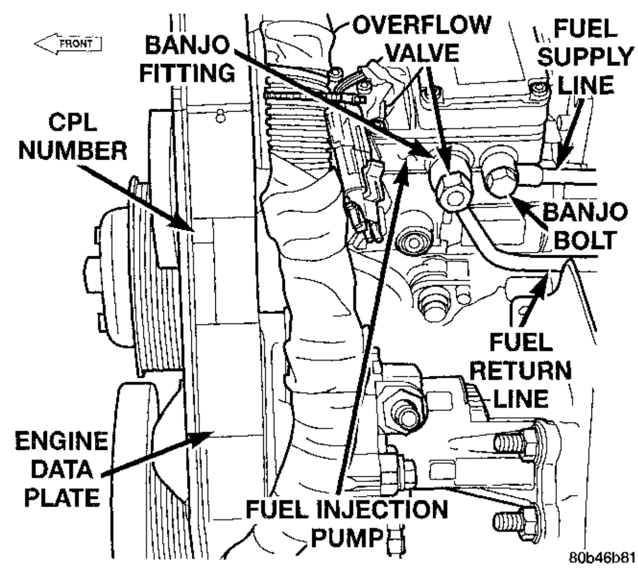

Fig. 64 Fuel Supply and Return Lines at Pump

(4) Remove fuel return line at side of injection pump by removing overflow valve (Fig. 64). Place rag beneath overflow valve to catch excess fuel.

REMOVAL AND INSTALLATION (Continued)

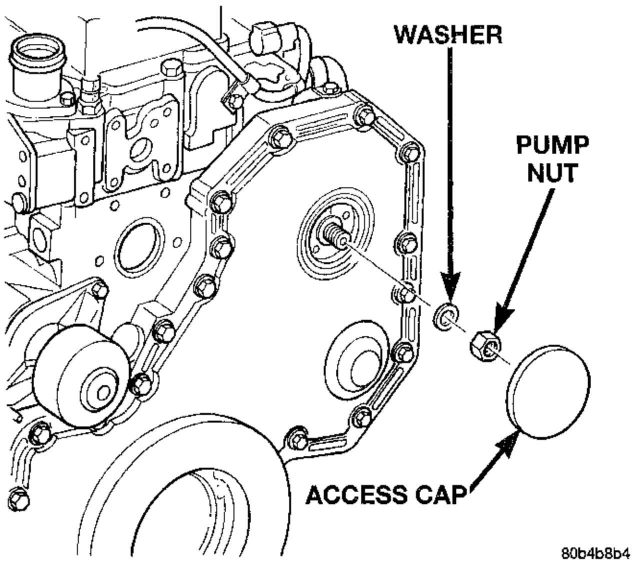

Fig. 65 Access Cap at Front Gear Cover

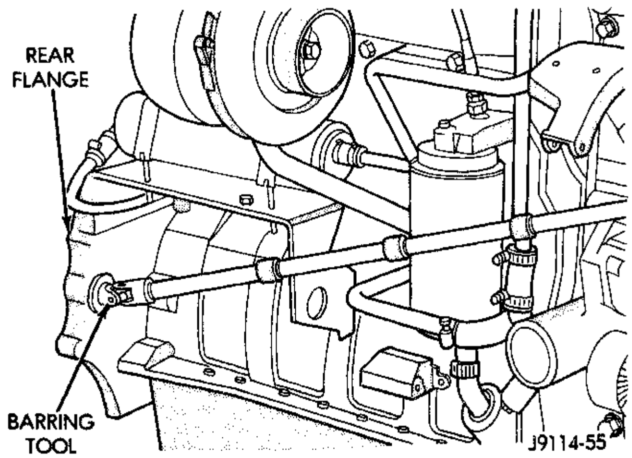

Fig. 66 Rotating Engine with Barring Tool

(5) Remove fuel supply line at side of injection pump by removing banjo bolt (Fig. 64). Also remove same line at top of fuel filter housing (banjo bolt).

(6) Remove all high-pressure fuel lines, intake air tube, accelerator pedal position sensor, air intake housing, engine oil dipstick tube, wiring clips, electrical cables at intake heaters and engine lifting bracket. Refer to High-Pressure Fuel Line Removal/Installation. All of these items are covered in this procedure.

(7) Unscrew plastic access cap (Fig. 65) at front gear cover.

CAUTION: To prevent pump/gear keyway from falling into gear housing, engine must be rotated until keyway is at 12 o'clock position (Fig. 67). If gear retainer nut, washer or key drops into gear housing, cover may have to be removed to retrieve them before engine is started.

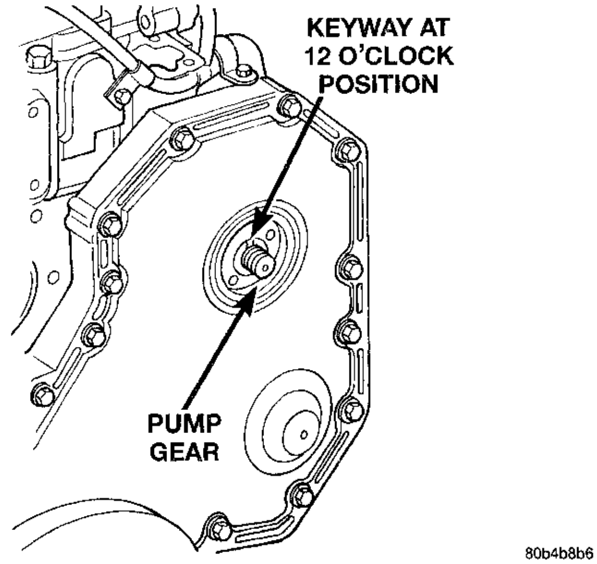

Fig. 67 Placing Keyway at 12 O'clock Position

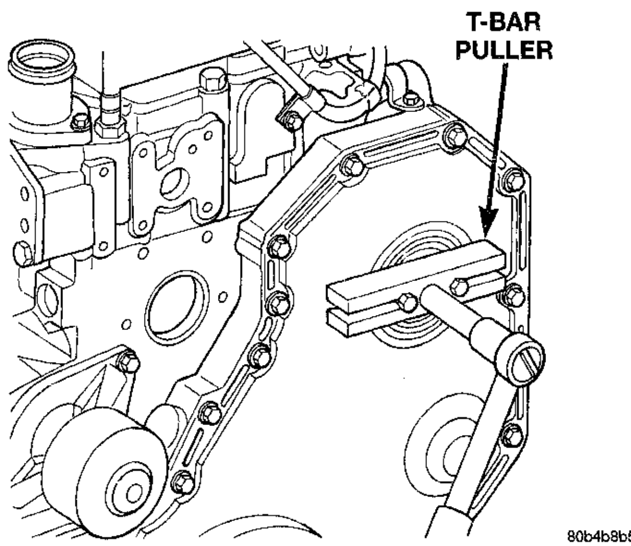

Fig. 68 Separating Injection Pump Gear from Pump Shaft

(8) Remove nut and washer retaining injection pump gear to injection pump shaft (Fig. 65).

(9) The engine can be rotated with a barring tool such as Snap-On No. SP371, MTE No. 3377371 (Cummins Tool Division), or an equivalent. The opening for barring tool is located in rear flange of engine on exhaust manifold side (Fig. 66). Remove rubber access plug covering this opening.

(10) Insert barring tool into flywheel housing opening (Fig. 66).

(11) Rotate engine until keyway is at 12 o'clock position (Fig. 67).

(12) Use T-bar type puller (Fig. 68) to separate injection pump gear from injection pump shaft. Attach two M8 X 1.24 MM (metric) screws through

REMOVAL AND INSTALLATION (Continued)

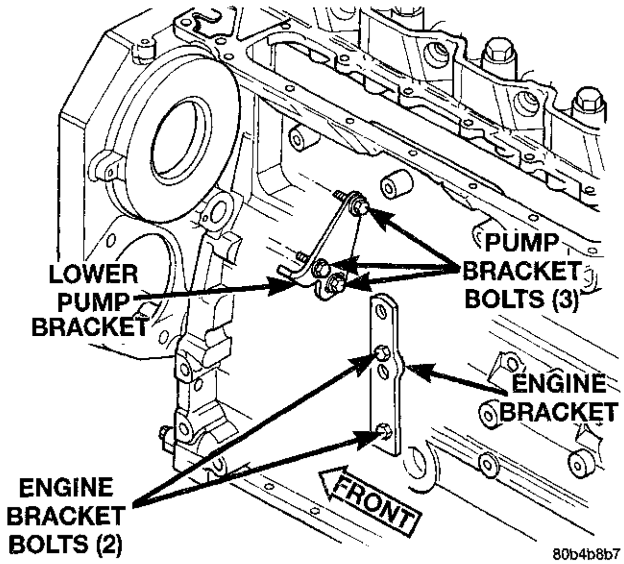

Fig. 69 Lower Pump Bracket and Mounting Bolts

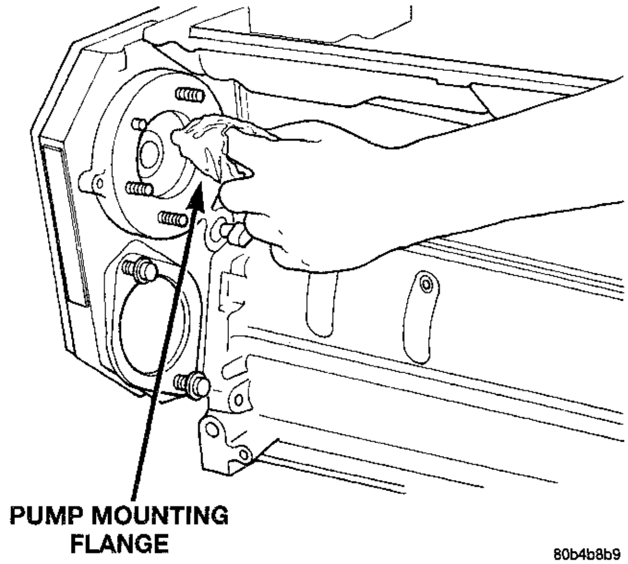

Fig. 71 Cleaning Pump Mounting Flange

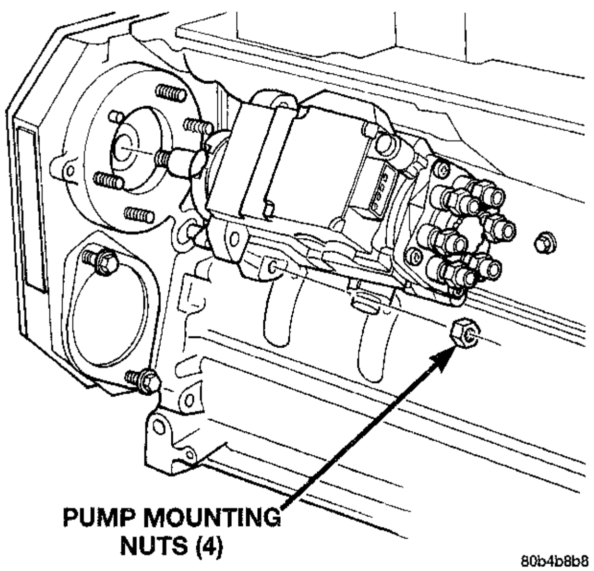

Fig. 70 Injection Pump Mounting Nuts

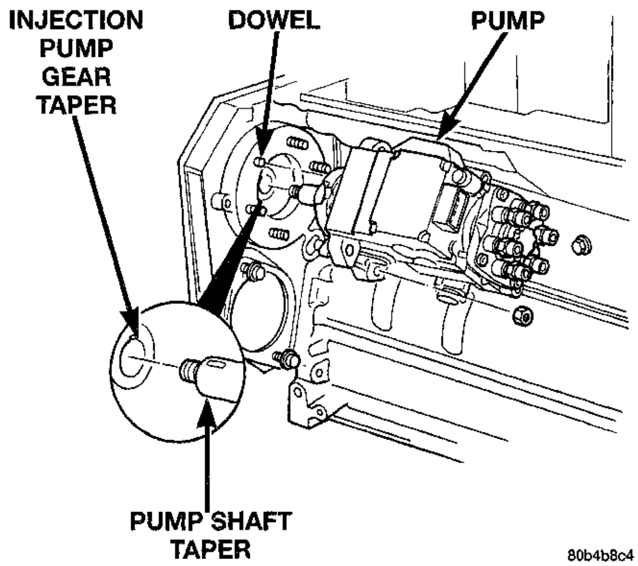

Fig. 72 Injection Pump Installation

puller and into two threaded holes supplied in pump gear. Pull injection pump gear forward until it loosens from injection pump shaft. **Pull on gear only enough to loosen it from injection pump shaft. Pulling gear too far may cause damage or breakage to gear cover.**

(13) Remove 3 lower pump bracket bolts (Fig. 69) and remove lower pump bracket. Loosen, but do not remove 2 engine bracket bolts (Fig. 69).

(14) Remove 4 injection pump-to-gear housing mounting nuts (Fig. 70).

(15) Remove injection pump from gear housing. **Take care not to nick injection pump shaft on aluminum gear housing when removing pump. Also be very careful not to drop pump keyway (Fig. 73) into gear housing.**

CAUTION: Whenever the fuel injection pump is removed from the engine, the pump drive gear is laying loose on the camshaft drive gear. Never attempt to crank or rotate the engine with the pump removed from the engine. Serious damage will occur.

INSTALLATION

(1) Inspect pump mounting surfaces at pump and mounting flange for nicks, cuts or damage. Inspect o-ring surfaces for nicks, cuts or damage.

(2) Clean injection pump mounting flange (Fig. 71) at gear housing. Also clean front of injection pump.

(3) Install new rubber o-ring (Fig. 73) at pump mounting area.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

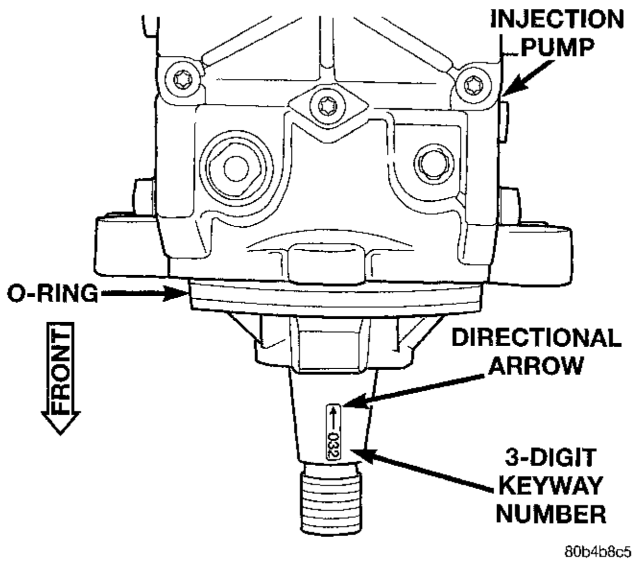

Fig. 73 Keyway, Keyway Arrow and Keyway Number

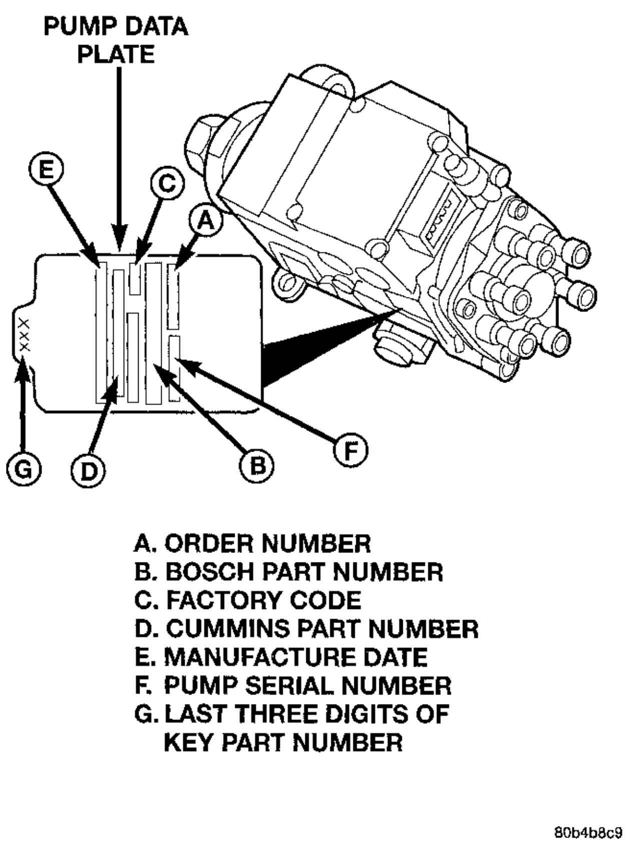

Fig. 74 Injection Pump Data Plate Location

(4) Apply clean engine oil **to injection pump o-ring only.**

The machined tapers on both injection pump shaft and injection pump gear (Fig. 72) must be absolutely dry, clean and free of any dirt or oil film. This will ensure proper gear-to-shaft tightening.

(5) Clean pump gear and pump shaft at machined tapers (Fig. 72) with an evaporative type cleaner such as brake cleaner.

Keyway Installation:

(6) The pump/gear keyway has an arrow and a 3–digit number stamped at top edge (Fig. 73). Position keyway into pump shaft with **arrow pointed to rear of pump.** Also be sure 3–digit number stamped to top of keyway is same as 3–digit number stamped to injection pump data plate (Fig. 74). If wrong keyway is installed, a diagnostic trouble code may be set.

(7) Position pump assembly to mounting flange on gear cover while aligning injection pump shaft through back of injection pump gear. When installing pump, dowel (Fig. 72) on mounting flange must align to hole in front of pump.

(8) After pump is positioned flat to mounting flange, install four pump mounting nuts and tighten finger tight only. Do not attempt a final tightening at this time. **Do not attempt to tighten (pull) pump to gear cover using mounting nuts. Damage to pump or gear cover may occur. The pump must be positioned flat to its mounting flange before attempting to tighten mounting nuts.**

(9) To prevent damage or cracking of components, tighten nuts/bolts in the following sequence:

(a) Install injection pump shaft washer and nut to pump shaft. Tighten nut **finger tight only.**

(b) Position lower pump bracket and install 3 bolts **finger tight only.**

(c) Do preliminary tightening of injection pump shaft nut to 30 N·m (15–22 ft. lbs.) torque. **This is not the final torque.**

(d) Tighten 4 pump mounting nuts to 43 N·m (32 ft. lbs.) torque.

(e) Tighten 3 lower pump bracket-to-pump bolts 24 N·m (18 ft. lbs.) torque.

(f) Tighten 2 engine bracket-to-engine bolts 24 N·m (18 ft. lbs.) torque.

(g) Do final tightening of injection pump shaft nut to 170 N·m (125 ft. lbs.) torque. Use barring tool to prevent engine from rotating when tightening gear.

(10) Install plastic access cap (Fig. 65) to front gear cover.

(11) Using new gaskets, install fuel return line and overflow valve to side of injection pump (Fig. 64). Tighten overflow valve to 24 N·m (18 ft. lbs.) torque.

(12) Using new gaskets, install fuel supply line to side of injection pump and top of fuel filter housing (Fig. 64). Tighten banjo bolts to 24 N·m (18 ft. lbs.) torque.

(13) Install all high-pressure fuel lines, intake air tube, accelerator pedal position sensor, air intake housing, engine oil dipstick tube, wiring clips, electrical cables at intake heaters and engine lifting

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

bracket. Refer to High-Pressure Fuel Line Removal/Installation. All of these items are covered in this procedure.

(14) Connect 9–way electrical connector to Fuel Pump Control Module (FPCM) (Fig. 63).

(15) Connect both negative battery cables to both batteries.

(16) Bleed air from fuel system. Refer to Air Bleed Procedure.

(17) Check system for fuel or engine oil leaks.

FUEL INJECTORS

The fuel injectors are located in the top of the cylinder head between the intake/exhaust valves (Fig. 75).

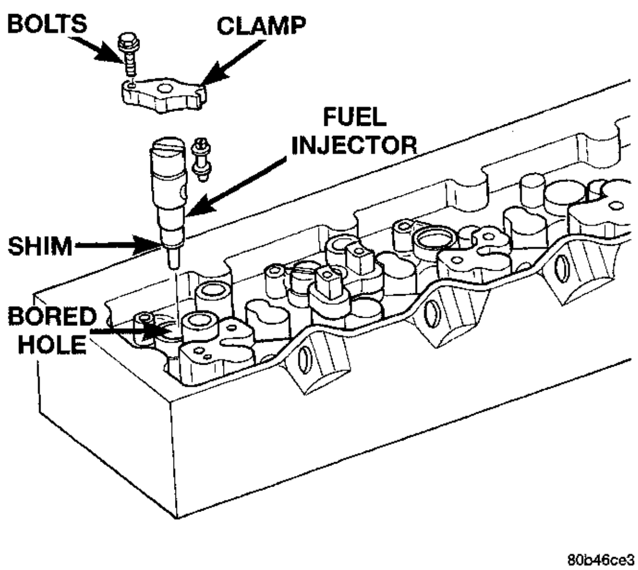

Fig. 75 Fuel Injector Location

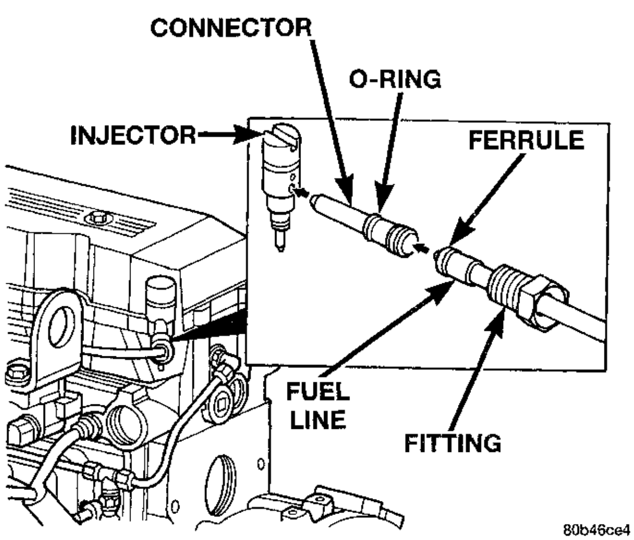

Fig. 76 Fuel Injector Connections

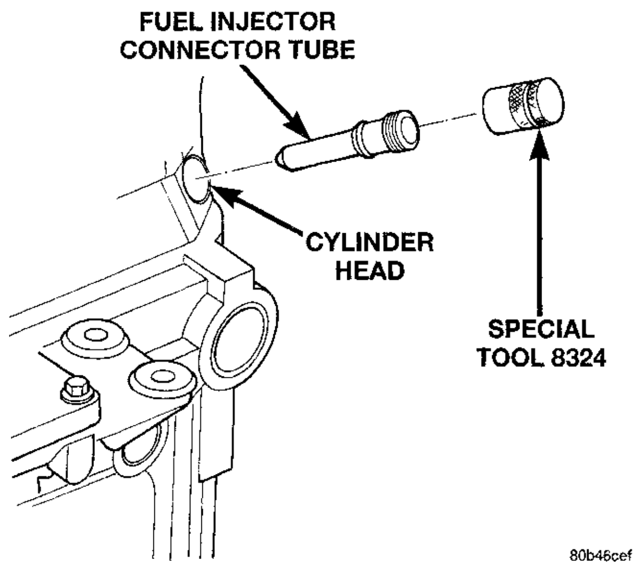

Fig. 77 Fuel Injector Connector Tube Removal

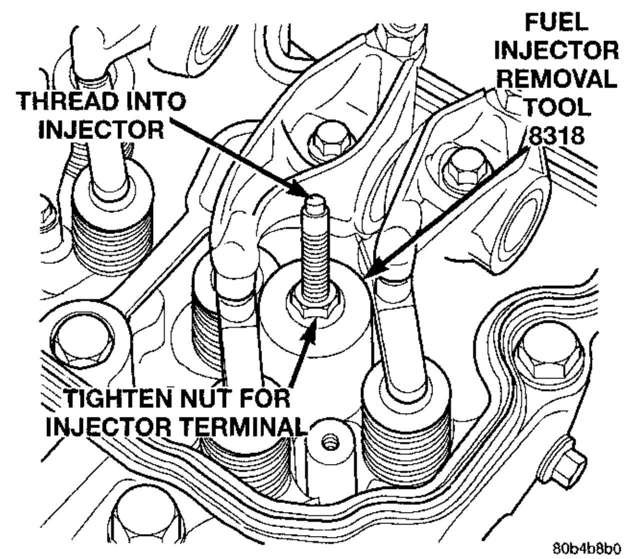

Fig. 78 Fuel Injector Removal

REMOVAL

CAUTION: Refer to Cleaning Fuel System Parts.

(1) Disconnect both negative battery cables from both batteries. Cover and isolate ends of cables.

Each fuel injector is connected to each high-pressure fuel line with a steel connector tube (Fig. 76). This steel connector is positioned into cylinder head and sealed with an o-ring. The connectors are connected to high-pressure fuel lines with fittings (Fig. 76).

(2) If injector at #1 or #2 cylinder is being removed, intake manifold air heater assembly must be removed. Refer to Intake Manifold Air Heater Removal/Installation.

REMOVAL AND INSTALLATION (Continued)

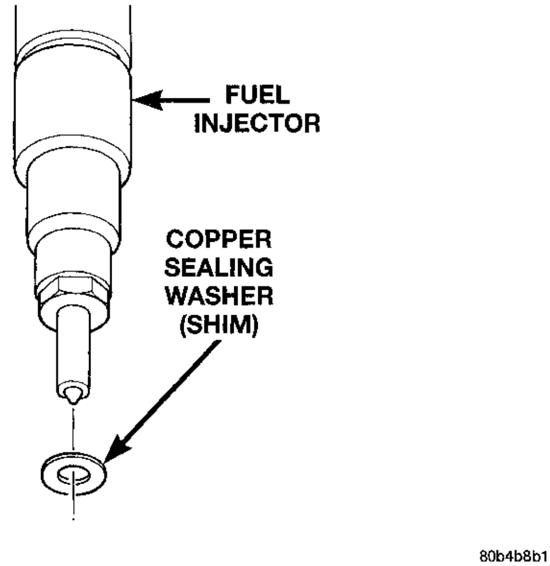

Fig. 79 Fuel Injector Sealing Washer (Shim) Location

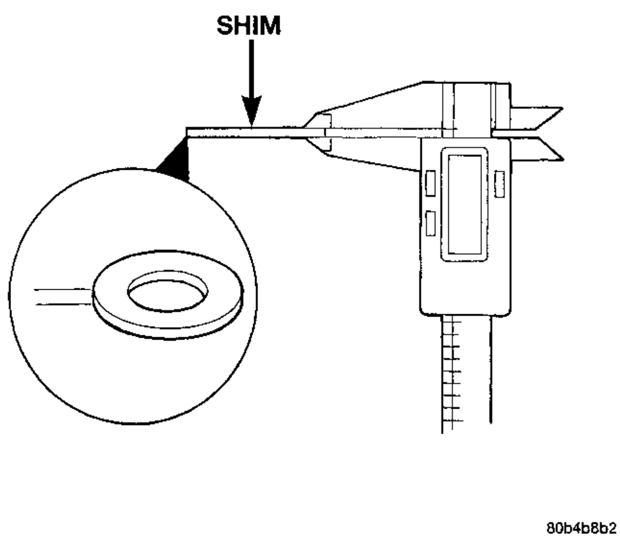

Fig. 80 Measuring Injector Sealing Washer (Shim)

(3) If injector at #5 cylinder is being removed, remove engine lifting bracket (2 bolts).

(4) Thoroughly clean area around injector and injector high-pressure lines before removal.

(5) Remove necessary high-pressure fuel lines. Refer to High-Pressure Fuel Lines Removal/Installation. **Do not bend any high-pressure fuel line to gain access to fuel injector.** Cover or cap any open fuel connections.

(6) Remove valve cover. Refer to Group 9, Engines.

(7) Thread Special Tool 8324 (Fuel Injector Connector Tube Remover) onto end of injector connector tube (Fig. 77).

(8) Pull injector connector tube from cylinder head. **The injector connector tube must be removed before attempting to remove fuel injector or serious damage to fuel injector and tube will result.**

(9) Remove and discard old o-ring (Fig. 76) from injector connector tube.

(10) Remove fuel injector hold down clamp bolt at front end of clamp (Fig. 75). **Do not loosen or remove special (2 shouldered) bolt at rear end of clamp.** Remove injector clamp by sliding it from shoulders on rear clamp bolt.

(11) Thread rod from Special Tool number 8318 (Fuel Injector Remover) into top of fuel injector (Fig. 78).

(12) Tighten nut on 8318 tool to pull (remove) fuel injector from cylinder head.

(13) Remove and discard old o-ring from fuel injector.

(14) Remove and discard copper sealing washer (shim) (Fig. 79) from bottom of injector. **If copper sealing washer has remained in cylinder head, it must be removed.**

INSTALLATION

(1) Inspect fuel injector.

(a) If necessary, perform pressure test of injector. Refer to Fuel Injector Testing.

(b) Look for burrs on injector inlet.

(c) Check nozzle holes for hole erosion or plugging.

(d) Inspect end of nozzle for burrs or rough machine marks.

(e) Look for cracks at nozzle end.

(f) Check nozzle color for signs of overheating. Overheating will cause nozzle to turn a dark yellow/tan or blue (depending on overheating temperature).

(g) If any of these conditions occur, replace injector.

(2) Thoroughly clean fuel injector cylinder head bore with special Cummins wire brush tool or equivalent (Fig. 81). Blow out bore hole with compressed air.

(3) The bottom of fuel injector is sealed to cylinder head bore with a copper sealing washer (shim) of a certain thickness. A new shim with correct thickness must always be re-installed after removing injector. Measure thickness of injector shim (Fig. 80). **Shim Thickness: 1.5 mm (.060")**

(4) Install new shim (washer) to bottom of injector (Fig. 79). Apply light coating of clean engine oil to washer. This will keep washer in place during installation.

(5) Install new o-ring to fuel injector. Apply small amount of clean engine oil to o-ring.

REMOVAL AND INSTALLATION (Continued)

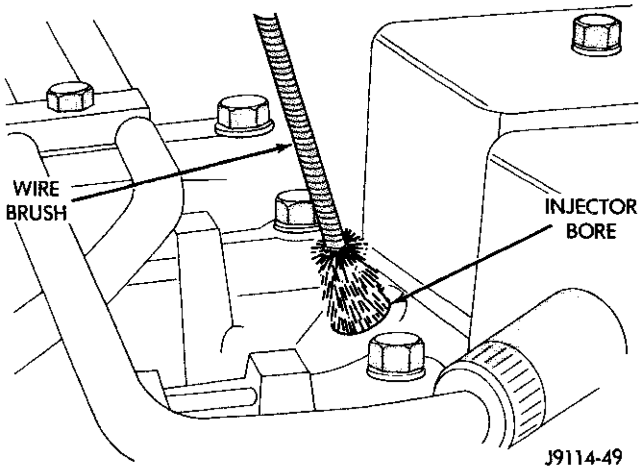

Fig. 81 Cleaning Cylinder Head Injector Bore— TYPICAL BORE

(6) Note fuel inlet hole on side of fuel injector. This hole must be positioned towards injector connector tube. Position injector into cylinder head bore being extremely careful not to allow injector tip to touch sides of bore. Press fuel injector into cylinder head with finger pressure only. **Do not use any tools to press fuel injector into position. Damage to machined surfaces may result.**

(7) Position fuel injector hold down clamp into shouldered bolt while aligning slot in top of injector into groove in bottom of clamp. Tighten opposite clamp bolt (Fig. 75) to 10 N·m (89 in. lbs.) torque.

(8) Install new o-ring to fuel injector connector tube. Apply small amount of clean engine oil to o-ring.

(9) Press injector connector tube into cylinder head with finger pressure only. **Do not use any tools to press tube into position. Damage to machined surfaces may result.**

(10) Connect high-pressure fuel lines. Refer to High-Pressure Fuel Lines Removal/Installation. **The fuel line fitting torque is very critical.** If fitting is under torqued, the mating surfaces will not seal and a high-pressure fuel leak will result. If fitting is over torqued, the connector and injector will deform and also cause a high-pressure fuel leak. This leak will be inside cylinder head and will not be visible resulting in a possible fuel injector miss and low power.

(11) Install valve cover. Refer to Group 9, Engines.

(12) (If necessary) install intake manifold air heater assembly. Refer to Intake Manifold Air Heater Removal/Installation.

(13) (If necessary) install engine lifting bracket. Tighten 2 bolts to 77 N·m (57 ft. lbs.) torque.

(14) Connect negative battery cables to both batteries.

(15) Bleed air from high-pressure lines. Refer to Air Bleed Procedure.

FUEL TRANSFER PUMP

The fuel transfer pump (fuel lift pump) is located on left side of engine, below and rearward of fuel filter (Fig. 82).

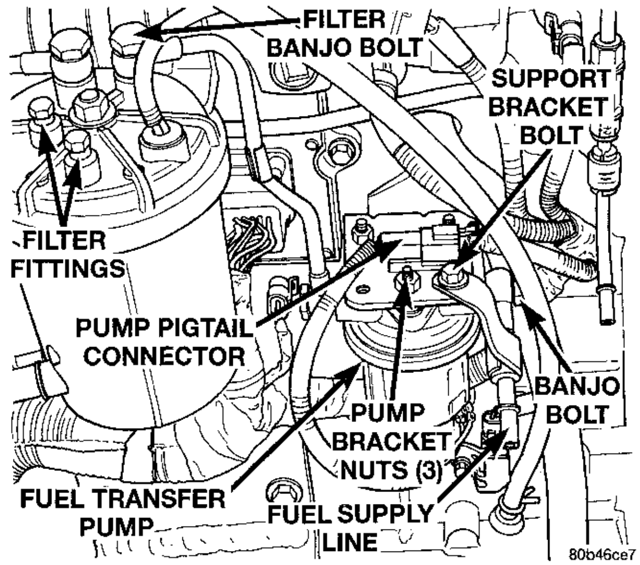

Fig. 82 Fuel Transfer Pump Location

REMOVAL

(1) Disconnect both negative battery cables at both batteries.

(2) Thoroughly clean area around transfer pump and fuel lines of any contamination.

(3) Remove starter motor. Refer to Starter in Group 8B for procedures.

(4) Place a drain pan below the pump.

(5) Disconnect fuel line quick-connect fitting at fuel supply line (Fig. 82) at rear of pump.

(6) Remove support bracket bolt at top of pump (Fig. 82).

(7) Remove banjo bolts at front and rear of pump (Fig. 82).

(8) Disconnect pigtail harness electrical connector from main engine wiring harness (Fig. 82).

(9) Remove three pump bracket nuts (Fig. 82) and remove pump from vehicle.

INSTALLATION

(1) Install new gaskets to fuel supply line/support bracket and banjo bolt at rear of pump. Install line and banjo bolt to pump. **Do not** tighten banjo bolt at this time.

(2) Install new gaskets to fuel line and banjo bolt at front of pump.

(3) Position 3 pump studs into pump mounting bracket and install 3 nuts. **Do not** tighten nuts at this time.

(4) Install support bracket bolt (Fig. 82). **Do not** tighten bolt at this time.

Mopar Authentic Restoration

REMOVAL AND INSTALLATION (Continued)

(5) Tighten 3 pump nuts to 12 N·m (9 ft. lbs.) torque.

(6) Tighten both banjo bolts to 24 N·m (18 ft. lbs.) torque.

(7) Tighten support bracket bolt 12 N·m (9 ft. lbs.) torque.

(8) Connect pigtail harness electrical connector to main engine wiring harness (Fig. 82).

(9) Connect fuel line quick-connect fitting to fuel supply line at rear of pump.

(10) Install starter motor. Refer to Starter Removal/Installation in Group 8B for procedures.

(11) Connect both negative battery cables at both batteries.

(12) Bleed air at fuel supply line at side of fuel injection pump. Refer to the Air Bleed Procedure.

(13) Start engine and check for leaks.

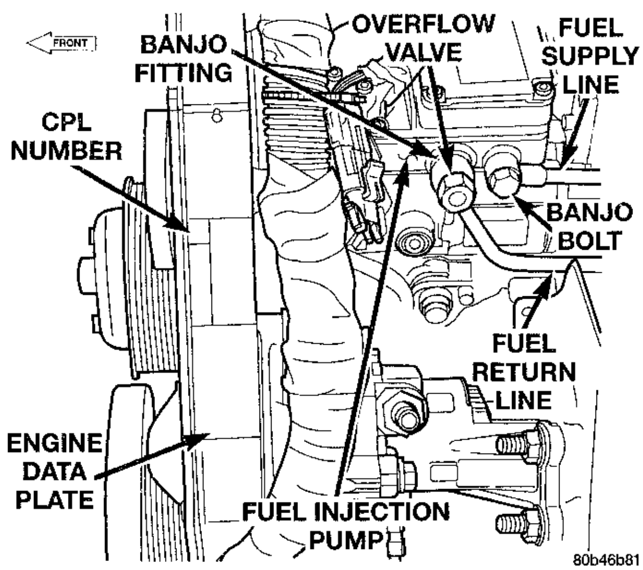

Fig. 83 Engine Data Plate Location

SPECIFICATIONS

ENGINE DATA PLATE

The engine data plate contains:

- Advertised horsepower
- Cubic inch/liter of engine
- Engine model number
- Fuel rate at advertised horsepower
- Idle speed specification
- Injection pump CPL number
- Injection pump timing (in degrees)
- Injector firing order
- Valve lash specification

If anything differs between the specifications found on the engine data plate, and the specifications used in this manual, use specifications on data plate. The engine data plate is permanently riveted to the side of the engine timing gear cover located on the drivers side of engine (Fig. 83).

FUEL INJECTION PUMP DATA PLATE

Pertinent information about the fuel injection pump is machined into a boss on the drivers side of the fuel injection pump (Fig. 84).

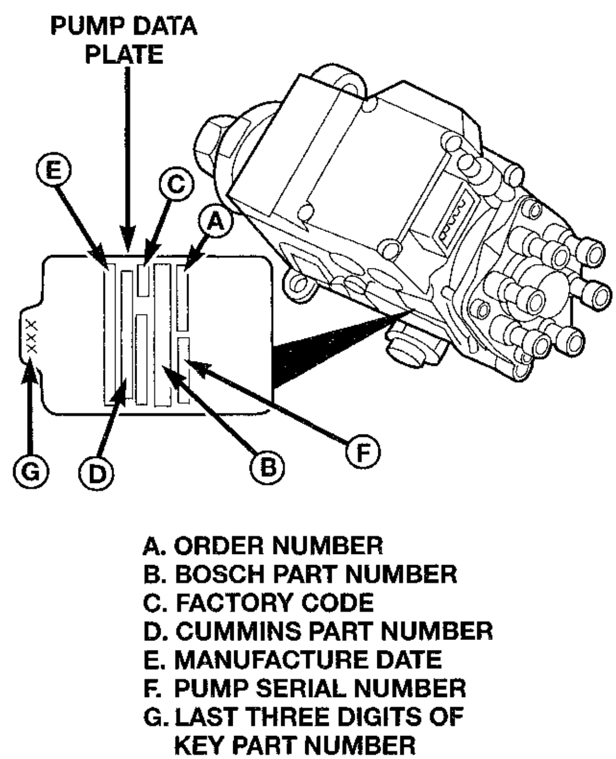

Fig. 84 Fuel Injection Pump Data Plate Location

FUEL TANK CAPACITY—DIESEL ENGINE

MODEL	LITERS	U.S. GALLONS
138″ Wheelbase With Extended Cab (Diesel Powered)	129	34
All Other Diesel Powered Models	132	35
Nominal refill capacities are shown. A variation may be observed from vehicle to vehicle due to manufacturing tolerance and refill procedure.

FUEL INJECTION SYSTEM-DIESEL ENGINE

INDEX

mopar AUTHENTIC RESTORATION PRODUCT

DESCRIPTION AND OPERATION

FUEL INJECTION SYSTEM—DIESEL ENGINE

Two different fuel systems (early and late) are used for the diesel engine in this model year. The **early** fuel system, using the two-valve-per-cylinder engine, will retain the mechanical fuel injection pump as used in previous model years. The **late** fuel system, using the four-valve-per-cylinder engine, will use an **electronic** fuel injection system with three different control modules. This book will include information for the **late** fuel system only.

The Engine Control Module (ECM) and Fuel Injection Pump Control Module (FPCM) are used primarily for fuel system control. The ECM is a separate replaceable component, while the FPCM is internal to the fuel injection pump and is a non-serviceable part. The ECM and FPCM are interconnected (wired together) for fuel injection control.

The Powertrain Control Module (PCM) is used to regulate or control the A/C, charging and speed control systems. It is also used to partially control certain electronic automatic transmission components. The PCM also has control over certain instrument panel components.

Refer to either Powertrain Control Module (PCM) or Engine Control Module (ECM) for additional information. Refer to (Fig. 1) for a partial list of fuel system components.

ENGINE CONTROL MODULE (ECM)

The Engine Control Module (ECM) and Fuel Injection Pump Control Module (FPCM) are used to electrically control the fuel system. The Powertrain Control Module (PCM) **does not control** the fuel system.

The ECM is bolted to the left side of the engine behind the fuel filter (Fig. 2). It is a separate component and can be serviced. The FPCM is internal to the fuel injection pump (Fig. 3) and cannot be serviced.

The main function of the ECM and the FPCM is to control the fuel injection system.

The ECM can adapt its programming to meet changing operating conditions. **If the ECM has been replaced, flashed or re-calibrated, the ECM must learn the Accelerator Pedal Position Sensor (APPS) idle voltage. Failure to learn this voltage may result in unnecessary diagnostic trouble codes. Refer to ECM Removal/Installation for learning procedures.**

The ECM receives input signals from various switches and sensors. Based on these inputs, the ECM regulates various engine and vehicle operations through different system components. These components are referred to as **ECM Outputs.** The sensors and switches that provide inputs to the ECM are considered **ECM Inputs.**

NOTE: ECM Inputs:

- Accelerator Pedal Position Sensor (APPS)
- Battery voltage
- Camshaft Position Sensor (CMP)
- CCD bus (+) circuits
- CCD bus (-) circuits
- Crankshaft Position Sensor (CKP)
- Data link connection for DRB scan tool
- (FPCM) Fuel Injection Pump Control Module
- Engine Coolant Temperature (ECT) sensor
- Ground circuits
- Intake manifold Air Temperature (IAT) sensor
- Manifold Air Pressure (MAP) Sensor
- Oil pressure sensor output
- PCM
- Power Take Off (PTO)
- Power ground
- Sensor return
- Signal ground
- Water-In-Fuel (WIF) sensor

NOTE: ECM Outputs:

After inputs are received by the ECM, certain sensors, switches and components are controlled or regulated by the ECM. These are considered **ECM Outputs.** These outputs are for:

- CCD bus (+) circuits
- CCD bus (-) circuits
- CKP and APPS outputs to the PCM
- Data link connection for DRB scan tool
- Five volt sensor supply
- Fuel injection pump
- Fuel injection pump relay
- (FPCM) Fuel Pump Control Module
- Fuel transfer (lift) pump
- Intake manifold air heater elements #1 and #2
- Intake manifold air heater relays #1 and #2
- Malfunction indicator lamp (Check engine lamp)
- Oil pressure gauge/warning lamp
- PCM
- Wait-to-start warning lamp
- Water-In-Fuel (WIF) warning lamp

ACCELERATOR PEDAL POSITION SENSOR (APPS)—ECM INPUT

The Accelerator Pedal Position Sensor (APPS) is a linear potentiometer. It provides the Engine Control Module (ECM) with a DC voltage signal proportional to the angle, or position of the accelerator pedal. In previous model years, this part was known as the Throttle Position Sensor (TPS).

Fig. 1 Fuel System Components—Diesel Engine

DESCRIPTION AND OPERATION (Continued)

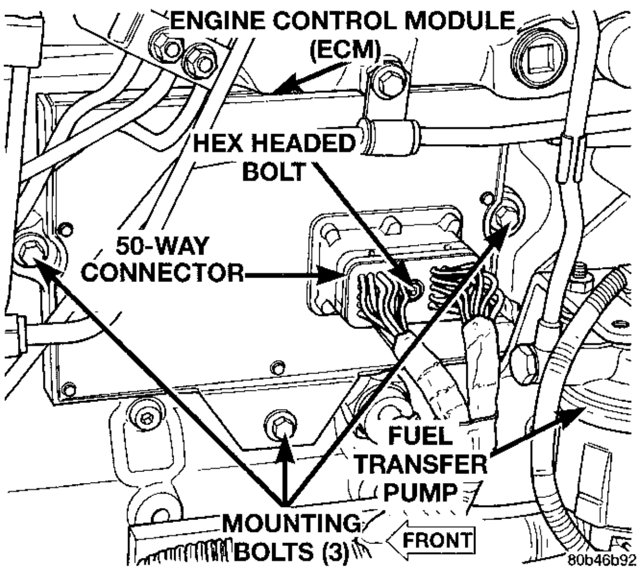

Fig. 2 Engine Control Module (ECM) Location

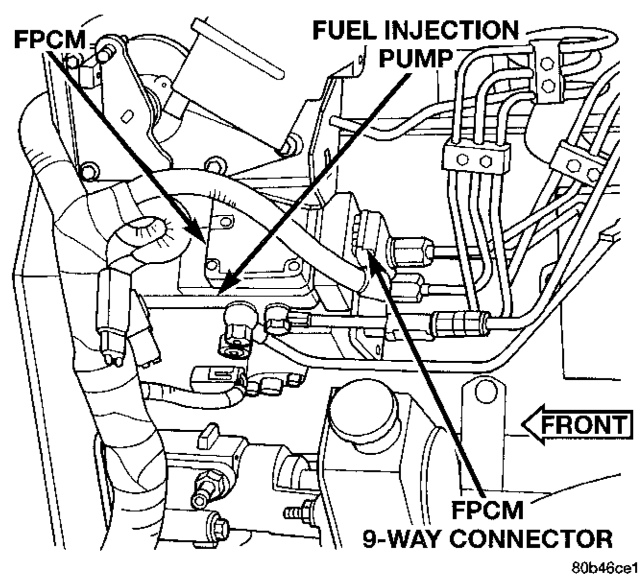

Fig. 3 Fuel Injection Pump Control Module (FPCM) Location

Diesel engines used in previous model years used a mechanical cable between the accelerator pedal and the TPS lever. Linkage and bellcranks between the TPS cable lever and the fuel injection pump were also used. Although the cable has been retained with the APPS, the linkage and bellcranks between the cable lever and the fuel injection pump are no longer used.

The APPS assembly is located at the top-left-front of the engine (Fig. 4). A plastic cover is used to cover the assembly. The actual sensor is located behind its mounting bracket (Fig. 5).

The APPS is serviced (replaced) as one assembly including the lever, brackets and sensor. The APPS is calibrated and permanently positioned to its mounting bracket.

CAUTION: Do not attempt to remove sensor from its mounting bracket as electronic calibration will be destroyed (sensor-to-bracket mounting screws are permanently attached). Two accelerator lever set screws (Fig. 4) are used to position lever. Do not attempt to alter positions of these set screws as electronic calibration will be destroyed.

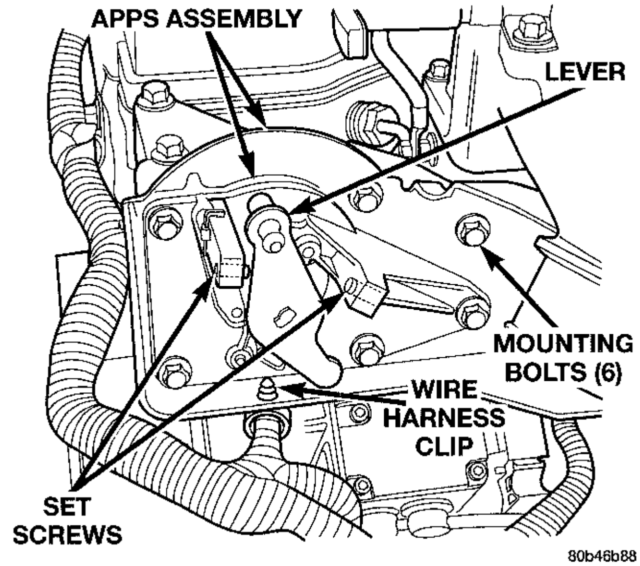

Fig. 4 APPS Assembly Location

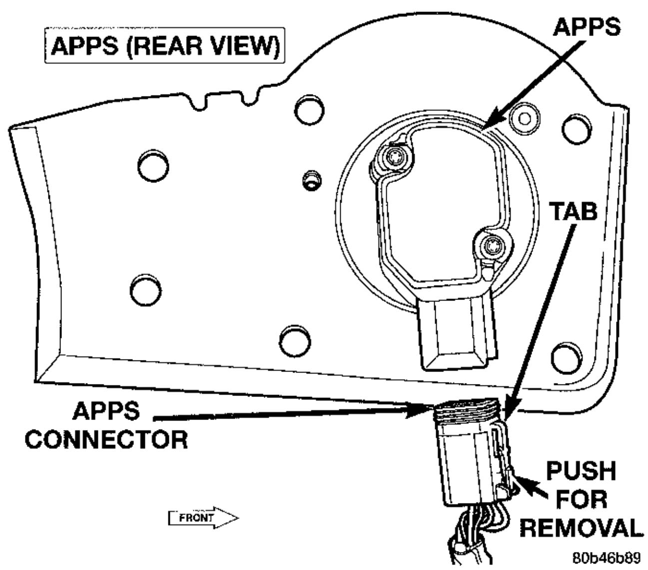

Fig. 5 APPS Sensor Location (Rear View)

BATTERY VOLTAGE—ECM INPUT

The battery voltage input provides power to the Engine Control Module (ECM). It also informs the ECM what voltage level is being supplied by the generator once the vehicle is running.

The battery input also provides the voltage that is needed to keep the ECM memory alive. The memory stores Diagnostic Trouble Code (DTC) messages.

DESCRIPTION AND OPERATION (Continued)

CAMSHAFT POSITION SENSOR (CMP)—ECM INPUT

The Camshaft Position Sensor (CMP) (Fig. 6) contains a hall effect device called a sync signal generator to generate a sync signal.

The sync signal generator detects a machined hole on the rear face of the camshaft drive gear. The signal is used to verify the position of the #1 cylinder during engine operation.

When the leading edge of the machined hole enters the tip of the CMP, the interruption of magnetic field causes the voltage to switch high resulting in a signal of approximately 5 volts.

When the trailing edge of the machined hole leaves the tip of the CMP, the change of the magnetic field causes the voltage to switch low to 0 volts.

The CMP is located below the fuel injection pump (Fig. 7). It is attached to the back of the timing gear cover housing.

The CMP is **not used** for any control of fuel system. It is used only for diagnostic purposes.

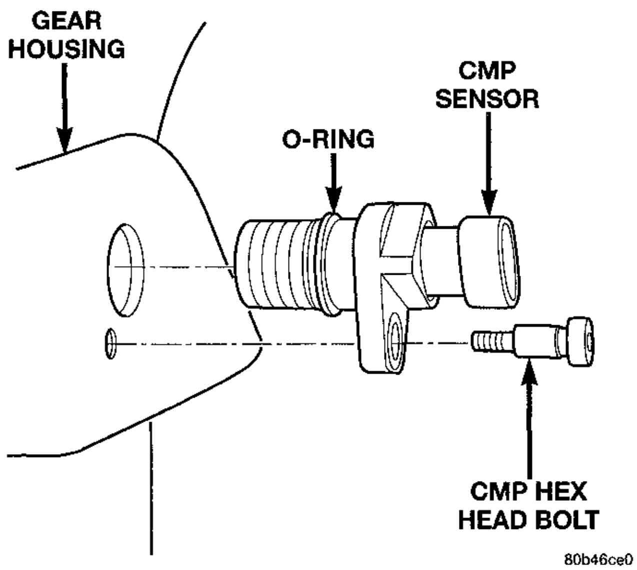

Fig. 6 Camshaft Position Sensor (CMP)

CCD BUS (+/-) CIRCUITS—ECM/PCM INPUTS/ OUTPUTS

The Engine Control Module (ECM) and the Powertrain Control Module (PCM) send certain signals through the CCD bus circuits. Some of these signals are parallel circuited between the two control modules (ECM and PCM). These signals are used to control certain instrument panel located items and to determine certain identification numbers.

Refer to Group 8E, Instrument Panel and Gauges for additional information.

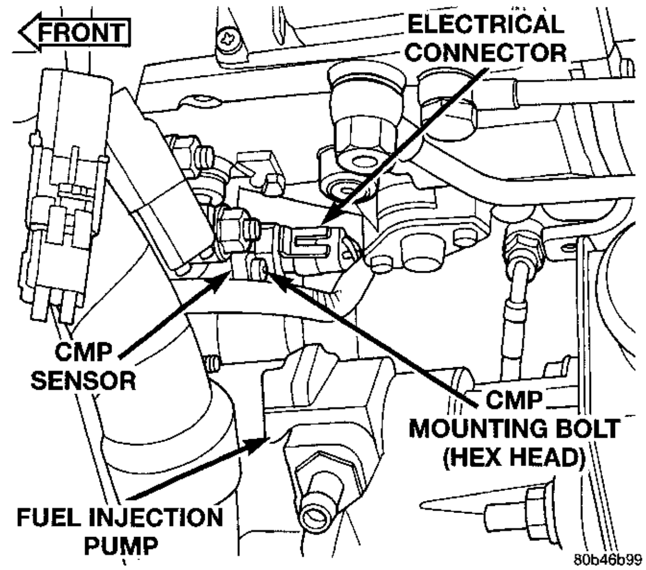

Fig. 7 Camshaft Position Sensor (CMP) Location

CRANKSHAFT POSITION SENSOR (CKP)—ECM INPUT

The Crankshaft Position Sensor (CKP) is located on the lower left-rear side of the engine behind the starter motor (Fig. 8).

Engine speed and crankshaft position are provided through the CKP. The sensor generates pulses that are the input sent to the Engine Control Module (ECM). The ECM interprets the sensor input to determine the crankshaft position. The ECM then uses this position, along with other inputs, to determine injector firing sequence and fuel timing. The sensor must be powered up by 5 volts to operate.

The sensor is a hall effect device combined with an internal magnet. It is also sensitive to steel within a certain distance from it.

The engine crankshaft is equipped with a bolt-on tone wheel (Fig. 9). The tone wheel is equipped with 35 teeth and a gap where the 36th tooth should be placed (Fig. 9). This missing tooth indicates to the ECM the relative position of cylinder #1 to the Top Dead Center (TDC) position. This does not mean that cylinder #1 is at TDC. When the CKP is aligned with the missing tooth, the missing tooth is 60 degrees away from cylinder #1 TDC position. The teeth cause pulses to be generated when they pass under the sensor. The pulses are the input to the ECM.

DESCRIPTION AND OPERATION (Continued)

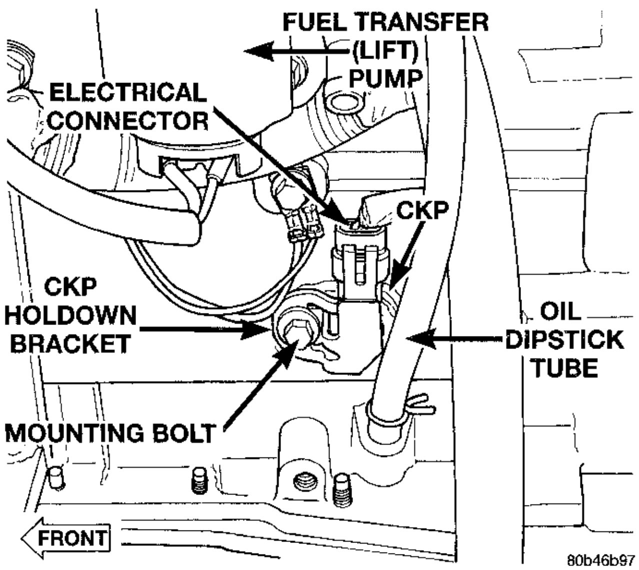

Fig. 8 Crankshaft Position Sensor (CKP) Location

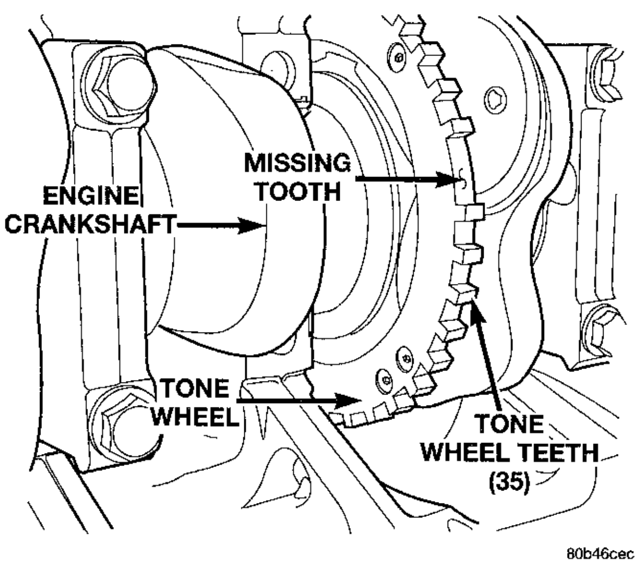

Fig. 9 Crankshaft Tone Wheel

ENGINE COOLANT TEMPERATURE (ECT) SENSOR—ECM INPUT

The engine coolant temperature sensor is installed into the front of the cylinder head near to the thermostat housing (Fig. 10) and protrudes into a water jacket. The sensor provides an input voltage to the Engine Control Module (ECM) to monitor coolant temperature. The ECM uses this input along with inputs from other sensors for engine protection, fuel timing and fuel control. As coolant temperature varies, the coolant temperature sensor resistance will change. This change in resistance results in a different input voltage to the ECM.

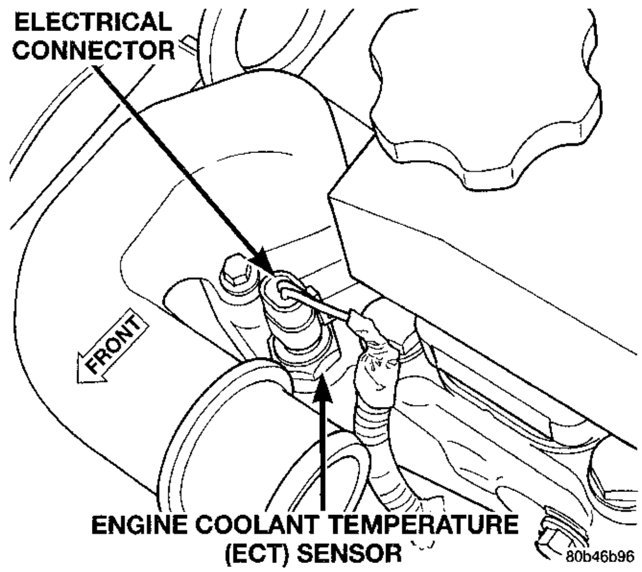

Fig. 10 Engine Coolant Temperature Sensor

FUEL TEMPERATURE SENSOR

Two different fuel temperature sensors are used. One of the sensors is located inside of the Bosch VP44 fuel injection pump and is a non-serviceable part. It is used to check fuel temperature within the injection pump and to set a Diagnostic Trouble Code (DTC) if a specific high fuel temperature has been reached. If high temperature has been reached, engine power will be de-rated by the Engine Control Module (ECM).

The other fuel temperature sensor is located in the top of the fuel filter housing and is serviceable. It is used to control the fuel heater element. Refer to Fuel Heater Description and Operation for additional information.

INTAKE MANIFOLD AIR TEMPERATURE (IAT) SENSOR—ECM INPUT

The IAT provides an input voltage to the Engine Control Module (ECM) indicating intake manifold air temperature. The input is used along with inputs from other sensors for engine protection, fuel timing and fuel control. As the temperature of the air-fuel stream in the manifold varies, the sensor resistance changes. This results in a different input voltage to the ECM.

The intake manifold air temperature sensor is installed into the rear of the intake manifold (Fig. 11) with the sensor element extending into the air stream.

AUTHENTIC RESTORATION PRODUCT

DESCRIPTION AND OPERATION (Continued)

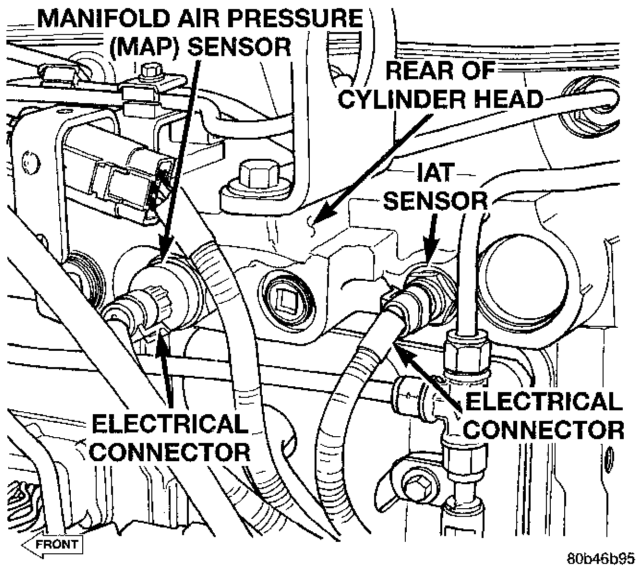

Fig. 11 Intake Manifold Air Temperature (IAT) Sensor Location

MANIFOLD AIR PRESSURE (MAP) SENSOR—ECM INPUT

The MAP sensor reacts to air pressure changes in the intake manifold. It provides an input voltage to the Engine Control Module (ECM). As pressure changes, MAP sensor voltage will change. The change in MAP sensor voltage results in a different input voltage to the ECM. The ECM uses this input, along with inputs from other sensors to provide fuel timing, fuel control and engine protection. Engine protection is used to derate (drop power off) the engine if turbocharger pressure becomes to high.

The MAP sensor is installed into the rear of the intake manifold (Fig. 11).

OIL PRESSURE SENSOR (ENGINE)—ECM INPUT

A signal is sent from the engine oil pressure sensor (sending unit) to the Engine Control Module (ECM) relating to engine oil pressure. The ECM monitors this signal and converts it to a pressure value. This value is used by the ECM for the engine protection system.

The pressure signal from the ECM is bussed to the instrument panel oil gauge/lamp via the CCD circuits.

The oil pressure sensor is installed into the oil pressure galley on the engine block. It is located below and to the rear of the ECM (Fig. 12).

PTO SWITCH SENSE—ECM INPUT

This Engine Control Module (ECM) input is used only on models equipped with aftermarket Power Take Off (PTO) units.

The input is used to tell the ECM that the PTO has been engaged. When engaged, the ECM will disable certain OBD II functions until the PTO has been turned off.

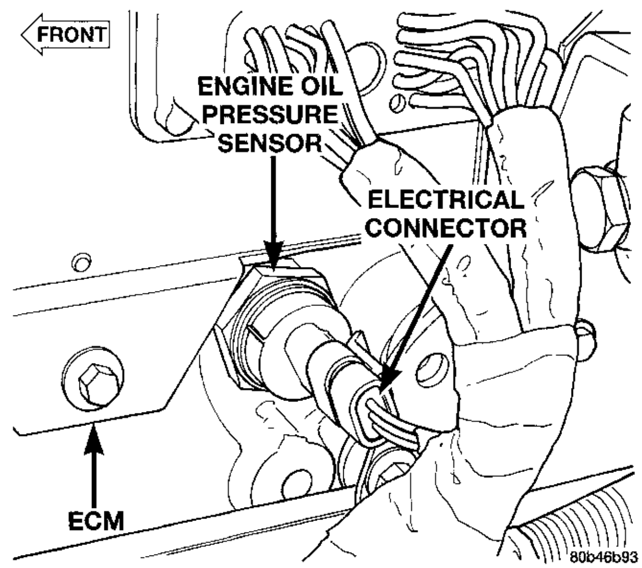

Fig. 12 Oil Pressure Sensor (Engine) Location

WATER-IN-FUEL (WIF) SENSOR—ECM INPUT

The sensor sends an input to the Engine Control Module (ECM) when it senses water in the fuel filter/water separator. As the water level in the filter/separator increases, the resistance across the WIF sensor decreases. This decrease in resistance is sent as a signal to the ECM and compared to a high water standard value. Once the value reaches 30 to 40 kilohms, the ECM will activate the water-in-fuel warning lamp through CCD bus circuits. This all takes place when the ignition key is initially put in the ON position. The ECM continues to monitor the input at the end of the intake manifold air heater post-heat cycle.

The WIF sensor is located at the bottom of the fuel filter/water separator canister (Fig. 13).

FUEL INJECTION PUMP RELAY—ECM OUTPUT

The Engine Control Module (ECM) energizes the electric fuel injection pump through the fuel injection pump relay. Battery voltage is applied to the fuel injection pump relay at all times. When the key is turned ON, the relay is energized when a 12–volt signal is provided by the ECM. When energized, 12–volts is supplied to the Fuel Pump Control Module. The Fuel Pump Control Module is located on the top of the fuel injection pump and is non-servicable.

The fuel injection pump relay is located in the Power Distribution Center (PDC). Refer to label under PDC cover for relay location.

DESCRIPTION AND OPERATION (Continued)

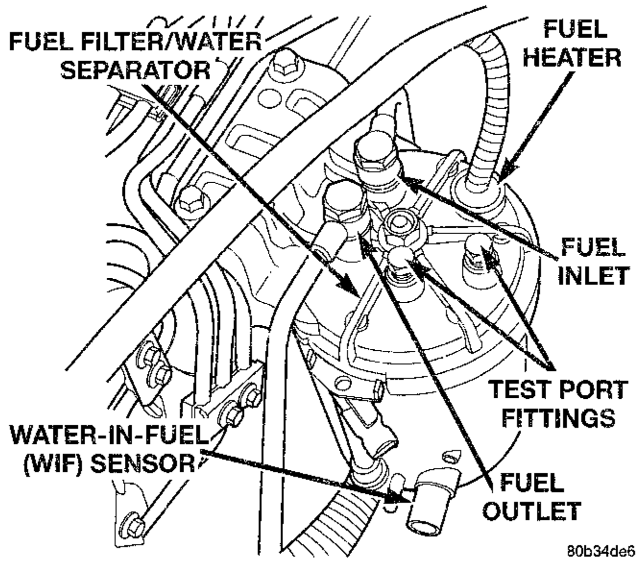

Fig. 13 Water-in-Fuel Sensor Location

INTAKE MANIFOLD AIR HEATER ELEMENTS

The air heater elements are used to heat incoming air to the intake manifold. This is done to help engine starting and improve driveability with cool or cold outside temperatures.

Electrical supply for the 2 air heater elements is controlled by the Engine Control Module (ECM) through the 2 air heater relays. Refer to Intake Manifold Air Heater Relays for more information.

Two heavy-duty cables connect the 2 air heater elements to the 2 air heater relays. Each of these cables will supply approximately 95 amps at 12 volts to an individual heating element within the heater block assembly.

The intake manifold air heater element assembly is located in the top of the intake manifold (Fig. 14).

Refer to the Powertrain Diagnostic Procedures manual for an electrical operation and complete description of the intake heaters, including pre-heat and post-heat cycles.

INTAKE MANIFOLD AIR HEATER RELAYS—ECM OUTPUT

The Engine Control Module (ECM) operates the 2 heating elements through the 2 intake manifold air heater relays.

The 2 relays are located in the engine compartment, attached to the left inner fender below the left battery (Fig. 15).

Refer to the Powertrain Diagnostic Procedures manual for an electrical operation and complete description of the intake heaters, including pre-heat and post-heat cycles.

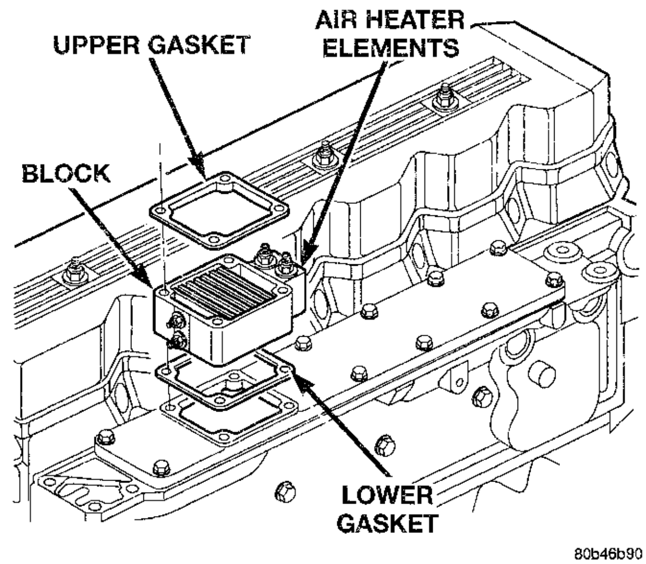

Fig. 14 Air Heater Elements Location

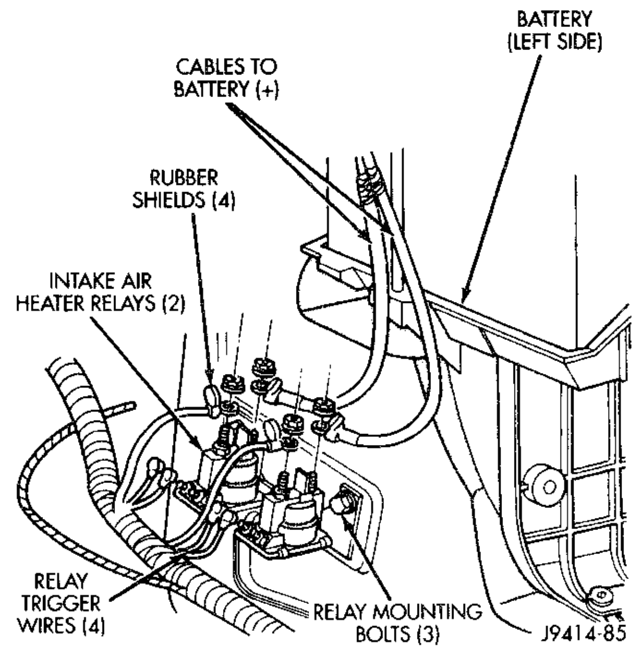

Fig. 15 Intake Manifold Air Heater Relays Location

WAIT-TO-START WARNING LAMP—ECM OUTPUT

The wait-to-start warning lamp is turned on and off by the Engine Control Module (ECM) based on the intake manifold air temperature sensor input. The lamp is located on the instrument panel.

The lamp is turned on when the key is first activated. If the ECM reads intake manifold air temperature below 19°C (66°F), it will turn the wait-to-start warning lamp on for the air heater pre-heat cycle. The lamp stays on until the pre-heat cycle is over.

DESCRIPTION AND OPERATION (Continued)

Refer to the Powertrain Diagnostic Procedures manual for electrical operation and complete description of the intake heaters, including pre-heat and post-heat cycles.

WATER-IN-FUEL WARNING LAMP—ECM INPUT

The Engine Control Module (ECM) turns on the water-in-fuel warning lamp if water is detected in the diesel fuel. The water-in-fuel warning lamp is located in the instrument panel. The lamp will illuminate for about two seconds each time the key is initially turned to the ON position as a bulb check.

If the lamp continues to be illuminated, it signals an immediate need for service. Refer to Fuel Filter/ Water Separator Removal/Installation for water draining procedures.

Also refer to Water-In-Fuel Sensor—ECM Input for additional information.

POWERTRAIN CONTROL MODULE (PCM)—DIESEL

Two different control modules are used: The Powertrain Control Module (PCM), and the Engine Control Module (ECM). The ECM **controls** the fuel system. The PCM **does not control** the fuel system.

The PCM is located in the right-rear side of the engine compartment (Fig. 16).

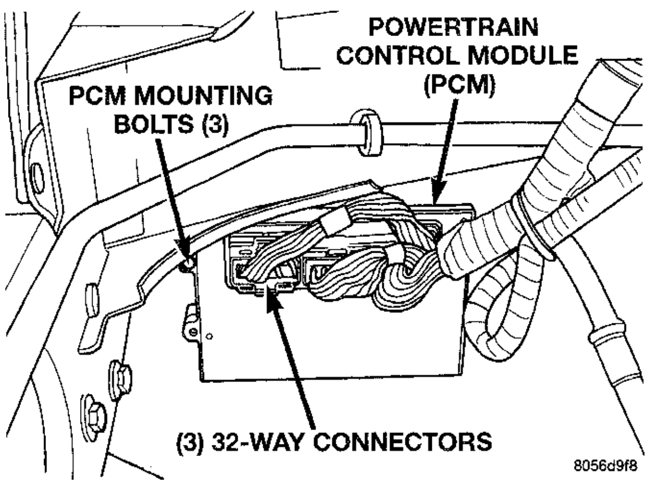

Fig. 16 PCM Location

The PCM's main function is to control: the vehicle charging system, speed control system, transmission, air conditioning system and certain bussed messages.

The PCM can adapt its programming to meet changing operating conditions.

The PCM receives input signals from various switches and sensors. Based on these inputs, the PCM regulates various engine and vehicle operations through different system components. These components are referred to as **PCM Outputs.** The sensors and switches that provide inputs to the PCM are considered **PCM Inputs.**

NOTE: PCM Inputs:

- A/C request (if equipped with factory A/C)
- A/C select (if equipped with factory A/C)
- Accelerator Pedal Position Sensor (APPS) output from ECM
- Auto shutdown (ASD) relay sense
- Battery temperature sensor
- Battery voltage
- Brake switch
- CCD bus (+) circuits
- CCD bus (-) circuits
- Crankshaft Position Sensor (CKP) output from ECM
- Data link connection for DRB scan tool
- Fuel level sensor
- Generator (battery voltage) output
- Ignition sense
- Output shaft speed sensor
- Overdrive/override switch
- Park/neutral switch (auto. trans. only)
- Power ground
- Sensor return
- Signal ground
- Speed control resume switch
- Speed control set switch
- Speed control on/off switch
- Transmission governor pressure sensor
- Transmission temperature sensor
- Vehicle speed inputs from ABS or RWAL system

NOTE: PCM Outputs:

After inputs are received by the PCM, certain sensors, switches and components are controlled or regulated by the PCM. These are considered **PCM Outputs.** These outputs are for:

- A/C clutch relay and A/C clutch
- Auto shutdown (ASD) relay
- CCD bus (+) circuits
- CCD bus (-) circuits
- Data link connection for DRB scan tool
- Five volt sensor supply
- Generator field driver (-)
- Generator field driver (+)
- Generator lamp (if equipped)
- Malfunction indicator lamp (Check engine lamp)
- Overdrive warning lamp (if equipped)
- Speed control vacuum solenoid
- Speed control vent solenoid
- Tachometer (if equipped)
- Transmission convertor clutch circuit
- Transmission 3–4 shift solenoid
- Transmission relay
- Transmission temperature lamp (if equipped)
- Transmission variable force solenoid (governor sol.)

DESCRIPTION AND OPERATION (Continued)

AIR CONDITIONING (A/C) CONTROLS—PCM INPUT

The A/C control system information applies to factory installed air conditioning units.

A/C SELECT SIGNAL: When the A/C switch is in the ON position, an input signal is sent to the powertrain control module (PCM). The signal informs the PCM that the A/C has been selected. The PCM adjusts idle speed to a pre-programmed rpm through the idle air control (IAC) motor to compensate for increased engine load.

A/C REQUEST SIGNAL: Once A/C has been selected, the powertrain control module (PCM) receives the A/C request signal from the clutch cycling pressure switch. The input indicates that the evaporator pressure is in the proper range for A/C application. The PCM uses this input to cycle the A/C compressor clutch (through the A/C relay). It will also determine the correct engine idle speed through the idle air control (IAC) motor position.

If the A/C low-pressure switch or high-pressure switch opens (indicating a low or high refrigerant pressure), the PCM will not receive an A/C request signal. The PCM will then remove the ground from the A/C relay. This will deactivate the A/C compressor clutch.

If the switch opens, (indicating that evaporator is not in proper pressure range), the PCM will not receive the A/C request signal. The PCM will then remove the ground from the A/C relay, deactivating the A/C compressor clutch.

AUTOMATIC SHUTDOWN (ASD) SENSE—PCM INPUT

A 12 volt signal at this input indicates to the PCM that the ASD has been activated. The ASD relay is located in the power distribution center (PDC). The PDC is located in the engine compartment. For the location of the relay within the PDC, refer to PDC cover.

This input is used only to sense that the ASD relay is energized. If the powertrain control module (PCM) does not see 12 volts + at this input when the ASD should be activated, it will set a diagnostic trouble code (DTC).

BATTERY VOLTAGE—PCM INPUT

The battery voltage input provides power to the Powertrain Control Module (PCM). It also informs the PCM what voltage level is being supplied by the generator once the vehicle is running.

The battery input also provides the voltage that is needed to keep the PCM memory alive. The memory stores Diagnostic Trouble Code (DTC) messages and speed control adaptive memory.

BATTERY TEMPERATURE SENSOR—PCM INPUT

Provides a signal to the PCM corresponding to the battery temperature. Refer to Group 8C, Charging System for additional information.

FUEL LEVEL SENSOR—PCM INPUT

The Powertrain Control Module (PCM) sends a 5 volt signal to the fuel level sensor (fuel gauge sending unit). The fuel level sensor will then return a signal to the PCM to indicate fuel level. A signal is then sent out from the PCM to the CCD bus circuits for fuel gauge operation.

SPEED CONTROL SWITCHES—PCM INPUT

Six different speed control functions, using three momentary contact switches, are monitored through this **multiplexed** input. The resistance monitored at this input, in combination with the length of time the PCM measures the resistance, determines which switch feature has been selected. The three switches are: On/Off, Set/Coast, Cancel and Resume/Accelerate.

Refer to Group 8H, Vehicle Speed Control System for further speed control information.

PARK/NEUTRAL POSITION SWITCH—PCM INPUT

The park/neutral switch provides an input to the powertrain control module (PCM). This will indicate that the automatic transmission is in Park, Neutral or a Drive gear selection. This input is used to determine speed control strategy and electrical operation of both the overdrive and torque convertor solenoids. Refer to Group 21, Transmissions, for testing, replacement and adjustment information.

TRANSMISSION TEMPERATURE SENSOR—PCM INPUT

The transmission temperature sensor is a variable, thermistor type. It reacts to temperature changes. At cold transmission oil temperatures, its resistance is high. As temperatures increase, its resistance will decrease.

The transmission temperature sensor is used on models equipped with an automatic transmission. Its purpose is to help control transmission fluid overheating. If transmission overheating has been determined by this sensor (temp. above approximately 280 degrees F), an input is sent to the powertrain control module (PCM). The PCM will then force a 4-3 downshift. Once transmission temperature has cooled below specifications, a 3-4 upshift will be allowed. An instrument panel mounted transmission temperature warning lamp is also used.

AUTHENTIC RESTORATION PRODUCT

DESCRIPTION AND OPERATION (Continued)

TRANSMISSION GOVERNOR PRESSURE SENSOR—PCM INPUT

Provides a signal proportional to the transmission governor pressure. It provides feedback for control of the governor pressure solenoid, which regulates transmission governor pressure. This input is used with 4–speed electronic transmissions only.

VEHICLE SPEED AND DISTANCE—PCM INPUT

The Vehicle Speed Sensor (VSS) is no longer used for any Dodge truck in the 1998 model year.

Vehicle speed and distance covered are measured by the Rear Wheel Speed Sensor. The sensor is mounted to the rear axle. A signal is sent from this sensor to the Controller Antilock Brake (CAB) computer. A signal is then sent from the CAB to the Powertrain Control Module (PCM) to determine vehicle speed and distance covered. The PCM will then determine strategies for fuel system and speed control system operation.

Refer to Odometer and Trip Odometer in Group 8E, Instrument Panel for additional information.

AIR CONDITIONING CLUTCH RELAY—PCM OUTPUT

The A/C relay is located in the Power Distribution Center (PDC). Refer to label under PDC cover for relay location.

The powertrain control module (PCM) activates the A/C compressor through the A/C clutch relay. The PCM regulates A/C compressor operation by switching the ground circuit for the A/C clutch relay on and off.

The PCM will also de-energize the relay if coolant temperature exceeds 125°C (257°F).

AUTOMATIC SHUTDOWN (ASD) RELAY—PCM OUTPUT

This circuit controls operation of the ASD relay. It provides the necessary power to operate the generator field control for charging system operation.

The ASD relay is located in the power distribution center (PDC). The PDC is located in the engine compartment. For location of relay within the PDC, refer to PDC cover.

GENERATOR FIELD SOURCE (+)—PCM OUTPUT

This output from the Powertrain Control Module (PCM) regulates charging system voltage to the generator field source (+) circuit. The voltage range is 12.9 to 15.0 volts. Models of previous years had used the ASD relay (directly) to apply the 12 volt + power supply to the generator field source (+) circuit. Refer to Groups 8A and 8C for charging system information.

GENERATOR FIELD DRIVER (-)—PCM OUTPUT

This output from the Powertrain Control Module (PCM) regulates charging system ground control to the generator field driver (-) circuit. Refer to Groups 8A and 8C for charging system information.

GENERATOR LAMP—PCM OUTPUT

If the powertrain control module (PCM) senses a low charging condition in the charging system, it will illuminate the generator lamp (if equipped) on the instrument panel. For example, during low idle with all accessories turned on, the lamp may momentarily go on. Refer to Groups 8A and 8C for charging system information.

DATA LINK CONNECTOR—PCM/ECM INPUT AND OUTPUT

The 16–way data link connector (diagnostic scan tool connector) links the Diagnostic Readout Box (DRB) scan tool or the Mopar Diagnostic System (MDS) with both the Powertrain Control Module (PCM) and the Engine Control Module (ECM). The data link connector (Fig. 17) is located at lower edge of instrument panel near steering column . For operation of the DRB scan tool, refer to the appropriate Powertrain Diagnostic Procedures service manual.

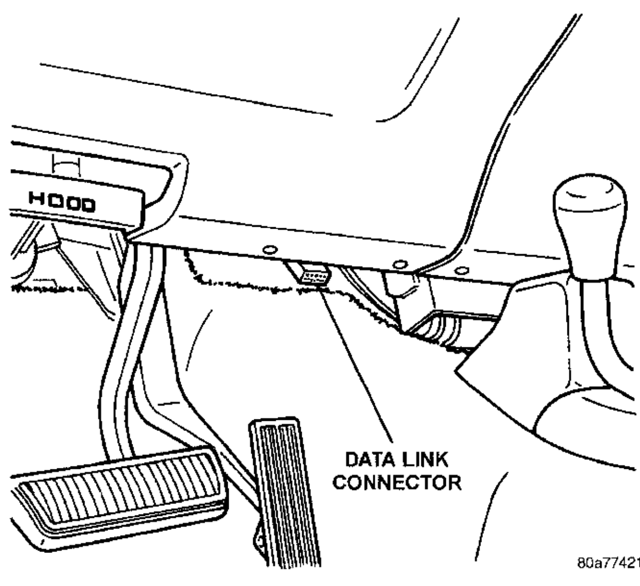

Fig. 17 16–Way Data Link Connector

MALFUNCTION INDICATOR LAMP—ECM/PCM OUTPUT

Refer to Group 25, Emission Control System for information.

DESCRIPTION AND OPERATION (Continued)

OVERDRIVE LAMP—PCM OUTPUT

Automatic Transmission Only: This circuit controls a signal for operation of the overdrive warning lamp. When the lamp is illuminated, overdrive is disengaged. When the lamp is off, overdrive is engaged.

OVERDRIVE/OVERRIDE SWITCH-PCM INPUT

On vehicles equipped with an automatic transmission and overdrive, the powertrain control module (PCM) regulates the 3-4 overdrive up-shift and downshift through the overdrive solenoid. This solenoid is located in the transmission. An overdrive/override push-button switch is located at the end of the shift lever.

The overdrive/override push-button switch is normally open (overdrive allowed) when the lamp is not illuminated. It momentarily closes (overdrive not allowed) when the operator presses the switch and the lamp is illuminated. Overdrive will revert to ON (lamp off) each time the ignition switch in turned on. The transmission downshifts if the operator presses the override switch while in overdrive.

Refer to Group 21 for more transmission information.

SPEED CONTROL SOLENOIDS—PCM OUTPUT

Speed control operation is regulated by the powertrain control module (PCM). The PCM controls the vacuum to the throttle actuator through the speed control vacuum and vent solenoids. Refer to Group 8H for Speed Control Information.

TACHOMETER—PCM OUTPUT

The Powertrain Control Module (PCM) supplies engine rpm values to the tachometer through the CCD circuits, after an engine speed (rpm) signal is sent from the Engine Control Module (ECM). Refer to Group 8E, Instrument Panel for tachometer information.

TORQUE CONVERTOR CLUTCH (TCC) SOLENOID—PCM OUTPUT

This circuit controls operation of the transmission mounted torque convertor clutch (TCC) solenoid used for torque convertor engagement.

The Powertrain Control Module (PCM) will determine when to engage and disengage the solenoid by monitoring vehicle miles per hour (mph) versus the output voltage of the Accelerator Pedal Position Sensor (APPS). The APPS signal is sent from the Engine Control Module (ECM). Also needed are various inputs from:

- Transmission temperature sensor
- Output shaft speed sensor
- Module timer
- Engine rpm signal from ECM
- Brake switch

TRANSMISSION TEMPERATURE WARNING LAMP—PCM OUTPUT

AUTOMATIC TRANSMISSION ONLY

An instrument panel mounted lamp is used to warn of a possible transmission fluid overheating condition. When transmission fluid temperature has been determined to be above approximately 280 degrees F by the transmission temperature sensor, a signal is sent to the powertrain control module (PCM). The PCM will then control warning lamp operation. The lamp will illuminate for about two seconds each time the ignition key is initially turned to the ON position as a bulb check.

This feature is used with certain heavy-duty automatic transmissions only.

Also refer to Transmission Temperature Sensor—PCM Input for additional information.

DIAGNOSIS AND TESTING

BOOST PRESSURE TEST

Two pressure gauges attached at two different points are required for this test.

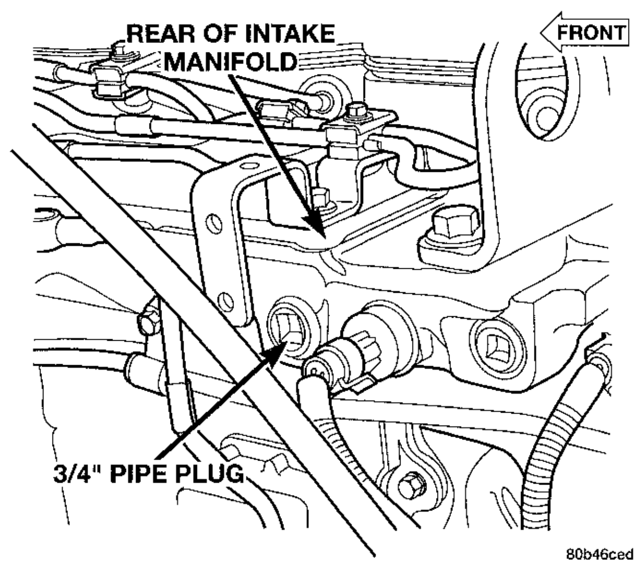

Fig. 18 Boost Pressure Test at Intake Manifold

(1) Obtain two 6828 fuel pressure test gauges (equivalent gauges are OK). **Gauge Consistency Test:** Connect the gauges together to a common pressure source and verify pressure consistency of both gauges. Do this consistency test at approximately 206 kPa (30 psi). If pressures are different, they can still be used for test. Note and record differences in pressures before testing. Make adjustments as necessary.

AUTHENTIC RESTORATION PRODUCT

DIAGNOSIS AND TESTING (Continued)

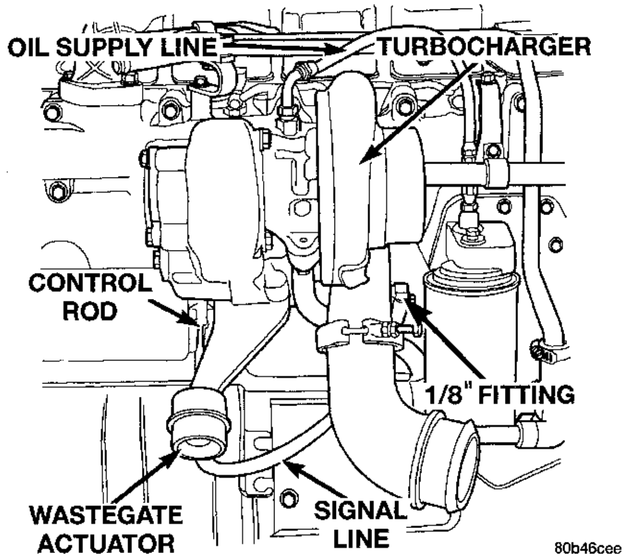

Fig. 19 Boost Pressure Test at Turbocharger

(2) Remove 3/4" pipe plug fitting at rear of intake manifold (Fig. 18). Temporarily replace this fitting with fitting reducer to adapt to pressure gauge. **Note: This pipe plug is located to front of MAP sensor. Do not remove plug to rear of MAP sensor. This is a COOLANT passage plug.**

(3) Loosen hose clamp and disconnect rubber signal line (Fig. 19) from 1/8" brass fitting at front of turbocharger.

(4) Remove 1/8" brass fitting (Fig. 19) from turbocharger. Temporarily replace this fitting with a 1/8" "T" fitting to adapt to pressure gauge.

(5) Reattach signal line to temporary "T".

(6) Attach first pressure gauge to intake manifold fitting.

(7) Attach second pressure gauge to "T" fitting at turbocharger.

Engine must be at rated RPM and full load for the test.

If gauge pressure differential is greater than 3 psi (6 in. Hg), check intercooler and associated piping for restrictions, plugging or damage.

Maximum pressure at intake manifold (rated rpm and load) is 36–37 in/hg ± 3 in/hg (17.7–18.2 psi ± 1.5 psi).

Wastegate should open at no higher than 38.7 in/hg (19 psi) at wide open throttle, full load. If wastegate is out of adjustment, a DTC may have been set. Refer to Wastegate Adjustment in Group 11, Exhaust System and Turbocharger for adjustment procedures.

REMOVAL AND INSTALLATION

ACCELERATOR PEDAL POSITION SENSOR (APPS)

The APPS is serviced (replaced) as one assembly including the lever, brackets and sensor. The APPS is calibrated to its mounting bracket. The APPS assembly is located at left-front of engine below plastic cable/lever/linkage cover (Fig. 20).

CAUTION: Do not attempt to remove sensor from its mounting bracket as electronic calibration will be destroyed (sensor-to-bracket mounting screws are permanently attached). Two accelerator lever set screws (Fig. 22) are used to position lever. Do not attempt to alter positions of these set screws as electronic calibration will be destroyed.

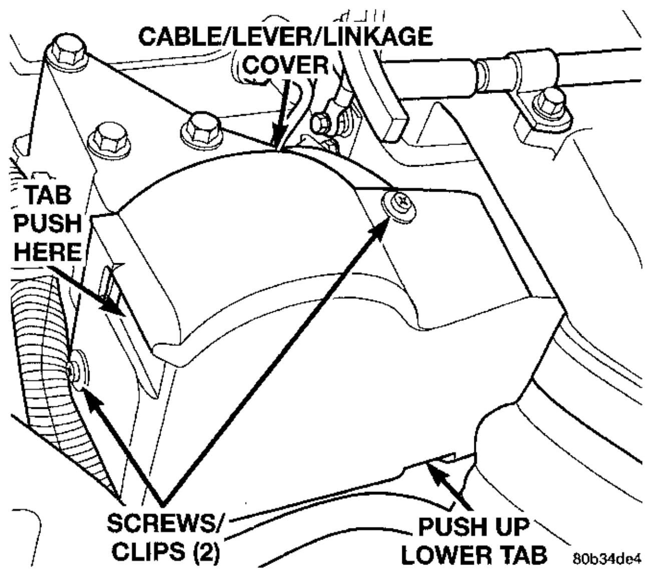

Fig. 20 Cable/Lever/Linkage/Cover

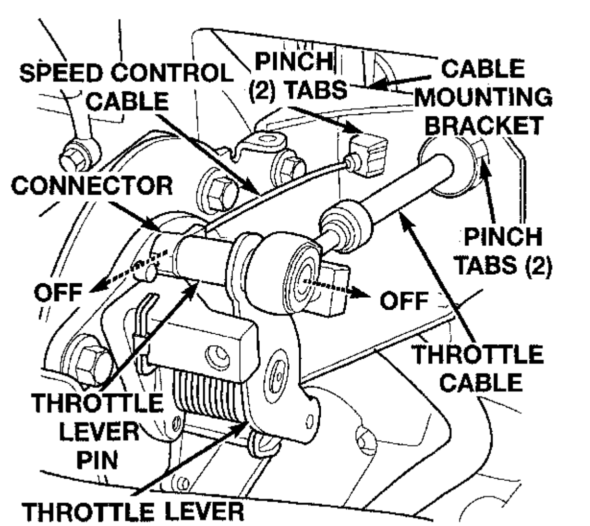

Fig. 21 Cables at Throttle Lever

REMOVAL AND INSTALLATION (Continued)

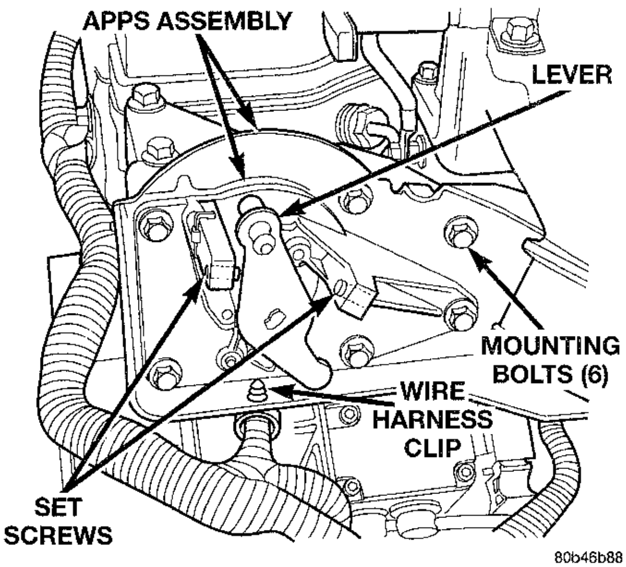

Fig. 22 APPS Assembly

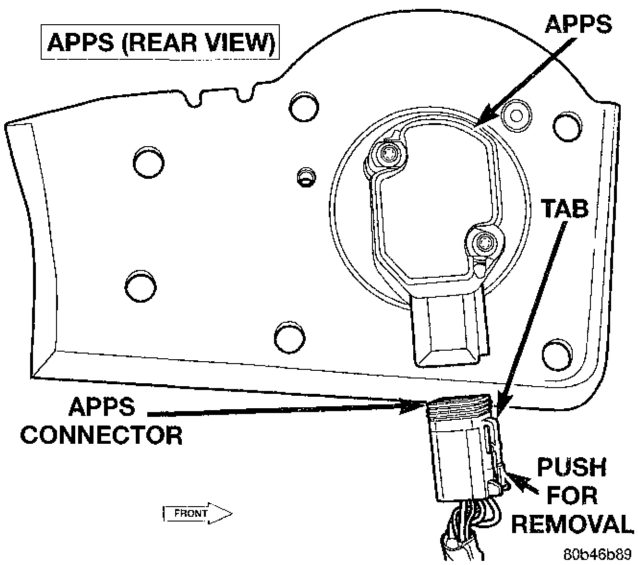

Fig. 23 Electrical Connector at Bottom of APPS

REMOVAL

(1) Disconnect both negative battery cables at both batteries.

(2) Remove cable cover (Fig. 20). Cable cover is attached with 2 Phillips screws, 2 plastic retention clips and 2 push tabs (Fig. 20). Remove 2 Phillips screws and carefully pry out 2 retention clips. After clip removal, push rearward on front tab, and upward on lower tab for cover removal.

(3) Using finger pressure only, disconnect end of speed control servo cable from throttle lever pin by pulling forward on connector while holding lever rearward (Fig. 21).**DO NOT try to pull connector off perpendicular to lever pin. Connector will be broken.**

(4) Using two small screwdrivers, pry throttle cable connector socket from throttle lever ball (Fig. 21). **Be very careful not to bend throttle lever arm.**

(5) Disconnect transmission control cable at lever arm (if equipped). Refer to Group 21, Transmission.

(6) Squeeze pinch tabs on speed control cable (Fig. 21) and pull cable rearward to remove from cable mounting bracket.

(7) Squeeze pinch tabs on throttle cable (Fig. 21) and pull cable rearward to remove from cable mounting bracket.

(8) If equipped with an automatic transmission, refer to Group 21, Transmission for transmission control cable removal procedures.

(9) Disconnect wiring harness clip (Fig. 22) at bottom of bracket.

(10) Remove 6 mounting bolts (Fig. 22) and partially remove APPS assembly from engine. After assembly is partially removed, disconnect electrical connector from bottom of sensor by pushing on connector tab (Fig. 23).

(11) Remove APPS assembly from engine.

INSTALLATION

(1) Snap electrical connector into bottom of sensor.

(2) Position APPS assembly to engine and install 6 bolts. Tighten bolts to 12 N·m (105 in. lbs.) torque.

(3) Connect wiring harness clip (Fig. 22) at bottom of bracket.

(4) If equipped with an automatic transmission, refer to Group 21, Transmission for transmission control cable installation procedures.

(5) Install speed control cable into mounting bracket. Be sure pinch tabs (Fig. 21) have secured cable.

(6) Install throttle cable into mounting bracket. Be sure pinch tabs (Fig. 21) have secured cable.

(7) Connect throttle cable at lever (snaps on).

(8) Connect speed control cable to lever by pushing cable connector rearward onto lever pin while holding lever forward.

(9) Install cable cover.

(10) Connect both negative battery cables to both batteries.

(11) **ECM Calibration:** Turn key to ON position. Without starting engine, slowly press throttle pedal to floor and then slowly release. This step must be done (one time) to ensure accelerator pedal position sensor calibration has been learned by ECM. If not done, possible DTC's may be set.

(12) Use DRB scan tool to erase any DTC's from ECM/PCM.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

CAMSHAFT POSITION SENSOR (CMP)

The camshaft position sensor (CMP) is located below the fuel injection pump (Fig. 24). It is attached to the back of the timing gear cover housing.

REMOVAL

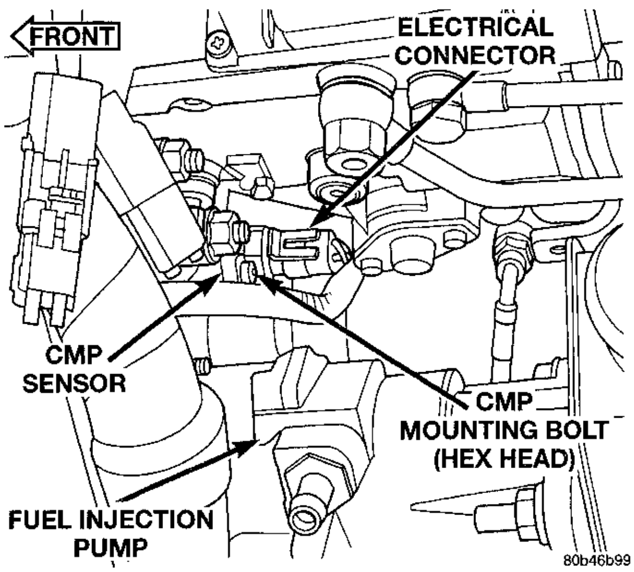

Fig. 24 Camshaft Position Sensor (CMP) Location

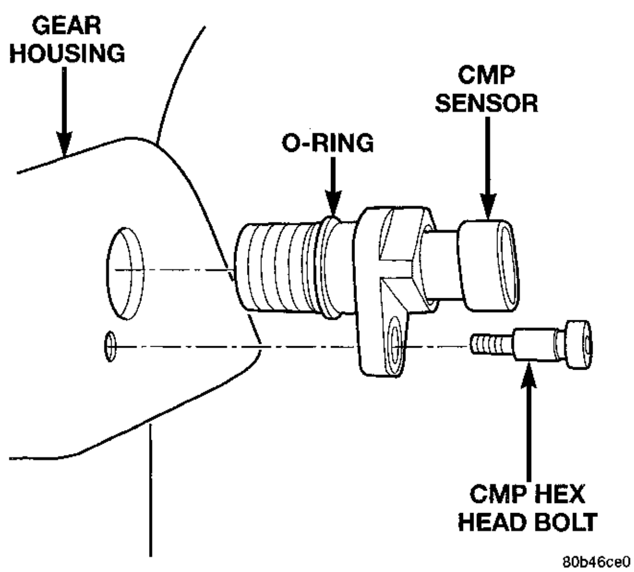

Fig. 25 Camshaft Position Sensor Removal/ Installation

(1) Disconnect both negative cables from both batteries.
(2) Clean area around CMP.
(3) Disconnect electrical at CMP (Fig. 24).
(4) Remove CMP mounting bolt. Bolt head is female-hex (Fig. 25).
(5) Remove CMP from engine by twisting and pulling straight back.
(6) Discard CMP o-ring (Fig. 25).

INSTALLATION

(1) Install new o-ring to CMP. Apply clean engine oil to o-ring.
(2) Clean area around CMP mounting hole.
(3) To prevent tearing o-ring, install CMP into gear housing using a twisting action.
(4) Install mounting bolt and tighten to 20 Nm (15 ft. lbs.) torque.
(5) Install electrical connector to CMP.
(6) Connect both negative cables to both batteries.

CRANKSHAFT POSITION SENSOR (CKP)

REMOVAL

The CKP is located on the left/rear side of engine block near the starter motor (Fig. 26).

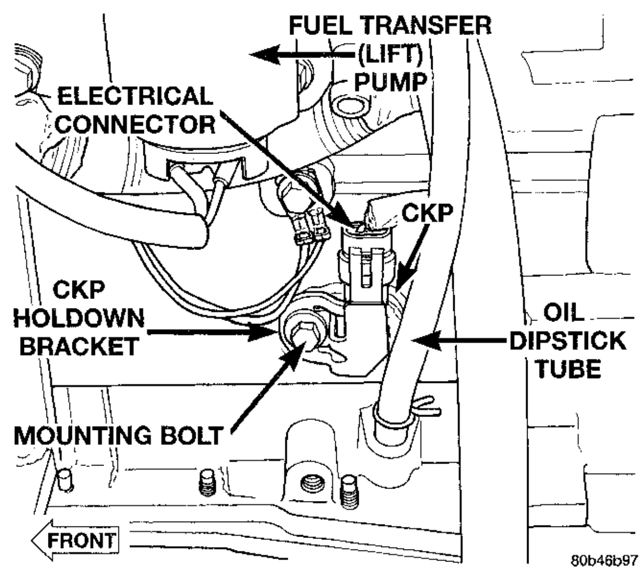

Fig. 26 Crankshaft Position Sensor (CKP) Location

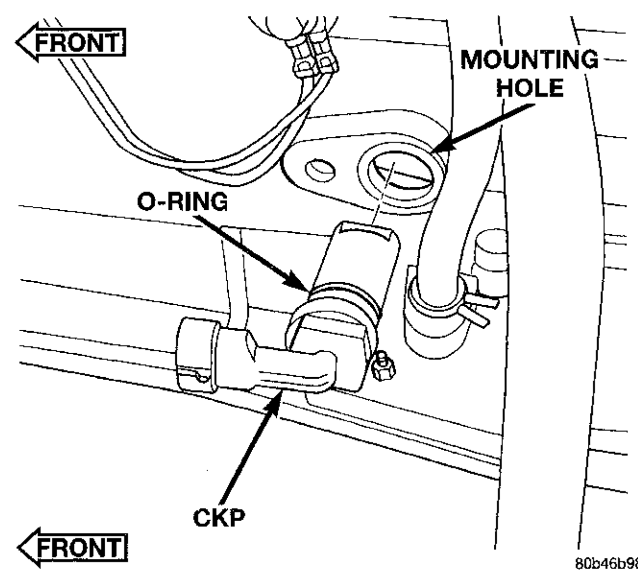

Fig. 27 CKP Removal/Installation

REMOVAL AND INSTALLATION (Continued)

(1) Disconnect both negative battery cables at both batteries.

(2) Remove starter motor. Refer to Group 8B, Starter.

(3) Disconnect electrical connector at CKP (Fig. 26).

(4) Remove CKP mounting bolt and hold down bracket (Fig. 26).

(5) Pull CKP from engine block with a slight twisting action.

(6) Discard old CKP o-ring (Fig. 27).

INSTALLATION

(1) Install new o-ring to CKP. Apply clean engine oil to o-ring.

(2) Clean area around CKP mounting hole.

(3) To prevent tearing o-ring, install CKP into engine block using a twisting action.

(4) Position hold down bracket and install mounting bolt.

(5) Tighten bolt to 24 N·m (18 ft. lbs.) torque.

(6) Install starter motor. Refer to Group 8B, Starter.

(7) Connect both negative battery cables at both batteries.

ENGINE CONTROL MODULE (ECM)

The ECM is bolted to the engine block behind the fuel filter (Fig. 28).

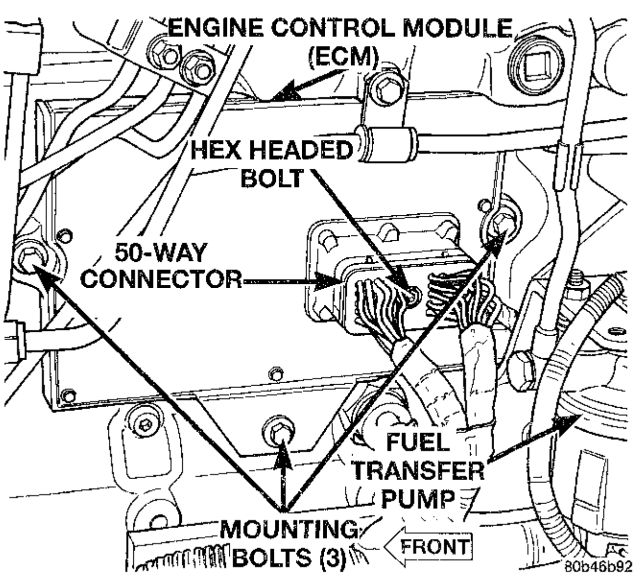

Fig. 28 Engine Control Module (ECM) Location and Mounting

REMOVAL

(1) Record any Diagnostic Trouble Codes (DTC's) found in the PCM or ECM.

To avoid possible voltage spike damage to either the Powertrain Control Module (PCM) or ECM, ignition key must be off, and negative battery cables must be disconnected before unplugging ECM connectors.

(2) Disconnect both negative battery cables at both batteries.

(3) Remove 50–way electrical connector bolt at ECM (Fig. 28). Note: Connector bolt is female 4mm hex head. To remove bolt, use a ball-hex bit or ball-hex screwdriver such as Snap-On ® 4mm SDABM4. As bolt is being removed, very carefully remove connector from ECM.

(4) Remove three ECM mounting bolts and remove ECM from vehicle.

INSTALLATION

Do not apply paint to back of ECM. Poor ground will result.

(1) Clean ECM mounting points at engine block.

(2) Position ECM to engine block and install 3 mounting bolts. Tighten bolts to 24 N·m (18 ft. lbs.).

(3) Check pin connectors in ECM and 50–way connector for corrosion or damage. Repair as necessary.

(4) Clean pins in 50–way electrical connector with a quick-dry electrical contact cleaner.

(5) Very carefully install 50–way connector to ECM. Tighten connector hex bolt.

(6) Install battery cables.

(7) **Turn key to ON position. Without starting engine, slowly press throttle pedal to floor and then slowly release. This step must be done (one time) to ensure accelerator pedal position sensor calibration has been learned by ECM. If not done, possible DTC's may be set.**

(8) Use DRB scan tool to erase any stored companion DTC's from PCM.

ENGINE COOLANT TEMPERATURE (ECT) SENSOR

The Engine Coolant Temperature (ECT) sensor is located at the front of the cylinder head near the thermostat (Fig. 29).

REMOVAL

WARNING: THE COOLING SYSTEM MAY BE UNDER PRESSURE. HOT COOLANT CAN CAUSE BURNS. OBSERVE THE WARNINGS IN GROUP 7, COOLING SYSTEM BEFORE PROCEEDING.

(1) Partially drain cooling system until coolant level is below cylinder head.

(2) Disconnect ECT sensor electrical connector from sensor (Fig. 29).

(3) Remove ECT sensor from cylinder head (Fig. 30).

(4) Discard sensor o-ring (Fig. 30).

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

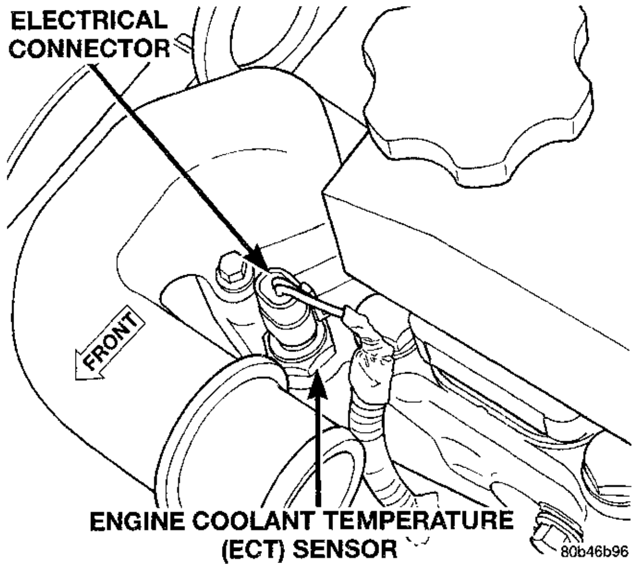

Fig. 29 ECT Sensor Location

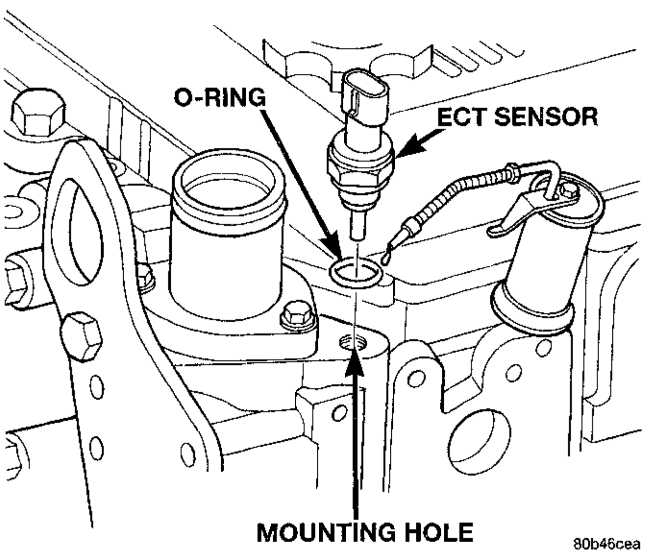

Fig. 30 ECT Sensor Removal/Installation

INSTALLATION

(1) Clean sensor mounting hole (Fig. 30) of rust or contaminants.

(2) Install new o-ring to sensor. Apply clean engine oil to sensor o-ring and sensor threads.

(3) Install ECT sensor into cylinder head. Tighten to 14 N·m (10 ft. lbs.) torque.

(4) Connect sensor electrical connector.

(5) Fill cooling system and check for coolant leaks. Refer to Group 7, Cooling System for procedures.

INTAKE MANIFOLD AIR TEMPERATURE (IAT) SENSOR

The IAT sensor is located in the left/rear side of the intake manifold (Fig. 31).

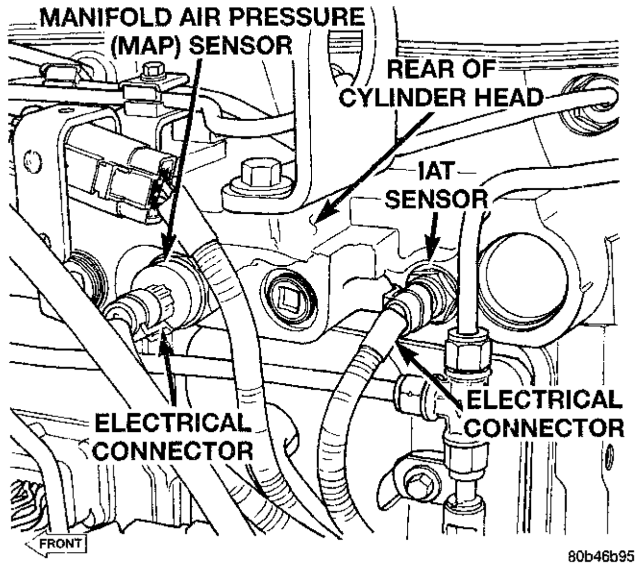

Fig. 31 IAT Sensor Location

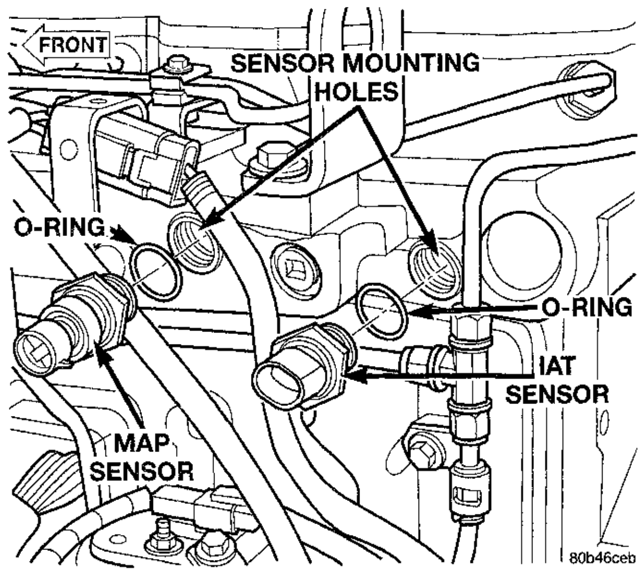

Fig. 32 IAT Sensor Removal/Installation

REMOVAL

(1) Disconnect electrical connector from IAT sensor (Fig. 31).

(2) Remove IAT sensor from intake manifold (Fig. 32).

(3) Discard sensor o-ring (Fig. 32).

INSTALLATION

(1) Clean sensor mounting hole (Fig. 32) of rust or contaminants.

(2) Install new o-ring to sensor. Apply clean engine oil to sensor o-ring and sensor threads.

(3) Install IAT sensor into intake manifold. Tighten to 14 N·m (10 ft. lbs.) torque.

(4) Connect sensor electrical connector.

REMOVAL AND INSTALLATION (Continued)

INTAKE MANIFOLD AIR HEATERS

The 2 intake manifold air heater elements are attached to a metal block located at the top of the intake manifold (Fig. 33). If servicing either of the heater elements, the entire block/element assembly must be replaced.

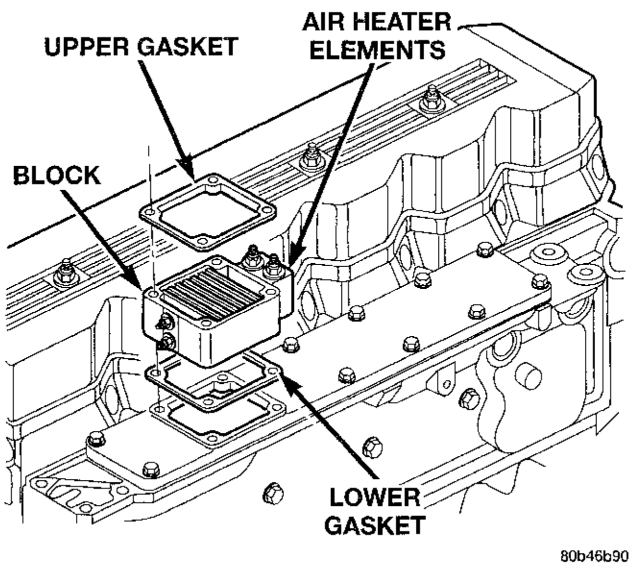

Fig. 33 Intake Manifold Air Heater Element Location

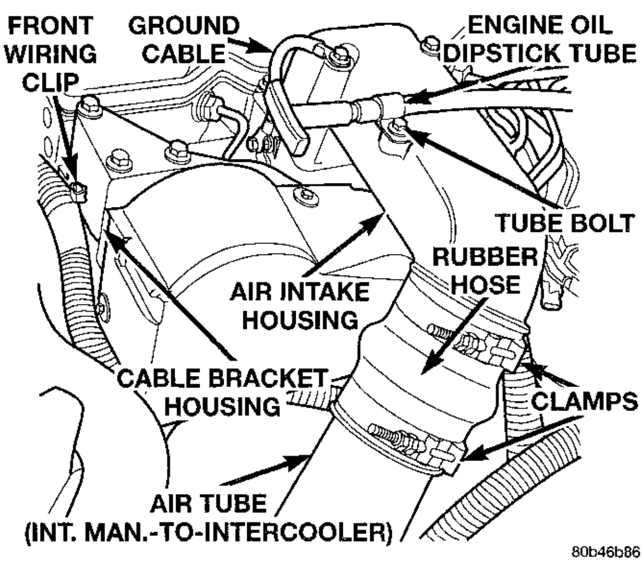

Fig. 34 Air Tube (Intercooler-to-Air Intake Housing)

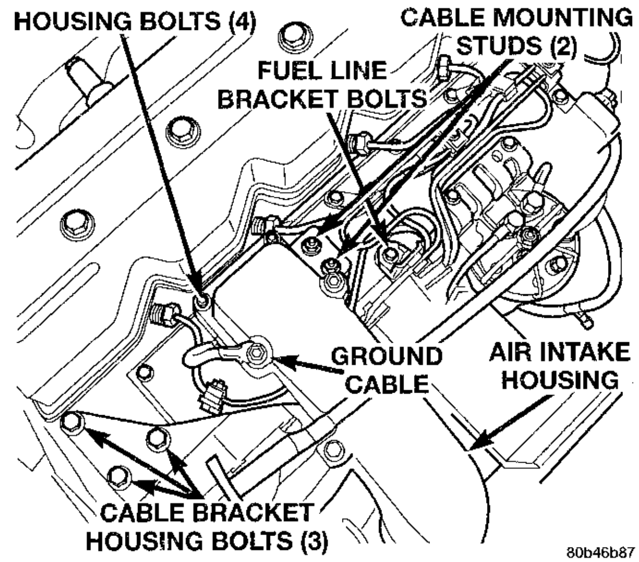

Fig. 35 Air Intake Housing

REMOVAL

(1) Disconnect both negative battery cables at both batteries.

(2) Disconnect clamp from rubber hose at air intake housing (Fig. 34).

(3) Disconnect rubber hose at air intake housing (Fig. 34).

(4) Remove engine oil dipstick tube mounting bolt (Fig. 34). Position dipstick tube to the side.

(5) Disconnect heater electrical cables at cable mounting studs (Fig. 35).

(6) Remove 4 housing bolts (Fig. 35).

(7) Remove air intake housing from top of heater elements.

(8) Remove heater element assembly from intake manifold.

(9) Clean old gasket material from air intake housing and intake manifold.

(10) Clean old gasket material from both ends of heater block (Fig. 33).

INSTALLATION

(1) Using 2 new gaskets, position element assembly and air housing to intake manifold.

(2) Position ground cable (Fig. 35) to air housing.

(3) Install 4 housing bolts and tighten to 24 N·m (18 ft. lbs.) torque.

(4) Connect heater cables at cable mounting studs (Fig. 35).

(5) Install engine oil dipstick tube and mounting bolt.

(6) Connect rubber hose to air intake housing.

(7) Connect clamp to rubber hose at air intake housing.

(8) Connect both negative battery cables at both batteries.

AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

INTAKE MANIFOLD AIR HEATER RELAYS

The relays are located in engine compartment, bolted to left inner fender below left battery (Fig. 36).

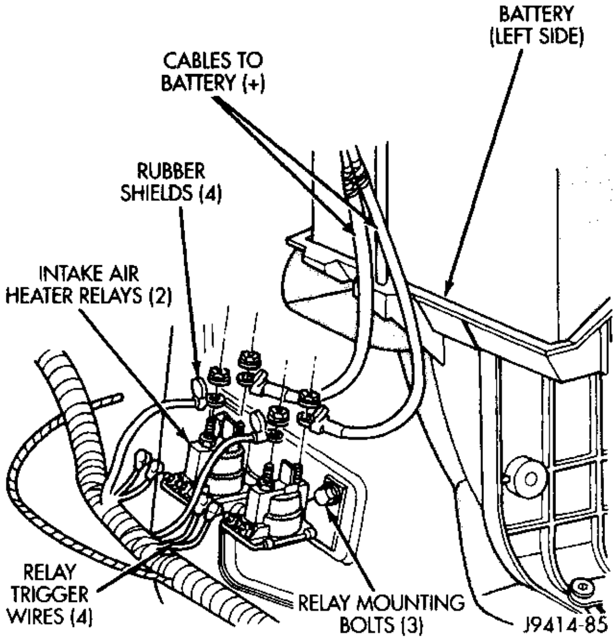

Fig. 36 Intake Manifold Air Heater Relays

REMOVAL

The mounting bracket and both relays are replaced as an assembly.

(1) Disconnect both negative battery cables at both batteries.

(2) Disconnect four relay trigger wires at both relays (Fig. 36). Note position of wiring before removing.

(3) Lift four rubber shields from all 4 cables (Fig. 36).

(4) Remove four nuts at cable connectors (Fig. 36). Note position of wiring before removing.

(5) Remove three relay mounting bracket bolts (Fig. 36) and remove relay assembly.

INSTALLATION

(1) Install relay assembly to inner fender. Tighten mounting bolts to 4.5 N·m (40 in. lbs.) torque.

(2) Connect eight electrical connectors to relays.

(3) Connect battery cables to both batteries.

MANIFOLD AIR PRESSURE (MAP) SENSOR

The MAP sensor is located in the left/rear side of the intake manifold (Fig. 37).

REMOVAL

(1) Disconnect electrical connector from MAP sensor (Fig. 37).

(2) Remove MAP sensor from intake manifold (Fig. 38).

(3) Discard sensor o-ring (Fig. 38).

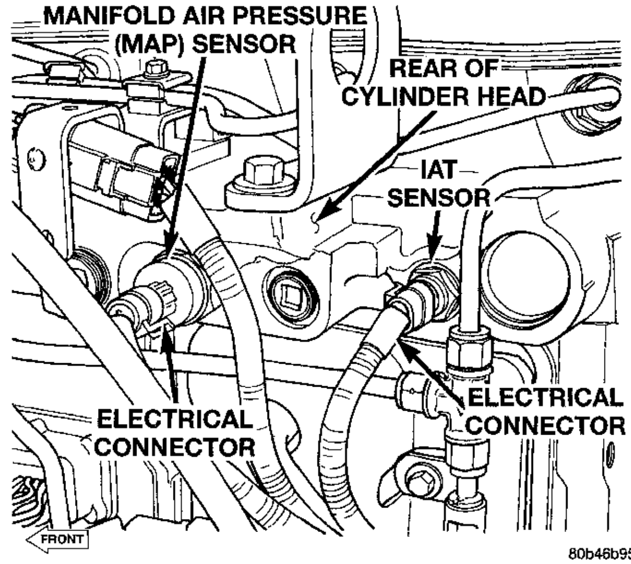

Fig. 37 MAP Sensor Location

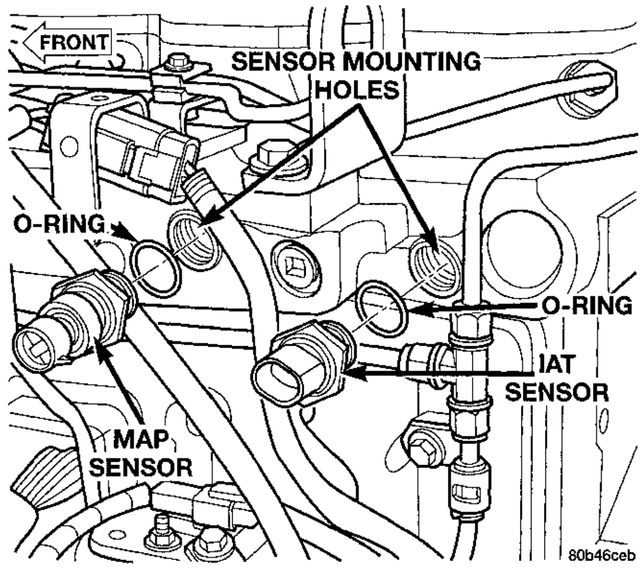

Fig. 38 MAP Sensor Removal/Installation

INSTALLATION

(1) Clean sensor mounting hole (Fig. 38) of rust or contaminants.

(2) Install new o-ring to sensor. Apply clean engine oil to sensor o-ring and sensor threads.

(3) Install MAP sensor into intake manifold. Tighten to 14 N·m (10 ft. lbs.) torque.

(4) Connect sensor electrical connector.

REMOVAL AND INSTALLATION (Continued)

POWERTRAIN CONTROL MODULE (PCM)

The PCM is located in the engine compartment (Fig. 39) to the rear of the air cleaner assembly.

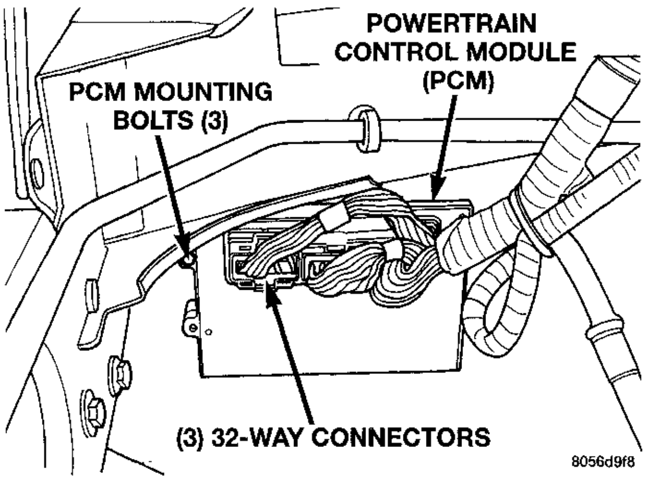

Fig. 39 PCM Location and Mounting

REMOVAL

To avoid possible voltage spike damage to either the PCM or the ECM, ignition key must be off, and both negative battery cables must be disconnected before unplugging PCM connectors.

(1) Disconnect negative battery cables at both batteries.

(2) Remove cover over electrical connectors. Cover snaps onto PCM.

(3) Carefully unplug the three 32–way connectors from PCM.

(4) Remove three PCM mounting bolts and remove PCM from vehicle.

INSTALLATION

(1) Install PCM and mounting bolts to vehicle.

(2) Tighten bolts to 4 N·m (35 in. lbs.).

(3) Check pin connectors in the PCM and the three 32–way connectors for corrosion or damage. Repair as necessary.

(4) Install three 32–way connectors.

(5) Install cover over electrical connectors. Cover snaps onto PCM.

(6) Install battery cables.

(7) Use the DRB scan tool to reprogram new PCM with vehicles original Identification Number (VIN) and original vehicle mileage. If this step is not done, a Diagnostic Trouble Code (DTC) may be set.

WATER-IN-FUEL SENSOR

The Water-In-Fuel (WIF) sensor is located at the side of fuel filter/water separator canister. Refer to Fuel Filter/Water Separator Removal/Installation for WIF sensor removal/installation procedures.

EMISSION CONTROL SYSTEM

ON-BOARD DIAGNOSTICS

INDEX

GENERAL INFORMATION

SYSTEM DESCRIPTION

Two different modules are used for powertrain control with the diesel engine. The Powertrain Control Module (PCM) is used primarily for charging system, transmission, and speed control functions. The Engine Control Module (ECM) is used to control the fuel system. The PCM is located in the right/rear of engine compartment (Fig. 1). The ECM is bolted to the left side of the engine cylinder block (Fig. 2). Refer to either Powertrain Control Module (PCM), or Engine Control Module (ECM) in Group 14, Fuel System for a list of inputs and outputs for each module.

The PCM and ECM monitor many different circuits in the powertrain system. If the ECM or PCM senses a problem with a monitored circuit often enough to indicate an actual problem, it stores a Diagnostic Trouble Code (DTC) in the ECM's or PCM's memory. With certain DTC's, if the problem is repaired or ceases to exist, the ECM or PCM cancels the code after 40 warm-up cycles. Certain other DTC's may be cancelled after 1 or 2 good "trips". Refer to Trip Definition. DTC's that affect vehicle emissions illuminate the Malfunction Indicator Lamp (CHECK ENGINE lamp). Refer to Malfunction Indicator Lamp.

Certain DTC's will set a "companion DTC" in the opposite control module. This means that after repair, the DTC must be erased from **both** modules.

Certain criteria must be met before the ECM or PCM will store a DTC in memory. The criteria may be a specific range of engine RPM, throttle opening, engine temperature or input voltage.

The ECM or PCM might not store a DTC for a monitored circuit even though a malfunction has occurred. This may happen because one of the DTC criteria for the circuit has not been met. **For example,** assume the DTC criteria requires the ECM to monitor the circuit only when the engine operates between 750 and 2000 RPM. Suppose the sensor's output circuit shorts to ground when engine operates above 2400 RPM (resulting in 0 volt input to the ECM). Because the condition happens at an engine speed above the maximum threshold (2000 rpm), the ECM will not store a DTC.

There are several operating conditions for which the ECM and PCM monitors and sets DTC's. Refer to Monitored Systems, Components, and Non-Monitored Circuits in this section.

Technicians must retrieve stored DTC's by connecting the DRB scan tool (or an equivalent scan tool) to the 16–way data link connector (Fig. 3). Refer to the Diagnostic Trouble Code chart (list). **Remember that DTC's are the results of a system or circuit failure, but do not directly identify the failed component or components.**

GENERAL INFORMATION (Continued)

Various diagnostic procedures may actually cause a diagnostic monitor to set a DTC. For instance, disconnecting a relay or removing an electrical connector while the engine is running. When a repair is completed and verified, connect the DRB scan tool to the 16–way data link connector to erase all ECM and PCM DTC's and extinguish the MIL (CHECK ENGINE lamp).

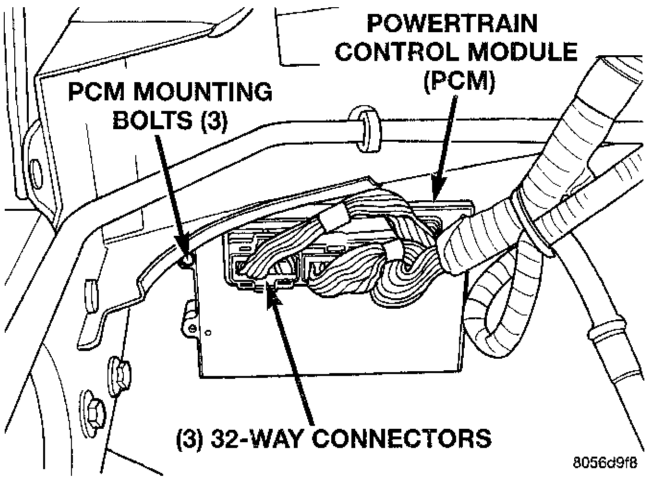

Fig. 1 Powertrain Control Module (PCM)

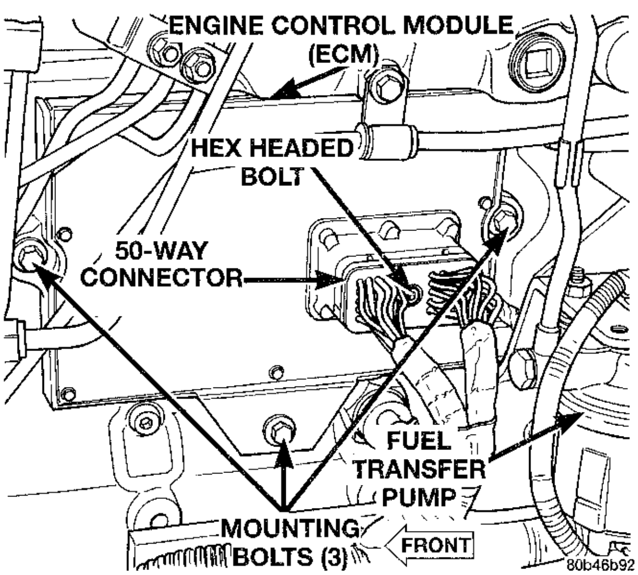

Fig. 2 Engine Control Module (ECM)

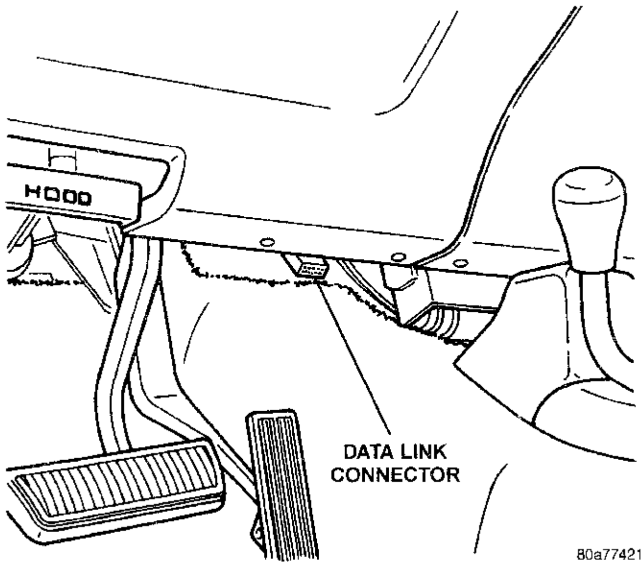

Fig. 3 16–Way Data Link (Diagnostic) Connector Location

DESCRIPTION AND OPERATION

MALFUNCTION INDICATOR LAMP (MIL)

Whenever the Engine Control Module (ECM), or the Powertrain Control Module (PCM) sets a Diagnostic Trouble Code (DTC) for an emission related item, it illuminates the Malfunction Indicator Lamp (MIL). The MIL is displayed on the instrument panel as the CHECK ENGINE lamp. The MIL will only be illuminated for DTC's that affect vehicle emissions.

There are some monitors that may take two consecutive “trips” to illuminate the MIL if a DTC has been detected. Refer to Trip Definition for additional information. The MIL will stay on continuously (if key is ON) when the ECM or PCM has entered a “Limp-In” mode or has identified a failed emission component.

The MIL either flashes or illuminates continuously when the PCM detects active engine misfire. Refer to Misfire Monitoring.

Additionally, the ECM or PCM may reset (turn off) the MIL if a previous malfunction (DTC) has not been re-detected after 2 consecutive “trips” have occurred.

The MIL will illuminate at key-on and will stay lit for approximately 2 seconds if the engine has not been cranked over. This is done as a bulb check (bulb test).

Refer to the Diagnostic Trouble Code charts for a list of emission related and non-emission related DTC's.

AUTHENTIC RESTORATION PRODUCTS

DESCRIPTION AND OPERATION (Continued)

DIAGNOSTIC TROUBLE CODES

A Diagnostic Trouble Code (DTC) indicates that either the Powertrain Control Module (PCM), or the Engine Control Module (ECM) has recognized an abnormal condition in the system. Certain DTC's will set a "Companion DTC", meaning the same code will be set in the opposite module (ECM or PCM).

DTC's are the results of a system or circuit failure, but do not directly identify the failed component or components.

Technicians must retrieve stored DTC's by connecting the DRB III scan tool (or an equivalent scan tool) to the 16–way data link connector (Fig. 3).

NOTE: For a list of DTC's, refer to the following charts.

OBTAINING DTC's

WARNING: APPLY PARKING BRAKE AND/OR BLOCK WHEELS BEFORE PERFORMING ANY TEST ON AN OPERATING ENGINE.

(1) Connect the DRB scan tool to data link (diagnostic) connector.

(2) Turn the ignition switch on, access Read Fault Screen. Record all the DTC's shown on the DRB scan tool.

(3) To erase DTC's, use the Erase Trouble Code data screen on the DRB scan tool.

(4) Certain DTC's are stored as "Companion DTC's". They must be erased from both the ECM and PCM.

(a) CHECK ENGINE lamp (Malfunction Indicator Lamp or MIL) illuminated during engine operation if this DTC was recorded (CARB and/or EPA requirements).

(b) CHECK ENGINE lamp (Malfunction Indicator Lamp or MIL) illuminated during engine operation if this DTC was recorded (CARB requirements only).

(c) ECM may derate engine power, degrade engine performance or put fuel system into "Limp-In" mode if this DTC was recorded.

(d) CHECK GAUGES lamp illuminated during engine operation if this DTC was recorded.

(e) Companion DTC recorded (DTC recorded in both ECM and PCM).

(f) Water-In-Fuel warning lamp illuminated if this DTC was recorded.

(g) CHECK ENGINE lamp (Malfunction Indicator Lamp or MIL) **not illuminated** during engine operation if this DTC was recorded.

DIAGNOSTIC TROUBLE CODE (DTC) DESCRIPTIONS

Generic Scan Tool P-Code	DRB Scan Tool Display	Description of Diagnostic Trouble Code
P0112 (b), (c)	Intake Air Temperature (IAT) Sensor Voltage Low	Intake manifold air temperature sensor voltage input below the minimum acceptable voltage.
P0113 (b), (c)	Intake Air Temperature (IAT) Sensor Voltage High	Intake manifold air temperature sensor voltage input above the maximum acceptable voltage.
P0117 (b), (c)	Engine Coolant Temperature (ECT) Sensor Voltage Too Low	Engine coolant temperature sensor voltage input below minimum acceptable voltage.
P0118 (b), (c)	Engine Coolant Temperature (ECT) Sensor Voltage Too High	Engine coolant temperature sensor voltage input above maximum acceptable voltage.
P0121 (a), (c)	Accel. Position Sensor Volts Do Not Agree w/idle Validation Sig.	Problem detected in APPS idle validation circuit
P0122 (a), (c)	Accelerator Position Sensor (APPS) Signal Voltage Too Low	APPS voltage input below the minimum acceptable voltage
P0123 (a), (c)	Accelerator Position Sensor (APPS) Signal Voltage Too High	APPS voltage input above the maximum acceptable voltage.
P0125 (b)	Engine is Cold Too Long	Engine does not reach operating temperature.
P0168 (c), (g)	Decreased Engine Performance Due To High Injection Pump Fuel Temp	Fuel temperature is above the engine protection limit. Engine power will be derated.
P0177 (f), (g)	Water In Fuel	Excess water found in fuel by water-in-fuel sensor

DESCRIPTION AND OPERATION (Continued)

Generic Scan Tool P-Code	DRB Scan Tool Display	Description of Diagnostic Trouble Code
P0178 (g)	Water In Fuel Sensor Voltage Too Low	Loss of water-in-fuel circuit or sensor.
P0181 (c), (g)	Fuel Injection Pump Failure	Low power, engine derated, or engine stops.
P0215 (g)	Fuel Injection Pump Control Circuit	Failure in fuel pump relay control circuit.
P0216 (b), (c)	Fuel Injection Pump Timing Failure	High fuel supply restriction, low fuel pressure or possible wrong or incorrectly installed pump keyway.
P0217 (c), (d)	Decreased Engine Performance Due To Engine Overheat Condition	Engine overheating. ECM will derate engine performance.
P0219 (c), (g)	Crankshaft Position Sensor Overspeed Signal	Engine has exceeded rpm limits.
P0222 (a)	Idle Validation Signals Both Low	Problem detected with idle validation circuits within APPS.
P0223 (a), (c)	Idle Validation Signals Both High (Above 5 Volts)	Problem detected with idle validation circuits within APPS.
P0230 (c), (g)	Transfer Pump (Lift Pump) Circuit Out of Range	Problem detected in fuel transfer pump circuits.
P0232 (g)	Fuel Shutoff Signal Voltage Too High	Fuel shut-off signal voltage too high from ECM to fuel injection pump.
P0234 (b), (c)	Turbo Boost Limit Exceeded	Problem detected in turbocharger wastegate.
P0236 (b)	Map Sensor Too High Too Long	Problem detected in turbocharger wastegate.
P0237 (b), (c)	Map Sensor Voltage Too Low	MAP sensor voltage input below the minimum acceptable voltage.
P0238 (b), (c)	Map Sensor Voltage Too High	MAP sensor voltage input above the maximum acceptable voltage.
P0251 (a), (c)	Fuel Inj. Pump Mech. Failure Fuel Valve Feedback Circuit	Problem sensed with fuel circuit internal to fuel injection pump.
P0253 (b), (c)	Fuel Injection Pump Fuel Valve Open Circuit	Problem sensed with fuel circuit internal to fuel injection pump.
P0254 (c), (g)	Fuel Injection Pump Fuel Valve Current Too High	Problem caused by internal fuel injection pump failure.
P0300 (b), (c)	Multiple Cylinder Mis-fire	Misfire detected in multiple cylinders.
P0301 (b), (c)	Cylinder #1 Mis-fire	Misfire detected in cylinder #1.
P0302 (b), (c)	Cylinder #2 Mis-fire	Misfire detected in cylinder #2.
P0303 (b), (c)	Cylinder #3 Mis-fire	Misfire detected in cylinder #3.
P0304 (b), (c)	Cylinder #4 Mis-fire	Misfire detected in cylinder #4.
P0305 (b), (c)	Cylinder #5 Mis-fire	Misfire detected in cylinder #5.
P0306 (b), (c)	Cylinder #6 Mis-fire	Misfire detected in cylinder #6.
P0320 (b)	No RPM Signal to PCM (Crankshaft Position Sensor Signal to JTEC)	A CKP signal has not been detected at the PCM.
P0336 (b), (c)	Crankshaft Position (CKP) Sensor Signal	Problem with voltage signal from CKP.
P0341 (b)	Camshaft Position (CMP) Sensor Signal	Problem with voltage signal from CMP.

AUTHENTIC RESTORATION PRODUCT

DESCRIPTION AND OPERATION (Continued)

Generic Scan Tool P-Code	DRB Scan Tool Display	Description of Diagnostic Trouble Code
P0370 (c), (g)	Fuel Injection Pump Speed/ Position Sensor Sig Lost	Problem caused by internal fuel injection pump failure.
P0380 (b)	Intake Air Heater Relay #1 Control Circuit	Problem detected in #1 air heater solenoid/relay circuit (not heater element)
P0381 (b)	Wait To Start Lamp Inoperative	Problem detected in wait-to-start bulb circuit.
P0382 (b)	Intake Air Heater Relay #2 Control Circuit	Problem detected in #2 air heater solenoid/relay circuit (not heater element)
P0387 (c), (g)	Crankshaft Position Sensor Supply Voltage Too Low	CKP sensor voltage input below the minimum acceptable voltage.
P0388 (c), (g)	Crankshaft Position Sensor Supply Voltage Too High	CKP sensor voltage input above the maximum acceptable voltage.
P0460 (g)	Fuel Level Unit No Change Over Miles	Fuel level sending unit voltage does not change for more than 40 miles.
P0462 (b)	Fuel Level Sending Unit Volts Too Low	Open circuit between PCM and fuel gauge sending unit.
P0463 (b)	Fuel Level Sending Unit Volts Too High	Circuit shorted to voltage between PCM and fuel gauge sending unit.
P0500 (b)	No Vehicle Speed Sensor Signal	A vehicle speed signal was not detected.
P0522 (c), (g)	Oil Pressure Voltage Too Low	Oil pressure sending unit (sensor) voltage input below the minimum acceptable voltage.
P0523 (c), (g)	Oil Pressure Voltage Too High	Oil pressure sending unit (sensor) voltage input above the maximum acceptable voltage.
P0524 (c), (d), (g)	Oil Pressure Too Low	Engine oil pressure is low. Engine power derated.
P0545 (g)	A/C Clutch Relay Circuit	Problem detected in air conditioning clutch relay control circuit.
P0562 (d), (g)	Charging System Voltage Too Low	Supply voltage sensed at ECM too low.
P0563 (d), (g)	Charging System Voltage Too High	Supply voltage sensed at ECM too high.
P0601 (b)	Internal Controller Failure	PCM Internal fault condition detected.
P0602 (b), (c)	ECM Fueling Calibration Error	ECM Internal fault condition detected.
P0606 (b)	ECM Failure	ECM Internal fault condition detected.
P0622 (d), (g)	Generator Field Not Switching Properly	An open or shorted condition detected in the generator field control circuit.
P0712 (b)	Trans Temp Sensor Voltage Too Low	Voltage less than 1.55 volts (4-speed auto. trans. only).
P0713 (b)	Trans Temp Sensor Voltage Too High	Voltage greater than 3.76 volts (4-speed auto. trans. only).
P0720 (b)	Low Output Spd Sensor RPM Above 15 mph	Output shaft speed is less than 60 rpm with vehicle speed above 15 mph (4-speed auto. trans. only).
P0743 (b)	Torque Converter Clutch Solenoid/Trans Relay Circuits	An open or shorted condition detected in the torque converter part throttle unlock solenoid control circuit (3 or 4-speed auto. trans. only).
P0748 (b)	Governor Pressure Sol Control/Trans Relay Circuits	An open or shorted condition detected in the governor pressure solenoid or relay circuits (4-speed auto. trans. only).

DESCRIPTION AND OPERATION (Continued)

Generic Scan Tool P-Code	DRB Scan Tool Display	Description of Diagnostic Trouble Code
P0751 (b)	O/D Switch Pressed (LO) More Than 5 Min	Overdrive Off switch input too low for more than 5 minutes (4-speed auto. trans. only).
P0753 (b)	Trans 3-4 Shift Sol/Trans Relay Circuits	An open or shorted condition detected in the transmission 2-4 shift solenoid circuit (4-speed auto. trans. only).
P1110 (c), (g)	Decrease Engine Performance Due To High Intake Air Temperature	Intake manifold air temperature is above the engine protection limit. Engine power will be derated.
P1180 (c), (g)	Decreased Engine Performance Due To High Injection Pump Fuel Temp	Fuel temperature is above the engine protection limit. Engine power will be derated.
P1283 (g)	Idle Select Signal Invalid	ECM or fuel injection pump module internal fault condition detected.
P1284 (b), (c)	Fuel Injection Pump Battery Voltage Out-Of-Range	Fuel injection pump module internal fault condition detected. Engine power will be derated.
P1285 (b), (c)	Fuel Injection Pump Controller Always On	Fuel injection pump module relay circuit failure detected. Engine power will be derated.
P1286 (c), (g)	Accelerator Position Sensor (APPS) Supply Voltage Too High	High voltage detected at APPS.
P1287 (c), (g)	Fuel Injection Pump Controller Supply Voltage Low	ECM or fuel injection pump module internal fault condition detected. Engine power will be derated.
P1291 (b)	No Temperature Rise Seen From Intake Air Heaters	Problem detected in intake manifold air heating system.
P1295 (c), (g)	Accelerator Position Sensor (APPS) Supply Voltage Too Low	APPS supply voltage input below the minimum acceptable voltage.
P1388 (g)	Auto Shutdown Relay Control Circuit	An open or shorted condition detected in the auto shutdown relay circuit.
P1389 (g)	No ASD Relay Output Voltage at PCM	An open condition detected In the ASD relay output circuit.
P1399 (g)	Wait To Start Lamp Circuit	Problem detected in wait-to-start lamp circuit
P01475 (g)	Aux 5 Volt Supply Voltage High	Sensor supply voltage for ECM sensors is too high.
P1488 (g)	5 Volt Supply Voltage Low	Sensor supply voltage for ECM sensors is too low.
P1492 (b), (d)	Ambient/Batt Temp Sensor Volts Too High	Battery temperature sensor input voltage above an acceptable range.
P1493 (b), (d)	Ambient/Batt Temp Sen Volts Too Low	Battery temperature sensor input voltage below an acceptable range.
P1594 (g)	Charging System Voltage Too High	Battery voltage sense input above target charging voltage during engine operation.
P1595 (g)	Speed Control Solenoid Circuits	An open or shorted condition detected in the speed control vacuum or vent solenoid circuits.
P1597 (g)	Speed Control Switch Always Low	Speed control switch input below the minimum acceptable voltage.
P1598 (g)	A/C Sensor Input Hi	Problem detected in air conditioning electrical circuit.
P1599 (g)	A/C Sensor Input Lo	Problem detected in air conditioning electrical circuit.
P1682 (d), (g)	Charging System Voltage Too Low	Charging system output voltage low.

AUTHENTIC RESTORATION

DESCRIPTION AND OPERATION (Continued)

Generic Scan Tool P-Code	DRB Scan Tool Display	Description of Diagnostic Trouble Code
P1683 (g)	Spd ctrl pwr rly, or s/c 12v driver circuit	An open or shorted condition detected in the speed control servo power control circuit.
P1688 (a), (c)	Internal Fuel Injection Pump Controller Failure	Internal problem within the fuel injection pump. Low power, engine derated, or engine stops.
P1689 (a), (c)	No Communication Between ECM and Injection Pump Module	Data link circuit failure between ECM and fuel injection pump. Low power, engine derated, or engine stops.
P1690 (b), (c)	Fuel Injection Pump CKP Sensor Does Not Agree With ECM CKP Sensor	Problem in fuel sync signal. Possible injection pump timing problem. Low power, engine derated, or engine stops.
P1691 (c), (g)	Fuel Injection Pump Controller Calibration Error	Internal fuel injection pump failure. Low power, engine derated, or engine stops.
P1692 (e), (g)	DTC Set In ECM	A "Companion DTC" was set in both the ECM and PCM.
P1693 (e), (g)	DTC Detected in PCM/ECM or DTC Detected in ECM	A "Companion DTC" was set in both the ECM and PCM.
P1694 (b), (e)	No CCD Messages received from ECM	Bus communication failure to PCM.
P1698 (e), (g)	No CCD Messages received from PCM	Bus communication failure to PCM. A "Companion DTC" was set in both the ECM and PCM.
P1740 (b)	TCC OR O/D Solenoid Performance	Problem detected in transmission convertor clutch and/or overdrive circuits (diesel engine with 4-speed auto. trans. only).
P1756 (b)	Governor Pressure Not Equal to Target @ 15-20 PSI	Governor sensor input not between 10 and 25 psi when requested (4-speed auto. trans. only).
P1757 (b)	Governor Pressure Above 3 PSI In Gear With 0 MPH	Governor pressure greater than 3 psi when requested to be 0 psi (4-speed auto. trans. only).
P1762 (b)	Governor Press Sen Offset Volts Too Low or High	Sensor input greater or less than calibration for 3 consecutive Neutral/Park occurrences (4-speed auto. trans. only).
P1763 (b)	Governor Pressure Sensor Volts Too HI	Voltage greater than 4.89 volts (4-speed auto. trans. only).
P1764 (b)	Governor Pressure Sensor Volts Too Low	Voltage less than .10 volts (4-speed auto. trans. only).
P1765 (b)	Trans 12 Volt Supply Relay Ctrl Circuit	Current state of solenoid output port is different than expected (4-speed auto. trans. only).
P1899 (b)	P/N Switch Stuck in Park or in Gear	Incorrect input state detected for the Park/Neutral switch (3 or 4-speed auto. trans. only).

COMPONENT MONITORS

There are several electrical components that will affect vehicle emissions if they malfunction. If one of these components is malfunctioning, a Diagnostic Trouble Code (DTC) will be set by either the Powertrain Control Module (PCM) or the Engine Control Module (ECM). The Malfunction Indicator Lamp (MIL) will then be illuminated when the engine is running (the MIL is displayed on the instrument panel as the CHECK ENGINE lamp).

These electrically operated components have input (rationality) and output (functionality) checks. A check is done by one or more components to check the operation of another component.

Example: The Intake Manifold Air Temperature (IAT) sensor is used to monitor intake manifold air temperature over a period of time after a cold start. If the temperature has not risen to a certain specification during a specified time, a Diagnostic Trouble Code (DTC) will be set for a problem in the manifold air heater system.

All open/short circuit checks, or any component that has an associated limp-in will set a DTC and trigger the MIL after 1 trip with the malfunction present. Components without an associated limp-in will take two trips to illuminate the MIL.

NON-MONITORED CIRCUITS

The PCM and/or the ECM will not monitor certain malfunctioning circuits or components that could cause driveability problems. Also, a Diagnostic Trouble Code (DTC) might not be stored for these malfunctions. However, problems with these circuits or components may cause the PCM/ECM to store DTC's for other circuits or components.**EXAMPLES:** A cylinder with low compression will not set a DTC directly, but may cause an engine misfire. This in turn may cause the ECM to set a DTC for an engine misfire. Or, a dirty or plugged air filter will not set a DTC directly, but may cause lack of turbocharger boost. This in turn may cause the ECM to set a DTC for a boost pressure malfunction.

FUEL PRESSURE

Primary fuel pressure from the fuel tank to the fuel injection pump is supplied by the low-pressure fuel transfer pump. High-pressure to the fuel injectors is supplied by the fuel injection pump. The ECM cannot detect actual fuel pressure, a clogged fuel filter, clogged fuel screen, or a pinched fuel supply or return line. However, a DTC may be set due to an engine misfire.

CYLINDER COMPRESSION

The ECM cannot detect uneven, low, or high engine cylinder compression. However, these could result in a possible misfire which may set a DTC.

EXHAUST SYSTEM

The ECM cannot detect a plugged, restricted or leaking exhaust system. However, DTC's may be set for engine misfire, high intake manifold temperature, high engine coolant temperature, turbocharger overboost or turbocharger underboost.

FUEL INJECTOR MECHANICAL MALFUNCTIONS

The ECM cannot determine if a fuel injector is clogged, the needle is sticking or if the wrong injector is installed. However, these could result in a possible misfire which may set a DTC.

EXCESSIVE OIL CONSUMPTION

The ECM cannot determine excessive oil consumption. However, if excess oil consumption is high enough, it could result in a possible engine misfire which may set a DTC.

AIR FLOW

The ECM cannot detect a clogged, restricted or dirty air filter element, or a restriction in the air inlet system. However, these could result in a possible misfire which may set a DTC.

AIR PRESSURE LEAKS

The ECM cannot detect leaks or restrictions in the air intake system. However, these could cause the ECM to store a Manifold Air Pressure (MAP) sensor DTC (boost pressure problem detected).

PCM/ECM SYSTEM GROUNDS

The PCM/ECM cannot directly determine poor system grounds. However, one or more DTC's may be generated as a result of poor grounds.

PCM/ECM CONNECTOR ENGAGEMENT

The PCM/ECM may not be able to determine spread, damaged or corroded connector pins. However, it might store DTC's as a result of spread connector pins (circuits that are open).

HIGH AND LOW LIMITS

Both the Powertrain Control Module (PCM) and the Engine Control Module (ECM) compare input signal voltages from each input device with established high and low limits for the device. If the input voltage is not within limits, and other criteria are met, the PCM/ECM will store a Diagnostic Trouble Code (DTC) in memory. Other DTC criteria might include engine RPM limits, or input voltages from other sensors or switches that must be present before verifying a DTC condition.

ROLLOVER VALVE

One rollover valve is used. The valve is used only to vent the fuel tank to the atmosphere. A check valve is located within the rollover valve to prevent fuel flow from fuel tank in the event of an accidental vehicle rollover. The rollover valve is located on top of the fuel tank module (Fig. 4). The valve may be serviced separately. If replacement is necessary, refer to Rollover Valve Removal/Installation.

REMOVAL AND INSTALLATION

ROLLOVER VALVE

REMOVAL

One rollover valve is used. The valve is located on top of fuel tank module (Fig. 4) and may be serviced separately.

(1) Disconnect both negative battery cables at both batteries.

(2) Remove fuel filler cap and drain fuel tank. Refer to Fuel Tank Removal/Installation in Group 14, Fuel System.

Mopar AUTHENTIC RESTORATION PRODUCT

REMOVAL AND INSTALLATION (Continued)

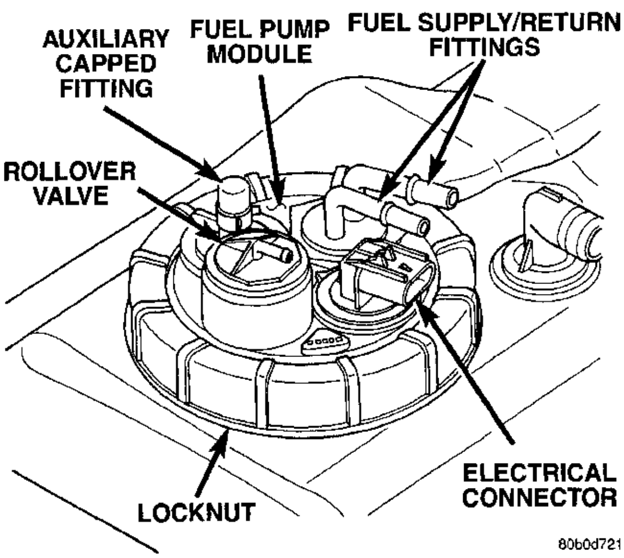

Fig. 4 Rollover Valve Location—Diesel Powered

(3) Remove fuel tank. Refer to Fuel Tank Removal/ Installation in Group 14, Fuel System.

(4) The rollover valve is seated into a rubber grommet. Remove valve by prying one side upward and then roll valve out of grommet.

(5) Discard old grommet.

INSTALLATION

(1) Install new grommet into fuel tank module.

(2) Using finger pressure only, press valve into place.

(3) Install fuel tank. Refer to Fuel Tank Removal/ Installation.

(4) Fill fuel tank. Install fuel tank filler cap.

(5) Connect both negative battery cables.

(6) Start vehicle and check for leaks.

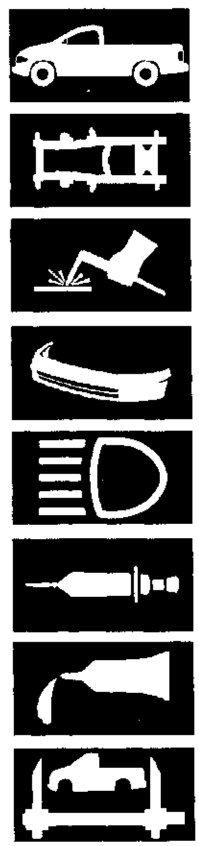
This manual has been prepared for use by all body technicians involved ı the repair of the new Dodge Dakota Pickup.

his manual shows:

- **Typical body panels contained in the new Dodge Ram Pickup**
- **The weld locations for these panels**
- **The types of welds for the panels**
- **Proper sealer types and correct locations**



Chrysler Corporation reserves the right to make improvements in design or to change specifications to these vehicles without incurring any obligation upon itself.

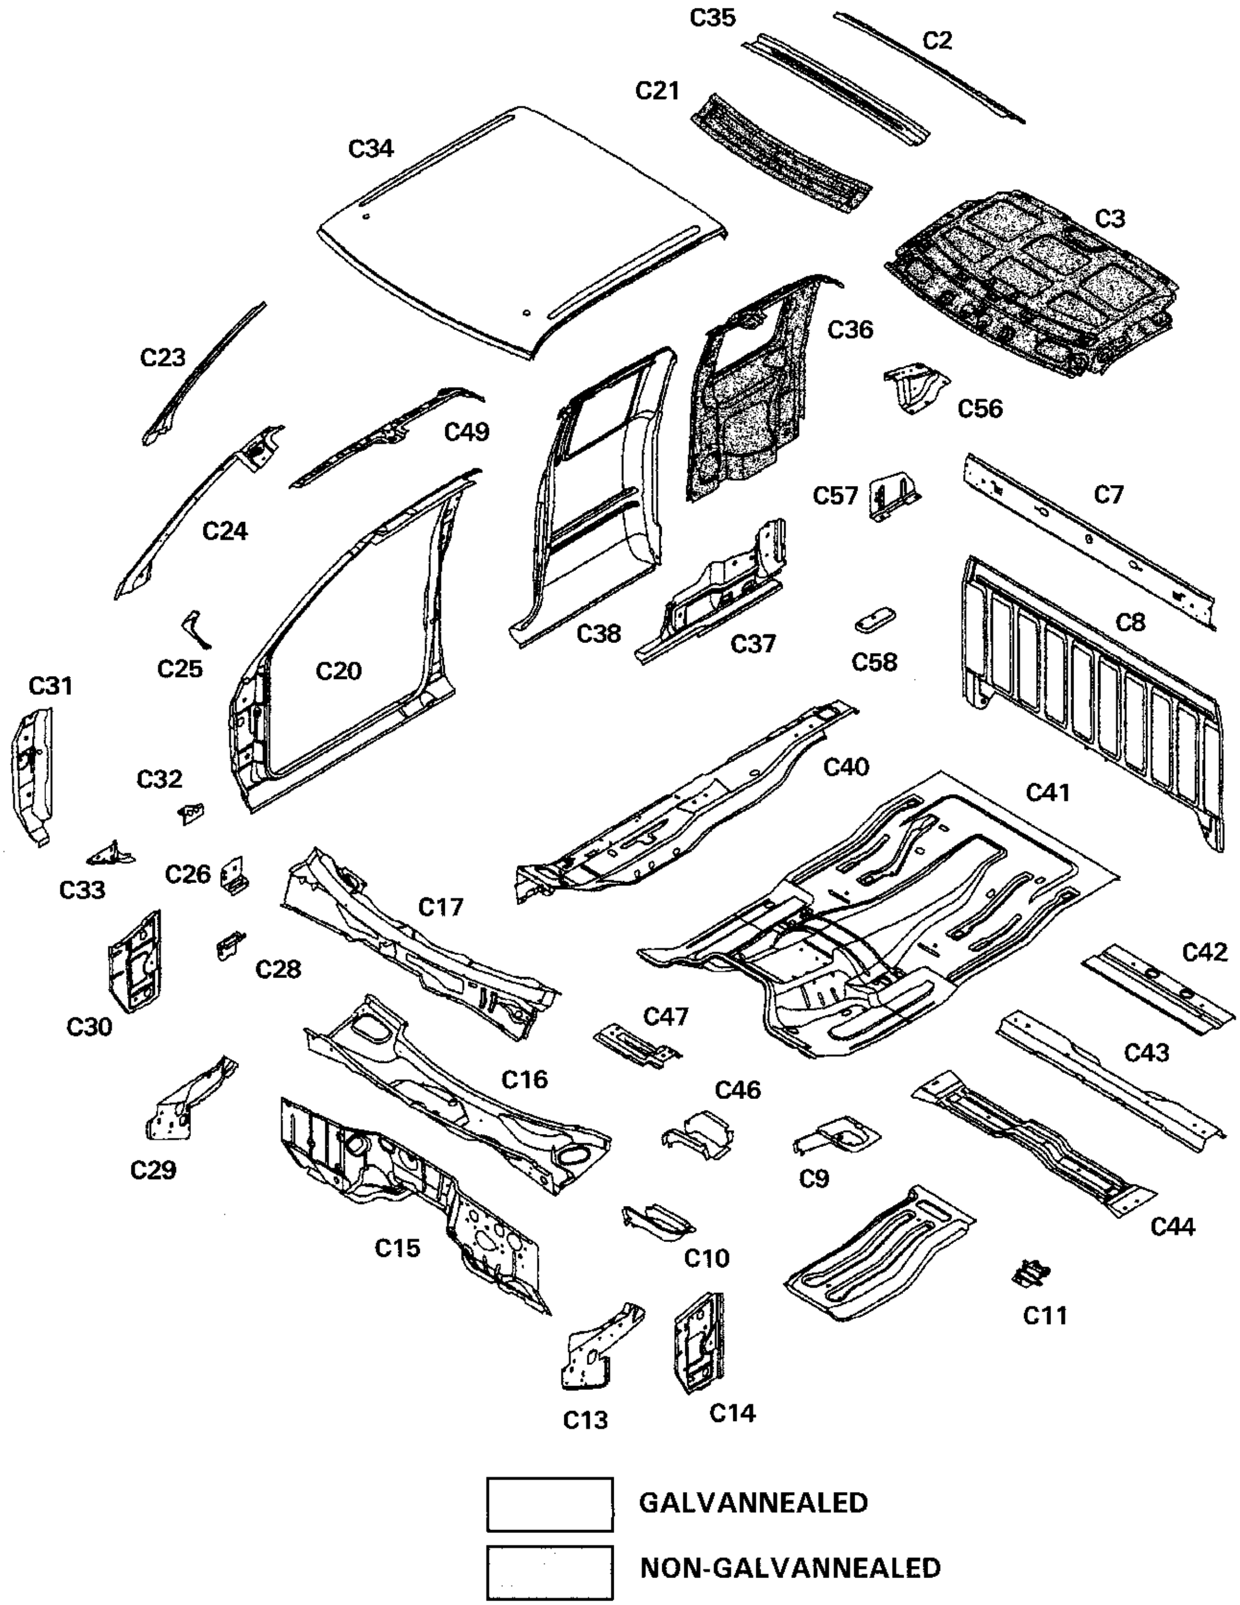
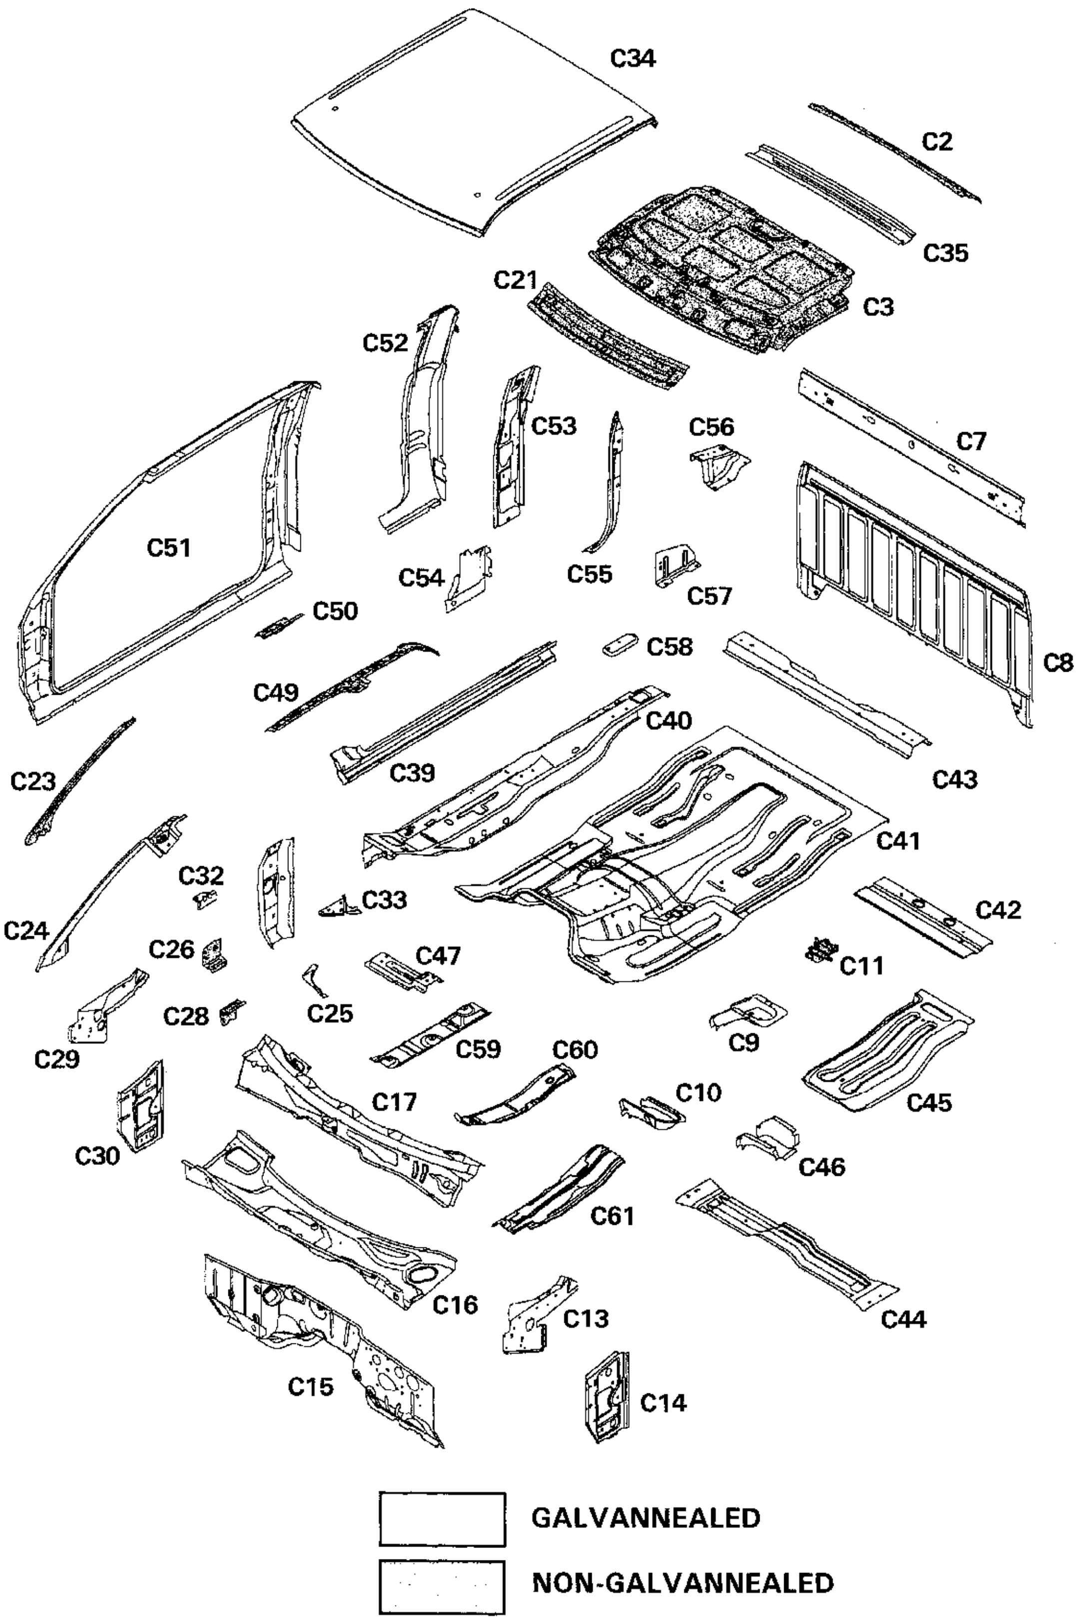
CORROSION PROTECTION (CLUB CAB)



CORROSION PROTECTION (QUAD CAB)



CORROSION PROTECTION (CARGO BOX)

	GALVANNEALED
	NON-GALVANNEALED

The following measures have been implemented in order to provide maximum corrosion prevention and protection.

1. The use of galvannealed coatings throughout the body structure.
2. Cationic electrode position undercoating is used on the complete body in all instances.
3. Body sealing.
4. Stone-chipping resistant primer application.
5. Underbody corrosion prevention.

Definitions of Steel used in the Dodge Ram Pickup:

MS 66- Represents an uncoated cold-rolled structural steel used mainly for interior braces and reinforcements.

MS 67- Represents an uncoated structural steel used in areas where structural integrity is critical. Eg., the type of steel used for the "A" pillar.

MS 264-050-XK- Represents an uncoated high strength steel used in applications where structural integity is critical.

Two-Sided Galvannealed MS 6000-44A- Represents a two-sided zinc coated steel in which the coating is fully alloyed with the sheet or strip surface.

Two-Sided Galvannealed MS 6000-44VA- Represents a two-sided zinc-iron coated high strength steel in which the coating is fully alloyed with the sheet or strip surface.

Body Side Aperture

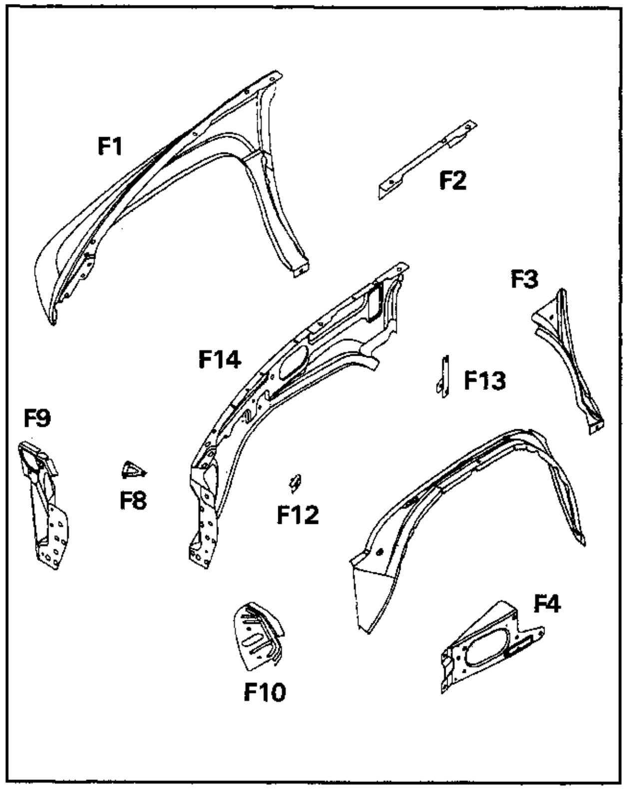
Inner Rear Quarter Panel

Outer Rear Quarter Panel

FRONT OUTER FENDER

The outer fender assembly is made up of several components, none of which are serviced separately. The outer fender is serviced as a complete assembly only.

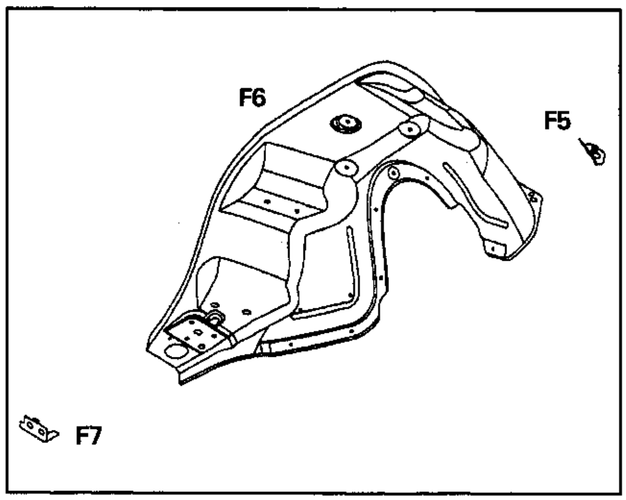
1. Outer fender panel (F1).
2. Upper fender reinforcement (F2).
3. Fender aperture reinforcement (F3).
4. Front fender reinforcement (F4).
5. Horn sensor tapping plate (F8).
6. Lower headlamp mounting panel (F9).
7. Upper headlamp mounting panel (F10).
8. Outer front wheelhouse panel (F11).
9. Inner fender to battery tray reinforcement (F12).
10. Inner fender tapping plate (F13).
11. Inner fender panel (F14).



FRONT INNER FENDER

The inner wheelhouse assembly is serviced separately from the fender assembly. The assemblies are welded together to form part of the front body.

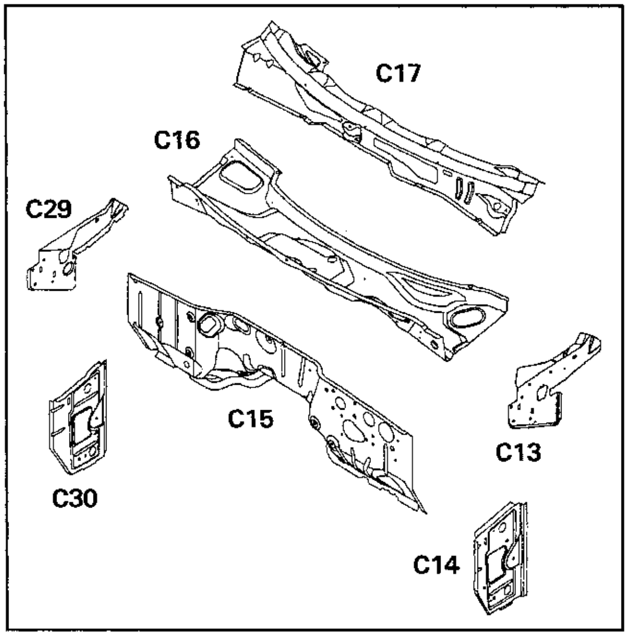
1. Inner wheelhouse to floor reinforcement (F5).
2. Inner front wheelhouse panel (F6).
3. Inner fender to wheelhouse reinforcement (F7).



COWL AND DASH

The right and left cowl side panels, plenum end panels, cowl bar, plenum lower panel and dash panel make up the cowl assembly. All panels are serviced separately.

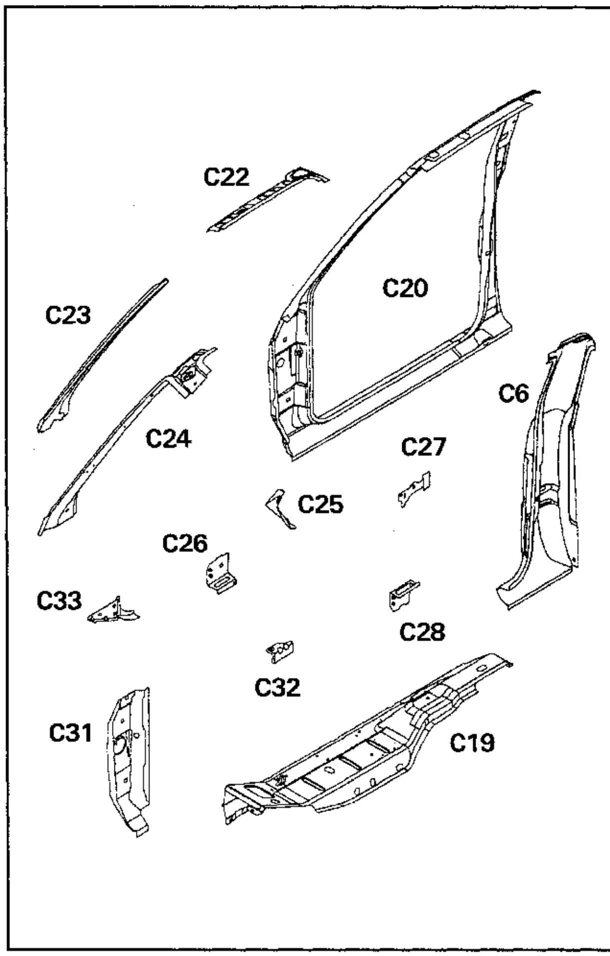
1. Plenum end panel, left side (C13).
2. Cowl side panel, left side (C14).
3. Dash panel (C15).
4. Plenum lower panel (C16).
5. Cowl bar panel (C17).
6. Plenum end panel, right side (C29).
7. Cowl side panel, right side (C30).



BODY SIDE APERTURE (REGULAR CAB)

The body side aperture is made up of several components layered and welded together. All components are serviced separately.

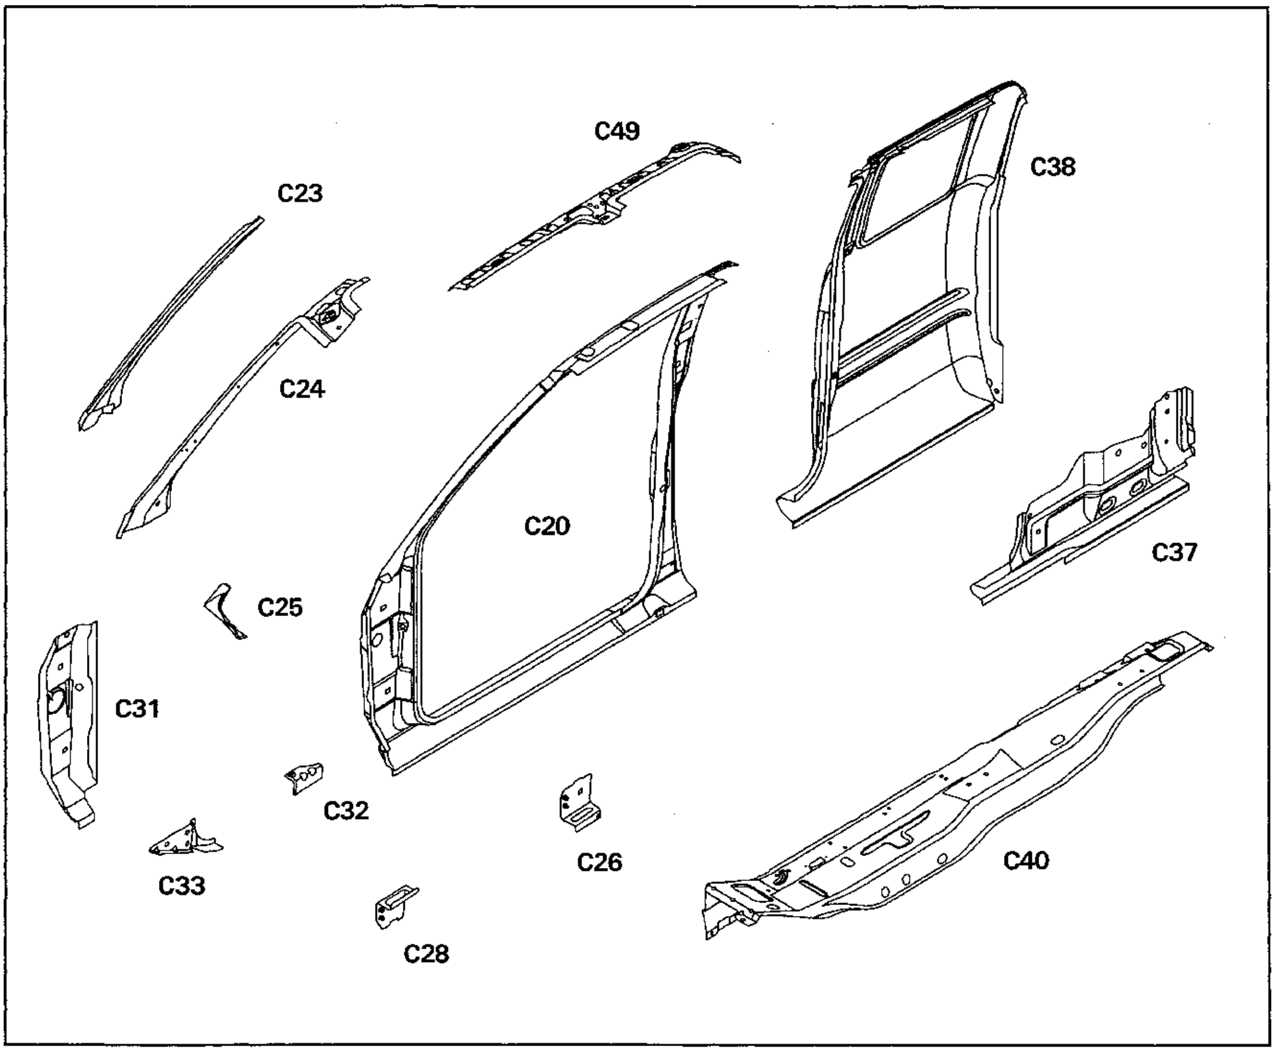
1. Rear quarter outer panel (C6).
2. Outer floor pan (C19).
3. Body side aperture (C20).
4. Roof side inner rail (C22).
5. Windshield side opening frame reinforcement (C23).
6. Windshield side opening frame (C24).
7. Cowl to pillar inner reinforcement (C25).
8. Body side hinge pillar upper tapping plate (C26).
9. Retractor mounting reinforcement (C27).
10. Body side hinge pillar lower tapping plate (C28).
11. Body side hinge pillar reinforcement(C31).
12. Aperture to fender bracket (C32).
13. Cowl side to fender reinforcement (C33).



BODY SIDE APERTURE (CLUB CAB)

All body side aperture is made up of several components layered and welded together. All panels are serviced separately.

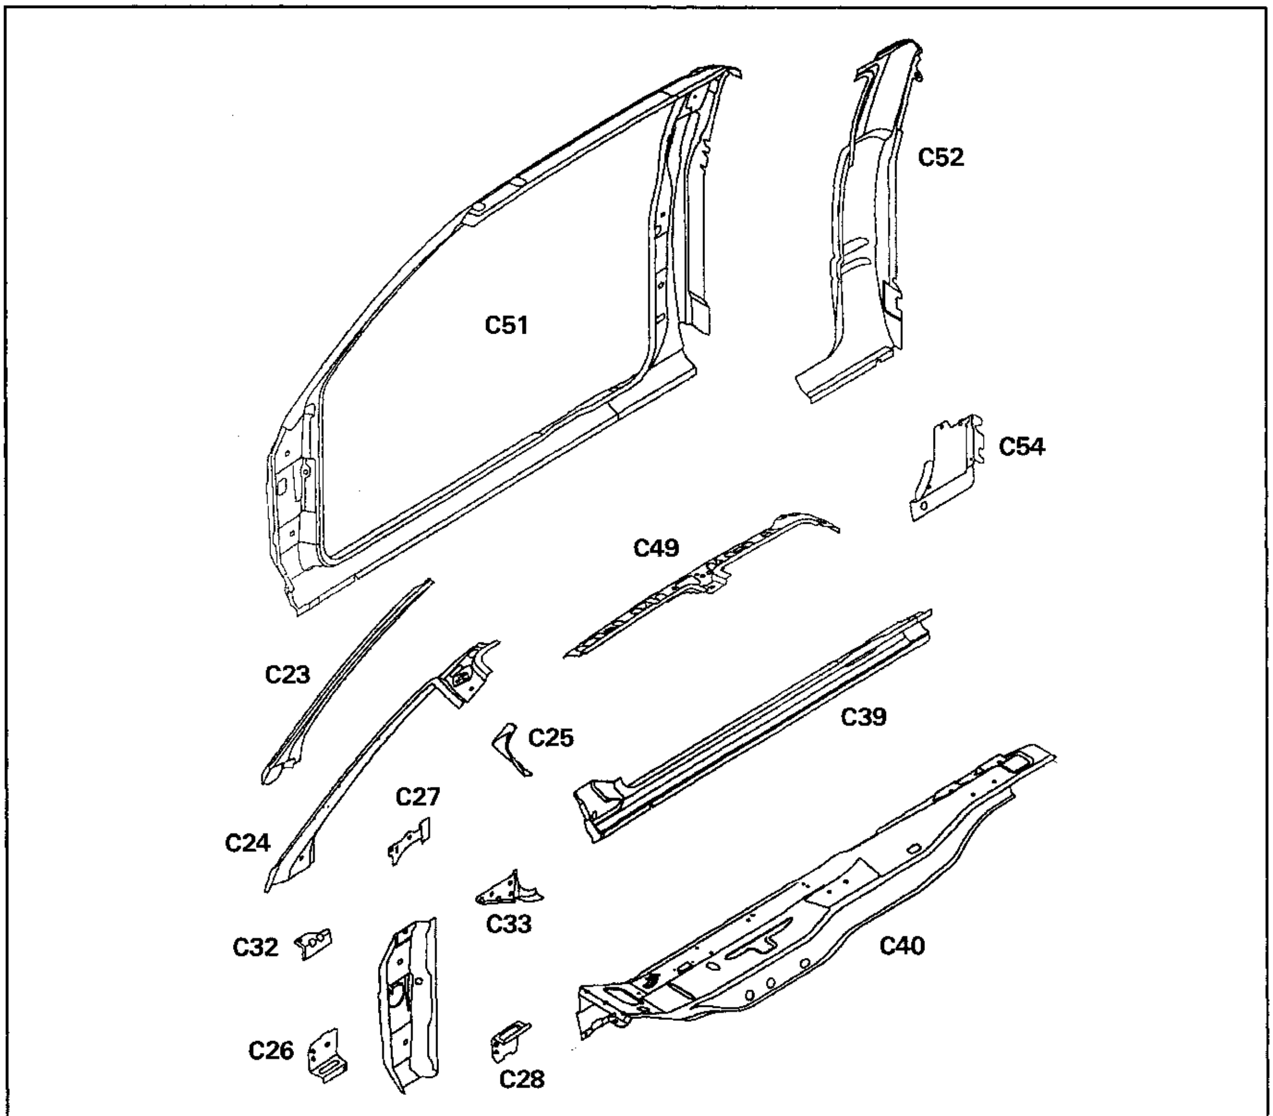
1. Body side aperture (C20).
2. Windshield side opening frame reinforcement (C23).
3. Windshield side opening frame (C24).
4. Cowl to pillar inner reinforcement (C25).
5. Body side hinge pillar lower tapping plate (C26).
6. Retractor mounting reinforcement (C27).
7. Body side hinge pillar lower tapping plate (C28)
8. Aperture to fender bracket (C32)
9. Cowl side to floor reinforcement (C33).
10. Rear quarter inner lower panel (C37).
11. Rear quarter outer panel (C38).
12. Sill reinforcement (C39).
13. Outer floor pan (C40).
14. Body side hinge pillar reinforcement (C48).
15. Half-door inner rail (C49).



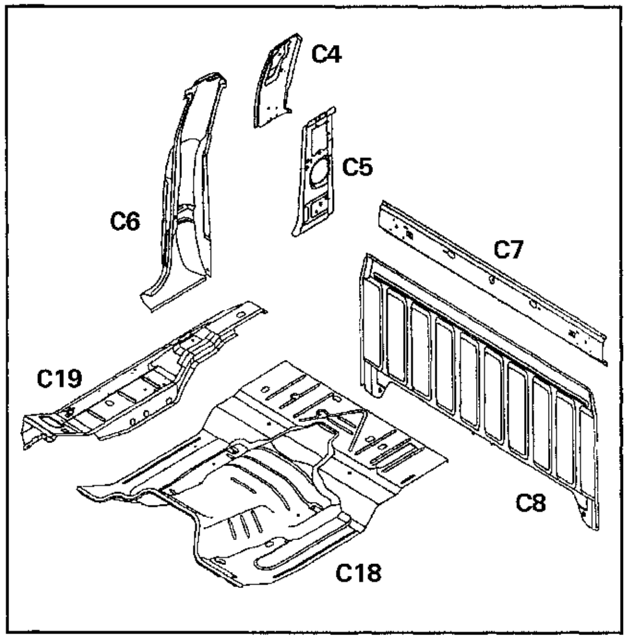
BODY SIDE APERTURE (QUAD CAB)

The body side aperture is made up of several components layered and welded together. All components are serviced separately.

1. Windshield side opening frame reinforcement (C23).
2. Windshield side opening frame (C24).
3. Cowl to pillar inner reinforcement (C25).
4. Body side hinge pillar upper tapping plate (C26).
5. Retractor mounting reinforcement (C27).
6. Body side hinge pillar lower tapping plate (C28)
7. Aperture to fender bracket (C32).
8. Cowl side to floor reinforcement (C33).
9. Sill reinforcement (C39).
10. Outer floor pan (C40).
11. Half-door inner rail (C49).
12. Half-door body side aperture (C51).
13. Quarter outer panel (C52).
14. Quarter inner panel (C54).



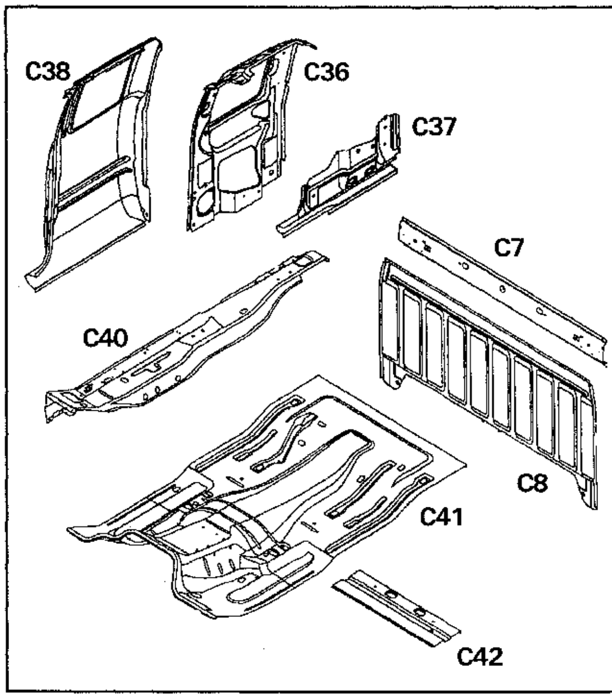
CAB BACK PANEL (REGULAR CAB)



The back panel and reinforcement panel are serviced separately. Both panels are welded in place.

1. Rear quarter inner upper panel (C4).
2. Rear quarter inner lower panel (C5).
3. Rear quarter outer panel (C6).
4. Cab back reinforcement (C7).
5. Cab back panel (C8).
6. Center floor pan (C18).
7. Outer floor pan (C19).

CAB BACK PANEL (CLUB CAB)



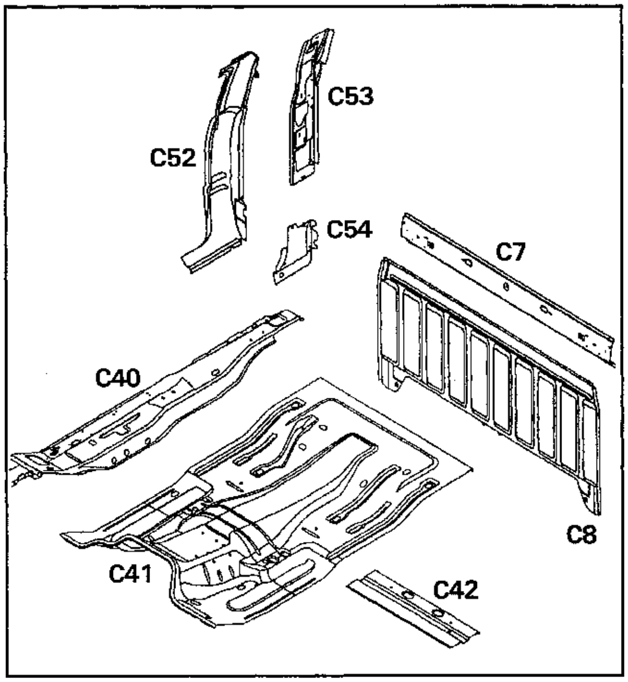
The back panel, reinforcement and extension are serviced separately. The extension panel is secured with structural adhesive and spot welds. The other panels are welded and sealed.

1. Cab back reinforcement (C7).
2. Cab back panel (C8).
3. Rear quarter inner upper panel (C36).
4. Rear quarter inner lower panel (C37).
5. Rear quarter outer panel (C38).
6. Outer floor pan (C40).
7. Center floor pan (C41).
8. Rear seatbelt anchor reinforcement (C42).

CAB BACK PANEL (QUAD CAB)

The back panel and reinforcement panel are serviced separately. Both panels are welded in place.

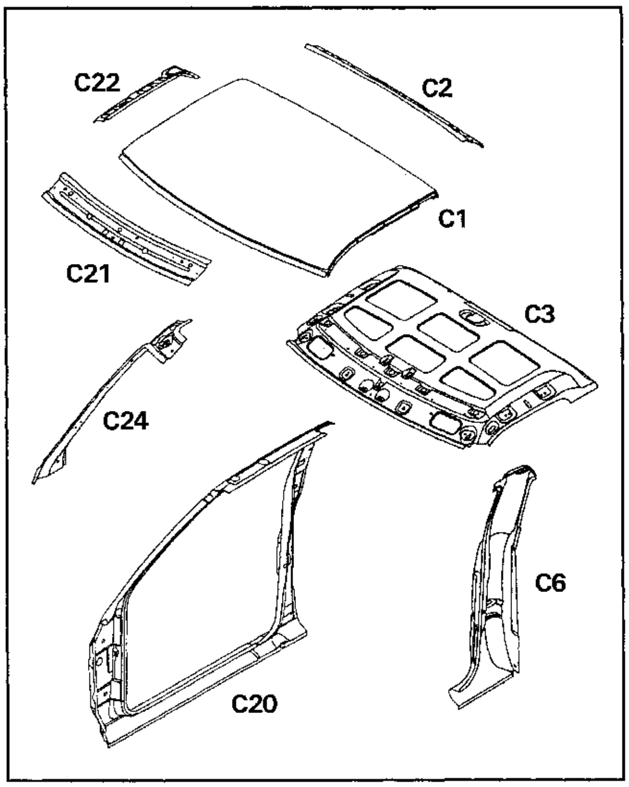
1. Cab back reinforcement (C7).
2. Cab back panel (C8).
3. Outer floor pan (C40).
4. Center floor pan (C41).
5. Rear seatbelt anchor reinforcement (C42).
6. Quarter outer panel (C52).
7. Quarter inner upper panel (C53)
8. Quarter inner lower panel (C54)



ROOF PANELS (REGULAR CAB)

The roof structure consists of inner and outer roof panels along with front and rear headers and side rails. All panels are serviced separately. Structural adhesive and spot welds are used to secure the panels.

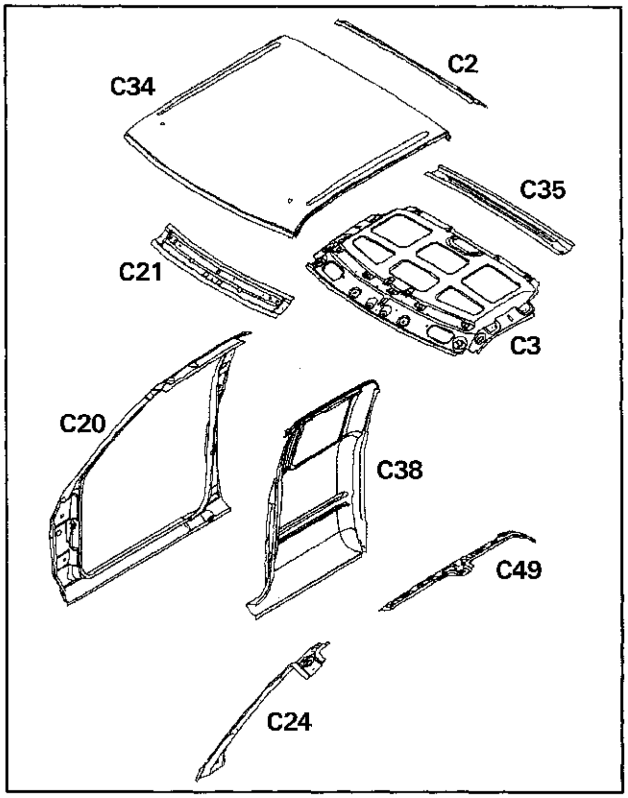
1. Roof outer panel (C1).
2. Rear header panel (C2).
3. Roof inner panel (C3).
4. Rear quarter outer panel (C6).
5. Body side aperture (C20).
6. Front header panel (C21).
7. Roof side inner rail (C22).
8. Windshield side opening frame (C24).



ROOF PANELS (CLUB CAB)

The roof structure consists of inner and outer roof panels along with front and rear headers and side rails. All panels are serviced separately. Structrual adhesive and spot welds are used to secure the panels.

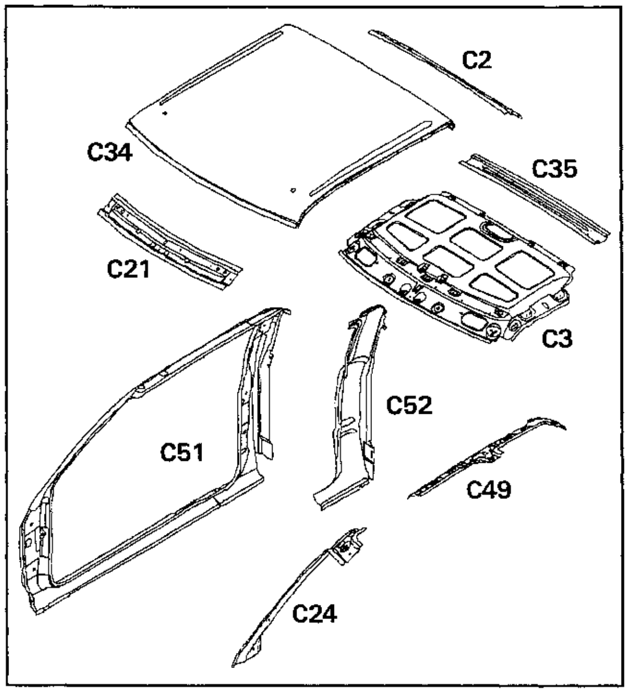
1. Roof header panel (C2).
2. Roof inner panel (C3).
3. Body side aperture (C20).
4. Front header panel (C21).
5. Windshield side opening frame (C24).
6. Roof outer panel (C34).
7. Roof bow (C35).
8. Rear quarter outer panel (C38).
9. Half-door inner rail (C49).



ROOF PANELS (QUAD CAB)

The roof structure consists of inner and outer roof panels along with front and rear headers and side rails. All panels are serviced separately. Structural adhesive and spot welds are used to secure the panels.

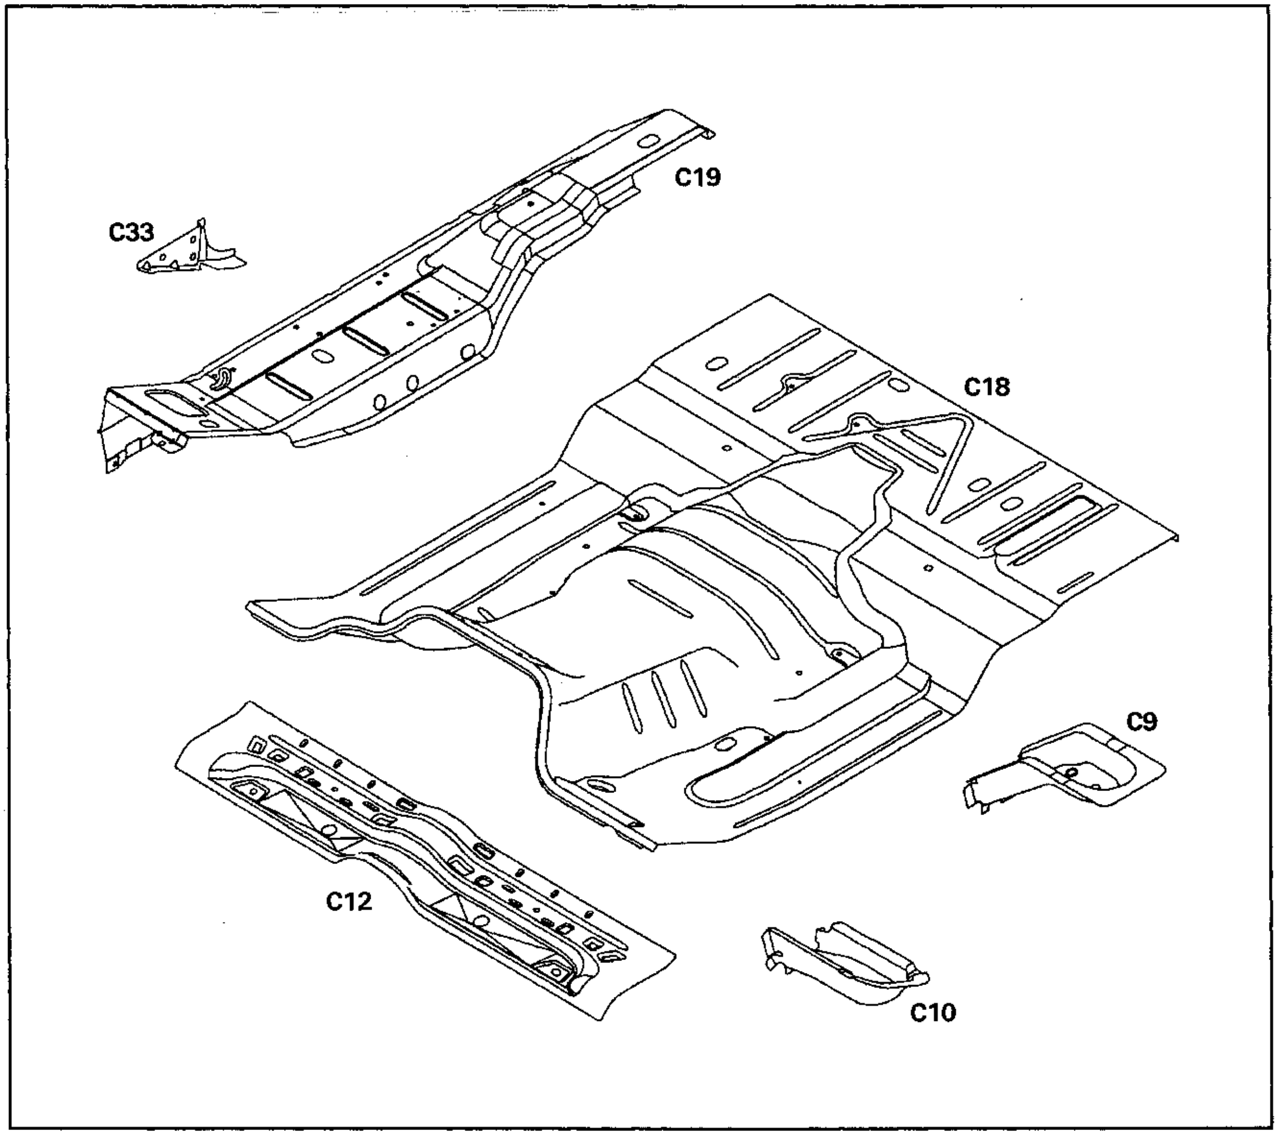
1. Roof header panel (C2).
2. Rear header panel (C3).
3. Front header panel (C21).
4. Windshield side opening frame (C24).
5. Roof outer panel (C34).
6. Roof bow (C35).
7. Half-door inner rail (C49).
8. Half-door body side aperture (C51).
9. Quarter outer panel (C52)



FLOOR PAN (REGULAR CAB)

The floor pan is made up of several components layered and welded together. All panel are serviced separately.

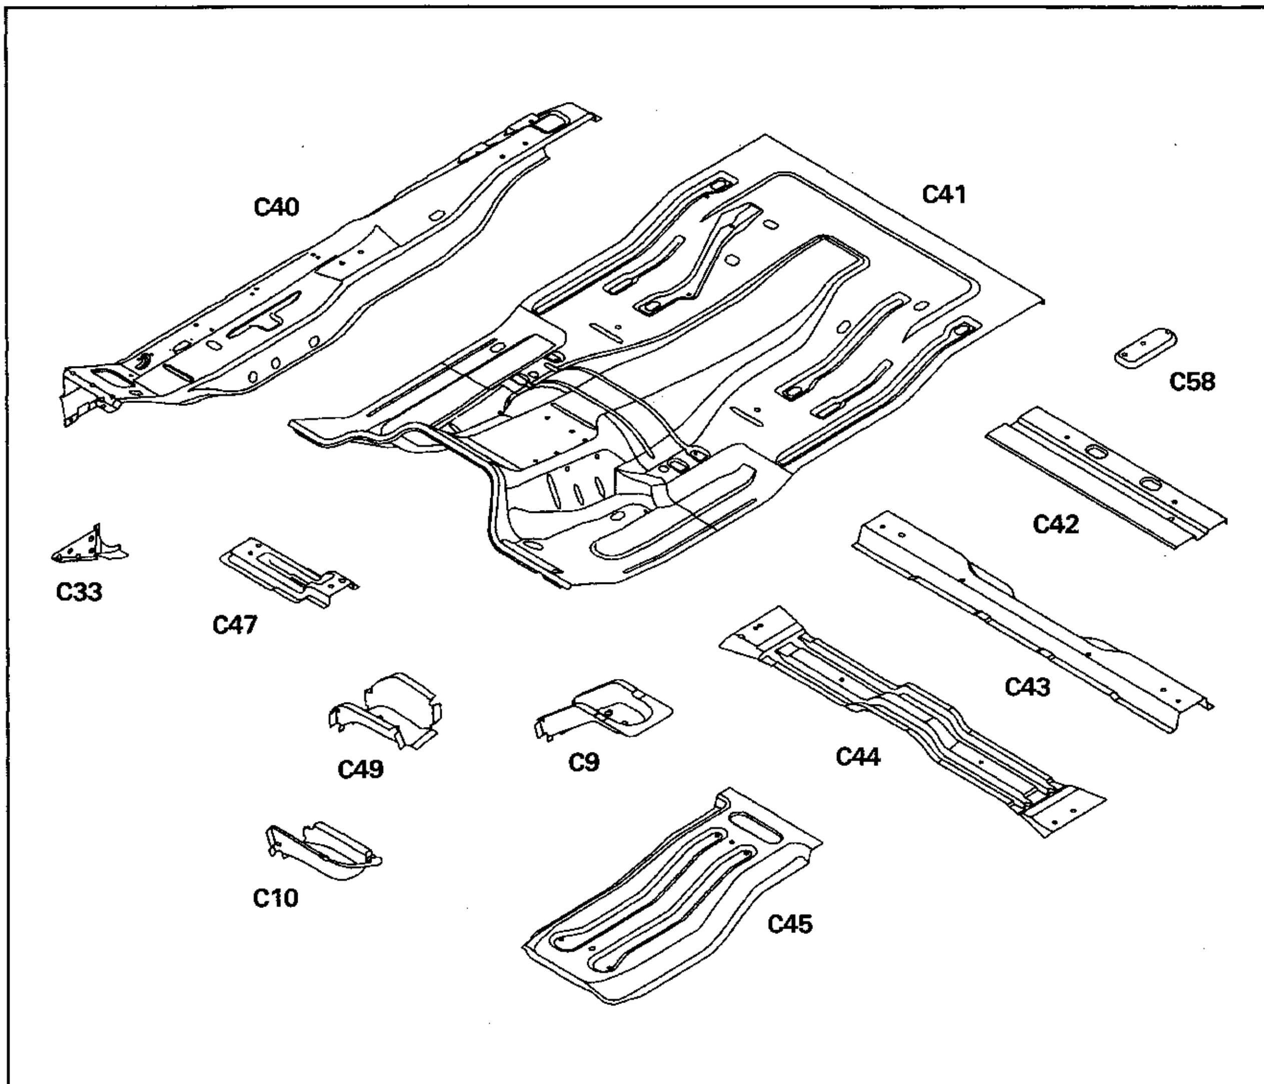
1. Rear body hold-down support (C9).
2. Front body hold-down support (C10).
3. Seatbelt anchor reinforcement (C12)
4. Center floor pan (C18).
5. Outer floor pan (C19).
6. Cowl side to floor reinforcement (C33).



FLOOR PAN (CLUB CAB)

The floor pan is made up of several components layered and welded together. All panels are serviced separately.

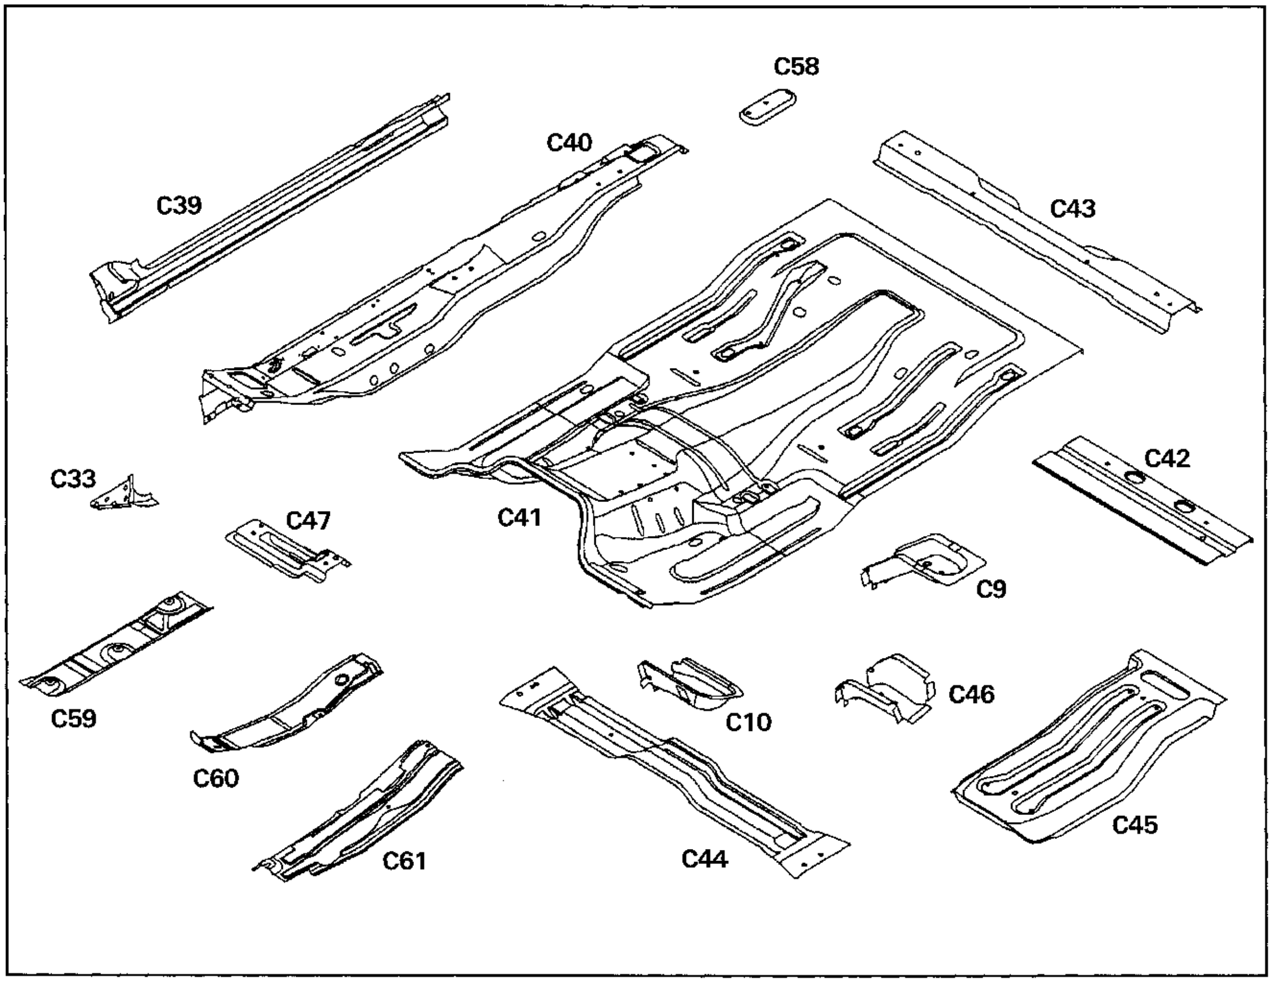
1. Rear body hold-down support (C9).
2. Front body hold-down support (C10).
3. Cowl side to floor reinforcement (C33).
4. Sill reinforcement (C39).
5. Outer floor pan (C40).
6. Center floor pan (C41)
7. Rear seatbelt anchor reinforcement (C42).
8. Rear floor crossmember (C43).
9. Front seat mounting rear crossmember (C44).
10. Center floor reinforcement (C45).
11. Front seat mounting front support (C47).
12. Half-door inner rail (C49).



FLOOR PAN (QUAD CAB)

The floor pan is made up of several components layered and welded together. All panels are serviced separately.

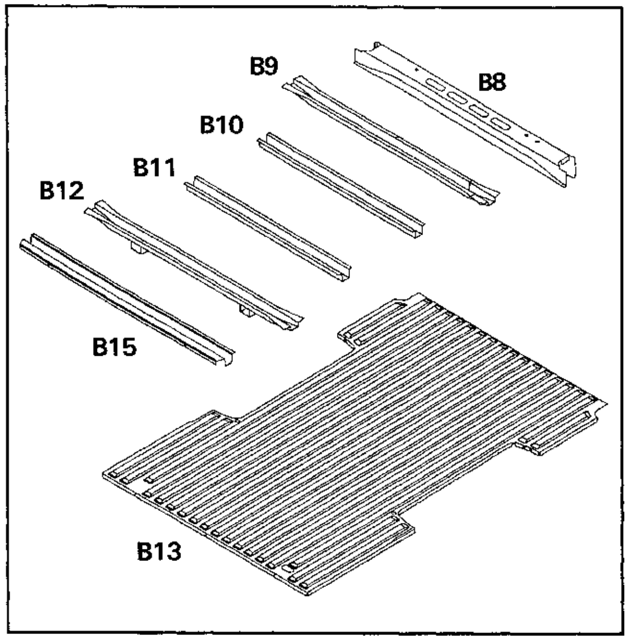
1. Rear body hold-down support (C9).
2. Front body hold-down support (C10).
3. Cowl side to floor reinforcement (C33).
4. Sill reinforcement (C39).
5. Outer floor pan (C40).
6. Center floor pan (C41).
7. Rear seatbelt anchor reinforcement (C42).
8. Rear floor crossmember (C43).
9. Front seat mounting rear crossmember (C44).
10. Center floor reinforcement (C45).
11. Mid body hold-down support (C46).
12. Front seat mounting front support (C47).
13. Front seat mounting rear support (C58).
14. Lower heat shield (C59).
15. Upper heat shield, left side (C60).
16. Upper heat shield, right side (C61).



FLOOR PANEL AND CROSSMEMBERS

All components of the cargo box floor assembly are serviced separately. All panels are welded together.

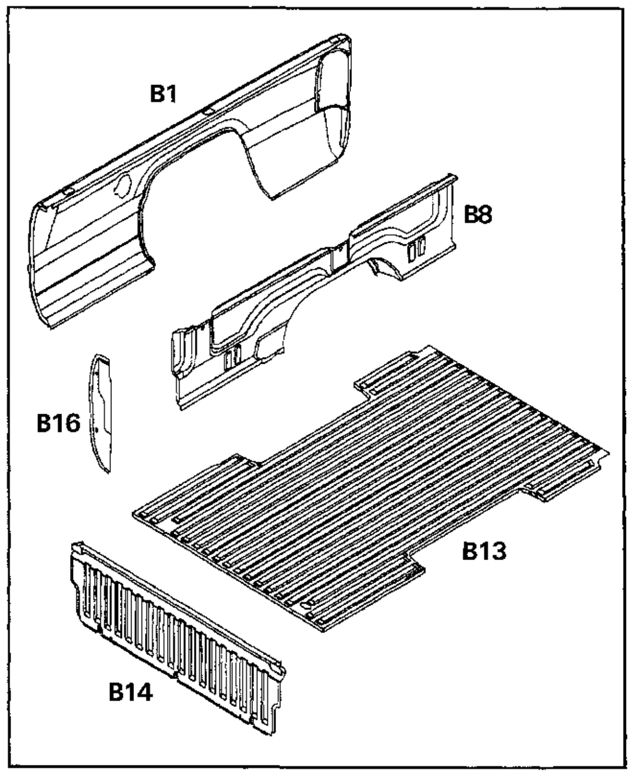
1. Box, rear crossmember (B8).
2. Box, crossmember (B9).
3. Box, center crossmember (B10).
4. Box, center crossmember (B11).
5. Box, crossmember (8 foot only) (B12).
6. Box, floor panel (B13).
7. Box, front crossmember (B15).



FRONT PANELS

The cargo box front closure is made up of several panels, each serviced separately.

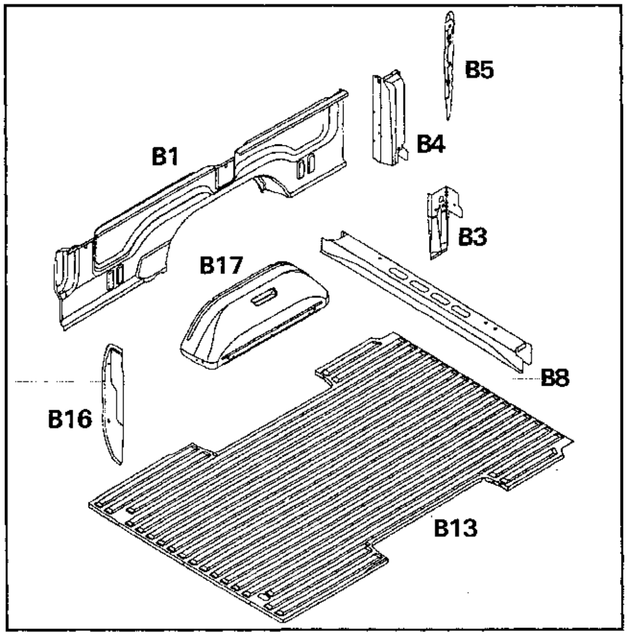
1. Box, side outer panel (B1).
2. Box, floor panel (B13).
3. Box, front center panel (B14).
4. Box, side front panel (B16).
5. Box, side inner panel (B18).



INNER SIDE PANEL

The cargo box inner side panel is basically the same for the 6 foot and 8 foot versions. The 8 foot version has one additional stake pocket in the center. All panels and components are welded together and are serviced separately.

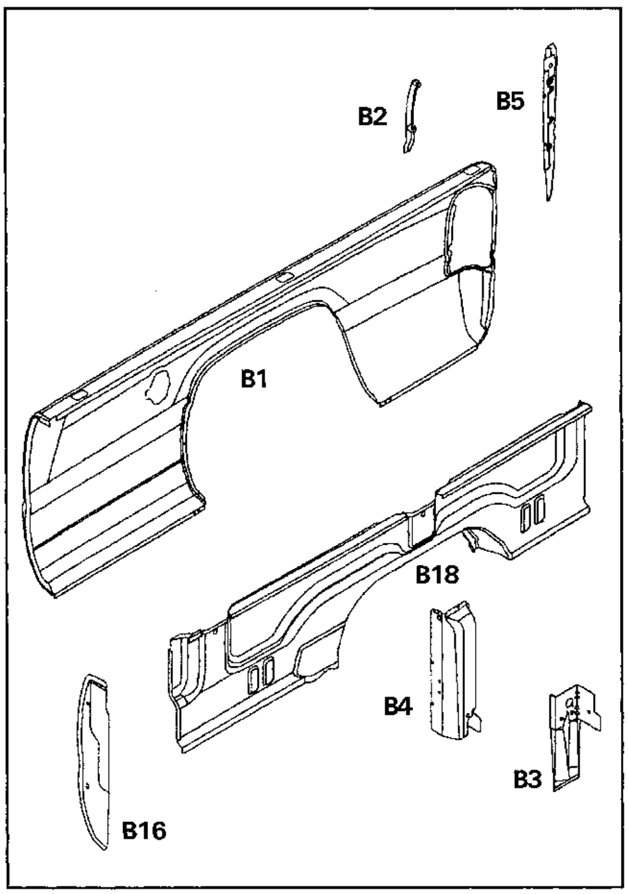
1. Box, side outer panel (B1).
2. Rear corner to rear sill gusset (B3).
3. Outer rear corner reinforcement (B4).
4. Box, side rear reinforcement (B5).
5. Box, rear crossmember (B8).
6. Box, floor panel (B13).
7. Box, side front panel (B16).
8. Rear wheelhouse inner panel (B17).



OUTER SIDE PANEL

The outer box side panel is the same for the 6 foot and 8 foot versions, except the 8 foot has the extra stake pocket in the center.

1. Box, side outer panel (B1).
2. Taillamp mounting bracket (B2).
3. Rear corner to rear sill gusset (B3).
4. Outer rear corner reinforcement (B4).
5. Box, side rear reinforcement (B5).
6. Box, side front panel (B16).
7. Box, side inner panel (B18).



AUTHENTIC RESTORATION PRODUCT

FRAME CONSTRUCTION CHARACTERISTICS

Dodge Ram Pickup

The Dodge Ram Pickup uses an exclusive patented three-section frame design that provides exceptional frame strength and stiffness. The construction of each of the three sections provides the special level of strength and stiffness needed by each part of the vehicle. The ends of the center section are swaged to fit into the front and rear sections. The front and center sections are welded together, and the center and rear sections are joined by a patented 14-rivet process. The frame is serviced as a complete unit only.

WELDED PANEL REPLACEMENT

Dodge Ram Pickup

The basic parts of the body structure are the welded panels. This section contains a brief description of the placement of some of these panels and their weld locations.

NOTE: To ensure the strongest, most durable and cleanest welds possible, perform testing before and during all weld procedures. Always follow American Welding Society specifications and procedures.

EXPLANATION OF MANUAL CONTENTS

This publication contains information used to repair the body structure of the Dodge Ram Pickup. The information is divided into sections covering the welded body panels (i.e., fenders, cab and box), location and use of structural adhesives and sealants, bumper configurations and frame dimensions. When servicing a damaged vehicle, please refer to the NOTES WITH REGARD TO REPAIR WORK. These notes are provided to assist in the repair process and ensure a timely and quality repair.

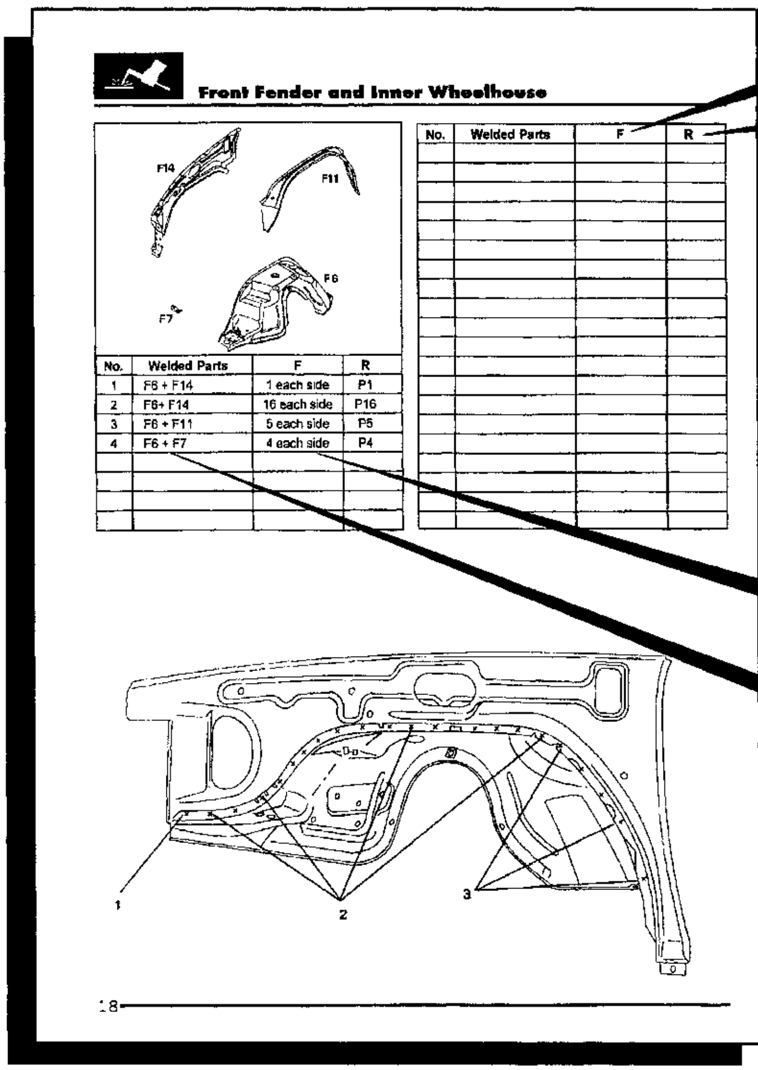
Symbols

Some of the operations for panel replacement are designated by the following symbols:

Rough cutting of panel to be replaced	++++ MIG Plug Weld	MIG Arc Welding

1 3 2 4 Continuous Stitch MIG Weld	Alternate stitch welds until you have a continuous MIG Weld.

NOTE: Although spot welds are the nuts and bolts of most body structures, they will not be used as a repair symbol because of the lack of proper spot weld equipment in most shops.



"**F**" indicates the number of factory welds to be separated. "**R**" indicates the number of welds to be made and the method to be used when making repairs.

If only a number is listed under "**F**" it indicates that the method used at the factory was a spot weld. For all other methods, both the welding method and the number of welds are indicated. For example, "**F**2, **R**P2" indicates that the 2 spot welds made at the factory should be replaced by 2 plug welds if repairs are made.

The welded components are indicated by using the designations given in the illustration below: For example, "a + b" indicates that component "a" and component "b" shown in the top illustration are welded

NOTE: Before beginning repair procedures, perform test welds to verify your equipment and to ensure your welds are the best quality. All welds should conform to the American Welding Society standards.

Certain body components must use sealers to ensure proper assembly. Be sure to check the **Body Sealing Locations** and **Structural Adhesives Sections** for location and sealer type.

For weld specifications contact:

American Welding Society
550 Northwest Le Jeune Road
P.O. Box 351040
Miami, Florida 33135
Phone: (305) 443-9353

Points which require particular attention during welded panel replacement work.

The panel removal instructions and accompanying illustrations are given in the order in which the work is to be performed.

The panel installation instructions and accompanying illustrations are given in the order in which the work is to be performed.

In order to keep the instructions brief and simple, obvious work procedures (such as removal of a panel after it has been cut) have been omitted where possible.

Front Fender and Inner Wheelhouse

NOTES WITH REGARD TO REPAIR WORK

- The front fender is made of many parts but is serviced only as a complete assembly.
- This section can be used for replacing the fender or the inner wheelhouse.

REMOVAL

1. Using a spot weld cutter or hole saw, cut all spot welds as indicated.
2. Separate fender assembly from inner wheelhouse.

PREPARATION

1. Clean all surfaces of panels being reused by removing sealers and adhesives.
2. Using old panel, transfer weld locations to replacement panel.

INSTALLATION

1. Install new panel and clamp or tack weld in place.
2. Check alignment and fit, and reposition if necessary.
3. Complete all spot or plug welds.
4. Apply anti-corrosion and sealer materials as necessary.

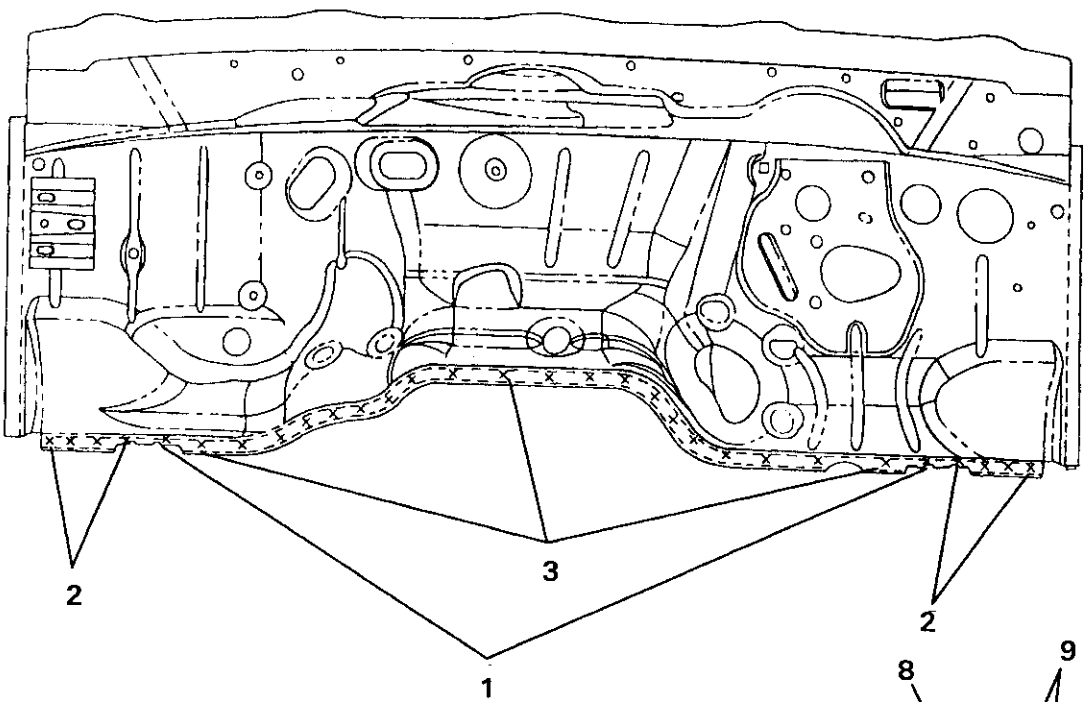
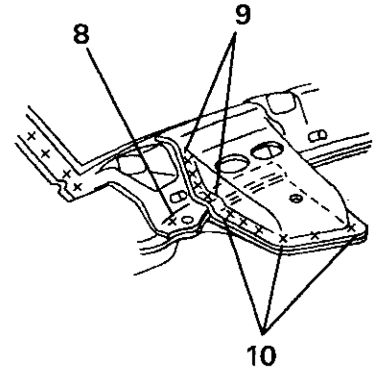
12	C13 + C16 + C17	13	P13





NOTES WITH REGARD TO REPAIR WORK

- Use care when removing undamaged panels to gain access to cowl or dash panels.
- Remove all flammable materials before starting any repairs.

REMOVAL

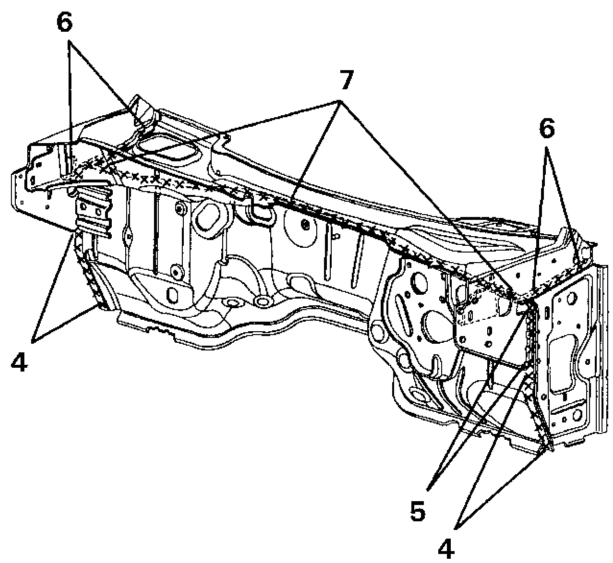
1. Carefully cut all spot welds with a spot weld cutter or hole saw.
2. Separate panels with air chisel or other suitable tools.
3. Remove damaged panel.

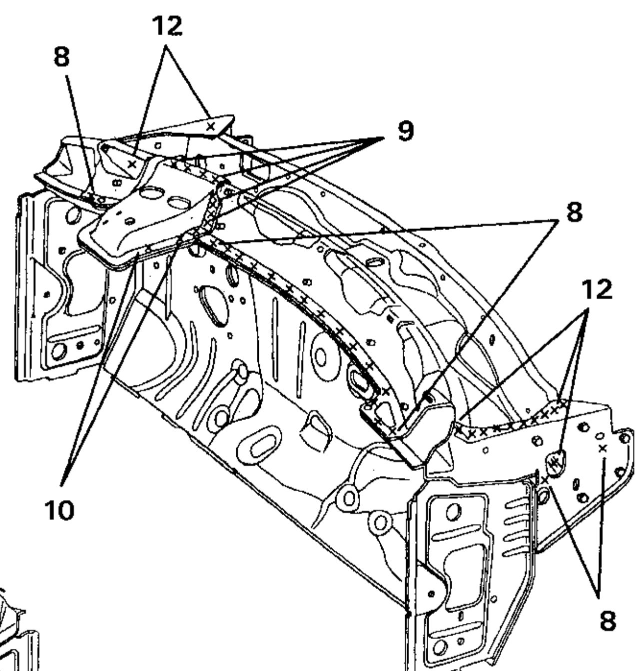
PREPARATION

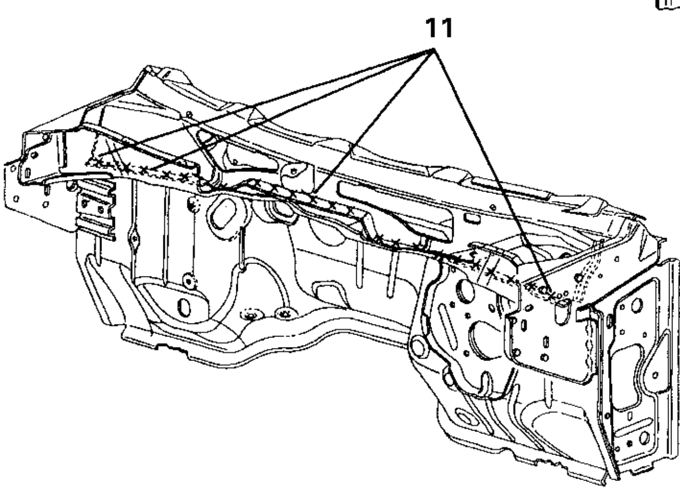
1. Transfer weld locations to new panel from old.
2. Clean all mating surfaces of adhesive.

INSTALLATION

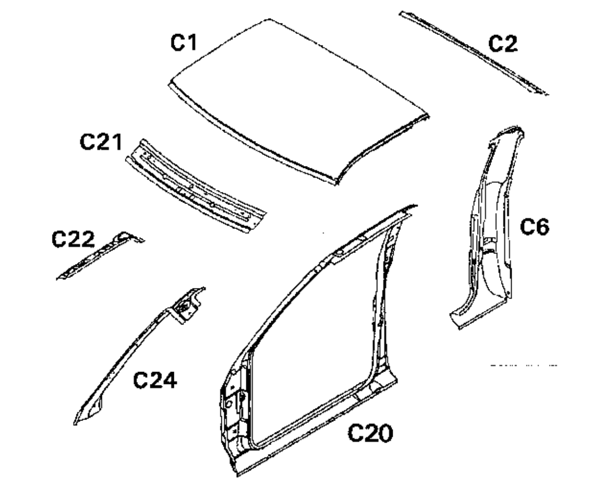
1. Test-fit new panel(s) and clamp in place. Double-check fit and alignment.
2. Plug weld new panel(s) at indicated locations.
3. Apply sealers and adhesives as required. Also apply anticorrosion materials as needed.





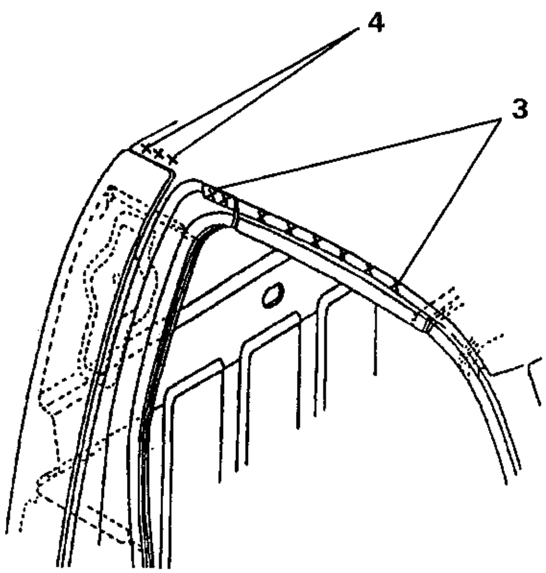


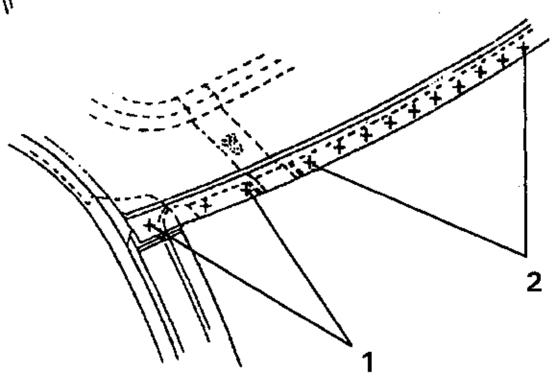
Roof Panel (Regular Cab)



No.	Welded Parts	F	R
1	C1 + C20 + C24	3 each side	P3
2	C1 + C21	10 each side	P10
3	C1 + C20 + C22	8 each side	P8
4	C1 + C6	3 each side	P3
5	C1 + C2	20	P20

No.	Welded Parts	F	R





NOTES WITH REGARD TO REPAIR WORK

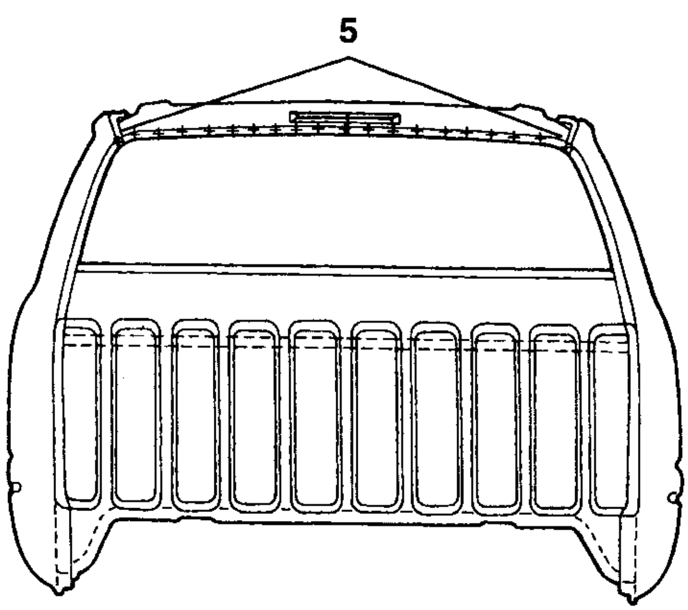
- Take care when handling a roof panel. The panels can be easily damaged by mishandling.
- Be sure to use the recommended adhesive for the roof bows.
- Before heating roof panel to soften old adhesive, make sure all flammable materials are removed from roof inner and outer areas.

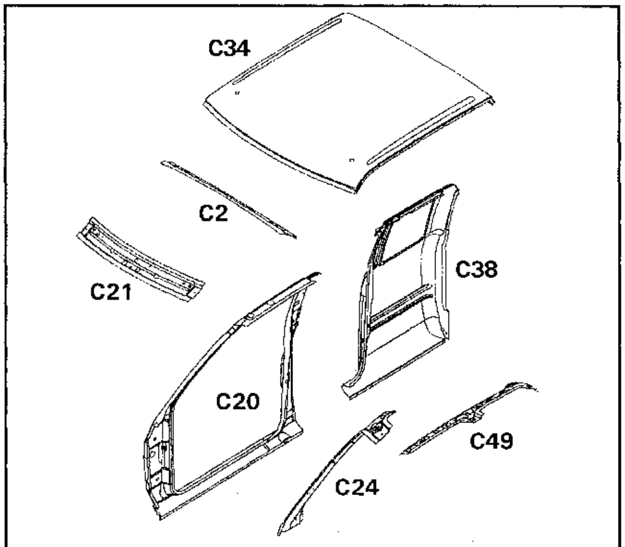
REMOVAL

1. Cut and separate the spot-weld locations, being careful not to damage any other paenls.
2. Heat the top of the roof panel at the areas where it has adhesives applied. This will make it easier to remove.
3. Remove the old roof panel.
4. Remove any old adhesive on roof braces, using a mule skinner's wire brush or something as aggressive.

INSTALLATION

1. Temporarily align and mount the new roof panel onto the body. Make corresponding reference marks on the panel and body structure for later use.
2. Use the old roof panel as a template to mark locations for plug welds on the new roof panel.
3. Apply the adhesive to the roof bows and place roof panel into position as marked previously.
4. After a double check for alignment, clamp panel down.
5. Plug weld the roof into place.
6. Finish seams as required.





No.	Welded Parts	F	R
1	C20 + C34 + C49	8 each side	P8
2	C24 + C34	3 each side	P3

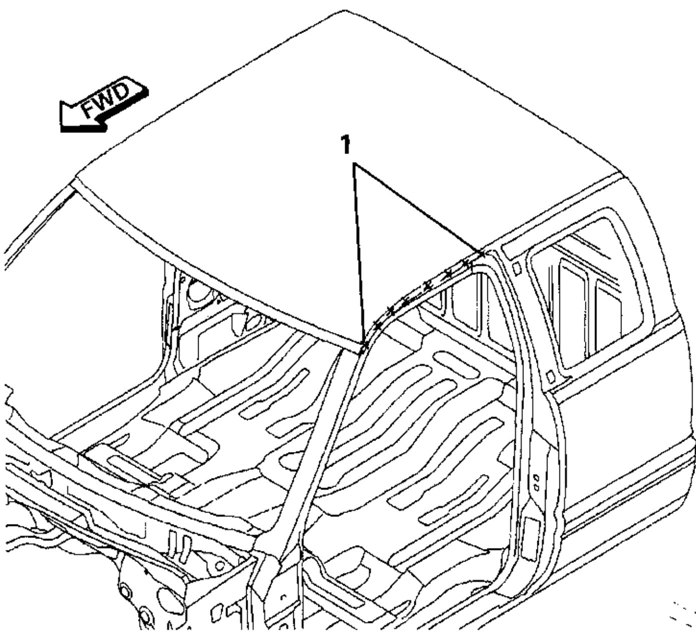
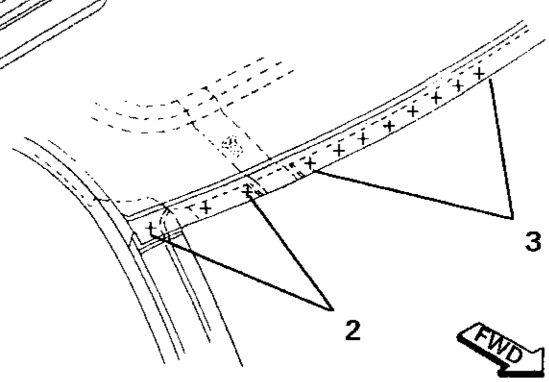
4	C34 + C38	11 each side	P11
5	C2 + C34	20	P20

No.	Welded Parts	F	R





NOTES WITH REGARD TO REPAIR WORK

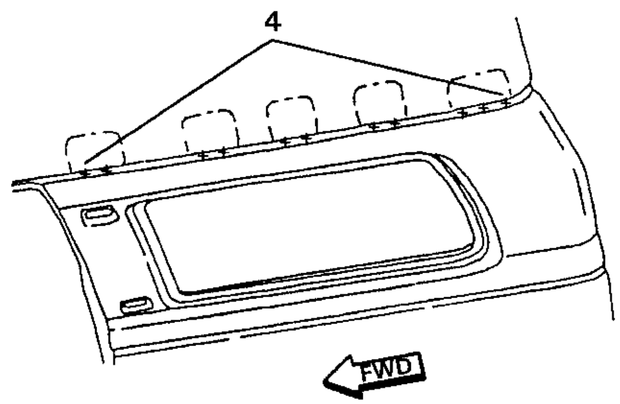
- Before heating the Roof Panel to soften old adhesive, make sure all flammable materials are removed from roof inner and outer areas.
- Take care when handling the Roof Panel. The panel can be easily damaged by mishandling.
- Be sure to use a good structural adhesive for the roof bows.

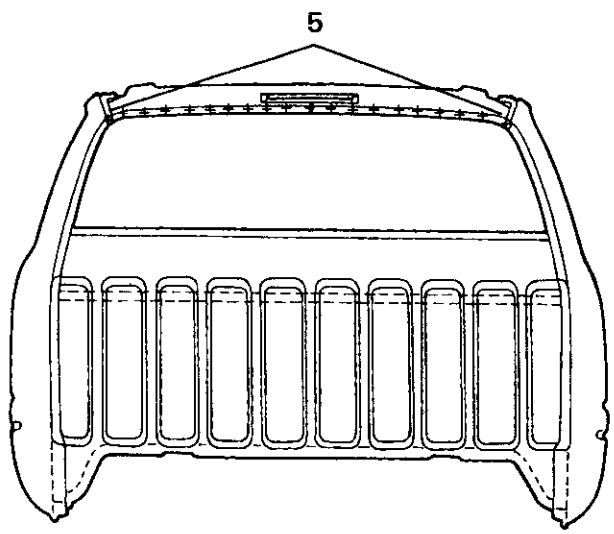
REMOVAL

1. Cut and separate the spot welded locations, being careful not to damage any panels.
2. Heat the top of the Roof Panel where adhesives are applied. It will make it easier to remove.
3. Remove the Roof Panel.
4. Remove any old adhesive on roof braces using a mule skinner's wire brush or something as aggressive.

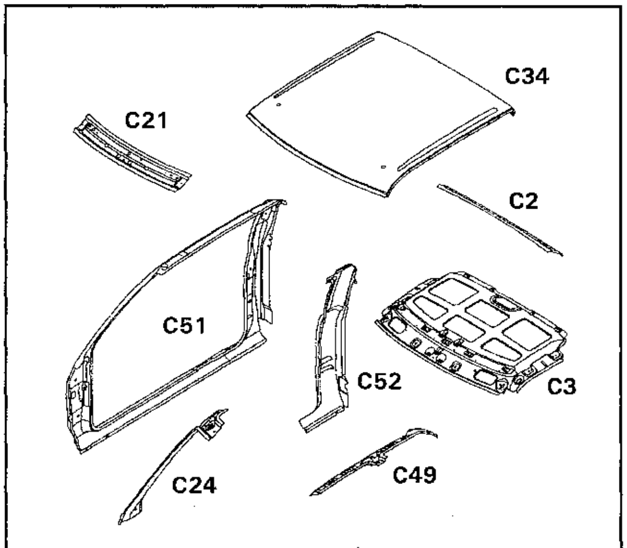
INSTALLATION

1. Temporarily align and mount the new Roof Panel onto the body. Make corresponding reference marks on the Roof Panel and body structure.
2. Use the old Roof Panel as a template to mark locations for plug welds on the Roof Panel.
3. Apply the adhesive to the Roof Bows and other mating surfaces and place the Roof Panel into position as marked previously.
4. After checking alignment and adjusting as necessary, clamp the panel down.
5. Plug weld the roof panel in place.
6. Finish seams as required.





Roof Panel (Quad Cab)



No.	Welded Parts	F	R
1	C24 + C34	1 each side	P1
2	C3 + C24 + C34	2 each side	P2
3	C3 + C21 + C34	14	P14

NOTES WITH REGARD TO REPAIR WORK

- The side aperture is a multilayer assembly. Use care when separating panels to avoid unnecessary damage.
- The side aperture may be sectioned using the proper non-structural repair procedures.

REMOVAL

1. Using a spot weld cutter or hole saw, carefully cut all spot welds at indicated locations.
2. Using an air chisel, separate damaged panels and remove.
3. It may be necessary to remove undamaged panels to gain access to panel being replaced.

PREPARATION

1. Clean and remove old adhesive and sealers from panels.
2. Grind and prep all panel flanges.
3. Using old panels, transfer weld locations to new panel.

INSTALLATION

1. Install new panel, fit and align, then clamp in place.
2. Recheck alignment and fit, tack weld.
3. Complete all plug weld as required.
4. Treat all welds and panels with anti-corrosion materials as required.
5. Apply sealers as required.

NOTES WITH REGARD TO REPAIR WORK

- The side aperture is a multilayer assembly. Use care when separating panels to avoid unnecessary damage.
- The side aperture may be sectioned using the proper non-structural repair procedures.

REMOVAL

1. Using a spot weld cutter or hole saw, carefully cut all spot welds at indicated locations.
2. Using an air chisel, separate damaged panels and remove.
3. It may be necessary to remove undamaged panels to gain access to panel being replaced.

PREPARATION

1. Clean and remove old adhesive and sealers from panels.
2. Grind and prep all panel flanges.
3. Using old panels, transfer weld locations to new panel.

INSTALLATION

1. Install new panel, fit and align, then clamp in place.
2. Recheck alignment and fit, tack weld.
3. Complete all plug weld as required.
4. Treat all welds and panels with anti-corrosion materials as required.
5. Apply sealers as required.

NOTES WITH REGARD TO REPAIR WORK

- To replace this panel, it will be necessary to remove the inner trim around the rear window area.
- The rear window will need to be removed as well as the cargo box.
- Use caution when welding or grinding; cover, remove or protect all flammable materials from sparks.

REMOVAL

1. Using a spot weld cutter or hole saw, carefully cut all spot welds where indicated. It will be necessary to remove the rear cab panel reinforcement and extensions first to gain access to hidden welds.
2. If replacing rear cab panel, it may be cut into smaller sections to aid in removal.

PREPARATION

1. Clean all weld surfaces and remove old sealers.
2. Transfer weld location points to new panels using damaged panel as a guide/template if possible.

INSTALLATION

1. The new panel will have to be installed from inside the cab and worked into place.
2. Clamp or tack weld into place.
3. Recheck fit and alignment.
4. Complete all plug welds.
5. Finish exterior surfaces at weld locations.
6. Apply anti-corrosion and sealing materials as necessary.

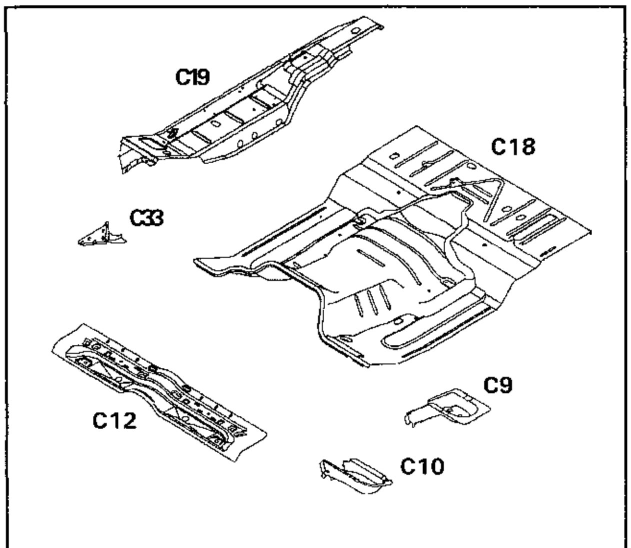
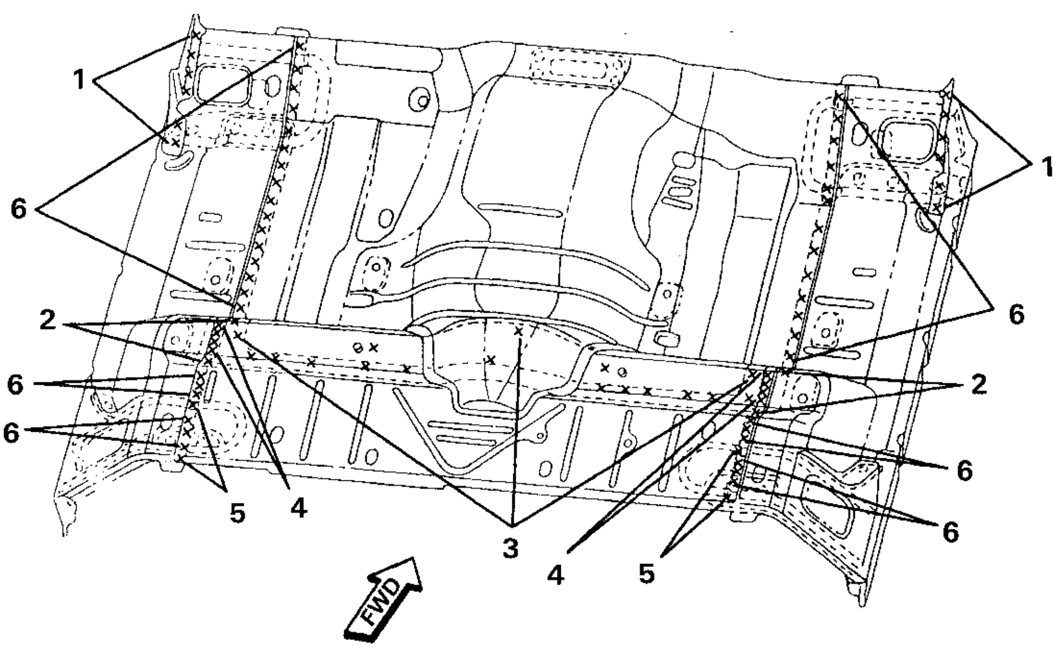
Floor Pan (Regular Cab)



No.	Welded Parts	F	R
1	C19 + C23	6 each side	P6
2	C12 + C18 + C19	2 each side	P2
3	C12 + C18	17	P17
4	C12 + C18 + C19	4 each side	P4
5	C9 + C18 + C19	2 each side	P2
6	C18+ C19	22 each side	P22
7	C9 + C18	8 each side	P8
8	C9 + C19	14 each side	P14
9	C9 + C19	7 each side	P7
10	C10 + C18	4 each side	P4
11	C10 + C19	8 each side	P8
12	C12 + C18	5 each side	P5
13	C18 + C19	2 each side	P2
14	C10 + C19 + C33	7 each side	P14



NOTES WITH REGARD TO REPAIR WORK

- The floor pan is made up of three separate panels. Each panel can be replaced individually.
- Replacing any of these panels is difficult. Many other panels and components have to be removed to gain access to the damaged panel. Use care not to damage other panels.

REMOVAL

1. Refer to cowl, side aperture and cab back panel sections for additional weld location information.
2. Carefully cut all spot welds and remove undamaged panels.
3. Cut all remaining spot welds and remove damaged panel.

PREPARATION

1. Using damaged panel, transfer weld locations to new panel.
2. Clean and prep all panel attaching surfaces.

INSTALLATION

1. Align and temporarily tack weld new panel into place.
2. Recheck for fit and alignment.
3. Complete all spot or plug welds.
4. Reinstall all remaining panels.
5. Apply sealer and anti-corrosion materials as required.

NOTES WITH REGARD TO REPAIR WORK

- Refer to Cargo Box Front Panel section for additional information.
- It will be necessary to remove the cargo box from the vehicle for this repair.
- Use caution when working on left side near fuel filler location.

REMOVAL

1. With cargo box properly supported, carefully remove all spot welds using weld cutter.
2. Use caution not to damage any adjacent panels.

PREPARATION

1. Clean and prep all panels not being replaced.
2. Remove primer coating at areas to be welded on new panel(s).
3. The taillamp support bracket (B2) can be welded in place before the panel on the box.

INSTALLATION

1. Install new panel on cargo box; align and clamp in place.
2. Tack weld new panel and recheck alignment and fit.
3. Complete spot and/or plug welding.
4. Treat all welds with anti-corrosion material.
5. Apply sealers as necessary.

NOTES WITH REGARD TO REPAIR WORK

- Refer to Cargo Box Front Panel and Outer Side Panel sections for additional weld location information.
- If replacing outer panel also, the inner and outer cargo box panels can be removed as an assembly.

REMOVAL

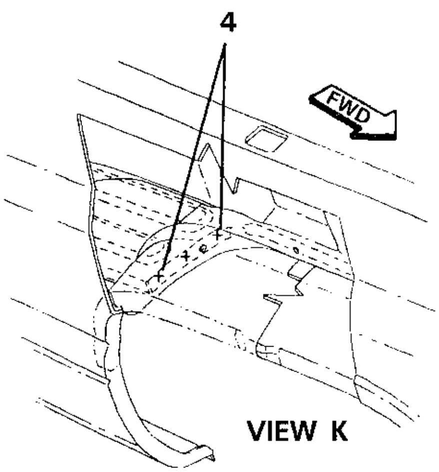
1. Locate and cut all spot welds using a spot weld cutter or 5/16" hole saw.
2. Use care when removing damaged panels not to cause unnecessary damage to panels not being used.

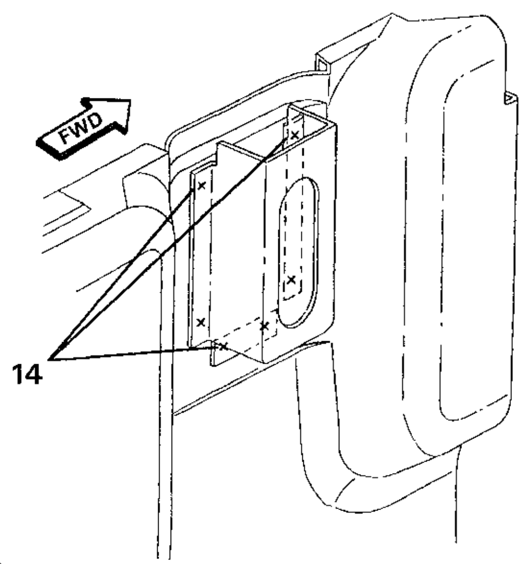
PREPARATION

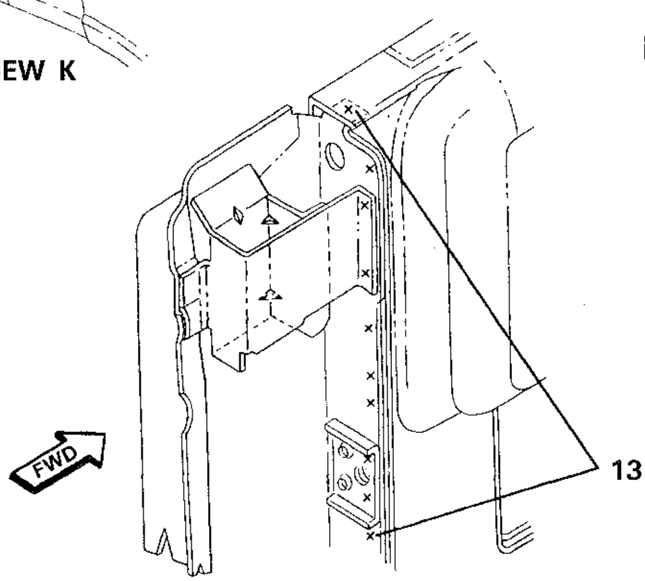
1. Using old panels, measure and locate weld locations onto new panels.
2. Clean and prep all panels for assembly.

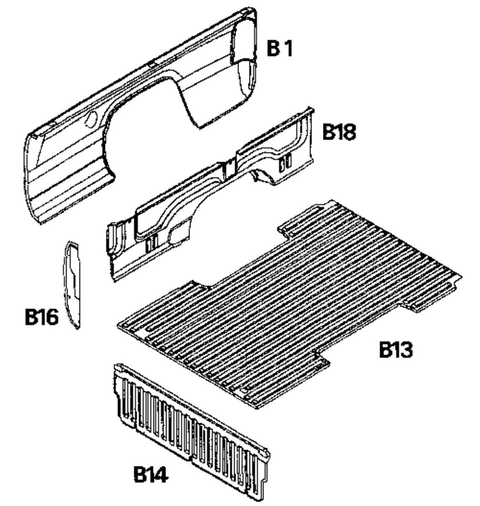
INSTALLATION

1. Temporarily attach all brackets and extensions panels to inner cargo box panel.
2. Recheck measurments, then weld in place.
3. Temporarily secure inner panel assembly to remainder of cargo box.
4. Place outer box panel in place and check for fit and alignment. Adjust inner and outer box panels as necessary.
5. Remove outer box panel and weld inner panel at spot weld locations.
6. Install outer panel as outlined in cargo box outer panel section.
7. Apply sealer and corrosion protection as necessary.









No.	Welded Parts	F	R

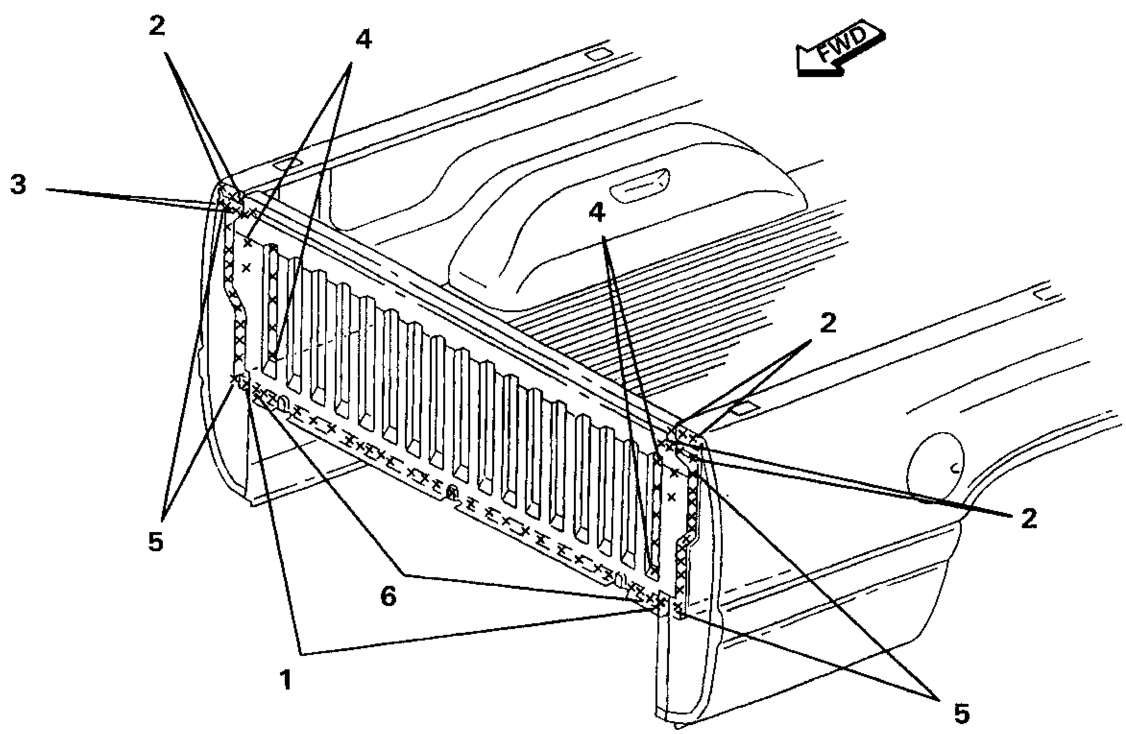
No.	Welded Parts	F	R
6	B13 + B14	26	P26
7	B1 + B16	15 each side	P15



NOTES WITH REGARD TO REPAIR WORK

- The front box panel consists of three sections.
- Use care when removing panel to be replaced, so as not to damage surrounding panels that are not being replaced.

REMOVAL

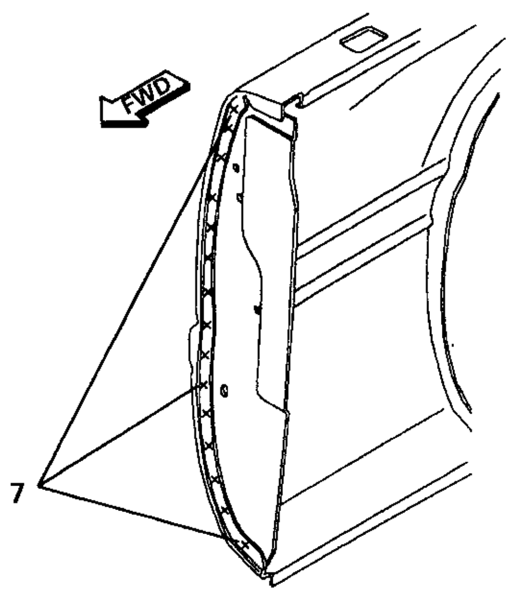
1. Use a spot weld cutter to remove spot welds.
2. Carefully spread box sides to remove front box panel.

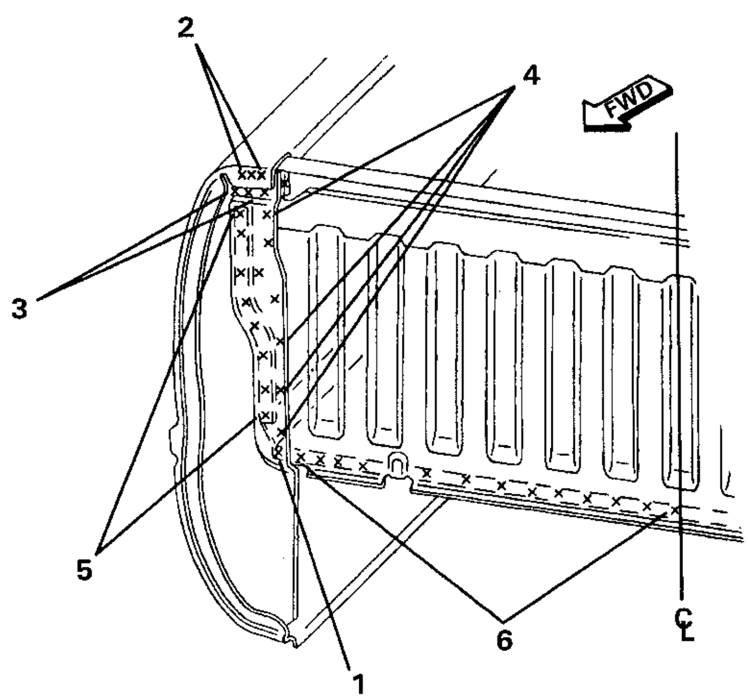
PREPARATION

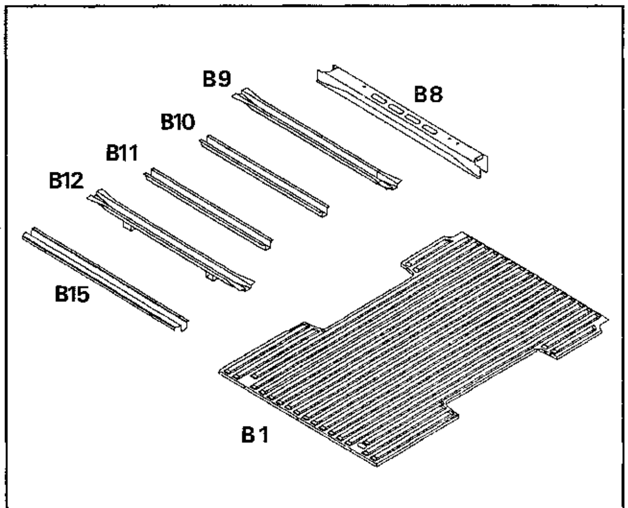
1. Clean and prepare all remaining panels.
2. If possible, use damaged panel as a pattern to locate spot or plug welds on new panel.

INSTALLATION

1. Carefully spread box sides and slip front panel into place.
2. Secure panel in place with clamps.
3. Recheck alignment and fit, and tack weld.
4. Secure panel with plug or spot welds.
5. Apply sealers in specified areas.
6. Treat all welded areas with anti-corrosion material.







No.	Welded Parts	F	R
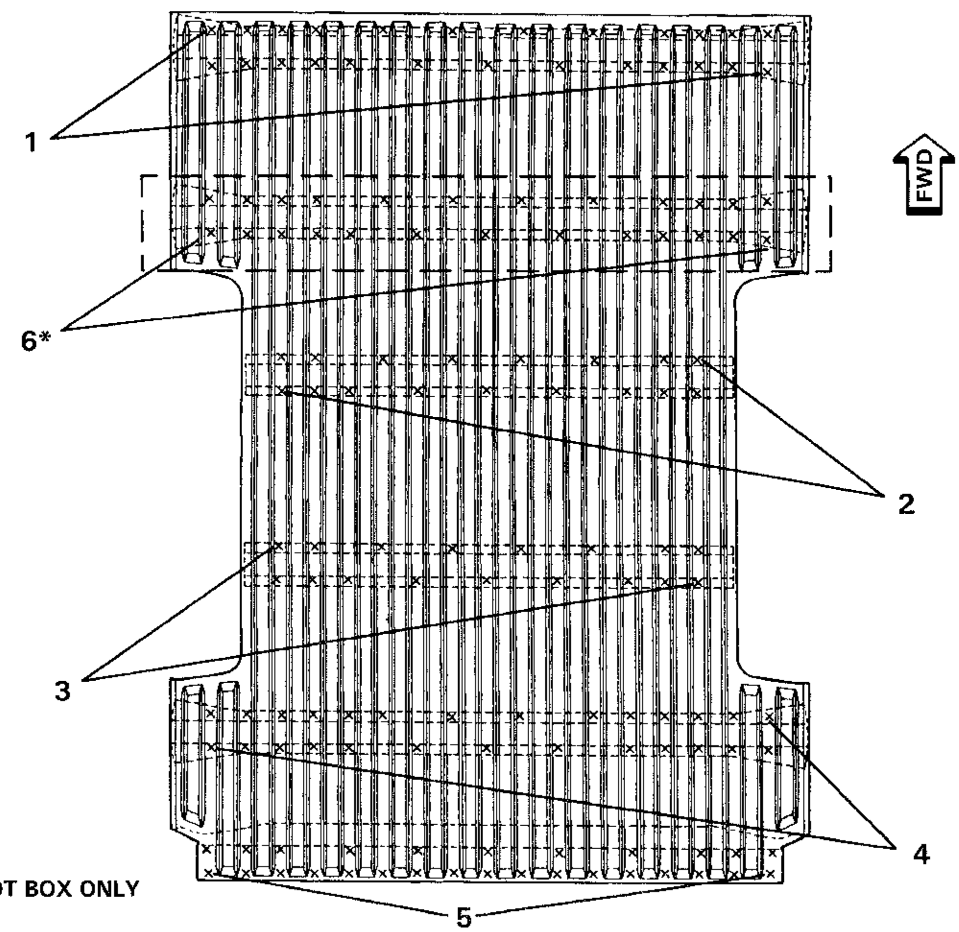
6	B12 + B13 *8ft. only)	25	P25



* 8 FOOT BOX ONLY

NOTES WITH REGARD TO REPAIR WORK

- Refer to Inner Box Side and Front Panel replacement sections for additional information.
- ALL replacement crossmembers come as complete assemblies with gussets and top plates already installed.
- If replacing crossmember(s) only, remove welds for that crossmember only.

REMOVAL

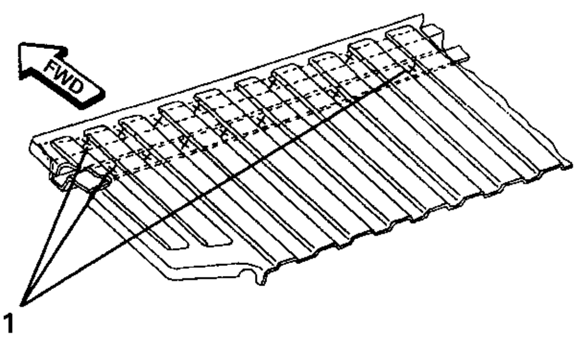
1. Remove cargo box from vehicle. Place box upside down on a suitable stand or on the floor. Support box floor from underside also.
2. Before starting floor panel removal, measure the locations of all crossmembers and transfer measurements to new panel.
3. Carefully cut and separate the spot welds attaching the box floor to the front and side panels using a 5/16" or 3/8" hole saw.
4. It is not necessary to separate the front panel from the box sides if these panels are undamaged.

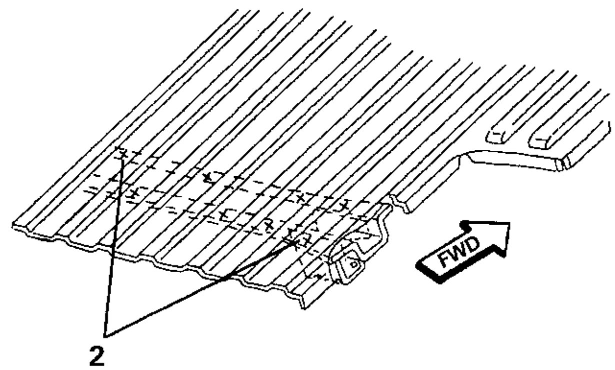
PREPARATION

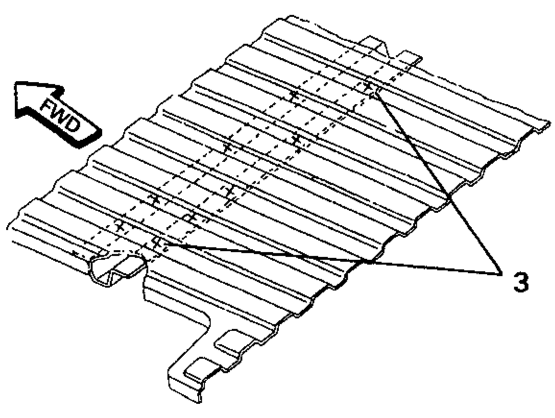
1. Use old floor panels as a guide for locating weld points on new floor panel.
2. Clean and prep all panels.
3. Position and weld crossmembers to new floor panel using measurments from old floor panel as a guide.

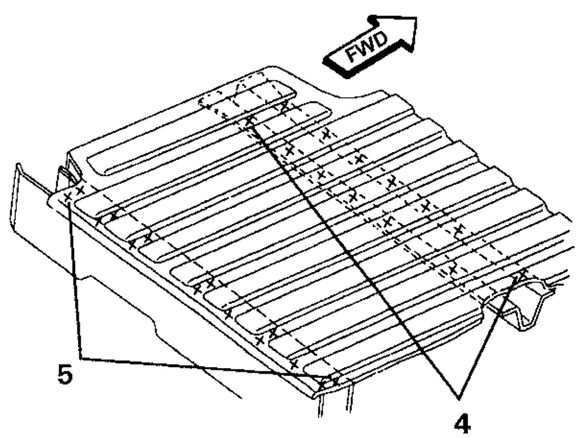
INSTALLATION

1. Place new floor panel into position with box sides and front panel, and clamp in place.
2. Check all measurments and alignments.
3. Tack weld new panel to adjacent panels.
4. Recheck measurments and alignments.
5. Plug weld all panels to factory specifications.
6. Apply seam sealer and anti-corrosion materials as necessary.









Notes

BUMPER SYSTEMS

Dodge Ram Pickup

The front bumper consists of a high-strength steel face bar (painted on base vehicles and chromed with the laramie SLT package) with molded upper and lower plastic fascias. The optional rear step bumper is the lightest and strongest in the industry. The bumper has a one-piece stamped steel face coupled with a reinforcement tube for strength. The outer ourface is chrome plated while the inner surface and reinforcement tube are painted to help prevent corrosion. The fascias are attached to the bumper which is then secured to the body via bumper reinforcement brackets. The bumper systems are designed to meet all federal safety standards.

STRUCTURAL ADHESIVES

Dodge Ram Pickup

Structural adhesive is used to bond panels for cosmetic or assembly reasons. There are many other benefits to using structural adhesives.

For example:

- Minimal or no welding required
- Added strength
- Reduced panel distortion

Notes

AUTHENTIC RESTORATION PRODUCT

BODY SEALING LOCATIONS

Dodge Ram Pickup

All repairs where panels are replaced may have voids that must be filled with sealant. Sealant also should be applied to sealer skips, pin holes and weld burn-through holes on the interior and exterior of the vehicle that would permit leakage of water, air or exhaust fumes.

Typical areas of the exterior that must be sealed are listed on this page. Typical areas of the interior that must be sealed are floor pans, wheelhouses, dash panel and cowl sides. Unless noted, all illustrations show the regular cab; sealing locations are similar for the club and quad cab.

AREAS AFFECTED

A - COWL AND PLENUM
B - HINGE PILLAR TOP VIEW
C - HINGE PILLAR END VIEW
D - FLOOR AND SIDE SILL
E - B-PILLAR
F - ROOF SIDE RAIL
G - SIDE SILL TO QUARTER PANEL
H - BOX REAR CORNER
J - BOX WHEEL WELL

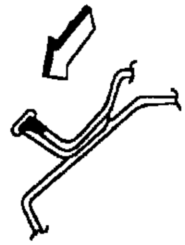
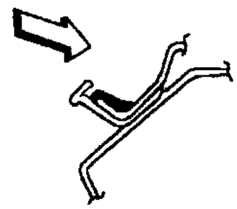
METHODS OF APPLYING AUTO BODY SEALANT



Hold gun nozzle in direction of arrow in order to effectively seal metal joints.



Do not hold gun nozzle in direction of arrow. Sealer applied as shown is ineffective.

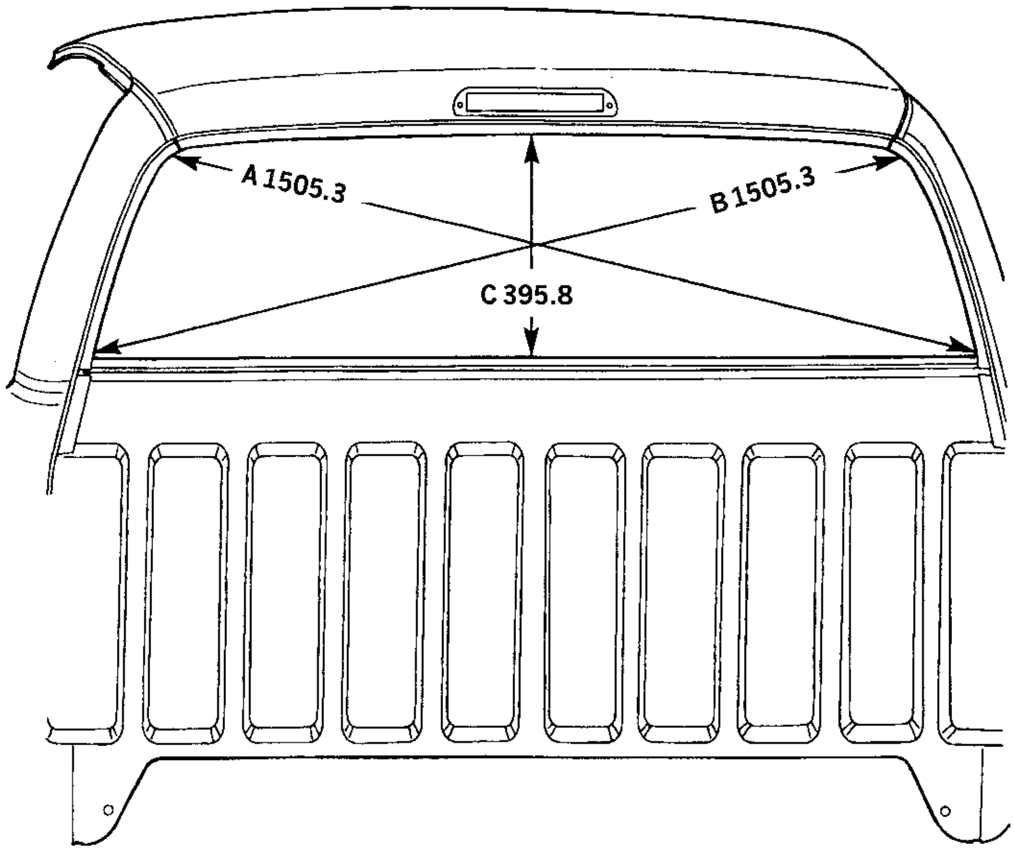
BODY DIMENSIONS & SPECIFICATIONS

Dodge Ram Pickup

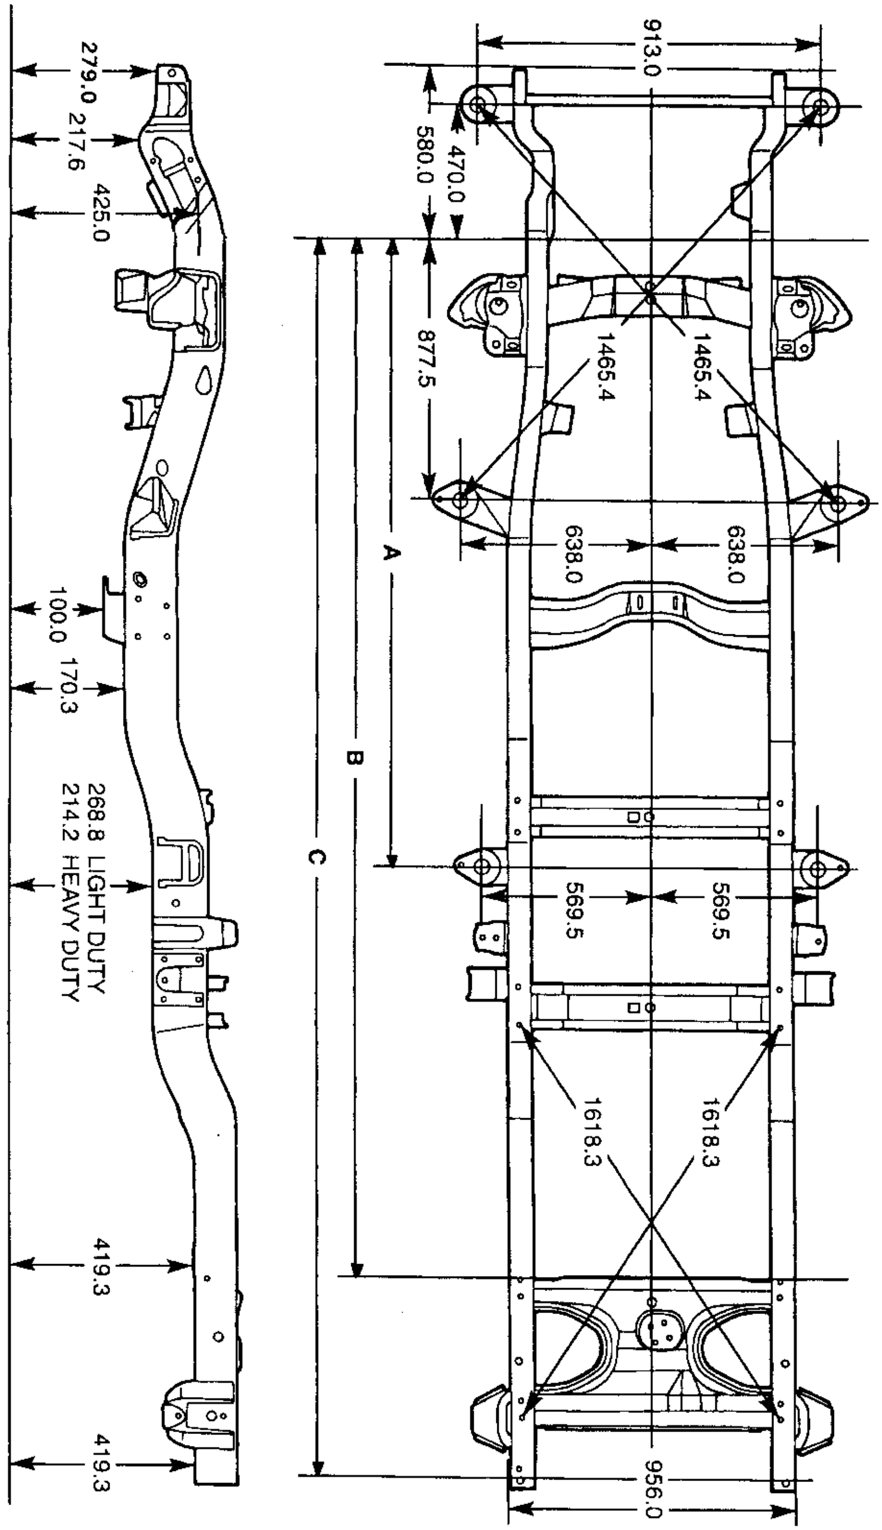
REAR VIEW



A & B. Center of radius at top corner to center of radius at lower corner of glass mounting flange.

C. Lower edge of upper back glass mounting flange to upper edge of lower back glass mounting flange measurement taken at centerline of rear glass opening.

Note: All measurements are in mm. Dimensions referred from PLP holes are from centerline of hole.

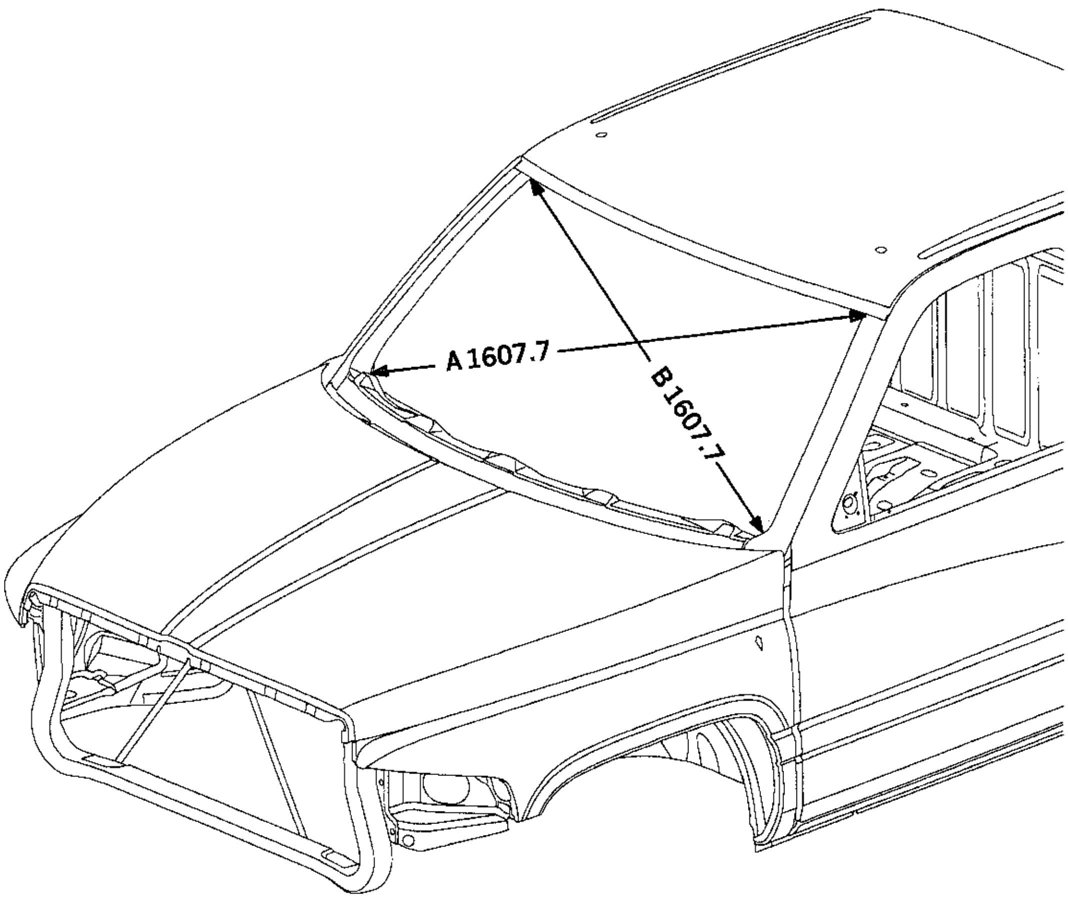


Note: All measurements are in mm. Dimensions referred from PLP holes are from centerline of hole.

LENGTH DIMENSIONS FOR DIFFERING WHEELBASES

WHEELBASE	LENGTH A	LENGTH B	LENGTH C
118	2118.0	3663.6	4185.4
134	2118.0	3994.5	4693.4
138	2626.0	4096.1	4693.4
154	2626.0	4502.5	5201.4
162	2118.0	4705.0	5042.5

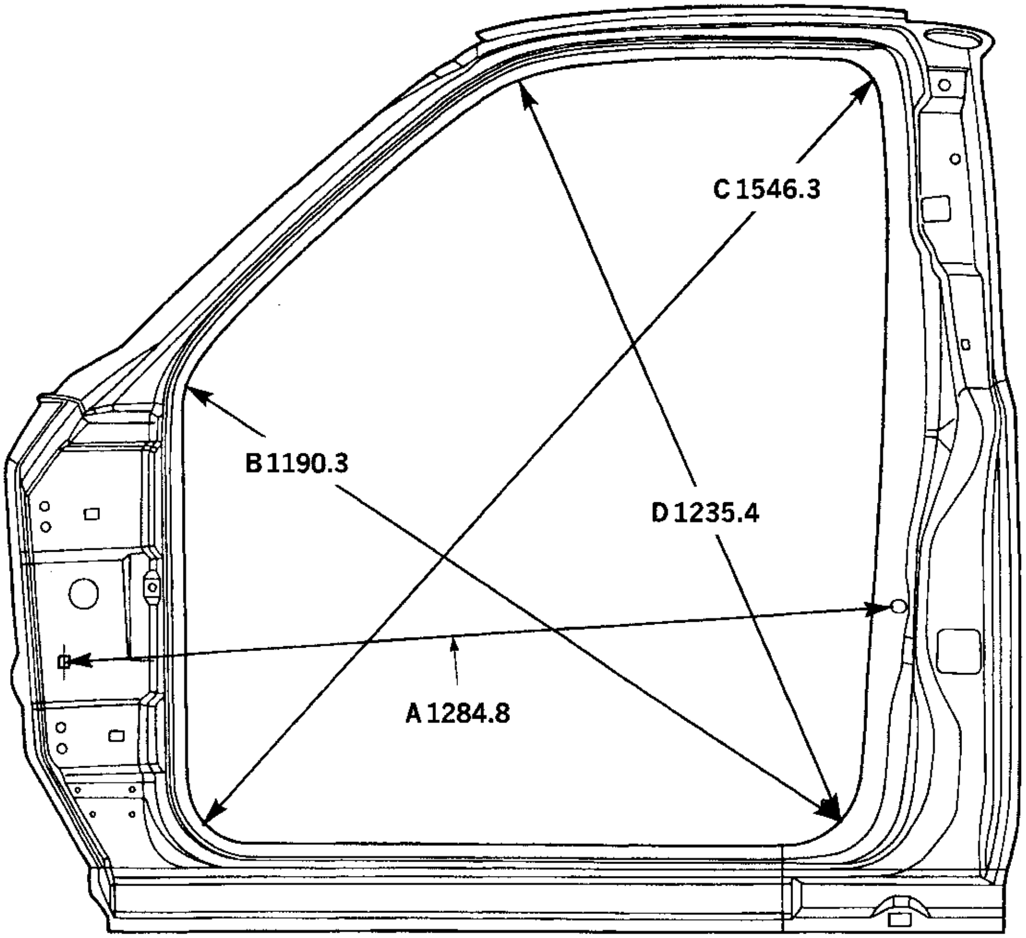
WINDSHIELD



A & B. Upper corner of windshield opening to top of radius at lower corner of opening.

Note: All measurements are in mm. Dimensions referred from PLP holes are from centerline of hole.

REGULAR CAB



A. Centerline of A-Pillar gaging hole to centerline of seat belt retractor hole at B-Pillar.

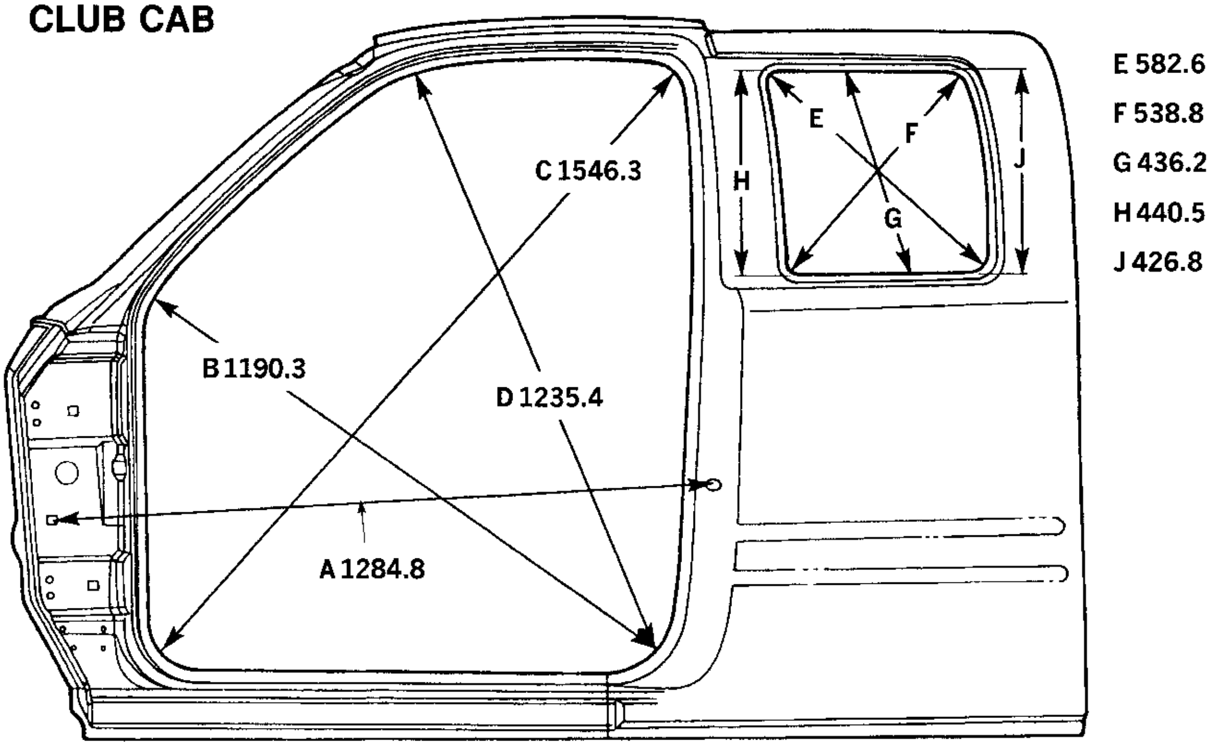
B. Center of radius at rear lower door opening flange inner edge to center of radius at cowl flange edge.

C. Center of radius at front lower door opening flange inner edge to center of radius at upper opening rear flange inner edge.

D. Center of radius at rear lower door opening flange inner edge to center of radius at upper front flange inner edge.

Note: All measurements are in mm. Dimensions referred from PLP holes are from centerline of hole.

CLUB CAB



A. Centerline of A-Pillar gaging hole to centerline of seat belt retractor hole at B-Pillar.

B. Center of radius at rear lower door opening flange inner edge to center of radius at cowl flange edge.

C. Center of radius at front lower door opening flange inner edge to center of radius at upper opening rear flange inner edge.

D. Center of radius at rear lower door opening flange inner edge to center of radius at upper front flange inner edge.

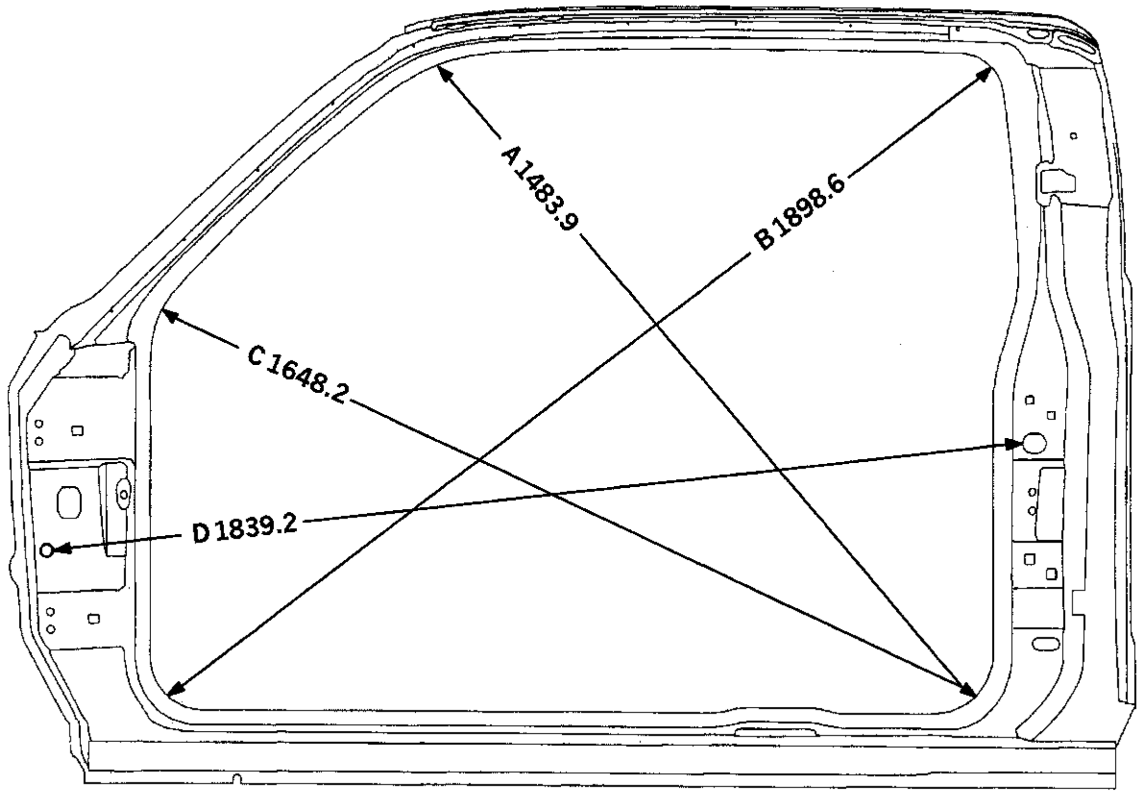
E. Lower rear corner inner flange edge to upper front corner inner flange edge of quarter glass opening.

F. Lower front corner inner flange edge to upper rear corner inner flange edge of quarter glass opening.

G. Upper inner flange lower edge to lower flange upper edge of quarter glass opening.

Note: All measurements are in mm. Dimensions referred from PLP holes are from centerline of hole.

QUAD CAB



A. Centerline of A-Pillar gaging hole to centerline of seat belt retractor hole at B-Pillar.

B. Center of radius at rear lower door opening flange inner edge to center of radius at cowl flange edge.

C. Center of radius at front lower door opening flange inner edge to center of radius at upper opening rear flange inner edge.

D. Center of radius at rear lower door opening flange inner edge to center of radius at upper front flange inner edge.

Note: All measurements are in mm. Dimensions referred from PLP holes are from centerline of hole.

This is a very easy way to write up your measurement information. You can tell at a glance when a dimension changes, and you can do what is necessary to stay in specification before you proceed.

Here's how to use this sheet or a similar one since each vehicle manufacturer supplies critical measuring point information.

Each time a correction is made to restore the body to its proper dimension, all readings should be taken again, in addition to the dimension you have just corrected.

The A-B-C, etc., are the measuring point dimensions. The 1-2-3, etc., are the readings taken at measurement step 1 , measurement step 2, etc.

This sheet tells you at a glance how you stand in restoring the body to its proper state.

When using the tram and centering gauge system, *always* compile a list of dimensions each time you measure. This provides the information for measurement comparison, especially during the pulling and straightening phase of body collision repair.

The manufacturer of the equipment supplies information, so be sure you constantly review this information and bulletins so you will be up to date on repair techniques.

TAKE FULL ADVANTAGE OF WHAT MOPAR SHEET METAL CAN DO FOR YOUR BUSINESS!

MANUFACTURING & STAMPING:	***ONLY MOPAR SHEET METAL REPLACEMENT PARTS ARE COMPUTER MANUFACTURED ON THE SAME STAMPING SIDES AS THE ORIGINAL SHEET METAL THAT'S USED ON CHRYSLER CORPORATION VEHICLES, AND MEETS OR EXCEEDS ALL FEDERAL SAFETY STANDARDS.***
FIT:	***ONLY MOPAR SHEET METAL MEETS CHRYSLER'S HIGH QUALITY STANDARDS FOR FIT AND FINISH BY USING A SPECIALLY CONSTRUCTED FIXTURE TO DUPLICATE THE VEHICLE'S ORIGINAL DESIGN DIMENSIONS.***
WARRANTY:	***MOPAR SHEET METAL IS BACKED BY A 7-YEAR/UNLIMITED MILEAGE LIMITED WARRANTY.****
COATING:	***ALL MOPAR SHEET METAL INCLUDES A GALVANNEALED COATING BETWEEN THE SPRAY PRIMER AND BASE METAL TO PROVIDE SUPERIOR CORROSION RESISTANCE.***
MATERIAL:	***MOPAR USES ONE-AND -A-HALF AND TWO SIDED GALVANIZED (ZINC-COATED) STEEL AND TWO-SIDED GALVANNEALED (ZINC/IRON-COATED) STEEL TO CONTRAST TOUGH SHEET METAL PARTS TO PROVIDE MAXIMUM PROTECTION.***

IF YOU CARE ABOUT YOUR BUSINESS AND YOUR CUSTOMERS' LONG-TERM SATISFACTION, USE ONLY MOPAR SHEET METAL PARTS ON CHRYSLER CORPORATION VEHICLES.

****SEE YOUR LOCAL CHRYSLER CORPORATION DEALER FOR A COPY OF THE WARRANTY.***
